M8 | Carmela Munos | Vista Community Clinic | I work for the Vista community Clinic, one of the cities doing community outreach for SANDAG in North County, San Diego. I have been working for adults in youth of several years, especially underserved communities. Many of these residents rely on public transportation because they cannot afford a car. So many of these families are very excited about the 5 Big Moves, they believe this new plan is more fair and equitable for everyone. The new plan will benefit everyone not only drivers. Thank you SANDAG all the efforts in creating an innovative plan that will provide options for all residents in San Diego. Thank you also for translating important chapters of the Regional Plan, this will help non-English speaking community members be more involved in the decision-making process. Looking forward for the public comment period. | We appreciate your support and feedback. Please continue to follow along in this process by visiting SDForward.com.

M9 | Carol Kim | | We’re really excited to see this RTP that’s been proposed today. It’s got a lot of great things in it, and we’re definitely going to be digging into the details as we move forward. I’m really looking forward to seeing some of these really good quality, good paying jobs go to local workers here in San Diego and absolutely on board with all the comments from our partners at the Quality of Life Coalition, as well as the Equity Committee talking about accessibility and the importance of including environmental justice communities and really tackling our transmission - our emissions and being able to lower those along with VMFs. So again, thank you for the work that’s gone into this, and we look forward to continuing to partner with you. Oh, and I think Edwin G. is gonna be coming on, and you called on him. He was having issues with his technology. | We appreciate your support and feedback. Please continue to follow along in this process by visiting SDForward.com.

M10 | Carolina Goldwin | Environmental Coalition | I’m with the Environmental coalition and the San Diego Transportation Equity working group. We know that the transit system doesn’t work. It doesn’t connect people to jobs and we have the seventh worst ozone pollution in the nation. 41 percent of our greenhouse gas emissions are coming from transportation so we submitted a letter with all our comments. We have short-term solutions that need to be seen in our communities fairly soon so that we could transport us into the future as soon as possible. We ask that the bus system be transformed by 2025, 24/h service, the youth opportunity pass, anti-displacement strategies, bathroom network, emergency ready system. All by 2025 a best electrification full transition by 2030 and long-term solution addressing the blue line. The blue line is the backbone of our transit system it should be our biggest move. We need to ensure the blue line infrastructure is not defunded and left to age without major investments. | The planned transit frequency improvements and spans of services for all routes, including existing local service and future regional services, will be added to Appendix A for the proposed Final Plan and can be currently viewed as part of the Social Equity Working Group agenda from August 5, 2021. Additionally, the transit agencies will continue to electrify their transport response to state mandates. SANDAG will conduct a Blue Line Express Feasibility and Conceptual Engineering Study as a Near-Term Implementation Action (to be included in Appendix B).

M11 | Christopher Allen | | I’m a San Diego native, proud Southwest Union carpenter and have helped build San Diego infrastructure for more than a decade. I have personally seen the relief in congestion and improvement of our communities by rapid transit, elevated rails, heavy rails, bike and walking pathways. We need to build forward-thinking infrastructure like this in America’s finest city and build it with a skilled and trained workforce as well. Investment to infrastructure should also go back to the community members that build these projects. I support this Regional Plan and let’s build community wealth together. | We appreciate your support and feedback. Please continue to follow along in this process by visiting SDForward.com.

<td>Alliance for Regional Solutions</td>
<td>I’m a representative to the social equity working group for the Alliance for Regional Solutions. The alliance is a robust collaborative of over 75 human serving and community serving organizations we also have representation from the cities of North County and the City of San Diego. Our mission is to provide services and improve the lives of the disadvantaged and there are significant underserved communities in North County. This plan is dramatically important to help them. Speaking of social equity: I want to reference a couple of things in the plan—well my time is wrapping up—I want to refer everybody to chapter 2 figure 2.4. This is a map showing a coverage of flexible fleets into the regional transportation system. Everybody go look at this figure 2.4 it is dramatically important to achieving social equity.</td>

<td>San Diego Union Iron Workers out of Local 229</td>
<td>I’m with the San Diego Union Iron Workers out of Local 229. We’re glad to see how much work has been put into this envisioning on how we can improve our transportation system in San Diego County. This is how we can provide the first-time safe, convenient, and realistic alternatives to driving. We also improve local roads. It’s long overdue. San Diego workers everywhere and across all industries will benefit from those options, as well as benefit from the positive climate impact we’ll see through reduced carbon emissions. We’re looking forward to partnering with SANDAG and the community in transforming San Diego County for better. We would love to be a part of this transportation movement in San Diego.</td>

<td>M15</td>
<td>Delia Contreras</td>
<td></td>
<td>Bueno días mi nombre es Delia Contreras. Yo nací en Texas viví toda mi vida en México desde chiquita me llevaron regresé cuando tenía 32 años. En el 2004 subí a la custodia de cuatro niños mis nietos y mis nietos no podía yo sostenerlos no conocía sistemas tenía y regresé muy joven Estados Unidos. Pero no conocía el sistema a esa edad cuando yo tenía yo cuatro nietos y mi experiencia es que en esta comunidad de City Heights es nosotros tenemos la línea morada. Y pase este no costo para los jóvenes porque yo supe que era no no sacar a mis nietos a ningún lado por no tener los recursos para llevarlos a ninguna parte. Ojalá que ustedes comprendan la necesidad que hay en mi comunidad y un minuto no es suficiente para contar una experiencia cuando hay niños con hambre con necesidad que no puede.</td>
<td>Gracias por expresar sus inquietudes. El Plan Regional 2021 fue desarrollado en coordinación y con la colaboración de organizaciones comunitarias (CO, por sus siglas en inglés) que representan a las comunidades de justicia ambiental. SANDAG realizó una evaluación de las necesidades de la comunidad trabajando con sus aliados de las CBO para evaluar las necesidades y oportunidades de los proyectos del Plan Regional 2021 a través de un significativo y representativo proceso que promovió la participación de las comunidades históricamente desfavorecidas. El propósito de la evaluación de las necesidades fue analizar exhaustivamente los servicios de transporte existentes y evaluar oportunidades para nuevas soluciones de transporte que aborden las necesidades específicas y los diversos contextos de las comunidades de la región. Este trabajo se integra al Anexo H del Plan Regional 2021.</td>
</tr>
<tr>

<tr>
<td>M18</td>
<td>Gary Hewitt</td>
<td></td>
<td>I am a resident of San Diego. It's great work by SANDAG staff on what can really be a truly transformational plan. My question is what if we build all these great new projects and people just keep driving? Driving a car will continue to be a very attractive option, and people will need to be nudged into making the travel decisions which help make this plan work. So I think this plan can be supercharged with a very low cost program called TDM for Transportation Demand Management, which reduces VMT by working with employers to reduce commute trips. The draft plan has a voluntary TDM program, and what I'm proposing today is instead having a mandatory TDM program, requiring employers with more than 50 employees to reduce trips to their work site by 20% over the first 5 years in the Regional Plan. So for some employers this would be providing incentives for carpooling and van pooling, flexible schedules, and allowing employees to work from home. For others who are not as flexible, it may be providing on-site bike parking or free transit passes for workers. For employees who can't implement these programs or meet the goal.</td>
<td>SANDAG has an existing TDM program, iCommute, which currently offers employers and commuters customized solutions for encouraging alternative transportation options. For some of these programs include offering incentives for carpool, vanpool, and transit; promoting shared mobility; promoting on-site amenities for commuters such as bike lockers and showers; and offering resources for developing telework/flexible work schedule programs. The 2021 Regional Plan proposes a Transportation Demand Management Ordinance that would require employers over a certain size to provide transportation benefits and amenities that encourage sustainable transportation choices. These types of TDM ordinances exist in other regions across the state. A near-term implementation action would be to complete a Transportation Demand Management Ordinance Policy Analysis. This policy analysis would detail the employers that the ordinance would apply to and mechanisms for implementation and enforcement.</td>
</tr>

<td>M19</td>
<td>Goyo Ortiz</td>
<td>Casa Familiar</td>
<td>I am the community development choreographer at Casa Familiar in San Ysidro. As a community agency we’re partnering with as a CBO with SANDAG for this endeavor and I would like to congratulate the SANDAG team for its comprehensive view of equitable regional transportation plan and I would like to ask members of the board to think about our working-class neighborhoods as you analyze this plan. Many of our residents depend on the public transportation not just through the 9 to 5 work week but on a 24/7 schedule, living under polluted air from our regional traffic from the international border. And we would also like to think about the blue line as it’s been the backbone for our light rail transportation system for year and we would like for it to be given the priority it and it's communities deserve.</td>
<td>The planned transit frequency improvements and spans of services for all routes, including existing local service and future regional services, will be added to Appendix A for the proposed Final Plan and can be currently viewed as part of the Social Equity Working Group agenda from August 5, 2021. Additionally, the transit agencies will continue to electrify their fleets in response to state mandates. SANDAG will conduct a Blue Line Express Feasibility and Conceptual Engineering Study as a Near-Term Implementation Action (to be included in Appendix B).</td>

<tr>
<td>M22</td>
<td>Jennifer Olguín</td>
<td>Environmental Health Coalition</td>
<td>I’m from San Ysidro. I’ve been involved with EHC since 2020. I live closer to a freeway than I do to a bus stop. We are closer to developing health issues than we are to public transportation. I urge you all to push for the blue line express and to improve the bus system now. As a teen I walked to places in the dark with my friends because public transportation was unreliable. I felt my heart racing because I was scared of what could happen. We risked our safety because it was faster to walk home than it was to take public transportation. Now I am older yet more terrified to use public transportation. I’m constantly on the lookout for anything that could be a threat while I wait for that trolley or bus that often comes many minutes late. Life is precious and anything could happen within that time. Especially to young women waiting alone. The blue line express and buses must run faster and punctually to guarantee safety for everyone. We all deserve to experience comfort and knowing that we can use public transportation to get home quickly and safely. SANDAG, MTS, and NCTD are taking steps to improve the safety on and near transit and are working to make those improvements now and in the future. For example, funding at MTS for security is being diverted from fare enforcement to safety improvements. The Blue Line Trolley is one of the most successful light rail lines in the nation. It recently had frequencies increased to 7.5 minutes from 5 a.m. to 9 p.m. Grade separations and track work will help to improve the reliability on the Blue Line. Appendix A includes specific improvements on the Blue Line, but in the short-term SANDAG will conduct a Blue Line Express Feasibility and Conceptual Engineering Study as a Near-Term Implementation Action (included in proposed final Appendix B: Implementation Actions). The study will focus the project specifications and clarify next steps for express connectivity along the Blue Line.</td>
<td></td>
</tr>
<tr>
<td>M23</td>
<td>Jessie O’Sullivan</td>
<td>Circulate San Diego</td>
<td>I work with Circulate San Diego. Thanks for the presentation on the Regional Plan. At Circulate we’ll be doing an analysis of how this plan compares with the 2015 plan including phases and projects and we will be sharing our conclusions with staff and board members. We appreciate the help from SANDAG staff for sharing this information with us, prepare this analysis, and this topic is very important to me as I understand it will impact the quality of life for my kids and future generations and the RTP needs robust, holistic, and immediate investment centered in environmental justice communities. In order to alleviate heavy pollution that stand for multiple environmental injustice and the climate crisis. San Diego can’t meet its climate goals without implementing your plan. Thank you to the board and staff who are pushing for a transportation system that centers social equity, create good union jobs, and secures climate safe future for all. The 2021 Regional Plan includes investments to make public transit more convenient and affordable. One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth under age 19. The Blue Line Trolley is one of the most successful light rail lines in the nation. It recently had frequencies increased to 7.5 minutes from 5 a.m. to 9 p.m. Grade separations and track work will help to improve the reliability on the Blue Line. Appendix A includes specific improvements on the Blue Line, but in the short-term SANDAG will conduct a Blue Line Express Feasibility and Conceptual Engineering Study as a Near-Term Implementation Action (included in proposed final Appendix B: Implementation Actions). The study will focus the project specifications and clarify next steps for express connectivity along the Blue Line.</td>

<td>Katherine Rhodes</td>
<td>Center for Policy Initiatives and Social Equity Working Group</td>
<td>That workers and people in San Diego have been waiting for decades for a better transit system. So hearing that some of these things are not going to happen for another decade is discouraging. We need these improvements to happen now and to get us moving in the right direction as soon as possible. Thank you for this time and please listen to the people who spoke today and talked about the importance of moving this forward soon.</td>
<td>The overall impact on the transportation system on GHG emissions is shown in Appendix T in the various plan years (2025, 2035, and 2050). SANDAG’s modeling tools don’t allow for the calculation of contributions from individual projects and, even if possible, that type of analysis would not appreciate the interrelationships amongst projects given the benefits of the system as a whole (rather than just a collection of individual projects).</td>
</tr>
<tr>
<td>M28</td>
<td>Kelvin Barrios</td>
<td>Laborers Local 89</td>
<td>Thank you for such a thorough report you have here. I put it all together, and there’s 4,775 pages to look through, but one of the comments I just wanted to make on Appendix A, the Transportation Projects, Programs and Phasing. I was wondering if you could add a column to the table for how much greenhouse gas emissions reduction that actually provides and so you could just add a column there so that way you know people could actually see it right next to how much it cost and how much it would reduce greenhouse gases. And then also I’m very much in favor of the free transit for youth. I think that if you get people young, and they’re used to the transit, they might actually use it in the future, might not ever actually buy a car so thank you so much.</td>
<td>The Cost Estimation Methodology and Funding Strategies for the 2021 Regional Plan were presented to the SANDAG Board of Directors on March 12, 2021, Item No. 8B. This report and presentation outlined the model assumptions developed for the draft 2021 Regional Plan. The entire Board meeting can be found at <a href="http://www.sandag.org">www.sandag.org</a>.</td>

<td>Kim Heinle</td>
<td>Bayside Community Center</td>
<td>I am with Bayside Community Center located in Linda Vista. We are a contracted CBO with the Social Equity Working Group, and we’ve been a part of the Regional Plan for years, and we’re extremely grateful for the opportunity to provide public comment and to weigh in on the plan. It’s been exciting to see how much more progressive the plan has become over the years and how much more digestible and understandable it is to our common public. We know that this is in large part thanks to the working group, the Social Equity Working Group, that’s helping to bridge this gap between regional planning and our community members who are directly impacted. Back in 2015, we got the Quick Reference Guide, and now we’re getting the guide and now we’re getting the plan translated into Spanish, and that’s a huge step forward, and we’re grateful for the SANDAG team, the board, my fellow CBOs, and of course our community members who are giving their time and input to help this Regional Plan in both an equitable and a sustainable direction.</td>
<td>We appreciate your support and feedback. Please continue to follow along in this process by visiting SDForward.com.</td>
</tr>
<tr>
<td>M30</td>
<td>Kira Tina</td>
<td>Center for Policy Initiatives and Social Equity Working Group</td>
<td>I’m a researcher and policy advocate at the Center for policy initiatives and transportation equity working group. The Regional Transportation Plan is our region’s opportunity to create a vision for transportation that will work for everyone. That is why the Transportation Equity Working Group’s ten big moves to transportation justice must be included in the RTP. For the final plan we urge the Board to first include a blue line express with frequent trips and 24/hr service. Second, continue serving the purple line serving central city heights and ensuring RTP prioritizes investments in the communities on the front lines of environmental injustice by phasing projects earlier in the implementation timeline. By investing in projects like the blue and purple line we can transform communities by connecting working people to job centers and creating reliable systems for those who need it most. While also making public transit a realistic option for those who currently rely on driving. Also including these transit improvements early in the RTP implementation is paramount to helping low income families, youth, and low wage workers who rely on transit better address their needs and improve quality of life.</td>
<td>The planned transit frequency improvements and spans of services for all routes, including existing local service and future regional services, will be added to Appendix A for the proposed Final Plan and can be currently viewed as part of the Social Equity Working Group agenda from August 5, 2021. SANDAG will conduct a Blue Line Express Feasibility and Conceptual Engineering Study as a Near-Term Implementation Action (to be included in Appendix B). Also, transit subsidies are a component of the proposed Final Plan and implementation of those subsidies would include a consideration of low-income and youth populations.</td>

### Draft 2021 Regional Plan Responses to Comments – Public Meeting Sourced

**ID** | **Commentor Name** | **Agency** | **Comment** | **Response**
--- | --- | --- | --- | ---
M34 | Maria Cortez | City Heights Development Corporation | I'm a resident here of City Heights, and I also work with the City Heights Development Corporation. Also volunteer with Mid-City CAN. I am proud to say that I am happy to hear about, amen, the Purple Line coming through City Heights. 44 years - no project should take that long. I hope I'm still alive to see this happen, sooner, if possible, than 2035. I am so happy for SANDAG and the staff here to take on the opportunity to see us do with the Purple Line, and also Todd knows how long it's been, and the pain and everything we've gone through here in City Heights. All of us deserve the same as everybody else, and also I am supporting the youth-opportunity bus passes for 24 years and under. It's a long time going, but yes, our students deserve the same as everybody else, and this is for everybody in San Diego. | The proposed final 2021 Regional Plan supports the electrification of the region’s transit fleets, with the state’s Innovative Clean Transit regulation. Appendices A and B include SANDAG’s proposed commitment of $75 million through 2025, $250 million between 2026 to 2035, and $32 million between 2036 and 2050 for zero-emission buses and infrastructure to accelerate the implementation of MTS’ and NCTD’s Zero Emission Bus (ZEB) Rollout Plans. Transit agency ZEB Rollout Plans are on the CARB website here: https://ww2.arb.ca.gov/our-work/programs/innovative-clean-transit/ict-rollout-plans. Also, in 2020, SANDAG entered in a Memorandum of Understanding (MOU) between the San Diego Unified Port District, and the California Department of Transportation to work cooperatively on “improving accessibility, sustainability, and economic vitality” San Diego Portside communities, such as Barrio Logan. The MOU specifically calls for the reductions of greenhouse gases and other pollutants, without compromising the health of local community members. SANDAG will continue to work closely to improve the health and quality of life in Portside communities. |
M35 | Marisa Garcia |  | I’ve been a resident here in Logan Heights my whole life. Although my neighborhood is abundant culture and close community, another thing we have in abundance here that is not so great is the pollution that we have to live in. It is a reality that we cannot escape because it comes from every angle, the port, the industry, the freeways, and all the vehicle traffic associated with them. On the clearest of days you can still see a faint haze of smog in our skies and it breaks my heart to know that many of us living here, especially the children growing up in this like I did, will inevitably suffer from breathing an other health problems. I’m aware that this issue cannot be fixed overnight but we can work every day to change the factors contributing to the problem. There are many bus routes that pass through our neighborhood and each one adds to the pollution we have. By electrifying our bus fleets, you can change the negative factor into a positive one and start reducing the pollution we face daily. I strongly encourage your support and electrifying our bus fleet by 2030 to help us gain a healthier community. Our lives are really at stake and we would really appreciate that. | The proposed final 2021 Regional Plan supports the electrification of the region’s transit fleets, and the state’s Innovative Clean Transit regulation. Appendices A and B include SANDAG’s proposed commitment of $75 million through 2025, $250 million between 2026 to 2035, and $32 million between 2036 and 2050 for zero-emission buses and infrastructure to accelerate the implementation of MTS’ and NCTD’s Zero Emission Bus (ZEB) Rollout Plans. Transit agency ZEB Rollout Plans are on the CARB website here: https://ww2.arb.ca.gov/our-work/programs/innovative-clean-transit/ict-rollout-plans. Also, in 2020, SANDAG entered in a Memorandum of Understanding (MOU) between the San Diego Unified Port District, and the California Department of Transportation to work cooperatively on “improving accessibility, sustainability, and economic vitality” San Diego Portside communities, such as Barrio Logan. The MOU specifically calls for the reductions of greenhouse gases and other pollutants, without compromising the health of local community members. SANDAG will continue to work closely to improve the health and quality of life in Portside communities. |
M36 | Mike Bullock |  | I want to thank you again for the redirection of SANDAG compared to the past, and I do support the 5 Big Moves. Now as I heard that presentation, I am concerned about whether we will meet our 2030 subsidies for the tarifas of the jóvenes usuarios. También se modificará el Anexo A del Plan Regional 2021 final propuesto para acalar aún más las mejores propuestas para la red de autobuses, incluyendo mejoras en la frecuencia y el alcance del servicio. | The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 |
climate stabilizing target and our other vehicle miles traveled reduction responsibilities. I didn’t hear
hardly any comments about that. I did notice that Ray Major did talk about behavioral change from
pricing, but that’s really all I heard and I think there needs to be information about how much we’re
reducing vehicle miles traveled with these projects, and I just point out that earlier people were
talking about one or two cents that would be a half mile going 10 miles, it would be 43 miles a month
and parking downtown can be worth $350 a month and at the county building it’s free.

M37 Mike Townsend  Mid-City CAN  I’m with Mid-City CAN, and I am a student and transit rider. I ask you to support no-cost transit passes
for all youth ages 24 and under in our region. We need the RTP to commit to implementing youth-
opportunity passes as early as 2022 or as soon as funding becomes available. Avoid a delayed
implementation. This is a crucial part of COVID-19 recovery and youth living in the San Diego
community today need youth-opportunity passes to connect with school, work, internships, and other
opportunities. As a student who often relied on public transportation to get to school, I understand
first-hand the impact that transportation fees have on students. Similar programs exist with great
success in Alameda County, Boston, San Francisco, and most recently Sacramento and Los Angeles.
We know it works. Please include the immediate implementation of youth-opportunity passes in the
2050 Regional Transportation Plan.

M38 Mohammed Tuama  Newcomers Support and Development  I am with the Newcomers Support and Development. I would like to say that I’m working with
newcomers and most newcomers are coming from active transportation countries, active
transportation systems, and their voice were included in this plan. I would like to thank Hasan, Coleen,
and Jane Clough, and Nile Sisters for making sure that newcomers from various languages were
included and were listened to when this plan was made.

M39 Naomi Sanchez  We appreciate your support and feedback. Please continue to follow along in this process
by visiting SDForward.com.

M40 Noah Harris  Climate Action Campaign  I am with Climate Action Campaign. Thanks to the staff for today’s presentation, we’re encouraged by
SANDAG’s bold vision as outlined through the draft plan. We urge you to prioritize investments in
the communities on the front lines of environmental injustice and the climate crisis and as the plan is
finalized to center the voices of transit dependent riders. Transportation accounts for almost half of
smog more than any other sector in the region. This draft Plan will achieve a 20% reduction by
2035 which is a great start, but to achieve zero carbon as climate science says is necessary we urge you
exceed our state mandated emissions reduction targets. Next we want to make sure that the plan
will help the city of San Diego Achieve its climate action plan mode share targets for biking walking
and transit and we’d like to see specific mode shift projections for the city to be able to track progress
our goals. Finally please make sure to include youth opportunity passes at no cost transit passes for
youth 24 and under the plan.

M41 Phillip Petrie  Interfaith Coalition for Earth Justice  I am the acting coordinator of the interfaith coalition for earth justice. We are a coalition of San Diego
Faith leaders concerned about all aspects of eco-justice. Thank you very much for the time to speak
this morning. I am really heartened by the national trend to put equity at the front of all policy
decisions, but this must not be just talk. As a Christian, I believe God has a special concern for all the
poor, for those marginalized by society which is summed up in Jesus’ statement, the last shall be
first and the last first. So I ask to keep the members of SANDAG, those here and those who are not
here, to keep the needs of San Diego’s frontline community foremost in your minds when moving forward with our Regional Transportation Plan.

We appreciate your support and feedback. Please continue to follow along in this process
by visiting SDForward.com.

<td>UA Plumbers and Steamfitters Local 230</td>
<td>I represent the members of UA Plumbers and Steamfitters Local 230. Thanks to all of you and the enormous amount of work that’s gone into developing a very promising Regional Transportation Plan. We think it’s past time San Diego has a transportation system that gives some practical, usable and cost-effective alternatives to driving and that’s what this RTP process will be. It will be a huge benefit to the workers and students making their daily commutes to school and workplaces. It will take cars off the highways, which will reduce greenhouse gas emissions, while also decreasing traffic for the folks that need to still drive their cars. We are also pretty excited about the thousands of good paying jobs that will be created right here in San Diego County. Hopefully jobs that will go to the very San Diegans whose taxpayers are paying for these projects. We’re hoping to get an opportunity to partner with all of you in the building of the transportation system of the future for all of us here in San Diego.</td>
<td>We appreciate your support and feedback. Please continue to follow along in this process by visiting SDForward.com.</td>

<td>Sean-Keoni Ellis</td>
<td>CDC</td>
<td>I’m a twenty-six-years-old native San Diegan who was born and raised in southeast, a lower-income community located between the four major freeways in central San Diego. For 10 out of 12 school age years I rode the bus and spent approximately 7000 hours on the bus so I could get from southeast to Point Loma to attend school. My parents could not drive me since they worked 15 hour days. I tell you my story because unfortunately my experience is not uncommon. As a staff member at City Heights CDC I hear the same challenges that I went through growing up such as one-way two-hour bus and trolley rides. Therefore, I’m calling you today to say that we’re excited to have worked with SANDAG staff as part of the Social Equity Working Group and now that the 2021 Regional Plan gets us closer to creating an equitable transportation system. However, we must ensure that the plan prioritizes communities like the one I grew up and still live in. Invest in me and in the future generation of transit riders who are hungry for opportunity and are in need of a transformative transportation system.</td>
<td>One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth under age 19.</td>
</tr>
<tr>

<td>I am bilingual but would like to comment in Spanish to support social equity. My name is Rosina Lisagara, I have been a resident for more than 23 years and I am an activist, a leader, and an ambassador of healthy communities in “Cichinista”, Coronado and other areas of National City. A walkable and culturally diverse community, with border crossings and that uses public transportation...[inaudible]...but there is so much disparity for our working people. We have the same health issues, pollution for years and data [inaudible] and the CDC. We need quick...[inaudible]...and local policies where people live and work.</td>
<td>Un componente esencial de la evaluación de los impactos del Plan Regional 2021 es analizar sus efectos para los grupos históricamente desfavorecidos y sistemáticamente marginados. Esta evaluación se conoce como el análisis de equidad social y se enfoca en las comunidades de color, en los residentes de bajos ingresos y en los adultos mayores. Aunque el Plan Regional 2021 propone mejoras para toda la región, esta evaluación se asegura de que los beneficios sean compartidos por todos y de que la carga generada por los cambios que implemente el Plan Regional 2021 no afecten desproportionadamente a ninguna de las poblaciones que son el enfoque de la equidad social. El Proyecto de Ley de la Asamblea 805 requiere que SANDAG identifique a las comunidades desfavorecidas descritas en la Sección 39771 del Código de Salud y Seguridad e incluye estrategias de transporte para reducir la exposición a la contaminación de estas comunidades. Una lista detallada de las estrategias de transporte, incluyendo los proyectos, las políticas y los programas que reducen la exposición a la contaminación de estas comunidades, aparece en el Anexo A del Plan Regional 2021 final propuesto.</td>
</tr>
<tr>
<td>M45</td>
<td>Sylvia Calzada</td>
<td>City Heights CDC</td>
<td>I’m a twenty-six-years-old native San Diegan who was born and raised in southeast, a lower-income community located between the four major freeways in central San Diego. Therefore, I’m calling you today to say that we’re excited to have worked with SANDAG staff as part of the Social Equity Working Group and now that the 2021 Regional Plan gets us closer to creating an equitable transportation system. However, we must ensure that the plan prioritizes communities like the one I grew up and still live in. Invest in me and in the future generation of transit riders who are hungry for opportunity and are in need of a transformative transportation system.</td>
<td>A critical component of reviewing the impacts of the 2021 Regional Plan is evaluating the effects on historically underserved and systemically marginalized groups. This evaluation is known as a social equity analysis and focuses on communities of color, residents with low incomes, and seniors. While the 2021 Regional Plan delivers improvements to the entire region, this review ensures that the benefits are shared by everyone and that the burdens of the 2021 Regional Plan’s changes are not disproportionally shouldered by any social equity focus population. Assembly Bill 805 requires that SANDAG identify disadvantaged communities as designated pursuant to Section 39771 of the Health and Safety Code and include transportation strategies to reduce pollution exposure in these communities. A detailed list of the transportation strategies, including projects, policies, and programs, that reduce pollution exposure in these communities is included in Appendix A, Attachment 2 of the proposed final 2021 Regional Plan.</td>

</table>

San Diego Forward: The 2021 Regional Plan
I'm with the San Diego Building and Construction Trades Council representing 35,000 union construction workers that have built San Diego. A big shout out to Hasan and his amazing team for this plan, Regional Transportation Plan. Equity comes with the opportunity to get good jobs and having transportation that provides folks and opportunity to go to construction sites early in the morning and come home late at night is an amazing vision. We're looking forward to working with SANDAG on the future construction projects and creating opportunity for folks in impacted communities.

The proposed final 2021 Regional Plan includes a commitment to building bathrooms at all new rail stations and developing a bathroom access plan to study the incorporation of bathrooms into existing stations.

The proposed final 2021 Regional Plan includes a commitment to building bathrooms at all new rail stations and developing a bathroom access plan to study the incorporation of bathrooms into existing stations.

I'm a transportation justice advocate from Rancho Penasquitos. Today I want to share my personal story about bathroom while taking transit. I'm getting older and I need to go to the bathroom very often. My wife also needs access to a clean bathroom with basic hygiene necessities such as soap and water.

When I retired three years ago, I decided to take transit to go meetings such as this like SANDAG and MTS board meetings or baseball games at PETCO Park. However, I found most of the tourist stations and transit hubs in San Diego don't have any restrooms. So I had to drive around and find those restrooms available for the public. SANDAG is envisioning a world-class system of transportation. How can any true reward system of transportation can be complete without easily accessible, clean restrooms. Please make sure restrooms are included in your plan.

We appreciate your support and feedback. Please continue to follow along in this process by visiting SDForward.com.

<td>52</td>
<td>Ricky Williams</td>
<td></td>
<td>Second is I would like to hear a bit more about flexible fleets. I know there’s a variety of mobility options identified for flexible fleets, and I’m curious which options are envisioned for deployment in the unincorporated areas and along these rural corridors.</td>
<td>The 2021 Regional Plan envisions the deployment of Flexible Fleet services to complement investments in transit, mobility hubs, and complete corridors. Flexible Fleets can range from bikes and scooters to autonomous shuttles, increasing the number of mobility choices for residents and visitors to use. In the unincorporated County, Flexible Fleets like shared, electric, and eventually autonomous shuttles would be available on-demand, ready to take you where you need to go. Today, services like on-demand rideshare, microtransit, and vanpool already provide a convenient travel option in areas where traditional fixed transit may not work well.</td>
</tr>
<tr>
<td>53</td>
<td>Ricky Williams</td>
<td></td>
<td>Finally, I’m curious to know what types of investments would be included along the complete corridors. I know you went over a lot of the safety investments, but in terms of technology improvements related to electric vehicles or other, what we would say, GHG-reducing activities are envisioned along these corridors. That is my comment.</td>
<td>The complete corridors assumes technology improvements related to both arterials within cities and within the highway system. Within city roadways, Smart Intersection System enhancements are planned to make those corridors more efficient and to decrease delay. On the highway system, dynamic lane management is anticipated and invested in to ensure that all lanes can be managed effectively and prioritize emergency services and transit on those corridors. The Regional Plan also includes incentives for EV charging stations and EVs.</td>
</tr>
<tr>
<td>54</td>
<td>Carolina Martinez</td>
<td>Environmental Health Coalition</td>
<td>I’m with the Environmental Health Coalition and the San Diego Transportation Equity Working Group. We thank the staff for the presentation and all the work that has gone to make this happen, especially all the intention to collaborate with us to ensure the environmental justice communities have immediate solutions. I wanted to bring up two points. One of them is that the plan looks very exciting, and we support it. We support a vision to transform the transportation system in the region. We appreciate the naming and recognition that our transit system doesn’t work. So because it needs a huge makeover, it’s going to take a lot of time and years that have been missed, a lot of opportunities that have been missed. So our communities cannot continue to wait for solutions so we are asking that while the long-term solutions are important, like the Purple Line and we support strongly, that our communities especially in the South Bay, communities like City Heights need immediate solutions. They are hurting right now, and they’ve been hurting, and they cannot afford to continue to hurt. So how could the Regional Transportation Plan implement solutions like a bus system that provides connectivity immediately and so that they could then wait for the Purple Line? How could the youth opportunity pass happen immediately so our young ones could ride transit for free rather than waiting many more years before they could actually access the system? So what are the solutions that could be implemented right now so that they could connect to jobs now and not 10 years from now? So that is something we are asking and we are urging the Regional Transportation Plan to include. The last thing is that the Blue Line unfortunately as we see it in the Regional Transportation Plan doesn’t reflect an investment into the future. The Blue Line is the line that is most used by riders currently. It’s the backbone of our transit system. It connects us to the border. However, the Regional Transportation Plan does not demonstrate that it will be taken into the future into the next 30 years. How does the infrastructure improve so that the Blue Line actually creates more connectivity, because right now it is not meeting the needs of our communities? So we are asking that a consideration for Blue Line Express be included as part of the Regional Transportation Plan.</td>
<td>The planned transit frequency improvements and spans of services for all routes, including existing local service and future regional services, will be added to Appendix A for the proposed Final Plan and can be currently viewed as part of the Social Equity Working Group agenda from August 5, 2021. SANDAG will conduct a Blue Line Express Feasibility and Conceptual Engineering Study as a Near-Term Implementation Action (to be included in Appendix B). One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.</td>
</tr>
<tr>
<td>55</td>
<td>Flavio Olivieri</td>
<td></td>
<td>I am a Chula Vista resident. My perspective is that the whole plan, it considers alleviating the transit situation for an existing employment and economic situation, and it is not really considering changes and evolution of the economy and labor centers. If you look at the trends in terms of new employment opportunities and the type of workforce that is required, we have to consider an economic development plan together with the transportation plan. So there is a very large investment tied to this transportation plan to serve a current employment structure. I mean, the whole plan continues to be fixed in the same static employment and economic structure. I don’t think it is looking into the future of how those changes would be, and instead of looking up into how to develop more distributed employment centers and economic development hubs, it is focused on, here and into 30 years, into servicing existing employment and economic centers. I think there should be a more inclusive and dynamic approach to creating opportunities and opportunities for economic growth.</td>
<td>The 2021 Regional Plan considers existing employment centers, commercial development that is in progress, and telework policies that influence commute patterns. As SANDAG develops the next Regional Plan, it will consider new trends and policies that may influence employment centers and commute patterns.</td>

<td>Martin M</td>
<td></td>
<td>Thank you for the presentation. The one thing that I am concerned of is that there seems to be three legs of this plan, but it seems like it is primarily driven by the need, desire to meet mandates for climate change mitigation. I think that a better solution for the people would exist if it wasn’t the primary focus. Now one of the things that I have considered many factors, including trips made by residents before it was called that is that the human-caused greenhouse gases that would be saved if indeed everything in weather and climate is by that one factor very insignificant, if anything at all. I believe that we are trying to fit the other two parts into something that has the mandates. I understand that the region has to meet state mandates, but I have concerns that those mandates aren’t feasible, and they aren’t in reality. The one thing that I do have to take umbrage with is when CO2 and greenhouse gases are called a health issue, and strictly speaking CO2 is not a pollutant, but I do know that we do need to have a better overall transit situation. I am supporting that, but I think it has to include everything, which includes the fact that people do need cars, people who visit the area and vacation here, and this is a very important part of the San Diego economy. They need their cars to travel, and they are not going to take buses and transit to the beaches and to the hotels. I think we need something that is more inclusive. I think it is just overall skewed toward meeting climate mandates, which I don’t believe are all valid.</td>
<td>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. The process for developing the transportation network considers about the needs of residents and visitors to the region. The transit system will be a compelling alternative to driving for many trips, while still allowing for a roadway system that supports people that need to drive.</td>
</tr>
<tr>
<td>MS7</td>
<td>Miguel Aguirre</td>
<td>Grand Central West LLC</td>
<td>I am a managing member of Grand Central West LLC. We own the McDonald’s Trolley Station, a private national gateway landmark located at the Port of Entry in San Ysidro. It is the heart of the San Ysidro Transit Center, also known as the San Ysidro ITC. Thank you for holding this South County Open house. As a born-and-raised San Diego county resident, my public comments are aimed at calling our mobility dynamic what it is: a binational corridor. Socioeconomically speaking, we are not an island separated from Baja or even Los Angeles or Riverside counties. The back-and-forth traffic between the Californias is more than evident. What is not evident, however, is what future we are planning for as a binational region. Repeatedly referring to the San Ysidro ITC as the number two station in the region is misleading. Number two to what? A one-day-in-the-future, maybe 20 years from now, $5 billion Central Hub Project? I’m not sure what this narrative is all about. Is San Ysidro today the highest volume station by far in our region or not? No disrespect is intended for the Central Hub Project. On the contrary, it is definitely needed; however, calling our national gateway, the world’s busiest border crossing, number two to something that doesn’t even exist leaves much cross-border vision to be desired. Recent documents report how California’s population has declined two years in a row for the first time in our history, how San Diego’s home prices surge with limited affordable housing in sight and how SANDAG’s previous 4.5 million population forecast by 2050 has been drastically reduced to 3.7 million. A recent San Diego regional EDC article on inclusive growth forecasts by the year 2028 we will have a shortage of 10,000 workers and how these challenges will make San Diego an unattractive place to live and do business. Big question: where will all the workers supporting our growing economy come from? SANDAG must tackle such issues strategically and that is a national need. The U.S. needs Mexico to be competitive with China and that is why we must address cross-border stigmas and focus on bridging disparities. It is time we have a reality check and call what we are planning for what it is: a dynamic binational corridor.</td>
<td>Appendix J of the 2021 Regional Plan includes information on SANDAG’s approach to planning within the context of the California-Baja California binational megaregion and the importance of strategies that leverage binational and interregional partnerships to facilitate and improve mobility for these critical crossborder and interregional flows. Please continue to follow along in this process by visiting SDForward.com.</td>
</tr>
<tr>
<td>MS8</td>
<td>Randy Torres-Van Vleck</td>
<td>BikeWalk Chula Vista</td>
<td>Congrats to SANDAG staff on the launch of the Regional Plan Draft. My name is Randy Torres-Van Vleck. I grew up in the Castle Park neighborhood of Chula Vista. I am a member of BikeWalk Chula Vista and the San Diego Train Station Equity Working Group. This is a really big moment for our region, a critical milestone for planning what’s needed to improve the quality of life from a train station perspective, land-use perspective, air quality perspective. This is really important work and congrats again to the staff. I am most excited about the South Bay to Sorrento Purple Line Alignment. That project will connect our South Bay communities, South East, Mission Valley, Sorrento Valley. Looking forward to expanding the Rapid Network in the near term. As Carolina from the Environmental Health Coalition mentioned, it is important that we make those near-term investments sure that communities that are riding transit now can get to where they need to go and that we have late night/24-hour service. That was ranked as the highest priority in the Mits’ elevate process so that’s</td>
<td>The planned transit frequency improvements and spans of services for all routes, including existing local service and future regional services, will be added to Appendix A for the proposed Final Plan and can be currently viewed as part of the Social Equity Working Group agenda from August 5, 2021. SANDAG will conduct a Blue Line Express Feasibility and Conceptual Engineering Study as a Near-Term Implementation Action (to be included in Appendix B). The proposed final 2021 Regional Plan includes a commitment to building bathrooms at all new rail stations and developing a bathroom access plan to study the incorporation of bathrooms into existing stations. One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study.</td>
</tr>

ID | Commentor Name | Agency | Comment | Response
---|----------------|--------|---------|-------------------
M59 | Rocina Lizarraga | | I am a National City resident, and the reason that I wanted to speak today is to thank you to SANDAG for this opportunity to provide this input outlet for us as residents. I have been in National City for a long time, and also I have initiatives of public transportation. I primarily collect direct info from residents here in the area. The feedback portion of this Regional Transportation Plan does not reflect, in my opinion, a short-term benefit for this plan. There are a lot of necessities among our senior population. Our core residents, especially the seniors, are struggling everyday with mobility problems and a sense of safety. This struggle everyday for people like the senior population that struggle everyday with mobility and physiological necessities because as we grow older we have more necessities. We want to see that included on the plan. I haven't seen it. These people, specifically that target population, have struggles every day when they use public transit. Neither the presentation or that has been said, and also how the plan is going to be impacting this type of population. I wish to see more of those necessities reflected on the plan. It should be addressed and have its own period. | This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth under age 19.

June 24, 2021 – East County Open House

M60 | Councilmember Jack Shu | City of La Mesa | Thank you SANDAG staff to Larry, Alex, and Hope for having this workshop, and of course my colleague Mayor Vazquez. I'm very thankful that you're having this workshop for East County and all that this plan may offer those of us in this county that's really looking forward to a much better transportation system to relieve some of our congestion issues as well as help us meet our greenhouse gas reduction goals and reduce pollution in our communities. I have a quick question, and I'm only doing this of course seeing that we seem to have some time with not Alex, when you presented the high-speed commuter rail system as well as the rapid bus systems, would it be possible for you to give me a quick example or maybe a time element as to what those services will do for those people commuting east-west or west-east with if those were put in place? So for example, if someone is traveling from El Cajon or even La Mesa going to downtown or some other part of the region, if we have those systems in place, what would do to their commute time compared to driving and probably driving and doing rush hour with congestion? What would be a comparison in terms of time and cost? | With the 2021 Regional Plan, SANDAG plans to reduce the region's greenhouse emissions while also providing travel options. For these envisioned Transit Leap services, we want to provide competitive travel options for folks traveling to downtown and throughout the region. The way to do that is by providing fast, reliable, and frequent service. In combination with Flexible Fleet services, new travel options should be more competitive than driving alone. Travel times definitely will be increased if we do nothing. In this plan, we're going to, at a minimum, make sure that people are going faster than what they can do today while reducing greenhouse gas emissions and reducing vehicle miles traveled. Appendix T has more detail about travel time in each of the corridors.

M61 | Don | | What changes has Hasan Ikhrata done with SANDAG's grant writing group to increase the number of federal grant dollars that come into San Diego to bring them up to par with what he was able to bring in in Los Angeles? | Since Hasan Ikhrata came to SANDAG, a new Grants Division has been formed to centralize grant application efforts at the agency. This staff is focused on searching for and tracking all grant opportunities SANDAG is eligible for and then providing that information to staff at SANDAG and its member agencies so that we can all coordinate on application efforts in the region. Experts in drafting grant applications have been identified to assist staff in preparing application materials to ensure higher success rates on grant applications. In addition, a new "Pursue Funding" initiative was adopted by the SANDAG Board in June 2021 and staff have set performance measures to track progress on grant applications.

M62 | Don Wood | | I want to thank SANDAG for doing a different sort of planning this round of the RTP. It's, it's refreshing to see SANDAG is changing its style a bit and is certainly more honest and forthcoming about the dollars involved, what the dollars can do. Hopefully SANDAG won't fall back into its old habits of promising more and delivering less, given that the shabby track record has had the last round of RTP | Thank you for your comments and support for the 2021 Regional Plan. SANDAG will continue to be transparent in this process through public and stakeholder engagement as we begin efforts to implement this plan.

<td>M63</td>
<td>Savannah O'Toole</td>
<td>SA-SEJ</td>
<td>I am an SA-SEJ fellow, an organizer with SD350. Thank you for your time. I would just like to add a few things, a few comments on your for tonight. So we would like environmental justice to be embedded in San Diego so therefore we're asking for 10 different changes to be included in the 2021 Regional Transportation Plan. We call for an environmental justice-centered RTP that will ensure the projects included in the RTP will prioritize environmental justice communities identified by the CalEnviroScreen, which is abbreviated CES which by listing projects that will directly benefit environmental justice communities by outlining immediate benefits via projects that will be implemented by 2025 and making all public communication easy to understand by the public in order to promote meaningful engagement. So therefore in the RTP we ask that the, that an equity-specific project list be included in an Appendix A for transportation projects, programs, and phasing document. I call for an improvement in the bus system now that is fast, frequent, reliable, and accessible through increasing frequency on popular lines, especially the overcrowded ones. So therefore I call for more clarity in Appendix A Transportation Projects, Programs, and Phasing that provides a list of specific and provide improvements to this business system. I call for increased funding for the planning, environmental review, engineering, and capital for the additional Blue Line track that allows 24-hour service and additional frequency enhancements. The information for the Blue Line needs to be more clarified, needs to be clarified. It's currently unclear if the double slash third track included in Appendix A refers to an additional track that will be provided express kind of with, that will provide express connectivity from the border to downtown San Diego. I call for a 24-hour service by 2025 on popular transit routes that to connect late night to early morning workers to their jobs. Therefore, the information in the RTP needs to be clarified. The language in both Appendix A and Chapter 2 should specifically call for the 24-hour service on popular transit routes and present a clear implementation schedule. I call for the funding, planning, environmental review, engineering, and capital for the Purple Line as a rail that connects environmental justice communities in central, central City Heights, and South Bay to Sorrento Valley. According to SANDAG staff, the alignment includes City Heights in the 582, is expected to be built by 2050 along with a branch to the Central Mobility Hub. The Multimodal Corridor Plan is currently studying alternatives that include a station in City Heights, and the 582, is expected to be built by 2050 along with a branch to the Central Mobility Hub. An additional route, the South Bay to Sorrento Comprehensive Multimodal Corridor Plan is currently studying alternatives that include a station in City Heights along the Commuter Rail Route SB8. The east-west Commuter Rail route SB8 between El Cajon and Downtown San Diego/Central Mobility Hub via SDSU includes that station in the current proposed alignment. The first part of Route SB8, from National City to the Chula Vista, is expected to be built by 2035 and is planned to be extended south from National City, to Chula Vista, and to the border by 2050. An additional route, Commuter Rail SB8, traveling from the border to National City on the same alignment as the SB8, is expected to be built by 2050 along with a branch to the Central Mobility Hub via downtown San Diego.</td>
<td>The 2021 Regional Plan has been developed with equity at the forefront. An equity specific project list has been included in the Draft 2021 Regional Plan Appendix A. As suggested, this list of projects with phasing will be added to Appendix A in the proposed final 2021 Regional Plan. Thank you for the suggestion and SANDAG agrees that this change will make it easier for the public to understand. SANDAG agrees that action is needed now to provide fast, frequent, reliable, and accessible transit, especially on highly utilized routes. Staff are bringing forward an item to the SANDAG Transportation Committee and to the Board of Directors in advance of approval of the 2021 Regional Plan to amend the agency budget and act now to invest in projects that will reduce environmental fate communities. Action this action seeks to increase services on transit lines that have insufficient service in the evenings and late nights, and/or provide fare subsidies for youth riders. Additionally, further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan. The Blue Line Trolley is one of the most successful light rail lines in the nation. It recently had frequencies increased to 7.5 minutes from 5 a.m. to 7 p.m. Grade separations and track work will help to improve the reliability on the Blue Line. Appendix A includes specifics on these projects, but in the short term SANDAG will conduct a Blue Line Express Feasibility and Conceptual Engineering Study as a Near-Term Implementation Action (included in proposed final Appendix B: Implementation Actions). The study will focus the project specifications and clarify next steps for express connectivity along the Blue Line. The proposed final 2021 Regional Plan includes increased service spans for the Trolley and bus service up to 20 hours per day. As SANDAG and the transit agencies move into more detailed planning efforts in the near future, some routes will be considered for 24-hour operation. The South Bay to Sorrento Comprehensive Multimodal Corridor Plan is currently studying alternatives that include a station in City Heights along the Commuter Rail Route SB8. The east-west Commuter Rail route SB8 between El Cajon and Downtown San Diego/Central Mobility Hub via SDSU includes that station in the current proposed alignment. The first part of Route SB8, from National City to the border, is expected to be completed by 2035 and is planned to be extended south from National City to Chula Vista, and to the border by 2050. An additional route, Commuter Rail SB8, traveling from the border to National City on the same alignment as the SB8, is expected to be built by 2050 along with a branch to the Central Mobility Hub via downtown San Diego.</td>

<td>Of course you know though I live out of state right now you know my family is in Rancho Bernardo, and I'm super passionate about transportation in general and just about San Diego geography. So to be honest you know I like some things about the SD Forward Plan, you know the managed lanes to kind of tour lanes, but I'm not, I'm rather a skeptic you know. Personally I'm a bit of a skeptic on rail transit right but if you're going to be building rail transit right but if you're going to be building rail transit I believe you have to convince kind of fiscally conservative suburbanites like me right. We look at the ridership statistics pre-COVID, even the San Diego Trolley was only carrying 120,000 people a day, and I think it's really important to improve existing capability, existing capacity on the San Diego Trolley and prove that it's actually you know moving a pretty big proportion of the inner city population, and it's actually taking cars off the road. So that's why I'm just a bit wary of you know maybe building these commuter rail lines that go all the way into the suburbs because you know if I don't really see a lot of people in inner city using it then I might be a bit skeptical of you know how many people are really going to use it if you extend it into the suburbs if it's simple a some, somewhat faster version of the coaster. So that's why I believe that's the first rail line that you should build if you do build a rail line should be focused on the inner city like maybe a mid, a mid-city trolley that goes from downtown, connects to SDSU and kind of passes through Balboa Park, and a mid-city. I think it's a very high-quality rail line and you know, it's a lot of low-income people who could really benefit from it, and if you get that right, if you manage actually to attract a lot of riders right, build this high-quality rail line, attract a lot of riders then I think suburbanites might be more convinced. I think this is the first step in actually building a more extensive rail system if, if that's desirable and furthermore on the existing export, existing trolley system, I think it's crucial if you want to, if you want to increase ridership to make sure that you have decreased frequencies, and I have heard that you are trying to decrease frequencies on the blue line to five minutes. Five minutes frequencies, and that is a very good first step because I believe frequency is the number one factor in driving up ridership. Now I would like to ask is the proposed kind of commuter rail lines, are they electric? Because you know I would hope that they're electric to reduce these noise emissions. Yeah, that's just my question.</td>
<td>The first commuter rail line that is proposed to be implemented would operate between National City and Sorrento Valley serving the inner city communities of City Heights, Mid-City and Southeast San Diego. This line has the highest ridership potential. The existing system would all move to 10 minute frequency all day. Select routes like the Blue Line would continue to operate at 7.5 minute headways. Going to a five minute headway is difficult downtown due to cross street traffic. The type of vehicles and propulsion will be determined during the advanced planning phase of the project.</td>
</tr>
<tr>
<td>M70</td>
<td>Alex Wong</td>
<td></td>
<td>Once again I'd like to go over the real plan, and I kind of heard about the Purple Line right so I've heard about it before, but I don't know if you've heard of this guy called Alone Levy, he's a transit researcher, and he said that's the - he has an article in the Voice of San Diego- he said that the Purple Line is not such a good idea. Why is because it goes through a free freeway median, and he's saying that freeway medians are generally not very attractive because the stations are inaccessible, well generally don't once you live near freeway medians. So for example, he will say that and also that the Purple Line is kind of circumferential. It doesn't actually take people to the downtown core. I'll take an example -</td>
<td>As part of the Regional Plan development, a new Purple Line alignment was developed that travels through the heart of our most dense communities and employment centers. This line will offer important connections that are not focused in the freeway median.</td>
</tr>
<tr>

<td></td>
<td>So I have looked at your plan, kind of looked at the transit leaps, and I do see what appears to be kind of a commuter rail corridor that kind of parallels I don't know University or El Cajon; however, you</td>
<td>The commuter rail route in the Regional Plan will go through a comprehensive alternatives analysis as part of advanced planning. During this time, a light rail alternative</td>
</tr>
</tbody>
</table>
know I previously mentioned that I believe that a mid a mid-city trolley would be fantastic because you know the busiest bus lines like the like the route the route 7 and the rapid 215 they pass through there. However, I strongly believe that this commuter rail corridor should instead be built as a trolley and why is that? Because if you build it as a commuter rail then I think stations will be further apart so people will have to take the bus or take the or some ridesharing to get to the station right and it will be they will have to make more transfers. Yeah, so instead I think that maybe it would be better to have a trolley line with more stops in between and people can just walk to a neighborhood station and have a one seat ride and then walk to their destination. And also you know you might think that denser stop spacing, well maybe it would make it slower, but I’m really believe that if you make it fully grade separated, you know elevated or underground, then it actually would be quite fast you know. I mean maybe at least 20 miles per hour in you know rush hour car traffic on roads like that probably only averages 12 miles per hour at best so that would easily be much faster than driving.

[moderator response]

Oh can I can I say can I say something here? Oh ok, yeah I do understand that but ok I think what I was meaning is that right on the map, I see a kind of commuter rail line that goes from I don’t know, downtown to SDSU, but I believe that that perhaps would be better built as a trolley line.

M72 Alla Valedspino

I'm a resident of the City of Vista, and I have been riding the public transit in North County for over 10 years; however, the loss of some bus lines near the Vista Civic Center has prevented me from being able to take transit and that's a shame because I know I'm not the only one. Transportation access for clients is a vital necessity and the lack of accessible transportation to individuals from low socioeconomic backgrounds is a major social determinant of health. Therefore, I suggest that SANDAG partner with community health centers so that patients have better access to health care. Another thing that I would like to add is that if SANDAG, MTS, and CCD wish to see higher ridership, there has to be a stronger effort to advertise public transportation to those that regularly drive a car and also advertise like popular destinations. In addition, SANDAG and local governments need to consider the reality that building luxury housing near public transit will not increase ridership even though they advertise like popular destinations. In addition, SANDAG and local governments need to consider the reality that building luxury housing near public transit will not increase ridership even though they advertise it as such; rather, it will decrease because these people can afford to have a car. If SANDAG wants to have more ridership, they need to have affordable housing built in your mobility hubs in public transit, which I know is something that you have mentioned today so that's a very good thing to hear. Overall, I am in support of the 5 Big Moves, and I'm especially interested to see what those flexible fleets would look like here. The next OS sounds interesting as well, and I hope that through the app there is a way to review the system so that SANDAG has real-time feedback on their bus line routes and schedules. That way they can make adjustments if necessary.

SANDAG partners extensively with Community Based Organizations to outreach to a variety of groups that utilize transit or have a role in getting people around the regions. In North County, SANDAG works with four different groups that cover Vista, San Marcos, Escondido, and Oceanside. With regard to affordable housing and mobility hubs, SANDAG will be working closely with jurisdictions across the region to ensure that a wide mix of housing types are providing close to transit.

M73 Craig Jones

I'm just interested to hear more about the difference between connectors and managed lane connectors on the maps that have been shown. How are they different from each other? What do each of them connect or unconnect? Thank you.

[moderator response]

So I think so. So I know what managed lane connectors are, that you can go seamlessly from one set of managed lanes to another, and the regular connectors are points where modes come together?

[moderator response]

Got it. It's, it's another version of roadway improvement. Okay, I got it.

M74 Craig Jones

I really appreciate this is a dialogue rather than a presentation so I think that's incredibly valuable. I should mention I am a member of SANDAG’s Social Equity Working Group. I'm a representative to the body from the Alliance for Regional Solutions in North County, which represents the interests of underserved populations. So Alla's comment is incredibly on point. We're trying to look for as much equity as possible and with this I can't overemphasize how important flexible fleets is as an element of this. It's perhaps one of the least developed in detail in the proposed plan because it requires a level of local development and organization, implementation, but I encourage everybody to really support flexible fleets. It's going to be incredibly important. Including providing equity and transportation, so

Flexible Fleets will offer people a variety of on-demand shared vehicles. Flexible Fleet services may complement fixed-route services, even in more suburban communities. They offer additional convenience, as the on-demand nature of Flexible Fleet services allows people to book a ride almost anywhere and anytime. Proposed Clean Transportation policies will also ensure that Flexible Fleet vehicles transition to zero-emission vehicles to further meet air quality mandates. In addition, the Regional Plan proposes investments in active transportation and Vision Zero policies to create a safer environment for biking. These strategies combined will make it easier to drive around without driving a car.
### Draft 2021 Regional Plan Responses to Comments – Public Meeting Sourced

<td>I just wanted to first of all, I just came back from a short trip to Seattle, and I just wanted to tell you about my experience upon landing at the airport. I used a common application, Google Map, and they directed me to the most nice experience I had in public transportation in a while. I was directed to the light rail system, and I got on it. It took us right to downtown Seattle, but not only that. There were alternatives to the way to get there. You know, I could have it told me on how to walk how far to walk to the stop, if I wanted to switch to a bus, take a different route and so on and so forth. I had about three different ways of getting where I had to go so that was great and we need something like that. I live in North County, and I think the public transportation availability here is very limited. My sister had to go to four appointments, medical appointments, from Oceanside, and it was very difficult for her because she had some you know physical problems in getting around. So I think we need we need more variety and more ability to connect the multiple methods of getting around that’s already been mentioned. They need to be all coordinated so that you know, one can hop, skip, and jump. I’ve had to give up jury assignments down at the county because of the transportation issue. So it affects us and more ways than you think, not just work so.</td>
<td>The draft 2021 Regional Plan includes, as part of the 5 Big moves, Complete Corridors where multiple modes are accommodated and NextOS that can both inform the traveling public of options and dynamically manage lanes for improved efficiency. Additionally, access to the airport is addressed through a whole suite of transportation solutions identified the &quot;Central Mobility Hub&quot; corridor in Appendix A.</td>

<tr>
<td>M76</td>
<td>Kevin Delmastro</td>
<td></td>
<td>I really appreciate all this information. I’m really excited. Me and some neighbors here in Tierrasanta actually would love to just take a short trip over to Kearny Mesa and hop on either light rail or rapid bus or something. Get different places. I actually have a saxophone business, go downtown a lot for gigs so that would be great. Parking is limited in a lot of the popular areas so I think that’s a big plus for the public transit and integrating technology and all the big moves you guys are talking about is really great. So I don’t really have any questions. I just want to say Bravo for trying to tackle this problem that San Diego has had for a while with limited transit.</td>
<td>We appreciate your support and feedback. Please continue to follow along in this process by visiting SDForward.com. The 2021 Regional Plan data viewer can be used to explore draft plan projects in your area.</td>
</tr>
<tr>
<td>M77</td>
<td>Kori Jensen</td>
<td></td>
<td>I’m a member of the Oceanside City Council and first I’d like to thank you for holding these open houses on the Draft 2021 Regional Plan. I, like, I’m sure other local elected officials view this plan as essential to our region’s future, and I appreciate the initiative displayed by board members and senior staff to plan and hold these open houses regarding a specific issue. It is apparent to all of us that San Diego County and indeed our entire state faces a dramatic shortage of housing for virtually all income levels. Now there will effort to address the need for housing for those at lower income levels, but I do want to note the similar need for affordable housing and accessible middle market housing in San Diego County. Many cities in the county including my own are moving fast to address that market need, if we hope to attract and retain good paying middle and upper income jobs. We need to make sure the workforce finds available homes appealing and that’s where we need SANDAG to be a partner with us by ensuring that transportation network of the near future supports the homes that will be built. The transit and road network must be accessible to the new home communities that will come online in the next decade and beyond. I hope for the maximum possible communication between SANDAG and our local planning staff so that the transportation plan for the rest of the century matches San Diego’s 21st Century housing supply.</td>
<td>SANDAG recognizes the need for more affordable housing for people of middle to low incomes households that are near employment centers and a variety of transportation options. SANDAG is currently developing a Regional Housing Incentive Program that will consider climate change, climate resilience, and consistency with the transportation improvements and land use goals included in the 2021 Regional Plan.</td>
</tr>
<tr>
<td>M78</td>
<td>Mario Ingrasci</td>
<td></td>
<td>I really want to see you guys build all this. I’m really enthusiastic. I’ve made comments before, I probably sound very pessimistic. I’m not pessimistic. I just want to make sure it works, but a couple little questions while you’re in North County there. Well this is North County but how much are you along the line and a third track that could help bypass specific stations. SANDAG will also be partnering with MTS to complete a study on a Blue Line express option that could</td>
<td>The Blue Line Trolley will be speed up through an extensive network of grade separations along the line and a third track that could help bypass specific stations. SANDAG will also be partnering with MTS to complete a study on a Blue Line express option that could</td>
</tr>
</tbody>
</table>
guys looking at possibly doing work on the existing trolleys to speed them up? Or on the Blue Line, there was a lot of talk about adding a third track so that you could have an express lane. Are any of those things still in the works or are they kind of like by the wayside? That’s my first question.

[moderator response]

Yeah because I was when you said the speed up time it gets to Old Town, I thought you were talking about probably using the Purple Line, not speeding up the Blue Line that much, but how about just speeding it up enough so that it’s faster? Because I know the trains can run pretty fast, much faster than they do. You know curves and safety, and I understand there’s a lot there, but when I when this when the trolley started it yeah well I won’t say definitely moved faster. It just seemed like it moved a lot faster and especially going through downtown right now the perception of how long it takes is really crazy. Let me ask a couple quick questions and -

[moderator response]

Well that’s true, but I’d like to see you get the mayor, and I can’t pronounce your boss’s name together in a room and so to get them to tell their engineers fix the traffic signals and the trolley downtown because if they wanted to, they could do it but either each one keeps blaming the other one. Every time when I talk to engineers “oh it’s the city’s problem. Oh no it’s SANDAG’s problem. Oh no it’s MTS’ problem.” If you guys told your engineers to do it, they could fix it because those trolleys didn’t used to stop. When they when they opened up they stopped only at the trolley stations. Speaking of I-5 and 78 and that connector, how about just making a regular connector there? When is that going to happen going from westbound to southbound? I’ll be quiet.

[moderator response]

I mean that’s been like that since I was a kid.

M79 Mario Ingrasci

How about Mission Valley here? Quick on. Well it could be specific, maybe I could talk to somebody offline off later, but I’m wondering about the most information I can get out of UCSD as far as what they’re doing with you guys and whatever is they think the best place for a train station is going east-west parallel to the existing station. For the I’m talking about the Purple Line through there.

[moderator response]

Not UCSD, SDSU. Mission Valley. In order to make that work, that Purple Line, well got a bunch of questions here together. You’ve got a rapid bus now running through down 15 and then goes up to Kearny Mesa. Now I don’t if the before the Purple Line comes through you have to have that going into the stadium or not. That’s would be nice, but I don’t think, I don’t even know if that’s what you’re talking about. Anyways, when you get the Purple Line in there there, I would like to see something worked out for with you guys and I would like to see on paper because I can’t get a, I know it’s up in the air, you can’t make them you know. It’s too early, but that project is being constructed now so the sooner you guys come to a corridor here in there the better, and if you if this is going to be a high-speed train you want going north and south, not going east and west, and they’re talking about a station for the Purple Line being parallel to the existing green line, I guess that’s there now yeah and that doesn’t make a whole lot of sense. You’re gonna be coming down and then go back up again. You should have an elevated train that goes right through the valley up in the air so it doesn’t have to you know through even parallel to 15 would be better but in the middle of their project would be the best place for it. I know they don’t want to do that exactly, but do you guys have any kind of, how do you negotiate with them?

[moderator response]

I think you should publicize that more so we all know what you’re doing. SDSU won’t say anything. They say “oh that’s in the works, we’ll do it” and then that’s all they want to talk about.

SANDAG staff have worked closely with SDSU to ensure that a future transit station will be available when the Purple Line is in operation. SANDAG conducts reviews of all projects under development to ensure that when appropriate transit can be incorporated. The 2021 Regional Plan Appendix A and data viewer can be used to explore other projects in your area. Please continue to follow along in this process by visiting SDForward.com.
I have attempted to use rapid transit from Poway, I live in Poway, to downtown when I can make the schedule work. It's a wonderful experience, and I would love to have been able to use it more. Unfortunately, it really hasn't worked out for me. I live in Poway, I used to work for SDG&E before I retired in Mission Valley. Trying to make the schedules work on transit, it took two hours to get anywhere. The BRT won't stop in Mission Valley, and you pretty much have to drive. So what I'm seeing from North County Inland, which is the I-15 Corridor, the solutions that we've been presented are the managed lanes and the BRT. And the managed lanes I love, but they require you to drive and so you're putting out pollutants out there, and there's still that big bottleneck at 163 and 15 in the evenings when you're trying to merge or the managed lanes really aren't helping. The BRT would be much more useful if it could actually get people there in a reasonable amount of time. Takes two hours to get anywhere and if you're not going outside of commute times, they don't function at all. So for example, if I wanted to go to a Padres game from Poway, I have to leave the Padres game by 6:30 p.m. in order to get home, or I'm going to get stuck overnight. This scheduling really drastically needs to improve in order to make it useful. What I would be hoping to see and I haven't really seen much attention to this so far is maybe you can address it. I would love to see that reconsidered and I also think that it would be good to explain what the future might really look like in terms of managed lanes. That state has a draft plan and I would love to see more publicity and energy put into the I-15 corridor, north and south, to help people get there.

I also live in one of the suburbs of San Diego, and I'm very supportive of the 5 Moves and my I'm generally you know it's basically I'm supportive of anything that helps to for all the reasons that you stated. I think the mass transit plan would be my preference. Anything that favors or prioritizes high-speed rail, light rail, and etc. over you know lane expansion would be my preference, even if I personally don't end up using it, I will see great benefit to the region, although I will, I will personally use it as well. My question is about the funding and sorry if it sounds a little naive but how far into this 2050 plan have we already approved funding for and what remains to be approved and can you just comment a little bit about that process? Is it going to be done in phases? I imagine. And you know sort of what's the next funding target and what can we as residents in the region to do push our elected officials to make sure this happens? Obviously this is a very refreshing change from previous years, looking at the big picture, looking taking a very long view approach to our region's transportation. So thank you again for the presentation. I'll wait for your answer.

My question, I think you had a slide about where the densest work areas are, and it was a little hard to read for me, but I believe you were probably pointing to the UTC area and Sorrento Valley area, if I'm not mistaken. What is the plan for to connect those two regions? Because currently as far as I know there is not an efficient way to get between those two areas. It's there a light rail or any kind of rail or anything high speed planned? [moderator response] If you can leave your email address that would be really helpful.

Let me apologize because I do live close to the coast, and I had a conflict when you had your coastal meeting so here I am. I really support the 5 Big Moves. They, they really are big moves, and they're exactly what we need, and I appreciate the change from the previous regional transportation plans, which I think were off track, and this one is, is doing an awful lot of things very well. I just want to state that now one thing I miss is, the transit leap that you put out quite a few months ago and maybe a year ago, I don't know. Included a, I believe it was probably a Sprinter line from Carlsbad Village to Vista Transit Center, and I thought that had a lot of potential, and I know you have to pick and choose, but I, I would love to see that that reconsidered, and I also think that it would be good to explain what the future might really look like in terms of managed lanes. That state has a draft plan that Transit and Flexible Fleets will work together to provide the experience that you've identified in your comment. It may be that one shared vehicle is used for the full trip or the trip is broken into two pieces with transit providing a portion of the trip. Next OS will be utilized to help passenger make those types of decisions. This type of trip could be applied throughout the San Diego region.
### Draft 2021 Regional Plan Responses to Comments – Public Meeting Sourced

<td>The reason I raised my hand is because of the discussion about greenhouse gas, and you're right, that is my primary concern, and I think it needs to be everyone's primary concern because of the time urgency, and I don't think that in the discussion that's going on and especially when you are saying that it's kind of hard to predict, and we'll do other regional transportation plans, and you were talking about regional transportation plan in four years, and you'd know better, and you know I just want to point out that what happened, what is happening in the northwest, and there's always things like this going on. Things that just are shocking you know. They're breaking all-time temperature records by record amounts, by 11 degrees. Unheard of temperatures in cities like Spokane and Seattle and that is not the scariest thing that's going on right now. The fact is there is a heat wave in the Russian permafrost which is going to be releasing methane gas and that is a feedback loop which could get so strong that it doesn't really matter what we do, and I think the discussion here seems to be in awareness that cars are the biggest problem and that we have to reduce driving, and I would say that the climate scientists are telling us that we need to reduce our emissions to 80 percent below what we emitted in 1990 by 2030. You know and the state mandates are 2035 and they're only 40 percent down, and they need to be 80 percent 5 years sooner and so we have an emergency situation and I love all the rail, but that takes a lot of time. And I love the zoning improvements, but that's going to take a lot of time and what we could do that would could be done in just several years, and you've heard me say this over and over again. It is pricing. We have really bad systems to charge people to use roads. We have really bad systems to charge people to use parking. We think it's free parking, and it's absolutely not free at all, and it's not equitable. Craig Jones, my friend, always talks about equity, but I don't hear him concerned that people are working downtown for the county, and they're not driving and that and a parking space downtown there can earn $350 a month. That's going to be a lot of money, and then you have a lot more people that aren't driving and that path to get the system that has been defined by the plaintiffs in that Climate Action Plan lawsuit, that system needs to be talked about and implemented. There has to be a path shown that will make that happen soon. We're running out of time.</td>
<td>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. The SB 375 reduction target must be achieved by reducing per capita VMT. The SB 5 Big Moves will ensure connectivity and result in people having more travel options and operating solutions, reducing per capita VMT. Local jurisdictions can and will identify GHG reduction targets and measures to reduce emissions beyond what is included in the 2021 Regional Plan. Next year, SANDAG will study usage-based fees and the effect the fees will have on meeting established goals like greenhouse gas emissions reduction and improving equity for different income levels and different populations. The first phase of the study will calculate the true cost of driving a vehicle – the cost to own and operate a vehicle, the effect on road wear and tear, the cost of increasing capacity of the transportation system to meet demand, local and global pollution caused by both fuel powered and electric vehicles, traffic accidents, traffic congestion, and the cost of delays caused by congestion to the economy and to the quality of life of travelers. The study will determine how existing revenues currently funds different parts of the transportation system and how different populations are impacted. This foundational understanding will help SANDAG design a road usage charge program that encapsulates multiple factors to make it more fair across the community than the current transportation funding sources. The study will assess the potential impacts of user fees on San Diego residents, visitors, and businesses, particularly those relying heavily on transportation. SANDAG staff will consult with its Board of Directors, stakeholders, and community members to develop implementation strategies for a road usage charge. This includes policies such as who will pay what and how much, the fee structure, and the distribution of revenues. SANDAG is committed to developing a carefully constructed program that will ensure that no group, such as those driving fuel-powered vehicles, low-income individuals, rural residents, or those with long commutes, are paying more than their fair share. There are multiple mechanisms, such as caps and rebates, that will be explored to ensure a fair system. The road usage charge, which is being studied by both the federal and state governments, is being considered to replace an old tax system that is no longer relevant. We know this is a challenge and we respect the concerns raised. We are committed to having authentic dialogues to work through the challenges and create a revenue system that is flexible, sustainable, equitable, fair to all.</td>

M86 Toshi Ishishara
So I live in Rancho Penasquitos. Any first of all, I want to say thank you very much for setting up this like a community forum, and they give us opportunity to provide inputs on RP. So I would like to know that in principle, I really support the MV. I mean a vision behind RP. Hasan called it’s 5 Big Moves right so I like that and I also like you to know that I take transit as much as possible; however, pandemic kind of stopped me taking from taking training but so that I’m thinking about restarting, taking transit pretty soon I believe, but my question is about greenhouse gas emission reduction target. So according to Chapter 1, I don’t remember, may not be Chapter 1, but also Sunday Staff stated the RTP will reduce per capita greenhouse gas emissions from transportation sectors to 10 below 2005 levels by 2035. That’s right so 20 and as you know transportation sector actually accounts for 50 percent of somebody came to my doorbell - 20, 50 right, so if we reduce 20 from 50 then we still end up with 40 percent, and as you know population is increasing. So if you look at Appendix X, so that’s X, that estimate that - oh somebody came to my door so and then the person is yelling at me so I think I’m gonna stop now and I hope I can continue sometime later today.

M87 Toshi Ishishara
I’m calling and then everybody listening to this community forum, I’m sorry. What’s happened actually somebody tried to break into one of my neighbor’s house so that’s what happened. So anyway so I’m gonna keep my comment in less than a minute so anyway. So my concern is the greenhouse gas emission target and what the ROT will bring, and I read Appendix X and the Appendix X shows basically the prediction of the greenhouse gas emissions in this region, and I think the estimate was done by UCSD, but if I look at the trend, so after 2035 basically it’s showing flat. There’s no reduction beyond 2035. Of course we expect the population to increase, right? So the per capita greenhouse emission will continue to decrease; however, because it’s fixed at a certain level, and I see that level is still very high so that really concerns me. So how we are going to fight the climate change, and I thought Santa GRP would be the one of the weapon, biggest weapon for us to fight climate change in San Diego. So I would like to hear more about what SANDAG is trying to do, and if you can include some kind of specific specificity in the Regional Plan, how it will conform to the ambitious greenhouse reduction like a goal set by not only state of California but also like a San Diego County and the other I mean municipalities.

M88 Toshi Ishishara
So I have one question and one comment. So my question is very simple. So some of my volunteers asked me about are we working on RTP or RP? Because I thought we were working on RTP by automotive so it became our business. [moderator response] Ok great, thank you. So then my comment is basically about this greenhouse gas reduction. So Chapter X, not the Chapter X. I’m sorry. Appendix X actually lists a whole bunch of sources of greenhouse emissions not only from passenger vehicles and light-duty trucks but also from solid waste, you name it. Everything there, and then I’m seeing basically reduction stop as I told you at 2035 and just stay flat from the point on so that’s very concerning to me so I just want you to know that I’m - has contributed to habitat conservation and presents the goals and objectives of the Regional Habitat Conservation Vision in order to protect sensitive habitats and resources for future generations.

As part of the 2021 Regional Plan, SANDAG will establish a Nature-Based Climate Solutions Program that will promote natural infrastructure that uses or mimics natural processes to benefit people and wildlife. SANDAG will prioritize resilience and innovative solutions in transportation infrastructure, Comprehensive Multimodal Corridor Plans, and consistent regional planning and implementation of the Sustainable Communities Strategy actions, emphasizing both nature-based and technological climate solutions. There are also further opportunities to expand upon ongoing efforts to assess the amount of carbon storage and sequestration potential of open space lands and the co-benefits from preserved open space, land management, and restoration activities.

The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. The SB 375 reduction target must be achieved by reducing per capita VMT.

The GHG Inventory (Appendix X) analyzes emissions from all sources and the projections account for state and federal legislation currently in place, as well as strategies within the 2021 Regional Plan. The 5 Big Moves will result in people having more travel options and operating solutions, reducing per capita VMT, and the Local jurisdictions can and will identify GHG reduction targets and measures to reduce emissions beyond what is included in the 2021 Regional Plan.

<td>M89</td>
<td>Alex Wong</td>
<td></td>
<td>So yes, it’s Alex from Monday, and I just wanted to short a question first of all. Now the mid-coast trolley, when it opens in November what will the frequencies be?</td>
<td>Our goal really is to get the entire transit system on at least 10 minute all day service. For the trolley and all the railroads, we plan to go to seven and a half minute frequency all day. So we do have extensive improvements in overall frequencies of our light rail system.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>[moderator response]</td>
<td>Blue Line is the route that goes from the border at San Ysidro to Old Town today. Ultimately, when Mid Coast opens in November, it will go all the way up to University City, with a stop at UTC at the very end of the line.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>So I think that’s very good but and yeah but do you have any plans to increase the Green Line frequencies? Because it seems like with all the development happening in Mission Valley you know that might be a good place too.</td>
<td>The Green Line travels through Mission Valley, connecting to El Cajon and Santee, and it comes all the way through the center of Mission Valley into Old Town and downtown San Diego. So it's one of the connections that provides access through the center of San Diego.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>[moderator response]</td>
<td>Our new line that will connect the Central Mobility Hub to the airport—that’s our new transit connection—we are planning on that operating at every two minute headways throughout the day. So that’s part of the capability that we’re looking at for our system. We’re not going to start out at two minutes on our bigger commuter rail service, but we’ll be evaluating technology throughout the advanced planning of these services to make sure that we're using the most up-to-date and current technology. And if that includes automation, then certainly it will be included in our analysis.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Oh well not the Orange Line in particular but rather I was thinking about this line through kind of mid-city and yes Hillcrest, right. I see it on your map. It’s commuter rail, but I’m thinking that maybe it could be built as a trolley instead or even because I think it would be better if people could walk to their neighborhood stops instead of you know having to take a bus or a rideshare to a bigger station. And also I wonder if you’ve ever considered on any of these new lines that you’re going to build that maybe you build something like the Vancouver SkyTrain, the Montreal REM. You know something that's fully automated. You know you can run them up to two minutes, to two minutes per train at peak hour and then you know they could be very the operational cost could be very low because you know 17 percent of operational costs are from drivers.</td>
<td>The regional plan is a big picture blueprint and further studies have to be on all of this. Regarding the purple line, we’re looking at that whole line right now. We think we know where the stations are going to go, but this is at a really high level that gets further refined later. We were calling it a commuter rail. Now, when we do the further study, I don’t want to say it would be a trolley, but that’s a possibility, or we may find out some other kind of automated system is available and could make that work. Those things happen further down in the planning, but that is to give you a sense that the level of planning we're doing right now is very high level, very regional.</td>
</tr>
<tr>
<td>M90</td>
<td>Deborah Jones</td>
<td></td>
<td>Hi, how are you? I don’t know how to turn on my camera but anyway. You know what I look like. In full disclosure I do work for SANDAG but just from a personal on a personal level, living in this area and also working in this area a couple of things that I’m wondering about as a citizen is whether ferry transportation is being considered for the plan. I’ve always thought it would be great to have some hovercraft ferries that go from downtown to the airport or from downtown over to Point Loma military base or from Chula Vista up to downtown or over to the airport just as a way to use our waterways as a transportation network and something maybe faster than what is currently used across to get to Coronado.</td>
<td>We do have a couple ferry projects in the plan, and really the first pairing that I’m going to talk about is a connection from Chula Vista to our military bases near 8th Street. That’s a really strong commute, and then up to downtown San Diego. That probably has the highest level of potential ridership. The other one would be to connect Chula Vista to Coronado and then ultimately downtown San Diego, kind of creating a triangle. And we are in fact, looking at ferry levels of speed that are much higher than the existing ferry today.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>We're definitely considering that as an option.</td>
<td>So those are the initial two that we have in the plan, but I’m sure that once we experience the value of those, we’ll be pursuing that as a bigger strategy in future plans.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>For sea level rise, it’s all about how we engineer these projects. If anyone’s familiar with what we’re doing even today on the LOSSAN corridors, all about raising up the bridges so that we’re addressing sea level rise is exactly why we need, as Steven was bringing up, to get the tracks off the bluffs. That is very problematic.</td>
<td>The design and construction of new infrastructure will consider the best available science, tools, and technology.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>So it’s really about, as we build the new infrastructure, that we’re respecting sea level rise. The other aspect of climate change is making sure that we've got evacuation routes for the people in the rural areas. That’s a big part of when we talk about improvements on the rural roadways, getting the evacuation routes so the people can get out in the instance of a fire.</td>
<td>So yes, it’s Alex from Monday, and I just wanted to short a question first of all. Now the mid-coast trolley, when it opens in November what will the frequencies be?</td>
</tr>
</tbody>
</table>
And then lastly because this is the topic du jour or certainly was for the year 2020, what impact telework or even the future of work and what industries will look like in the future. So where are we assuming, it is being assumed in the plan, that everybody's going to be commuting into an office or will we be teleported, you know? What does what does Star Trek vision look like for work and has that been factored into congestion and the way we work? Thank you.

Telework is one of the strategies that is helping us to achieve our GHG reduction targets in the Regional Plan and SCS. Our assumption for the 2021 Regional Plan is that telework will grow much more than we've anticipated in past plans, but we know that many occupations cannot be done from home. To understand the potential for telework in the region and inform the telework target setting process, SANDAG conducted an analysis of jobs that are conducive to telework and found that 39% of all occupations in the region are considered home workable. This is a bit higher than the national average at 34%. It's important to keep in mind though that although a job could be done from home, it does not mean it will be. It's up to the employer's discretion to determine who gets to telework, when and why.

And we also looked at the percent of jobs in our region that are considered essential. During the pandemic certain types of jobs were defined as essential and included jobs in grocery stores, healthcare, and transportation. In our region 64% of occupations were considered essential. SANDAG also randomly surveyed businesses and employees in the region. While 2 in 5 businesses expect to incorporate remote working in their business model post-pandemic, just 15% anticipate that half or more of their employees will work from home most of the week.

I'll just take this opportunity to mention to everyone here that SANDAG does have an Equity Working Group that is specifically assigned to advise on the Regional Plan and ensure that equity is at the forefront of this plan. That working group is chaired by City Councilmember Vivian Moreno. And within the next few days here, we are going to be having a discussion with the, the working group. And by the way, these are public meetings, so anyone here on the call is more than welcome to attend. The information about the meetings is posted, on our website, they're all done virtually. So, you know, you can do this from the comfort of your home, or your office, and we're really going to be talking about what is something, what's an early action that we can take, when it comes to equity. We're going to be asking our SANDAG board of directors to set aside some funding here in the next couple of months so that we can start to show what this Regional Plan could look like and pilot some of those ideas. So, thank you for your comments Haneen, and I know that City Heights CDC is really involved in the working group and appreciate all that participation.

The South Bay to Sorrento Comprehensive Multimodal Corridor Plan is currently studying alternatives that include a station in City Heights along the Commuter Rail Route 582. The east-west Commuter Rail route 581 does include that station in the current proposed alignment.

I just want to know about the Purple Line because I would like for it to go underground. This way, we would be saving a lot of emissions and save a lot of time on traffic so from what I understood with the Purple Line it's supposed to be going underground, coming through City Heights going from the border all the way to Sorrento Valley, and another one that I’m involved in is that the buses to the beach. We would love to have the buses go to the beach because a lot of our kids and the different underserved communities have never been to the beach, and it’s heartbreaking when you see that and hear that. I think it's a great opportunity to have these kids going to the beach exploring other communities outside of our communities, and also I would like to see more buses running more frequent. Having 24-hour service if possible because there are a lot of people that go to work, and they're out of luck when they go to work but getting back to the Purple Line. We need the Purple Line here in City Heights because we are one of the highest transit users in San Diego and to see it come through City Heights that would be a dream come true, and Todd knows all about that and everybody else. I'm Colleen, I want to say as always you have done a wonderful job and not only just you but everybody there at SANDAG. What a wonderful way to end the evening. So if I could have some answers maybe I guess on my questions that would be great.
The South Bay to Sorrento Comprehensive Multimodal Corridor Plan is currently studying alternatives that include a station in City Heights along the Commuter Rail Route 582. The east-west Commuter Rail route 581 does include that station in the current proposed alignment.

The 2021 Regional Plan includes increased service spans for the trolley and bus service up to twenty hours per day. As SANDAG and the transit agencies move into more detailed planning efforts in the near future, some routes will be considered for 24-hour spans.

We appreciate your support and feedback. Please continue to follow along in this process by visiting SDForward.com. The 2021 Regional Plan data viewer can be used to explore draft plan projects in your area.

The 2021 Regional Plan includes increased service spans for the trolley and bus service up to twenty hours per day. As SANDAG and the transit agencies move into more detailed planning efforts in the near future, some routes will be considered for 24-hour spans.

We appreciate your support and feedback. Please continue to follow along in this process by visiting SDForward.com. The 2021 Regional Plan data viewer can be used to explore draft plan projects in your area.

The proposed final 2021 Regional Plan includes a commitment to building bathrooms at all new rail stations and developing a bathroom access plan to study the incorporation of bathrooms into existing stations. One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.

SANDAG will be undertaking a Blue Line study in 2022 to refine how the travel time could be speed up. SANDAG is also working with our Community Based Organizations to increase service frequency on routes that would benefit our social equity communities.

The intent of the managed lanes is to create a flexible system that can be managed in real time. This is similar to how the I-15 corridor is currently managed in North County today. Solo drivers will have options to use the lanes but at a price and transit services can travel congestion free. The result is better optimization of the system that encourages higher occupancy travel but with real alternatives that are competitive with driving.

The South Bay to Sorrento Comprehensive Multimodal Corridor Plan is currently studying alternatives that include a station in City Heights along the Commuter Rail Route 582. The east-west Commuter Rail route 581 does include that station in the current proposed alignment.

Response provided during the public meeting: Ultimately it is the voters of the San Diego region that are going to decide if they want to buy this plan. And so at some point in the next year or two years, there will very likely be something on the ballot for consideration. So that’s the first thing I wanted to mention, and that would not be the only funding source. A new sales tax measure, for example, would allow us to leverage state and federal dollars. And for anyone who’s been following work that SANDAG’s been doing, on average for every dollar we raise in the San Diego region, we’re usually able to get two dollars and fifty cents in return from state and federal programs. So that’s a start. We also have laid out a number of other funding strategies, because it’s not just the sales tax measure that’s going to get us there. So I wanted I want to share that with you. The other thing with the team is working on right now is if you’ve had a chance to look at the two appendices U and V, that’s how we fund the plan. And some of the phasing plan is also in appendix A. We’re working to really align that and get more refinement on things. It’s really important to keep in mind, again, as I mentioned earlier, this is really a big picture blueprint. There’s a lot of additional work that needs to get done to refine that phasing. But we’re at least going to lay out a more detailed phasing program as we develop the final.

And then finally we just have general questions about the phasing of the projects. You know that’s something that is very just like personal to City Heights residents as we’ve waited for decades for active transportation transit improvements. So what are we gonna do? The question is what are we gonna do differently in these next 15 years compared to what we’ve done these past 15 years to get projects, transformative ones, built more quickly? Yeah looking forward to these you know some of these answers and working with you all on getting the 5 Big Moves approved. Thank you.”

When it comes to Imperial and Riverside, we do work with the neighboring counties to look at what’s happening with that cross border transportation. We do multiple surveys, and we’re always looking for ways to look at travel options there. I think probably the best way to do that is through the connections of our managed lanes. For RCTC, the Riverside Transit Authority, we have worked closely with them. When we first started this plan, we drew connections and big circles around Orange County. Riverside County, the border, Imperial County, and further east towards as you’re heading into Arizona. We know that these are connections are really important, and San Diego isn’t landlocked. We are dealing a lot with our neighbors in each area. So the plan currently has a lot of connections in Escondido, and then there are plans in the future to extend our routes up to potentially Temecula to coordinate with RCTC.

But in the plan is high speed rail, and high speed rail connects our Inland Empire along Riverside County, across the center of our region, and down into downtown San Diego. So, that’s really the route that we see as the fastest connection from those inland Empire areas over to our downtown San Diego area.

Related to Orange County, we work with our neighbors to the north, and today we have we have the transit service Metrolink that stops at the Oceanside Transit Center. And we also have the Amtrak Pacific Surfliner that serves both Orange County, Los Angeles, and our region. So it’s something that we’re always looking at ways to align all the transportation between Orange County and our San Diego region, and also with Imperial county and Riverside.

On LOSSAN too, part of what we’re looking at is creating an interconnected rail service. So the Metrolink trains could come all the way down and operate through the LOSSAN corridor, and then we can provide those direct connections. That is part of the state rail plan, that’s part of SANDAG’s plan, and that’s part of why we’re doing those improvements on the LOSSAN corridor.
### Draft 2021 Regional Plan Responses to Comments – Public Meeting Sourced

<td>Next, many of many persons commute to from our international neighbor to the south, Mexico. How has SANDAG worked with federal authorities to ease the commute to our coworkers who live in Mexico?</td>
<td>SANDBAG appreciates your support and feedback. The SANDAG Borders Committee was established in 2001 to bring together elected officials and representatives from all neighboring jurisdictions to address joint challenges related to regional planning and collaborate across jurisdictional and international boundaries to develop and implement strategies within the broader context of the megaregion. The Mexican government is represented through the Mexican Consulate as an advisory member of the Borders Committee as well as Board of Directors. The 2021 Regional Plan is designed to build on the close working relationships among partners throughout the California–Baja California binational megaregion, including those at all levels of government in Mexico. Efforts will include completing the Otay Mesa East-Mesa de Otay II Port of Entry project, implementing the Regional Border Management System (RBMS), and advancing the San Ysidro Mobility Hub project. These and other initiatives will help create the momentum needed to improve crossborder mobility. Appendix J includes more information on SANDAG’s approach to working with binational partners. Please continue to follow along in this process by visiting SDForward.com.</td>
</tr>

<td></td>
<td>So I think a quick and easy way to facilitate traffic or trolley movement through downtown would be to give it a signal priority. I lived in France for six years back in the 1990s and that’s just what they did. They just gave it automatic signal priority and there you go. Secondly, just a quick question regarding double tracking the line all the way down to well eventually ideally take the commuter rail all the way down to the border is the existing line extending it through Santa Fe Depot all the way down to the border and is then taking it off the bluffs you have to take it off of your rail line. That’s just to a really anybody really looking at that situation, that’s just an disaster waiting to happen and it’s not going to get cheaper by waiting to move it off the bluffs. I don’t just wanted to see what you guys is certain yeah I’m certain that’s on your plate. I just like to know if there’s anything specific that you guys have to speed that up.</td>
<td>SANDAG recognizes addressing the bluffs as a priority. The Regional Plan identifies funding for bluff stabilization in the short term while also prioritizing funding to start work on a long term solution to realign the rail corridor into a tunnel in Del Mar by 2035. There is also a project to bypass Miramar Hill and realign the tracks in a tunnel with a new station at UTC by 2050. Regarding your idea to go all the way down to the border, we are working to take the Blue Line trolley and create a type of service that would be express.</td>
</tr>
<tr>
<td>M07</td>

<td></td>
<td>So I too also want to mention that we do need more bathrooms because a lot of times as has been said those of us that are younger need to use the restroom and can’t, we have to go somewhere else and when we get back we’ve either missed the bus or we’ve missed the trolley, and we have to wait again. And also families with younger kids, it’s you know painstaking to see them having to hold it and sometimes they can’t. And also I am in agreement also with Stephanie about the no expansions on the freeways because my god, we’re already bad enough as it is and so we need to be more, having more buses running on time and also more frequency. This way we will reduce the gas emissions and car and also too I would like to see more information being used by the by the buses and the trolleys vocally because sometimes you miss what they, what’s been flashed or what’s been said. Sometimes they’re not saying it frequently enough, and I too would like to see that happen. And also I’ve noticed that the security guards there are much nicer now, and I just want to say thank you for you guys and MTS, I’m taking hold on that and I too would also like to thank SANDAG’s staff for everything that they’ve been doing. As I said earlier, it’s about time and my hat’s off to Hasan here who is who has shown incredible leadership. And also I would like to congratulate him for having to have us for the next three years, and as you will see the community is also now starting to see and trust SANDAG more with the transparency.</td>
<td>The proposed final 2021 Regional Plan includes a commitment to building bathrooms at all new rail stations and developing a bathroom access plan to study the incorporation of bathrooms into existing stations. The 2021 Regional Plan is not proposing any new highway expansions or addition of highway general purpose lanes but rather is focusing on a regional network of managed lanes to ensure that the Regional Plan meet state and federal greenhouse mandates, reduce traffic congestion, and address social equity. Proposing a managed lanes network that uses existing infrastructure by converting shoulders or general purpose lanes gives an opportunity to increase capacity on lanes that traditionally would not benefit from increased use of high occupancy vehicles or transit. Your comment has been forwarded to San Diego Metropolitan Transit System (MTS).</td>
</tr>
<tr>
<td>M08</td>
<td>Michelle Krug</td>
<td></td>
<td>I have not had a chance yet to have someone go over the details of the Regional Plan yet. I will do that, but I do want to emphasize as much as possible to please bear in mind having as many audio sim signals. So when I’m at a trolley, because I’m blind, when I’m at a trolley station I love that we do have more information written you know on signage, but can you also keep in mind having more audio saying when the trolley- what trolley is arriving, but you know that’s in the public transportation and on the buses. And the other thing is pushing or emphasizing the 24-hour service which as someone who’s retired now but as a wastewater operator I worked rotating shifts, and it would be</td>
<td>The transit operators work on the ADA announcements at stations. We will forward them your comment. SANDAG is undertaking a study to determine which routes would be eligible and able to be operated 24/7. This study should be done in late 2021. Your comment has been forwarded to North County Transit District (NCTD) and San Diego Metropolitan Transit Service (MTS).</td>
</tr>

</table>
great if we really were able to safely use transportation no matter what shift we were all working. Thank you very much for your work, and Hasan is just our angel. He has just brought hope in a way that I’ve never felt for decades since I’ve been here in 1979.

M109 Rocina Lizarraga
Olivewood Gardens

I would like to appreciate all the comments from my colleagues that are joining in this movement of advocacy and activism and both being vocal in this Regional Plan. I’m Rocina Lizarraga, and I work for Olivewood Gardens in National City, and our city has been historically disinvested and been penalized despite the efforts of the local jurisdictions to provide most of the amenities. Our city just want to advocate for this time for the senior population. After revisiting all the graphic and reading and inquiring about that, and I know there’s a great report in all the data that shows that our communities are in necessity. The assessments that we’ve been done after doing that we just discovered myself that there’s very little amenities for people with that is aging. That we have a large population of seniors that they decide they deserve considerations of biological necessities and also disabilities not only physical but sensorial and also disabilities on necessities that they need when using transportation. Most likely they use public, private transportation because it’s more convenient. It doesn’t align with this non-used cars and use public transportation gold that we have with this draft plan. I’m looking for Appendix Q, Appendix L, and there’s figure that says safety but it doesn’t it does not reflect what we wanted to see. I’m so purely support what member Jennifer Martinez is saying that there’s biological necessities that they have because they’re aging. So I would like to see more of that and I think the team on SANDAG is completely in that they will revise again and see if we can reflect this type of necessities for our disabled population in all ages because it says all ages are included in this and considered in this draft plan. So I would like to see more of that, and I would like to see in the future the lengthy implementation of these programs.

We would like to refer you to Appendix H: Social Equity Engagement and Analysis. There, you will find an increase to region wide access to basic needs -- such as medical facilities, parks, and retail -- for seniors through 2050. According to Appendix H, transit access for seniors to medical facilities increases from 79.5% in 2016 to 84.5% by 2050.

In Appendix B: Implementation Actions, you will find our curb management strategies, which will aim to best-use and manage all modes of transportation on our streets for everyone safely and efficiently. One of the key elements of curbside management are paratransit and accessible loading areas to serve our disabled populations.

For more details on these initiatives, please see Appendix B.

M110 Scott Anglum

I’ll be very brief. Once again, the draft Regional Plan is revolutionary and hopefully, if anything, it’ll be expanded in its scope and depth. There is widespread support for the initiatives that are outlined within them and once again please recognize that there is great public support, great public emphasis behind sustainable, regular and reliable transportation in the region so that dependency is not the default in the area. All right, that is all.

We appreciate your support and feedback. Please continue to follow along in this process by visiting SDForward.com.

M111 Stephanie Hernandez
City Heights CDC

I am a program manager at City Heights CDC and also a member of the SANDAG Social Equity Working Group and San Diego Transportation Equity Working Group. I just really wanted to emphasize and recommend that Transportation Committee members read that transit, the 10 transit lifeline document that the San Diego Transportation Equity Working Group has shared with you all that really addresses our priorities for the Regional Plan, such as, mentioned, bathroom access, transit frequency, Purple Line alignment in City Heights. But I also wanted to just mention that a lot of our residents that we’ve spoken to also want, we’ll be sharing a letter fairly soon, but a lot of many have addresses just making sure there’s an increased access to the bay, the beach area. A lot of youth cannot access the beach who live in City Heights, and it takes about two hours to get there so we really recommend that there is some type of mention of beach access in the Regional Plan again and also making sure that there is no freeway expansions. You know freeways definitely have divided communities like City Heights, and so we recommend that bus transit only lanes are prioritized moving forward.

SANDAG agrees that action is needed now to provide fast, frequent, reliable, and accessible transit, especially on highly utilized routes. Staff are bringing forward an item to the SANDAG Transportation Committee and to the Board of Directors in advance of approval of the 2021 Regional Plan to amend the agency budget and act now to invest in transit that benefits environmental justice communities. This action seeks to increase services on transit lines that have infrequent service in the evenings and late nights, and/or provide fare subsidies for youth riders. Additionally, further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.

The proposed final 2021 Regional Plan includes a commitment to building bathrooms at all new rail stations and developing a bathroom access plan to study the incorporation of bathrooms into existing stations.

The South Bay to Sorrento Comprehensive Multimodal Corridor Plan is currently studying alternatives that include a station in City Heights along the Commuter Rail Route 582 (Purple Line). The east-west Commuter Rail route 581 between El Cajon and Downtown San Diego/Central Mobility Hub via SDSU includes that station in the current proposed alignment. The first part of Route 582, from National City to Sorrento Mesa, is expected to be built by 2035 and is planned to be extended south from National City, to Chula Vista, and to the border by 2050. An additional route, Commuter Rail 583, traveling from the border to National City on the same alignment as the 582, is expected to be built by 2050 along with a branch to the Central Mobility Hub via downtown San Diego.

The Regional Plan outlines the following projects in the Pacific Beach/Mission Beach areas. These proposed projects can be viewed in more detail using the Dataviewer on SDForward.com/envision. Pacific Beach Mobility Hub.

<td>Toshi Ishihara</td>
<td>SanDiego350</td>
<td>I’m a member of San Diego 350, and I’m also a member of San Diego Equity Transportation Working Group. So I’m a climate change and transportation equity advocate. So Hasan, his staff and also board members and also public, I really appreciate you putting together this draft Regional Plan. I like a part of it, but I think it is not challenging enough, means it is not challenging the reality we have today in terms of like greenhouse gas emissions and climate change. As you know, the world is burning, and our survival is at stake. And if I look at the Chapter 1, page 13, it says the Regional Plan will reduce net capital greenhouse gas emissions from cars and light duty trucks to 20 percent below 2005 levels by 2035. Of course that exceeds the region’s mandate target of 19 percent, but if we look at the fact that more than 50 percent maybe around 50 percent of the greenhouse gas emissions in these regions are coming from transportation right and the 20 percent to 50 percent like a simple state maybe 10 percent reduction, but it is not the case because we are talking about reduction of 20 percent below 2005 level. So that means to me we are talking about target which can make only tiny dent to the entire and overall greenhouse gas emission from the transportation system in San Diego. So I like Regional Plan, but I would like to see SANDAG take some more like aggressive stance in order to fight greenhouse gas emissions and also fight climate change.</td>
<td>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. The SB 375 reduction target must be achieved by reducing per capita VMT. The 5 Big Moves will enhance connectivity and result in people having more travel options and operating solutions, reducing per capita VMT. Senate Bill 375 also requires the 2021 Regional Plan include a Sustainable Communities Strategy (SCS) for the San Diego region. This SCS describes coordinated transportation and land use planning. When combined with the transportation network, the SCS exceeds the state’s target for reducing per capita GHG emissions set by the California Air Resources Board.</td>
</tr>
<tr>
<td>M113</td>
<td>Ariana</td>
<td>Mid-City CAN</td>
<td>I’m calling in with Mid City CAN. I want to say thank you to SANDAG for working so hard in drafting the 2031 Regional Plan. We are asking that they include youth opportunity passes, no cost transit passes for youth for ages 24 and under. When it comes to the transit subsidies we are asking for them to be the priority group. In the pandemic we have seen that there is a need to develop lifelong transit riders. I think that YOP can definitely do this. When we are investing in young people we are ensuring that young people have the opportunity to access school, work, and other activities. I myself was a transit rider for many years. Because of this, I was able to get a lot of opportunities I couldn’t get as a young person. Youth opportunity passes really addresses the need for sustainability. We are hearing from other speakers that there’s a lot going on that is impacting our world and we need more folks from all economic backgrounds to ride transit as a method to reduce emissions. And YOP is actually a key strategy to make sure that we increase ridership for all these folks. YOP is already a program that has been invested in in other cities in California so I hope that YOP is listed as a priority group.</td>
<td>One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.</td>
</tr>
<tr>
<td>M114</td>
<td>Bee Mittermiller</td>
<td>SanDiego350</td>
<td>I’m from the San Diego 350 Organization, I’d like to congratulate SANDAG staff for putting together this incredibly detailed Regional Plan. It finally sets the goal of creating a public transportation system that has the potential to attract new riders who want a way to get around without the frustrations, headaches, and costs of congestion, car ownership, and parking. Shifting people to the use of public transportation, bicycles, and walking are the most effective ways to improve mobility and reduce greenhouse gas emissions. Improving this will also keep the riders who are already depending on the system. As everyone mentioned, we are living in a nightmare of the climate crisis. This cannot be denied any longer. San Diego can do its part to address this crisis by adopting the 2021 Regional Plan but we want SANDAG to prioritize all of the projects, big and small, that will reduce greenhouse gas emissions as fast as possible while also addressing equity. We appreciate the staff’s past and future outreach to all individuals and organizations who want the best planning for our region. As members of San Diego 350, we plan to remain engaged in the process and look forward to further discussions.</td>
<td>We appreciate your support and feedback. Please continue to follow along in this process by visiting SDForward.com.</td>
</tr>
</tbody>
</table>
I am a policy advocate with Mid-City CAN. We are calling to request that you amend the 2021 Regional Plan to include youth opportunity passes, ages 24 and under, and under no-cost transit passes. As a youth from National City and youth opportunity passes, you are truly investing in youth lives. Young riders depend on transit at a much higher rate than adults. In San Diego, young commuters ages 16 to 24 use public transit at a rate double that of adults 25 to 59. YOP is about equal access to opportunity. Transit-dependent youth ages 24 and under need no-cost transit to get to school, work, medical care, recreational sites, and life opportunities. The cost of a pass is a barrier for many families earning minimum wage. It is also an investment in sustainability. We need more people from all socioeconomic backgrounds to be riding transit as a method to reduce carbon emissions. YOP is a key strategy to increase ridership from all socioeconomic backgrounds and develop lifelong transit riders in our region. We need YOP to increase ridership and be sustainable. Lastly, it is also an investment in a proven program. San Francisco, Sacramento, Los Angeles, Santa Ana, Alameda, and more jurisdictions across California and outside of California have already implemented similar programs. SANDAG must take bold action and include YOP in our 30-year vision for transportation in the region. The program has proven to work for people and transit agencies. Please amend the 2021 Regional Plan to include youth opportunity passes, ages 24 and under, and funded as an early action pilot program. Also included the 10 transit lifeline projects brought forth to you in a letter from the San Diego Transportation Equity Working Group, which represents the priorities and needs of the communities we serve.

I live in San Diego, and taught in city schools for over 32 years. I truly appreciate the shift SANDAG has taken to accomplish transit goals but I think the greenhouse gas reduction goals are too low for the speed and gravity of the current climate emergency. There is still too much emphasis on roads for private vehicles. Climate change is manifesting itself quickly all around us so our response needs to be big, bold, and fast. A way to cut car emissions, which are about half of the county's total emissions, is with attractive and enhanced public transport that provides efficient and easy mobility for all of us. I’ve taught many years at a small public high school downtown on the campus of City College, where students come from surrounding low-income neighborhoods. The school district provides free or discounted youth passes for MTS, depending on family circumstances, and this has made a huge difference for our students allowing them to flourish and take college classes early. I’ve seen the problems that occur when they can’t get those passes in a timely manner or when trolleys don’t run efficiently enough to help them juggle their time commitments to school, work, and family. The Regional Plan should include free transit passes for all school-age youth and young adults much sooner than 2027. To help them in every way possible, join our vibrant economy and citizenry. Furthermore, no-cost passes will encourage significant participation in public transportation and shift expectations for how San Diegans use transit, allowing us to meet more accelerated targets for greenhouse gas reductions. We can do better than forty percent by 2030 if we act quickly on public transit goals.

I request that you amend the draft 2021 Regional Plan to state that youth opportunity passes, no-cost transit passes for youth ages 24 and under, will receive priority. As a youth from National City and recent graduate from UCLA, I have firsthand experience understanding how no-cost transit promotes accessibility for youth to excel in school, jobs, and early career opportunities. In Los Angeles, I benefited greatly from no-cost transit as it allowed me to navigate the city and go to work in order to support myself in my undergraduate career. The low-income youth of San Diego region deserve better mobility. With that, I ask to please amend the 2021 Regional Plan to include youth opportunity passes for all youth 24 and under and funded as an early action pilot program.

I'm a representative to the Social Equity Working Group from the Alliance for Regional Solutions, which represents communities with unmet need in North San Diego County. One of the points that Mr. Bullock, Mike, was making before when he ran out of time on your public comments was that the world is literally on fire here with climate change, and this is true. Let's just look around and admit what's happening here. We have a local, regional obligation to act as quickly as possible to counter and stop the production of greenhouse gases. The Regional Transportation Plan, the draft and the Regional Plan that has been proposed moving forward as quickly as possible will fulfill our moral commitments to school, work, and family. The Regional Plan should include free transit passes for all school-age youth and young adults much sooner than 2027. To help them in every way possible, join our vibrant economy and citizenry. Furthermore, no-cost passes will encourage significant participation in public transportation and shift expectations for how San Diegans use transit, allowing us to meet more accelerated targets for greenhouse gas reductions. We can do better than forty percent by 2030 if we act quickly on public transit goals.

Thank you for your support of the 2021 Regional Plan and the climate strategies contained in the Plan.

<td></td>
<td>Climate disruption is here now. Just look at the headlines. Floods, droughts, massive fires getting worse every year, people dying from extreme heat, and our agricultural industry having to scale down from lack of water. Anyone who is paying attention and taking it seriously knows what we need to do. We must reduce greenhouse gas emissions in every way we can before it is too late. What that means is as good as this plan is, it needs to be better. Don’t get me wrong, I have been looking at regional plans for twenty years, and this is the best plan I have ever seen for our region but I worry that it does not go far enough or fast enough spending money on highways when we all know that we need to drive less, is not the best thing we can do. We need to prioritize active transportation and transit, and cut off expanding freeways. We must choose actions that get the most greenhouse gas reductions per dollar first. Transportation demand management and cutting subsidies to driving are fast and effective ways to reduce greenhouse gas emissions at low cost. Do them first. I’ll close with a quote from the past. “You don’t need a weatherman to know which way the wind blows”.</td>
<td>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. Reducing GHG emissions and achieving state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan.</td>
</tr>
<tr>
<td>M20</td>
<td>Denise Lopez</td>
<td></td>
<td>I will be going to UCSD this fall. I request that you amend the 2021 Regional Plan to include that youth opportunities passes will be used for youth 25 and under. As a youth dependent on transportation for my four years in high school, I have seen that we have struggled getting to school on time. This is very important to me. I will need the youth opportunity pass to attend UCSD which is very far away from me. There have been opportunities that I’ve had to turn down due to lack of transportation options. We are unable to travel safely at night because the buses stop running at 10 PM.</td>
<td></td>
</tr>
<tr>

<td>Haney Hong</td>
<td>San Diego County Taxpayers Association</td>
<td>I am the President of the San Diego County Taxpayer’s Association. It’s good to see everybody again. You may recall that a couple months ago, Hasan invited me to moderate a panel of experts around understanding around the Regional Transportation Plan, the final draft. And I just want to say thanks to all of you as well as the staff under Hasan’s leadership for putting in all the time and effort to develop this draft. I’m here because I want to acknowledge first that there’s a lot of hard work that’s gone into the Regional Transportation Plan, and I think it’s important to say thanks to all of you as well as the staff under Hasan’s leadership for putting in all the time and effort to develop this draft. I also want to state that it’s really important that as we go through this draft and go through this discussion and achieve the public policy discussion that Hasan talks about the region needing to have, we need to understand what goes into the plan. What are the assumptions that are built into the plan? What were the methods that were used to develop the plan, as well as what are the sensitivities in terms of the finance, when assumptions change or rates are different than for instance, what might be included in the plan? So, I just want to say that the San Diego Taxpayers Educational Foundation, the research arm of the Taxpayers Association, has a working group of folks here who’ve submitted a bunch of questions to staff. And it also has been submitted here for this meeting for the record, and I think that addressing those questions will help us understand and assure understanding around the Regional Transportation Plan, the final draft.</td>
<td>We have received the list of questions regarding revenue and cost estimates on the 2021 Regional Plan and are responding to each concern raised.</td>
</tr>
<tr>
<td>M22</td>
<td>Jim</td>
<td></td>
<td>I am from Encinitas. In the many years since World War II we have devoted a vast majority of our transportation dollars to cars, cars, and more cars. In the past, it made sense, but now we know about the many downsides of cars which are climate change and social inequity. While there are cars and more cars, let’s build a cleaner, healthier, more convenient, and more inclusive transportation system. We don’t have to start from scratch because there are many examples from around the world that we</td>
<td>The 2021 Regional Plan seeks to offer fast, safe and reliable transportation options for the San Diego region that make public transit a competitive alternative to personal vehicles. Please continue to follow along in this process by visiting SDForward.com.</td>

<td>Hammond Climate Solutions</td>
<td>I live in Chula Vista, and I am with Hammond Climate Solutions. I want to thank the board and staff for your leadership in drafting this plan. I’m encouraged by SANDAG’s bold, new direction, and I want to ensure that the 2021 Regional Plan is as strong as possible for climate, jobs, and justice. As you all know, the climate crisis is rapidly accelerating, and we need bold action from SANDAG in order to ensure that the region is doing everything possible to reach zero carbon. I encourage the board to exceed emission targets set forward by the state, prioritize multimodal infrastructure, funding for alternative-powered vehicles, and provide much needed funding to the regions communities of concern, who have historically experienced underinvestment when it comes to transportation improvements. I grew up driving my dad to and from public transit and have seen firsthand how our transit system is not working in communities of concern. We need to invest in these communities who are on the front lines of environmental injustice and who suffer from disconnected public transit. Finally, I encourage the board to fully fund youth opportunity passes, something that community-based organizations have been advocating for years because every San Diegan deserves access to high-quality transportation and economic mobility, especially our young people.</td>
<td>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. Reducing GHG emissions and achieving state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan. The 2021 Regional Plan has been developed with equity at the forefront. An equity specific project list has been included in the Draft 2021 Regional Plan Appendix A. As suggested, this list of projects with phasing will be added to Appendix A in the proposed final 2021 Regional Plan. Thank you for the suggestion and SANDAG agrees that this change will make it easier for the public to understand. One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by PY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.</td>
</tr>
<tr>
<td>M124</td>
<td>Katie Meyer</td>
<td>SanDiego350</td>
<td>I’m calling with San Diego 350. I’m calling because I both wanted to thank the staff at SANDAG for their progress around transportation in this Regional Transportation Plan. This is a huge step forward, and as a lifelong transit rider, I appreciate this progress. I also want to encourage you all to move further in this plan to meet our emissions targets and properly address our climate crisis. San Diego 350 wholeheartedly supports incorporating the 10 transit lifelines into the plan, and I especially want to encourage you to accelerate the timeline for all transit projects. So that includes trolley, buses, rail, and biking infrastructure. Environmental justice communities need transit solutions the most and need them right now, and they disproportionately suffer from the effects of climate change. We need to move these projects up as well as encourage you all to adopt 24-hour service and 10-minute frequency on popular bus routes right now. I personally have been trying to take the bus late at night many times, and I know from experience how frustrating it is, and that is not serving the needs of the community or the needs of environmental justice communities.</td>
<td>SANDAG agrees that action is needed now to provide fast, frequent, reliable, and accessible transit, especially on highly utilized routes. Staff are bringing forward an item to the SANDAG Transportation Committee and to the Board of Directors in advance of approval of the 2021 Regional Plan to amend the agency budget and act now to invest in transit that benefits environmental justice communities. This action seeks to increase services on transit lines that have infrequent service in the evenings and late nights, and/or provide fare subsidies for youth riders. Additionally, further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan. The proposed final 2021 Regional Plan includes increased service spans for the Trolley and bus service up to 20 hours per day. As SANDAG and the transit agencies move into more detailed planning efforts in the near future, some routes will be considered for 24-hour operation.</td>

<td></td>
<td>I want to start by thanking you for including the Black Contractors Association under project labor agreements. It is essential to address the long-term and ongoing lack of equity for black citizens here in San Diego. We see the racial and economic injustice in our region where we have 5 percent of our community is black, yet 20 percent of our unsheltered population are black. This shows why we need</td>
<td>SANDAG is currently developing a Regional Housing Incentive Program that will support the development and adoption of policies and processes improvements to accelerate housing production for very low-income-, low-income-, and moderate-income housing while taking several factors into consideration to ensure the program meets the goals of</td>
</tr>
</tbody>
</table>
to have the executive order signed this year by President Biden to make sure that public contracts addressed as ongoing racial inequity. Related to that, an increasing number of riders on transit are unsheltered. We need to consider adding them as a community of concern. They’re disadvantaged, their health is often challenged, yet many of them are employed they are workers. They need transit to get to and from their jobs. Related to that, I would encourage looking providing safe parking near MTS stations. So that people who are working and lack a permanent home have a place to park that doesn’t kick them out and put them at risk. Regarding convenience, please coordinate events that are ongoing regarding being more competitive in transit we have extended hours especially for areas that have nighttime events so people who are not comfortable driving at night and want to partake in community events later in the evening have a later transit ride. I know that this is a MTS issue, but please take this into account. Making the ride safe and comfortable again goes back to addressing the needs of very diverse people including our unsheltered population.

I just want to quote what’s in that platform. Support the design and implementation of a single, environmentally sound technology system that will collect and distribute fees for the use of roads, parking, and transit that is both economically fair and convenient and protects user privacy and the interest of low income users. And certainly youth would be free, and a lot of other individuals would also be free. That would be means-based, of course.

Now just broadly, in Chapter I, you’ve got that big triangle there with the three challenges: congestion, and the best way to do that is with congestion pricing, road use charge will provide a platform for that; social equity, and you need a good road use charge, you need a fair car parking system if you want sustainable, equitable, fair to all.

I support the 10 lifetime provisions as stated by the 350.org speaker, and I agree with the call for the youth opportunity passes, but I think we have to make this much bigger than that, part of an overall system as called for in the California Democratic party platform. I just want to quote what’s in that platform. Support the design and implementation of a single, environmentally sound technology system that will collect and distribute fees for the use of roads, parking, and transit that is both economically fair and convenient and protects user privacy and the interest of low income users. And certainly youth would be free, and a lot of other individuals would also be free. That would be means-based, of course.

Next year, SANDAG will study usage-based fees and the effect the fees will have on meeting established goals like greenhouse gas emissions reduction and improving equity for different income levels and different populations. The first phase of the study will calculate the true cost of driving a vehicle – the cost to own and operate a vehicle, the effect on road wear and tear, the cost of increasing capacity of the transportation system to meet demand, local and global pollution caused by both fuel powered and electric vehicles, traffic accidents, traffic congestion, and the cost of delays caused by congestion to the economy and to the quality of life of travelers. The study will determine how existing revenues currently funds different parts of the transportation system and how different populations are impacted. This foundational understanding will help SANDAG design a road usage charge program that encapsulates multiple factors to make it more fair across the community than the current transportation funding sources.

The study will assess the potential impacts of user fees on San Diego residents, visitors, and businesses, particularly those relying heavily on transportation. SANDAG staff will consult with its Board of Directors, stakeholders, and community members to develop implementation strategies for a road usage charge. This includes policies such as who will pay what and how much, the fee structure, and the distribution of revenues. SANDAG is committed to developing a carefully constructed program that will ensure that no group, such as those driving fuel-powered vehicles, low-income individuals, or those with long commutes, are paying more than their fair share. There are multiple mechanisms, such as caps and rebates, that will be explored to ensure a fair system.

The road usage charge, which is being studied by both the federal and state governments, is being considered to replace an old tax system that is no longer relevant. We know this is a challenge and we respect the concerns raised. We are committed to having authentic dialogues to work through the challenges and create a revenue system that is flexible, sustainable, equitable, fair to all.

I am with Climate Action Campaign and a member of the San Diego Green New Deal Alliance calling to comment on SANDAG’s Draft 2021 Regional Plan. We thank the staff and board for their work and our very encouraged by SANDAG’s bold new direction to start the process of transforming the San Diego region’s transportation system, so it is more sustainable, equitable, and climate safe. The most up-to-date climate science says that we must slash emissions towards zero carbon as soon as possible to stop the worst impacts of the climate crisis, which, as we’ve seen this summer, are worsening each year. Extreme heat, wildfires, drought, flooding, and more: these have and will disproportionately impact historically underinvested communities of concern.

As such, we urge you to first exceed state mandated emissions reduction targets by maximizing mode shift towards bike, walk, and transit. We must get people out of their fossil fuel cars and into more sustainable, equitable, fair to all.

The 2021 Regional Plan. Additionally, SANDAG will coordinate with the Social Equity Working Group and other interested stakeholders to ensure the housing program promotes equity and addresses issues like gentrification and displacement.

Most of California’s unhoused population resides in major metropolitan areas; however, homelessness impacts communities of all sizes. Efforts to address homelessness are led by local jurisdictions in the region and SANDAG supports their efforts to seek funding sources from the State Department of Housing and Community Development (HCD) to address homelessness, begin initiatives, or conduct pilot programs. For more information, please visit: https://hcd.ca.gov/policy-research/specific-policy-areas/homelessness.shtml.

SANDAG agrees that Safety in and around regional mobility hubs including transit stops situated throughout these communities is of utmost importance. Future improvements to create well-lit stations that also offer amenities like clean public restrooms or secure parking for personal bikes and other micromobility devices will contribute to comfort and convenience as well.
### Draft 2021 Regional Plan Responses to Comments – Public Meeting Sourced

<tr>
<td>M130</td>
<td>Noah Harris</td>
<td>Climate Action Campaign</td>
<td>Second, investments should be prioritized in the communities on the front lines of the climate crisis and environmental justice: the communities with disconnected transit trips, dangerously polluted air, and lack of access to job centers.</td>
<td>One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by PY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.</td>
</tr>
<tr>
<td>M131</td>
<td>Pamela Heatherington</td>
<td></td>
<td>I’ll start with thanking everyone for your leadership and getting us this draft regional plan. But I want to start with the premise that the environment is the foundation for all living things. We owe it to future generations to secure a regional funding source to protect and manage a comprehensive habitat system. Our substantial acreage has been permanently conserved, additional acres must be acquired, and the conserved lands must be maintained and monitored to ensure that sensitive local plants and wildlife do not become extinct. As a critical partner, we ask SANDAG to continue to foster the effort to secure a regional funding source. Without a sustainable environment, all else is lost.</td>
<td>As outlined in Appendix AA - Regional Habitat Conservation Vision of the 2021 Regional Plan, SANDAG identifies that a regional funding source is needed to implement regional habitat conservation plans to protect species and their habitats from extinction into the future. The Regional Habitat Conservation Vision identifies specific goals to Protect, Connect and Respect species and their habitats within our region.</td>
</tr>
<tr>
<td>M132</td>
<td>Rita Clement</td>
<td>SanDiego350</td>
<td>I’m with San Diego 350, which is a member of the San Diego Green New Deal Alliance. I’m speaking because I wanted to thank the staff at SANDAG for their progress around transportation and this Regional Transportation Plan.</td>
<td>While several barriers have been identified in implementing the vision for regional habitat conservation, the role of SANDAG as the regional planning agency and its commitment in its development of a Sustainable Communities Strategy will provide new opportunities to fulfill the promises made during the adoption of the region’s various regional habitat conservation plans.</td>

**San Diego Forward: The 2021 Regional Plan**

C7D-35
I’m a resident of North Park, San Diego. I wanted to thank you all for your effort drafting this plan and putting in the necessary steps to combat the climate crisis. I do want to ensure that the 2021 Regional Plan is as robust and comprehensive as possible for climate, jobs, and justice. As other folks have said today, the climate crisis is already here with what we are seeing with fires, flooding, storms, droughts, and record-breaking temperatures across the U.S., especially here in California. The worst impacts of the climate crisis already have and will continue to disproportionately impact low income communities and communities of color first and the longest. SANDAG must do its part to ensure that we reach zero-carbon as quickly as possible. And I recommend the following strategies, first exceed state-mandated emissions reductions; second, prioritize investments in bike, walk, and transit; and third, direct funding to historically underinvested communities of concern to bring about immediate transportation improvements in the neighborhoods on the front lines of environmental injustice. Please prioritize youth opportunity passes within the transit funding as an early action pilot program.

Many of the items in this list are included in the Regional Plan. SANDAG staff are also working with our Community Based Organizations to develop pilot projects that could lead to early implementation.

The 2021 Regional Plan has been developed with equity at the forefront. An equity-specific project list has been included in the Draft 2021 Regional Plan Appendix H. As suggested, this list of projects with phasing will be added to Appendix A in the proposed final 2021 Regional Plan. Thank you for the suggestion and SANDAG agrees that this change will make it easier for the public to understand.

SANDAG agrees that action is needed now to provide fast, frequent, reliable, and accessible transit, especially on highly utilized routes. Staff are bringing forward an item to the SANDAG Transportation Committee and to the Board of Directors in advance of approval of the 2021 Regional Plan to amend the agency budget and act now to invest in transit that benefits environmental justice communities. This action seeks to increase services on transit lines that have infrequent service in the evenings and late nights, and/or provide fare subsidies for youth riders. Additionally, further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.

<td>&quot;Lifeline 3. - 08.05.21 SE-WG Meeting - Blue Line Express (CHCDC, EHC): Fund the planning, environmental, engineering, and capital for the additional Blue Line track that allows express, 24-hour service, and additional frequency enhancements. Rail-grade separations should only move forward with the addition of a third track that eliminates conflict between the Blue Line and freight. The Blue Line is the backbone of our transit system. It has the highest ridership and is one of the best-performing transit lines in the San Diego region. However, it is overcrowded, has limited frequency, delayed connectivity, and no 24-hour service. Status: The information listed needs to be clarified. It is unclear if the double/third tracking included in Appendix A refers to an additional track that will provide express connectivity from the border to downtown San Diego.&quot;</td>
<td>The Blue Line Trolley is one of the most successful light rail lines in the nation. It recently had frequencies increased to 7.5 minutes from 5 a.m. to 7 p.m. Grade separations and track work will help to improve the reliability on the Blue Line. Appendix A includes specifics on these projects, but in the short term SANDAG will conduct a Blue Line Express Feasibility and Conceptual Engineering Study as a Near-Term Implementation Action (included in proposed final Appendix B: Implementation Actions). The study will focus the project specifications and clarify next steps for express connectivity along the Blue Line.</td>
</tr>

<td>SANDAG Social Equity Working Group</td>
<td>&quot;Lifeline 10 - 08.05.21 SE-WG Meeting - Emergency Ready Transit System (EHC, NLRC): Fund the planning and implementation of a transit emergency response strategy to provide safety particularly to EJ communities during community-wide emergencies. EJ residents are more likely to live in proximity to hazardous land uses that frequently result in fires and neighborhood emergencies. Simultaneously, frontline communities are also most vulnerable in the face of climate disasters. Status: Not included in the RTP.&quot;</td>
<td>MTS and NCTD will work closely with the County Office of Emergency Services to ensure that transit vehicles can be used in the case of any public emergency. Additionally, SANDAG’s specialized transportation grant program requires all grantees to work with the County to get their wheelchair accessible vehicles registered to assist in emergencies. Appendix Q also describes emergency evacuation strategies, including signaling, traffic control guides, roadblocks and barricades, electronic signage, land expansion, contra-flow lanes, traveler information services, use of mass transit, and airport uses.</td>
</tr>
</tbody>
</table>
| M144 | SANDAG Social Equity Working Group Members | SANDAG Social Equity Working Group | "Addendum 1 - 08.05.21 SE-WG Meeting (BCC, CF, CHCDC, ECC, OWG, SHC, UCP): SE WG request improvements to transit stop, which includes items such as benches, bus shelters, and bike racks. Shelters should also include lighting and protection from the elements such as sun and rain. As an early action of the Regional Plan, SANDAG will be developing a new Active Transportation Improvement Plan. The plan will be a living document that will grow and change over time to make it safe and comfortable to use active transportation. SANDAG prioritizes community engagement and will develop these connections in partnership with the community so that we can make sure the routes take people where they want to go."

As each of these transportation projects moves forward there will be a great deal of planning, engineering, and design work ahead of the project’s construction. In the future there are opportunities for bike, pedestrian, and neighborhood safety projects in conjunction with the RTP’s transportation projects. The Current Community Planning Projects are a good example and we strongly encourage you to be involved in the South Bay to Sorrento project. See more info here: https://www.sandag.org/index.asp?subclassid=83&fusenaction=home& subclasshome. | MTS and NCTD currently provide shelters wherever it is physically feasible. As part of larger infrastructure projects like Next Generation Rapid, Trolley and Commuter Rail, all stations will have shelters. |
<p>| M145 | SANDAG Social Equity Working Group Members | SANDAG Social Equity Working Group | Addendum 2 - 08.05.21 SE-WG Meeting (ARS, ECC, NLRC, OWG): The SE-WG requests a prioritization of flexible fleets. Communities outside of the urban center such as North County, South Bay, and East County, especially need access to flexible fleets. In less urbanized regions, and regions with higher vulnerable populations, flexible fleets can connect populations into the transit system. SANDAG will also be conducting pilot programs for the implementation of Flexible Fleets and other micro-mobility options to help connect people in less dense regions into the greater transit network. Information regarding Flexible Fleets can be found in Appendix A and N. Addition materials can be found at: <a href="https://sdforward.com/docs/default-source/2021-regional-plan/5039-sdplicationfivebigmovesonesheets-flexible-fleets-june2019_final.pdf?sfvrsn=79d3f665_2">https://sdforward.com/docs/default-source/2021-regional-plan/5039-sdplicationfivebigmovesonesheets-flexible-fleets-june2019_final.pdf?sfvrsn=79d3f665_2</a>. | As early an action of the Regional Plan, SANDAG will be developing a new Active Transportation Improvement Plan. The plan will be a living document that will grow and change over time to make it safe and comfortable to use active transportation. <td>&quot;Addendum 9 - 08.05.21 SE-WG Meeting (BCC, CHCDC): SE-WG requests that access to the beach be implemented into the 2021 Regional Plan. Many community members from disenfranchised backgrounds lack access to the beach. Transit riders have prohibitively long rides to access the beach and other San Diego waterfronts.&quot;</td>
<td>The transit network that has been developed for the Regional Plan includes faster access to the beach. There are Rapid and Commuter Rail routes that will operate between Mid-City and the proposed Central Mobility Hub. From that location you can seamlessly transfer to routes that will take you to Ocean Beach, Pacific Beach and La Jolla.</td>
</tr>
<tr>
<td>M53</td>
<td>SANDAG Social Equity Working Group Members</td>
<td>SANDAG Social Equity Working Group</td>
<td>Addendum 10 - 08.05.21 SE-WG Meeting (ECC, NSDI, OWG): SE-WG Requests that multilingual language materials and signage be implemented into the 2021 Regional Plan. The San Diego region currently has large Spanish-only and Arabic-only speaking residents. The language barriers these residents experience on a daily basis, is only further exacerbated by a lack of multilingual signage and informational materials. Furthermore, a lack of adequate language materials only further alienates these populations, excludes them from job markets, and excludes them from utilizing our transit systems.</td>
<td>SANDAG will be applying a social equity planning framework throughout the implementation of the Regional Plan. Through this framework, one of the Regional Plan’s near-term actions includes developing a Digital Equity Strategy and Action Plan that will address regional accessibility gaps in communications infrastructure, technology, and digital literacy. Within digital equity, we have been working with our Community-Based Organization partners (or CBOs) to ensure that language translations and educational resources on transit are available to all San Diegans as we advance with our next OS system. Additionally, one of the points our CBO Partners have emphasized in our outreach is addressing the accessibility of existing infrastructures like multilingual language materials and signage for our current transportation system, which will be a essential to our early-action plans. For more information, I would like to refer you to Appendix B on the Digital Equity Strategy and Action Plan. For more information on our community-based outreach please see Appendix H: Social Equity: Engagement and Analysis.</td>
</tr>
<tr>
<td>M54</td>
<td>SANDAG Social Equity Working Group Members</td>
<td>SANDAG Social Equity Working Group</td>
<td>Addendum 11 - 08.05.21 SE-WG Meeting (OWG, VCC): The transit fare of the San Diego regional are still prohibitively expensive for our low income riders. The SE-WG implors SANDAG to explore avenues to make transit more affordable and even free for certain areas or segments of the population. The SE-WG requests that these considerations be included in the 2021 Regional Plan. Examples to consider include LA Metro with single fares of $1.75, LA Go (County Bus) with $14/30 day senior passes.</td>
<td>One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth 18 and under.</td>

<td>SANDAG Social Equity Working Group Members</td>
<td>SANDAG Social Equity Working Group</td>
<td>Addendum 12 - 08.05.21 SE-WG Meeting (UCP, CF, EHC, ECC): For decades, San Diego has implemented housing without consideration of the transportation needs of the residents that will inhabit those housing units, and without consideration of the greater impact to the transportation network as a whole. The SE-WG requests that SANDAG consider the implementation of housing near transit stations, especially in National City and El Cajon, and the implementation of Mobility Hubs in City Heights, Euclid Amp; Market, and San Ysidro.</td>
<td>SANDAG is developing a Regional Housing Incentive Program and it will meet the goals of the proposed final 2021 Regional Plan. SANDAG’s housing incentive program will include development of a regional anti-displacement strategy; consider climate change and resilience, consistency with the transportation improvements included in the Regional Plan, and alignment with other SANDAG grant programs. Additionally, SANDAG will coordinate with its Social Equity Working Group, tribal nations, and other interested stakeholders to ensure the housing incentive program promotes equity and addresses gentrification, displacement, and other issues. The transportation system envisioned in the 2021 Regional Plan relies on a vast network of digital infrastructure to connect and manage the transportation system. For Complete Corridors, NextOS, Flexible Fleets, Transit Leap, and Mobility Hubs to succeed, a robust</td>

August 5, 2021, Meeting Minutes

Chair Vivian Moreno (SANDAG Board Alternate) called the meeting of the 2021 Regional Plan Social Equity Working Group to order at 10:01 a.m.

1. Welcome and Introductions

Chair Moreno welcomed the Working Group members.

2. Public Comments/Communications/Member Comments

Randy Torres-Van Vleck, City Heights Community Development Corporation, spoke about the Metropolitan Transit System (MTS) Trolley 40th Anniversary celebration held on Saturday, July 31, 2021, and acknowledged that it was a great event. Randy Torres-Van Vleck announced that MTS is changing their fare system from MTS Compass to PRONTO.

Brian “Barry” Pollard, Urban Collaborative Project, spoke about the success of the MTS Trolley 40th Anniversary celebration. Brian Pollard acknowledged MTS for the outreach efforts with members of the public living in the San Diego region, free Trolley and bus ridership during the month of August, and to contact him or Randy Torres-Van Vleck for additional information on PRONTO cards.

Robin Joy Maxson, Ramona Community Planning Group and member of the public, spoke about the Latino population of Ramona, a geographical area currently not being represented, and expressed wanting to join the Working Group.

3. Approval of Meeting Minutes (Approve)

Action: Upon a motion by Brian “Barry” Pollard and a second by Carol Lewis (El Cajon Collaborative), the Working Group approved the minutes with corrections made from its July 22, 2021, meeting.

The motion passed.

Yes: Craig Jones (Alliance for Regional Solutions), Rose Ceballos (Bayside Community Clinic), Lisa Cuestas (Casa Familiar), Randy Torres-Van Vleck (City Heights Community Development Corporation), Brendaly Rodriguez (Chula Vista Community Collaborative), Carol Lewis, Konane Martinez (National Latino Research Center), Breanne Lash (Nile Sisters Development Initiative), Claire Groebner (Olivewood Gardens), Fe Seligman (Samahan Health Centers), Brian “Barry” Pollard, and Erica Leary (Vista Community Clinic).

No: None.

Abstain: None.

Absent: None.
Mohammed Tuama, Nile Sisters Development Initiative, spoke about language barriers and inaccurate translation on public transit flyers and videos. And suggested SANDAG provide outreach efforts on how to ride public transit to the community in various languages.

Rocina Lizarraga, Olivewood Gardens, spoke about the concerns affecting residents in community like limited transportation for senior citizens, unfinished bike lane connectivity, safety for bike riders and pedestrians, and the development of a bus system that is affordable, frequent, and reliable. Ms. Lizarraga also spoke in support of addressing the homelessness issue in National residents do not feel safe walking in their community.

Fe Seligman, Samahan Health Centers, spoke about having a micro-level analysis on social benefits for low-income community from proper infrastructure of purple line serving Central City Heights and South Bay to Sorrento Valley, fund the planning, environmental, engineering and improvements for proper bus stops.

Brian “Barry” Pollard, Urban Collaborative Project, spoke in support of a transit hub at Euclid Avenue and Market Street, having a tremendous amount of need of a transportation center located in the area. The Orange Line Trolley needs numerous calming crossing improvements, installing electric buses to help eliminate pollution in community, emphasized how education is vital among all transportation groups and how community-driven process for all under-served communities is important. Increasing the marketing budget analysis was discussed.

Erica Leary, Vista Community Clinic, spoke in support of developing a safe bus system that is sheltered for users - students and additional frequency enhancements, the 10 Transit Lifelines, provide YOP and savings in general, completing the managed lane on 78, and fund anti-displacement efforts to protect North County residents.

Craig Lewis, spoke in support of comments made by Konane Martinez and Erica Leary on observations made relative to North County on an alternative travel time on the Sprinter, and fund the implementation of next generation rapid going east and west between Oceanside and Escondido (see reduction of travel to ½ hr.).

Carmela Munoz, Vista Community Clinic, spoke in support of improving frequency of the Sprinter and accomplishing the rapid bus route expansions project before 2023, by providing an accelerated implementation to the North County Mall in Escondido.

Randy Torres-Van Vleck, Community Development Corporation, spoke in support of all the regional priorities shared by the CBO communities and summarized a brief description of implementing an equitable, efficient, and affordable transit system, having equitable access to the beach, fund an anti-displacement strategy to protect vulnerable communities in the San Diego region.

Carolina Martinez, Environment Health Coalition, San Diego Transportation Equity Working Group, provided a summary of the collective and collaboration on the 10 Transit Lifelines and spoke in support of Item 5. Congratulated the CBOs for participating in the San Diego Transportation Equity Working Group they represent.

Ghina M. Yamout, Marrs Services Inc., member of the public, expressed interest in being an advocate on areas of green infrastructure, areas of low-income residents, improving water quality and asked SANDAG to incorporate green infrastructure for best transit in the Equity Plan.

Maritza Garcia, member of the public, spoke in support of incorporating an electric bus fleet system to help reduce pollution that affects residents and incorporate transit lifelines.

Jose Franco Garcia, Environmental Health Coalition, spoke in support of the 10 Transit Lifelines and provided a brief testimony of the community feedback in developing a bus system that is safe, reliable, and holistic to make a great transit plan for the San Diego region. SANDAG needs to develop an anti-displacement plan.
Allie Fen, Community Organizer, Environmental Health Coalition, spoke in support of funding for restroom access in public transit stations, and the 10 Transit Lifelines.

Sally Smull, member of the public, spoke in support of the 10 Transit Lifelines, Trolley crossing issues, the desperate need for YOP, seven-day a week bus service, trees and benches needed in all public bus stops in the area. And thanked everyone for their time and energy in working on this important process.

Nancy Cruz, member of the public, spoke in support of the 10 Transit Lifelines, transit initiatives that allow for investing in public transportation, improve commute times and environment in her community.

Laura Benavidez, City Heights Community Organizer, Environmental Health Coalition, spoke in support of the 10 Transit Lifelines and her experience as a community organizer, and the community-driven process with the SDTEWG.

Esperanza Gonzalez, Community Organizer, Environmental Health Coalition, spoke in support of the 10 Transit Lifelines and to prioritize funding to provide 24-hour bus service to working residents in the City Heights community. Mrs. Gonzalez depends on public transportation to move around the region.

Jack Shu, Councilmember City of San Diego, thanked everyone for their comments, participation in advocating for equity, environmental justice, and to think big and encouraged to move forward with this plan.

Maria Magdalena Cerda Baez, Border Environmental Justice Policy Advocate, Environmental Health Coalition, spoke in support of increasing transportation services in Imperial Beach for youth attending college and universities in the region. Maria Baez shared personal experiences her children endured while attending college from Imperial Beach.

Nicole Burgess, Board Member of Walk San Diego, commended everyone in this group and spoke in support of equity and environmental justice, the YOP, providing 24-hour bus service, transit to integrate mini mobility hubs – bike shares for all San Diegans and add to the RTP.

Karla Montevisa, member of the public, spoke in support of developing a bus system that is frequent and reliable for her community.

Roddy Jerome, Community Member, Environmental Health Coalition, spoke in support of the 10 Transit Lifelines.

Konane Martinez, National Latino Research Center, spoke about an official key aspect provided by the community making the County of San Diego and SANDAG accountable to the feedback received by the working groups and community by providing them with an update on changes.

**Action:** Upon a motion by Lisa Cuestas and a second by Craig Jones, the Working Group recommended that the Board of Directors approve support of the 10 Transit Lifelines and all of the other recommendations from the Working Group to be integrated into in the 2021 Regional Plan.

The motion passed.

Yes: Craig Jones, Rose Ceballos, Lisa Cuestas, Randy Torres-Van Vleck, Brendaly Rodriguez, Carol Lewis, Konane Martinez, Breanne Lash, Claire Groebner, Fe Seligman, Brian “Barry” Pollard, and Erica Leary.

No: None.

Abstain: None.

Absent: None.
6. Transit Equity Early Action Budget Amendment Update (Discussion)
This item was postponed to a future meeting.

7. Possible Topics for Next Meeting (Discussion/Possible Action)
Chair Moreno asked the Working Group to discuss possible topics for the next meeting.
Action: Discussion

8. Upcoming Meetings (Information)
The next Working Group meeting is scheduled for Thursday, September 23, 2021, at 10 a.m.

9. Adjournment
Chair Moreno adjourned the meeting at 11:54 a.m.
Confirmed Attendance at SANDAG 2021 Regional Plan Social Equity Working Group Meeting

August 5, 2021

<td>L1</td>
<td>We are excited for the future of transportation in our region. The 2021 Regional Plan includes visionary elements to building an efficient, accessible, and sustainable transportation system. Thank you for everyone’s effort on it. However, we bring to your attention that a key program is missing. We request that you amend the draft 2021 Regional Plan to include Youth Opportunity Passes (YOP), no-cost transit passes for youth ages 24 and under.</td>
<td></td>
</tr>
</tbody>
</table>

For 10 years, the Improving Transportation in City Heights Team (ITCH) has advocated to have no-cost transit passes for youth in San Diego. Mid-City CAN, the ITCH team, and the undersigned supporters request that you include YOP (ages 24 & under) in the 2021 Regional Plan. YOP requires a spot among to priorities in our 30-year vision for transportation in the region.

We ask the Board of Directors to take the following actions:

1. Amend the 2021 Regional Plan to state that Youth Opportunity Passes, no-cost-transit passes for youth ages 24 and under, will be funded when transit subsidies are allocated.

2. Amend the 2021 Regional Plan to state that transit subsidies will be allocated at the earliest implementation possible.

3. Fund Youth Opportunity Passes (24 & under) as an early-action Transit Pilot Program this year. YOP (24 & under) is a necessary program, as illustrated by the following facts:

   1. Transit-dependent youth have been disproportionately impacted by the COVID-19 pandemic. In San Diego County, there are approximately 86,000 young workers (ages 16-24) who work in the industries that were hard hit by the COVID-19 epidemic. The industries include hospitality, food services, retail, oil and gas mining, transportation, employment services, travel, and leisure.

   2. YOP (24 & under) is a way to increase ridership and develop a transit-culture. Only 10,463 youth (ages 16-24) use public transit in San Diego, but these young commuters use public transit at a rate double that of their older counterparts (adults ages 26-59). YOP will further promote transit use among young San Diegans.

   3. YOP (24 & under) helps divert youth away from the school to prison pipeline. MTS officers decide who to check for fare evasion, YOP prevents the criminalization of youth of color due to their inability to afford a pass. Literature suggests that Black youth are arrested for fare evasion at a rate 5 times higher than their white peers and Latino/a/x youth are arrested at a rate 4 times higher than their white peers.

   4. YOP (24 & under) promotes the reductions of GHGs. A person who switches from a 20-mile round-trip commute by car to using existing public transit, can reduce his or her annual CO2 emissions by 4,800 pounds per year. Decreasing greenhouse gas emissions is a matter of equity. Residents in low-income, BIPOC communities are exposed to more pollution than their more affluent counterparts. For example, City Heights residents are exposed to twice the amount of diesel particulate matter from trucks & cars than La Jolla residents.

   One of the Implementation Actions listed in Appendix B is a Regional Transit Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.

SANDAG looks forward to partnering with the “Improving Transportation in City Heights” team in implementing the 2021 Regional Plan, including Youth Opportunity Passes.
5. YOP (24 & under) addresses climate justice. Mid-City CAN has conducted 250+ conversations with residents in Communities of Concern (CoC). Over 86% of residents noted that climate change directly impacted them. Extreme weather has become a barrier to work and school for CoC residents who already face significant barriers to education and employment. Residents who normally walk or bike to work must increasingly rely on cars or public transportation that is inaccessible due to cost or distance. YOP eliminates the cost barrier to transportation for youth ages 24 and under.

6. YOP (24 & under) is a proven program. Similar programs exist in Alameda County, Los Angeles, Sacramento, San Francisco, and Santa Ana. Youth Opportunity Passes helps ensure youth from all backgrounds are connected to their schools, internships, medical care, and early-career opportunities.

Andrew Puls
L2

My wife and I have been Logan Heights residents for approximately five years. I am writing to express my support for the incorporation of a project which goal is to address social and economic inequity, rising levels of health concerns aggravated by greenhouse gas emissions, and transportation injustices in San Diego’s Barrio Logan and Logan Heights communities. Specifically, we request the addition of a Freeway Lid as a priority project as identified in SANDAG’s 2021 Draft Regional Plan (Draft Plan).

Our once united community was devastated by Interstate 5 which forcibly displaced hundreds in the 1950’s and has burdened those who remained. Pursuant to Chapter 1: Equity Focus (p. 11) of Draft Plan, we know ReConnect Logan Freeway Lid will transform and reconnect our community. A freeway lid can help our community by dismantling the barriers that the I-5 created by bringing the community together, addressing health concerns by capturing GHG emissions, creating non-existing green spaces, and allowing for development of affordable housing. All goals in line with the Draft Plan of creating efficient movement of people and goods, providing affordable, reliable, and safety mobility options, and allowing for healthier air.

As mentioned, the construction of the I-5 forced many families to be displaced, and while the construction allowed for transportation advancements, since the 1950’s our community has been subject to inequality, misrepresentation, and systemic injustices in transportation and racism, to mention a few. We continue to be a working-class neighborhood composed of nearly 90% Mexican Americans, and while our we are proud of our heritage and activism deeply rooted in our National Landmark of Chicano Park, the reality is that I-5 has created much insecurity by facilitating gang turfs, separating families from places of worship, and limiting children’s access to neighborhood schools. It is time for our community to heal – a freeway lid is the answer.

Given the significant investment and planning of projects in the Barrio Logan/Logan Heights communities in the Draft Plan as identified in Appendix A: Transportation Projects, Programs, and Phasing, it is appropriate to identify and call out ReConnect Logan Freeway Lid as a project on this list. A few of the multiple projects that will impact Barrio Logan/Logan Heights are:

- The creation of Managed Lanes on Interstate 5, Project ID CC002 Complete Corridor: ML/Goods Movement (p. A-8)
- Additional cargo due to the Harbor Drive 2.0 proposal that will facilitate cargo in the community of Barrio Logan, Project ID GM06 Goods Movement: Roadways (p. A-11)
- Harbor Drive Corridor, project ID GM05 2050 Goods Movement: Roadways Harbor Drive Multimodal Corridor Improvements that will facilitate Trucks for the Port of San Diego (p. A-12)
- Besides being in line with the 2021 Draft Regional Plan, ReConnect Logan Freeway Lid is also pursuant to Appendix H in relation to California Assembly Bill 805 which requires the reduction of pollution exposure in disadvantaged communities. Furthermore, our project is also pursuant to the Sustainable Communities Strategy per California SB 375 since it would help reach the overall goal of reducing GHG emissions of 15% (p. 18 of Draft Plan), as well as allowing for accommodation to the Regional Housing Needs Assessment Determination. For all these reasons, our community is looking forward to the addition of a Freeway Lid as a priority project as identified in SANDAG’s 2021 Draft Regional Plan.

Caltrans District 11 has also expressed interest in exploring opportunities for freeway caps. In alignment with the 2021 Regional Plan, SANDAG and Caltrans District 11 are currently developing Comprehensive Multimodal Corridor Plans in coordination with agency partners and local city governments. Comprehensive Multimodal Corridor Plans (CMCPs) are data-driven plans to reduce congestion and generate transportation choices while preserving community character and creating opportunities for enhancement projects. Opportunities for freeway caps will be considered in the CMCPs.

<td>AVAD Investments Inc.</td>
<td>1. Extension of the Home Avenue Route to Market Street for Pedestrians, Bicycles, and Vehicles. The Home/Market connection would provide significant economic development stimulus to the Mt. Hope and City Heights areas. It would assist in congestion relief by providing an alternate to freeway traffic on the SR 94 - Martin Luther King Freeway.</td>
<td>1. While Home Avenue is not on the Adopted Regional Bike Network, the 2021 Regional Plan includes the nearby and parallel Chollas Creek Bikeways: North Fork - Bayshore Bikeway to University Bikeway and South Fork - Petway Park to Market Creek Plaza which will improve the connections described in this comment. The project alignment and details can specifically be found in the updated data viewer and Appendix A. Your comment was forwarded to the City of San Diego.</td>
</tr>
<tr>
<td>L4</td>
<td>2. Completion of the Transportation markings along Home Avenue. Curb are not marked for safety, to promote proper parking, traffic movement, and access for Buses and the Disabled. The Bicycle route is not fully painted and warning ramps for the visually impaired are not in place. Building out at key intersections should be funded to increase pedestrian crossing safety.</td>
<td>2. Home Avenue is not in the Adopted Regional Bike Network. The City of San Diego and Metropolitan Transit System are the implementing agencies for these improvements. The South Bay to Sorrento Comprehensive Multimodal Corridor Plan is in development and provides another opportunity to provide input on transportation solutions for this area.</td>

--- | --- | ---
L11 | Overall, the policies of the California Coastal Act that guide our work at the Coastal Commission significantly overlap with the goals of SANDAG’s Regional Plan, including policies to protect marine and coastal land habitats, concentrate urban development, maximize public access and expand multi-modal transportation, reduce VMT, and improve coastal resiliency to sea level rise and other climate-change hazards. For example, Appendix B: Implementation Actions identifies eight 2035 goals drawn from the Regional Climate Action Planning Framework which generally align with the referenced Coastal Act policies:

- "High density, transit-oriented housing" aligns with the Coastal Act policy of focusing development in or near existing developed areas (Coastal Act Section 30250).
- "Conserve open space and agricultural lands" aligns with Coastal Act policies related to conservation of sensitive habitat, open space, and coastal agricultural lands (Coastal Act Sections 30230, 30231, 30233, 30241).
- "100% of new buses are zero-emission," "400,000+ electric cars on the road," "Sustainable freight (transitioning to zero emissions where feasible)," and "Up to 100% renewable electricity," aligns with the Coastal Act requirement that new development minimize energy consumption and VMT and be consistent with requirements imposed by an air pollution control district or the State Air Resources Board on each particular development (Coastal Act Section 30253).
- "Walkable and bikeable communities" aligns with Coastal Act policies promoting the protection, addition, and enhancement of public access (Coastal Act Sections 30210, 30212.5, 30252).

Appendix B additionally identifies strategies for the implementation of affordable housing, such as minimum zoning near transit, fee-waiver programs, and accessory dwelling units, which align with Coastal Act Sections 30213 (Lower Cost Overnight Accommodations) and 30013 (Environmental Justice). However, there are aspects of the Regional Plan that could be strengthened to be more consistent with the Coastal Act as described below.

L12 | Consistent with Senate Bill (SB) 375, the California Air Resources Board (ARB) sets targets for reduction of GHG emissions from passenger vehicles for the target years 2020 and 2035, which Chapter 2, “Sustainable Communities Strategy,” notes the Regional Plan will accomplish. However, as noted in the Regional Plan, Executive Order B-30-15, and California Senate Bill 32 (Pavley, 2018), set a further statewide goal of reducing California’s GHG emissions to 40 percent below 1990 levels by 2030 and the Executive Order B-55-18 set a statewide goal of carbon neutrality by 2045.

Recognizing the needs of all residents and visitors to the San Diego region, the Regional Plan rightfully includes improvements to all transportation modes, including roads and parking, but in order to meet or exceed the referenced GHG and climate goals, projects that improve public transit and active transportation to minimize VMT should be completed as quickly as possible, consistent with the Coastal Act (Section 30253). Additionally, active transportation projects that provide emission free transportation options and can be implemented relatively quickly should be prioritized, including completing segments of the California Coastal Trail and Coastal Rail Trail in the near-term (2025) rather than in future phases (2035 or 2050). Specifically, trail segments providing access to major employment centers that would relieve strain on coastal access corridors and that would help relieve congestion on Interstate 5, such as the segments connecting Carmel Valley to Roselle Canyon; Del Mar to Sorrento; and Roselle Canyon/UTC to Rose Canyon, should be prioritized for near-term construction. In general, Coastal Commission staff support greater proportions of investment in transit, active transportation, and environmental enhancement projects as compared to roadway improvements targeting single-occupant vehicles.

L13 | Finally, the Coastal Act (Section 30250) encourages new residential, commercial, or industrial development, to be located within, contiguous with, or in close proximity to, existing developed areas. Accordingly, the Regional Plan must prioritize transportation investments which encourage jobs and housing to be concentrated in developed areas and avoid further encroachment into habitat, farmland, and open space recreational areas by moving them forward to earlier construction phases.

L14 | Given that beaches and coastal resources are major destinations in the San Diego region, the Regional Plan should maximize access to the coast, including expanded investments in bicycle and pedestrian routes. The proposal to dedicate 55% of the anticipated $163 billion in funding over the next 30 years to capital improvements to the transit system will improve public access to and along the coast, and is supported by Commission staff, but projects that recognize the needs of all residents and visitors to the San Diego region, the Regional Plan rightfully includes improvements to all transportation modes, including roads and parking, but in order to meet or exceed the referenced GHG and climate goals, projects that improve public transit and active transportation to minimize VMT should be completed as quickly as possible, consistent with the Coastal Act (Section 30253). Additionally, active transportation projects that provide emission free transportation options and can be implemented relatively quickly should be prioritized, including completing segments of the California Coastal Trail and Coastal Rail Trail in the near-term (2025) rather than in future phases (2035 or 2050). Specifically, trail segments providing access to major employment centers that would relieve strain on coastal access corridors and that would help relieve congestion on Interstate 5, such as the segments connecting Carmel Valley to Roselle Canyon; Del Mar to Sorrento; and Roselle Canyon/UTC to Rose Canyon, should be prioritized for near-term construction. In general, Coastal Commission staff support greater proportions of investment in transit, active transportation, and environmental enhancement projects as compared to roadway improvements targeting single-occupant vehicles.

Consistent with this comment, the 2021 Regional Plan proposes a land use pattern that complements the transportation investments of the plan and concentrates future growth and development in Mobility Hub areas.

As SANDAG developed the proposed network for the 2021 Regional Plan, data on trip-making was used to understand the critical connections of the region. Connections to coastal areas are represented in these critical connections. Implementation of the regional bike network as well as complete streets in Mobility Hubs will support enhancements for active transportation in coastal communities.
specifically facilitate access to beaches and coastal areas from the inland portions of the region should be expedited, as well as options for enhancing connections to public transit, the California Coastal Trail (CCT), the Coastal Rail Trail, and other visitor-serving recreational opportunities. Implementation of the Regional Plan would make significant improvements to the regional bike network, most notably in terms of Class I corridors and in coastal communities that will enjoy enhanced coastal access as a result of these improvements. Coastal Commission staff support these improvements as well as further network and infrastructure enhancements for active transportation, such as widened sidewalks in areas without designated bike lanes, increased funding for bicycle parking and locker facilities, and bicycle-specific signalings integration on local arterials and feeder streets.

L15 Coastal Commission staff acknowledge and appreciate the inclusion of updated information regarding the completeness and deficiencies in the San Diego region's portion of the California Coastal Trail in the 2021 Technical Addendum to Appendix W: California Coastal Trail. The addendum should also reference the recent work of the California Coastal Commission, California Department of Transportation, and Coastal Conservancy in developing an ArcGIS-based mapping tool that identifies all complete and incomplete segments of the Coastal Trail and classifies them according to trail type, identifies land ownership, and identifies features, such as individual stairways and pathways. The most recent update to the CCT mapping effort is outlined in the California Coastal Commission Memorandum Re: California Coastal Trail Mapping Project, April 2021. In light of these improvements to the available data and SANDAG's identification of large portions of the CCT that are still in need of completion, a stronger emphasis on pedestrian and bicycle improvements necessary to complete the trail should be provided in Chapter 3 and a stronger and more specific funding commitment for the CCT should be provided in Appendix A: "Transportation Projects, Programs, and Phasing." Specifically, a portion of the funding identified for "Local Streets and Roads" (9% of the Regional Plan expenditures) should be allocated to funding the completion of the CCT.

L16 Further, Commission staff encourage the integration of data related to weekend peak traffic in the planning phase of projects with potential impacts to congestion on major coastal access corridors used to access weekend recreation, such as Interstate 8, Interstate 5, and Pacific Coast Highway. Commission staff encourage SANDAG to implement enhanced transit alternatives where weekend coastal access will be significantly affected.

L17 Coastal Commission staff suggest that the Regional Plan include specific reference to Coastal Act Chapter 3 policies requiring the preservation of coastal resources, as well as specific language concerning the importance of protecting and restoring the region’s urban canyons, coastlines, beaches, and other coastal corridors within the San Diego region bisect or are located directly adjacent to sensitive marine resources including coastal bluffs, streams, lagoons, and the Pacific Ocean. Many of these coastal systems have already been impacted by historical transportation infrastructure development and additional impacts to these resources are restricted by Coastal Act policies. Except for certain specific instances, fill of a wetland or other coastal waters is prohibited (Section 30233), and the marine resources (Section 30230), water quality (Section 30231), and environmentally sensitive habitat areas (Section 30240) are often associated with the coastal environment and are also protected.

L18 The Regional Plan should include increased funding to adapt and/or relocate existing transportation infrastructure known to be vulnerable to climate change and sea level rise (e.g., Pacific Coast Highway and the rail corridor along Del Mar bluffs). New infrastructure proposed to be funded should be analyzed not only for vulnerability to H+H+ projections of SLR over the expected life of the proposed project, but also tidal and fluvial hydraulics as applied to the local area and in the context of storm surge, wave run-up, erosion, and other variables. Projects which reduce vulnerability to climate change and sea level rise (e.g., active transportation projects and relocation of the rail corridor from coastal bluffs) should be prioritized and expedited.

L19 The Coastal Act was also recently amended to add Environmental Justice as a policy to be analyzed in our regulatory work, and to add a designated Environmental Justice commissioner on the Coastal Commission. Accordingly, although we applauded the Regional Plan's focus on equity and recognize the need to generate revenue for implementation, Commission staff urge SANDAG to carefully analyze the equity implications of the Regional Pricing Strategy, including ensuring that dynamic tolling on managed lanes, parking and curb pricing, and road user charges do not regressively impact low-income community members who may not be able to afford to live in transit-oriented neighborhoods.

L20 Further, the Regional Plan should utilize access to coastal recreation as a metric with which to measure the efficacy of its Environmental Justice Programs. This should be accomplished by comparing travel times to coastal resources (e.g., the nearest usable beach) in communities of concern to travel times in other nearby communities. Transit programs specifically facilitate access to beaches and coastal areas from the inland portions of the region should be expedited, as well as options for enhancing connections to public transit, the California Coastal Trail (CCT), the Coastal Rail Trail, and other visitor-serving recreational opportunities. Implementation of the Regional Plan would make significant improvements to the regional bike network, most notably in terms of Class I corridors and in coastal communities that will enjoy enhanced coastal access as a result of these improvements. Coastal Commission staff support these improvements as well as further network and infrastructure enhancements for active transportation, such as widened sidewalks in areas without designated bike lanes, increased funding for bicycle parking and locker facilities, and bicycle-specific signalings integration on local arterials and feeder streets.

In response to this comment, a reference to the California Coastal Trail mapping effort was added to the 2021 Technical Addendum in Appendix W. SANDAG efforts in bike and pedestrian infrastructure implementation have most recently and intensely been focused on utility transportation for all-weather travel by bicycles, pedestrians, or other ped-assisted devices with strict adherence to local codes and ADA standards. Regarding the recommendation to allocate a percentage of the Local Streets and Roads funding for completion of the trail, this would require a Board action and approval for application to just a subset of jurisdictions with intersecting segments of the trail, while not applying to others.

SANDAG designs, funds and builds All Ages and Abilities bikeway utility routes (like the New Segments identified in Appendix W) to develop a comprehensive regional bike network as approved by the SANDAG Board of Directors in 2010's Riding to 2050: The San Diego Regional Bike Plan, and prioritized with funding in 2013 by the Board of Directors via the SANDAG Bicycles Early Action Program (EAP). More information can be found at the following links:

SANDAG provides an analysis of projects’ impacts to coastal resources identified under the California Coastal Action in the Draft EIR analysis (Section 4.4 Biological Resources). SANDAG encourages the Coastal Commission to comment on that report.

Resilience of transportation infrastructure to climate impacts is a priority of the 2021 Regional Plan. As such, the relocation of the rails off of the Del Mar bluffs is a priority project with planning already underway. Appendix R includes additional information on current climate adaptation and resilience efforts underway and new programs that will reduce vulnerability to climate change and sea level rise. In response to this comment, language has been added related to increasing funding, prioritizing, and expediting projects to adapt and/or relocate existing climate vulnerable transportation infrastructure.

SANDAG will launch a study in the next year to further study the potential of usage-based fees and their capabilities in addressing various goals, including equity and greenhouse gas emissions reduction. The initial phase of this study will focus on calculating the true cost of driving, and better understanding what sources of existing revenue are funding different parts of the system and how different populations are impacted by existing revenue mechanisms. This foundational understanding will help SANDAG to design a road usage charge program that is more fair than current transportation funding sources. SANDAG also will collaborate with state and federal agencies that are partnering to evaluate road charge programs in California.

Further, the Regional Plan should utilize access to coastal recreation as a metric with which to measure the efficacy of its Environmental Justice Programs. This should be accomplished by comparing travel times to coastal resources (e.g., the nearest usable beach) in communities of concern to travel times in other nearby communities. Transit programs...

<td>L21</td>
<td>Previous Regional Transportation Plans and the North Coast Corridor Public Works Plan / Transportation and Resource Enhancement Program (NCC PWP/TREP) have referenced the need for relocation of the rail corridor that passes along the Del Mar Bluffs to an inland alignment. Erosion due to wave action currently threatens the toe of the Del Mar bluffs and the stability of the railroad tracks at the top of the bluffs. Coastal Commission staff support relocation of the rail corridor and completion of double tracking as quickly as possible. The Coastal Commission has authorized a series of improvements to existing shoreline protection devices in Del Mar to maintain continued rail operations, including the most recent Consistency Certification No. CC-0004-18 in February 2019 and CC-0001-20 in August 2020; however, these projects are intended to serve as interim measures only. Although these types of repair and maintenance projects may be necessary in the short-term, they should not delay the planning efforts associated with a long-term solution, including identifying a preferred tunnel alignment and allocating funding to initiate environmental review of the rail corridor relocation project. If we continue to rely on reactive, hard-arming measures to protect the rail corridor in place, we will lose our coastal beaches in the face of anticipated sea level rise at Del Mar and elsewhere. Therefore, Coastal Commission staff request that the Del Mar tunnel project be prioritized further by being moved to the five-year capital project list. This would allow double tracking to occur sooner, improving coastal access by sustainable modes of transportation while protecting the Del Mar bluffs, a vital visual and habitat resource for the San Diego region.</td>
<td>SANDAG can consider access to coastal resources in the Comprehensive Multimodal Corridor Plans and future updates of the Regional Plan. The Del Mar tunnel is a top priority for SANDAG. Planning work is underway with preliminary engineering and environmental phase expected to begin as soon as 2022 if funding is secured. SANDAG reviewed the timelines of other similar tunnel projects throughout North America and the 12 to 15 year timeframe is consistent with industry best practices. The 2021 Regional Plan identifies funding to kick start the environmental, design, and right-of-way phases of the Del Mar Tunnel project by 2025 with construction funding in the 2035 phase.</td>

<tr>
<td>L25</td>
<td>In general, Coastal Commission staff support improvements to transit alternatives that provide access to coastal areas and recreation. Significant gaps in the regional bus network improvements laid out in the Regional Plan exist in the coastal communities of Encinitas, Solana Beach, La Jolla, Pacific Beach, Mission Beach, and Ocean Beach, whereas other coastal communities are slated to enjoy more robust transit improvements. As such, Coastal Commission staff encourage SANDAG to analyze and prioritize transit improvements that improve coastal access in these communities, and particularly improvements that provide these communities with meaningful alternatives to single-occupant vehicles to access the nearby beaches and recreational areas.</td>
<td>The 2021 Regional Plan proposes improvements to the local bus system and rapid bus routes that service many of the coastal communities identified in this comment. In addition, Flexible Fleet services will provide on-demand services to supplement the transit system and provide meaningful alternatives to single-occupant vehicles.</td>
</tr>
<tr>
<td>L26</td>
<td>With development concentrated at the coastal region, has the scientists’ estimates of a 2.5 sea level rise been taken into account for development in this area? ([pdf page 9])</td>
<td>As described in Chapter 2, 5% of future housing growth is expected in coastal mobility hub areas. Best available science and data on sea level rise impacts and adaptation strategies will continue to be considered in development in coastal areas. Vulnerabilities are localized and there are development opportunities in coastal communities that are not at risk of sea level rise impacts.</td>
</tr>
<tr>
<td>L27</td>
<td>There was a brief mention of the California Transportation Plan 2050 (CTP 2050) in the bulleted list on Page 14. As the State of California’s transportation roadmap, it might be pertinent to demonstrate with a few sentences as to how the 2021 Regional Plan meets or aligns with the CTP 2050’s Recommendations on Page 6 of the Executive Summary of the CTP 2050 document. Here is language that could be potentially used: “The CTP 2050 demonstrates how major metropolitan areas, rural areas, and state agencies can coordinate planning and particularly improvements that provide these communities with meaningful alternatives to single-occupant vehicles. SANDAG will work to align with the goals, policies, strategies, and recommendations laid out in the CTP 2050 where applicable.”</td>
<td>The 2021 Regional Plan aligns well with the recommendations from CTP 2050. SANDAG looks forward to coordinating with Caltrans on these recommendations.</td>
</tr>
<tr>
<td>L28</td>
<td>Pages 14 and 15 feel a bit out of place and seems like it would be better places after the Table of Contents that is present in the “Forward” section, rather than being right before Chapter 2. The chapter list of Page 15 is essentially the same as the Table of Contents so keeping the nice graphics with the same overview/summary would be good, while having the actual TOC have subsections within the chapters listed, with their corresponding pages as well (5 Big Moves, etc).</td>
<td>SANDAG will consider this suggested edit to Chapter 1 and the table of contents.</td>
</tr>
<tr>
<td>L29</td>
<td>It may be beneficial to mention how these goals will contribute to California’s overall State goal of reducing GHGs, with a mention of AB 32’s goal of lowering statewide GHG emissions 80% below 1990 levels by 2050 as well as SB 32’s midpoint goal of lowering statewide GHG emissions 40% below 1990 levels by 2030. Disregard if this was mentioned but overlooked by the reviewer.</td>
<td>Chapter 2, under Climate Strategies, mentions how implementation of the 2021 Regional Plan supports local jurisdictions and state agencies in achieving their climate goals.</td>
</tr>
<tr>
<td>L30</td>
<td>On Page 44: “The 2015 update of the regional plan was projected to cost $130 billion in 2020 dollars. The 2021 Regional Plan is projected to cost $163 billion. Why the higher cost? As we have detailed in Chapters 1 and 2, the 2021 Regional Plan completely reimagines our transportation system—”. While the 2015 may also be assumed to have taken bold steps to reimagine the transportation system, it might be ideal to refer to the appropriate technical Appendix as to why a newer, updated approach is costing $33 billion more six years later.</td>
<td>Chapter 3 includes references to technical appendices with details on the proposed projects, estimated costs, and revenues; these include Appendix A: Transportation Projects, Programs, and Phasing; Appendix U: Cost Estimation Methodology; and Appendix V: Funding and Revenues.</td>
</tr>
<tr>
<td>L31</td>
<td>Overall a very good and thorough plan, would just mention of alignment with the CTP 2050.</td>
<td>Thank you for your support of the 2021 Regional Plan and suggestion to mention alignment with the CTP 2050.</td>
</tr>
<tr>
<td>Caltrans District 11</td>
<td>Transportation is the largest source of greenhouse gas (GHG) emissions in the San Diego region; in 2016, on-road light-duty vehicles accounted for 41% of emissions. One strategy to reduce emissions is to reduce Vehicle Miles Traveled (VMT). The Regional Housing Needs Allocation Plan informed development of the SCS land use pattern, and the region’s major employment centers and urban core mobility hubs are expected to take on the most housing and job growth in the region over the next 30 years. It is anticipated this development pattern will support VMT reduction from light-duty vehicles by balancing the ratio of jobs to housing land uses. Additionally, the 2021 Regional Plan proposes expansion of the regional transit network such that thirty-minute transit access from mobility hubs to Tier 1 employment centers increases from 13% to 28% for communities of color and increases from 16% to 33% for residents with low incomes by 2050. This improvement will provide important access to economic opportunities to these communities while incentivizing mode shift.</td>
<td>We appreciate your support and feedback. Please continue to follow along in this process by visiting SDForward.com.</td>
</tr>
<tr>
<td>L33</td>
<td>Caltrans supports SANDAG’s embrace of new and improved mobility management strategies such as developing a smart intersection system, a comprehensive system to manage cross-border trips, and real-time traffic management solutions (including dynamic truck parking) to manage many modes of transportation, including freight movement.</td>
<td>Thank you for your support of the proposed investments in mobility management strategies.</td>
</tr>

ID | Comment | Response
--- | --- | ---
L34 | We encourage SANDAG to continue efforts on a recently funded grant to develop a Sustainable Freight Implementation Strategy. This work will help the region execute a road map for a more efficient, economically competitive, and sustainable freight transportation system, establish a framework to transition to a clean freight system, reduce pollution exposure to environmental justice communities, and help implement state sustainable freight efforts such as the California Sustainable Freight Action Plan, the California Freight Mobility Plan, Governor Gavin Newsom’s ‘Zero-Emission by 2035’ Executive Order (N-79-20), and Assembly Bill 617 (C. Garcia, 2017) Community Emission Reduction Program. | SANDAG looks forward to coordinating with Caltrans and other partners on the Sustainable Freight Implementation Strategy.
L35 | Caltrans supports consideration and the development of new mechanisms for viable VMT mitigation options for highway capacity projects, such as exploring statewide and regional VMT mitigation bank concepts and evaluating feasibility and exploring potential expansion of an Advanced Mitigation Program to include GHG/VMT mitigation. | SANDAG participates in the statewide SB 743 working group on these topics and looks forward to continuing to coordinate with Caltrans and other agencies on VMT mitigation options.
L36 | As the 2021 Regional Plan looks to develop performance measures, analyze, and address congestion, please consider presenting data about how travel, delay, and transit use will evolve with the implementation of the plan. | SANDAG will consider these data as it implements Action 10 of the 2021 Regional Plan: Advance a data science program to better understand travel behavior and issues in the region, update travel demand modeling tools, and improve transparency and reporting on program effectiveness and project delivery. Appendix T of the proposed final 2021 Regional Plan will include forecasted travel time data for key corridors.
L37 | Caltrans is encouraged by the investments outlined in SANDAG’s Supporting Policies and Programs. These investments will support programs that complement the capital and operational investments of the transportation system, encourage sustainable growth and development, and implement innovative demand strategies. Please consider including a program for Highways to Boulevards Conversion or freeway cap/lid/decks to create new park space, housing, or community amenities to help restore and revitalize communities. Proposed locations will be discussed and determined in the future. | In alignment with the 2021 Regional Plan, SANDAG and Caltrans District 11 will continue to develop Comprehensive Multimodal Corridor Plans (CMCPs) in coordination with agency partners and local city governments. Opportunities for Highways to Boulevards Conversions or freeway caps will be considered in the CMCPs.
L38 | Please consider including in the listing of transportation projects, programs, and phasing the San Diego-Coronado Bridge Suicide Prevention Barrier Project. The Coronado Bridge has the highest concentration of death by suicide for a spot location on the state highway system. Without mention in the regional plan, the project may not be able to compete for state or federal funding. | A discussion of the San Diego-Coronado Bridge Suicide Prevention Barrier Project will be added to Appendix Q Transportation Security and Safety in the proposed final Regional Plan.
L39 | Caltrans recognizes the rural areas of our region play a vital role in California’s economy. Rural communities are often also the gateway to the state’s preserved landscapes that are central to supporting California’s tourism industry. Yet, rural communities are already experiencing the impacts of a changing climate—from unprecedented storms to devastating wildfires. While transportation goals are inherently and fundamentally the same no matter the context—to provide safe access to destinations for people and goods—unique local and regional conditions require tailored solutions to advance these goals, and solutions may look different in varying local contexts. Please consider including additional examples of sustainable transportation solutions that could be applied in rural settings, understanding that these efforts will require collaboration with the local and Tribal governments that serve the locations, such as:

1. Increasing transit service in a corridor through investments in bus service, vanpools, micro-transit or mobility on demand services, and park-and-ride facilities.
2. Roadside land management activities related to wildfires.
3. Addressing safety through the multidisciplinary Safe System Approach that employ tools for speed management, such as road diets, conversion of intersections to roundabouts, and signal coordination to slow speeds.
4. Improving efforts on coordination for broadband access in transportation and growth, remote work/VMT reduction, economic development, and regional housing strategies. Broadband access remains a critical issue in rural communities and with many Tribal nations.
5. Adding and improving connected facilities for walking and bicycling and for first/last-mile connections to local, interregional, and regional transit routes. Rural cores should support walking and biking on commercial corridors and main streets.
6. Prioritizing connections to natural areas; Tribal communities may desire access to ceremonial sites outside of the rural core.
7. Facilitating emergency evacuations through efficient traffic management strategies, such as the use of contra flow, | Please see where these examples are included in the 2021 Regional Plan: These examples are included in Transit Leap and Flexible Fleet services. This example is included in the description of the Climate Adaptation and Resilience implementation actions in Appendix B. These examples are included in the description of Active Transportation and Demand Management and complete streets in mobility hubs. These examples related to broadband access have been added to the description of rural corridor improvements in Appendix A. The 2021 Regional Plan includes the adopted Regional Bike Network, which identifies the I-8 Bikeway along that rural corridor. Examples provided in this comment can be considered in County of San Diego-led active transportation projects and in a future Regional Active Transportation Plan. The Intragareonal Tribal Transportation Strategy was used to inform many of the improvements identified for the rural corridors. These examples have been added to the description of rural corridor improvements in Appendix A. These examples are included in the Electric Vehicle programs proposed in the 2021 Regional Plan.
use of two-way left turn lanes as through travel lanes, construction of full structural sections of shoulders and installation of transportation management systems (TMS) elements, such as closed circuit television (CCTV) cameras, changeable message signs (CMS), and traffic detection equipment.

8. Deploying zero-emission vehicle charging or fueling infrastructure —including for battery electric, fuel cell (hydrogen) electric, and other zero-emission vehicle technologies.

Center for Sustainable Energy

CSE supports SANDAG's proposed Mobility Hubs concept to provide integrated transportation solutions. CSE recommends that SANDAG utilize these Mobility Hubs to showcase a variety of clean energy and transportation technologies. Specifically, Mobility Hubs could raise awareness of zero-emission transportation alternatives, including EVs and zero-emission buses. Additionally, the mere presence of visible public charging infrastructure can influence consumers' willingness to pay for an EV by up to $5,000. CSE also recommends that additional clean energy technologies be integrated into the Mobility Hubs. For example, EV chargers could be coupled with solar panels and battery storage systems to provide greater utilization of clean electricity. To expand this concept even further, CSE encourages SANDAG to consider deploying microgrids in conjunction with Mobility Hubs. Microgrids can further integrate these technologies to provide additional emissions reductions, while also managing grid impacts and providing resiliency benefits during extreme weather events. Through islanding capabilities, microgrids would enable Mobility Hubs to continue to charge electric fleets during electric grid outages, further alleviating consumers' concerns about all-electric transportation options.

CSE is pleased to participate in SANDAG's Energy Working Group (EWG) and strongly supports the EWG's role in coordinating regional climate action planning, particularly through the use of analytical tools such as the Regional Climate Action Planning Framework (ReCAP). CSE encourages SANDAG to continue this work by periodically sharing best practices on climate action planning. For example, CSE suggests that the release of the ReCAP Snapshots be accompanied by targeted policy recommendations for local jurisdictions. Additionally, the EWG is an effective venue for sharing best practices on local climate equity planning initiatives, such as the Climate Equity Index reports prepared by the Cities of San Diego and Chula Vista, and applying these "lessons learned" on a broader regional scale. CSE also recommends SANDAG engage its Regional Plan Social Equity Working Group (WG) to gather feedback and recommendations on how to operationalize equity throughout the agency, using the Regional Plan as a starting point. Lastly, CSE recommends that the EWG and the Social Equity WG seek to collaborate with emergency planning professionals on this effort would be imperative. Through the Holistic Implementation of Adaptation and Transportation Resilience project, SANDAG is currently preparing an implementation tool, economic guidance document, and equity prioritization document to help local planners address climate risks and adaptation needs by holistically implementing projects that link mitigation, adaptation, and broader community benefits. Staff has received input from the Social Equity Working Group and will be incorporating it into the final deliverables. Furthermore, the 2021 Regional Plan includes a Regional Resilience Framework, which could leverage creative partnerships to support regional resilience, such as creating "resilience hubs" for emergency/disaster response; partnering with emergency planning professionals on this effort would be imperative.

CSE supports the development of SANDAG's proposed Next OS platform to incorporate transportation data and streamline individuals' travel patterns. CSE offers a number of recommendations to integrate EVs into this platform and facilitate better understanding of travel behavior and associated emissions impacts.

First, CSE recommends that SANDAG include data on EV infrastructure locations and availability in the Next OS platform. Lack of access to EV charging is often cited as one of the largest barriers preventing consumers from purchasing EVs. Even EV owners often experience difficulty finding a public EV charger given the number of EV service providers (EVSPs) with proprietary software applications. Additionally, CSE encourages SANDAG to consider integrating information regarding EV charger availability to prevent queues from developing at these sites. While some EVSPs have added waitlist functionalities into their software, there is no uniform approach to addressing this challenge. By integrating these factors into the Next OS platform, SANDAG can support current and prospective EV owners and further promote electrified transportation.

Second, CSE recommends incorporating greenhouse gas (GHG) emissions data into the Next OS platform in order to provide individuals with information regarding the estimated emissions intensity of various transportation modes. For example, an individual could use the Next OS platform to choose between taking transit or requesting ride-hailing services, considering the emissions associated with each mode and making their decision based off of this information. Similarly, the platform could compare the emissions intensity of various options within a specified mode of travel. For example, an individual choosing to use ride-hailing services could assess the emissions impacts of single-occupancy vehicle trips versus pooled trips or the difference between rides in an EV versus in an internal combustion engine vehicle. This functionality could increase public awareness of emissions impacts and encourage greater utilization of clean transportation options.

SANDAG will explore ways to integrate EV charger location and availability data into the Next OS platform.
<table>

<tr>
<td>L44</td>
<td>Third, CSE recommends that the key analytical insights obtained through the Next OS platform be compiled and highlighted on public dashboards, either on the platform itself or on SANDAG’s website. By its nature, the Next OS platform will collect significant levels of data on individual travel patterns and preferences. Analyzing this data will yield key insights that can further inform regional planning and policymaking. Additionally, highlighting these insights through dashboards and visualizations, and thereby making this data accessible and understandable to the general public, will also enable individuals to better understand their transportation options and impacts. These dashboards should be made available in multiple languages and should be updated at regular intervals.</td>
<td>SANDAG envisions the development of a data analytics module within Next OS that will allow for the analysis of travel data from various modal sources. Next OS will also provide the ability to share the data to transportation operators, planning staff, and decision makers via planned Next OS dashboards. SANDAG will also explore ways to provide data via a public facing dashboard.</td>

<tr>
<td>L45</td>
<td>My name is Josephine S. Talamantez and my family have been Logan Heights residents since 1906 and the CPMCC have been in the area for 6 years. I am writing to express my support for the incorporation of a project which goal is to address social and economic inequity, rising levels of health concerns aggravated by greenhouse gas emissions, and transportation injustices in San Diego’s Barrio Logan and Logan Heights communities. Specifically, we request the addition of a Freeway Lid as a priority project as identified in SANDAG’s 2021 Draft Regional Plan (Draft Plan). Our once united community was devastated by Interstate 5 which forcibly displaced hundreds in the 1950’s and has burdened those who remained. Pursuant to Chapter I: Equity Focus (p. 11) of Draft Plan, we know ReConnect Logan Freeway Lid will transform and reconnect our community. A freeway lid can help our community by dismantling the barriers that the I-5 created by bringing the community together, addressing health concerns by capturing GHG emissions, creating non-existing green spaces, and allowing for development of affordable housing. All goals in line with the Draft Plan of creating efficient movement of people and goods, providing affordable, reliable, and safety options, and allowing for healthier air. As mentioned, the construction of the 1-5 forced many families to be displaced, and while the construction allowed for transportation advancements, since the 1950’s our community has been subject to inequity, misrepresentation, and systemic injustices in transportation and racism, to mention a few. We continue to be a working-class neighborhood composed of nearly 90% Mexican Americans, and while we are proud of our heritage and activism deeply rooted in our National Landmark of Chicano Park, the reality is that I-5 has created much insecurity by facilitating gang turfs, separating families from places of worship, and limiting children’s access to neighborhood schools. It is time for our community to heal - a freeway lid is the answer. Given the significant investment and planning of projects in the Barrio Logan/Logan Heights communities in the Draft Plan as identified in Appendix A: Transportation Projects, Programs, and Phasing, it is appropriate to identify and call out ReConnect Logan Freeway Lid as a project on this list. A few of the multiple projects that will impact Barrio Logan/Logan Heights are: The creation of Managed Lanes on Interstate 5, Project ID CC002 Complete Corridor: ML/ Goods Movement (p. A-8)Additional cargo due to the Harbor Drive 2.0 proposal that will facilitate cargo in the community of Barrio Logan, Project ID GM06 Goods Movement: Roadways (p. A-11) Harbor Drive Corridor, project ID GM05 2050 Goods Movement: Roadways Harbor Drive Multimodal Corridor Improvements that will facilitate Trucks for the Port of San Diego (p. A-12) Besides being in line with the 2021 Draft Regional Plan, ReConnect Logan Freeway Lid is also pursuant to Appendix H in relation to California Assembly Bill 805 which requires the reduction of pollution exposure in disadvantaged communities. Furthermore, our project is also pursuant to the Sustainable Communities Strategy per California SB 375 since it would help reach the overall goal of reducing GHG emissions of 15% (p. 18 of Draft Plan), as well as allowing for accommodation to the Regional Housing Needs Assessment Determination. For all these reasons, our community is looking forward to the addition of a Freeway Lid as a priority project as identified in SANDAG’s 2021 Draft Regional Plan.</td>
<td>Caltrans District 11 has also expressed interest in exploring opportunities for freeway caps. In alignment with the 2021 Regional Plan, SANDAG and Caltrans District 11 are currently developing Comprehensive Multimodal Corridor Plans in coordination with agency partners and local city governments. Comprehensive Multimodal Corridor Plans (CMCPs) are data-driven plans to reduce congestion and generate transportation choices while preserving community character and creating opportunities for enhancement projects. Opportunities for freeway caps will be considered in the CMCPs.</td>

<td>Greater transit frequencies (7 min on peak, and 10 mins all day) in Transit Priority Areas; Collaborate with the Built Environment Team on a Pilot Program to identify and test high ridership routes in City Heights</td>
<td>SANDAG agrees that action is needed now to provide fast, frequent, reliable, and accessible transit, especially on highly utilized routes. Staff are bringing forward an item to the SANDAG Transportation Committee and to the Board of Directors in advance of approval of the 2021 Regional Plan to amend the agency budget and act now to invest in transit that benefits environmental justice communities. This action seeks to increase service on transit lines that have infrequent service in the evenings and late nights, and/or provide fare subsidies for youth riders. Additionally, further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.</td>
</tr>
<tr>
<td>L48</td>
<td>Late night and weekend service improvements with 24-hour service on major routes.</td>
<td>The proposed final 2021 Regional Plan includes increased service spans for the Trolley and bus service up to 20 hours per day. As SANDAG and the transit agencies move into more detailed planning efforts in the near future, some routes will be considered for 24-hour operation.</td>
</tr>
<tr>
<td>L49</td>
<td>Supporting the Purple Line alignment through central City Heights.</td>
<td>The South Bay to Sorrento Comprehensive Multimodal Corridor Plan is currently studying alternatives that include a station in City Heights along the Commuter Rail Route 582. The east-west Commuter Rail route 581 between El Cajon and Downtown San Diego/Central Mobility Hub via SDSU includes that station in the current proposed alignment. The first part of Route 582, from National City to Sorrento Mesa, is expected to be built by 2035 and is planned to be extended south from National City, to Chula Vista, and to the border by 2050. An additional route, Commuter Rail 583, traveling from the border to National City on the same alignment as the 582, is expected to be built by 2050 along with a branch to the Central Mobility Hub via downtown San Diego.</td>
</tr>
<tr>
<td>L50</td>
<td>Bikeways on major corridors with implementation of Early Action Projects in Mid-City by 2023.</td>
<td>The bicycle network outlined in the 2021 Regional Plan were laid out and prioritized based on the analysis performed in Riding to 2050: San Diego Regional Bike Plan. While the horizon year for build out is 2050, this just means it would be proposed to be completed by that time. Many projects will likely be completed sooner, and some are already in construction. This is especially true as new funding sources come available. Additionally, as an early action out of the 2021 Regional Plan, SANDAG will be developing a new Regional Active Transportation Plan in which projects will be reassessed and reprioritized based on data and community engagement. The regional network compliments the much more extensive networks which local jurisdictions plan and construct on their own streets. There are also opportunities for the development of protected bike networks via “Complete Streets in Mobility Hubs” funding included in the Regional Plan.</td>
</tr>
<tr>
<td>L51</td>
<td>Implementing traffic-calming measures including but not limited to: protected bike lanes, roundabouts, raised crossings to improve to ensure a safer biking experience.</td>
<td>Traffic-calming measures such as those described in this comment are included in the proposed 2021 Regional Plan through investments in the Regional Bike Network, Complete Streets in Mobility Hubs, and Vision Zero programs.</td>
</tr>
<tr>
<td>L52</td>
<td>Planting more trees throughout City Heights to foster a healthier urban environment.</td>
<td>The 2021 Regional Plan includes a nature-based climate solutions program that could be used to fund activities such as tree-planting.</td>
</tr>
<tr>
<td>L53</td>
<td>Ensuring Youth Opportunity Passes for those aged 24 and under by 2023.</td>
<td>One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.</td>

</table>
City of Carlsbad

L59 City staff have attended the series of workshops that SANDAG hosted during the public review period, and respectfully, starts this section with several questions related to; the process of the; Plan and the Draft EIR. By way of introduction, a jurisdiction’s General Plan, such as the city’s General Plan, identifies the expected population of the city and any lands outside of the city limits but within their Sphere of Influence where future growth is anticipated to occur. The city’s General Plan identifies the subject area adjacent to the McClellan-Palomar Airport for development under the designation for limited and light industrial use.

For future land use planning, land use assumptions must reasonably proxy and be generally consistent with local planning standards and; programs; to; be considered; growth accommodating; rather than growth inducing. SANDAG has the; authority under Government; Code Section 65584 to; determine existing and projected housing needs, as well
as the share of housing needs to be allocated to cities and counties, but it; is unclear; if SANDAG has jurisdiction to; allocate new housing growth to; areas in a manner not consistent with Government Code Section 65584. Attachment 1 includes additional information on the applicable Government Code and standards. Therefore, and as indicated above, the build-out of properties within the Business Park and flight activity zone must be done in accordance; with the city’s General Plan Land Use Diagram, as amended, in accordance with city approval.

Government Code section 65080(b)(2)(B) provides that a Sustainable Communities Strategy (SCS) "use most recent planning assumptions considering local general plans and other factors.” It also requires that the SCS "set forth a forecasted development pattern for the region, which, when integrated with the transportation network and other transportation measures and policies, will reduce the greenhouse gas emissions from automobiles and light trucks to achieve, if there is a feasible way to do so, the greenhouse gas emission reduction targets approved by the state board.” The SCS included in the 2021 Regional Plan projects development that would achieve the state-mandated GHG emissions reduction target when integrated with the transportation investments, programs and policies in the Plan. The SCS land use pattern proposed in the 2021 Regional Plan focuses growth and development in the mobility hub areas. The allocation of housing units to subregional areas represents general areas projected for future growth in mobility hub areas, not specific parcels, for future housing development or housing unit type. A number of land uses at the parcel level, aggregated up, comprise these general areas. The exercise of land use authority is reserved to local jurisdictions. For Carlsbad, the SCS land use pattern forecasts 6,575 housing units from 2016 to 2050, which is within the total housing unit capacity of the City’s general plan as provided to SANDAG (6,992 housing units) and accommodates the City’s RHA allocation of 3,873 housing units by 2035. The Series 14 Regional Growth Forecast Documentation and Sustainable Communities Strategy Land Use Pattern Subregional Allocation methodology is available at: https://sdforwarddata-sandag-hub.arcgis.com/documents/SANDAG/series-14-regional-growth-forecast-and-scsland-use-pattern-subregional-allocation-oct-2021-draft/about.

L60 1. The SANDAG website states, "The SANDAG Sustainable Communities Strategy and Final EIR from its 2015 Regional Plan will remain valid and in compliance for purposes of state funding eligibility and other state and federal consistency purposes until the SANDAG Board of Directors adopts a new Regional Plan and EIR, provided those actions are completed by the end of December 2021.” SANDAG needs to clarify how the Draft EIR, Response to Comments and Adoption will be completed this year and what will occur if they are not completed by the end of this year. Additionally, please clarify when the Draft EIR will be available; it is difficult to completely assess the full impacts of this plan when the public review of the documents is piecemealed.

a. SANDAG should clarify how public comments on the Plan are going to be addressed in the Draft EIR prior to its release.

b. In the Draft EIR, SANDAG needs to clearly articulate the impacts to land use and if the Plan will cause a significant environmental impact due to a conflict with any land use plan, policy or regulation adopted for the purpose of avoiding or mitigating an environmental effect. Appendix F: Regional Growth Forecast and Sustainable Communities Strategy Land Use Pattern appears to be inconsistent with the city’s General Plan and rezone program to accommodate the Regional Housing Needs Assessment, as well as the general plans of other jurisdictions such as the cities of Coronado, Del Mar and the County of San Diego. The Draft EIR should clarify how implementation of this Plan can occur if those changes are not made.

1a. The Draft EIR analyzes the draft Regional Plan. Comments and responses received on the Draft Regional Plan will be provided in the Final Regional Plan and inform the Final EIR.

1b. The Draft EIR includes the required land use analysis in Section 4.11.

<td>4. As with each update of the Regional Plan, SANDAG prepares an updated Regional Growth Forecast and subregional allocation that may be a deviation from prior forecasts that have been used in local or subregional analyses. SANDAG is typically required to update the Regional Plan every four years in order to account for the changes in funding outlooks and planning assumptions and to align with state and federal methodologies and mandates.</td>
<td>The SCS land use pattern proposed in the 2021 Regional Plan focuses growth and development in the mobility hub areas. The allocation of housing units to subregional areas represents general areas projected for future growth in mobility hub areas, not precise parcel locations, for future housing development or housing unit type. A number of land uses at the parcel level, aggregated up, comprise these general areas. The precise zoning at the parcel level is within local jurisdictions’ land use authority. For Carlsbad, the SCS land use pattern forecasts 6,675 housing units from 2016 to 2050, which is within the total housing unit capacity of the City’s general plan as provided to SANDAG (6,992 housing units) and accommodates the City's RHNA allocation of 3,873 housing units. The Series 14 Regional Growth Forecast Documentation and Sustainable Communities Strategy Land Use Pattern Subregional Allocation methodology is available at: <a href="https://sdforwarddata-sandag.hub.arcgis.com/documents/SANDAG-series-14-regional-growth-forecast-and-scs-land-use-pattern-subregional-allocation-oct-2021/draft/about">https://sdforwarddata-sandag.hub.arcgis.com/documents/SANDAG-series-14-regional-growth-forecast-and-scs-land-use-pattern-subregional-allocation-oct-2021/draft/about</a>.</td>
</tr>
<tr>
<td>L64</td>
<td>5. The city seeks clarity on why the Plan does not incorporate policies to promote roundabouts over signalized intersections and include a budget line item under the Complete Corridors to fund the construction of roundabouts at new or improved locations when found feasible. This clarification would support the Federal Highway Administration (“FHWA”)’s project for Accelerating Roundabout Implementation in the United States and the County of San Diego Air Pollution Control Board’s support for implementing roundabouts to address GHG and reduce fatalities.</td>
<td>7. Roundabouts, curb extensions, and similar traffic calming measures are included in the Mobility Hub complete streets investments as a means for slowing vehicular traffic in neighborhoods where a higher volume of multimodal travel to/from key destinations, particularly active transportation, is anticipated.</td>
</tr>
<tr>
<td>L65</td>
<td>6. SANDAG has been tracking AV deployment and found that AVs do not provide the capacity needed to reduce VMT on roadways. Current AVs are small passenger vehicles that carry up to four people at a time. On some of our larger transit routes, like the Blue Line Trolley, we have up to 60,000 boardings per day. The planned Purple Line passenger rail service identified in the 2021 Regional Plan is projected to have upwards of 80,000 daily boardings. If these trips were made in single occupant AVs, it would result in significant congestion on our local roadways. Alongside the transit system, the 2021 Regional Plan proposes Flexible Fleet services, which include shared vehicle technologies that could be automated in the future. Flexible Fleets would be supported by the complete corridor investments in the existing freeway infrastructure.</td>
<td>6. SANDAG is preparing an updated Regional Growth Forecast and subregional allocation that may be a deviation from prior forecasts that have been used in local or subregional analyses. SANDAG is typically required to update the Regional Plan every four years in order to account for the changes in funding outlooks and planning assumptions and to align with state and federal methodologies and mandates.</td>
</tr>
<tr>
<td>L66</td>
<td>4. At this point, it is not clear if SANDAG’s assumptions adequately contemplate the development patterns included in the Sustainable Communities Strategy (“SCS”)/Regional Transportation Plan (“RTP”), and Regional Air Quality Strategy (&quot;RAQS&quot;), local climate action planning business-as-usual estimates, sub-regional traffic modeling, or the airspace the Sustainable Communities Strategy (&quot;SCS&quot;)/Regional Transportation Plan (“RTP”), and Regional Air Quality Strategy alternatives such as automated /shared vehicle technologies and personalized zero emissions transit programs that are</td>
<td>5(a)(b) As part of the development of the transit services for the 2021 Regional Plan, SANDAG completed a comprehensive data analysis to understand the primary travel patterns anticipated to occur between today and 2050. This analysis is described in Appendix 7. In addition, SANDAG incorporated the latest information on telecommute patterns as a result of the COVID-19 pandemic. Employment data for the region shows that only a portion of jobs are “telecommutable” and many individuals must travel to a work location. Additionally, SANDAG has been tracking traffic volumes and congestion is returning to pre-pandemic levels. This demonstrates the need for alternatives to driving.</td>
</tr>

</table>

San Diego Forward: The 2021 Regional Plan

C7E-14
ID | Comment | Response
---|---|---
L67 | 8. The city seeks clarity on the project phasing proposed within the Plan. Specifically, the city is seeking to understand the timing of implementation of unfunded TransNet projects related to the new projects presented within the Regional Plan. To support this, the city is requesting that SANDAG input the information requested in Table 1 (Attachment 6). | 8. A comparison between the TransNet Program of Projects and the Draft 2021 Regional Plan was included in the July 7, 2021 ITOC Agenda item #2 ([https://www.sandag.org/uploads/meetingid/meetingid_5886_29414.pdf](https://www.sandag.org/uploads/meetingid/meetingid_5886_29414.pdf)). In addition to the report narrative, you will find in Attachment 1 the details regarding the original TransNet projects and how those are addressed in the Regional Plan corridor by corridor. |
L68 | 9. The city seeks specific data on the proposed 200 miles of rail service contemplated in the Plan. To support this, the city is requesting that SANDAG input the information requested in Table 3 (Attachment 7). Specific questions:
  a. Please provide more information about the scope of the high-speed rail alignments, potential vehicle technologies and their cost estimates.
  b. Will the Coaster keep the same rail alignment?
  c. What funding is programmed or planned for the Carlsbad Village railroad trench and the other projects along the current NCTD/Coaster Service right-of-way?
  d. Will some of the tracks be at grade with fencing and trains traveling at 110 miles per hour speeds? | There are over 30 sources of funding included in the projected revenues for the 2021 Regional Plan. While the assumptions used to develop these revenues are determined to be reasonable based on state and federal standards, the level of projected expenditures provides flexibility to account for any changes in the timing or availability of these funds over the next 30 years. SANDAG is typically required to update the Regional Plan every four years to account for the changes in funding outlooks, priorities, and planning assumptions. |
L69 | Section 2. In addition to the comments on process and the Draft EIR provided above, city staff remain concerned that there is not enough detail on the feasibility of implementation of this significant shift in transportation strategy. On specific content in the plans, we outline our recommendations and comments below:
  1. Funding for the Plan:
     The draft 2021 Regional Plan sets out an ambitious plan to build and operate a region-wide system of transportation projects, programs and other improvements. This is a substantial role for SANDAG to play in supporting both the construction and operation of these projects, programs and other improvements. SANDAG should set annual revenue targets to directly fund everything and should approve any recommended sustainable revenue tools to help meet these targets. Many of the funding strategies will require legislative changes, or voter-approved taxation. SANDAG should clarify what will occur if the funding is not available, or opposition to projects stops them from construction, and if General Plans in the region are not modified to implement the Plan. | 2. SANDAG will work with local jurisdictions on how to conduct modeling with the service bureau and how to factor in assumptions related to pricing, parking, teleworking, and micromobility. |
L70 | 2. Appendix D: Sustainable Community Strategy Documentation: Appendix D includes the Sustainable Communities Strategy, which outlines assumptions included in the Activity Based Model 2+ (“ABM 2+”), updated for this. This model will be necessary for use by publicly and privately initiated land use projects preparing documents for consistency with VMT/CEQA Guidelines and Traffic Impact Analysis (“TIA”) Evaluations. City staff respectfully request direction from SANDAG on how to conduct modeling with the service bureau and how to factor in these assumptions applied to ABM 2+. Specifically, the addition of pricing, parking costs for coastal communities, 10% teleworking and micromobility. SANDAG should provide direction on how this could be worked into General Plans that are updated every 5-20 years. | 3. Both the Appendix A “Mobility Hubs” and “Policies and Programs” section include investments that would benefit school sites and school access. Within the “Mobility Hub” investments, there are Complete Streets assumptions to make streets safer for people who walk and bike by investing in traffic calming and pedestrian improvements. Under “Policies and Programs” the Plan includes in Vision Zero programming that prioritizes safety through roadway design while working with cities to develop community engagement programs that identify local street safety issues and provide technical guidance to resolve those issues through investment, policies, and programs. |
L71 | 3. Appendix A: Transportation Projects, Programs, and Phasing: Transportation projects and sites result in a significant congestion, VMT generation, and peak hour delay throughout the region. Additional funding and projects should be recommended with a specific focus on improving safety and multimodal access in and around school sites along with programs to incentivize non-single occupancy vehicle trips to schools. | 3. Both the Appendix A “Mobility Hubs” and “Policies and Programs” section include investments that would benefit school sites and school access. Within the “Mobility Hub” investments, there are Complete Streets assumptions to make streets safer for people who walk and bike by investing in traffic calming and pedestrian improvements. Under “Policies and Programs” the Plan includes in Vision Zero programming that prioritizes safety through roadway design while working with cities to develop community engagement programs that identify local street safety issues and provide technical guidance to resolve those issues through investment, policies, and programs. |
L72 | Table A11: Given the proven success of the Carlsbad Connector microtransit pilot program, the city agrees with the Plan’s recommendations to provide similar on-demand microtransit systems throughout North County at all mobility hub sites and major transit centers. | SANDAG looks forward to coordinating with Carlsbad and other North County jurisdictions on microtransit systems. |
L73 | Table A13: The segment of El Camino Real between Poinsettia Lane and Camino Vida Roble is proposed to be widened from two to three lanes to prime arterial standards. With the adoption of the city’s General Plan, the city has determined that the widening of this portion of El Camino Real is not feasible due to constrained right-of-way and would result in negative impacts to other travel modes. City staff recommend removal of this proposed project recommendation CB32 (that is, a ‘do nothing’ scenario, or appraise and evaluate different mobility projects and/or alternative designs). | Complete Corridors, such as those planned for I-5 via Project IT CC004, provide a variety of travel choices and use technology to manage how highways and major roads are used in real time. They provide a balance of dedicated, safe space for everyone, including freight vehicles and people who walk, bike, drive, ride transit, and use Flexible Fleets. This will not only improve traffic operations and efficient operations along this corridor, but it will help to provide additional access while assisting the region in meeting its greenhouse gas reduction mandates. More information on Flexible Fleets can be found here: [https://www.sdforward.com/mobility-planning/flexible-fleets](https://www.sdforward.com/mobility-planning/flexible-fleets). |
L74 | 4. Active Transportation: The city appreciates the Regional Plan’s overall approach of providing a connected network of high-quality bicycle facilities throughout the region. Regional bikeways are recommended throughout the city including along Palomar | SANDAG will work closely with the City as active transportation projects advance into project-level design to ensure the project meets the needs of the corridor. SANDAG appreciates suggestions for improving...
First, and most notably, during the South Bay to Sorrento Comprehensive Multimodal Corridor Plan (CMCP) engagement process, City staff expressed concern about the Orange Avenue Business District / village area being designated a Mobility Hub without meaningful engagement with City residents and the City Council. It is highly unlikely the City would agree to construction of a new mobility hub in the Orange Avenue corridor. Therefore, the City requests the mobility hub be removed from both the South Bay to Sorrento CMCP and the 2021 Regional Plan. The 2021 Regional Plan refers to mobility hubs as areas “to concentrate future development.” The City is concerned that mobility hubs and related transportation investment may have a significant adverse impact in Coronado’s village area. While the City is supportive of on-demand travel options, it is difficult to imagine where facilities for the “Flexible Fleets” and “Transit Leaps” might be sited, such as ride hailing zones, electric vehicle charging stations, micro-mobility parking areas, parcel delivery lockers, and sidewalk delivery kiosks. The description of mobility hubs also includes drone technology, which is a concern given the proximity to Naval Air Station North Island (NASNI).

The designation of the City’s village as a mobility hub is also concerning as it relates to the future of housing allocations for Coronado. Presumably, given the State and SANDAG’s priority to increase housing density in transit rich areas, mobility hubs and related transportation investment may have a significant adverse impact in Coronado’s village area. The 2021 Regional Plan refers to mobility hubs as areas “to concentrate future development.” The City is concerned that the designation of the village area as a mobility hub will lead to continued increased regional housing needs allocations, which will negatively impact the City’s character, in addition to the challenge of space and regulatory limitations to accommodate more high-density housing.

In the event that the village area continues to be designated as a mobility hub, the City asks that the use of drone security be removed from the plan due to privacy and safety concerns, that the use of e-bikes or scooters be limited and orderly, and that new facilities not block or impede pedestrian movement. Finally, before any strategies are implemented within the village area, more public outreach and interagency collaboration will be required to inform Coronado residents of the plan.

Coronado is a major destination due to its location adjacent to one of the region’s top military bases. Additionally, people commuting to hospitality, retail, and dining jobs is a daily occurrence, and the community serves as one of the region’s top tourism destinations for visitors from both outside and within San Diego County. These trip inducing factors contribute to the area’s high propensity for regional mobility hub designation. Not all mobility hub areas are created equal, and they don’t all require construction of a major transit center. Coastal mobility hubs similar to others in the North County area are envisioned to rely upon an array of on-demand Flexible Fleets to help people complete short trips in and around the hub without needing to rely on a car.

The suite of Flexible Fleets and supporting Mobility Hub amenities as included in the 2021 Regional Plan can be tailored to meet the needs of people traveling to and within Coronado. These features would enhance connections to transit (including the ferry) or help shift shorter, drive alone trips to alternative modes. It’s vital to understand that a variety of personally owned micromobility devices such as electric-assist bikes, scooters, and other motorized rideables are included in this category of options. Such devices are becoming increasingly popular among youth and adults alike. Since Coronado attracts so many residents from other parts of the region in addition to out of towners, it will be important to consider the provision of amenities like secure micromobility storage for these personally owned devices at or very near popular destinations.

Coronado is a major destination due to its location adjacent to one of the region’s top military bases. Additionally, people commuting to hospitality, retail, and dining jobs is a daily occurrence, and the community serves as one of the region’s top tourism destinations for visitors from both outside and within San Diego County. These trip inducing factors contribute to the area’s high propensity for regional mobility hub designation. The 6th Cycle Regional Housing Needs Assessment (RHNA) Plan, adopted by the Board of Directors and approved by the California Department of Housing and Community Development, includes a methodology which allocates housing throughout the region near jobs and transit. Consistent with state law, the RHNA process occurs about every 8 years. During the next RHNA process, the Board of Directors will again consider a methodology for allocating housing throughout the region, which may be different from the 6th Cycle methodology.

San Diego Forward: The 2021 Regional Plan
### Draft 2021 Regional Plan Responses to Comments – Letter Sourced

<td>L79</td>
<td>In addition to the City’s concern for a mobility hub in the village, the City finds that the 2021 Regional Plan presupposes that 2022-29 RHNA is finalized although there is pending litigation related to the RHNA. To address this issue, the City asks that the following language be inserted as a footnote on p.13 of the 2021 Regional Plan, after the sentence: “The SANDAG Board of Directors adopted the RHNA Plan on July 10, 2020, with the final housing unit allocation” to read:</td>
<td>This language has been added to the introductory pages of Appendix K, Regional Housing Needs Assessment Plan.</td>
</tr>
</tbody>
</table>

> In September 2020, the cities of Coronado, Imperial Beach, Lemon Grove and Solana Beach filed a Petition for Writ of Mandate in San Diego Superior Court challenging, among other things, the Board’s adoption of the RHNA Plan. SANDAG demurred to the cities’ Petition and the demurrer was sustained by the court in February 2021. The petitioning cities have appealed the ruling on the demurrer to their Writ Petition, and that appeal remains pending in the Fourth District Court of Appeal. |

| L80 | In addition, the City proposes to add the following paragraph to the end of p.14 of Appendix K: | Similar language acknowledging the pending litigation has been added to the introductory pages of Appendix K, Regional Housing Needs Assessment Plan. |

> On September 24, 2020, the cities of Coronado, Imperial Beach, Lemon Grove and Solana Beach filed a Petition for Writ of Mandate in San Diego Superior Court, Case No. 37-2020-00033974-CU-MC-CTL against SANDAG and SANDAG’s Board of Directors seeking an order requiring that SANDAG give those cities a fair hearing on their RHNA appeals and decide the cities’ appeals in a legal manner without bias and without the use of the weighted voting mechanism. Specifically, the petitioning cities asked the court to order: (1) that the final RHNA allocation approval by SANDAG be rescinded; (2) that SANDAG’s denial of the cities’ RHNA appeals be rescinded; (3) that the appeals be remanded to SANDAG for fair consideration; and (4) that SANDAG be prohibited from utilizing a weighted vote on the cities’ RHNA appeals. On February 5, 2021, SANDAG’s demurrer to the Petition for Writ of Mandate was sustained by the Superior Court. The petitioning cities have appealed the ruling on the demurrer to their Writ Petition. That appeal remains pending in the Fourth District Court of Appeal. So long as the litigation is pending, the Board’s adoption of the RHNA Plan cannot be considered final. |

| L81 | A new Rapid route is depicted from Downtown to NASNI. The City would be interested in extending this route further into the commercial village area. | SANDAG, MTS, and the City can explore extension of the Rapid route from Downtown to NASNI for consideration in the next Regional Plan. |

| L82 | The description of the Transportation Demand Programs includes language that suggests that employers will be required to provide transportation benefits. The City does not support requiring local businesses to provide specific benefits and would not enforce this or any other mandatory regulatory actions. | The 2021 Regional Plan proposes a Transportation Demand Management Ordinance and a near-term implementation action would be to complete a Transportation Demand Management Ordinance Policy Analysis. This policy analysis would detail the employers that the ordinance would apply to and mechanisms for enforcement. |

| L83 | Appendix A identifies a new off-street bike path on Glorietta Boulevard. The City’s Active Transportation Master Plan does not identify such a future improvement, the Bayshore Bikeway Plan recommends no changes to this area, and there is already a bike lane on Glorietta Boulevard. Please update A.12 and A.13. | These projects were approved by the SANDAG Board of Directors in 2010 with the development of a comprehensive regional bike network - Riding to 2050. The San Diego Regional Bike Plan and these Class I Bayshore Bikeway segments were identified again and prioritized in 2013 via the SANDAG Early Action Program (EAP). More information can be found at the following links: https://www.sandag.org/index.asp?classid=34&subclassid=122&projectid=97&fuseaction=projects.detail.https://www.sandag.org/index.asp?classid=34&subclassid=122&projectid=97&fuseaction=projects.detail. |

| L84 | In Appendix B one of the strategies to increase housing affordability is to minimize zoning near transit. Since most of the village area is near transit, the City would not implement strategies that adversely alter its community character through reduced zoning requirements or eliminated single family zoning. | While this is a strategy to increase housing affordability and reduce vehicle-miles traveled, land use authority is reserved to local jurisdictions because they are best positioned to effectively implement the objectives outlined in the Regional Plan through understanding of the unique needs of their communities and geographies. |

| L85 | In the land use maps in Appendix F, there are some areas of Coronado shown as mixed use. Although there is some existing, non-conforming mixed-use development in the City, there are no areas in the City that are zoned for mixed use, and there are no plans to zone additional areas for new mixed-use. | The SCS land use pattern assumes mixed use development to accommodate future growth and development in the mobility hub areas. Implementation of the land use pattern is to be refined through coordinated planning with the City as zoning authority is reserved to local jurisdictions. |

| L86 | The City generally supports improvements to the public transportation system, but encourages SANDAG to do so in a manner that does not compromise necessary road maintenance and improvement projects. | SANDAG is committed to working collaboratively with stakeholders, peer agencies, and the City in the development, deployment, and operations of new regional transit services in order to identify and mitigate issues (including coordination with other projects within the same or similar boundaries). |

| L87 | The City also supports new waterborne transportation options, such as ferry routes, and encourages SANDAG to prioritize the financing and expansion of waterborne transportation options in its regional planning documents. | SANDAG is working with MTS and the Cities of San Diego and Coronado on exploring grant opportunities to plan and fund ferry transportation for possible inclusion in the next Regional Plan. |

| L88 | We applaud SANDAG for prioritizing public safety, solutions to traffic congestion, social equity, GHG emission reduction, and air quality. We recommend that SANDAG also acknowledge open space and natural habitat preservation as a key priority of the Regional Plan. The long-term sustainability of the San Diego region, along with the quality of life of its | Both Chapter 2 and Appendix AA include information about open space and natural habitat preservation in the San Diego region. |

---

**City of Oceanside, Planning Division**

We applaud SANDAG for prioritizing public safety, solutions to traffic congestion, social equity, GHG emission reduction, and air quality. We recommend that SANDAG also acknowledge open space and natural habitat preservation as a key priority of the Regional Plan. The long-term sustainability of the San Diego region, along with the quality of life of its community, is crucial to the region's future. SANDAG is working with MTS and the Cities of San Diego and Coronado on exploring grant opportunities to plan and fund ferry transportation for possible inclusion in the next Regional Plan. Both Chapter 2 and Appendix AA include information about open space and natural habitat preservation in the San Diego region.
We encourage SANDAG to consult with the scientific community on the most recent sea level rise projections for the region’s coastline. It is our understanding that NASA now projects sea level rise of less than one foot by 2050, based on roughly three inches of sea level rise over the past decade. While there are many factors that could contribute to significantly greater sea level rise over this period, we believe it important to base regional planning efforts on the most likely sea level rise scenario.

The Draft SCS established the overarching goal of a fast, fair, and clean mobility network. It will be important to devise a network, so too are water quality, soil quality, hazardous materials, and solid waste management. While air quality and GHG emissions are fundamental considerations in determining the cleanliness of the mobility user groups. It would be worthwhile to also consider the relative safety and comfort of mobility options as experienced by different user groups. While air quality and GHG emissions are fundamental considerations in determining the cleanliness of the mobility network, so too are water quality, soil quality, hazardous materials, and solid waste management.

The region’s mobility network? How will the elderly access transit? What accommodations will need to be made to ensure that the elderly have equal access to the region’s mobility network?

SANDAG has a long history of working closely with senior community members, social service providers, nonprofits and community-based organizations to develop and fund specialized transportation services geared specifically towards the needs of seniors. The Regional Plan network includes a variety of modes that work together seamlessly to provide all San Diego residents, regardless of age or ability, access to multiple travel choices. Flexible Fleets are an example of an option that is particularly well suited for the senior population. Flexible Fleet options like ridehail, rideshare, and microtransit, offer a range of mobility options and vehicles that can accommodate many types of trips and meet the needs of various users. They can make it easy for seniors to access medical appointments and other basic needs without relying on a car. Flexible Fleet vehicles and services are adaptable and can offer personalized accommodations such as wheelchair lifts, door-to-door services, and other options for people with physical limitations. SANDAG has conducted outreach and will continue to engage with seniors to ensure their mobility needs are met. In addition, SANDAG is developing a Flexible Fleets Implementation Strategic Plan that will address potential barriers to accessing Flexible Fleets, options for people without smartphones or internet, educational opportunities about how to access Flexible Fleets, and more.

The regional population forecast is intrinsically tied to several aspects of the Regional Plan and is updated based on the latest forecasts from the California Department of Finance for each update of the Regional Plan. Revenue estimates for gas tax, sales tax, and user fees account for this updated population forecast and related vehicle fuel consumption and vehicle miles traveled estimates from ABM2+. The funding strategy will continue to be updated and adjusted for each Regional Plan to reflect changing conditions.

The 2021 Regional Plan does not include mode shift goals, however, SANDAG’s activity based model (ABM2+) estimates the mode shift performance of the proposed plan. The ABM2+ is a state-of-the-art tool for analyzing the transportation network, land use pattern, and other policies of the Regional Plan, however, it is based on the information we know today. There are many emerging technologies and future behavior changes that could impact mode shift in the future. SANDAG will continue to use best available data and research on mobility to inform future updates of the ABM and estimated performance of the Regional Plan. The mode share estimates from ABM2+ are reported for the entire region. We expect in areas of denser land use and a greater confluence of mobility options to have a greater than average modal change.

The Draft SCS establishes the overarching goal of a fast, fair, and clean mobility network. It will be important to devise and consistently apply appropriate metrics for evaluating how mobility improvements and services further this goal. With regard to the relative speediness of new or enhanced mobility options, it would be worthwhile to consider how travel times associated with alternative modes compare with those associated with SOV automobile trips. In addition to evaluating the fairness of a particular improvement or service in terms of access, cost, and functionality, it would be worthwhile to also consider the relative safety and comfort of mobility options as experienced by different user groups. While air quality and GHG emissions are fundamental considerations in determining the cleanliness of the mobility network, so too are water quality, soil quality, hazardous materials, and solid waste management.

Chapter 3 (Table 3.1) and Appendix E include information on the performance indicators for the 2021 Regional Plan, which align with these suggested metrics. SANDAG will launch a study in the next year to further study the potential of usage-based fees and their capabilities in addressing various goals, including equity and greenhouse gas emissions reduction. SANDAG staff will work with Board Members, stakeholders, and community members to develop implementation strategies for a road usage charge, including high level constructs of the program, such as who will pay, the fee structure, and the distribution of revenues. The study will also assess the potential impacts of user fees on different San Diego residents, visitors, and businesses. SANDAG is committed to developing a carefully constructed program that will promote equity and ensure that no particular group is disproportionately burdened. There are multiple mechanisms, such as caps and rebates, that will be explored to ensure a fair system.

The efficient movement of goods into and through the San Diego region is essential to the health and stability of the regional economy. Assessment of the efficiency of goods movement should consider how delivery systems contribute to....

The 2021 Regional Plan Appendix Y includes the 2021 Freight Gateway Study Update, which highlights freight flows within and to/from our region. SANDAG will be initiating the “San Diego and Imperial Counties...
overall VMT and how these systems can further evolve to minimize their environmental impacts, including their contributions to traffic congestion, air pollution and GHG emissions, roadway wear-and-tear, and noise pollution. As we facilitate cleaner forms of transportation, we can also consider ways to enhance both indoor and outdoor air quality in highly urbanized areas through landscaping, ventilation systems, weather-stripping, etc.

The North County Comprehensive Multimodal Corridor Plan (North County CMCP) is a strategic blueprint for identifying and implementing multimodal projects and services within North County communities. The North County CMCP work is using the Regional Plan to integrate the needs and projects identified where they align with sub-regional and regional transportation needs to reinforce the integrated system approach to meeting the diverse demands of North County’s communities.

While there are not specific line items listed for within the 76 corridor, under the complete corridor concept for rural corridors like SR 76, the vision is looking into other strategies using technology and roadway operational improvements that could increase access, efficiencies, and safety by considering widening shoulders to allow safe passing lanes and rapid access to first responders, the use of technology (speed control, dynamic lane configuration using reversible lanes) to address crashes and increase capacity during evacuation routes with the use of real-time driver information in the event of fire or other natural disasters. Earlier phases of the 2021 Regional plan for SR 76 include approximately $55 million proposed for the implementation of smart intersection technologies (2025 phase) and approximately $222 million for operational and technology improvements (2035 phase).

The complete corridor concept for rural corridors like SR 76 includes strategies using technology and roadway operational improvements that could increase access, efficiencies, and safety by considering widening shoulders to allow safe passing lanes and rapid access to first responders, the use of technology (speed control, dynamic lane configuration using reversible lanes) to address crashes and increase capacity during evacuation routes with the use of real-time driver information in the event of fire or other natural disasters. Earlier phases of the 2021 Regional plan for SR 76 include approximately $55 million proposed for the implementation of smart intersection technologies (2025 phase) and approximately $222 million for operational and technology improvements (2035 phase).

SANDAG’s Transportation Demand Management (TDM) program currently offers jurisdictions and developers technical support and resources for implementing local demand/supply management strategies. Most recently, SANDAG developed the Mobility Management Toolbox to help jurisdictions and developers evaluate the potential Vehicle Miles Traveled (VMT) benefits of mobility management measures, including TDM and Transportation System Management (TSM). In addition, SANDAG’s TDM program works with over 200 businesses throughout the region to offer customized solutions that promote alternative commuting options.

SANDAG is considering the development of regional guidelines for designing Mobility Hub and Complete Streets projects that could include specific strategies for curb space into the design process. Local Management is included as one of the key policies in the Regional Plan, and SANDAG intends to partner with local jurisdictions and other necessary stakeholders to pilot curb space projects as part of a near-term implementation strategy. Deploying curb space pilots will be conducted in alignment with the deployment of Flexible Fleets, and pilot results can help inform best practices to follow regionwide.
L104 The proliferation of warehousing and distribution facilities in the San Diego region has major implications for land use, economic development, and climate mitigation. These facilities tend to occupy large tracts of land while providing relatively few jobs per acre. Vehicle trips generated by these facilities can contribute significant VMT and associated GHG emissions. We encourage SANDAG to consider guidelines and incentives that promote innovation in the warehousing and distribution sector (e.g., more efficient land use, zero-emission vehicle fleets, etc.). SANDAG will be initiating the “San Diego and Imperial Counties Sustainable Freight Implementation Strategy” (Strategy) in early 2022 to identify regional strategies that transition the region to a more sustainable, efficient, equitable, and economically competitive freight transportation system. SANDAG will consider these suggestions when developing this Strategy and will work with our local partners on vetting the Strategy’s recommendations. The projects and policies identified in this Strategy will be incorporated in future regional plans.

L105 Value pricing of public parking facilities is key to facilitating efficient use of these resources, generating revenue for local transportation improvements, encouraging alternative modes of transportation, and motivating efficient use of private parking facilities. While parking pricing is largely within the authority of local jurisdictions, SANDAG can support localities in navigating the technical and political challenges of implementing value pricing programs. Parking Management is one of the key policy areas included in the Draft 2021 Regional Plan. As part of the Regional Plan, SANDAG has designated program funding towards working with local jurisdictions to implement parking management strategies such as managing parking resources to provide jurisdictions with guidance on implementing parking policies, such as the 2014 Parking Management Toolbox. One of the Regional Plan implementation strategies includes updating the Toolbox to account for newer modes and more flexible curb space strategies.

L106 Performance monitoring, as illustrated in Table 31, should include public health benchmarks, particularly those that provide insight on the public health impacts of air pollution, lack of access to healthy food, sedentary lifestyles, etc. SANDAG relies on partner agencies for tracking public health benchmarks, including the San Diego County Air Pollution Control District, San Diego Food Systems Alliance, and Health and Human Services Agency.

L107 In Figure A.1, SR 76 and SR 78 are identified as significant corridor geographies, while SR 56, SR 94, and SR 125 are identified as such. The Planning Division recommends that these two important regional roadways be identified in the same manner as other east-west highways in the region. All corridors identified in the Regional Plan are critical and considered significant to ensure that the Regional Plan vision meet state and federal air quality mandates, reduce traffic congestion, and address social equity. Figure A.1 reflects the focus corridors of the areas of the five Comprehensive Multimodal Corridors (CMCP) that are currently under development, as well as the anticipated study areas for future corridor plans and the North Coast Corridor. SR 78 between I-5 and I-15 and the western portion of SR 76 are included in the North County CMCP and are shown in the orange area on Figure A.1.

L108 As identified in Table A.1, the Inland Rail Trail (IRT) through Oceanside is not shown as being implemented until 2035. The IRT is a crucial component of the North County bicycle trails network, facilitating access to NCTD Sprinter rail and Breeze bus services, connecting cyclists to the Coastal Rail Trail, activating north south bikeways (e.g., El Camino Real, College Boulevard), and contributing to complete streets improvements within the Oceanside Blvd corridor. The Planning Division recommends that the Draft Regional Plan commit to implementation of this segment of the IRT by 2025. SANDAG is committed to completing the Inland Rail Trail. The Oceanside segment is identified as the final segment of the Inland Rail Trail to be completed, consistent with the Bike Early Action Program (EAP). SANDAG is actively pursuing opportunities to advance active transportation projects through grant funding, using Demand-Based Criteria to prioritize project implementation, and integrating bike projects into Comprehensive Multimodal Corridor Plans. Recently, the Board of Directors approved $12.057 million of Active Transportation Program Cycle 5 (ATP) grant funds for Inland Rail Trail Phase 4 (CIP No. 1223095). That funding will help SANDAG meet the very aggressive schedule to begin construction on this Phase by 2024.

L109 The Planning Division recommends that acquisition of land in mobility hub areas be identified as a higher priority, as property aggregation will be key to efficient redevelopment of many of these areas. Some land acquisition may be necessary to implement elements of the regional mobility hub concept if future transit station locations are being proposed. SANDAG will work closely with the City of Oceanside should this need be identified. However, we also recognize near-term opportunities to work with existing rights-of-way at transit stations to retrofit curbside space for active passenger and small goods delivery in addition to siting supporting amenities like wireless electric vehicle charging, interactive travel kiosks, improved shelter equipped with WiFi, and more. Additional land use redevelopment opportunities may be identified in partnership with the private sector to convert surface parking to mixed uses that integrate shared mobility service accommodations, for example.

L110 The extension of Meltrose Drive and the interchange at Highway 78 and Rancho del Oro are not listed among the arterial improvements in Table A.13. Both of these improvements are listed in the City’s Circulation Element (CE). While the City is currently contemplating removal of the extension from Santa Fe Avenue to Spur Avenue from the CE, the unconstructed segment between North River Road and State Route 76 will remain. The SANDAG Shoreline Preservation Working Group is a long-standing advisory group to the Regional Planning Committee on critical shoreline issues, including the development of the 2021 Regional Plan. Paramount is continued support for the region's ongoing and future beach nourishment efforts and other sea-level rise adaptation strategies.

L111 Implementation Action 9 calls for expansion of regional programs on low-carbon transportation options, roadway safety and maintenance, and nature-based climate solutions. While the Planning Division supports nature-based climate solutions where feasible, we note that certain stretches of the region’s coastline face imminent threat from coastal hazards and are not amenable to nature-based solutions. The Planning Division encourages SANDAG to support near-term coastal adaptation measures that address urgent local conditions and buy time for the development and implementation of long-range adaptation strategies.

L112 In addition to the enumerated strategies to increase housing availability and affordability (p. 19), the Planning Division encourages SANDAG to consider gap financing for inclusionary housing projects that do not qualify for tax credit financing and/or other federal and state subsidies. In determining eligibility for gap financing, SANDAG should consider key sustainability metrics - e.g., proximity to transit, employment, and essential services, energy efficiency and renewable energy sourcing, pedestrian-oriented design, resilient building materials, etc. SANDAG is currently developing a Regional Housing Incentive Program and will take several factors into consideration to ensure the program meets the goals of the 2021 Regional Plan. The program will consider climate change and resiliency and consistency with transportation improvements included in the 2021 Regional Plan. Furthermore, SANDAG is developing a new grant program focused on accelerating housing production and have identified potential regional projects such as establishing a regional framework to potentially raise, administer, and allocate funding for affordable housing in the San Diego region. Additionally, Table A.13 consists of near-term arterial projects that are included the Regional Transportation Improvement Program (RTIP) and require Air Quality Conformity analysis. The projects mentioned here are either not currently listed in the RTIP or have not programmed funding to a capital project phase and therefore are not listed.

<tbody>
<tr>
<td>L113</td>
<td>The Planning Division applauds SANDAG for recognizing that the relatively low resale value of certain electric vehicles presents an opportunity for lower-income households to enter the electric vehicle market. SANDAG can further support EV ownership in low-income and historically disadvantaged communities by coordinating with dealerships in the region on marketing and financing programs.</td>
<td>SANDAG will be developing a regional zero emission vehicle (ZEV) incentive program to help low- and moderate-income households purchase electric vehicles. The program is to support the purchase and/or lease of over 100,000 ZEVs by 2035. As part of the program design and implementation, SANDAG plans to engage with car dealerships and/or car associations, as well as coordinate with other vehicle incentive program administrators to enable consistent messaging and information for residents, dealerships and other stakeholders. These incentives will be in addition to other financing and incentives available in the region. As part of the ZEV incentive program development, SANDAG also will explore opportunities to incentivize secondary market (used) vehicles.</td>
</tr>
<tr>
<td>L114</td>
<td>The “Fix It First” implementation strategy is described as “bringing transit and road infrastructure back to optimal performance.” The Planning Division questions the notion that the region’s mobility infrastructure has ever demonstrated “optimal performance.” Perhaps a better catch-phrase here would be something akin to “Build Back Better,” as this speaks to more than just perpetuating the status quo.</td>
<td>Thank you for your comment.</td>
</tr>
<tr>
<td>L115</td>
<td>In its consideration of tools and strategies that provide for the effective operation and management of regional infrastructure as a coordinated system, SANDAG should work closely with local jurisdictions to identify, enhance, and integrate local data collection and traffic management programs into a regional whole. The City of Oceanside maintains a Traffic Management Center that, with adequate staffing, has the potential to provide real-time traffic data to support signal optimization and other efficiencies.</td>
<td>SANDAG looks forward to coordinating with Oceanside on data collection and traffic management programs.</td>
</tr>
<tr>
<td>L116</td>
<td>The Planning Division is concerned that the most recent iteration of the regional population forecast may significantly underestimate Oceanside’s capacity for additional population, housing, and employment. We understand that the statewide forecast prepared by the Department of Finance shows considerably less growth in the San Diego region over the next three decades than previously anticipated, and we acknowledge that population and housing growth in Oceanside has been declining over the past 20 years. Nevertheless, housing demand in Oceanside remains strong, and the City is still one of the most affordable housing markets in the San Diego region. Moreover, the local employment base continues to grow, particularly in the manufacturing, healthcare, and hospitality sectors. We believe Oceanside has the potential to accommodate significant growth through infill and redevelopments, and that the revitalization of the City’s urban corridors will draw new residents and employers. The City’s outdated General Plan has likely contributed to low growth projections over the past three forecast periods (2008, 2012, and 2016). The City is currently in the process of updating its General Plan, with the intent to incentivize infill and redevelopments through new zoning standards, a streamlined review process, CEQA clearance, and targeted infrastructure improvements.</td>
<td>SANDAG looks forward to continuing to coordinate with the City of Oceanside to incorporate latest planning assumptions into future updates of the Regional Plan.</td>
</tr>

<td>SANDAG needs to clarify how the Draft EIR, Response to Comments and Adoption will be completed this year and what will occur if they are not completed by the end of this year. SANDAG should also clarify how comments on the plan are going to be addressed in the Draft EIR prior to its release.</td>
<td>The Draft EIR analyzes the draft Regional Plan. Comments and responses received on the Draft Regional Plan will be provided in the Final Regional Plan and inform the Final EIR. SANDAG’s schedule calls for the Board of Directors to consider EIR certification and adoption of the Regional Plan by the end of the year.</td>
</tr>
<tr>
<td>L118</td>
<td>Looking at the detailed data provided by SANDAG it is not clear why the citywide numbers only show moderate increases in population. See comments provided by the City’s Planning Division.</td>
<td>As noted in comments from the City’s Planning Division, the regional population forecast prepared by the California Department of Finance shows less growth over the next 30 years than previously anticipated.</td>
</tr>
<tr>
<td>L119</td>
<td>In Appendix A: Transportation Projects, Programs, and Phasing, it should be noted that Trips to and from school sites result in a significant congestion, VMT generation, and peak hour delay throughout the region. Additional funding and projects should be recommended with a specific focus on improving safety and multimodal access in and around school sites along with programs to incentivize non-single occupancy vehicle trips to schools.</td>
<td>Both the Appendix A “Mobility Hubs” and “Policies and Programs” section include investments that would benefit school sites and school access. Within the “Mobility Hub” investments, there are Complete Streets assumptions to make streets safer for people who walk and bike by investing in traffic calming and pedestrian improvements. Under “Policies and Programs” the plan includes in Vision Zero programming that prioritizes safety through roadway design while working with cities to develop community engagement programs that identify local street safety issues and provide technical guidance to resolve those issues through investment, policies, and programs.</td>
</tr>
<tr>
<td>L120</td>
<td>Considering FHWA’s project for Accelerating Roundabout Implementation in the United States, and the County of San Diego Air Pollution Control Board’s support for implementing roundabouts to address GHG and reduce fatalities, the Plan should incorporate policies to promote roundabouts over signalized intersections and include a line item under the Complete Corridors to fund the construction of roundabouts at new locations and replace signalized intersections when found feasible.</td>
<td>Roundabouts, curb extensions, and similar traffic calming measures are included in the Mobility Hub complete streets investments as a means for slowing vehicular traffic in neighborhoods where a higher volume of multimodal travel to/from key destinations, particularly active transportation, is anticipated.</td>
</tr>
<tr>
<td>L121</td>
<td>Descriptions of the following projects are insufficient. In order to provide comments, the City requests that SANDAG provide more detailed project description, information and clarifications for the following projects:</td>
<td>For the projects listed in this comment (1–4) the cost estimates are a planning-level determination for designing and building an All Ages and Abilities bikeway facility type either on-street, or off. These estimates are based on the most recently competed SANDAG bikeway projects in $2020 then applied consistently.</td>

<td>L124</td>
<td>The City of Poway would like to see vehicle, bike, pedestrian and transit infrastructure improvements and connections to be added from the Highway 67 through Scripps Poway Parkway to the I-15 Freeway. I have spoken to several property and business owners in the South Poway Business Park (SPBP) including Geico and parking is a constant issue. There is currently no public transit route into the SPBP. Having public transit, bike, pedestrian and highway/road improvements/connections providing better more efficient access to the SPBP is essential for future employment growth in the area. Many workers in the Poway area live in Ramona and East County and this is a vital connection for the City and the Region. SANDAG has also identified Scripps Poway as a Tier 3 employment center in their draft Employment Center analysis. Construction is also underway to add thousands of more employees in the SPBP. To be clear, we are recommending that Scripps Poway Parkway become a critical connection and a multimodal corridor (<a href="https://www.sandag.org/uploads/publication/publication_id_4720_28341.pdf">https://www.sandag.org/uploads/publication/publication_id_4720_28341.pdf</a>).</td>
<td>The San Vicente Comprehensive Multimodal Corridor Plan (CMCP) effort is currently underway. The CMCP will include a suite of solutions for consideration in future planning, implementation, and improvement activities along the corridor, including Highway 67 connections with Poway Road and Scripps Poway Road, respectively. The CMCP will include active transportation, clean transportation, transit, resilience and environment, right-of-way and utilities, equity, and evacuation considerations. The CMCP stakeholder working group includes representation from the City of Poway, which is intended to integrate jurisdictional priorities into the suite of solutions within the boundaries of the CMCP planning area. Your comment has been forwarded to San Diego Metropolitan Transit System (MTS).</td>
</tr>
<tr>
<td>L125</td>
<td>Regarding the Hwy 67, please note that the City of Poway’s General Plan Transportation Element includes a multi-use path on the west side of SR-67 (reference p.3 <a href="http://docs.poway.org/weblink/0/doc/50446/Electronic.aspx">http://docs.poway.org/weblink/0/doc/50446/Electronic.aspx</a>). This multi-use path would include a separated two-way bike path and a fenced DG equestrian trail. The multi-use path provides a critical and safe pathway for bikers, bikers, runners, walkers, children, and equestrians. A multi-use path also creates a necessary loop between the City’s Iron Mountain trailhead and other destinations (e.g., Mt. Woodson, Lake Poway) which is also a goal within the Transportation Element. We recommend the San Vicente corridor plan is consistent with the City’s plans.</td>
<td>The San Vicente CMCP will consider all relevant and related plans and projects, in collaboration with City of Poway staff, to ensure there is cohesion between the CMCP and the communities within and adjacent to it, including active transportation considerations.</td>
</tr>
<tr>
<td>L122</td>
<td>The City requests that the following two projects be added to the Regional Plan: A. A connection between the west and east side of I-15 at the SR-78 interchange for bicycle and pedestrian traffic. Under existing conditions, there is no safe access for bicyclists and pedestrians across I-5 in this area. B. Bike infrastructure improvements on SR-76, as repeatedly requested by Caltrans and the City of Oceanside.</td>
<td>A. While this alignment is not in the Regional Bike Network, there are opportunities for the development of protected bike network via “Complete Streets in Mobility Hubs” funding, which is intended to fund retrofits to facilitate short trips of less than 3 miles in a safe and comfortable way to make it easier and more attractive to choose active transportation. This connection you’ve described falls within the Oceanside Mobility Hub. B. Parallel and in close proximity to this highway, the Regional Bike Network serves this corridor and destinations via the All Ages and Abilities existing facilities along the San Luis Rey River Trail which is proposed for extension as project AT113 specifically.</td>
</tr>
<tr>
<td>L123</td>
<td>The recommendations made in this section are the results of a conceptual community workshop on what might be considered, and the following recommendations mentioned in this appendix as a result of this workshop shall by no means be construed as the City of Oceanside’s official request and/or recommendations: A. Ocean side Boulevard reduced to two lanes with protected bikeways. B. The Strand closed to vehicle traffic and available only for bikes and pedestrians.</td>
<td>The Network Planning Workshop was considered an exploratory exercise and the summary memo includes the following language on page 9: “Disclaimer: The principles presented in this workshop are not intended to be fully developed policies, but rather inspiration for an integrated approach to safe and active mobility network solution. Similarly, the workshop outcomes included may not meet local practices and are not intended to be implemented networks, but rather conceptual prototypes to better understand the active transportation network process.”</td>
</tr>

<tbody>
<tr>
<td>L126</td>
<td>State Route 67 is also designated as a scenic roadway by the Poway General Plan. As a part of the General Plan requirements, a 50-foot wide landscape open space easement is required from adjacent property owners from the ultimate right-of-way line along State Route 67 when development is proposed. This easement shall be landscaped and modified as needed to enhance the scenic quality of the area as discussed in the General Plan Transportation Element Policy B – Scenic Roadsides. Providing scenic roadway elements to the design will also help the corridor be more compatible with surrounding open space. To contribute to the General Plan goals, we would suggest that the right-of-way incorporate design elements consistent with a scenic roadway (e.g., naturalized decorative solid walls, native landscaped medians and shoulders, additional landscape areas and trees where feasible, earthen berms). The CMCP study identifies ways to improve roadway safety, enhance the urban-rural transportation interface (with special consideration given to limiting impacts on surrounding environmental habitats and wildlife), engage with tribal nations, and create greater trip reliability and efficiency throughout the study area while supporting climate action initiatives. The suite of solutions will include active transportation, clean transportation, transit, resilience and environment, right-of-way and utilities, equity, and evacuation considerations. The City of Poway is an integral member of the stakeholder working group and in the development of the CMCP.</td>
<td></td>
</tr>
<tr>
<td>L127</td>
<td>As discussed, a multi-modal transportation system provides users transportation options and choices and thereby reduces traffic congestion and GHG emissions. Regional multi-use paths have been a great asset to communities across the country. Here in San Diego, the SR-56 Bike Path is separated from the highway and is often used by runners, walkers, and equestrians. In contrast, it is uncommon to see bikers, walkers, and equestrians in a bike route adjacent to a highway (for instance, SR-76). A multi-use path is also kid friendly because of the separation from the highway and kids are often seen on the SR-56 Bike Path and not commonly seen within bike routes adjacent to a Highway. The multi-use path also accommodates a more rural aesthetic and is safer for users. Multi-use paths have become a critical component to the transportation system and are treasured by the communities they are a part of. The addition of the multi-use path along Hwy 67 is more consistent with the goals and policies of the 2050 RTP. We recommend the San Vicente corridor plan provides a separated mixed-use path throughout the full length of the corridor. The虚ural open house held on June 16, 2021 was titled County Unincorporated and included connections to adjacent cities, including Poway. In the future, we will be clearer about areas covered in each sub-regional workshop. The San Vicente CMCP will consider all relevant and related plans and projects, in collaboration with City of Poway staff, to ensure there is cohesion and consistency between the CMCP and the communities within and adjacent to it, including active and multi-modal transportation considerations.</td>
<td></td>
</tr>
<tr>
<td>L128</td>
<td>Lastly, during the workshop portion for the Draft 2021 Regional Plan, workshops were provide by area (North, East, Central, etc.). Based on the mapped areas shown, Poway residents and community stakeholders were not represented as a part of any region and that outreach with appropriate comment period should be provided prior to moving forward with Draft. I'd be happy to assist you with what an appropriate outreach should be. The virtual open house held on June 16, 2021 was titled County Unincorporated and included connections to adjacent cities, including Poway. In the future, we will be clearer about areas covered in each sub-regional workshop.</td>
<td></td>
</tr>
</tbody>
</table>

City of San Diego

| L129 | I am writing to express the City of San Diego’s support for SANDAG’s San Diego Forward: The 2021 Regional Plan (2021 Regional Plan). The 2021 Regional Plan is a major step towards reducing vehicle miles traveled by single occupant vehicles and greenhouse gas (GHG) emissions in the region by incorporating five transformational strategies which will be critical to enabling the City of San Diego to implement its Climate Action Plan. The City applauds SANDAG’s commitment to making infrastructure and technological investments in the mobility system with a greater emphasis on accessibility, transit, bicycling and walking as well as innovative and bold strategies to manage demand on regional roadways prioritizing safety and aligning with the City’s commitments to Vision Zero. The City’s General Plan is consistent with the 2021 Regional Plan as both focus on development within vibrant mixed-use village centers served by high frequency transit. The City supports the 2021 Regional Plan’s intent to preserve open space from non-sustainable development. The City looks forward to closely working with SANDAG to implement the strategies described in the 2021 Regional Plan. Thank you for your support of the 2021 Regional Plan. SANDAG looks forward to working closely with the City of San Diego to implement the strategies of the plan and achieve our shared goals. |

| L130 | The City supports the 2021 Regional Plan’s vision to improve the transportation network in the region especially the planning and implementation of a complete network of efficient, convenient, and reliable transit services that connect people from where they live to where they work or go to school. The development of a dynamic management system of traffic flow and transit services, facilities for bicycles, scooters, pedestrians, and flexible micro transit, offer an equitable approach to first and last-mile connections to transit, a vision zero strategy to address safety, and implementation of the City’s Climate Action Plan. SANDAG looks forward to collaborating with the City to implement the 2021 Regional Plan and support implementation of the City’s Climate Action Plan. |

| L131 | The City also supports the 2021 Regional Plan’s development of mobility hubs throughout the region. As part of our land use planning efforts, the City is providing policies to support the implementation of hubs as vibrant centers of activity where future housing and employment growth are connected by transit. The San Ysidro and Central mobility hubs are critical transportation facilities and having a direct connection to the U.S.-Mexico Border and San Diego International Airport is a vital step towards having a transit system that meets the needs of residents and visitors. SANDAG sees the City as a key partner in developing mobility hubs, including the critical facilities at San Ysidro and the Central Mobility Hub. |

| L132 | The City shares the 2021 Regional Plan’s goal to provide better transit access and housing opportunities in employment centers. Over the past two years, the City has adopted updated Mission Valley and Kearny Mesa Community Plans to accommodate more housing and existing and future transit improvements in high employment centers. We are also in the process of updating our community plans for University and Mira Mesa (Sorrento Mesa) which include major high-tech and biotech employment centers. These plans focus additional housing opportunities along existing and planned transit lines needed to support continued economic prosperity. Downtown San Diego has experienced a high level of residential growth as well as a recent resurgence of employment growth. The success of future housing and job growth in these employment centers is predicated on the implementation of rail SANDAG agrees that the City’s work to update community plans have been critical to advancing goals of accommodating more housing near transit and employment centers. We look forward to working together on integrated land use and transportation solutions. |
Draft 2021 Regional Plan Responses to Comments – Letter Sourced

<table>
<thead>
<tr>
<th>ID</th>
<th>Comment</th>
<th>Response</th>
</tr>
</thead>
<tbody>
<tr>
<td>L133</td>
<td>The City strongly supports efforts to increase mobility options including the development of high frequency transit in communities with increased transit infrastructure and service needed to provide convenient access to job centers. The City recommends that SANDAG identify the planning and engineering of the commuter rail (purple line) between San Ysidro and Sorrento Valley, separation of existing light rail at-grade crossings, dedicated and/or flex lanes for Rapid Bus routes within the City, as well as double tracking the LOSSAN corridor as shovel ready projects for future state and federal funding.</td>
<td>The 2021 Regional Plan includes the recommendations in this comment. SANDAG will continue to pursue state and federal funding for these projects.</td>
</tr>
<tr>
<td>L134</td>
<td>The San Ysidro and Barrio Logan communities are affected by truck emissions due to their proximity to the U.S.-Mexico border crossing and the Port of San Diego respectively. The 2021 Regional Plan addresses the needs for air, rail, and port goods movement and smarter border strategies to support trade and international commerce. The City supports San Diego Forward’s goals and policies to reduce air pollution which are needed to meet federal air quality conformity requirements and improve some of our most underserved, low-income communities.</td>
<td>The 2021 Regional Plan includes strategies to reduce pollution exposure in disadvantaged communities. This analysis is attached to Appendix A of the proposed final 2021 Regional Plan.</td>
</tr>
<tr>
<td>L135</td>
<td>The City has a long history of planning together with SANDAG to create a land use pattern and transportation network that facilitates greater mobility and increased connectivity between employment and housing. The City encourages SANDAG to continue funding the Smart Growth Implementation Program which provides needed funding for planning and capital projects that support the implementation of the Regional Plan. We have included additional recommendations attached to this letter for SANDAG’s consideration and look forward to partnering with SANDAG on its new Housing Incentive Program to achieve the goals of the Regional Housing Needs Assessment Plan. We are committed and look forward to a continued partnership with SANDAG on the long-term implementation of the San Diego Forward: The 2021 Regional Plan.</td>
<td>The 2021 Regional Plan includes expanded funding for planning and capital grant programs for member agencies. SANDAG looks forward to partnering with the City on the Housing Incentive Program and other efforts to implement the Regional Plan.</td>
</tr>
<tr>
<td>L136</td>
<td>The City supports the planning and implementation of future rail projects identified in the 2021 Regional Plan. Appendix A, page A-15 on the note on the bottom of the page, please clarify if the purple commuter rail should be route 582 and not 581 as noted. Commuter rail route 581 as identified on page A-29, project TL-01 is Downtown to/from La Mesa projected to be in the 2050 transit network.</td>
<td>Thank you for this comment, this correction has been made.</td>
</tr>
<tr>
<td>L137</td>
<td>The future purple commuter rail connection would provide access for people throughout the communities within the southern and central portion of the City to employment centers in Kearny Mesa, University, and Sorrento Mesa. The City recommends considering alignment and station options that would serve the Mid-City communities and SDSU West at Mission Valley. We look forward to working with SANDAG in reviewing ridership information/forecasts based on different proposed alignments for the entire line including with and without stations serving the Mid-City communities and SDSU West.</td>
<td>SANDAG will be engaging with City staff during the advanced planning phase of the Purple Line which will finalize station locations and more ridership analysis.</td>
</tr>
<tr>
<td>L138</td>
<td>The City looks forward to working with SANDAG in evaluating options for grade separation of existing light rail at-grade crossings within the City.</td>
<td>Evaluating options for grade separations will be done in coordination with the City.</td>
</tr>
<tr>
<td>L139</td>
<td>The City recommends implementing near-term operational improvements such as the use of restripping for providing dedicated and/or flex lanes for Rapid Bus routes while planning for long-term capital improvements. We look forward to working with SANDAG in evaluating near-term and long-term options for dedicated and/or flex lanes for Bus Rapid routes.</td>
<td>SANDAG looks forward to working with the City to evaluate and implement dedicated and/or flex lanes for Rapid Bus routes. Many of the Rapid routes will be fully built in 2035 and 2050 as described in the tables in Appendix A, while some of the Rapid routes will be expedited to open sooner in 2025 with a “light version” (Phase I). The light version of Rapid is meant to allow for a Rapid route to operate with minimal capital investment using existing bus stops. The full version of Rapid will build up the route’s amenities with improved shelters, bus guideways, and/or other transit priority measures.</td>
</tr>
<tr>
<td>L140</td>
<td>The City recommends including the Via Las Cumbres/I-8 Interchange/Hotel Circle North &amp; South/Fashion Valley Road project in the list of proposed projects in Appendix A. As a regionally significant project that provides freeway and active transportation connections to two light rail transit stations and the San Diego River Trail. This will support the recently adopted Mission Valley Community Plan which increasing housing opportunities near the existing light rail stations.</td>
<td>Interchange improvements along the I-8 corridor will be explored as part of the I-8 Comprehensive Multimodal Corridor Plan and during development of the I-8 Managed Lanes project. SANDAG will coordinate with the City on these efforts to ensure the needs of the Mission Valley community are met.</td>
</tr>
<tr>
<td>L141</td>
<td>While the City supports increasing the amount of Transit Priority Areas (TPAs), the City requests that the existing TPAs be maintained in the 2021 Regional Plan. The TPAs are a critical part of the City planning process for future development to help meet out Climate Action Plan goals for the reduction of vehicle miles traveled. Maintaining future transit routes and the TPAs provides consistency in our land use and mobility planning efforts.</td>
<td>The 2021 Regional Plan expands Transit Priority Areas (TPAs) and includes Mobility Hub areas that align with TPAs to facilitate future development that supports Climate Action Plan goals.</td>
</tr>
</tbody>
</table>

City of Solana Beach

- **Mobility Hubs** – Page 19 of Chapter 2 of the Draft Plan, the Sustainable Communities Strategy (SCS), describes planned “Mobility Hubs” as areas or communities in the region with “a high concentration of people, destinations, and travel choices” that “offer on-demand travel options and supporting infrastructure that enhance connections to high-quality Transit Leap services.” While the SCS seems to acknowledge that these Mobility Hubs can vary both in size and transit services. | A map and descriptions of the five different Mobility Hub types has been added to the proposed final 2021 Regional Plan.                                                                                                                                                                                                                                                             |
<table>
<thead>
<tr>

<th>Comment</th>
<th>Response</th>
</tr>
</thead>
<tbody>
<tr>
<td>L143</td>
<td>Additionally, by virtue of the fact that the Solana Beach Train Station is within 2½ miles of the cities of Del Mar, Encinitas and San Diego and the County of San Diego, this regional Coastal Mobility Hub Area in the Adopted Plan should, for purposes of planning for future housing and job growth, extend into and cover the City of Del Mar and the Del Mar Fairgrounds and areas of the cities of Encinitas and San Diego and the County of San Diego immediately adjacent to Solana Beach.</td>
<td>The coverage area of each regional Mobility Hub is based on a data-informed propensity analysis carried out in parallel with Transit Leap routing assessment. The analysis leveraged Census Block Group geographies to assess which areas were most conducive to hubs based on factors including current and forecasted population and jobs, proximity to major destinations, community of concern coverage, levels of short trip-making, etc. While these regional Mobility Hub coverage areas have been used to model the impact Transit Leap and Flexible Fleet trips to/from these hubs have on reducing vehicle miles traveled, they do not restrict Flexible Fleets from serving neighborhoods that may be between or beyond hubs. Some Flexible Fleet services operating within regional hubs will also need to reach outlying destinations like the set of beach and shopping communities cited in this comment. There will be many opportunities for Flexible Fleets to connect to Transit Leap stops located along routes in between hubs. The same applies to improvements on Complete Corridor arterials (e.g., Lomas Santa Fe, Via de la Valle) connecting to and from hubs. As SANDAG collaborates with cities on Regional Plan project and policy implementation in the years to come, conceptual mobility hub boundaries will be refined while taking into consideration city corridor and land use planning goals and policies, similar to what has already begun as part of the Comprehensive Multimodal Corridor Plans (CMCP) planning and design process. More detailed network-level analysis will be needed within each Mobility Hub to finalize detailed Transit Leap routing, Complete Corridor cross-sections, Flexible Fleet pilots, and supporting technologies.</td>
</tr>
<tr>
<td>L144</td>
<td>Transit Leap Services – As noted above, the Propensity Analysis discussed in Appendix T for both Transit Leap Services and Mobility Hubs determined that Solana Beach and its Train Station were at the lower end in the region both in meeting the needs of transit riders now and in the future and for suitability as a Mobility Hub. While the City acknowledges that the presence of the Train Station in Solana Beach might make it reasonable to include a potential future Mobility Hub in the Adopted Plan, during the recent Regional Housing Needs Assessment (RHNA) allocation process, the City also made it clear that, both now and in the near term, the Train Station does not currently provide adequate Coaster or Amtrak headways, nor does it provide meaningful connections to other transit services to be considered a Mobility Hub now. Indeed, despite the North County Transit District (NCTD) Board recently voting to increase Coaster service beginning in October 2021, such a designation is still largely aspirational. While, again, the City acknowledges that the Draft Plan and the Adopted Plan are just that – a plan for the future – Appendix A of the Draft Plan – Transportation Projects, Programs, and Phasing – appears to support this position. Table A.5 (Interstate 5 North Coastal Corridor) identifies one Transit Leap project (TL40) – Rapid 473 – for implementation in the year 2035. Similarly, Table A.9 (State Route 56) identifies one Transit Leap project (TL006) – Rapid 103 – for implementation in the year 2050. These 15 to 30-year forward-looking Transit Leap projects, while helpful for the future, do not appear to satisfy the near-term objectives of a Coastal Mobility Hub.</td>
<td>Flexible Fleets are envisioned to not only provide connections to existing and future Transit Leap services but also supply seamless on-demand travel options to and from regional mobility hub areas in the near-term. Given NCTD’s interest in transitioning some BREEZE bus routes to a more on-demand service model, there will be opportunities to pilot a variety of pooled ride and micromobility options prior to longer-term Transit Leap investments. Rapid 473 is slated to be implemented as soon as 2029, and the 103 in 2040 (2029 and 2040 are Air Quality Conformity phase years).</td>
</tr>
</tbody>
</table>

In order to justify the designation of the Solana Beach Train Station as a Coastal Mobility Hub, both now and in the future, immediate Transit Leap service connections should be considered for inclusion in the Adopted Plan. |
### Draft 2021 Regional Plan Responses to Comments – Letter Sourced

<table>
<thead>
<tr>
<th>ID</th>
<th>Comment</th>
<th>Response</th>
</tr>
</thead>
<tbody>
<tr>
<td>L145</td>
<td>Appendix B: Implementation Actions – Appendix B provides detail on commitments and key actions to implement elements and strategies of the Draft Plan. Key to this objective is the involvement of and coordination with each member agency as they are most knowledgeable of the needs of their respective communities. Indeed, Near-term Implementation Action No. 2 in Table B.1 identifies the need to partner with local governments to develop five initial Comprehensive Multimodal Corridor Plans (CMCPs). Therefore, the City requests that the following minor edits to Appendix B (page 16) under “Land Use and Regional Growth” be included:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>“The 2021 Regional Plan vision for land use focuses on development and growth in Mobility Hub areas urbanized areas near jobs to preserve San Diego’s open space and support transportation investments by reducing vehicle miles traveled (VMT). Mobility Hubs are an opportunity to provide housing to address the Regional Housing Needs Assessment. Land use authority is reserved to local jurisdictions because they are best positioned to effectively implement the objectives outlined in the 2021 Regional Plan through understanding of the unique needs of their communities and geographies. Because land use authority is reserved to local jurisdictions, SANDAG will leverage efforts in line with the 2021 Regional Plan.”</td>
<td></td>
</tr>
<tr>
<td></td>
<td>The proposed final 2021 Regional Plan includes similar edits to Appendix B that acknowledge the importance of coordination with each member agency on land use and regional growth given that land use authority is reserved to local jurisdictions.</td>
<td></td>
</tr>
<tr>
<td>L146</td>
<td>Regional Housing Needs Assessment – Following adoption of the Draft RHNA allocation by the SANDAG Board in September 2020, appeals of the allocation were filed by the cities of Coronado, Imperial Beach, Lemon Grove and Solana Beach. In order that these appeals are correctly noted for the record, there are two locations in the Draft Plan to which a clarifying footnote and additional language should be added to the Adopted Plan. Specifically, the City requests the following for the Adopted Plan:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>On page 33 of the Draft Plan, after the sentence: “The SANDAG Board of Directors adopted the RHNA Plan on July 10, 2020, with the final housing unit allocation” the following footnote should be added:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>*In September 2020, the cities of Coronado, Imperial Beach, Lemon Grove and Solana Beach filed a Petition for Writ of Mandate in San Diego Superior Court challenging, among other things, the Board’s adoption of the RHNA Plan. SANDAG demurred to the cities’ Petition and the demurrer was sustained by the court in February 2021. The petitioning cities have appealed the ruling on the demurrer to their Writ Petition, and that appeal remains pending in the Fourth District Court of Appeal. On page 14 of Appendix K (Regional Housing Needs Assessment Plan), the following paragraph should be added to the end of this page/section:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>On September 24, 2020, the cities of Coronado, Imperial Beach, Lemon Grove and Solana Beach filed a Petition for Writ of Mandate in San Diego Superior Court, Case No. 37-2020-00033974-CU-MC-CTL against SANDAG and SANDAG’s Board of Directors seeking an order requiring that SANDAG give those cities a fair hearing on their RHNA appeals and provide the cities’ appeals in a legal manner without bias and without the use of the weighted voting mechanism. Specifically, the petitioning cities asked the court to order: (1) that the final RHNA allocation approval by SANDAG be rescinded; (2) that SANDAG’s denial of the cities’ RHNA appeals be rescinded; (3) that the appeals be remanded to SANDAG for fair consideration; and (4) that SANDAG be prohibited from utilizing a weighted vote on the cities’ RHNA appeals. On February 5, 2021, SANDAG’s demurrer to the Petition for Writ of Mandate was sustained by the Superior Court. The petitioning cities have appealed the ruling on the demurrer to their Writ Petition. That appeal remains pending in the Fourth District Court of Appeal. So long as the litigation is pending, the Board’s adoption of the RHNA Plan cannot be considered final.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Similar language has been added to the introductory pages of Appendix K, Regional Housing Needs Assessment Plan.</td>
<td></td>
</tr>
</tbody>
</table>

### Cleveland National Forest Foundation/Save Our Forest and Ranchlands

<p>| L147 | Therefore, SOFAR and CNFF urge the SANDAG Board of Directors to include a Climate, Housing, Transit Alternative in the 2021 RTP update—an alternative focused on meeting both the housing needs and greenhouse gas (&quot;GHG&quot;) reduction goals for a qualified land use area that have been set collectively by the State of California, the City of San Diego, and SANDAG: |
|     | - 40% reduction in GHG below 1990 levels by 2030 (California AB 32 and SB 32) |
|     | - 80% reduction in GHG below 1990 levels by 2050 (Governors Schwarzenegger and Brown) |
|     | - 25% reduction in per capita GHG from passenger cars and trucks relative to 2005 by 2035 (California SB 375; California |
|     | The 2021 Regional Plan aligns with many of the elements of the Climate, Housing, Transit Alternative while meeting all legal requirements of the Regional Plan. As the 2021 Regional Plan is implemented, SANDAG looks forward to continuing to advance efforts related to climate, housing, and transit. Section 6.5.3 of the Draft EIR presents reasons why the Climate, Housing, and Transit Alternative was not evaluated in detail in the EIR. The 2021 Regional Plan proposes a land use scenario that accommodates the Regional Housing Needs Assessment and, when combined with the transportation system, allows the region to meet its SB 375 greenhouse gas reduction target. Analysis of the 2021 Regional Plan’s consistency with other California |</p>

<tr>
<td>L148</td>
<td>Real estate developers and their allies are currently pressuring San Diego County to retain its unlawful and inaccurate thresholds for assessing VMT impacts under SB 743, claiming that mitigation for VMT impacts will make housing in more remote parts of the County unaffordable. But housing in these areas is already unaffordable when transportation costs—that is, costs of driving long distances from locations not served by transit—are taken into account. SANDAG can help facilitate a better approach through the RTP, one that encourages the County to plan for housing in areas where transportation costs are low rather than allowing developers to build in remote areas and then trying to “mitigate” for the resulting VMT. The answer to housing affordability is H+T affordability. It is building more housing in the H+T affordable light-colored areas and in expanding the supply of H+T affordable areas through increased transit service.</td>
<td>The area’s indicated in the figure provided are well-aligned with the mobility hub areas identified in the 2021 Regional Plan. While land use authority is reserved to local jurisdictions, the 18 cities and the County, SANDAG will work closely with jurisdictions to incentivize building of housing in the mobility hub areas. In coordination with the development of the proposed 2021 Regional Plan, SANDAG will embark on developing a housing incentive program, which will support jurisdictions in the development and adoption of policies and process improvements to accelerate housing production. The program will also look for ways to leverage funding from the State of California to provide more housing in the region and meet the goals of the 2021 Regional Plan.</td>
</tr>
<tr>
<td>L149</td>
<td>…In the past, the housing allocations have been aspirational but not enforced. The State has signaled that it plans to be more aggressive about enforcement during this cycle. SANDAG can help facilitate a better approach through the RTP, one that encourages the County to plan for housing in areas where transportation costs are low rather than allowing developers to build in remote areas and then trying to “mitigate” for the resulting VMT. The answer to housing affordability is H+T affordability. It is building more housing in the H+T affordable light-colored areas and in expanding the supply of H+T affordable areas through increased transit service.</td>
<td>SANDAG is developing a Regional Housing Incentive Program to meet the goals of the 2021 Regional Plan and assist local jurisdictions in achieving housing goals. SANDAG’s housing incentive program will include development of a regional anti-displacement strategy, and consider climate change and resiliency, availability of transit and active transportation, and consistency with the transportation improvements included in the Regional Plan. Additionally, SANDAG will coordinate with its Social Equity Working Group, tribal nations, and other interested stakeholders to ensure the housing incentive program promotes equity and addresses gentrification, displacement, and other issues.</td>
</tr>
<tr>
<td>L150</td>
<td>The recently-completed study concludes that the Miramar tunnel and rail line straightening would add a critical link to the LOSSAN rail corridor. See Exhibit 81 (Miramar Tunnel Feasibility Study). Critically, it finds that the feasibility criteria for the Miramar tunnel have been satisfied. Its specific findings include the following: 1. The project would increase discretionary passengers by 1,300 to 1,700 per day, thereby reducing annual VMT 200 million to 240 million miles and GHG by 70,000 to 84,000 tons. 2. The project would provide competitive travel times, including a transit system average clock time that is approximately 3% faster than the automobile. 3. The project would be cost competitive, with transit riders cost at $180/month versus automobile costs of $507/month. 4. The project has no fatal engineering flaws. The study further acknowledges a prior federal study that found construction of the Miramar tunnel along with other corridor improvements would reduce travel time between San Diego and Los Angeles to two hours. In short, construction of the new tunnel, which would provide enhanced access to downtown and the airport, would be a key transportation improvement for the region and the state. As the study notes, the LOSSAN rail corridor— together with the I-5 freeway— is the second-most traveled route in North America. The Miramar tunnel must be considered a key component of the Climate, Housing, Transit Alternative.</td>
<td>The Miramar tunnel is identified in the 2021 Regional Plan to support improvements to the Coaster and new commuter rail service.</td>
</tr>
<tr>
<td>L151</td>
<td>At the next level is a network of higher-speed, high frequency transit lines with separate rights of way and fewer stops. In many regions, a light rail service fills this niche, but in the San Diego region the Trolley has not filled this niche well. It</td>
<td>The 2021 Regional Plan proposes new commuter rail service and upgrades to existing light rail service, including grade separations and eliminating stops for express service.</td>
</tr>
</tbody>
</table>
Both the regional rail and higher-speed high-frequency tiers need to be well connected. The Climate, Housing, Transit Alternative must include an inter-modal terminal (Grand Central) connecting San Diego’s urban core, the Airport, the LOSSAN corridor, the Sprinter corridor, and the Trolley system. The Climate, Housing, Transit Alternative must also include efficient connections with frequent local buses (which could possibly be automated in the future). To this end, SANDAG must grapple with the first mile/last mile issue as this reflects a failure in land use and the existing transit system. While higher income travelers may have a choice of Uber-type services to solve this problem, this should not be viewed as a remedy for the average traveler.

The billions of dollars spent on freeway expansion the past 20 years have A) failed to reduce congestion, B) caused a substantial increase in VMT and GHG emissions, and C) resulted in a severe housing shortage. The transportation models used to justify these freeway expansion projects have been wrong on all counts. These models - both in the San Diego region and in regions throughout the U.S. – forecast dire increases in travel time if freeways are not widened, and substantial increases in travel time even if they are widened. In fact, as shown in Figure 9 (see attached letter for figures), travel time has stayed remarkably constant in the U.S. for decades. Figure 9 shows the “average time spent driving a private vehicle in a typical day.” There was an increase during the 1990s, a time when many women were joining the labor force, but since 2000 there has been little change. Time spent driving also is very similar across differently sized regions. There is evidence that people have a “travel time budget.” If travel speeds drop, they (on average) will adapt to travel a shorter distance. In contrast, if travel speeds increase, people (on average) will travel longer distances. This phenomenon is known as “induced travel”. In work for the California Air Resources Board (“CARB”), researchers at the University of California and the University of Southern California reviewed the literature on induced travel and concluded: “Thus, the best estimate for the long-run effect of highway capacity on VMT is an elasticity close to 1.0, implying that in congested metropolitan areas, adding new capacity to the existing system of limited-access highways is unlikely to reduce congestion or associated GHG in the long-run. The SANDAG regional transportation model fails to account properly for induced travel although there now are newer algorithms that could address this deficiency. Senate Bill 743 establishes VMT as the appropriate metric for determining the impacts of transportation projects. This has made properly accounting for induced VMT critical in the regulatory process. The Office of Planning and Research’s (“OPR”) Technical Advisory on Evaluating Transportation Impacts in CEQA recommends: Whenever employing a travel demand model to assess induced vehicle travel, any limitation or known lack of sensitivity in the analysis that might cause substantial errors in the VMT estimate (for example, model insensitivity to one of the components of induced VMT described above) should be disclosed and characterized, and a description should be provided on how it could influence the analysis results. A discussion of the potential error or bias should be carried into analyses that rely on the VMT analysis, such as greenhouse gas emissions, air quality, energy, and noise. The National Center for Sustainable Transportation at the University of California at Davis has produced an Induced Travel Calculator to help address the deficiencies in the models. Recently, Caltrans also has issued new draft guidance on accounting for induced travel. It recommends following the OPR recommendations: Caltrans recommends using the VMT analysis approaches recommended in OPR’s advisory when evaluating the transportation impacts of projects on the State Highway System (SHS). Neither expanding freeways nor not expanding freeways will have any effect on regional congestion or average travel times. However, expanding freeways will cause significant increases in VMT and GHG emissions, and will continue to starve the transit system of needed investments.

The 2021 Regional Plan proposes a Central Mobility Hub to connect the urban core, the Airport, the LOSSAN corridor, Trolley system, and many bus routes.

The 2021 Regional Plan proposes a land use pattern that focuses growth in the mobility hubs to align with transportation investments and facilitate more bikable and walkable communities. SANDAG is working closely with the City of San Diego to ensure the 2021 Regional Plan complements the City’s efforts to achieve the mode share goals of its Climate Action Plan.

Appendix D of the 2021 Regional Plan includes an induced demand analysis (as required by the California Air Resources Board) to be factored into estimated 2035 greenhouse gas emissions. This analysis utilized the Induced Demand Calculator referenced in the comment.

<td>Both the regional rail and higher-speed high-frequency tiers need to be well connected. The Climate, Housing, Transit Alternative must include an inter-modal terminal (Grand Central) connecting San Diego’s urban core, the Airport, the LOSSAN corridor, the Sprinter corridor, and the Trolley system.</td>
<td>The 2021 Regional Plan proposes a Central Mobility Hub to connect the urban core, the Airport, the LOSSAN corridor, Trolley system, and many bus routes.</td>
</tr>
<tr>
<td>L153</td>
<td>The Climate, Housing, Transit Alternative must also include efficient connections with frequent local buses (which could possibly be automated in the future). To this end, SANDAG must grapple with the first mile/last mile issue as this reflects a failure in land use and the existing transit system. While higher income travelers may have a choice of Uber-type services to solve this problem, this should not be viewed as a remedy for the average traveler.</td>
<td>The 2021 Regional Plan proposes an expanded network of Rapid buses and improvements to the local bus system to facilitate more frequent and longer spans of service. The proposed investments in Flexible Fleets will allow for more options to facilitate first mile/last mile connections to transit with solutions that can be customized for different communities (microtransit, ridesharing, bikeshare, etc.).</td>
</tr>
<tr>
<td>L154</td>
<td>Finally, the goal of a functional transit system is to serve an area-complete bike and walkable land use because no trip begins or ends on a transit vehicle. Most transit trips begin and end with a walk trip. In regions with high transit use, there are generally about twice as many walk trips as transit trips. Investments in walk and bike infrastructure should be a top priority. Consistent with the City’s Climate Action Plan, the Climate, Housing, Transit Alternative must model a 50% transit, walk and bike mode share for residents in the central core.</td>
<td>The 2021 Regional Plan proposes a land use pattern that focuses growth in the mobility hubs to align with transportation investments and facilitate more bikable and walkable communities. SANDAG is working closely with the City of San Diego to ensure the 2021 Regional Plan complements the City’s efforts to achieve the mode share goals of its Climate Action Plan.</td>
</tr>
<tr>
<td>L155</td>
<td>Building a real regional transit network will require all the region’s transportation investment dollars for the foreseeable future. The Climate, Housing, Transit Alternative must not include any freeway expansion.</td>
<td>Appendix D of the 2021 Regional Plan includes an induced demand analysis (as required by the California Air Resources Board) to be factored into estimated 2035 greenhouse gas emissions. This analysis utilized the Induced Demand Calculator referenced in the comment.</td>

<td>LS6</td>
<td>Given that transit in the San Diego region has been and continues to be severely under-funded and under-built compared to roadway projects, as discussed above, the Climate, Housing, Transit Alternative must exclude roadway/freeway funding and expansion. Herefore, SANDAG’s planning has arbitrarily segmented freeway and transit projects. This artificial segmentation is not only irrational, it is fatal in achieving sustainable housing goals because transit, bike, and walk mobility and auto-based mobility serve contradictory land use purposes. SANDAG’s failure to historically recognize this fundamental truth is the Achilles heel of its planning and lies at the doorstep of the agency’s on-going inability to deliver a plan that truly unites our community on an ecologically sustainable foundation. It is abundantly clear that SANDAG’s past planning efforts have not only been deficient but have repeatedly failed to heed the ominous warnings from the courts, the public, and the planet itself. With California literally on fire due largely to climate change induced drought and high temperatures, SANDAG has failed the public by not aggressively pursuing a transportation scenario that would meet the State’s GHG and VMT reduction goals. The Climate, Housing, Transportation Alternative would achieve targets set in legislation, the California Air Resources Board’s Climate Change Scoping Plan, and relevant Executive Orders. Similarly, with regard to the local housing crisis, it is inconceivable that SANDAG’s prior RTPs have not called for a 50% transit, bike, and walk mode share alternative necessary to activate infill housing, especially since the urban core is already zoned for such housing. Here too, the Climate, Housing, Transit Alternative would facilitate this infill housing and help the City of San Diego achieve the targets set forth in its Climate Action Plan. Additionally, the County’s continued business-as-usual approach to planning makes the need for SANDAG to strengthen guidance regarding future development in the region all the more pressing. In spite of all the talk of a new direction, the County recently unveiled a plan update for the forest community of Alpine which can only be described as a VMT and ecosystem catastrophe. This planning contradiction was noted in Shute Mihaly’s comment letter on the Alpine plan. The tectonic shift in regional transit mobility mentioned in the opening paragraph of this letter must become a reality soon to avoid irreversible damage to our wild lands and a missed opportunity for the region. Faced with these pressing social and environmental challenges, SANDAG’s new regional direction can be strengthened by following established judicial, executive, and local legislative guidelines designed to meet the housing and climate crises. The public urgently deserves to see what it would take for the region to build a world-class transit system and to develop reasonably priced infill housing. Common sense dictates that the Climate, Housing, Transit Alternative would necessarily begin with a complete, first phase transit, bike, and walk system with an inter-modal terminal connecting the Airport, the Central Core, the LOSSAN Corridor, the Sprinter corridor, and the Trolley system. It is important to note that the Climate, Housing, Transit Alternative would not only be the “environmentally sustainable” alternative, it would also be the socio-economic superior alternative because a true transit, bike and walk system reduces both the cost and shortage of housing and the cost of driving. In conclusion, in the face of a severe, entrenched housing crisis endangering the public welfare and the severe climate crisis endangering the planet, SANDAG owes the public nothing less than a transit alternative that immediately meets these life threatening challenges rather than artificially prolonging them.</td>
<td></td>

</table>
| LS7 | Transportation accounts for nearly half of the region’s emissions. To remain on track to achieve carbon neutrality, as climate science says is necessary, SANDAG must go further in exceeding CARB’s target. We believe a reduction from light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. Reducing GHG emissions and achieving state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan.

Climate Action Campaign

| LS8 | Page A-51 of Appendix A proposes “subsidies to reduce the fares paid by transit riders.” Appendix A should be amended to include an explicit commitment to Youth Opportunity Passes (YOP)—no-cost transit passes for youth 24 and under—and should be implemented immediately following the adoption of the 2021 Regional Plan. SANDAG should also commit to overseeing YOP in partnership with MTS and NCTD, to ensure successful implementation by the local transit operating agencies. Community based organizations have been fighting for YOP for nearly a decade, as it is an essential investment in our region’s youth, providing access to education and early career opportunities, while fostering the next generation of sustainable transportation riders.3 We urge you to make YOP a top priority in the 2021 Regional Plan. |
| LS9 | Attachment 6 of Appendix T (Network Development and Performance), includes the “Performance Measure Results Tables.” Page T-6-6 includes mode share projections for the 2021 Regional Plan for the benchmark years 2025, 2035, and 2050 for peak period work trips, all day work trips, and all trips.4 SANDAG has provided the requested data to Climate Action Campaign. |

The 2021 Regional Plan aligns with many of the elements of the Climate, Housing, Transit Alternative while meeting all legal requirements of the Regional Plan. As the 2021 Regional Plan is implemented, SANDAG looks forward to continuing to advance efforts related to climate, housing, and transit. Section 6.5.5 of the Draft EIR presents reasons why the Climate, Housing, and Transit Alternative was not evaluated in detail in the EIR.

<td>L160</td>
<td>To maximize mode shift away from fossil fuel cars and towards bike, walk, and transit, Transit Leap timelines must be expedited, and prioritized in the early years of the plan over Managed Lanes and Managed Lane Connector, which will yield an increase in vehicle miles travelled. Investments in commuter rail, light rail, and bus rapid transit infrastructure should be prioritized in Communities of Concern, to increase access to sustainable mobility options and connections to the region’s job centers. The climate crisis and environmental injustice have and will impact Communities of Concern first and worst. Historically underinvested communities are exposed to the region’s most dangerously polluted air from cars and trucks, and are left with disconnected transit trips or long, expensive car commutes. As such, we support the inclusion of “Social Equity Early Action Transit Pilots” as a mechanism to streamline immediate investments in the communities on the frontlines of these crises.</td>
<td>SANDAG agrees that action is needed now to provide fast, frequent, reliable, and accessible transit, especially on highly utilized routes. Staff are bringing forward an item to the SANDAG Transportation Committee and to the Board of Directors in advance of approval of the 2021 Regional Plan to amend the agency budget and act now to invest in transit that benefits environmental justice communities. This action seeks to increase services on transit lines that have infrequent service in the evenings and late nights, and/or provide fare subsidies for youth riders. Additionally, further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.</td>
</tr>
<tr>
<td>L161</td>
<td>Page A-26 of Appendix A states that the Del Mar tunnel will be complete by 2035. Currently, the 1.6 mile stretch of LOSSAN tracks in Del Mar is located dangerously close to the edge of the bluffs, and several bluff failures within feet of the tracks have occurred over the past 2 years alone. With the bluffs eroding at approximately 6 inches per year, and the ever-intensifying threat of sea-level rise due to the climate crisis, these incredibly dangerous bluff failures will only increase in severity and frequency, putting lives seriously at risk. Moving the tracks off the bluffs is essential to securing a long-term solution for the LOSSAN corridor, while preventing increased air pollution from shipping trucks, and ensuring economic prosperity for the region. To secure a climate-safe transportation system, we urge you to make the Del Mar tunnel a top priority, and urge for completion as soon as possible, no later than 2025-2030.</td>
<td>The Del Mar tunnel is a top priority for SANDAG. Planning work is underway with preliminary engineering and environmental phase expected to begin as soon as 2022 if funding is secured. SANDAG reviewed the timelines of other similar tunnel projects throughout North America and the 12 to 15 year timeframe is consistent with industry best practices. The 2021 Regional Plan identifies funding to kick start the environmental, design, and right-of-way phases of the Del Mar Tunnel project by 2025 with construction funding in the 2035 phase.</td>
</tr>
</tbody>
</table>
| L162 | Thank you for providing the public and businesses with the opportunity to comment on the draft Regional Plan. Our banquet hall is located in the City Heights community adjacent to the Webster neighborhood and along the Auburn Creek tributary of the Chollas Creek. We have been in business at this location for more than 50 years. The list of priority projects for our District 9 and District 4 service area are as follows:  
1. Extension of the Home Avenue Route to Market Street for Pedestrians, Bicycles and Vehicles. The Home / Market connection would provide significant economic development stimulus to the Mt. Hope and City Heights areas. It would assist in congestion relief by providing an alternate to freeway traffic on the SR 94. The Home / Market connection was originally planned but delayed for racially motivated reasons. Decades ago the 94 Freeway was the Color Line barrier. The Home/Market connection would reknit neighborhoods that were separated by the installation of the 94 Martin Luther King Freeway. | While Home Avenue is not on the Adopted Regional Bike Network, we have included the nearby and parallel Chollas Creek Bikeways: North Fork - Bayshore Bikeway to University Bikeway and South Fork - Petway Park to Market Creek Plaza in the Regional Plan which will help improve some of the connections you’ve described. The project alignment and details can specifically be found in the updated data viewer and Appendix A’s tables and maps for quick reference in the forthcoming Final Regional Transportation Plan that will be presented to the SANDAG Board of Directors for adoption this fall. Your comment was forwarded to the City of San Diego. |
<p>| L163 | 2. Completion of the Bus Stop &amp; Pedestrian Sidewalk System on Home Avenue East of Fairmount Avenue. Sidewalks are generally absent on the North side of Home Avenue, East of Fairmount Avenue. Pedestrians must walk in the street and are exposed to dangerous high-speed traffic. Curbs are not marked for safety and to assist the proper parking, traffic movements, and access for Buses and the Disabled. The Bicycle route is not painted and warning ramps for the visually impaired are often not in place. Please fund and work with adjacent property owners to install enhanced bus shelters and amenities, along Routes 13 and 965. Bulb, out at key intersections, should be funded to increase pedestrian crossing safety. Please consider installation of pedestrian safety sidewalk and street lighting along Home Avenue and Fairmont. Installation of better lighting would enhance safety and could tie the neighborhoods together into a more friendly and effective neighborhood. | We encourage you to be involved with the in-progress CMCP for this area - the South Bay to Sorrento Corridor here: <a href="https://www.sandag.org/index.asp?classid=12&amp;subclassid=83&amp;projectid=611&amp;fuseaction=projects.detail">https://www.sandag.org/index.asp?classid=12&amp;subclassid=83&amp;projectid=611&amp;fuseaction=projects.detail</a>. The City of San Diego and Metropolitan Transit System are collaborating on that effort too and are the implementing agencies for these improvements you’ve requested. That said, our plan is a plan for the whole region, and our efforts are regional. Your comment was forwarded to the City of San Diego. |
| L164 | 3. Undersized Auburn Creek under crossings. Please fund the correction of undersized flood water under crossings at Fairmont and Federal Boulevards. The under crossings are no longer the proper size to carry the flood condition flows along Auburn Creek; because the creek has been channelized and the permeable storm water area fully developed. | SANDAG consider stormwater, or urban runoff during the project development process and partners with regional transportation infrastructure owners and operators to manage stormwater from roads and highways in the region. For more information on stormwater, please see Appendix B of the 2021 Regional Plan. |</p>

<td>L165</td>
<td>Land use and transportation planning in the San Diego region is evolving to better address the most pressing issues of today, including climate change, quality of life, attainable housing, and social and economic inequities. The County has several planning efforts underway which prioritize addressing these issues, including the Regional Decarbonization Framework, the Climate Action Plan Update, the Electric Vehicle Roadmap, Office of Environmental and Climate Justice, and establishment of VMT thresholds. While independent of the Regional Plan, these efforts are aligned with the goals of the Regional Plan. County staff is interested in further understanding the regional growth modeling assumptions used within the Regional Plan and alignment with these County efforts.</td>
<td>SANDAG looks forward to continuing coordination with the County on planning efforts that align with the 2021 Regional plan, including the Regional Decarbonization Framework, Climate Action Plan Update, Electric Vehicle Roadmap, Office of Environmental and Climate Justice, and establishment of VMT thresholds.</td>
</tr>
<tr>
<td>L166</td>
<td>The County represents more than 500,000 residents who live within 34 unincorporated communities throughout the region. County staff would like to better understand how the Regional Plan will address transportation options outside proposed mobility hubs for those communities. The unincorporated community of Ramona, for example, has a population of 36,000 residents, which is a larger population than the incorporated communities of Imperial Beach, Lemon Grove, Coronado, Solana Beach, and Del Mar.</td>
<td>While certain types of Flexible Fleets are envisioned to converge in more dense communities (e.g., micromobility, last-mile delivery), there are also Flexible Fleet services that operate outside of Mobility Hubs including unincorporated communities. These services may include on-demand rideshare, ridehail, carshare, and microtransit services. As an implementation action of the 2021 Regional Plan, SANDAG is conducting a Flexible Fleets Implementation Strategic Plan to determine the appropriate use cases and geographic locations that are best appropriate for Flexible Fleet services including unincorporated communities of the County of San Diego. In addition, the 2021 Regional Plan includes investments in broadband connectivity that will facilitate improved access to online services and on-demand mobility services.</td>
</tr>
<tr>
<td>L167</td>
<td>Less than 1% of the unincorporated area is within the proposed mobility hubs, which is where transit and on-demand travel infrastructure investment will be focused. The unincorporated north and east county communities represent a significant population with higher-than-average VMT in the region. Investment in public transit and other transportation options will make it easier for people to drive less, which results in decreased GHG emissions. However, investment outside of mobility hubs appears to be limited, which would make it difficult for unincorporated residents to use new transit service.</td>
<td>Investments in the 2021 Regional Plan for unincorporated communities include improvements to local bus services (increased frequencies and span of service) and Flexible Fleet services. Additional detail on the improvements to local bus service has been added to Appendix A. In addition, the investments in the mobility hubs also serve residents of the unincorporated area as many residents live near a mobility hub and will be able to access the transit system within a reasonable amount of time on a Flexible Fleet service, then be able to make use of the Rapid bus, light rail, or commuter rail systems.</td>
</tr>
<tr>
<td>L168</td>
<td>To promote greater equity, County staff see opportunities to expand the proposed mobility hubs to include adjacent unincorporated communities. When we overlay the proposed mobility hubs with the County’s VMT efficient areas (using both the unincorporated and regional averages), North County Metro, Lakeside, and Spring Valley (Attachment B) are adjacent to what appear to be proposed mobility hubs. These unincorporated communities would benefit from additional access and investment associated with inclusion in adjacent mobility hubs, as these communities have few existing alternative options to driving.</td>
<td>The coverage area of each regional Mobility Hub represents a general area defined through a propensity analysis (detailed in Appendix 1). The mobility hubs of the 2021 Regional Plan depict a framework that will be used to guide future collaborative planning efforts between SANDAG and local jurisdictions. In reviewing the County’s suggestions, SANDAG agrees that the areas identified are appropriate to consider in future mobility hub planning. The areas identified also align with Transit Priority Areas. In the proposed final 2021 Regional Plan, mobility hub maps also reflect Transit Priority Areas to be more inclusive of these areas.</td>
</tr>
</tbody>
</table>
| L169 | County staff is also interested in understanding how Regional Housing Needs Assessment (RHNA) allocations would be assigned. For the current 6th RHNA cycle, which covers 2021 - 2029, SANDAG allocated 6,700 units for the unincorporated area, with a total housing forecast in the Regional Plan of 7,419 units through 2050 for the unincorporated area. This forecast projects the County’s RHNA allocation of 6,700 units being met by 2029, with an additional growth of 719 units by 2035, and projects no further growth in the unincorporated area through 2050. Based on this forecast, it appears that beyond 2035, all future housing needs in the region from RHNA cycles would be allocated to and met by growth in incorporated cities. | The 2021 Regional Plan accommodates the regional housing need determined by the Department of Housing and Community Development for the 6th Cycle RHNA. That determination specifically identified additional need resulting from a low vacancy rate, overcrowding, and housing unit demolitions in the region. The remaining housing projected through 2050 is based on the January 2020 vintage of the Department of Finance population projections. As described in Appendix F, additional assumptions used in developing the forecasted housing units include a gradual increase in the region’s vacancy rate to 4% by 2040, identification of vacation rentals as unoccupiable units, and a decline in household size as the population ages. While land use authority is reserved to the local jurisdictions, land use patterns will directly impact GHG emissions from the transportation sector. "Specifically, where and how the State population grows will have implications on distances traveled and tailpipe emissions; as well as on secondary emissions from the transportation sector, including emissions from vehicle manufacturing and distribution, fuel refining and distribution, demand for new infrastructure (including roads, transit, and active transportation infrastructure), demand for maintenance and upkeep of existing infrastructure. Conversion of natural and working lands further affects missions, with the attendant impacts to food security, watershed health, and ecosystems. Less dense development also demands higher energy and water use." (2017 Scoping Plan, California Air Resources Board, p. 77). Government Code section 65080(b)(2)(B) requires that the SCS “set forth a forecasted development pattern for the region, which, when integrated with the transportation network and other transportation measures and policies, will reduce the greenhouse gas emissions from automobiles and light trucks to achieve, if there is a feasible way to do so, the greenhouse gas emission reduction targets approved by the state board.” The
### Draft 2021 Regional Plan Responses to Comments – Letter Sourced

<tbody>
<tr>
<td>L70</td>
<td>In order to fulfill the goals of the Regional Plan in providing access to affordable, reliable, and safe mobility options for everyone in the region, County staff would like to work with SANDAG to ensure consideration is given to future investments and incentives within the unincorporated area that would result in expanded options for transit and active transportation, and to encourage shorter and fewer automobile trips, including locations of mobility hubs, transit leap, flexible fleets, and complete corridors.</td>
<td>SANDAG looks forward to coordinating with the County on many areas of implementation for the Regional Plan including the Flexible Fleet Implementation Strategic Plan, Active Transportation Plan, Comprehensive Multimodal Corridor Plans, and advanced transit planning. All of these efforts provide opportunities for refinement of the Regional Plan concepts at a local level.</td>
</tr>
<tr>
<td>L71</td>
<td>County staff would like to continue coordinating with SANDAG to further identify Regional Plan investments in infrastructure, technology, and communication improvements for roads identified in both the County’s Mobility Element and unincorporated roads included in the BAS and how these investments will further connect the unincorporated area to proposed mobility hubs, flexible fleets, or transit leaps. In addition to providing efficient movement of people and goods, these investments would increase the efficiency of evacuation routes, relay important information on evacuation conditions to first responders, and assist in getting residents safely away from hazardous conditions, all important components of resiliency planning.</td>
<td>The 2021 Regional Plan puts in place a regional framework for a reimagined transportation system. The plans and studies identified as implementation actions of the Regional Plan will provide opportunities for SANDAG to work closely with the County on these suggestions for applying the 5 Big Move concepts to the unincorporated areas and improving mobility options and safety.</td>
</tr>
<tr>
<td>L72</td>
<td>County staff appreciates the difficulty in forecasting funding and revenue sources for a regional transportation network. The Regional Plan identifies use of TransNet funds as part of the implementation, but it is not clear whether projects that have previously been planned, programmed, or awarded as part of the previous plan using TransNet would retain that funding allocation, or if there would be a reallocation of these funds as part of the Regional Plan. It is also unclear if there would be any changes to the current allocation or use of funds that local agencies receive directly for local road system improvements. The unincorporated area relies on TransNet funding to build, improve, and maintain transportation facilities that enhance roadway safety and support smart growth development, including road infrastructure to support increased transit options. Loss or reallocation of this funding could affect these projects and limit the County’s ability to provide transportation services in support of our goal of reducing greenhouse gas emissions.</td>
<td>A comparison between the TransNet Program of Projects and the Draft 2021 Regional Plan was included in the July 7, 2021 ITOC Agenda item #2 (<a href="https://www.sandag.org/uploads/meetingid/meetingid_5886_29414.pdf">https://www.sandag.org/uploads/meetingid/meetingid_5886_29414.pdf</a>). In addition to the report narrative, you will find in Attachment 1 the details regarding the original TransNet projects and how those are addressed in the Regional Plan corridor by corridor.</td>
</tr>
<tr>
<td>L73</td>
<td>The Regional Plan indicates that user fees would help build a transportation system that provides travelers with alternatives to driving. County staff would like to further discuss how the proposed road user charges would be developed, implemented, and applied to ensure that this funding strategy will not disproportionately burden unincorporated communities, which often have longer commutes and less access to alternative transportation options due to lack of regional planning for transit services to these communities. Revenues generated should also be allocated to support additional transportation and mobility options in unincorporated communities, while vehicle use by those with access to alternate modes of transportation should be disincentivized since their communities are receiving significant investments in public transit. County staff looks forward to learning more about how future funding and investment would be applied to ensure that both the benefits and the costs of the Regional Plan are equitably distributed across the region.</td>
<td>The 2021 Regional Plan maintains the current allocation of TransNet Local Street and Road funds for local jurisdictions. Next year, SANDAG will study usage-based fees and the effect the fees will have on meeting established goals like greenhouse gas emissions reduction and improving equity for different income levels and different populations. The first phase of the study will calculate the true cost of driving a vehicle – the cost to own and operate a vehicle, the effect on road wear and tear, the cost of increasing capacity of the transportation system to meet demand, local and global pollution caused by both fuel powered and electric vehicles, traffic accidents, traffic congestion, and the cost of delays caused by congestion to the economy and to the quality of life of travelers. The study will determine how existing revenues currently fund different parts of the transportation system and how different populations are impacted. This foundational understanding will help SANDAG design a road usage charge program that encapsulates multiple factors to make it more fair across the community than the current transportation funding sources. The study will assess the potential impacts of user fees on San Diego residents, visitors, and businesses, particularly those relying heavily on transportation. SANDAG staff will consult with its Board of Directors, stakeholders, and community members to develop implementation strategies for a road usage charge. This includes policies such as who will pay what and how much, the fee structure, and the distribution of revenues. SANDAG is committed to developing a carefully constructed program that will ensure that no group, such as those driving fuel-powered vehicles, low-income individuals, rural residents, or those with long commutes, are paying more than their fair share. There are multiple mechanisms, such as caps and rebates, that will be explored to ensure a fair system. The road usage charge, which is being studied by both the federal and state governments, is being considered to replace an old tax system that is no longer relevant. We know this is a challenge and we respect the concerns raised. We are committed to having authentic dialogues to work through the challenges and create a revenue system that is flexible, sustainable, equitable, fair to all.</td>
</tr>
</tbody>
</table>
| L74  | The Regional Plan provides SANDAG with an opportunity to guide future investments in a way that meets smart growth objectives and reduces GHG emissions, but also guides future allocation of resources to achieve equitable outcomes. Several of the unincorporated communities, such as Lakeside, Spring Valley, and Ramona, have larger populations than some of the incorporated cities that are prioritized in the Regional Plan. In review of the proposed plan expenditures, a majority of the capital investments (55% of RTP funding) appear to go toward mobility hubs, complete corridors, and Next OS investments that are considered the current and future needs of the whole region, including unincorporated communities. The reimagined transportation system offers benefits that extend through the region as residents and visitors travel outside their communities for work, recreation, school, entertainment, and accessing basic needs. The investments in Next OS, Flexible Fleets, Mobility Hubs, and programs are... | ...
ID L175
David Alvarez, on behalf of ReConnect Logan Community Leaders

On behalf of the residents and community leaders of Barrio Logan and Logan Heights, we submit these letters of support for the creation of a priority not currently identified in the 2021 Draft Regional Plan. It is imperative that you incorporate a project to address social and economic inequity, rising levels of health concerns aggravated by greenhouse gas emissions, and transportation injustices in San Diego’s Barrio Logan and Logan Heights communities.

Specifically, we request the addition of a Freeway Lid as a priority project in SANDAG’s 2021 Draft Regional Plan (Draft Plan).

Our once united community was devastated by Interstate 5 which forcibly displaced hundreds in the 1950’s and has burdened those who remained. Pursuant to Chapter 1: Equity Focus (p. 11) of Draft Plan, we know ReConnect Logan Freeway Lid will transform and reconnect our community. A freeway lid can help our community by dismantling the barriers that the I-5 created by bringing the community together, addressing health concerns by capturing GHG emissions, creating non-existing green spaces, and allowing for development of affordable housing. All goals in line with the Draft Plan of creating efficient movement of people and goods, providing affordable, reliable, and safety mobility.

As mentioned, the construction of the I-5 forced many families to be displaced, and while the construction allowed for transportation advancements, since the 1950’s our community has been subject to inequality, misrepresentation, and systemic injustices in transportation and racism, to mention a few. We continue to be a working-class neighborhood composed of nearly 90% Mexican Americans, and while we are proud of our heritage and activism deeply rooted in our National Landmark of Chicano Park, the reality is that I-5 has created much insecurity by facilitating gang turfs, separating families from places of worship, and limiting children’s access to neighborhood schools. It is time for our community to heal – a freeway lid is the answer.

Given the significant investment and planning of projects in the Barrio Logan/Logan Heights communities in the Draft Plan as identified in Appendix A: Transportation Projects, Programs, and Phasing, it is appropriate to identify and call out ReConnect Logan Freeway Lid as a project on this list. A few of the multiple projects that will impact Barrio Logan/Logan Heights are:

The creation of Managed Lanes on Interstate 5, Project ID CC002 Complete Corridor: ML/Goods Movement (p. A-8)

Additional cargo due to the Harbor Drive 2.0 proposal that will facilitate cargo in the community of Barrio Logan, Project ID GM06 Goods Movement: Roadways (p. A-11)

Harbor Drive Corridor, project ID GM05 2050 Goods Movement: Roadways Harbor Drive Multimodal Corridor Improvements that will facilitate Trucks for the Port of San Diego (p. A-12)

Besides being in line with the 2021 Draft Regional Plan, ReConnect Logan Freeway Lid is also pursuant to Appendix H in relation to California Assembly Bill 805 which requires the reduction of pollution exposure in disadvantaged communities. Furthermore, our project is also pursuant to the Sustainable Communities Strategy per California SB 375 since it would help reach the overall goal of reducing GHG emissions of 15% (p. 18 of Draft Plan), as well as allowing for accommodation to the Regional Housing Needs Assessment Determination. For all these reasons, our community is looking forward to the addition of a Freeway Lid as a priority project as identified in SANDAG’s 2021 Draft Regional Plan.
A. ZE drayage trucks are commercially available now and also comparable in costs today along with increasingly positive total cost of ownership (TCO) in years ahead.

1. In section 4.1 (page Y-165), it states that "Port of SD: ZE vans and trucks may be suited to accommodate demand for goods movement in the area while reducing air quality and noise impacts, given the volume of local truck trips and improvements in ZE technologies..." Data indicates that these local trips, as well as much longer drayage trips, are already feasible today with ZE drayage trucks.

2. Per the Port of San Diego study (November 2020), ZE drayage trucks with a range of over 100 miles are commercially available today. The Port study explains that: a. Five different ZE drayage trucks are expected to be commercially available by the end of 2020, while another seven should become available by 2022/2023. Each has a range of over 100 miles, which is enough to complete the average drayage truck duty cycle of less than 100 miles on a single charge; b. The range of existing electric Class 8 trucks cap out at around a 150-mile range on a single charge; c. ZE drayage trucks requiring more than 150 miles will be available soon; and, d. Truck ranges are expected to increase as manufacturers develop longer-range batteries with the Tesla semi planned to exceed 500 miles near the 2023 timeframe.

3. ZE drayage trucks are comparable in costs today along with increasingly positive total cost of ownership (TCO) in years ahead. a. A Lawrence Berkeley National Laboratory (March 2021) study concludes that a Class 8 electric truck operated 300 miles per day when compared to a diesel truck offers a roughly 3-year payback and net present savings of about $200,000 over a 15-year lifetime. b. The 2035 Report 2.0: Plummeting Costs and Dramatic Improvements In Batteries Can Accelerate Our Clean Transportation Future from UC Berkeley’s Goldman School of Public Policy (April 2021) explains that the TCO for heavy-duty electric vehicle starts out as positive compared to diesel and gets substantially better through 2035.

B. ZE drayage trucks (not near-zero) are needed to reach air quality and climate goals.

SANDAG will continue to support flexibility for funding and incentives to promote private and public sector adoption of zero-emission truck technologies. SANDAG will also share information on ZE commercial vehicle availability to private sector companies and industry organizations in the region through the Freight Stakeholders Working Group.

SANDAG will be assessing existing medium-/heavy-duty ZE fleets and infrastructure, identifying barriers, and developing near and long term strategies for transitioning to these fleets through the recently awarded California Energy Commission Blueprints for Medium- and Heavy-Duty Zero-Emission Vehicle Infrastructure grant.
### Draft 2021 Regional Plan Responses to Comments – Letter Sourced

<td>L79</td>
<td><strong>C. Misclassification of truck drivers needs to be explained in report.</strong> 1. Misclassification of truck drivers in California needs to be explained in the SANDAG report. On page Y-24, it states “…A large portion of truck operators in the freight industry are independent contractors who own their own vehicles and work for larger corporations. As policies start to implement regulations that discourage the continued use of heavy-duty diesel trucks and enforce the use of zero-emission vehicles, independent truck owners will be left with outdated vehicles they can no longer use, leading to potential unemployment for these operators.” 2. The drayage, package delivery, and other short-haul segments of the trucking industry are home to ongoing and egregious worker exploitation. 3. Trucking companies, brokers, and other contracting entities often illegally misclassify drivers as independent contractors (when they are employees by law) to avoid paying wages, benefits, equipment costs, taxes, and regulatory compliance costs. 4. Misclassified drivers operate 70 to 90% of California’s drayage trucks, making misclassification the drayage segment’s dominant business model.</td>
<td>Litigation is ongoing related to the trucking industry and California Assembly Bill S (AB S). Appendix Y now contains the following updated passage:  “In 2019, AB 5 was passed to regulate the use of independent contractors in a variety of activities that also included trucking. In January 2020, San Diego U.S. District Court Judge Roger Benitez issued a preliminary injunction blocking the enforcement of AB 5 against California trucking companies that contract with owner-operator truckers. The initial lawsuit was filed by the California Trucking Association (CTA) and two owner-operators seeking to prevent the application of AB 5 to the trucking industry. In late April 2021, in a ruling from a three-judge panel of the Ninth Circuit Court of Appeals, the panel reversed the granting of CTA’s preliminary injunction. Following the Ninth Circuit’s denial of CTA’s petition for rehearing in June, CTA filed a petition for a writ of certiorari with the United States Supreme Court on August 9, 2021. At this time, the deadline for the State of California’s response is October 12, 2021.”</td>
</tr>
<tr>
<td>L80</td>
<td><strong>D. The Freight Gateway Study should address potential impacts of climate change on goods movement.</strong> 1. The Gateway Study did not address potential impacts of climate change on 2050 freight projections. Impacts are difficult to predict, but it would be reasonable to develop scenarios that do not assume simple linear growth in freight volumes, due to disruptions in supply chains, extreme weather events, sea level rise, and potential changes in key industries in the San Diego region such as agriculture, construction, and tourism. As overarching policy directions, the San Diego region must plan for predicting critically important goods closer to home, and reducing our dependence on goods movement as an economic driver.</td>
<td>The IHS Markit Transcan data used to develop the freight forecasts for the Freight Gateway Study Update include economic considerations resulting from climate change and other possible disruptions. Section 3.1 of the study has been revised to reflect this. SANDAG recognizes the importance of resilience through disruptions and will incorporate this into future goods movement planning efforts.</td>
</tr>
<tr>
<td>L81</td>
<td><strong>E. Additional Comments on Goods Movement Planning and the Freight Gateway Study.</strong> 1. Appendix Y correctly notes the importance of equity for workers in the freight industry, but mentions the potential impact of automation only in passing, on page Y-5. SANDAG needs to address the challenges of automation more fully. Who makes the decisions to automate unloading, loading, or movement of freight? What opportunities are there for workers and the public to participate in these decisions? What policies are in place, or needed, to support workers whose jobs may be at risk as a result of a shift to automation? Until these questions are answered fully, SANDAG’s goods movement planning will be failing these workers. 2. Marine Highway M-5 is mentioned briefly on page Y-8 as a potential new source of trade. Short sea shipping may be a good option for reducing GHG and truck traffic at the same time, Portside residents need to know how this mode shift would impact air quality in their communities. Will additional ships be coming to San Diego’s cargo terminals if the project is approved? Will these ships be shorepowered? Goods movement planning requires that local impacts be identified and addressed. 3. Urban warehouses for e-bike deliveries are mentioned as an innovative delivery option on page Y-26. It is important to be clear that if trucks will also be accessing these facilities, they do not belong in residential areas. Residents of Barrio Logan and west National City have struggled for decades to eliminate incompatible land uses such as warehouses from their communities. 4. Regarding infrastructure needs for truck freight hauling, the report, in Section 2.12.1, Gaps in Existing Road effects of emissions on our climate. In addition, the “zero/near-zero emission” policies found within Appendix Y reflect statewide goals, strategies, and actions identified in the California Sustainable Freight Action Plan and California Freight Mobility Plan 2020. SANDAG acknowledges that more work needs to be done in this area and that various climate action plans developed for the region, along with federal and state agency initiatives, are being incorporated as SANDAG’s comprehensive strategies for addressing climate change in this and future regional plans. SANDAG continues to partner with the California Air Resources Board, the City of San Diego, the City of National City, the Port of San Diego, and other agencies to support the implementation of their specific climate action plans.</td>
<td>SANDAG understands that this topic is evolving and will continue to work with stakeholders, monitor the adoption and readiness of technologies, and engage with the community as automation technologies mature. SANDAG will stay cognizant of policy decisions to avoid unintended consequences and influence outcomes. In January 2021, SANDAG provided a letter of support for an application submitted by the Port of San Diego and other west coast ports for the MARAD America’s Marine Highway – West Coast M-5 Coastal Connector. SANDAG will stay engaged with the Port of San Diego, assist as needed with policy decisions, communicate, and collaborate with stakeholders and community leaders to identify and monitor local impacts. SANDAG will collaborate with the City of San Diego and the City of National City in the configuration of truck routes in portside communities considering potential innovations like urban warehouses. SANDAG continues to support progress toward an adequate electric vehicle charging infrastructure for both freight and passenger vehicles in collaboration with public agency and private industry stakeholders. This support includes planning through the Comprehensive Multimodal Corridor Plans (CMCPs) that include federally designated zero-emission vehicle corridors and commensurate charging infrastructure as well as the development of a Blueprint for Medium-/Heavy-Duty (MO/HD) ZEV infrastructure. A SANDAG board resolution was passed to work collaboratively to establish the framework and agreement for a joint electric vehicle charging incentive program with the California Energy Commission, County Air Pollution Control District, and the California Air Resources Board.</td>

### Friends of Rose Canyon 1

**L1B2** Our overall comment is that the 2021 Draft Regional Plan states that it proposes a bold new vision. However, it is based on a massive expansion of our highways. This includes widening many of our highways to add Managed Lanes and adding huge, elevated concrete “Managed Lane Connectors” (MLCs) wherever highways intersect. These MLCs will require even further highway widening to add lanes where traffic would enter and exit the connectors. In some cases these MLCs connect highways at very different elevations or with multiple other on and off ramps and bridges in the same location. Just the area we focus on, these added MLs and MLCs will have huge direct and indirect environmental impacts on sensitive habitat, MSCP lands, Marian Bear Park, Rose Canyon Open Space Park, MCAS Miramar, and the Rose Creek and Carroll Canyon Creek/Sorrento Valley/Penasquitos Lagoon watersheds. Furthermore, just in the area we focus on, these MLs and MLCs will cost many hundreds of millions of dollars.

**L1B3** How sure is SANDAG of those calculations? What is the course correction if we start adding all this highway capacity and the benefits don’t show up? Do the PTV modeler and other SANDAG staff know where the projected benefits require that all the highway MLs and all the MLCs be added to achieve the projected benefits? What if we get half way into building this out and find that adding all this highway capacity is not bringing the benefits anticipated?

**L1B4** Based on what we see proposed for just the area we focus on, we see major direct and Indirect Impacts on MSCP lands, open space, habitat, native plant and animal species, wildlife corridors, creeks, and watersheds. Adding Managed Lanes and Managed Lane Connectors means bulldozing land and building extensive new concrete surfaces and retaining walls and drainage ditches, expanding direct impacts and edge effects on habitat and wildlife; increasing storm water run-off, noise and light impacts, invasive species, habitat loss, loss of wildlife connectivity and wildlife corridors, increased erosion, trash, and air and water pollution. “Mitigating” these impacts through projects done in distant mitigation banks doesn’t reduce the impacts in the areas where these impacts occur.

While SANDAG staff have stated in meetings with the QOL coalition that they are not widening outside the highway ROWs, that does not mean there won’t be major highway widening and environmental impacts. In some cases, CA FDOT has widened even within the ROW extending the damaging impacts and pushes the edge effects closer to and into sensitive habitat.

**L1B5** Meanwhile, the Purple Line (Commuter Rail 582) from Sorrento Mesa to the Border (a true transit project) will not be completed until 2050. In concept, we strongly support this project, assuming it is largely underground through the environmentally sensitive areas we focus on. But despite the importance of this transit project, we know little beyond the vaguest description of its route. Where might it be underground? Where might it be at grade or above grade? Why is it not being completed until 2050 while the ITP prioritizes adding so many highway MLs and MLCs?

**L1B6** On April 15, 2021, the Sierra Club sent the attached letter to SANDAG Director Hasan Ikhrata, Director of Regional Planning Coleen Clementson, Senior Transportation Planner Jennifer Williamson, and several SANDAG BOD members. At a subsequent meeting with the Quality of Life Coalition’s Transportation Committee, Coleen Clementson stated the 2021 Regional Plan includes no additional freeway widening along Interstate 805 between SR-52 and Sorrento Valley Road. The Direct Access Ramp at I-805 has been removed from the 2021 Regional Plan. There are no park and rides or Rapid stations planned for the Southwest Corner of Nobe/I-805. A bus route would

---

**Response**

**Center for Sustainable Energy** as part of the Regional Vehicle Charging Program partnership program.

SANDAG will continue to coordinate with Caltrans in their efforts to plan the deployment of potential medium- and heavy-duty truck charging infrastructure in conjunction with parking identified through the California State Truck Parking Study that is currently underway.

SANDAG builds public transportation and active transportation projects and thus has an interest in the status of aggregate commodities that are available in the region. SANDAG, however, does not control regional private sector markets and will be subject to the same demand-driven market dynamics as other aggregate consumers. SANDAG continues to support maritime and highway vehicle conversion to zero emission power to further reductions in air pollutants and GHGs from these industries.

---

<td>L187</td>
<td>Project ID CCT14 is called I-805 (Nobel Drive) - it should be deleted from the RTP</td>
<td>The Direct Access Ramp at Nobel/I-805 has been removed from the 2021 Regional Plan. There are a number of constraints that limit the ability of the Rapid bus to access La Jolla Village Drive via the Managed Lanes. The current plan is to use existing ramps or operational improvements that would give the bus some level of priority to enter the existing ramps. Mere planning will need to occur as this project moves forward.</td>
</tr>
<tr>
<td>L188</td>
<td>The RTP should reduce the amount of highway expansion and the number of MLCs in this area. SR-52 should not be widened and the MLCs between these highways should be eliminated. The following projects would cause major environmental damage to MSCP lands and to the area's critical and already highly constrained wildlife corridors. This area illustrates our concern about the RTP as a whole. The RTP proposes a massive expansion of highway capacity in the name of creating &quot;Complete Corridors&quot; that will, in theory, carry BRT lanes and carpools. While it is true that some existing general purpose lanes will be converted to &quot;Managed Lanes&quot;, the RTP proposes an expansion of all the highways in this area to add MLs plus multiple MLCs between these highways that will further degrade the habitat and wildlife corridors.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>CCO85: 2035 - MLC I-805 (SR 52) West to North and South to East CCT - $149 mil This MLC will cause major environmental damage to an area with important wildlife corridors that connect MCAS Miramar, San Clemente Canyon (and Marian Bear Park) and Rose Canyon. These wildlife corridors are identified in the MSCP and in the MCAS Miramar Natural Resource Management Plans. The wildlife corridor between MCAS Miramar and San Clemente Canyon is already highly constrained at the I-805/SR 52 intersection. In addition, the elevation change between the I-805 and SR 52 is significant. A further environmental impact will occur due to adding two MLs to SR 52 east of I-805 and one ML to SR 52 west of I-805.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>CCO86: MLC I-805 (SR52) North to West and East to South ($126 mil): More environmental impacts in this same area.</td>
<td></td>

**Friends of Rose Canyon 2**

| L189| The City of San Diego's chosen alignment for the Coastal Rail chosen between Gilman/La Jolla Colony Drive and Sorrento Valley Coaster Station should be added to the RTP and the old alignment should be deleted (Rose Canyon, "UTC" (along Judicial Drive), Roselle Canyon and Roselle St to the Sorrento Valley Coaster station). This old alignment was thoroughly studied and rejected due to multiple major problems. |
|     | SANDAG has worked with project partners at Caltrans to include the North Coast Bike Trail projects in the 2021 Regional Plan as part of the Adopted Regional Bike Network, this includes the completed segments referenced here. |
The Draft RTP contains inconsistent and out-of-date labeling of a portion of the City of San Diego’s Coastal Rail Trail. The City is the Lead Agency for the Coastal Rail Trail in the City, and it has selected the alignment and completed final design of the alignment along Gilman Drive to UCSD.

The City has deleted its Bike Master Plan the old Rose Canyon, “UTC”, and Roselle Canyon alignment. The City studied that route for years and rejected it for multiple reasons.

The RTP therefore needs to:
- cut three planned CRT segments and trim one CRT segment
- relabel the CRT route in the RTP to coincide with the approved Gilman Drive CRT segment, adding the UC San Diego CRT segment plus the I-5 Bicycle Corridor.
- Amend Appendix A and Appendix L in the SANDAG RTP to be consistent with this change.

The RTP should make the following changes summarized in the following tables (see attached letter for full tables presented by commenter):

<table>
<thead>
<tr>
<th>ID</th>
<th>Comment</th>
<th>Response</th>
</tr>
</thead>
<tbody>
<tr>
<td>L190</td>
<td>The savings for the three old, out-of-date segments to be cut is $53 million (Rose Canyon, UTC Judicial Drive) and Roselle Canyon, plus any savings from trimming the route AT032 by cutting Sorrento to Roselle, a segment made unnecessary by the I-5 bike path from the Sorrento Valley Coaster Station to UCSD. Two of the three segments in the City's chosen CRT route are either complete or funded, so it can be anticipated that almost all of the $53 million in the RTP can be freed up for active transportation projects that address equity, for example, in Chollas Creek, South Bay, or the Midway Corridor.</td>
<td>Portions of the City of San Diego's 163 mile Coastal Rail Trail project S00951 are already identified as the Gilman Connector in the project list in Appendix A. This will be a connector to SANDAG's recently upgraded Rose Canyon Bike Path and newly constructed Rose Creek Bikeways to the south. Extending north, however, there remains a need for safe, direct, all ages and abilities active transportation alternatives extending into currently underserved residential (University) and employment centers (UTC, Sorrento Valley) to improve alternatives in this major transportation corridor. In order for SANDAG to stimulate the shift from personal motor vehicle use to people choosing to bike, a network of well-designed routes is essential. The City of San Diego's project on Gilman Drive is greater than 2 miles away from, and represents just 25% of, the entire length of the projects requested to be removed. These projects and this alignment were first identified in the 2000 Coastal Rail Trail Project Study Report: <a href="https://www.sandiegoegomoving.com/Libraries/Transnet-doc/Coastal_Rail_Trail_Project_Study_Report_reduced.sflb.ashx">https://www.sandiegoegomoving.com/Libraries/Transnet-doc/Coastal_Rail_Trail_Project_Study_Report_reduced.sflb.ashx</a>. These projects were approved by the SANDAG Board of Directors in 2010 with the development of a comprehensive regional bike network - Riding to 2050: The San Diego Regional Bike Plan: <a href="https://www.sandag.org/index.asp?projectid=353&amp;fuseaction=projects.detail">https://www.sandag.org/index.asp?projectid=353&amp;fuseaction=projects.detail</a>. Again, these Coastal Rail Trail segments were identified as a priority project in 2013 via the Bike Early Action Program (EAP): <a href="https://www.sandag.org/index.asp?classid=34&amp;ubclassid=122&amp;projectid=497&amp;fuseaction=projects.detail">https://www.sandag.org/index.asp?classid=34&amp;ubclassid=122&amp;projectid=497&amp;fuseaction=projects.detail</a>. SANDAG plans to deliver all bikeway projects proposed in the 2021 Regional Plan, and looks forward to partnering with Friends of Rose Canyon and the City of San Diego to ensure the success of these projects.</td>
</tr>
</tbody>
</table>
| L191 | The CRT route has City and Community support:
- The SANDAG CRT routes do not exist in the City of San Diego Bike Master Plan. They were explicitly deleted by the San Diego City Council in December 2013.
- The approved CRT Project route in San Diego has been selected, with the final Gilman Dr. link ready for construction and on the CIP list for 2020-2021.
- The approved CRT route was developed and selected by a City of San Diego Public Working Group in 2013-2014.
- The approved CRT route is supported by the Community Planning Groups: the UCPC in 2013 and 2021, and the La Jolla Planning Association in 2021.
- The approved CRT route has been supported by the City of San Diego in 2013, 2016 and budgeted in 2021. | SANDAG agrees that the infrastructure improvements listed here are all critically needed. |

| L92  | This firm represents Lakeview 1, LLC, Lakeview 2, LLC and Moller Lakes Investment, LLC (collectively, Lakeview), owners of the approved Otay Ranch Resort Village Project (Resort Village) On behalf of Lakeview, we have reviewed SANDAG’s Draft 2021 Regional Plan (Draft Plan) and provide the comments that follow below. | Government Code section 65080(b)(2)(B) provides that a Sustainable Communities Strategy (SCS) “use most recent planning assumptions considering local general plans and other factors.” It also requires that the SCS “set forth a forecasted development pattern for the region, which, when integrated with the transportation network and other transportation measures and policies, will reduce the greenhouse gas emissions from |
As relevant background, the Resort Village is part of the Otay Ranch General Development Plan/Subregional Plan approved by the County of San Diego Energy and Natural Resources Committee in 1993. Otay Ranch, portions of which have been built out, is a complete community approved for 24,000 homes; commercial/retail uses; other non-residential uses; schools and public services; parks, recreation facilities, open space and a protected biological preserve; and complementary amenities designed to be developed over a 50- to 50-year period. Consistent with the land use parameters established in 1993 for Otay Ranch, the County of San Diego Board of Supervisors, in November 2020, approved the Resort Village for 1,938 residential units, a resort, and other complementary uses (such as parks and trails, a public safety site, an elementary school, and resident-serving commercial). As a general matter, development of the approved Otay Ranch planned community—of which the Resort Village is a part—has been counterevolving in regional context and projections since 1993.

As discussed below, it appears that SANDAG’s Draft Plan has omitted from its designations the Resort Village and its approved uses, resulting in a disconnect between the Draft Plan and the legal status of the Resort Village as a fully-entitled project.

We understand that the Draft Plan strives to transform the way San Diegans move through and about the region in an effort to address safety, traffic congestion, social inequities, air pollution and greenhouse gas (GHG) emissions. The Draft Plan includes an updated Sustainable Communities Strategy (SCS), which sets forth a “forecasted development pattern” that is designed to: (i) achieve per capita GHG reduction targets set for the region by the California Air Resources Board (CARB), (ii) accommodate the Regional Housing Needs Assessment (RHNA), and (iii) utilize the “most recent planning assumptions.” (Draft Plan, p. 19). SANDAG reports that its SCS will exceed CARB’s 2035 reduction target for the region by one percent; i.e., a 19 percent reduction is required and the SCS, if implemented, will realize a 20 percent reduction.

We provide the following comments on the Draft Plan, including its SCS:

1. Government Code section 65800, subdivision (b)(2)(B) requires SANDAG “to use the most recent planning assumptions considering local general plans and other factors” [italics added]. In this regard, Figures F.7, F.8 and F.9 in Appendix F of the Draft Plan are in error and must be corrected to ensure SANDAG’s compliance with this statutory requirement for its SCS. Specifically, the referenced figures show approved and entitled development located within Otay Ranch—including the Resort Village—as “Vacant” on the SCS land use pattern maps for 2025s, 2035 and 2050. This is obviously incorrect. The “Vacant” appellation is inconsistent with the County’s approval of its General Plan in 2011, the Otay Ranch General Development Plan/Subregional Plan in 1993, and the Resort Village in 2020. As such, it results in incorrect in development forecasts that are incorrect and incapable of supporting the Draft Plan’s findings and objectives. Therefore, we respectfully request that SANDAG modify the referenced figures to reflect the land use densities long-assigned by the County and long-recognized by its General Plan. This portion of unincorporated South County is a complete community approved for 24,000 homes; commercial/retail uses; other non-residential uses; schools and community development for the 6th Cycle RHNA. Government Code section 65080(b)(2)(B) requires that the SCS “set forth a forecasted development pattern for the region, which, when integrated with the transportation network and other transportation measures and policies, will reduce the greenhouse gas emissions from automobiles and light trucks to achieve, if there is a feasible way to do so, the greenhouse gas emission reduction targets approved by the state board.” The SCS included in the 2021 Regional Plan projects development that would achieve the state-mandated GHG emissions reduction target when integrated with the transportation investments, programs and policies in the Plan. The Regional Plan forecasts development through 2050 consistent with projections from the California Department of Finance but does not represent buildout of jurisdictions’ General Plans. The Otay Ranch Resort Village Project had not been approved by the Board of Supervisors at the time the SCS Land Use Pattern was developed, and it was not projected for future development in the SCS. The Regional Plan and its SCS are iterative planning documents that are typically updated every four years to account for new data, analysis, policy, and experience.

The 2021 Regional Plan accommodates the regional housing need determined by the Department of Housing and Community Development for the 6th Cycle RHNA. Government Code section 65080(b)(2)(B) requires that the SCS “set forth a forecasted development pattern for the region, which, when integrated with the transportation network and other transportation measures and policies, will reduce the greenhouse gas emissions from automobiles and light trucks to achieve, if there is a feasible way to do so, the greenhouse gas emission reduction targets approved by the state board.” The SCS included in the 2021 Regional Plan projects development that would achieve the state-mandated GHG emissions reduction target when integrated with the transportation investments, programs and policies in the Plan. The Regional Plan and its SCS are iterative planning documents that are typically updated every four years to account for new data, analysis, policy, and experience.

As described in Appendix F, the Regional Growth Forecast has accounted for the need to increase the quantity of in-county housing opportunities. Appendix F includes the following language: “First, the forecast assumes the region’s vacancy rate would increase to 4% by 2040. The 4% vacancy rate assumption acknowledges that the region’s vacancy rate in 2018 was estimated to be less than 2% and that both state and local housing policy has recently focused on accelerating housing production. Second, the forecast assumes that the Series 14 Regional Growth Forecast accounts for vacation rentals and second homes, which are “unocupiable,” meaning that they are not available for year-round residence. The result of this assumption is that more housing units would need to be developed to counteract the housing units no longer available for residents to long-term occupancy. Third, data for all the counties in the U.S. show that as the population ages, household size declines, and the Series 14 Regional Growth Forecast assumes that due to the aging
L195 As relevant background, Village 14 and Planning Areas 16 and 19 are part of the Otay Ranch General Development Plan/Subregional Plan approved by the County of San Diego and City of Chula Vista in 1993. Otay Ranch, portions of which have been built out, is an officially complete community approved for 24,000 homes; commercial/retail uses other than non-residential uses; schools and public services; parks, recreation facilities, open space and a protected biological preserve; and complementary amenities designed to be developed over a 30- to 50-year period. Consistent with the land use parameters established in 1993 for Otay Ranch, the County of San Diego Board of Supervisors, in June 2019, approved the Specific Plan and Tentative Map for the Adara community for up to 1,179 residential units and other complementary uses (such as parks and trails, a public safety site, an elementary school, and resident-serving commercial). As a general matter, development of the approved Otay Ranch planned community—of which Village 14 and Planning Areas 16 and 19 is a part—has been accounted for in regional plans and projections since 1993.

As discussed below, however, it appears that SANDAG’s Draft Plan has omitted from its design assumptions the Adara community and its approved uses, resulting in a disconnect between the Draft Plan and the legal status of Adara as a fully-projected entity located within Otay Ranch.

We understand that the Draft Plan strives to transform the way San Diegans move through and about the region in an effort to address safety, traffic congestion, social inequities, air pollution and greenhouse gas (GHG) emissions. The Draft Plan includes an updated Sustainable Communities Strategy (SCS), which sets forth a “forecasted development pattern” that is designed to: (i) achieve per capita GHG reduction targets set for the region by the California Air Resources Board (CARB), (ii) accommodate the Regional Housing Needs Assessment (RHNA), and (iii) utilize the “most recent planning assumptions.” (Draft Plan, p. 19). SANDAG reports that its SCS requirement for its SCS. Specifically, the referenced figures show approved and entitled development located within Otay Ranch—including Village 14 and Planning Areas 16 and 19—as “Vacant” on the SCS’ land use pattern maps for 2025, 2035 and 2050. This is obviously incorrect. The “Vacant” appellation is inconsistent with the County’s approval of its General Plan in 2011, the Otay Ranch General Development Plan/Subregional Plan approved by the County of San Diego and City of Chula Vista in 1993. Otay Ranch, portions of which have been built out, is an officially complete community approved for 24,000 homes; commercial/retail uses other than non-residential uses; schools and public services; parks, recreation facilities, open space and a protected biological preserve; and complementary amenities designed to be developed over a 30- to 50-year period. Consistent with the land use parameters established in 1993 for Otay Ranch, the County of San Diego Board of Supervisors, in June 2019, approved the Specific Plan and Tentative Map for the Adara community for up to 1,179 residential units and other complementary uses (such as parks and trails, a public safety site, an elementary school, and resident-serving commercial). As a general matter, development of the approved Otay Ranch planned community—of which Village 14 and Planning Areas 16 and 19 is a part—has been accounted for in regional plans and projections since 1993.

We provide the following comments on the Draft Plan, including its SCS:

1. Government Code section 65800, subdivision (b)(2)(B) requires SANDAG “to use the most recent planning assumptions considering local general plans and other factors” (italics added). In this regard, Figures F.7, F.8 and F.9 in Appendix F of the Draft Plan are in error and must be corrected to reflect SANDAG’s current and reasonable anticipated growth in the unincorporated areas.2 Therefore, the referenced figures show approved and entitled development located within Otay Ranch—including Village 14 and Planning Areas 16 and 19—as “Vacant” on the SCS’ land use pattern maps for 2025, 2035 and 2050. This is obviously incorrect. The “Vacant” appellation is inconsistent with the County’s approval of its General Plan in 2011, the Otay Ranch General Development Plan/Subregional Plan in 1993, and the Adara Specific Plan and Tentative Map in 2019. As such, it results in development forecasts that are incorrect and incapable of supporting the Draft Plan’s findings and objectives. Therefore, we respectfully request that SANDAG modify the referenced figures to reflect the land use densities long-approved by the County and long-recognized by its General Plan for this portion of unincorporated South County.

2. The Draft Plan’s forecasted development pattern will not accommodate the RHNA. Specifically, the Draft Plan—in Table F.3 of Appendix F—projects the construction of just 7,419 dwelling units in unincorporated County areas over the next roughly 30 years (through 2050). This number does not accurately represent the amount of approved, planned and reasonably anticipated growth in the unincorporated areas. For example, in the 6th RHNA Cycle, which covers the Draft Plan through the 2029 planning period (and thus does not align with the 2035 horizon year of the SCS modeling), SANDAG assigned 6,700 dwelling units to the unincorporated areas.2 Therefore, it appears the Draft Plan assumes that a mere 719 additional units will need to be built in unincorporated areas between 2030 and 2050, an assumption that is at odds with reasonable approximations of future RHNA cycles and existing market supply-and-demand evaluations for the San Diego region. The Draft Plan’s assumption of 7,419 units also is approximately 1/8th of the County’s General Plan build-out capacity of approximately 65,000 dwelling units. Thus, we respectfully request that SANDAG reevaluate the reasonableness of its forecasted development pattern.

The 2021 Regional Plan accommodates the regional housing need determined by the Department of Housing and Community Development for the 6th Cycle RHNA. Government Code section 65080(b)(2)(B) requires that the SCS “set forth a forecasted development pattern for the region, which, when integrated with the transportation network and other transportation measures and policies, will reduce the greenhouse gas emissions from automobiles and light trucks to achieve, if there is a feasible way to do so, the greenhouse gas emission reduction targets approved by the state board.” The SCS included in the 2021 Regional Plan projects development that would achieve the state-mandated GHG emissions reduction target when integrated with the transportation investments, programs and policies in the Plan. The Regional Plan forecasts development through 2050 consistent with projections from the California Department of Finance but does not represent buildout of jurisdictions’ General Plans. The Otay Ranch Village 14 and Planning Areas 16 and 19 had not been approved by the Board of Supervisors at the time the SCS Land Use Pattern was developed, and it was not projected for future development in the SCS. The Regional Plan and its SCS are iterative planning documents that are typically updated every four years to account for new data, analysis, policy, and experience.

### L197

3. It is unclear to what extent the SCS and its supporting quantification framework account for the home-to-work, interregional commute reality present in San Diego. We know that the San Diego region’s failure to provide sufficient in-County housing opportunities has resulted in the exportation of some San Diego workers who now must commute into the region from more affordable housing opportunities in Riverside County or Mexico. The spirit of Senate Bill (SB) 375, which created the statutory framework for SANDAG’s SCS, will not be met unless and until we grapple with how land use choices made in the San Diego region affect San Diego workers. The Draft Plan must clarify SANDAG’s strategies for reducing interregional commuting. Such strategies must ensure a sufficient quantity of in-County housing opportunities exists; otherwise, home-to-work, interregional commuting will continue to be a major problem.

### Response

As described in Appendix F, the Regional Growth Forecast has accounted for the need to increase the quantity of in-County housing opportunities. Appendix F includes the following language: “First, the forecast assumes the region’s vacancy rate would increase to 4% by 2040. The 4% vacancy rate assumption acknowledges that the region’s vacancy rate in 2018 was estimated to be less than 2% and that both state and local housing policy has recently focused on accelerating housing production. Second, the forecast assumes that the Series 14 Regional Growth Forecast accounts for vacation rentals and second homes, which are “unoccupiable,” meaning that they are not available for year-round residence. The result of this assumption is that more housing units would need to be developed to counteract the housing units no longer available to residents for long-term occupancy.”

The 2021 Regional Plan includes investments in a housing program to coordinate with local jurisdictions, developers, and other stakeholders to accelerate affordable housing production near jobs and transit.

### L198

My family has lived in Barrio Logan/Logan Heights for over 100 years. I’m a retired school teacher and founder and Executive Director of the Good Neighbor Project. SD my home and office is located at 2215 Logan Ave. I am writing to express my support for the incorporation of a project which goal is to address social and economic inequity, rising levels of health concerns aggravated by greenhouse gas emissions, and transportation injustices in San Diego’s Barrio Logan and Logan Heights communities. Specifically, we request the addition of a Freeway Lid as a priority project as identified in SANDAG’s 2021 Draft Regional Plan (Draft Plan)

Our once united community was devastated by Interstate 5 which forcibly displaced hundreds in the 1950’s and has burdened those who remained. Pursuant to Chapter 1: Equity Focus (p. 11) of Draft Plan, we know Re-Connect Logan Freeway Lid will transform and reconnect our community. A freeway lid can help our community by dismantling the barriers that the I-5 created by bringing the community together, addressing health concerns by capturing GHG emissions, creating non-existing green spaces, and allowing for development of affordable housing. All goals in line with the Draft Plan of creating efficient movement of people and goods, providing affordable, reliable, and safety mobility options, and allowing for healthier air.

As mentioned, the construction of the I-5 forced many families to be displaced, and while the construction allowed for transportation advancements, since the 1950’s our community has been subject to inequality, misrepresentation, and systemic injustices in transportation and racism, to mention a few. We continue to be a working-class neighborhood composed of nearly 90% Mexican Americans and while we are proud of our heritage and activism deeply rooted in our National Landmark of Chicano Park, the reality is that I-5 has created much insecurity by facilitating gang turfs, separating families from places of worship, and limiting children’s access to neighborhood schools. It is time for our community to heal – a freeway lid is the answer.

Given the significant investment and planning of projects in the Barrio Logan/Logan Heights communities in the Draft Plan as identified in Appendix A: Transportation Projects, Programs, it is appropriate to identify and call out Re-Connect Logan Freeway Lid as a project on this list. A few of the multiple projects that will impact Barrio Logan/Logan Heights are:

- The creation of Managed Lanes on Interstate 5, Project ID CC002 Complete Corridor: ML/Goods Movement (p. A-8)
- Additional cargo due to the Harbor Drive 2.0 proposal that will facilitate cargo in the community of Barrio Logan, Project ID GM06 Goods Movement: Roadways (p. A-11)
- Harbor Drive Corridor, project ID GM05 2050 Goods Movement: Roadways Harbor Drive Multimodal Corridor Improvements that will facilitate Trucks for the Port of San Diego (p. A-12)

Besides being in line with the 2021 Draft Regional Plan, Re-Connect Logan Freeway Lid is also pursuant to Appendix H in the 2021 Regional Plan, SANDAG and Caltrans District 11 have also expressed interest in exploring opportunities for freeway caps. In alignment with the 2021 Regional Plan, SANDAG and Caltrans District 11 are currently developing Comprehensive Multimodal Corridor Plans in coordination with agency partners and local city governments. Comprehensive Multimodal Corridor Plans (CMCPs) are data-driven plans to reduce congestion and generate transportation choices while preserving community character and creating opportunities for enhancement projects. Opportunities for freeway caps will be considered in the CMCPs.
Harvey Levine

L199 I need to preface my comments by expressing my admiration for the product that SANDAG has produced and for the investment that has been made in developing a potentially ideal transit-based solution to the environmental and density challenges with which we are faced in this remarkable county. The professionalism and quality exhibited in the published works are of the highest rank and served me well in my quest to understand the goals of the RTP and the methods to achieve them. It is indeed a visionary expression of a world-class system for a future population. I recognize the serious challenges and I fear for the future of the planet. I applaud the bold and creative efforts to meet these challenges head on, to work to meet state and federal mandates, and to qualify for state and federal funding and subsidies where available.

L200 In my consulting practice I have often been engaged to perform due diligence on business cases for major programs and for proposals for new business initiatives. As I became deeply interested in the 2021 RTP, I couldn’t help seeing items that sounded alarms and triggered reality checks. As I have seen all too often, the search for the ideal has surpassed the practicalities of what is reasonable and achievable. I also am concerned that the sponsors may have based their assumptions on a best case or “wished for” values rather than a most likely set of scenarios. This plan begs for a responsible investigation and evaluation of the RTP by members of the SANDAG board who will carry the responsibility for this investment in the future. There is actually more risk than an investment. The county appears to be committed to facilitate and mandate a radical change in the culture and behavior of a vast populace whose lifelong belief is that having a personal vehicle to go anywhere, at any time, is an inalienable right. The board is not voting for a transportation plan. It is voting to mandate a change to the very foundation of our lifestyle. They better get it right. We need to do something that will work.

L201 Actually, there are two huge hurdles. One is the nature of people to resist paradigm shifts. Cultures cannot be mandated. They exist by will of the people. The 2021 Regional Plan makes assumptions of colossal culture change that cannot be reasonably presumed. This is a fact of life that governs what can be accomplished, no matter how “good” it is for the people and for the planet. For example we need only look to our current COVID-19 crisis. The only way out of this pandemic is via vaccination. The science is certain. The data is monumentally supportive. Yet, a major portion of the population refuses to do what is good for them and for the nation. Has this artifact of human nature been given adequate consideration in the plan?

The second hurdle, which has led to the demise of even the most seemingly foolproof plans, is the failure to consider the potential downside of the business case. In every plan there is a range of possible outcomes. We can look at the case through three lenses; the optimistic, the most likely, and the pessimistic. Where things fall apart is when exuberant support for the “optimistic” case causes the sponsor to downplay the “most likely” and to ignore the “pessimistic, and the associated risks.” The pessimistic case fully considers risks. It creates alternate models representing the potential downside. The downside can happen. Even the most infallible plans have collapsed, leading to total failure of the venture, because of the reluctance to use assumptions that consider potential events and conditions that are not of the sponsor’s liking.

Here in San Diego, even in SANDAG, we have a history of inflated assumptions. We have seen it in the forecast of pension funding and in the projection of tax revenues. We have also seen it in the estimates of transit ridership. What assurances can you give the public that the 2021 Regional Plan is not based on inflated assumptions of income, ridership, or even the level of acceptance of change by the public?

Where are the models that represent a lesser level of expectations and what that would mean to accomplishment of the goals? I see a presentation of the ideal. Where is the picture of the realistic?

L202 Director Ikhnata boldly declares that it is the plan’s intention to pressure the public to change its wasteful use of personal motorized vehicles as a response to environmental concerns of growing proportions, as well as to meet various government mandates. He talks about incentives. But when queried about how the change in behavioral culture will come about, he repeatedly brings up “pricing”. He says “it will work if we price it right.” Of course “pricing” is a code word for “fees.” Using a euphemism cannot disguise what it is.

Thank you for your comment. SANDAG will launch a study in the next year to further study the potential of usage-based fees and their capabilities in addressing various goals, including equity and greenhouse gas emissions reduction. The initial phase of this study will focus on calculating the true cost of driving, and better understanding what sources of existing revenue are funding different parts of the system and how different populations are impacted by existing revenue mechanisms. This foundational understanding will help.
L203 Now, looking at some of the initiatives in the RTP, there are data that belies the expected results. Director Ikhrata was asked if he could provide an example of where MANAGED LANES was implemented. Oddly I-15 was used as an example. However, the design calls for Managed Lanes for I-5 and CA-78/56/52 without adding new lanes (except for repurposing shoulders), whereas the I-15 project created four additional lanes for HOV or toll-payer use. Unless all of the lanes are contiguous (which they are not) and narrow bridges are widened, the periodic merging of lanes would create new bottlenecks and backups. So would increased public safety vehicles, or emergencies that would impact travel lanes in the absence of shoulders. Is this really safe or practical? How would traffic control (police radar and traffic stops) operate? What happens in a medical emergency or when a vehicle has a mechanical problem, a flat tire, or runs out of gas or battery power? How is congestion reduction alleviated when a lane is isolated for buses? This model of managed lanes is more like a game of whack-a-mole. I am apprehensive of drivers’ attention being diverted from the road by a system of signs and signals directing them to a particular managed lane that changes with traffic conditions.

How effective would the Managed Lanes concept be if it doesn’t involve increased reliable capacity? SANDAG projects an increase in use of mass transit (at peak commuting times) from about 3% to 11.2% (in 2035). Will this be enough to sufficiently impact the carbon reduction goal? SANDAG is also projecting a population growth of 15.2% by 2035. It would seem that the movement of commuters will not be enough to offset the growing demand for roadways. How do we significantly reduce congestion (a key goal) without increasing capacity? Do we gain enough to justify the cost and inconvenience of construction and repurposing plus the imposition of user fees?

L204 On the other hand, there are other conditions that might represent a reduction of emissions-producing vehicles. Among the important forecast values that we must consider for the RTP is the impact of electric vehicles. All manufacturers are making massive investments and commitments to have a majority of their output be EVs, within a decade. Governments are equally committed to replacing petroleum-fueled vehicles by 2035. Are we likely to gain more in the real goal of reduced greenhouse gases through the mandated and incentivized move to EVs?

When the shift to EVs is added to the impacts of more workers not having to drive to an office every day, potentially offsetting the population growth, the expense and “pricing” of the full managed lanes solution may not be warranted. Not if the justification is the reduction in the production of GHG. As an aside, we have to learn not to justify massive, expensive projects because there is government funding earmarked for such programs. Yes, I am thinking of California High-Speed Rail. These programs always end up growing extensively beyond the original (misrepresented) scope and cost, causing the agencies that thought that they were getting a free lunch to bleed real cash.

L205 Let’s get back to the “incentives” to get drivers to shun their cars. The “right” pricing essentially means making it painful to pay the VMT (vehicle mile traveled) fees. What I am hearing now is a charge of two cents per mile for the state plus two cents per mile for the county. So a highway trip from Rancho Bernardo to downtown and back would cost about two dollars to drive. Enough to make people angry, but not enough for them to use other means for travel. If they don’t meet the HOV criteria, it’s either pay additional fees or be limited to what are designed to be slower lanes. In the latter case, how does that help relieve congestion? It just pushes lower income drivers to use the most congested lanes. How does that support the stated “equality” goals?

The “right” pricing – that is; fees that will cause drivers to shun the controlled highways – may eventually lead to drivers eliminating such trips altogether. That may help the goal of easing congestion. But there will be offsetting penalties if the cancelled trips lead to people not shopping, eating out, or going to entertainment venues. This, in turn, will reduce income from sales taxes as well as impact the bottom line of these businesses (more tax losses). Has this been factored in?
into the equation?
When combined with other initiatives, such as reducing or completely eliminating parking in many areas, both business and residential, the campaign against car owners becomes draconian. The thinking is that if people are using MASS TRANSIT and local connection options there will no longer be a need to own a personal vehicle. So whether you’re going out to the mountains to go hiking, or over to Costco to load up on groceries and a 30-roll package of toilet paper, can you say that you really don’t need a car?

Sure! Hey guys! Let’s grab our beach chairs and umbrellas, the cooler, our cornhole game and a couple of surf boards and take the bus over to Cardiff State Beach (from Green Valley in Poway). And we’ll stop off for dinner in Rancho Santa Fe on the way home, toting all our stuff. Currently, there is no reasonable mass transit to support that (according to MTS trip planner). The software did come up with a solution that would take four hours just to get to the beach, using four busses and the Sprinter (plus some walking) and told me to start 90 minutes earlier than I had specified. Is better coverage in the works?

Would the group be able to make the trip in one day? Could they manage with all their gear?

So let’s stop dreaming about a world without cars. Can we be practical and come up with ideas and real incentives to cut down on VMT?

Furthermore, as an “incentive” to dump your car or truck, the plan calls for charging for parking spot use and even to pull over to the curb. Yes, it’s in the plan – see page 60 “Parking and curb pricing.” Pricing is the term that is used for “fees.”

With the estimate of only 11.2% of commuters using mass transit (and less for the general public) what we need is more parking. We shouldn’t need to drive around looking for parking spots or hang out at the curb with the motor running. If you want to change behavior, do it with rewards, not with penalties.

While there are some interesting ideas in this plan, I predict that the overall result will be to nickel and dime car owners in multiple ways without actually achieving the results that are expected.

The regional network of Mobility Hub areas overlaps with communities that already feature higher concentrations of people, places, and trip-making. As SANDAG partners with cities, transit agencies, and additional entities to deploy Flexible Fleet solutions these services will not only help people travel within a hub but also to places beyond and between hubs. Please refer to Figure 2.4 in the plan which illustrates how Flexible Fleets expand coverage to neighborhoods beyond the mobility hub areas. In areas outside of mobility hubs, Flexible Fleets such as shared, electric, and eventually autonomous shuttles would be available on-demand, ready to take you where you need to go. Today, services like on-demand rideshare, microtransit, and vanpool already provide a convenient travel option in areas where traditional fixed transit may not work well.

The Bakersfield/Fresno/Merced rail is an interesting question that is raised. The project, while being a success story, is a real catalyst for a multitude of other projects. The study will assess the potential impacts of user fees on San Diego residents, visitors, and businesses, particularly those relying heavily on transportation. SANDAG staff will consult with its Board of Directors, stakeholders, and community members to develop implementation strategies for a road usage charge. This includes policies such as who will pay what and how much, the fee structure, and the distribution of revenues. SANDAG is committed to developing a carefully constructed program that will ensure that no group, such as those driving fuel-powered vehicles, low-income individuals, rural residents, or those with long commutes, are paying more than their fair share. There are multiple mechanisms, such as caps and rebates, that will be explored to ensure a fair system.

The expectation that businesses will all of a sudden relocate to properties within a mobility hub is speculative, at the very least, there is no evidence that businesses will move to mobility hubs. Where is the evidence? Furthermore, if the new model is for these businesses to not have parking then the people will choose to take their business elsewhere. In the end, SANDAG may achieve their goal to reduce VMT. The public will do their shopping on line. They’ll enjoy their own cooking at home. And the biggest accomplishment will be a local business decline and more tax losses. The roads will be wall to wall with gas-guzzling Amazon vans.

The implementation of the proposed 2021 Regional Plan will be a truly collaborative effort between SANDAG, local jurisdictions, transit agencies, private developers, and employers. While land acquisition may be considered for certain projects, land use decisions are reserved to local jurisdictions. Innovative public-private partnerships should be encouraged to find solutions that meet the needs of all stakeholders.

Thank you for your comments and your interest in mobility in our region. We encourage you to stay engaged by visiting SANDAG.com. Public engagement will continue until the Board is asked to adopt the 2021 Regional Plan in December 2021.

Regarding the I-15 corridor, the I-15 Corridor is difficult to serve with rail because of the development patterns which resulted in widely spread out communities. This area is served by Rapid bus routes which will be expanded in the future with more services.

<td>L209</td>
<td>Back to my personal travel habits and needs. I recently purchased an e-bike and use it almost daily. I take it to the tennis courts on week days – just less than a mile and with no major intersections. I love the ride and am happy to not use my gas engine vehicles for such short trips. But the e-bike is not practical for most errands and my primary use is for exercise and recreation. There are several areas where I cannot ride because of poorly maintained bike lanes or unmarked bike lanes in high-traffic streets and intersections. The nearest formal bike trail (i-56) is about a ten mile ride over a treacherous, unmaintained bike lane on Carmel Mountain Road in Rancho Penasquitos. The money available for biking would be better spent on improving these impediments than in uprooting city streets to make us look like Holland. Also, I would not be able to use the e-bike with mass transit because the bike is too heavy to put on the bike carriers. (Does anyone ever use these? I never see a bus with a bike. I also never see a bus with more than two passengers.)</td>
<td>As an early action out of the Regional Plan, SANDAG will be developing a new Active Transportation Plan. The plan will take a fresh look at the network and the options to make it safe and comfortable to use active transportation. Your comment was forwarded to the City of San Diego.</td>
</tr>
<tr>
<td>L210</td>
<td>I have not addressed the practicality of the proposed high-speed coastal rail or other light rail expansions due to lack of details. Shouldn’t we be looking at a set of alternatives, rather than a single plan? On the LOSSAN corridor segment, I’d like to see figures for a solution based on upgrading the Coaster system, rather than assuming that a new high-speed system is needed to meet our goals. The benefits of a high-speed train tend to be grossly overstated when one considers that the actual rail time is just a small portion of the overall door-to-door trip time. Doubling the speed of a locomotive may equate to a 5% to 10% improvement in trip time. Increasing distances between stations makes the use of high-speed rail less convenient and may add additional time to last-mile segments. Frequency (less waiting time) may contribute more to shortening trips than high speed. It is good to see this in the plan.</td>
<td>The Regional Plan identifies investments in the LOSSAN corridor to improve capacity, speeds, safety, frequency, and significantly reduce travel time primarily due to higher-speed realignments with the Del Mar Tunnel and Miramar/JUC Tunnel. In 2020, SANDAG began work on a Regional Rail Alternatives Alignment Study (<a href="https://www.keanearchitects.com/Libraries/Lossan-PDFs/SANDAG-LOSSAN-DMB-FactSheet_LongTermAlignment_11-10-2020.pdf">https://www.keanearchitects.com/Libraries/Lossan-PDFs/SANDAG-LOSSAN-DMB-FactSheet_LongTermAlignment_11-10-2020.pdf</a>) that identifies incremental higher-speed upgrades to the LOSSAN corridor to meet the goals in the Regional Plan. Thank you for your comment.</td>
</tr>
<tr>
<td>L211</td>
<td>On a final note, I am compelled to comment on some disturbing issues relative to the relationships and behavior between the agency (SANDAG), the SANDAG Board of Directors, and the public. There is no way that we can accept the response by Director Ikhrata to criticism voiced by board member Rodriguez (Oceanside), at the 5/21/21 SANDAG presentation. Obviously dismissing the board member’s right to question the RTP, Ikhrata interrupted to say “We are the experts.” It is this attitude that highlights the importance of the Board exercising its responsibility to provide oversight and leadership for this important agency. We must further question the intent of Director Ikhrata to influence the recent Supervisor election, and hence the selection of board members by making a political contribution to a likely supportive candidate in opposition to a candidate that voiced resistance to the developing RTP. How these two incidents can go unchallenged is beyond belief. Where is the oversight?</td>
<td>Thank you for your comments and your interest in mobility in our region. We encourage you to stay engaged by visiting SDForward.com. Public engagement will continue until the Board is asked to adopt the 2021 Regional Plan in December 2021.</td>
</tr>
<tr>
<td>L212</td>
<td>High-speed Rail: Going from 60 MPH to 120 MPH will not deliver a great time savings if distances between stops are greater and time from station to destination is increased. The easiest and most economical way to make train-based travel faster is actually to have stops closer to the &quot;last-mile&quot; and to up the frequency so that travelers don’t have to spend the projected time gained waiting for the next train. Commuter rail, with short distances will not gain much from doubling the top speed. Electrification will help acceleration times and reduce GHG emissions. Can we modify what we already have and still achieve our goal – faster and cheaper? Urban/suburban rail should run every four minutes in peak travel times and every eight minute at other times. At the least a ten minute interval would free travelers from needing partnerships can be forged to fund, design, and implement various aspects of mobility hubs including stations, complete corridors improvements, and other mobility hub amenities.</td>
<td>Thank you for your comments and your interest in mobility in our region. We encourage you to stay engaged by visiting SDForward.com. Public engagement will continue until the Board is asked to adopt the 2021 Regional Plan in December 2021.</td>

San Diego Forward: The 2021 Regional Plan G7E-45
Managed lanes are meant to be flexible based on the needs of the corridor at different times of the day by using real-time data through the Next Operating System (Next OS). In the event of a breakdown or accident lane designations can shift to accommodate emergency vehicles while managing traffic flow.

SANDAG and Caltrans are currently preparing several Comprehensive Multimodal Corridor Plans which aim to create a comprehensive set of safe, sustainable, and equitable transportation solutions that are tailored to the needs of the corridor. The design and operation of the managed lanes network will be further assessed through these Plans and other detailed engineering studies.

The maximum capacity of any highway is determined by the capacity at its most constricted point. The plan calls for increasing capacity on limited access highways, such as SR-56, by utilizing shoulders. SR-56 would increase from four lanes to seven lanes. However, the inner shoulders are only four to eight feet and they do not continue at the six lanes to seven lanes. Therefore, the inner shoulders are only four to eight feet and they do not continue to the six locations where the highway goes over a bridge. It seems that this would require adding lanes on the existing divider and building six new bridges at the overpasses to accommodate the three additional traffic lanes. Without this, the bottlenecks would nullify any gains from the added lanes.

Bicycling: Bicyclists are one of the ways SANDAG is working to reduce regional GHG emissions and improve local air quality. SANDAG’s proposed EV commitments such as regional electric vehicle infrastructure (e.g., EV charging stations and hydrogen fueling stations). These electric vehicle investments are one of the ways SANDAG is working to reduce regional GHG emissions and improve local air quality.

The 2021 Regional Plan aims to create safe and well-connected routes for bicyclists and pedestrians. The intention of the network in this Regional Plan is a framework which facilitates trips associated with regional commuting (SANDAG is counting on at least a tripling of biking to work) and building six new bridges at the overpasses to accommodate the three additional traffic lanes. Without this, the bottlenecks would nullify any gains from the added lanes.

With 12 deaths to bikers in seven months, more has to be done promote safety. Countless injuries are awaiting bikers that are forced to ride on unmaintained bike lanes, opening up municipalities to large law suites.

The intention of the network in this Regional Plan is a framework which facilitates trips associated with regional commuting (SANDAG is counting on at least a tripling of biking to work) and building six new bridges at the overpasses to accommodate the three additional traffic lanes. | L217 | On page 10, the plan states that in 2019, greater than 90 percent of CA-MEX trade was moved by truck across the international border. A great fact to know, but where does your regional plan address and mitigate for the smoggy trucks registered in Mexico that are hauling those goods? Will the plan only regulate the emissions of vehicles registered in San Diego County (or California) while out-state and out-of-country (Mexican) vehicles get a “free pass”? | In California, regulation of vehicle emissions is managed by California Air Resources Board (CARB). CARB conducts inspections of heavy-duty trucks traveling in California including those registered out of state and from foreign countries. At border ports of entry CARB inspects heavy-duty trucks for excessive smoke, and engine certification label compliance. SANDAG partners with CARB and the San Diego Air Pollution Control District on air quality conformity (see appendix C) and emission reduction strategies across the region. In addition, SANDAG is committed to the following actions:  
- Pursue programs and projects to further policies focused on electrification of fleets, and Executive Order N-79-20 related to sales of zero-emission personal and medium/heavy-duty vehicles.  
- Plan for goods movement strategies that reduce border congestion that exacerbates emissions resulting from vehicle delay.  
- Continue coordination on strategies identified in the 2021 California-Baja California Border Master Plan. |
| L218 | On page 12, the plan states: “from 2016 to 2050, nearly 60 percent of population growth will be among those who are 75 years and older.” Will this aging population (60 percent who are projected to be people of color), feel physically safe while using public transit (buses, trams, trolleys) during evening/night time? Will they all have smart phones and be able to navigate a smart phone application that gives them a choice of transportation modality based on a variety factors including CO2 emissions? | SANDAG has a long history of working closely with senior community members, social service providers, non-profits and community-based organizations to develop and fund specialized transportation services geared specifically towards the needs of seniors. The Regional Plan network includes a variety of modes that work together seamlessly to provide all San Diego residents, regardless of age or ability, access to multiple travel choices. Flexible Fleets are an example of an option that is particularly well suited for the senior population. Flexible Fleets options like ridehail, rideshare, and microtransit, offer a range of mobility options and vehicles that can accommodate many types of trips and meet the needs of various users. They can make it easy for seniors to access medical appointments and other basic needs without relying on a car. Flexible Fleet vehicles and services are adaptable in nature and can offer personalized accommodations, such as wheelchair lifts, door-to-door services, and other options for people with physical limitations. SANDAG has conducted outreach and will continue to engage with seniors to ensure their mobility needs are met. In addition, SANDAG is developing a Flexible Fleets Implementation Strategic Plan that will address potential barriers to accessing Flexible Fleets, ensuring options for people without smartphones or internet, providing education about how to access Flexible Fleets, and more. |
| L219 | On page 15, the plan states that if the 2021 plan was implemented, “by 2050, this could result in 13 percent of commuters using transit (up from 3 percent today) and that there would be a substantial decline in commuters driving alone to work (from 80 percent today to 62 percent in 2050).” Those figures do not reflect any significant behavioral changes regarding transportation choices given that this plan would greatly expand mass transit frequency and routes. In 2021, many city busses are carrying just two to three passengers while trolleys carry more passengers depending on their routes. How realistic are the 2021 plan’s predicted increases? Were urban residents asked about factors that would actually make them leave their cars and use mass transit instead? Was the current trend of working remotely from home factored into these calculations? What if the public perceives that it is not in their best interests to share a bus or a trolley with a group of strangers who may or may not be healthy? What happens when the next pandemic impacts our region and mass transit shuts down for public safety reasons? Clearly more studies on the current trends in mass transit usage must be analyzed before the predictions contained in this plan can be validated. Also, additional studies on the effects of the COVID pandemic on transit usage figures are critical. Analysts should avoid using the data from any month when all mass transit ridership figures have been waived, as they will skew the data. (This will happen in September 2021.) | The performance of the 2021 Regional Plan is based on the best available data at this time. It will be important to continue to monitor trends and impacts to travel behavior as the Regional Plan is implemented and updated in the future. Priority Implementation Action 10 is to advance a data science program to better understand travel behavior in the region, update travel demand modeling tools, and improve transparency and reporting on program effectiveness and project delivery. |
| L220 | On page 25, the 2021 plan calls for providing a variety of transit riders with reduced fares (seniors, low-income, students, youth and the disabled). This is fiscally untenable. What is the actual cost per passenger mile on a bus, trolley, or light rail? Appendix A predicts that in 2020 dollars, transit fare subsidies in 2035 will be $982 million dollars and in 2050, subsidies will be $4 BILLION dollars which means that the answer to the previous question about the cost per passenger mile must be too high to print!!! This plan cannot seriously contemplate spending $4 billion dollars to possibly achieve a 13 percent increase in mass transit ridership. | Yes, the Regional Plan envisions a public transportation system that is cheaper to ride than in the past. By offering these lower fares, more residents, especially those in disadvantaged communities, will be able to afford transportation freedom. SANDAG has prioritized equity in San Diego Forward. The 2021 Regional Plan (2021 Regional Plan) more than ever before. Promising a system that is faster, fairer, and cleaner, the planning efforts intend to uplift people who have been historically faced with social injustice. |
| L221 | The 2021 plan which seeks to “reimagine” regional transportation strategies appears to be a huge and costly wish list of programs and government regulations directed primarily at changing residents’ driving behavior at a tremendous loss of personal freedoms. It envisions spending millions of dollars to create an expanded bike network with corridors by outreach and will continue to engage with seniors to ensure their mobility needs are met. In addition, SANDAG is developing a Flexible Fleets Implementation Strategic Plan that will address potential barriers to accessing Flexible Fleets, ensuring options for people without smartphones or internet, providing education about how to access Flexible Fleets, and more. | Build out of the Regional Bike Network along with investments in complete streets and Vision Zero programs are components of the 2021 Regional Plan that advance goals related to reducing greenhouse gas emissions, improving safety for all users, and advancing public health. |
2050. Again, where is the data that shows that kind of expenditure will get more people out of their cars and onto bicycles? A recent case in point: the removal of 400 parking spaces along the business district on 30th Street in the North Park area so that bike lanes, that are rarely used to commuting to and from work, could be installed. Not only are the merchants upset about the loss of customer parking and business, but delivery trucks are now blocking bike lanes to make their deliveries and handicapped parking has become confusing for those who need it. The 2021 plan will greatly expand on that unpopular and costly transportation strategy.

L222 Under this plan, transportation in and around mobility hubs or areas of concentrated development (cities) would be highly regulated with curb management regulations/fees based on the time of day parking rates, and ride-hailing opportunities. Ride-hailing at mobility hubs is described as offering people on-demand vehicles for short and long-distance trips, possibly subscription-based services which would “allow people to reserve a vehicle that best serves the needs of their trip.” So, it is okay to rent/driver a vehicle but just not to personally own a vehicle?

Flexible Fleets are shared, electric, mobility services that provide greater options for making trips around the region. Different vehicles allow you to pick the service that best meets your needs and provide an option for people to rent a vehicle or share a ride as that can be more convenient and affordable than owning a personal vehicle.

L223 On page 32, the plan states: “In the San Diego region, almost half of all trips are three miles or less, and most everyday trips are made within neighborhoods using local streets.” Where is the data to back up this statement? This page also states: “On average, one person is killed or seriously injured in traffic violence everyday in the region.” Everyone understands the safety risks that they take when they drive a car and they believe those risks to be acceptable. Again, no driving statistics are referenced, and of course, the plan does not provide data on the numbers of people who are mugged walking down the regional’s streets or at trolley stations, etc.

The SANDAG travel demand model is the data source for the region’s daily trip making estimates. Person trips, travel behavior characteristics, and related decisions are based on empirical data collection efforts conducted by SANDAG, Caltrans, and the federal government. Out of more than 13 million daily trips completed by residents, more than 6 million of those trips are 3 miles or less.

L224 Everyone agrees that climate change is real. On page 34, several climate strategies are listed. The blue pie chart at the top of the page lists “collecting rainwater” as one viable climate mitigation strategy. Why doesn’t this 2021 plan identify more impactful strategies such as building new reservoirs/expanding existing ones or building additional desalination plants? It should be noted, that even if the 2021 plan is implemented, it will not stop the sea levels from rising.

The Venn Diagram on page 34 of the 2021 Regional Plan, is illustrative in nature, offering graphics to accompany the definitions for mitigation, adaptation, and resilience. The local jurisdictions and other public agencies, including water authorities, can and will identify climate strategies beyond what is included in the 2021 Regional Plan. New transportation infrastructure projects will be engineered to integrate adaptation strategies that consider the best available science, tools, and technology to make them, and the region’s transportation network, more resilient to the impacts of climate change, such as sea level rise.

L225 This plan would require employers and developers to provide transportation benefits and on-site amenities to encourage people to use sustainable transportation choices. Does the County want even more businesses to flee California for a friendlier business climate? Employers can figure out how to use flexible work schedules and tele-work options to attract and sustain their workforce without unnecessary government intervention/legislation.

The 2021 Regional Plan proposes a Transportation Demand Management Ordinance that would require employers over a certain size to provide transportation benefits and amenities that encourage sustainable transportation choices. These types of TDM ordinances exist in other regions across the state. A near-term implementation action would be to complete a Transportation Demand Management Ordinance Policy Analysis. This policy analysis would detail the employers that the ordinance would apply to and mechanisms for implementation and enforcement.

L226 Of course, of the 2021 plan’s proposed transportation management “strategies” come at a huge cost ($163 billion dollars). The plan identifies $90 billion dollars that will come from local funding sources: sales taxes, impact fees, fuel taxes, road tolls, increased passenger fares, general funds, housing revenue, ride-hailing fees, value pricing, and road user charges also called vehicle miles travelled (VMT). Road usage fees or VMT, which have yet to be implemented through legislation, are needed to offset the reduction in gasoline taxes as more electric vehicles (EV) use our roadways. Under this plan, VMT fees would come on top of the existing federal, state, and local gasoline taxes, and they would unfairly penalize the drivers of gas-powered vehicles, who frequently are the low-income residents who live in the rural areas of the County. (VMT would not be collected on out-of-state vehicles.) Under the 2021 plan, fees of all kinds would be raised, including variable road tolls based on the time of day (congestion), fees for solo drivers using carpool lanes, and fees for ride-sharing services like Uber. The fees and regulations imposed by this plan will disproportionately impact low-income residents, while the plan claims to promotes social equity. They are the ones who will not be able to afford to park/driver their own private vehicles while transportation choices of more affluent residents will not be affected.

Next year, SANDAG will study usage-based fees and the effect the fees will have on meeting established goals like greenhouse gas emissions reduction and improving equity for different income levels and different populations. The first phase of the study will calculate the true cost of driving a vehicle – the cost to own and operate a vehicle, the effect on road wear and tear, the cost of increasing capacity of the transportation system to meet demand, local and global pollution caused by both fuel powered and electric vehicles, traffic accidents, traffic congestion, and the cost of delays caused by congestion to the economy and to the quality of life of travelers. The study will determine how existing revenues currently funds different parts of the transportation system and how different populations are impacted. This foundational understanding will help SANDAG design a road usage charge program that encapsulates multiple factors to make it more fair across the community than the current transportation funding sources.

The study will assess the potential impacts of user fees on San Diego residents, visitors, and businesses, particularly those relying heavily on transportation. SANDAG staff will consult with its Board of Directors, stakeholders, and community members to develop implementation strategies for a road usage charge. This includes policies such as who will pay what and how much, the fee structure, and the distribution of revenues. SANDAG is committed to developing a carefully constructed program that will ensure that no group, such as those driving fuel-powered vehicles, low-income individuals, rural residents, or those with long commutes, are paying more than their fair share. There are multiple mechanisms, such as caps and rebates, that will be explored to ensure a fair system.

L227 Of course, of the 2021 plan’s proposed transportation management “strategies” come at a huge cost ($163 billion dollars). The plan identifies $90 billion dollars that will come from local funding sources: sales taxes, impact fees, fuel taxes, road tolls, increased passenger fares, general funds, housing revenue, ride-hailing fees, value pricing, and road user charges also called vehicle miles travelled (VMT). Road usage fees or VMT, which have yet to be implemented through legislation, are needed to offset the reduction in gasoline taxes as more electric vehicles (EV) use our roadways. Under this plan, VMT fees would come on top of the existing federal, state, and local gasoline taxes, and they would unfairly penalize the drivers of gas-powered vehicles, who frequently are the low-income residents who live in the rural areas of the County. (VMT would not be collected on out-of-state vehicles.) Under the 2021 plan, fees of all kinds would be raised, including variable road tolls based on the time of day (congestion), fees for solo drivers using carpool lanes, and fees for ride-sharing services like Uber. The fees and regulations imposed by this plan will disproportionately impact low-income residents, while the plan claims to promotes social equity. They are the ones who will not be able to afford to park/driver their own private vehicles while transportation choices of more affluent residents will not be affected.

Figure 3.3 on page 50 shows the 2021 Regional Plan Expenditures with an estimated total of $163 billion in 2020 dollars. There needs to be a similar pie chart within the 2021 plan that shows how much money will be spent on each as noted in the comment, this information is available in Appendices A and U of the 2021 Regional Plan.

| L229 | I have been a Logan Heights business owner for over 12 years. I am writing to express my support for the incorporation of a project which goal is to address social and economic inequity, rising levels of health concerns aggravated by greenhouse gas emissions, and transportation injustices in San Diego’s Barrio Logan and Logan Heights communities. Specifically, we request the addition of a Freeway Lid as a priority project as identified in SANDAG’s 2021 Draft Regional Plan (Draft Plan)  

Our once united community was devastated by Interstate 5 which forcibly displaced hundreds in the 1950’s and has burdened those who remained. Pursuant to Chapter 1: Equity Focus (p. 1) of Draft Plan, we know ReConnect Logan Freeway Lid will transform and reconnect our community: A freeway lid can help our community by dismantling the barriers that the I-5 created by bringing the community together, addressing health concerns by capturing GHG emissions, creating non-existing green spaces, and allowing for development of affordable housing. All goals in line with the Draft Plan of creating efficient movement of people and goods, providing affordable, reliable, and safety mobility options, and allowing for healthier air.  

As mentioned, the construction of the I-5 forced many families to be displaced, and while the construction allowed for transportation advancements, since the 1950’s our community has been subject to inequality, misrepresentation, and systemic injustices in transportation and racism, to mention a few. We continue to be a working-class neighborhood composed of nearly 90% Mexican Americans, and while our we are proud of our heritage and activism deeply rooted in our National Landmark of Chicano Park, the reality is that I-5 has created much insecurity by facilitating gang turfs, separating families from places of worship, and limiting children’s access to neighborhood schools. It is time for our community to heal - a freeway lid is the answer.  

Given the significant investment and planning of projects in the Barrio Logan/Logan Heights communities in the Draft Plan as identified in Appendix A: Transportation Projects, Programs, and Phasing, it is appropriate to identify and call out ReConnect Logan Freeway Lid as a project on this list. A few of the multiple projects that will impact Barrio Logan/Logan Heights are:  

The creation of Managed Lanes on Interstate 5, Project ID CC002 Complete Corridor: ML/Goods Movement (p. A-8)  

Additional cargo due to the Harbor Drive 2.0 proposal that will facilitate cargo in the community of Barrio Logan, Project ID GM06 Goods Movement: Roadways (p. A-11)  

Harbor Drive Corridor, project ID GM05 2050 Goods Movement: Roadways Harbor Drive Multimodal Corridor Improvements that will facilitate Trucks for the Port of San Diego (p. A-12)  

Besides being in line with the 2021 Draft Regional Plan, ReConnect Logan Freeway Lid is also pursuant to Appendix H in relation to California Assembly Bill 805 which requires the reduction of pollution exposure in disadvantaged communities. Furthermore, our project is also pursuant to the Sustainable Communities Strategy per California SB 375 since it would help reach the overall goal of reducing GHG emissions of 15% (p. 18 of Draft Plan), as well as allowing for accommodation to the Regional Housing Needs Assessment Determination. For all these reasons, our community is looking forward to the addition of a Freeway Lid as a priority project as identified in SANDAG’s 2021 Draft Regional Plan. | Caltrans District 11 has also expressed interest in exploring opportunities for freeway caps. In alignment with the 2021 Regional Plan, SANDAG and Caltrans District 11 are currently developing Comprehensive Multimodal Corridor Plans in coordination with agency partners and local city governments. Comprehensive Multimodal Corridor Plans (CMCPs) are data-driven plans to reduce congestion and generate transportation choices while preserving community character and creating opportunities for enhancement projects. Opportunities for freeway caps will be considered in the CMCPs. |
| L230 | I have been a Logan Heights resident for 34 years. I am writing to express my support for the incorporation of a project which goal is to address social and economic inequity, rising levels of health concerns aggravated by greenhouse gas emissions, and transportation injustices in San Diego’s Barrio Logan and Logan Heights communities. Pursuant to Chapter 1: Equity Focus (p. 11) of Draft Plan, we know ReConnect Logan Freeway Lid will transform and reconnect our community. A freeway lid can help our community by dismantling the barriers that the I-5 created by bringing the community together, addressing health concerns by capturing GHG emissions, creating non-existing green spaces, and allowing for development of affordable housing. All goals in line with the Draft Plan of creating efficient movement of people and goods, providing affordable, reliable, and safety mobility options, and allowing for healthier air. As mentioned, the construction of the I-5 forced many families to be displaced, and while the construction allowed for transportation advancements, since the 1950’s our community has been subject to inequality, misrepresentation, and systemic injustices in transportation and racism, to mention a few. We continue to be a working-class neighborhood composed of nearly 90% Mexican Americans, and while we are proud of our heritage and activism deeply rooted in our National Landmark of Chicano Park, the reality is that I-5 has created much insecurity by facilitating gang turfs, separating families from places of worship, and limiting children’s access to neighborhood schools. It is time for our community to heal – a freeway lid is the answer. Given the significant investment and planning of projects in the Barrio Logan/Logan Heights communities in the Draft Plan as identified in Appendix A: Transportation Projects, Programs, and Phasing, it is appropriate to identify and call out ReConnect Logan Freeway Lid as a project on this list. A few of the multiple projects that will impact Barrio Logan/Logan Heights are: The creation of Managed Lanes on Interstate 5, Project ID CC002 Complete Corridor: ML/Goods Movement (p. A-8) Additional cargo due to the Harbor Drive 2.0 proposal that will facilitate cargo in the community of Barrio Logan, Project ID GM06 Goods Movement: Roadways (p. A-12) Besides being in line with the 2021 Draft Regional Plan, ReConnect Logan Freeway Lid is also pursuant to Appendix H in relation to California Assembly Bill 805 which requires the reduction of pollution exposure in disadvantaged communities. Furthermore, our project is also pursuant to the Sustainable Communities Strategy per California SB 375 since it would help reach the overall goal of reducing GHG emissions of 15% (p. 18 of Draft Plan), as well as allowing for accommodation to the Regional Housing Needs Assessment Determination. For all these reasons, our community is looking forward to the addition of a Freeway Lid as a priority project as identified in SANDAG’s 2021 Draft Regional Plan.</td>
<td>preserving community character and creating opportunities for enhancement projects. Opportunities for freeway caps will be considered in the CMCPs.</td>

<td>Operational and Financial Assumptions</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>1. NCTD seeks specific data on the proposed dedicated source of funding to be used to provide reduced or free fares within the region. NCTD believes that it is important that SANDAG identify a source that is not sales tax based to mitigate impacts to service levels during economic downturns. The source of funding should also match increases in operating costs. 2. NCTD seeks specific data on the proposed level of funding that is proposed to be dedicated to transit operations, preventative maintenance, and state of good repair maintenance and replacements, respectively. 3. NCTD seeks specific data on the assumed transit service frequencies throughout the duration of the plan, and specifically as it relates to local transit bus operations. To support this, NCTD is requesting that SANDAG input the information requested in Table 2 (Attachment C). 4. NCTD seeks specific data on plans and funding that will be allocated to support road, technology, and other infrastructure improvements to advance faster, frequent, and more reliable transit service.</td>
<td>the same alignment. Some segments of the LOSSAN corridor and will likely include fencing will remain at grade with fencing. 1. Fare subsidies may be attached to sales tax measures but could be paid for by other sources as they become available. 2. Systemwide Operations Costs are shown in Appendix A in Table A.16. 3. Additional data on transit frequencies and span of service has been added to Appendix A as Attachment 2. 4. Local streets and roads funding can be found in Appendix A in Table A.18. Next OS operating funds which will support transit optimization and other features to prioritize transit is shown in Table A.15.</td>

<td>Customer Research Questions</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>1. NCTD seeks clarity on the transit customer research conducted as part of the Central Mobility Hub planning process, either as part of the Draft 2021 Regional Plan development process or the Central Mobility Hub Comprehensive Multimodal Corridor Plan (CMCP) process. NCTD is specifically seeking information on transit user experience impacts related to the relocation of transit service from Old Town Station to the proposed Central Mobility Hub. 2. NCTD seeks clarity on the transit customer research conducted as part of the Sorrento Mesa spur planning process, either as part of the Draft 2021 Regional Plan development process, SD-LOSSAN Rail Corridor Realignment Study process, or South Bay to Sorrento CMCP. NCTD is specifically seeking information on transit user access and user experience impacts related to the relocation of transit service from the existing Sorrento Valley COASTER Station to a proposed Sorrento Mesa location.</td>

<tr>
<td>L234</td>
<td>Oceanside Bicycle and Pedestrian Committee</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>Our Committee has reviewed the draft 2021 Regional Plan and wishes to submit several comments for SANDAG consideration. First, as a general statement, the Committee appreciates the Plan’s significant shift in how people move about in the region, as proposed through the “Five Big Moves” and interrelated projects and programs. We concur with SANDAG’s conclusion that the imperative of responding to the climate crisis requires such a significant shift from previous Regional Transportation Plans. We also strongly agree with the statement on page 1 of Appendix L: Active Transportation, that Active Transportation is a key element interwoven through the 5 Big Moves; it connects people to all kinds of destinations and defines the infrastructure needs to make the system work for everyone. With this statement in mind, we have specific input regarding several of the key Active Transportation projects which affect Oceanside, as listed in Appendix A, Page A-35, as follows: AT031 – Coastal Rail Trail Oceanside – Broadway to Eaton– This project appears to be off-street from Vista Way/Broadway to Broadway/Eaton (using the railroad right-of-way), then on-street on Eaton to Hwy 101. The existing portions of the Coastal Rail Trail north and south of Cassidy Street in this area are sub-standard (see photo) – the usable width of the trail in this section is only about 7 feet wide and does not provide sufficient space for cyclists to pass walkers safely without nearly coming to a stop. In addition, in preliminary City discussions with the Buena Vista Audubon Society, the possibility exists that the Society might allow development of the trail through their property south of the end of Broadway Street, connecting to the improved trail on Coast Highway. This would provide a safer and traffic-free connection rather than putting trail users directly on Eaton and Coast Highway. For these reasons, the City of Oceanside, with Committee support, submitted a Caltrans Sustainable Transportation Planning Grant request in February 2021, seeking funding for a “Coastal Rail Trail Morse-Vista Way Improvement Study”. Please see our attached January 27, 2021 letter on same. We await word on the outcome of this grant request. Accordingly, we recommend that SANDAG include the potential for widening the trail in this area and connecting it through the Audubon Society property as part of Project AT031 and revise the budget accordingly.</td>
<td>We appreciate the input from Oceanside’s Bicycle and Pedestrian Committee members. The bike network shown in the plan is the Adopted Regional Bike Network, which was adopted in 2018. As an early action out of the Regional Plan, SANDAG will develop a new Active Transportation Plan which will look at adding in a number of new connections like these you have mentioned. Even sooner, I’d encourage your organization to be involved with the efforts of the North County CMCP if you are not already: <a href="https://www.sandag.org/index.asp?classid=12&amp;subclassid=83&amp;projectid=609#usection=projects.detail">https://www.sandag.org/index.asp?classid=12&amp;subclassid=83&amp;projectid=609#usection=projects.detail</a></td>

<td>AT049</td>
<td>- Inland Rail Trail Oceanside – This project is intended to cover the entire Inland Rail Trail segment within Oceanside, from Melrose to west of I-5. The Committee strongly supports this project – completion of the Inland Rail Trail and the Coastal Rail Trail within Oceanside are the two top-priority projects in Oceanside's adopted Bicycle Master Plan. The Committee's concern about this project is SANDAG’s listed “Year Built” of 2035. Completion of the Inland Rail Trail has been an adopted goal of the north county communities it travels through since 1995, through a Memorandum of Understanding (copy attached). In that MOU, the corridor agencies adopted the following vision 25 years ago: NCTD and the sponsor agencies desire to create a multi-modal transportation facility which will help these communities achieve a higher quality of life by promoting alternative transportation opportunities, reducing automobile trips, improving air quality, reducing congestion, providing recreational opportunities, and increasing access to desired North County destinations. This trail has also been identified as a priority project in the SANDAG Ride to 2050 Plan and is key in promoting bike commuting in the region. The only nearby alternative to completing this trail in Oceanside is to ride on Oceanside Blvd., which is very challenging if not outright unsafe for cyclists given its narrow bike lane widths, complete disappearance of the bike lane at major intersections, high traffic speeds, and heavy truck volume. Simply put, the citizens of Oceanside should not have to wait 40 years for their portion of the IRT to be completed, when the communities across North County made it clear in 1995 that completion of this trail was a priority. This delay is not fair to Oceanside on a general basis and is further exacerbated by equity considerations – Oceanside is home to a significant minority population (52% composition) whereas other North County coastal cities have majority white populations ranging from 74% to 90%. The proposed SANDAG Regional Plan includes a significant “Focus on Equity”, including the statement, in developing and implementing the 2021 Regional Plan, SANDAG has a responsibility to listen to the communities we serve, prioritize equitable solutions in the transportation system, and analyze the burdens and benefits of this system for historically underserved communities. While Escondido and San Marcos had all or portions of their IRT constructed by 2008, and Vista’s segments are completed, in design, or under construction now, the Oceanside segment is not even in preliminary planning at this time. Given the frequent mention throughout the Regional Plan of the importance of bike trail improvements to the overall success of the Plan, and the Focus on Equity, we implore SANDAG to move up the completion of this segment of the IRT commensurate with its importance to the Adopted Regional Bike Network. We believe that this project could be completed in roughly five years if it was prioritized, as follows: -18 months for alignment definition and design -18 months for any necessary permitting, approvals, and right-of-way acquisition -24 months for construction</td>

<tr>
<td>AT074</td>
<td>- Coastal Rail Trail Oceanside Segment 1 ALT - According to the materials provided by SANDAG staff, this segment of the Coastal Rail Trail at the northern connection with the San Luis Rey River Trail would become just an on-street bike lane on Pacific Street, from just west of the railroad tracks underpass to west of the Oceanside Transit Center. This alternative does not appear to take advantage of the currently built off-street segment adjacent to the tracks from under I-5 to Neptune Way (see photo). Why not incorporate that portion as part of this segment before returning to on-street status?</td>

</tr>
<tr>
<td>AT113</td>
<td>- San Luis Rey River Trail Extension – This project proposes to extend the east end of the San Luis Rey River Trail from where it returns to surface streets at Andrew Jackson Street near Polk Street, all the way out to Old Hwy 395, mostly adjacent to the river. It should be noted that the proposed alignment does not make use of the already-constructed segment from Tyler Street to Via Manos at Hwy 76. In addition, there may also be City easements along the farmland adjacent to Highway 76, leading from Via Manos to the next neighborhood to the east. There, another already-constructed trail segment circumnavigates the residential neighborhood, coming out right across the street from Mission Vista High School on Melrose. All of these segments, if linked together, offer the opportunity to create a significant trail extension in the near future at very little cost. We urge SANDAG to consult with long-term Bicycle and Pedestrian Committee members who have extensive historical background on trails in this area. Additional Proposed Project #1 - SANDAG should consider an improved connection between the Vista Way shopping area east of I-5 and the Oceanside communities west of I-5. Currently, due to the topography of the alternative East/West routes, the freeway is a significant barrier to this community having access to the large shopping area on Vista Way east of I-5. Riding from the shopping center, west to the coast, requires riding up a very steep hill at the back of the shopping center and another one on Cassidy Street. They are both difficult climbs, especially with groceries. Such a project would likely entail a bridge overpass of I-5, in the vicinity of Kelly Street. Travelling East, once the Active Transportation user is past I-5, the optimum route would probably follow the least-elevation-change path, which would entail a turn to the south. We found that there is a similar bridge in Cupertino, over I-280, on Mary Avenue, that cost only $8 million, approximately 13 years ago.</td>

<tr>
<td>Additional Proposed Project #2 - SANDAG should consider the Oceanside Coast Highway Corridor Study Road Diet and Incentive Zone, as approved by Oceanside in August 2019 between Harbor Drive and Morse, to be an Active Transportation Project. The project would convert this portion of the road, which is now mostly avoided by the Active Transportation Community, to be one that is safe and desirable. This “complete street” transformation would provide more room on the road for all roadway users, fewer signalized intersections, and reduced speeds. It would maintain good traffic flow, by having roundabouts at most arterials and a turning lane for streets and driveways between arterials. It would have a desirable mixed-use, smart-growth ambiance, with designated bike lanes, wider sidewalks, community-oriented commercial developments, upscale housing, and shade trees. This project is on the historical Route 101. The street is two blocks East of the Oceanside Transit Center, where new developments are planned. The City Library, a Community Center, and City Hall are on this street, just blocks from the Transit Center. The Bicycle and Pedestrian Committee has been urging Oceanside to expand its Climate Action Plan (CAP) by giving its City employees a car-parking system that encourages use of alternative modes to driving alone. This complete street project would help City employees get to work without driving.</td>
<td>One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.</td>
<td></td>
</tr>
<tr>
<td>The PRC Board of Directors agrees that all San Diegans should have access to safe high-quality transportation and economic mobility. After consultation with our partner organizations and members, we submit the following recommendations to improve mass transportation to meet the needs of all our residents in the region. These recommendations also support our critical task of reducing carbon emissions.</td>
<td>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. The SB 375 reduction target must be achieved by reducing per capita VMT. The 5 Big Moves will enhance connectivity and result in people having more travel options and operating solutions, reducing per capita VMT. Local jurisdictions can and will identify GHG reduction targets and measures to reduce emissions beyond what is included in the 2021 Regional Plan.</td>
<td></td>
</tr>
<tr>
<td>Many of our members have children dependent on mass transit. No-cost transit passes for all youth encourages a culture of lifelong transit riders independent of cars. As part of a long-term strategy to build a greener and equitable San Diego, invest in youth no-cost transit passes. This and subsidies for elder travel will also stimulate the region’s equitable economic recovery. This works in other cities, and it is time San Diego MTS offers youth passes to connect our youth to our region.</td>
<td>The deployment of Flexible Fleets such as e-bikes, shuttles, or ridesharing is envisioned as part of the 2021 Regional Plan to provide convenient and affordable options in different communities. SANDAG is developing a Flexible Fleet Implementation Strategic Plan to identify near-term opportunities for Flexible Fleet pilots that support mobility, equity, and sustainability goals.</td>
<td></td>
</tr>
<tr>
<td>Ensure appropriate training of transit security - whether private or in partnership with local law enforcement. The training must include restorative practices as practiced by the county law enforcement, de-escalation tactics and bias-recognition studies. Members of the PRC Board have witnessed unacceptable targeting by transit security of young people, young women, people without housing, young men of color, and other residents. These interactions too often result in fines and/or arrests. They are terrifying for all who watch these aggressive tactics. Involve community groups in oversight of transit security training.</td>
<td>SANDAG, MTS, and NCTD believe that more can be done to improve the safety on and near transit and are working to make those improvements now and in the future. For example, funding at MTS for security is being diverted from fare enforcement to safety improvements.</td>
<td></td>
</tr>
<tr>
<td>Ensure public safety of all passengers through community oversight of security training and reduce aggressive policing at transit stops.</td>
<td>The lack of transit coverage of the “last mile traveled” is a large problem for both riders and our Climate. This is especially an issue for transit-dependent seniors who shop by bus in East County. Aggressive implementation of “flexible fleets” at the neighborhood/community level is vital, especially to achieve transportation equity. In addition, buses need more space for bags to ensure that transit riders can shop &amp; ride! Why aren’t shelves also put above the seats, allowing for more storage area of shopping bags, etc.</td>
<td></td>
</tr>
<tr>
<td>B. The proposed RTP will only achieve a 20% reduction in GHGs by 2035. San Diego needs a climate plan which exceeds this, and strives for 30% reduction. The overall system must live up to the promise to give a public transportation alternative that is as fast or faster, and less expensive, than private automobiles. There is concern that the proposed RTP will fall short of this promise.</td>
<td>The deployment of Flexible Fleets such as e-bikes, shuttles, or ridesharing is envisioned as part of the 2021 Regional Plan to provide convenient and affordable options in different communities. SANDAG is developing a Flexible Fleet Implementation Strategic Plan to identify near-term opportunities for Flexible Fleet pilots that support mobility, equity, and sustainability goals.</td>
<td></td>
</tr>
<tr>
<td>C. Ensure public safety of all passengers through community oversight of security training and reduce aggressive policing at transit stops.</td>

---|---|---
L239 | D. The PRC supports the Recommendations from the Transportation Equity Working Group: | 1. The 2021 Regional Plan has been developed with equity at the forefront. An equity specific project list has been included in the Draft 2021 Regional Plan Appendix H. As suggested, this list of projects with phasing will be added to Appendix A in the proposed final 2021 Regional Plan. Thank you for the suggestion and SANDAG agrees that this change will make it easier for the public to understand.

1. An Environmental Justice Centered RTP |  |  
2. Improve the Bus System Now: Develop a bus system that is fast, frequent, reliable, and accessible by increasing frequency on popular lines, especially overcrowded ones. More clarity in Appendix A: Transportation Projects, Programs, and Phasing that provides a list of specific improvements to the bus system. Bus improvements are one of the most affordable ways to immediately increase connectivity, reduce toxic air pollution and greenhouse gas (GHGs) emissions in the region. At the same time, SANDAG must stop approving freeway expansions and also charge for “full cost of parking”. Too often, parking is subsidized by either private or public entities, a perk for car owners who don’t have to pay the full price of parking. History has shown that dependence on individual cars only leads to continued congestion. Solutions to congestion must be through public transit (rails, bus) and transit housing hubs so that people who need transit can get to it easily. Focus on transit, affordable housing near transit centers. We must reduce VMT to have a decided impact/reduction on climate gas emissions.  
3. Blue Line Express: Fund the planning, environmental, engineering, and capital for the additional Blue Line track that allows express, 24-hour service, and additional frequency enhancements. Rail-grade separations should only move forward with the addition of a third track that eliminates conflict between the Blue Line and freight. The information listed needs to be clarified. It is unclear if the double/third tracking included in Appendix A refers to an additional track that will provide express connectivity from the border to downtown San Diego.  
4. 24-Hour Service by 2025: Provide 24-hour service on popular transit routes to connect late night and early morning workers to their jobs by 2025. Participants of the Elevate SD 2020 community engagement efforts ranked this as their highest priority. The information listed needs to be clarified. Appendix A includes local bus enhanced frequencies to ten minutes in key corridors but does not state if that would result in 24-hour service. Simultaneously, Chapter 2 includes all-day services from 20-22 hours per day for rail and rapid, but it excludes local bus routes and a clear implementation schedule.  
5. Purple Line Serves Central City Heights: Fund the planning, environmental, engineering, and capital for the Purple Line as a rail line that connects EJ communities in central City Heights and South Bay to Sorrento Valley.  
7. Electrify Bus Fleet by 2030: Fund the implementation of California’s Innovative Clean Transit rule to accelerate the electrification of the bus fleet ten years before mandated by the California Air Resources Board.  
8. Identify Anti-Displacement strategies: Fund anti-displacement efforts to protect vulnerable communities living near transit corridors by developing an anti-displacement strategy that includes affordable/low-income housing and preservation of naturally occurring existing affordable housing, community ownership, and tenant protections.  
9. Bathroom network much needed!!! Develop a bathroom access plan and provide MTS with funding for a clean and accessible bathroom network open at all major transit stations. State-of-the-art bathrooms are mobility and key to a successful transit system.  
10. Emergency Ready Transit System: Fund the planning and implementation of a transit emergency response strategy to provide safety particularly to EJ communities during community-wide emergencies. EJ residents are more likely to provide fare subsidies for youth riders. Additionally, further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan. The 2021 Regional Plan is not proposing any new highway expansions or addition of highway general purpose lanes but rather is focusing on a regional network of managed lanes that uses existing infrastructure by converting shoulders or general purpose lanes. In regard to parking management, SANDAG is looking into various parking and curb management strategies to encourage alternative modes of travel, including parking/curb pricing and reduced parking requirements.  
3. The Blue Line Trolley is one of the most successful light rail lines in the nation. It recently had frequencies increased to 7.5 minutes from 5 a.m. to 7 p.m. Grade separations and track work will help to improve the reliability on the Blue Line. Appendix A includes specifics on these projects, but in the short term SANDAG will conduct a Blue Line Express Feasibility and Conceptual Engineering Study as a Near-Term Implementation Action (included in proposed final Appendix B: Implementation Actions). The study will focus the project specifications and clarify next steps for express connectivity along the Blue Line.  
4. The proposed final 2021 Regional Plan includes increased service spans for the Trolley and bus service up to 20 hours per day. As SANDAG and the transit agencies move into more detailed planning efforts in the near future, some routes will be considered for 24-hour operation.
5. The South Bay to Sorrento Comprehensive Multimodal Corridor Plan is currently studying alternatives that include a station in City Heights along the Commuter Rail Route S82. The east-west Commuter Rail route S82 between El Cajon and Downtown San Diego/Central Mobility Hub via SDSU includes that station in the current proposed alignment. The first part of Route S82, from National City to Sorrento Mesa, is expected to be built by 2035 and is planned to be extended south from National City, to Chula Vista, and to the border by 2050. An additional route, Commuter Rail S83, traveling from the border to National City on the same alignment as the S82, is expected to be built by 2050 along with a branch to the Central Mobility Hub via downtown San Diego.  
7. The proposed final 2021 Regional Plan supports the electrification of the region’s transit buses and the state’s Innovative Clean Transit regulation. Appendices A and B include SANDAG’s proposed commitment of $75 million through 2025, $250 million between 2026 to 2035, and $332 million between 2036 and 2050 for zero-emission buses and infrastructure to accelerate the implementation of MTS’ and NCTD’s Zero Emission Bus (ZEB) Rollout Plans. Transit agency ZEB Rollout Plans are on the CARB website here: https://ww2.arb.ca.gov/our-work/programs/innnovative-clean-transit/ict-rollout-plans.  
8. Land use authority is reserved to local jurisdictions – the cities and the county. The cities and the county are best positioned to effectively implement the objectives outlined in the 2021 Regional Plan as those jurisdictions understand the unique needs of their communities and geographic areas. SANDAG is developing a Regional Housing Incentive Program and it will meet the goals of the proposed final 2021 Regional Plan.

<th>Response</th>
</tr>
</thead>
<tbody>
<tr>
<td>L240</td>
<td>The 2021 Regional Plan is a significant departure from previous approaches in several regards, principally that it would be exorbitantly expensive to the region at a cost $163B should it be implemented. By way of illustration, every one of the 3.3M residents of San Diego County in 2016 could be provided with a $49,000 electric vehicle for less cost than implementing the proposed Regional Plan, without even allowing for tax incentives.</td>
<td>This line of thinking is shortsighted. While the distribution of electric vehicles (if possible) would generate short-term benefits, it would not address long term transportation needs. The Regional Plan invests in lasting transportation projects that will serve existing populations and the generations that will follow.</td>
</tr>
<tr>
<td>L241</td>
<td>Also by way of comparison, the entire Transnet program will generate $15B through the 40 year life of the program from 2008-2048, less than 10% of the cost of the proposed 2021 Regional Plan.</td>
<td>The Regional Plan relies on over 30 sources of revenues, not just TransNet.</td>
</tr>
<tr>
<td>L242</td>
<td>The funding model for the 2021 Regional Plan is also a departure from previous efforts. Where in the past a transportation charges returned a defined benefit (i.e. improved roadway maintenance or the privilege of driving in a less congested Managed Lane), no such pretense is offered with this cost model. Per mile VMT “user fees” (which could be considered by many as taxes or penalties on autos) charged to use a private vehicle on a public roadway are mostly diverted to transit improvements, operations, maintenance, subsidies, and other programs rather than returned to the user in the form of a benefit. Many will view area roadways as bought and paid for with their and their parent’s tax dollars, not as a government-owned resource carrying a toll to be charged back to motorists. Given that the gas tax will not only remain, but most likely escalate, and be piled on to other fees and taxes, including VMT costs passed through by companies transporting daily goods, the situation does not promote equity or provide affordability to San Diego’s working families.</td>
<td>Next year, SANDAG will study usage-based fees and the effect the fees will have on meeting established goals like greenhouse gas emissions reduction and improving equity for different income levels and different populations. The first phase of the study will calculate the true cost of driving a vehicle - the cost to own and operate a vehicle, the effect on road wear and tear, the cost of increasing capacity of the transportation system to meet demand, local and global pollution caused by both fuel powered and electric vehicles, traffic accidents, traffic congestion, and the cost of delays caused by congestion to the economy and to the quality of life of travelers. The study will determine how existing revenues currently funds different parts of the transportation system and how different populations are impacted. This foundational understanding will help SANDAG design a road usage charge program that encapsulates multiple factors to make it more fair across the community than the current transportation funding sources. The study will assess the potential impacts of user fees on San Diego residents, visitors, and businesses, particularly those relying heavily on transportation. SANDAG staff will consult with its Board of Directors, stakeholders, and community members to develop implementation strategies for a road usage charge. This includes policies such as who will pay what and how much, the fee structure, and the distribution of revenues. SANDAG is committed to developing a carefully constructed program that will ensure that no group, such as those driving fuel-powered vehicles, low-income individuals, rural residents, or those with long commutes, are paying more than their fair share. There are multiple mechanisms, such as caps and rebates, that will be explored to ensure a fair system. The road usage charge, which is being studied by both the federal and state governments, is being considered to replace an old tax system that is no longer relevant. We know this is a challenge and we respect the concerns raised. We are committed to having authentic dialogues to work through the challenges and create a revenue system that is flexible, sustainable, equitable, and fair to all.</td>
</tr>
<tr>
<td>L243</td>
<td>The track record of SANDAG and its partners (principally Caltrans, MTS and NCTD) in delivering major transportation programs for the San Diego region within budget and on schedule has not been stellar, particularly when transparency on the real costs of the programs is factored into the equation. MTS’ Mission Valley East Trolley Extension (or “Green Line”) was pushing 50% over the original budget ($361M vs. $506M) and even that did not approach inclusion of all the</td>
<td>The Mid-Coast Trolley project is being delivered on time and within budget. More details of the project can be found here: <a href="https://www.keepsandiegomoving.com/Mid-coast/midcoast-intro.aspx">https://www.keepsandiegomoving.com/Mid-coast/midcoast-intro.aspx</a></td>

<tr>
<td>L244</td>
<td>Several other major programs that were supposed to be included in the original Transnet authorization (extensions of State Route 76 and State Route 52, for example) were delayed over a decade with the commensurate increases in cost of the programs, traffic congestion, delays and emissions. The same pattern of deferring promised capital projects (particularly roadways) ad infinitum appears to be repeated in the 2021 Regional Plan. Assuming adoption of the Regional Plan by 2025 it appears highly unlikely given previous efforts that environmental, design and construction for any of the major transportation programs will be completed and ready for revenue service by 2035. Very few, if any, major local highway or transit projects in the region have gone from inception to ribbon cutting in a decade. The Mid Coast Trolley extension will end up taking over twenty years from inception to revenue operations. Accountability in this area is a serious issue.</td>
<td></td>
</tr>
</tbody>
</table>
| L245| The single most costly element of the 2021 Regional Plan is the proposed “high speed rail” (HSR) network. Aligning local high speed rail (HSR) facilities underground is not a panacea for avoiding environmental, right of way, utility, acquisition, and relocation costs related to development of a high speed transit network, nor will relying on tunneling technologies that are yet to be developed (and which may ultimately be proprietary) substantially reduce the risk or cost, or automatically render an economically infeasible transportation system more feasible once it goes underground. Tunnelled alignments carry a whole new set of risks and costs, all of which come in to play when you elect to use the earth as a structure supporting your transportation system or the infrastructure above it. Fire and life safety, geologic conditions, surficial settlement, faulting/seismicity, HVAC needs, groundwater, subsurface environmental conditions, and other factors all have the ability to exponentially increase the cost and risk of below grade facilities, as well as kill the project outright. Proposing an underground (and under water) alignment parallel to the eastern shore of San Diego Bay under unstable Bay Mud, with the specter of future sea level rise and across a fault zone would range from ill-advised to sheer lunacy.  
Elon Musk’s The Boring Company (TBC) estimates current tunnel costs can range from $100M to $18 per mile. Their ultimate goal is to reduce costs to 10% of the low-end figure, or $10M per mile, to be truly feasible on a large scale and today they are not even close to approaching that figure. TBC recently complete a 1.7 mile “bare” tunnel (no vehicles, track or infrastructure) in the sandy soils under the Las Vegas Convention Center at a cost of $52.5M, or over $30M per mile. 
The cost of a fully functioning surface high speed rail system including track, systems, vehicles, stations and support facilities can be expected to be at least $200M per mile in 2020 dollars, not allowing for more expensive tunneled alignments. The best data points are recently constructed and nearly completed projects, including Mission Valley East and Mid-Coast Trolley extensions. Published per mile costs for several recent programs in the western U.S. are shown in the table below, confirming the roughly $200M per mile plus escalation is the going rate for a high speed, grade separated, electrified surface rail system in an urban setting. | This Regional Plan has been developed to prioritize different goals from previous efforts in order to provide a faster, fairer, and cleaner transportation system. The Managed Lanes system envisioned will help provide access to alternative modes, not facilitate boundless solo vehicle travel. The costs for the Commuter Rail include not only tunnel construction costs, but track and guideway construction, professional services, environmental, mitigation, right-of-way, and a 30% contingency on top of everything. |
| L246| A major factor in the selection of underground alignments will be the availability of expertise and resources with the San Diego region to prosecute a large-scale tunneling program. With the exception of a very short section of “real” tunnel (as opposed to a “cut and cover” installation) on MTS’ Green Line, regional design and construction experience/expertise on passenger-carrying tunnels is essentially non-existent. Importing consultants and contractors is always an option, but never a good one as it does little for local hiring and talent development, or the ability to favorably negotiate contracts on behalf of the region when there is only one game in town (or worse yet, coming in from out of town). Decades of experience have been developed in the region developing the LRT system, this needs to be leveraged in a local High Speed Rail program.  
To the extent possible, local expertise will be used, however, national and international expertise may be needed for the planning and engineering. SANDAG is committed to using local labor as much as possible. | |
| L247| Another question mark in the development of the Regional Plan is that the proposed high speed rail alignments generally parallel existing transportation corridors (whether you are talking freeways or LRT) but propose entirely new alignments. This is the worst of both worlds. It is far less expensive to increase capacity by (re)constructing new facilities within existing transportation corridors than by pioneering new alignments. New alignments require connecting infrastructure to be reconstructed and have the potential to introduce new environmental impacts (and mitigation) to areas not previously exposed to transportation activities, which also factors into the environmental justice arena. The entire San Diego Trolley system could be reconstructed as a higher speed rail system for a fraction of the cost of a new underground HSR system with the bonus that the same vehicles could be used regionally to phase out the diesel powered DMUs used on the Sprinter. Trolleys can run at 55 mph, how fast do you want to go? On modern transit systems travel time is dictated more by the number of stops rather than the top speed of the vehicles.  
All services included in the Regional Plan include operations and maintenance assumptions, including the cost to purchase transit vehicles. | |

<td>L248</td>
<td>To secure a healthy, safe, and equitable future, SANDAG must embrace an outcomes-driven RTP and identify priority outcomes aligned with those values. Below are seven key outcomes the Quality of Life Coalition urges SANDAG to prioritize in the 2021 Regional Transportation Plan:</td>
<td>The 2021 Regional Plan has been developed with equity at the forefront. An equity-specific project list has been included in the Draft 2021 Regional Plan Appendix H. To make this information more accessible, this list of projects with phasing will be added to Appendix A in the proposed final 2021 Regional Plan. The AB 805 analysis included communities ranking in the top 25% of CalEnviroScreen 3.0 scores and an additional analysis for the top 50% scoring census tracts with the understanding that there are communities in the region with varying levels of vulnerability. The 2021 Regional Plan significantly reduces per capita VMT, however, total VMT increases through the life of the plan at a slower rate than population growth. Electric vehicle programs in the plan include investment in zero-emission buses and associated charging/fueling infrastructure.</td>
</tr>
<tr>
<td>L249</td>
<td>• Reducing transportation-related pollution levels in disadvantaged communities.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>➢ AB 805 requires SANDAG to identify which communities to prioritize in their efforts to reduce pollution levels in this RTP.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>➢ SANDAG must use CalEnviroScreen 3.0 to identify these communities; we recommend defining disadvantaged communities as those in the top 30% of census tracts countywide, but also acknowledge that there are historically underinvested communities in San Diego County that are not adequately represented on this tool.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>➢ Any new transportation vision that successfully reduces pollution levels in disadvantaged communities must include significant reduction in Vehicle Miles Traveled (VMT) and rapid electrification of the bus fleet.</td>
<td></td>
</tr>
<tr>
<td>L250</td>
<td>2. Align with and exceed cities’ CAP transportation mode shift targets.</td>
<td>The 2021 Regional Plan (Appendices A and B) contains Supporting Policies and Programs to support local climate action planning. Over one billion dollars is envisioned to go towards programs to support climate action planning, provide climate adaption and resilience, and promote electric vehicles and infrastructure (see Table A.17 of the Appendix A). The GHG Section 4.8 of the Draft EIR documents how the 2021 Regional Plan is consistent with local climate action plans and identifies specific investments as mitigation, including a new Climate Action Plan grant program.</td>
</tr>
<tr>
<td></td>
<td>• SANDAG’s plan needs to support those local plans in order for our cities to be able to hit their targets and support transportation alternatives to driving, such as mass transit.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Further, AB 805 – the new state law to reform SANDAG – requires that SANDAG align the RTP with local climate action plans.</td>
<td></td>
</tr>
<tr>
<td>L251</td>
<td>3. Achieve a 30% or more per capita GHG reduction from transportation by 2035.</td>
<td>The 2021 Regional Plan exceeds the SB 375 target of 19% reductions of per capita GHG by 2035 and the Board of Directors Resolution goal of a 30% reduction of GHG emissions from all on-road transportation by 2035. Please see Section 4.8 of the Draft EIR for analysis and discussion of the Plan’s effect on GHG emissions. Section 4.4 of the Draft EIR analyzes the 2021 Regional Plan’s consistency with state climate goals. It also includes Mitigation Measure GHC-Sc, which calls for SANDAG to implement a nature-based climate solutions program to increase rates of carbon sequestration.</td>
</tr>
<tr>
<td></td>
<td>• SB 375 requires a minimum of 19% reduction by 2035; however, SANDAG Executive Director Hasan Ikhrata has identified a 30% target as feasible, and SANDAG should pursue the maximum feasible reduction to adequately address the threat of climate change.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• VMT reduction and mode shift through land use, housing, and transportation planning decisions must play a significant role in GHG reduction.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• As evidenced by Governor Brown’s Executive Order B-65-18 to Achieve Carbon Neutrality by 2045, and SB 12 and EO S-3-05, which set statewide emissions reductions targets at 40% below 1990 levels by 2030 and 80% below 1990 levels by 2050 for less than $500M per mile ($200M per mile escalated 30 years at 3%), you need to seriously consider other alternatives. At costs exceeding $500M per mile the 2021 Regional Plan proposal does not pass the “sniff test” on the high speed rail issue. The planners need to go back to the drawing board on this element to provide better alternatives.</td>
<td></td>

<td>L252</td>
<td>4. Create a rate structure that increases ridership and expands access to mobility.</td>
<td>The 2021 Regional Plan proposes an expanded public transit network including commuter rail, light rail, Rapid bus, and local bus services. The network was developed to be a comfortable, convenient option to the automobile. The Regional Plan includes funding for amenities such as restrooms at new rail stations and a study to improve bathroom access for existing transit stations. Funding for complete streets in mobility hubs supports safe access for people biking and walking to transit. The commuter rail service connects the highest demand trip areas between residents and employment centers. The purple line alignment through City Heights is being studied in the South Bay to Sorrento Comprehensive Multimodal Corridor Plan currently underway. Funding for the relocation of rail on the Del Mar Bluffs to a tunnel is prioritized in the 2021 Regional Plan. The Plan includes investments in Flexible Fleets, expansion of broadband, investment in zero emission vehicles, and improvements on rural corridors. These benefit rural communities with improved access to mobility options via technology, increased safety on hazardous roads particularly during emergency situations, and advanced deployment of zero emission vehicles.</td>
</tr>
<tr>
<td>L253</td>
<td>5. Ensure that public transit is safe, comfortable, and convenient with automobile travel.</td>
<td>Chapter 1 of the Regional Plan notes that AB 805 requires use of a skilled and trained workforce. In addition, on July 23, 2021, the SANDAG Board of Directors authorized staff to begin negotiations with the San Diego County Building and Construction Trades Council to execute a Community Benefits Agreement.</td>
</tr>
<tr>
<td>L254</td>
<td>Ensure transportation projects are creating high-quality careers in construction in our region through a Project Labor Agreement.</td>
<td>The proposed land use pattern of the 2021 Regional Plan concentrates growth and development primarily in the mobility hub areas, which allows for preservation of open space and natural habitat in the San Diego region. Environmental mitigation funding for transportation projects is accounted for in the cost estimates of the Regional Plan. Section 4.4 of the Draft EIR discusses the impacts of the 2021 Regional Plan on biological resources, including the regional habitat conservation plans such as the MSCP. Mitigation has been identified to avoid and reduce biological resources’ impact on the future construction of transportation and land use projects.</td>
</tr>

The ever-increasing urgency to prevent a climate catastrophe demands fast action to reduce greenhouse gas emissions. Projected emissions from GHG of Natural Gas use doesn’t assume a reduction in use by 2050 but instead assumes

The methodology used to calculate GHG emissions from Natural Gas in Appendix X: 2016 Greenhouse Gas Emissions Inventory and Projections for the San Diego Region is based on the best available data, including building standards through the 2019 Edition of California Title 24. Without a CEC California Energy Demand Forecast beyond 2030, more conservative building codes were assumed so as to not overestimate reductions. Future changes in building standards and related forecasts will be incorporated into future emissions inventories and related natural gas calculations.

All comments from the San Diego County Bicycle Coalition included in the Quality of Life Coalition letter were also received directly from the San Diego County Bicycle Coalition. Comments and responses are provided under “San Diego County Bicycle Coalition.”

The proposed managed lanes network uses existing infrastructure by repurposing shoulders and general purpose lanes to offer priority access to transit, carpools, vanpools and low-emission vehicles with appropriate decals to achieve meeting state and federal greenhouse gas and air quality targets. The Regional Plan also supports investments in the electrification of cars, trucks and buses and their supporting infrastructure. Appendices A (Table A.17) and B address SANDAG’s proposed EV commitments. For light duty vehicles, SANDAG plans to invest $45 million by 2025 and a total of $270 million by 2050 for EV charging station incentives.

The 2021 Regional Plan places emphasis on maximizing the use of existing facilities to add corridor capacity to ease congestion while also trying to achieve meeting state and federal greenhouse gas and air quality targets. The proposed managed lanes network uses existing infrastructure by repurposing shoulders and general purpose lanes to offer priority access to transit, carpools, vanpools and low-emission vehicles with appropriate decals. The system of managed lanes and supporting connectors support Transit Leap and high occupancy vehicles to create a seamless systemwide network that will provide people with transportation options, reducing the need to add new highways or general purpose lanes.

Thank you for your support of these improvements to the LOSSSAN rail corridor.

The 2021 Regional Plan includes major investments in the LOSSAN rail corridor. The San Dieguito Double Track and Special Events Platform project replaces a single track wooden trestle bridge with a new double track concrete bridge within existing NCTD right-of-way increasing tidal flow to wetlands. The Del Mar Tunnel project would include double tracking through the Los Penasquitos Lagoon in an alignment to be determined. Double tracking across that Los Penasquitos lagoon would be designed to increase tidal flow. The Del Mar Tunnel would undergo environmental review and permitting from the appropriate federal and state regulatory agencies.

</table>
Table A.14 summarizes investments in Mobility Hub amenities and Flexible Fleet travel options across all 31 regional Mobility Hub areas as depicted on the map in Chapter 2, Figure 2.4. Given that planning has already commenced for Central Mobility Hub and San Ysidro communities, Transit Leap investment costs have been included as project-specific line items in Tables A.1 and A.2.

Table A.14 summarizes investments in Mobility Hub amenities and Flexible Fleet travel options across all 31 regional Mobility Hub areas as depicted on the map in Chapter 2, Figure 2.4. Given that planning has already commenced for Central Mobility Hub and San Ysidro communities, Transit Leap investment costs have been included as project-specific line items in Tables A.1 and A.2.

To assist the region to meet its habitat conservation goals, the proposed final 2021 Regional Plan has identified $2,087 million for an enhanced habitat conservation, management, and monitoring program. These funds are complemented with a $565 million Nature-Based Climate Solutions Program that will promote both habitat conservation and restoration and carbon sequestration (See Climate Adaptation and Resilience programs). In addition, future mitigation of the transportation projects included in the 2021 Regional Plan will result in an additional $300-$500 million of land acquisition and restoration for habitat mitigation (incorporated in project costs presented in Appendix A).
Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID | Comment | Response
---|---|---
L276 | Page 23. The plan states that, to the extent feasible, it will stay within rights-of-way to minimize impacts and would produce other environmental benefits (water quality, air quality, reduced flooding, etc.). How does the infrastructure system that is proposed in the 5 Big Moves compare to the transportation infrastructure system that was anticipated in 2004 when the original RTP and MSCP agreements were established? | While a majority of TransNet extension ordinance projects have been started or built, there are projects that remain on the TransNet extension list of projects that are being reimagined in the 2021 Regional Plan as part of a regional system. Those are detailed in a report to the TransNet Independent Taxpayer Oversight Committee on July 7, 2021: https://www.sandag.org/index.asp?meetingID=5886&section=meetings.detail.

L277 | More specifically, because SANDAG agreed to mitigate (and has mitigated?) for expected upland and wetland habitat impacts in advance of projects impacts – based on a previous set of projects/infrastructure, will the new infrastructure have new impacts that are beyond or not mitigated by the previous agreements? For example, adding many connectors among the freeways and expanding some state routes could directly and indirectly impact habitat and wildlife corridors in areas of what was anticipated in the initial agreements. If so, how will the plan ensure no net losses of habitat acres, functions and values (including to movement corridors)? | Near-term Action 3a is to update TransNet ordinance and associated Board policies to reflect projects and priorities included in the 2021 Regional Plan. The TransNet Environmental Mitigation Program will be evaluated as this action is implemented and these questions will be considered in that process. In response to this comment, a study related to EMP has been added under action 9a.

L278 | Page 25. The plan has the potential to produce and encourage environmental benefits (climate change mitigation, air and water quality improvements) as summarized in this section. Include more discussion about the plan’s commitments to meet or improve upon the longstanding habitat and conservation agreements (e.g., NCCP/HCP permits), avoid new/unpermitted impacts to habitat/species, and mitigate for any significant unavoidable impacts. | Chapter 2 has been revised with this discussion. In addition, Appendix AA also includes discussion of environmental benefits of SANDAG’s Nature-Based Climate Solutions Program that will promote natural infrastructure that uses or mimics natural processes to benefit people and wildlife. SANDAG will prioritize resilience and innovative solutions in transportation infrastructure, Comprehensive Multimodal Corridor Plans, and consistent regional planning and implementation of the Sustainable Communities Strategy actions, emphasizing both nature-based and technological climate solutions. There are also further opportunities to expand upon ongoing efforts to assess the amount of carbon storage and sequestration potential of open space lands and the co-benefits from preserved open space, land management, and restoration activities.

L279 | Page 27. To assist the public’s understanding of the essence of the plan, add several figures to show the relationships (by time period) among transportation infrastructure, mobility hubs, and smart growth/increased housing density areas. More specifically, provide a set of diagrams to illustrate - at the system/regional perspective - which projects are to be completed by 2025, 2035, and 2050 and which mobility hubs/Smart Growth areas they serve. Because Smart Growth areas are expected to increase their housing densities, the plan must provide justifications and demonstrable commitments (e.g., policies, funding, incentives) that support the presumptions that the cities and county will make those density increases in step with the basic transportation improvements (transit leap, active transportation, mobility hubs, complete corridors). | Appendix A includes detailed maps for transportation projects planned for during each phase of the 2021 Regional Plan. Appendix F includes figures demonstrating areas for future growth. In addition, SANDAG has made this information available in its online data viewer: www.sdforward.com/envision.

L280 | Previously, SANDAG produced a short list/explanation of its incentives for smart growth (https://www.sandag.org/uploads/publicationid/publicationid_1997_5188.pdf), but it is unclear how effective those incentives have been. How does the plan improve on those incentives? | Information on effectiveness of the smart growth incentive program is available online: https://keepsandiegomoving.com/SmartGrowth/smartgrowth-intro.aspx.

L281 | Page 31. Goods movement comprises a relatively small part of the region’s GHG emissions (Appendix X), but its associated on-road use by heavy trucks and allied freight rail access/rail car storage – especially through/near the Port District terminals – creates significant impacts to local transportation, air quality and quality of life. The RTP/SCS’s transportation infrastructure system improvements must be fully integrated with the Port’s implementation of its proposed maritime operations strategy and additional actions to relocate (to the extent feasible) truck parking and freight rail car storage away from the coastal area. | SANDAG collaborated with the Port of San Diego (Port) on the strategies identified in the 2021 Regional Plan and will continue to partner with the Port on implementing these projects. SANDAG is also working with partner agencies and local communities to ensure that projects identified in the Assembly Bill 617, Ports Environmental Justice Neighborhoods Community Environmental Reduction Plan and the Port’s Maritime Clean Air Strategy are implemented. SANDAG also recently signed a memorandum of understanding with the Port and Caltrans to coordinate closely on implementing projects near the Port’s Working Waterfront that improve accessibility, sustainability, economic vitality, and community health.

L282 | Pages 32-33. The essence of the plan’s sustainable communities strategy is expressed in the introduction to the region’s growth and development: “The 2021 Regional Plan envisions a regional pattern of growth and development that reflects smart growth, transit-oriented development, preserving natural resources, and building communities that are resilient to the consequences of climate change and other environmental changes. Ensuring social equity and the availability of housing that is affordable for everyone are also top priorities.” Those goals will only be achieved when the cities and county, which constitute SANDAG, fully acknowledge the necessity to amend their general plans to accommodate and implement the identified changes. | While land use authority is reserved for local jurisdictions, SANDAG will work closely with local jurisdictions to implement the land use pattern proposed in the 2021 Regional Plan. Near-term and continuing actions listed under Priority Implementation Action 8 related to land use include IB) update evaluation criteria and provisions of SANDAG grant programs to encourage planning and capital projects that allow for high-density and mixed-use development within Mobility areas and/or transit priority areas; 8c) launch a regional housing incentive grant program to fund local plan updates in Mobility Hub areas that can lead to more housing in transit-rich areas with infrastructure, services, and jobs; and 8h) utilize the intergovernmental review process to evaluate consistency of development projects with the Sustainable Communities Strategy.

The forecasted concentration of jobs and housing (and population) in the urban areas that are necessary to implement overall GHG emission reduction targets have been established for 2030, 2040 and 2050. Provide explanation of how the plan will continue to contribute to reducing vehicle per capita and overall GHG emission reduction goals after the 2035 target date. [As noted in our comment on Appendix D (Page 4-3), the plan’s post-2035 contribution to reducing GHG emissions will remain flat after 2035, implying that the current measures will not contribute substantially to those higher GHG emission reduction targets.] Reducing GHG emissions and achieving state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan. As described in Chapter 2, implementing the 2021 Regional Plan, while also facilitating the development and implementation of local climate action plans across the region will help the State, SANDAG, cities, and other public agencies achieve their climate goals.

<tr>
<td>L283</td>
<td>Pages 34-35. The global threat from continued GHG emissions and unique threats, conditions, and opportunities to reduce GHGs within our region are recognized in this plan. The GHG inventory and calculation of anticipated reductions by sector illustrate how the plan would be able to meet and exceed the region's SB 375 GHG emission reduction target for 2035. As noted in preceding comments, achieving that goal requires significant cooperation from each of SANDAG's member jurisdictions through changes to their general plans (especially land use/zoning) as well as how their Climate Action Plans support and augment the RTP/SCS. While this plan demonstrates that could meet/exceed the mandated GHG emission reduction target for 2035, the projected emissions out to 2050 in Appendix X suggest that the region will be far from &quot;carbon neutrality by 2045.&quot; That is not a region-by-region requirement, but it is critical that this plan incorporate goals and policies - and at least propose possible actions/projects - that would put the region on a more aggressive GHG emission reductions pathway post-2035.</td>
<td>Reducing GHG emissions and achieving state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan. As described in Chapter 2, implementing the 2021 Regional Plan, while also facilitating the development and implementation of local climate action plans across the region will help the State, SANDAG, cities, and other public agencies achieve their climate goals.</td>
</tr>
<tr>
<td>L284</td>
<td>Decisions pertaining to which and when to initiate projects should balance the basic emission reduction priority and their effectiveness in promoting the more broad actions (i.e., specific local jurisdiction actions) to optimize system buildout. However, as noted on Page 14 of the plan, SANDAG has a specific requirement to identify disadvantaged communities, include strategies to reduce pollution exposure in those communities, and use of a skilled and trained workforce (via the RTP/SCS). So, the &quot;balancing&quot; decision must have a larger frame of reference than just GHG emission reductions.</td>
<td>Thank you for your comment.</td>
</tr>
<tr>
<td>L285</td>
<td>Page 44. The plan should clarify that the region' projected population growth will result in continued – albeit slowing - total VMT, but implementing the plan will result in a significant net reduction in VMT/capita that is consistent with the requirements of SB 375.</td>
<td>Information on estimated VMT performance of the 2021 Regional Plan is included in Appendix T.</td>
</tr>
<tr>
<td>L286</td>
<td>Page 45. As described, there are real constraints on the allowable uses (types of project investments) and timing (when available) of the known and reasonably anticipated funding sources. Our prior comments (e.g., Pages 19, 27, 32-33) raised concerns about how the RTP/SCS will ensure concurrent and effective linking of the growth in the mobility hubs (smart growth areas) with the transportation infrastructure. This is particularly of concern because growth in the mobility hub areas may occur – based on local jurisdictions' requirements and needs - even if the transportation infrastructure and operational improvements are not able to be funded concurrently. How will the RTP/SCS ensure (and measure/monitor) that the housing/jobs/transportation linkage will occur as needed?</td>
<td>Priority Implementation Action #10 is to advance a data science program to better understand travel behavior in the region, update travel demand modeling tools, and improve transparency and reporting on program effectiveness and project delivery. SANDAG will be implementing the 2021 Regional Plan, monitoring performance, and updating the plan every four years to incorporate the latest data, policies, and incorporate corrective measures.</td>
</tr>
<tr>
<td>L287</td>
<td>Pages 45-47. The projected costs to implement the revised transportation infrastructure and operations, combined with SCS strategies, will require SANDAG to evaluate and adopt new revenue funding sources. The plan does not provide sufficient descriptions of how SANDAG will evaluate the effectiveness of implementing the identified potential new revenue sources. For example, charges for Managed Lane use and a general Road User Fee potentially overlap costs for drivers; paying the premium for managed lane access may induce more VMT as well as be cost-prohibitive to lower income populations; there is no discussion about how local jurisdictions could/should adopt parking cost strategies to both promote transit (reduce vehicle use) and increase revenues that can be then incorporated into their local funding share.</td>
<td>Next year, SANDAG will study usage-based fees and the effect the fees will have on meeting established goals like greenhouse gas emissions reduction and improving equity for different income levels and different populations. The first phase of the study will calculate the true cost of driving a vehicle – the cost to own and operate a vehicle, the effect on road wear and tear, the cost of increasing capacity of the transportation system to meet demand, local and global pollution caused by both fuel powered and electric vehicles, traffic accidents, traffic congestion, and the cost of delays caused by congestion to the economy and to the quality of life of travelers. The study will determine how existing revenues currently funds different parts of the transportation system and how different populations are impacted. This foundational understanding will help SANDAG design a road usage charge program that encapsulates multiple factors to make it more fair across the community than the current transportation funding sources. The study will assess the potential impacts of user fees on San Diego residents, visitors, and businesses, particularly those relying heavily on transportation. SANDAG staff will consult with its Board of Directors, stakeholders, and community members to develop implementation strategies for a road usage charge. This includes policies such as who will pay what and how much, the fee structure, and the distribution of revenues. SANDAG is committed to developing a carefully constructed program that will ensure that no group, such as those driving fuel-powered vehicles, low-income individuals, rural residents, or those with long commutes, are paying more than their fair share. There are multiple mechanisms, such as caps and rebates, that will be explored to ensure a fair system. The road usage charge, which is being studied by both the federal and state governments, is being</td>

</table>
Monitoring must address both implementation and performance. The proposed performance indicators are essential and it does not appear to be covered by the proposed performance indicators in Table 3.1.

Nature-based climate solutions are described with more detail in Appendix B. More detail on the natural environment and nature-based solutions has been added to Chapter 2.

These comments will be considered as SANDAG implements Priority Implementation Action #10 to advance a data science program to better understand travel behavior in the region, update travel demand modeling tools, and improve transparency and reporting on program effectiveness and project delivery.

Chapter 2 of the 2021 Regional Plan is the Sustainable Communities Strategy (SCS). Appendix D is SCS Documentation and Related Information.

SANDAG is required to update the Regional Plan every four years to incorporate the latest data, policies, population projections, and technology assumptions. SANDAG will consider additional strategies to reduce GHG emissions in future iterations of the Regional Plan.

The legend for this map has been updated.

A performance monitoring report using the indicators from Appendix E is developed halfway between each 4-year regional plan cycle. The report is shared with the SANDAG Board of Directors to provide a high-level status update on critical areas across the region. This information helps inform the Board of Directors in their development of regional goals for the subsequent regional plan. The indicators use available observed data which also informs how each indicator is calculated.
L294. For all Indicators, one presumes that there is a threshold or trigger point (for when the plan is failing to meet an objective) at which the plan would be required to begin initiating actions in response to reaching the trigger/threshold. Or conversely, if the threshold indicates that the plan has successfully achieved a goal, what if any additional effort is required?

L295. The RTP/SCS performance monitoring plan will likely have to be periodically updated to reflect new requirements (e.g., air quality standards may change), new technologies may allow for improvements to the current indicators, and conditions may warrant changes in the types of issues relevant to the plan and/or the identified indicators may need to be revised or replaced. Regardless of that reality, the public, stakeholders and jurisdictions/agencies should be reporting, evaluating and relying on the performance monitoring to determine how the RTP/SCS is functioning must be provided a more complete description of the performance monitoring plan.

The Regional Plan performance indicators are reviewed for changes with each regional plan. Updates to the indicators are often from changes in policy direction and data sources. Past Regional Plan Performance Monitoring Reports, which include detailed methodology, are available at: https://www.sandag.org/index.asp?classid=12&projectid=308&usesection=projects.detail.

L296. Pages F-10-12 (Tables F.1-3). While there appears to be a similarity in the relative growth in population, jobs and housing among the jurisdictions, the Unincorporated County’s projected population growth (0.9%), jobs growth (23.2%) and housing growth (4.3%) seem to be noticeably different. In particular, there is a very high projected growth in jobs compared to population and housing. How does that seeming disparity in jobs growth with population and housing growth (which has implications for transportation to housing) impact other jurisdictions for which the “disparity” in projected population, jobs and housing pose challenges to the RTP/SCS’s 5 Big Moves? Are there other jurisdictions for which the “disparity” in projected population, jobs and housing pose challenges to the RTP/SCS’s 5 Big Moves approach?

L297. Pages F-15-16 (Figure F-8). - Five areas that appear to support significant jobs but are outside of mobility hubs are Camp Pendleton, MCAS Miramar, Pt. Loma and North Island (military employment) and East Otay Mesa. How are SANDAG and the military planning to address this?

Military job growth is concentrated on current sites of military employment because of the unique characteristics of military jobs. This job growth will be outside of Mobility Hubs unlike other private employment in the region. Additionally, during the development of the Mobility Hubs, staff ensured that each military installation is located near a Mobility Hub so that military personnel have access to transit and other amenities offered on Mobility Hubs.

L298. Page AA-1. The introductory paragraph – or a new second paragraph - should include a brief description of the relationship of SANDAG’s existing TransNet program, the regional Multiple Species/Multiple Habitat Conservation programs and regional funding for habitat conservation and preserve management. Any significant differences in the proposed RTP/SCS from previous versions should be discussed later in this appendix.

The text includes a discussion of the history of regional funding for habitat conservation, the role that SANDAG has played in the past, and the potential future role SANDAG could play as part of the implementation of the 2021 Regional Plan.

L299. Page AA-3. Figure AA.1. Recommend the map title be revised to “Existing and Proposed/Potential San Diego Region Habitat Conservation Lands” and change the legend to conform.

The title and legend has been updated.

L300. Page AA-6. The Regional Habitat Conservation Vision presumably applies across all of the lands within the SANDAG member agencies. Because the local jurisdiction and agencies have their own General Plans/Open Space Element, Climate Action Plans, and other planning processes that would have direct effects on a regional vision, please provide more discussion regarding how this vision is expected to be integrated into the local jurisdictions’ and agencies’ plans. Such as, will SANDAG add staff to coordinate this effort, what new policies and projects would this require, etc.

The 2021 Regional Plan indicates that the region must come together to take on implementation of the completion of the regional habitat conservation plans that were started in the 1990s. SANDAG has served as a forum for these discussions in the past and can be again. Implementation of the Vision would be made after adoption of the 2021 Regional Plan.

L301. Page AA-6. The Regional Funding section should add more information. We recommend adding more to the introduction of this issue. Begin the section with a new introduction: “A functioning and adequately funded set of regional habitat preserves is essential to this region’s overall capability to address climate change. The benefits from habitat preserves range from meeting regulatory requirements associated with continued development and ongoing operations and maintenance by the local jurisdictions; improving/lifting the long-term potential for rare/threatened species and their habitats to adapt to climate change; providing for movement by species and vegetation communities as a response to climate change; and serving as a carbon sink. While these conserving and managed lands are part of the ‘baseline’ condition relative to GHG emissions, they are valuable because natural areas remove CO2 and eliminate development potential.” Also, revise the last part of this paragraph to state: “A regional funding source was proposed as part of a ballot measure (that failed) in 2016 to help offset the preserve implementation costs to local jurisdictions. Without a new regional funding source, securing crucial land acquisitions and long-term management and monitoring, which are essential to the success of these plans to protect species and their habitat from extinction, falls into question. In 2011, the estimated unfunded regional cost to ensure implementation of the regional habitat conservation plans was $3.0 billion. SANDAG will work with the member agencies to develop and promote the establishment of the regional funding source that complements the infrastructure and operations components of the 5 Big Moves.”

The text in Appendix AA has been updated to better reflect the sentiment of the recommendation.

To assist the region to meet its habitat conservation goals, the proposed final 2021 Regional Plan has identified $2,087 million for an enhanced habitat conservation, management, and monitoring program. These funds are complemented with a $565 million Nature-Based Climate Solutions Program that will promote both habitat conservation and restoration and carbon sequestration (See Climate Adaptation and Resilience programs). In addition, future mitigation of the transportation projects included in the 2021 Regional Plan will result in an additional $300-$500 million of land acquisition and restoration for habitat mitigation (incorporated in project costs presented in Appendix A). SANDAG is committed to working with its regional partners to identify funding to fulfill this commitment.

L302. Page AA-6. Recommend revising the sentence “Connect habitat areas through wildlife corridors and linkages and connect people to local species and San Diego’s natural habitats.” to “Connect habitat areas through wildlife corridors and linkages and connect people to local species and San Diego’s natural habitats.”

The text in Appendix AA has been updated to reflect the sentiment of these recommendations.
and linkages, and enhance peoples’ access, where appropriate, to natural habitat areas."

Page AA-7. Recommend adding a sentence to the end of the paragraph: "It is essential that the remaining habitat conservation plans be completed, which will then establish the necessary core habitat areas and key connections across the region."

Page AA-8. Recommend revising the following sentence: "In addition to acquiring more properties to connect wildlife, in the following years, San Diego’s North County will complete their MSCP, which will prioritize acquisitions that establish critical connections for high-risk species that reside in North County communities." To state "In addition to acquiring more properties to connect wildlife, in the following years, when the North and East County MSCPs are completed, they will prioritize acquisitions that establish critical connections for high-risk species that reside in North/East County as well as connections to preserve lands in Orange and Riverside counties."

Page AA-10. The paragraph that describes regional funding should reference - or reiterate - our recommended new statement (Page AA-6) regarding SANDAG’s commitment to work with its member agencies to develop and establish a new regional funding source for habitat conservation.

<tr>
<td>L303</td>
<td>Several projects that were in the Early Action Plan appear in Appendix A. How do the projects in the EAP differ than the projects here?</td>
<td>In September 2013, the SANDAG Board of Directors approved $200 million in local transportation funding, intended to be leveraged for and supplemented with grant funding, to implement the Regional Bike Plan EAP. Since that time, SANDAG has been working on public outreach, environmental review, design, and construction to complete the EAP projects and in this process has more specifically defined the EAP projects which are now capital improvement projects.</td>
</tr>
<tr>
<td>L304</td>
<td>In general, the dollar amount spent on managed lanes rather than mode-shift is concerning. More funding and increased timelines for active transportation &amp; transit leap projects should be prioritized.</td>
<td>A better transit system is a fundamental component of this Regional Plan. Revenues to fund the transit projects don’t come in all at once but dollars that are available are applied to ensure that the best transit projects are initiated first and that those projects address social equity considerations. The investments in Managed Lanes will support high speed transit service to ensure time competitive trips as compared to the auto.</td>
</tr>
<tr>
<td>L305</td>
<td>Page A-14, Section TLS8 How does the San Diego - Coronado Military Ferry connect to the Central Mobility Hub?</td>
<td>The airport transit connector is envisioned to have a station at the East Basin near Harbor Island that would provide a connection to a new ferry terminal that would serve Naval Air Station North Island.</td>
</tr>
<tr>
<td>L306</td>
<td>Page A-42, Table A.13 In general, the Arterials section neglects to mention active transportation and public transportation facilities along arterial corridors. If SANDAG wants to get San Diegans out of their cars, then arterial streets need to prioritize pedestrians, bicycles, and public transportation over cars.</td>
<td>The arterials portion of Appendix A are projects from the various cities through the RTIP programming process (using Local Streets and Roads funding). The inclusion of complete streets and active transportation elements would be outlined in each of these projects’ descriptions by “IF ID” in the RTIP.</td>
</tr>
<tr>
<td>L307</td>
<td>Page A-42, Project CB04B This intersection’s bike lanes are in need of protection and better visibility for drivers. NCTD Bus 309 stops at this intersection as well, is SANDAG planning on providing any infrastructure improvements for bus and pedestrian connectivity?</td>
<td>The 2021 Regional Plan aims to create safe and well-connected routes for bicyclists and pedestrians. The intention of the network in this Regional Plan is a framework which facilitates trips associated with regional purposes designed to enhance neighborhood connections to schools, employment centers, and other everyday destinations. The regional network will not include details regarding the types of bicycle and pedestrian facilities for specific projects are not yet determined and will require future planning and coordination with local jurisdictions, community members, and stakeholders such as your organization. SANDAG looks forward to working with you on these project details in the future.</td>
</tr>
<tr>
<td></td>
<td>Page A-42, Project CB22 SANDAG should prioritize building safe active transportation infrastructure to and from the Carlsbad Poinsettia Station along this corridor. Sidewalks and bike lanes heading north disappear at the station, and this project makes it appear that SANDAG isn’t planning on including those elements. SANDAG should not widen Avenida Encinas from Palomar Airport Road to Embarcadero Lane. Instead, SANDAG should keep the current configuration and build wide sidewalks and protected bicycle facilities.</td>
<td>The misspelling pointed out in project O22 on page A-43 has been updated in our documentation. Your comment was forwarded to agencies that oversee these facilities.</td>
</tr>

<td>We appreciate your support and feedback. Please continue to follow along in this process by visiting SDForward.com.</td>
</tr>
<tr>
<td>L316</td>
<td>Page G-50, Section 3.0 Support for working in partnership with Tribes, Mexico, Military, and other stakeholder agencies.</td>
<td>We appreciate your support and feedback. Please continue to follow along in this process by visiting SDForward.com.</td>
</tr>
<tr>
<td>L317</td>
<td>Page G-53, Section 4.0 - Table 1: Public Workshops Rather than increasing the amount of public workshops by an arbitrary number (10%), SANDAG staff should use data to calculate public engagement by geographic region throughout the county, and use that data to determine low engagement rates where more public workshops are needed.</td>
<td>Community input is critical to creating a plan that represents the varied values, needs, and interests of the San Diego region’s residents and businesses. SANDAG is committed to conducting effective public outreach as part of the 2021 Regional Plan as well as all of our planning and construction activities and agrees that data should continue to inform our planning as well as outreach and communications activities.</td>
</tr>
<tr>
<td>L318</td>
<td>Page G-53, Section 4.0 - Table 1: Pre-document consultation Add: “Gather an additional” to “5,000 individual remarks” so context is more clear.</td>
<td>We appreciate your feedback and suggestions.</td>
</tr>
<tr>
<td>L319</td>
<td>Page G-53, Section 4.0 - Table 1: Opportunities for engagement Rather than increasing the availability of platforms for public outreach by 15%, the goal should be to re-evaluate the effectiveness of current platforms being used during a certain time period and then determine if another platform could be more effective. In addition, special topic/targeted workshops should be made available in as many languages as possible and include dedicated outreach to stakeholder groups who have not participated in or have been historically excluded from the public engagement process prior to the 2021 Draft Regional Plan.</td>
<td>A key objective of SANDAG’s outreach effort is to engage with people in historically underserved communities throughout the planning process. SANDAG is currently identifying the potential effectiveness of new communications platforms, including new social media platforms. Additionally, we routinely evaluate the effectiveness of outreach to traditional media platforms, such as print, radio, and TV outlets, to determine if outreach should be expanded to more effectively reach diverse audiences throughout the region. Public facing materials may be translated into multiple languages upon request. Spanish language interpretation is made available at public meetings, and interpretation in additional languages is available upon request.</td>
</tr>
<tr>
<td>L320</td>
<td>Page G-57, Appendix A1 In order to reach a younger audience, “San Diego County Media Outlets” should be expanded to include student publications at the region’s school systems and colleges/universities. In addition, many young people engage with social media accounts for local news information, so SANDAG should research where they could make an impact through social media channels besides their own.</td>
<td>SANDAG strives to engage people of all ages in public outreach throughout the planning process. This feedback will be incorporated into Appendix G.</td>
</tr>
<tr>
<td>L321</td>
<td>Page H-15, Section: Existing Conditions in Disadvantaged Communities in the Region SANDAG notes that 5.7% of households in the region have “zero vehicles available” but hasn’t defined what a vehicle is outside of being “dependent on transit services.” How does SANDAG define “transit services?” If a person didn’t own a vehicle, in this case, is considered to be an automobile.</td>
<td>A vehicle, in this case, is considered to be an automobile.</td>
</tr>

</table>
San Diego Forward: The 2021 Regional Plan

L322 Page H-33, Section: Defining Performance Measures for Social Equity Analysis
Support using percentage of population within 0.25 miles of a Bike Facility as a social equity performance measure.

Response: We appreciate your support and feedback. Please continue to follow along in this process by visiting SDForward.com.

L323 Page H-55, Section: Access to Basic Needs
Why were biking and walking metrics only included for parks and retail sections, but not for access to employment or education centers?

Response: The purpose of these access measures is to gauge network performance to concentrated, high-demand employment centers (see Figure T.5) and higher education centers that are regionwide destinations. Transit was used to cover the regionwide travel shed with walking and flexible fleets as the means to access transit.

L324 Page H-58, Table H.11
The bicycle statistics laid out in this table are inaccurate and out-of-touch with reality. While theoretically true that a bicycle could use the existing network to access parks, our current street network is dangerous for cyclists due to the lack of safe infrastructure and most parks are not considered accessible by regional bicycle advocates. How was “Access” by bike defined and used in these calculations? Did safety, comfort, bike parking, and ridership play a part in defining “access” by bicycle?

Page H-60, Table H.12
This table has the same issue with Table H.11. The bicycle statistics laid out in this table are inaccurate and out-of-touch with reality. While theoretically true that a bicycle could use the existing network to access retail spaces, our current street network is dangerous for cyclists due to the lack of safe infrastructure and most retail/commercial areas are not considered bicycle-friendly by regional bicycle advocates.

Response: Access is based strictly on location/proximity of residents to various amenities (parks, retail, employment, etc.).

L325 Page K-29, Section: Objectives and Factors
Support the promotion of shared-use mobility, including bike sharing

Response: We appreciate your support and feedback. Please continue to follow along in this process by visiting SDForward.com.

L326 How does SANDAG plan to promote use of active transportation by allowing bicycles on transit?

Response: By working with our partners at NCTD, MTS, and Caltrans/LOSSAN.

L327 How does SANDAG plan on expanding the bicycle locker program?

Response: SANDAG is adding new electronic bike lockers at all the Mid-Coast stations in Fall 2021. Two of those stations (Nobel & University Towne Center) will have group bike parking facilities to accommodate up to 40 bikes each. We will continue to monitor daily usage and reallocate resources accordingly. Additionally, SANDAG will study existing transit stations to determine if bike lockers could be beneficial in the future.

L328 SANDAG should consider adding bicycle cars on trains to accommodate bicycles on trains.

Response: Thank you for the suggestion.

L329 Page L-6, Section: Complete Streets in Mobility Hubs
What does “enhanced bike and micromobility parking” mean?

Response: Secure Parking Areas, primarily.

L330 Page L-7, Section: Vision Zero
What are the details of SANDAG’s plan to collect and analyze crash data for bicycle traffic?

Response: We will continue to use the statewide resources provided by CHP via SWITRS. Additionally, SANDAG’s ARJIS staff works with public safety data and discussions are ongoing with local jurisdictions regarding the prospect of supplementing that statewide-maintained data with any additional collision reporting at the local jurisdiction level which may not be included in the FARS/SWITRS databases.

L331 Page L-7, Section: Riding into the Future
What is the timeline for SANDAG developing a new, comprehensive Regional Active Transportation Plan as a near-term action from the 2021 Regional Plan?

Response: Near-term actions are commitments to be implemented prior to the next Regional Plan (2025).

L332 Page L-10, Section: Significance of Reduced Speed Limits
What is SANDAG’s plan to reduce speed limits in San Diego County?

Response: SANDAG submitted a letter of support for Assembly Bill (AB) 43 and will continue to support the recommendations from the AB 2363 Zero Traffic Fatalities Task Force.

L333 Page L-16, Section: Principles by Layer: General
Add: Limit bicycle interaction with mixed traffic wherever possible

Response: SANDAG follows national and international best practices in bikeway design to create safe facilities for users of all ages and abilities. Multiple studies show that most people feel safer in protected bikeways, and when well designed, they are safer than any other type of bike facility. The focus of our efforts is on people who may be “interested but concerned” in riding a bike alone or with family. For those who do not feel comfortable riding in protected bikeways, the California Vehicle Code allows people to bike in the roadway with traffic. While protected bikeways are a great solution in many cases, we know they are not always the best solution. Every project goes through a detailed and context sensitive design process which results in decisions regarding the best facility, which may include protected bikeways, buffered bikeways, shared use paths, or shared streets with significant traffic calming elements. The Regional Plan also includes funding for upgrading existing bikeways that may not meet current best practices in maintenance or bikeway design.

L334 Page L-16, Section: Principles by Layer: General
All Transit Leap nodes should be served by bicycle routes.

Response: Bikeways are fundamental component of the Mobility Hubs and the active transportation networks will be developed in conjunction with these projects.

<tr>
<td>L344</td>
<td>Another recommendation in the Airport Transit Plan is the transition of MTS Bus Route 992, which is currently the main transit connection to the Airport, to a Rapid Ilus service. It also suggested that combining the new Rapid 992 with other Rapid bus routes, such as the 215 along the El Cajon Boulevard corridor and 235 along the Interstate 15 corridor, could improve airport transit ridership by better linking to major regional destinations and by increasing single-seat access to the San Diego International Airport. As such, the Airport Authority requests that the 2021 Regional Plan clarify whether these AMAP-identified priorities will be implemented or have been substituted with alternative implementation options.</td>
<td>SANDAG will take this recommendation under consideration.</td>
</tr>
<tr>
<td>L345</td>
<td>Figure 2.4 (Page 27) in the Draft Plan identifies regional mobility hub areas that could accommodate this increased demand for jobs, housing, shopping, and recreation, while being served by expanded transit networks. In the Airport Authority’s initial review, it appears that many of these hub areas are in close proximity to airports. As such, the Airport Authority requests that the 2021 Regional Plan assess the potential ridership benefits from upgrading MTS Bus Route 992 to a Rapid service and extending other existing and planned Rapid routes to serve the SAN terminal areas.</td>
<td>The land use pattern proposed in the 2021 Regional Plan focuses growth and development in the mobility hub areas. The allocation of housing units to subregional areas represents general areas projected for future growth and not precise locations for future housing development or housing unit type. The exercise of land use authority is reserved to local jurisdictions.</td>
</tr>
<tr>
<td>L346</td>
<td>Page 21 in Appendix Y states that “when combined with the rate at which trucks produce emissions per day, neighborhoods in close proximity to the airport are put at a higher [air quality] risk” without citing any environmental impact study to substantiate this conclusion. The Airport Authority has ensured that current and future emissions from the San Diego International Airport’s activities are included in the most recent 2020 State Implementation Plan (2020 SIP) for attaining air quality standards in the San Diego region under the federal Clean Air Act. The 2020 SIP determined that SAN’s emissions can be accommodated without causing the region to experience additional exceedances of criteria pollutant standards.</td>
<td>We have clarified the narrative in Appendix Y and cited CalEnviroScreen 3.0 for community pollution exposure and vulnerability data.</td>
</tr>
<tr>
<td>L347</td>
<td>Figure 2.10 in Appendix Y is an outdated map of SAN, which doesn’t properly reflect the airport property boundaries and onsite aeronautical uses.</td>
<td>We have replaced the outdated map with the Regional Location Map included in the San Diego International Airport Airfield Improvements and Terminal 1 Replacement Project Draft Environmental Assessment, released in June 2021.</td>
</tr>
<tr>
<td>L348</td>
<td>Page 78 in Appendix Y includes statements that air cargo operations are constrained due to limited airport space for expansion. As identified in its 2013 Northside Improvements Environmental Assessment, the Airport Authority is proposing a new SAN Northside Cargo Development project. The project would include a consolidated as expanded apron to accommodate additional cargo aircraft parking. Additionally, the Airport Authority opened a new 93,000-square-foot Airline Support Building on North Harbor Drive this</td>
<td>We have incorporated this updated information into Appendix Y.</td>
</tr>
<tr>

<tr>
<td>------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>L349</td>
<td>Page 78 in Appendix Y relies on the outdated 2009 Destination Lindbergh Study to estimate SAN’s air cargo capacity and identify cargo operational deficiencies. The FAA approved the most recent SAN aviation activity forecast in June 2019, which is publicly available at [a href=&quot;<a href="http://www.san.org/plan%22%3Ewww.san.org/plan">http://www.san.org/plan&quot;&gt;www.san.org/plan</a>&lt;/a]. The forecast anticipates that the number of cargo aircraft operations (i.e. takeoffs or landings) will increase by nearly 7% by 2050, even with the Airport’s single-runway configuration. Approximately 15% of SAN’s freight volumes are transported as “belly cargo.”</td>
<td>We have incorporated this updated information in Appendix Y.</td>
</tr>
<tr>
<td>L350</td>
<td>On page 20 in Appendix C, the Draft Plan states that its model relies on airport passenger survey data from 2008 to estimate airport-related travel patterns and demands on local and regional transportation facilities. The Airport Authority notes that ground access characteristics have changed dramatically over the last decade, especially with the introduction of ride分享 companies. The Airport Authority also noticed that the modeling appears to be based on SAN aviation activity forecasts that were developed in 2013 (Figure S.18 in Appendix S). As previously stated, the FAA approved the most recent aviation activity forecast in June 2019, which is publicly available at <a href="http://www.san.org/plan">www.san.org/plan</a>. The new “constrained demand scenario” forecast estimates that SAN will serve approximately 20.3 million enplaned passengers in 2050.</td>
<td>SANDAG appreciates you bringing to our attention new data that we can incorporate for future airport operations. We will incorporate the new aviation activity forecast in a post-Regional Plan version release of the activity-based model. While the current airport model was updated to include new ground access modes such as TNC usage, we will also be incorporating new survey data for the airport during the Central Mobility Hub study including calibration to the latest ground counts.</td>
</tr>
<tr>
<td>San Diego County Taxpayers Association</td>
<td></td>
<td></td>
</tr>
<tr>
<td>L351</td>
<td>What assumptions (i.e. debts service and length of projects) are going into estimating costs in YOE dollars?</td>
<td>The Cost Estimation Methodology and Funding Strategies for the RTP were presented to the SANDAG Board of Directors on March 21, 2021, Item No. 8B. This report and presentation described the various funding assumptions developed for the draft 2021 Regional Plan. The entire Board meeting can be found at <a href="http://www.sandag.org">www.sandag.org</a>.</td>
</tr>
<tr>
<td>L352</td>
<td>All existing TransNet funding has been claimed by currently running projects. How is the $15 billion in TransNet funding estimated? Is the $15 billion based on the assumption that San Diego voters will approve of a new extension to the program in 2024? How much of the $15 billion relies on the assumption that there will be TransNet revenue between 2048 and 2050?</td>
<td>From FY 2002 to FY 2020, on average TransNet growth has been just 0.2 percentage point higher than TDA. Therefore, SANDAG considers TransNet as a reliable source to estimate future TDA revenue in the long-term.</td>
</tr>
<tr>
<td>L353</td>
<td>Is the Quarterly TransNet Forecast a reliable source for estimating revenue from the Transportation Development Act (TDA) even though there have been observed “small differences” in TransNet and TDA growth rate? Is TDA growing faster than TransNet, or is it the other way around?</td>
<td>The 5-year average is 2.7%, however, the 10-year average is 6.6% in the initial review of these funds. With additional information related to one more year of data, it revealed that the 10-year average was 3.6%. SANDBAG believed it would be best to be conservative with these funds and assume an average of 5% growth that is consistent through 2048. This growth rate is linear as it should encompass the extreme highs and lows that accompanies this particular fund source.</td>
</tr>
<tr>
<td>L354</td>
<td>Has the growth of General Fund/Miscellaneous Local Road Funds been linear historically? Are you assuming that they will continue to be linear (why or why not)? If the 5-year average growth in these funds is 2.7%, how did you derive a 3% growth during the period of the 2021 RTP implementation? Is this a weighted average or an average of averages across jurisdictions?</td>
<td>How much of the $15 billion relies on the assumption that there will be TransNet revenue between 2048 and 2050? There is an estimate of $1.5 billion for 2049 and 2050 in YOE dollars.</td>
</tr>
<tr>
<td>L355</td>
<td>How much of the value capture estimate (2.7 billion) relies on the estimated value of Central Mobility Hub Enhanced Infrastructure Financing as opposed to existing agreements and programs?</td>
<td>How is the $15 billion in TransNet funding estimated? See Appendix V for methodology. The $15 billion is in YOE dollars.</td>
</tr>
<tr>
<td>L356</td>
<td>What is the Managed Lanes Feasibility Tool mentioned in Appendix V? What model or data did SANDAG use to estimate the $22 billion from FasTrak revenue?</td>
<td>Is the quarterly TransNet Forecast a reliable source to estimate future TDA revenue in the long-term?</td>
</tr>

## Draft 2021 Regional Plan Responses to Comments – Letter Sourced

<table>
<thead>
<tr>
<th>ID</th>
<th>Comment</th>
<th>Response</th>
</tr>
</thead>
<tbody>
<tr>
<td>L357</td>
<td>How did SANDAG achieve a passenger farebox recovery rate of 35%, and what is the basis of SANDAG’s assumption that the recovery rate will be linear? Is the assumption that operating costs would be linear and that farebox recovery would follow the same linear growth? With proposed free fares, how will the estimated revenue be achieved?</td>
<td>Farebox recovery ratio is calculated by dividing the system’s total fare revenue by its total operating expenses. Fare revenue is calculated by taking the ridership numbers that are generated through the Activity Based Model and multiplying them by the average fare. Operating costs grow by a Consumer Price Index of three percent annually. Each mode of transit has its own calculator for operating cost. Fare revenue does not grow at a linear rate. Ridership on routes changes based on new routes that come online, changes to land uses, and changes in the overall network. Free fares will be calculated with a subsidy given back to the operators to cover operating costs. Farebox recovery ratio should not change as a result but the amount of revenue subsidy will change.</td>
</tr>
<tr>
<td>L358</td>
<td>What will be the source of funding for reduced or free fares? Is it sales tax based? Fare subsidies may be attached to sales tax measures but could be paid for by other sources as they become available.</td>
<td></td>
</tr>
<tr>
<td>L359</td>
<td>What source of revenue is each project listed in Appendix A tied to? If a source of revenue runs low, are there alternative ways to fund the projects associated with that source of revenue?</td>
<td>The project costs shown in Appendix A are related to the revenues explained and tabulated in Appendix V. Other than the revenues associated with the 2025 phased projects and programs, revenues sources are estimates based on future projections, coupled with historical information. If some of those future revenues don’t materialize for any reason, it is not unreasonable to anticipate other (currently unknown sources) may take their place. A good recent example is funding received from Senate Bill 1 (SB 1) that was not previously anticipated and contributed to real dollars available to the region for transportation projects. However, if any future dollars do not materialize, and are not backfilled from other sources, future plans would need to be updated. These types of updates can easily be captured incrementally, given that the Regional Plan is updated every four years.</td>
</tr>
<tr>
<td>L360</td>
<td>What is the timeline for the development of each of the projects in Appendix A? Are delays in these timelines considered in the cost estimates?</td>
<td>The project development timeline for the projects listed in Appendix A varies but generally follows a 6 to 14 year window, depending on the project. These windows are inclusive of the planning/environmental/design and construction phases estimated for each project. For example, highway projects are estimated to be completed within 6 years once dollars are programmed and Rapid transit projects are assumed to have an 8 year completion window. These estimates are based on recently completed projects in the region.</td>
</tr>
<tr>
<td>L361</td>
<td>Have there been or will there be changes in the 2021 RTP to account for the impacts of the Covid-19 pandemic? Is SANDAG assuming that the effects of the pandemic on people’s lifestyles and the economy will be short term? How do SANDAG’s assumptions about the pandemic impact the RTP?</td>
<td>SANDAG has been considering the impacts of the pandemic on transportation. This includes tracking traffic levels on major corridors in the region and conducting surveys of commuters and employers across the region to understand how the pandemic might change travel behavior in the future. As a result of this research, the 2021 Regional Plan assumes a much higher rate of telework. However only 38% of all occupations in the region are considered home workable. Also, the majority of employers in the region that expect to offer telework, reported that they will offer it on a part time basis to a portion of their employees after the pandemic. Therefor viable commute options will continue to be needed for the many commuters who have to travel to their job site. Also, a common misconception is that teleworkers don’t drive much. Data from our own regional household travel survey as well as data from the national household travel survey demonstrates that teleworkers actually make more discretionary trips for shopping, leisure, and social purposes. This is why we are seeing traffic volumes at or above pre-pandemic levels on our major corridors despite the fact that we have more people teleworking. To reduce car traffic in the future, more viable alternatives to driving are needed. The 2021 Regional Plan proposes a variety of convenient travel options, including faster transit service and flexible fleet services, for all types of trips.</td>
</tr>
<tr>
<td>L362</td>
<td>Are there technological assumptions as well in the RTP? Is the plan based on all current technology, or are there plans that are based on expected future technology? If some plans are dependent on future technology, how are you making sure that people will feel comfortable with using the new technology?</td>
<td>The 2021 Regional Plan accounts for advancements in technology and potential impacts to the transportation system. For example, the Flexible Fleets of today will evolve to be connected and autonomous. Industry projections vary but widespread deployment of shared, autonomous services is unlikely until 2035 or later. The 2021 Regional Plan lays out a strong backbone transportation network that will evolve and adapt as new technologies and demands change. As new and emerging technologies or Flexible Fleets become available, SANDAG will study, design, and test services to ensure they provide equitable, sustainable and inclusive options so all can benefit from the service.</td>
</tr>
<tr>
<td>L363</td>
<td>Have there been changes related to the 2021 RTP already? If so, is there any feedback from users? Please provide a detailed response.</td>
<td>Comments received on the 2021 Regional Plan and responses to each are documented in Appendix G of the proposed final 2021 Regional Plan. This appendix also notes when comments on the draft 2021 Regional Plan resulted in changes to the proposed final 2021 Regional Plan.</td>
</tr>
</tbody>
</table>
L364 What assumptions are made in the Transit Leap Capital Cost Estimate? Based on observed figures in the SF Bay Area, it seems that, for commuter rail alone, every mile requires $1 billion. How does $55 billion for all Transit Leap capital costs break down into its modes? Answer to question 9 would probably address this if sufficiently detailed.

Estimating costs for Transit Leap considered development options for new commuter rail, light rail/Trolley, and Rapid improvements to existing transit services. Costs were developed using the Federal Transit Administration Capital Cost Database, which is intended for developing order-of-magnitude cost estimates for conceptual transit projects. The cost models are automatically adjusted to account for differences in regional cost levels between locations. The unit costs generated from the Capital Cost Database were compared with known actual project costs for the San Diego region, and they were adjusted as necessary. Capital transit projects include cost estimates for construction (both station and segment per mile), right-of-way acquisition, and other non-construction “soft” costs such as environmental review, planning, and design. The transit capital costs also include the costs of vehicles through the 30-year timeline of the 2021 Regional Plan.

L365 Since $27.7 billion of the total estimated revenue will depend on the Regional Road User Charge, it seems that SANDAG is confident that the fee will be implemented in 2026. Why does SANDAG think that this fee would be popular among San Diego voters? Is the $27.7 billion based on the assumption that every kind of vehicle will be charged? If the fee is not approved by voters, is there a source of revenue that would replace it?

The proposed final 2021 Regional Plan has been updated to reflect 2030 as the start of implementation for the road usage charge to better align with the timing that the State and other regions are expecting to transition to a road usage charge.

Next year, SANDAG will study usage-based fees and the effect the fees will have on meeting established goals like greenhouse gas emissions reduction and improving equity for different income levels and different populations. The first phase of the study will calculate the true cost of driving a vehicle - the cost to own and operate a vehicle, the effect on road wear and tear, the cost of increasing capacity of the transportation system to meet demand, local and global pollution caused by both fuel powered and electric vehicles, traffic accidents, traffic congestion, and the cost of delays caused by congestion to the economy and to the quality of life of travelers. The study will determine how existing revenues currently funds different parts of the transportation system and how different populations are impacted. This foundational understanding will help SANDAG design a road usage charge program that encapsulates multiple factors to make it more fair across the community than the current transportation funding sources.

The study will assess the potential impacts of user fees on San Diego residents, visitors, and businesses, particularly those relying heavily on transportation. SANDAG staff will consult with its Board of Directors, stakeholders, and community members to develop implementation strategies for a road usage charge. This includes policies such as who will pay what and how much, the fee structure, and the distribution of revenues. SANDAG is committed to developing a carefully constructed program that will ensure that no group, such as those driving fuel-powered vehicles, low-income individuals, rural residents, or those with long commutes, are paying more than their fair share. There are multiple mechanisms, such as caps and rebates, that will be explored to ensure a fair system.

The road usage charge, which is being studied by both the federal and state governments, is being considered to replace an old tax system that is no longer relevant. We know this is a challenge and we respect the concerns raised. We are committed to having authentic dialogues to work through the challenges and create a revenue system that is flexible, sustainable, equitable, and fair to all. The intensive outreach and public participation process of the study will help design a system that appeals to San Diego voters. Many of the sources of revenue in the Regional Plan are uncertain, they are estimates that are developed with the best information we have available today. Some of these sources may not come to fruition, however there will also likely be new revenue sources available for transportation projects in the next 30 years that we cannot predict today.

The revenue assumptions from the road usage charge in the Regional plan are based on an assumption that the fee would apply to resident trips, airport trips (SAN & CBX), visitor trips, and cross-border trips. Trips that were not included are freight, non-freight commercial, and trips that come into or through the County. Which types of trips are subject to a road usage charge will be refined in future plans as additional work is done towards implementation.

There are over 30 sources of funding included in the projected revenues for the 2021 Regional Plan. While the assumptions used to develop these revenues are determined to be reasonable based on state and federal standards, the level of projected expenditures provides flexibility to account for any changes in the timing or availability of these funds over the next 30 years.

L366 The total estimated revenue is about $30 billion more than the total estimated expenditure (in YOE dollars) for the 2021 RTP. Where would the extra revenue go?

There are over 30 sources of funding included in the projected revenues for the 2021 Regional Plan. While the assumptions used to develop these revenues are determined to be reasonable based on state and federal standards, the level of projected expenditures provides flexibility to account for any changes in the timing or availability of these funds over the next 30 years.

L367 What is the assumption for increase in construction costs? What is the assumption for inflation? Do the construction cost estimates take into account both an increase in construction costs and inflation in the conversion to $2020?

Increases in both construction and operating costs are tied to the inflation rate for the Plan which is an escalation rate of 1.93 percent annually applied (starting in 2021) from the 10-year moving average Engineering News Record (ENR) Los Angeles Construction Cost Index (CCI).

</tr>
<tr>
<td>L369</td>
<td>What is the time period when State Transit Assistance funding is expected to grow at 3% per year versus 5% per year? Is SANDAG's goal to encourage use of public transportation being considered in making assumptions about the growth rate of STA revenue?</td>
<td>STA funds are assumed to grow at a constant rate of 3% per year until 2036. The assumption then changes in 2036 to 5% annually to align with the possible increase in Diesel tax and further legislation similar to SB1. STA is determined from Diesel tax and does not rely heavily on increase in public transit.</td>
</tr>
<tr>
<td>L370</td>
<td>Does the State Highway Operations Protection Program only last for 10 years? When did it start, and, if it only lasts a decade, how will it be able support the 2021 RTP projects throughout their lifetimes?</td>
<td>The State Highway Operations and Protection Program (SHOPP) is an ongoing four year program funded by the state, with projects selected from the state's 10-year plan. This program was created by California Code 14526 in 1977 and is adopted every two years along with the State Transportation Improvement Program (STIP). The program is expected to continue unless there is a change to California State Law.</td>
</tr>
<tr>
<td>L371</td>
<td>How much of the Cap-and-Trade Revenue is, separately, from the Transit and Intercity Rail Capital Program, Affordable Housing and Sustainable Communities program, and Carbon Transit Operations program? Given that the Transit and Intercity Rail Capital Program and AHSC are competitive programs, how are revenues from these programs estimated through 2050? Is there a source that shows prior success in receiving the competitive funds?</td>
<td>The 2020 base year amounts are as follows: TIRCP $31.28M, AHSC $19.4M, and LCTOP $5.15M. For TIRCP, the region received approximately $31.28M/year on average from 2015-2020. This estimate assumes a 2% increase every year and a 10% increase every ten years starting in 2030. For AHSC, the region received approximately $19M/year on average for the first three competitive cycles and assumes a 10% increase every ten years starting in 2030. LCTOP received is approximately $5M/year since the first 2026 cycle estimated to increase 5% per year and is continuously appropriated from auction proceeds of Green House Gas Reduction (GGRF) funding and distributed based on the STA formula.</td>
</tr>
<tr>
<td>L372</td>
<td>What percentage of total revenues are assumed to come from competitive funding sources? Are they referring to different sources of revenue?</td>
<td>Competitive Fund sources are assumed to make up approximately 13% of the total plan revenue. Recent transportation legislation has seen a shift towards more competitive programs, so that amount could increase in the future, however SANDAG continues to compete well for funding both at a state and federal level due to our international border and major port status.</td>
</tr>
<tr>
<td>L373</td>
<td>Why are Motorist Aid Services mentioned twice as a source of revenue (once as state and once as local revenue)? Are they referring to different sources of revenue?</td>
<td>One program is state funded from the Freeway Service Patrol and SBI funds and the Local program is funded from a $1 annual fee on vehicle registrations.</td>
</tr>
<tr>
<td>L374</td>
<td>SANDAG assumes that the State FASTLANE will receive 20% of the state share of TCEP. In 2020, the revenue reflected 19% of the shares. How much does 1% represent in funding money? Also, what is the basis for the different growth rate estimates?</td>
<td>State FASTLANE assumes a 20% share of the state's 40% share of SB1 TCEP target which is $1300M/year. 40% of the $300M/year is $120M and 20% of that is $24M/year in 2018. In 2019, $24.5M is assumed and 2020 assumes $25M/year after applying the 2%/year estimated growth rate. 1% of the $25M estimate for 2020 represents $250K. State FASTLANE growth estimates assume a combination of new revenues from SBI, state and federal funds, as well as the state's historic commitment to fund border projects, which is the reason for the different growth rate assumptions.</td>
</tr>
<tr>
<td>L375</td>
<td>How much of the $2 billion in revenue estimate from State Managed Federal Programs come from each of the programs? What is the basis for the assumption that there would be additional revenue from Federal Highway Administration discretionary funds, and how much of the $2 billion depends on it? What is the basis for each of the estimated growth rates?</td>
<td>The programs included are the Highway Bridge Program and the Highway Safety Improvement Program. The State is assumed to use its portion of federal funds to supplement the funding for these discretionary programs. The funding is projected to be 74% for Bridge and 26% for Safety programs. As these programs are funded from federal formula funds, the growth rates were assumed to be the same as CMAQ/STP and other federal highway formula funds.</td>
</tr>
<tr>
<td>L376</td>
<td>What is the short-term growth rate of the Solutions for Congested Corridors program that funds the Road Maintenance and Rehabilitation Account?</td>
<td>There is no short-term growth rate for this fund source because it is an off-the-top, set amount per SBI legislation.</td>
</tr>
<tr>
<td>L377</td>
<td>How much of the revenue from the Federal Transit Administration Formula programs go to Sections 5307, 5337, 5339, and 5310 each? What is the basis for the change in the growth rate of this revenue from 2% per year to 10% per six years?</td>
<td>As part of the FTA revenues, the calculation includes 5307, 5337, and 5339. The average split is 65% of 5307, 30% of 5337 and 5% of 5339. Based on past history of previous federal legislation the average annual increase of funding is 2% per year. The revenue assumptions include a 10% increase to account for new federal legislation which historically increases revenues substantially.</td>
</tr>
<tr>
<td>L378</td>
<td>What is the basis for the assumption that the growth rate of CMAQ and regional STP revenue will change from 5% annually to 10% per six years in 2030?</td>
<td>As new federal acts are approved, we assume a 10% increase in funding to maintain buying power.</td>
</tr>
<tr>
<td>L379</td>
<td>What is the short-term growth rate of the Federal Highway Administration Discretionary revenue before 2030? What is the basis? What is the basis of the growth rate estimation beyond 2030? What years are the estimates based on?</td>
<td>The estimates are based on the averages of actual grants received over the period of the grant programs (2014-2020). Due to the elimination of federal earmarks, there is an assumption the funding will double due to...</td>
</tr>
</tbody>
</table>
How was the $294 million in Grant Anticipation calculated? The Grant Anticipation Notes are calculated from Mid-coast financial model that reflects actual issuance of GANs that occurred in 2018.

What is the impact of reduced VMT on revenues from fuel taxes and tolls. Is this accounted for? SANDAG’s 2021 RP assumes the road usage charge will replace the gas tax revenue lost by the move to fuel efficient and zero emission vehicles. Whether Uber, Lyft, and food delivery drivers would be subject to a road usage charge, and if so, how it may impact the drivers and users of those services will be analyzed as part of this effort.

What projects would be impacted if the New Sales Tax and MTS Local Revenues measures do not pass? The absence of new sales tax would impact all types of projects in the Regional Plan. Additionally, the lack of a sales tax measure for MTS would minimize the amount of both transit infrastructure and transit operations in the MTS service area.

Are Ridehailing Company Service Fees anticipated to be on the 2024 ballot? Do ride hailing companies, separately, have to pay for the Road User Charge? What is the basis of the assumption that Ridehailing Company Service Fees would be popular among voters? SANDAG will launch a study in the next year to further study the potential of usage-based fees and their capabilities in addressing various goals, including equity and greenhouse gas emissions reduction. This study will also assess the potential impacts on businesses, particularly those relying heavily on transportation to do business. SANDAG staff will work with Board Members, stakeholders, and community members to develop implementation strategies for a road usage charge, including high level constructs of the program, such as who will pay, the fee structure, and the distribution of revenues. Whether Uber, Lyft, and food delivery drivers would be subject to a road usage charge, and if so, how it may impact the drivers and users of those services will be analyzed as part of this effort.

Have other states been successful so far in transitioning to a Road User Charge? A variety of states, in addition to California, are in various phases of piloting and deploying a transition to a Road Usage Charge, including Utah, Texas, and a Kansas/Minnesota joint effort. The state of Oregon is the furthest along, with their program called OReGO. Volunteer participants pay 1.8 cents for each mile they drive, and that money goes directly into the State Highway Fund. Starting in 2019, the Legislature authorized ODOT to allow unlimited OReGO participants. Drivers of fuel-powered vehicles can receive a credit for fuel tax and remote emissions testing, and drivers of electric vehicles are eligible for reduced registration fees.

How is the growth rate of Regional Road User Charge revenue 2.7% until 2050 when the assumption is that more people will use transit, as opposed to personal vehicles, with the success of the 2021 RTP? The road usage charge revenue assumptions were updated between the draft and final plan. The vehicle miles travelled (VMT) assumptions for the region show a decrease annually between 2040 and 2050. The per mile fee in 2020$ for the Regional Road Usage Charge also decreases between 2030 (first year of implementation) of .033 cents per mile to .028 cents per mile in 2050.

Which projects would be eliminated if Federal and State discretionary grants were not received? The plan relies on a host of revenues from federal, state, and local sources. Without all three of these sources mingled together, SANDAG would lose the ability to build a multitude of projects and would dampen the ability to maximize local dollars to garner additional funds. Additionally, given that the Plan includes a 30-year planning period, it is possible that some sources could be swapped for others as state and federal priorities change.

What projects would be impacted if the New Sales Tax and MTS Local Revenues measures do not pass? The absence of new sales tax would impact all types of projects in the Regional Plan. Additionally, the lack of a sales tax measure for MTS would minimize the amount of both transit infrastructure and transit operations in the MTS service area.

How do the Federal Transit Administration and CMAQ estimated growth rates reflect revenue from recent years? Federal Transit Administration (FTA) revenues increase by 2% on an annual basis which is consistent with historical increases. The Regional Plan assumes a new Federal Transportation Legislation Bill every 6 years which reflect past practices. With new legislation, it is assumed that revenues will have a one-time increase of 10% which has historically been the case.

Actual apportionment for federal highway formula funds during the years of the FAST Act would have averaged a 5% increase per year, consistent with the plan estimated growth rates, except for a decrease in CMAQ funds as a result of reaching the end of the maintenance period for carbon monoxide attainment in 2018. That resulted in a decrease to our CMAQ apportionment in FY18/19, bringing the average to 4%. SANDAG does not foresee another decrease to CMAQ during the period of this plan so expects to see a continuation of the 5% increase per year.

What is the impact of reduced VMT on revenues from fuel taxes and tolls. Is this accounted for? SANDAG’s 2021 RP assumes the road usage charge will replace the gas tax revenue lost by the move to fuel efficient and zero emission vehicles.

For example, if a regional agency estimated receiving $1 million in 2020 from the gas tax, then in 2030, they could have estimated receiving $500,000 from the gas tax, and $500,000 from a road usage charge.

Current Transportation Development Act (TDA) funds are currently used to support existing transportation services and state of good repair capital projects. Are the $7.6 billion TDA revenues in Appendix V existing TDA revenues or new sources of TDA revenues? The TDA established two funding sources: 1) Local Transportation Fund (LTF) and 2) State Transit Assistance (STA). The $7.6B in TDA revenues shown in Appendix V is based on these two existing fund sources.
San Diego Transportation Equity Working Group (SDTEWG)

L390
1. A Regional Plan that Prioritizes environmental justice:
Demonstrate environmental justice (EJ) communities are a priority by identifying projects that will improve their access to public transportation by 2025. These primarily low-income communities of color face the most pollution in the San Diego region and rely most on transit. The projects should include the development of a Safe Routes To Transit strategy and an early action project Mobility Hub at Euclid Transit Center.

Recommendation:
Include an equity specific project list as part of Appendix A: Transportation Projects, Programs, and Phasing document that provides all details including the expected project completion year.
Response: Pull from 10 transit lifelines

2. Youth opportunity Passes (YOP):
Provide no-cost transit passes for all youth ages 24 and under to build generations of lifelong transit riders and connect youth to school, work, internships, and early career opportunities.

Recommendation:
Amend the Plan to explicitly state that transit fare subsidies will be allocated to fund no-cost transit for youth ages 24 and under. The plan currently lacks a commitment to no-cost passes for this age group.

3. Bus service every 10 minutes:
Make bus service reliable and affordable now– we can’t afford to wait. Buses are one of the most cost-effective ways to get us where we need to go while cutting climate pollution. We need immediate solutions while big infrastructure projects are being built.

Recommendation:
Projects TL63, TL64, and TL65 on page A-52 of Appendix A, should include cost and bus frequency improvement details to demonstrate they will be prioritized, particularly those planned to be completed 2025. Simultaneously, only one of all the Transit Leap projects within the South Bay to Sorrento Corridor has a 2025 year implementation. The Transit Leap rapid lists on page A-12 through A-14 that will service environmental justice communities should be prioritized for a 2025 completion. Finally, MTS should be included as an agency to collaborate as part of the partnerships listed on page B-3 of Appendix B and near-term actions for the implementation of bus frequency enhancements.

4. Blue Line express:
Build a 24-hour Express Blue Line. The Blue Line already has the highest ridership and is one of the best-performing transit lines in the region. However, it is overcrowded, has limited frequency, delayed connections, and no 24-hour service.

Recommendation:
The RP needs to outline clear construction of an additional track that can provide express 24-hour service. Currently, the project details fail to demonstrate that a third track will be implemented. According to project description TL13 on page A-14, a Blue Line San Ysidro to UTC, Double/Third tracking and Grade Separations at Taylor/Ash are planned for a 2050 implementation.

5. 24-hour service:
By 2025, provide 24-hour service on popular transit routes to connect workers to their destinations. Participants in San Diego’s MTS community engagement efforts ranked this as their highest priority.

Recommendation:
Project ID TL63, TL64 and TL65 should include bus frequency increase to 24 hours. As well as all the Transit Leap projects within the South Bay to Sorrento that will service environmental justice communities.

6. The Purple Line:

L391
1. The proposed 2021 Regional Plan has been developed with equity at the forefront. An equity specific project list has been included in the Draft 2021 Regional Plan Appendix H. As suggested, this list of projects with phasing will be added to Appendix A in the proposed final 2021 Regional Plan. Thank you for the suggestion and SANDAG agrees that this change will make it easier for the public to understand.

2. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.

3. SANDAG agrees that action is needed now to provide fast, frequent, reliable, and accessible transit, especially on highly utilized routes. Staff are bringing forward an item to the SANDAG Transportation Committee and to the Board of Directors in advance of approval of the 2021 Regional Plan to amend the agency budget and act now to invest in transit that benefits environmental justice communities. This action seeks to increase services on transit lines that have infrequent service in the evenings and late nights, and/or provide fare subsidies for youth riders. Additionally, further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.

4. The Blue Line Trolley is one of the most successful light rail lines in the nation. It recently had frequencies increased to 7.5 minutes from 5 a.m. to 7 p.m. Grade separations and track work will help to improve the reliability on the Blue Line. Appendix A includes specifics on these projects, but in the short term SANDAG will conduct a Blue Line Express Feasibility and Conceptual Engineering Study as a Near-Term Implementation Action (included in proposed final Appendix B: Implementation Actions). The study will focus the project specifications and clarify next steps for express connectivity along the Blue Line.

5. The proposed final 2021 Regional Plan includes increased service spans for the Trolley and bus service up to 20 hours per day. As SANDAG and the transit agencies move into more detailed planning efforts in the near future, some routes will be considered for 24-hour operation.

6. The South Bay to Sorrento Comprehensive Multimodal Corridor Plan is currently studying alternatives that include a station in City Heights along the Commuter Rail Route 582. The east-west Commuter Rail route 581 between El Cajon and Serra Mesa via San Diego/Central Mobility Hub via I-805 includes that station in the current proposed alignment. The first part of Route 582, from National City to Sorrento Mesa, is expected to be built by 2035 and is planned to be extended south from National City, to Chula Vista, and to the border by 2050. An additional route, Commuter Rail 583, traveling from the border to National City on the same alignment as the 582, is expected to be built by 2050 along with a branch to the Central Mobility Hub via downtown San Diego. One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study.

7. The proposed final 2021 Regional Plan supports the electrification of the region’s transit buses and the state’s Innovative Clean Transit regulation. Appendices A and B include SANDAG’s proposed commitment of $75 million through 2025, $250 million between 2026 to 2035, and $332 million between 2036 and 2050 for zero-emission buses and infrastructure to accelerate the implementation of MTS’ and NCTD’s Zero Emission Bus (ZEB) Rollout Plans. Transit agency ZEB Rollout Plans are on the CARB website here: https://ww2.arb.ca.gov/our-work/programs/innovative-clean-transit/ict-rollout-plans.

8. Land use authority is reserved to local jurisdictions – the cities and the county. The cities and the county are best positioned to effectively implement the objectives outlined in the 2021 Regional Plan as those jurisdictions understand the unique needs of their communities and geographies. SANDAG is developing a Regional Housing Incentive Program and it will meet the goals of the proposed final 2021 Regional Plan.
Fund the planning, environmental, engineering, and construction work for the Purple Line as a rail line that connects environmental justice communities in central City Heights and the South Bay to Sorrento. Recommendation: SANDAG’s housing incentive program will include development of a regional anti-displacement strategy, consider climate change and resilience, consistency with the transportation improvements included in the Regional Plan, and alignment with SANDAG grant programs. Additionally, SANDAG will coordinate with its Social Equity Working Group, tribal nations, and other interested stakeholders to ensure the housing incentive program promotes equity and addresses gentrification, displacement, and other issues.

9. The proposed final 2021 Regional Plan includes a commitment to building bathrooms at all new rail stations and developing a bathroom access plan to study the incorporation of bathrooms into existing stations.

10. MTS and NCTD work closely with the County Office of Emergency Services to ensure that transit vehicles can be used in the case of any public emergency. Additionally, SANDAG’s specialized transportation grant program requires all grantees to work with the County to get their wheelchair accessible vehicles registered to assist in emergencies. Appendix Q also describes emergency evacuation strategies, including signaling, traffic control guides, roadblocks and barricades, electronic signage, land expansion, contra-flow lanes, traveler information services, use of mass transit, and airport uses.

The detailed ridership analysis of the Purple Commuter Rail alignment listed on page A-15 is promising and points to a purple line that will include stations in City Heights. The RP should include project phasing that prioritizes the development of stations in central City Heights and the South Bay region with a 2035 project completion.

? An all-electric bus fleet by 2030: Accelerate the electrification of buses, because our communities cannot afford to wait 20 years to breathe cleaner air and reduce climate pollution. Recommendation: The transition to zero-emission buses, including rapid routes, should be accelerated for a 2030 completion with the support of recently approved state and federal funding sources. Page A-3 outlines program investments for Zero-Emission Buses and Infrastructure. The funding should be redistributed to prioritize the program’s implementation to meet the 2030 completion goal.

8. Anti-displacement strategies: Protect low-income communities of color living near transit corridors from gentrification with proactive strategies that include building affordable housing while preserving naturally occurring affordable housing, community ownership, and tenant protections. We need comprehensive solutions! Recommendation: We commend SANDAG for including a Regionwide Displacement Study for near-term implementation. The study is listed on page B-3 of Appendix B and should be completed before the adoption of the RP in order to truly inform and prevent displacement due to the plan’s implementation.

9. Restroom access: Create a plan to make restrooms available to the public and provide MTS with funding for a clean and accessible restroom network with access at all major transit stations. Recommendations: Include restroom access as an item in the capital operations budgets. The 2021 Regional Plan states that “mobility needs to be widely accessible, affordable, easy to use, and tailored to a person’s individual needs. In short, mobility must be viewed as a basic human right”. State-of-the-art bathrooms are mobility and key to a successful transit system. 10. Emergency-ready transit system: Provide transit for environmental justice communities to evacuate during emergencies. EJ communities are more vulnerable to climate disasters and more likely to live near industries, military operations and other dangerous activities that may have accidents that cause fires, leak toxins, and other crises. Recommendations: Include a study and implementation strategies to establish an emergency-ready transit as part of the near-term action in Appendix B within the Social Equity Planning Framework section.

Finally, the SDTEWG strongly recommends that SANDAG develop an equity pricing program, a Next OS equity plan, and policies that safeguard the privacy of Black, Indigenous, People of Color (BIPOC). The SDTEWG supports the efforts to implement a regional pricing strategy and the Next OS as long as they are implemented with an equity framework, which is not reflected in the Draft RP. All regional pricing strategies must include mechanisms to protect low-income families who cannot afford to pay to be able to drive. All Next OS infrastructure should give development priority to environmental justice communities. And, policies must be in place to ensure data collected does not target BIPOC or use the information to over-police our communities.

SANDAG will launch a study in the next year to further study the pricing strategies and their capabilities in addressing various goals, including equity and greenhouse gas emissions reduction. SANDAG advances planning on technology initiatives such as Flexible Fleet pilots, Next OS, Mobility Hubs, equity will continue to be a priority for SANDAG.

1. A Regional Plan that Centers Environmental Justice: Prioritize environmental justice (EJ) communities by identifying projects that will improve their access to public transportation by 2025, which should include the development of a Safe Routes To Transit strategy and an early action project Mobility Hub at Euclid Transit Center.

2. Youth Opportunity Passes (YOP): Provide no-cost transit passes for all youth ages 24 and under to build generations of lifelong transit riders and connect youth to school, work, internships, and early career opportunities.

3. Bus Service every Ten Minutes: Make bus service reliable and affordable now - we can’t afford to wait. Buses are one of the most cost-effective ways to get us where we need to go while cutting climate pollution.

4. Blue Line Express: Build a third track for a 24-hour Express Blue Line. The Blue Line already has the highest ridership and is one of the best-performing transit lines in the region.

5. 24 Hour Service: Connect late-night and early-morning workers by 2025. Provide 24-hour service on popular transit routes to connect workers to their destinations.

6. The Purple Line: Fund the planning, engineering, and construction work for the Purple Line as a rail line that connects environmental justice communities in central City Heights and the South Bay to Sorrento Valley.

7. An All-electric Bus Fleet: Accelerate the electrification of buses, because our communities cannot afford to wait 20 years to breathe cleaner air and reduce climate pollution.

8. Anti-displacement Strategies: Protect low-income communities of color living near transit corridors from gentrification with proactive strategies that include building affordable housing while preserving naturally occurring affordable housing, community ownership, and tenant protections. We need comprehensive solutions.

9. Restroom Access: Create a plan to make restrooms available to the public and provide MTS with funding for a clean and accessible restroom network with access at all popular transit stations.

10. Emergency-ready Transit System: Provide transit for environmental justice communities to evacuate during emergencies. EJ communities are more vulnerable to climate disasters and more likely to live near industries, military operations and other dangerous activities that may have accidents that cause fires, leak toxins, and other crises.

We urge the SANDAG Board to support the 10 Transit Lifelines and ensure their inclusion in the 2021 RP.

1. One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth under age 19.

SANDAG agrees that action is needed now to provide fast, frequent, reliable, and accessible transit, especially on highly utilized routes. Staff are bringing forward an item to the SANDAG Transportation Committee and to the Board of Directors in advance of approval of the 2021 Regional Plan to amend the agency budget and act now to invest in transit that benefits environmental justice communities. This action seeks to increase services on transit lines that have infrequent service in the evenings and late nights, and/or provide fare subsidies for youth riders. Additionally, further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.

4. The Blue Line Trolley is one of the most successful light rail lines in the nation. It recently had frequencies increased to 7.5 minutes from 5 a.m. to 7 p.m. Grade separations and track work will help to improve the reliability on the Blue Line. Appendix A includes specifics on these projects, but in the short term SANDAG will conduct a Blue Line Express Feasibility and Conceptual Engineering Study as a Near-Term Implementation Action (included in proposed final Appendix B: Implementation Actions). The study will focus the project specifications and clarify next steps for express connectivity along the Blue Line.

SANDAG agrees that action is needed now to provide fast, frequent, reliable, and accessible transit, especially on highly utilized routes. Staff are bringing forward an item to the SANDAG Transportation Committee and to the Board of Directors in advance of approval of the 2021 Regional Plan to amend the agency budget and act now to invest in transit that benefits environmental justice communities. This action seeks to increase services on transit lines that have infrequent service in the evenings and late nights, and/or provide fare subsidies for youth riders. Additionally, further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.

5. The proposed final 2021 Regional Plan includes increased service spans for the Trolley and bus service up to 20 hours per day. As SANDAG and the transit agencies move into more detailed planning efforts in the near future, some routes will be considered for 24-hour operation.

6. SANDAG agrees that this change will make it easier for the public to understand. We urge the SANDAG Board to support the 10 Transit Lifelines and ensure their inclusion in the 2021 RP.

<tr>
<td>L394</td>
<td>1. Reduce GHG emissions from cars and light trucks to fight the Climate Crisis. We ask you to meet bolder GHG emission reduction targets. Climate change is accelerating and its effects are devastating environmental justice communities. For our families and children to have a livable future we cannot wait any longer to respond. Transportation accounts for half of the GHG emissions in the San Diego region. The targeted 20% reduction per capita of GHG emissions from cars and light trucks below 2005 levels by 2035 will have only a small impact on the GHG emissions from transportation, even if we successfully reach that goal. The emissions reduction goal must be at least by 2030.</td>
<td>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. Reducing GHG emissions to achieve state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan.</td>
</tr>
<tr>
<td>L395</td>
<td>To rapidly reduce GHG emissions, we ask you to accelerate the timeline for development and improvement of transit (trolleys, trains, and buses) and active transportation (biking and walking). Also, the plan must include effective strategies to encourage a rapid shift away from cars to public transit and from fossil fuel burning vehicles to zero-emission vehicles. Managed lanes on freeways should be implemented to enable buses to run faster and on-time and so that they are a more attractive means of transportation than cars.</td>
<td>The 2021 Regional Plan is focused on creating more mobility options to all people in the San Diego region through a fast, reliable, and fair public transportation system and micromobility options including e-bikes and scooters, rideshare, and microtransit shuttles. The Regional Plan also proposes a network of managed lanes using existing infrastructure that provide priority access to people using transit, carpooling, or vanpooling.</td>
</tr>
<tr>
<td>L396</td>
<td>2. By 2023 or sooner, implement no-cost youth transit passes for those 24 and younger. This would advance social justice by helping youth, who often lack resources, to travel to education, employment, and services. This would immediately improve transit ridership numbers and contribute to transit being seen as a viable alternative to car travel. Youth passes are an investment in the success of transit, as youth who are accustomed to using transit become adults who will choose buses and trains over cars.</td>
<td>One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth under age 19.</td>
</tr>
<tr>
<td>L397</td>
<td>3. Improve the transit system now to make it more frequent, reliable, accessible, affordable and fast. The 2021 Regional Plan must prioritize improvements in public transit. We need a real alternative now in order to begin the transition away from cars without delay. The current transit system needs to improve by increasing passenger capacity, frequency and service hours on popular lines to make it more convenient, reliable, accessible, and fast. This means 24-hour service and 10-minute frequency on many popular bus routes currently in service. This should be done immediately to introduce the public to a new transit era by providing MTS and NCTD with the necessary financial support.</td>
<td>SANDAG agrees that action is needed now to provide fast, frequent, reliable, and accessible transit, especially on highly utilized routes. Staff are bringing forward an item to the SANDAG Transportation Committee and to the Board of Directors in advance of approval of the 2021 Regional Plan to amend the agency budget and act now to invest in transit that benefits environmental justice communities. This action seeks to increase services on transit lines that have infrequent service in the evenings and late nights, and/or provide fare subsidies for youth riders. Additionally, further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.</td>
</tr>
<tr>
<td>L398</td>
<td>3. Prioritize the needs of Disadvantaged, Environmental Justice Communities. Disadvantaged, Environmental Justice Communities, which disproportionately suffer from the effects of climate change, cannot afford to wait; they need immediate improvements while long-term infrastructure projects are developed. This means not building new roads, accelerating the Purple Line, and collaborating with MTS and NCTD to make improvements to the Blue Line and Sprinter and add Bus Rapid Transit routes to serve those communities. We ask for the completion of the Purple Line via City Heights all the way to the border by 2035 instead of stopping in National City per the draft Regional Plan. That is because half of the Purple Line ridership will come from Chula Vista, Imperial Beach, and Tijuana. We also ask for enhancement to the Blue Line to reduce travel time from the border and South Bay region to downtown to provide faster access to the jobs in the downtown area.</td>
<td>The Blue Line Trolley is one of the most successful light rail lines in the nation. It recently had frequencies increased to 7.5 minutes from 5 a.m. to 7 p.m. Grade separations and track work will help to improve the reliability on the Blue Line. Appendix A includes specifics on these projects, but in the short term SANDAG will conduct a Blue Line Express Feasibility and Conceptual Engineering Study as a Near-Term Implementation Action (included in proposed final Appendix B: Implementation Actions). The study will focus the project specifications and clarify next steps for express connectivity along the Blue Line. Additionally, the South Bay to Sorrento Comprehensive Multimodal Corridor Plan is currently studying alternatives that include a station in City Heights along the Commuter Rail Route 582. The east-west Commuter Rail route 581 between El Cajon and Downtown San Diego/Central Mobility Hub via SDSU includes that station in the current proposed alignment. The first part of Route 582, from National City to Sorrento Mesa, is expected to be built by 2035 and is planned to be extended south from National City, to Chula Vista, and to the border by 2050. An additional route, Commuter Rail 583, traveling from the border to National</td>

<td>L405</td>
<td>The environmental community has repeatedly advised SANDAG staff and Board members that this SANDAG statement is clearly factual, warranted, and long predicted. It would behoove senior staff, under direction of the Board of Directors, to lobby for state and federal environmental grant funding or appropriations. The current, unprecedented state budget surplus is too great an opportunity to ignore in light of the devastating consequences of doing nothing for lack of funding and planning. <a href="https://www.sandag.org/uploads/publicationid/publicationid_1236_5646.pdf">https://www.sandag.org/uploads/publicationid/publicationid_1236_5646.pdf</a></td>
<td>On January 28, 2011 the SANDAG’s Quality of Life Subcommittee discussed regional funding need for various infrastructure; habitat conservation was one of those discussed. The estimated funding need was $3,083 million in 2010$. <a href="https://www.sandag.org/uploads/meetingid/meetingid_2872_12391.pdf">https://www.sandag.org/uploads/meetingid/meetingid_2872_12391.pdf</a>. To assist the region to meet its habitat conservation goals, the proposed final 2021 Regional Plan has identified $2,087 million for an enhanced habitat conservation, management, and monitoring program. These funds are complemented with a $565 million Nature-Based Climate Solutions Program that will promote both habitat conservation and restoration and carbon sequestration (See Climate Adaptation and Resilience programs). In addition, future mitigation of the transportation projects included in the 2021 Regional Plan will result in an additional $300-$500 million of land acquisition and restoration for habitat mitigation (incorporated in project costs presented in Appendix A).</td>
</tr>
</tbody>
</table>

L406 | SANDAG Board members please compare this TransNet EMP land grant program to the CAPITAL projects multimillion dollar budget. To say the environmental community is “challenged” speaks to this massive funding and equity disparity. Please consider that in 2011 the deficit was $3 billion. In 2021 the equivalent dollar shortfall is $3.62 billion. “Allocation of $4 million is done annually by the SANDAG Board of Directors pursuant to a two-year work plan. A portion of this funding is allocated and distributed through a competitive TransNet EMP Land Management Grant Program to maintain the integrity of existing regional habitat preserves through enhanced land management.” While the environmental community is grateful, $4 million a year will require 75-years to catch up to 2011 environmental standards and funding deficit, to say nothing of funding the present Regional Habitat Conservation Vision. | Through SANDAG’s Environmental Mitigation Program (EMP), $4 million dollars has been allocated annually to assist the region with land management and biological monitoring. The funding has established nine cycles of land management grants, the development of the management strategic plan, regional monitoring and the establishment of the San Diego Management and Monitoring Program (SDMMP). |
A steady, secure regional funding source is needed to complete the land acquisitions as proposed and to provide for ongoing land management. San Diego Forward: The 2021 Regional Plan A4-10

Simply stated, SANDAG’s PROTECT, RESPECT and CONNECT current environmental theme will largely remain a slogan until funding becomes a serious SANDAG Board of Directors priority. As San Diego’s premier and leading planning organization, the environmental community is mystified by the seeming lack of Board direction for the required environmental reviews and mitigation for CAPITAL projects.

When developing the Regional Habitat Conservation Vision, several barriers were identified that have slowed efforts to fully address regional habitat conservation within the region, including a lack of ongoing secure regional funding, a lack of institutional knowledge and public awareness, and waning political focus on habitat conservation.

Similarly, the focus on habitat conservation as a major public policy issued (SJC) has waned since the 1990s. Public policy focuses on imminent issues. Over the years, environmental public policy has shifted towards stormwater issues and climate adaptation as the top-of-mind issues. Ironically, habitat conservation contributes towards resolving each of these issues. In some respects, regional habitat conservation is a victim of its own success, being perceived as an issue that has been resolved by the region without an understanding of the current gaps.

As we evaluate potential funding for existing conserved lands, MSCP Preapproved Mitigation Areas (PAMA), defined reserves, preserve and managed properties, it becomes abundantly clear that there are no planned funding objectives of substance for the San Diego Region’s natural lands. Natural lands protection is currently limited to $4 million. This defect is delineated in the void of conservation funding in Appendix U Cost Estimation Methodology of 18 different forecast costs budget totaling $163,536,000,000. In this unprecedented budget no funds are planned for maintaining MSCP conservation lands and the required mitigation for Capital projects. https://sdforward.com/docs/default-source/2021-regional-plan/appendix-aa---regional-habitat-conservation-vision.pdf

The TransNet Environmental Mitigation Program (EMP) also established the San Diego Management and Monitoring Program (SDMMP) to provide a coordinated, scientific approach to management and biological monitoring of protected lands in San Diego County. Appendix AA, addressing The Regional Habitat Conservation Vision contradicts the illusion of effective planning by the $3.0 billion funding deficiency from 2011 to date. Essentially, the natural lands preservation budget is bereft of new funding sources, relying exclusively on the existing $4,000,000 per year of the original TransNet sales tax funding.

Without a regional funding source, the implementation—and ultimately, the success—of these plans to protect species and their habitats from extinction falls into question. In 2011, the estimated unfunded regional cost to implement the regional habitat conservation plans was $3.0 billion. This SANDAG RTP statement could not be more timely or appropriate for discussions and decisions to cure the unfunded regional cost. Hesitation to address funding result in an additional $300 -$500 million of land acquisition and restoration for habitat mitigation.

The bottom line of this Sierra Club communication, is that the RTP plan does not address the on-the- ground reality of SANDAG acting as though the agency did not bear planning responsibility for the huge, and growing, natural land MSCP conservation and preservation costs. Instead, regardless of environmental mitigation first claims, SANDAG has devoted their existing financial resources solely to CAPITAL projects, disregarding the costs of maintaining already preserved and reserved MSCP lands and mitigating the carbon associated with these capital projects.

To assist the region to meet its habitat conservation goals, the proposed final 2021 Regional Plan has identified $2,087 million for an enhanced habitat conservation, management, and monitoring program. These funds are complemented with a $565 million Nature-Based Climate Solutions Program that will promote both habitat conservation and restoration and carbon sequestration (See Climate Adaptation and Resilience programs). In addition, future mitigation of the transportation projects included in the 2021 Regional Plan will result in an additional $300-$500 million of land acquisition and restoration for habitat mitigation (incorporated in project costs presented in Appendix A). In total, the proposed final 2021 Regional Plan identified $3 billion for habitat conservation efforts.

SANDAG is committed to working with its regional partners to identify funding to fulfill this commitment.

As described above, the proposed final 2021 Regional Plan identifies $3 billion for habitat conservation efforts. SANADG is committed to working with its regional partners to identify funding to fulfill this commitment.

As of September 2021, SANDAG has provided $161 million towards acquisition of lands for capital project mitigation. $55 million for regional land management and monitoring, and $16.6 million of Land Management grant funds.

Thank you very much for your comment.

I have been a Logan Heights resident (OR BUSINESS OR NON PROFIT) for 10 years. I live 1 blocks from Interstate 5 freeway caps will be considered in the CMCPs.

Comprehensive Multimodal Corridor Plans (CMCPs) are data-driven plans to reduce congestion and generate transportation choices while preserving community character and creating opportunities for enhancement projects. Opportunities for freeway caps will be considered in the CMCPs.

Caltrans District 11 has also expressed interest in exploring opportunities for freeway caps. In alignment with the 2021 Regional Plan, SANDAG and Caltrans District 11 are currently developing Comprehensive Multimodal Corridor Plans in coordination with agency partners and local city governments. Comprehensive Multimodal Corridor Plans (CMCPs) are data-driven plans to reduce congestion and generate transportation choices while preserving community character and creating opportunities for enhancement projects. Opportunities for freeway caps will be considered in the CMCPs.

<td>Our once united community was devastated by Interstate 5 which forcibly displaced hundreds in the 1950's and has burdened those who remained. Pursuant to Chapter 1: Equity Focus (p. 11) of Draft Plan, we know ReConnect Logan Freeway Lid will transform and reconnect our community. A freeway lid can help our community by dismantling the barriers that the 1-5 created by bringing the community together, addressing health concerns by capturing GHG emissions, creating non-existing green spaces, and allowing for development of affordable housing. All goals in line with the Draft Plan of creating efficient movement of people and goods, providing affordable, reliable, and safety mobility options, and allowing for healthier air.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>As mentioned, the construction of the 1-5 forced many families to be displaced, and while the construction allowed for transportation advancements, since the 1950's our community has been subject to inequity, misrepresentation, and systemic injustices in transportation and racism, to mention a few. We continue to be a working-class neighborhood composed of nearly 90% Mexican Americans, and while we are proud of our heritage and activism deeply rooted in our National Landmark of Chicano Park, the reality is that 1-5 has created much insecurity by facilitating gang turfs, separating families from places of worship, and limiting children’s access to neighborhood schools. It is time for our community to heal - a freeway lid is the answer.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Given the significant investment and planning of projects in the Barrio Logan/Logan Heights communities in the Draft Plan as identified in Appendix A: Transportation Projects, Programs, and Phasing, it is appropriate to identify and call out ReConnect Logan Freeway Lid as a project on this list. A few of the multiple projects that will impact Barrio Logan/Logan Heights are:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>1. The creation of Managed Lanes on Interstate 5, Project ID CC002 Complete Corridor: ML/Goods Movement (p. A-8)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>2. Additional cargo due to the Harbor Drive 2.0 proposal that will facilitate cargo in the community of Barrio Logan, Project ID GM06 Goods Movement: Roadways (p. A-11)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>3. Harbor Drive Corridor, project ID GM05 2050 Goods Movement: Roadways Harbor Drive Multimodal Corridor Improvements that will facilitate Trucks for the Port of San Diego (p. A-12)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>4. Besides being in line with the 2021 Draft Regional Plan, ReConnect Logan Freeway Lid is also pursuant to Appendix H in relation to California Assembly Bill 805 which requires the reduction of pollution exposure in disadvantaged communities. Furthermore, our project is also pursuant to the Sustainable Communities Strategy per California SB 375 since it would help reach the overall goal of reducing GHG emissions of 15% (p. 18 of Draft Plan), as well as allowing for accommodation to the Regional Housing Needs Assessment Determination. For all these reasons, our community is looking forward to the addition of a Freeway Lid as a priority project as identified in SANDAG's 2021 Draft Regional Plan.</td>
<td></td>
<td></td>

**University Professional and Technical Employees - CWA 9119, Local 9 UCSD**

\[ L412 \]

While the Regional Plan is the boldest that SANDAG has proposed in decades, it is still highway first, which perpetuates a state of structural immobility, and will take too long to create necessary changes for public transit to be an alternative to cars and address our climate crisis. As transportation accounts for 41% of greenhouse gas emissions in San Diego, we have the opportunity to greatly reduce GHG emissions and create a more socially equitable region, by improving our transit system. Therefore, I urge you on behalf of the SDTEWC to support these proposed changes:

1. Meet the required greenhouse gas emission targets, and ensure measures actually get us to those goals, by using the federal and state funds available to create high quality union jobs. Climate change is accelerating and we are currently seeing the results, which is especially devastating to frontline communities, so the emissions reduction goal of 40% by 2030 is inadequate to meet the climate crisis.
2. Accelerate the timeline for all transit (trolleys, buses, rail) and biking infrastructure improvements and prioritize the Environmental-Justice communities that need transit solutions the most. Environmental-Justice communities cannot afford to wait; they need immediate improvements while the long-term infrastructure projects are being planned. This means no new roads but rather accelerating the purple line and collaborating with MTS to make improvements to the blue line, both of which serve these communities.
3. Develop a transit system that is fast, frequent, reliable, and accessible by increasing passenger capacity and frequency on popular lines. This should be done immediately to introduce the public to a new transit era by providing MTS and NCTD with the necessary financial support for implementation.
4. Create and fund an anti-displacement strategy to protect vulnerable communities living near transit corridors by developing new affordable housing, preserving existing affordable housing, encouraging community ownership.
5. Make immediate improvements to current amenities surrounding transit stops with dedicated funding. Amenities

The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. Reducing GHG emissions and achieving state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan. The Blue Line Trolley is one of the most successful light rail lines in the nation. It recently had frequencies increased to 7.5 minutes from 5 a.m. to 7 p.m. Grade separations and track work will help to improve the reliability on the Blue Line. Appendix A includes specifics on these projects, but in the short term SANDAG will conduct a Blue Line Express Feasibility and Conceptual Engineering Study as a Near Term Implementation Action (included in proposed final Appendix B: Implementation Actions). The study will focus the project specifications and clarify next steps for express connectivity along the Blue Line.

The South Bay to Sorrento Comprehensive Multimodal Corridor Plan is currently studying alternatives that include a station in City Heights along the Commuter Rail Route SB2. The east-west Commuter Rail route SB1 between El Cajon and Downtown San Diego/Central Mobility Hub via SDSU includes that station in the current proposed alignment. The first part of Route SB2, from National City to Sorrento Mesa, is expected to be built by 2035 and is planned to be extended south from National City, to Chula Vista, and to the border by 2050. An additional route, Commuter Rail SB3, traveling from the border to National City on the same alignment as the SB2, is expected to be built by 2050 along with a branch to the Central Mobility Hub via downtown San Diego. SANDAG agrees that action is needed now to provide fast, frequent, reliable, and accessible transit, especially on highly utilized routes. Staff are bringing forward an item to the SANDAG

<tr>
<td>1.424</td>
<td>Complete Corridors, such as the SR-67 and 1-15 Corridors, are envisioned to act as the backbone of the regional transportation system. In addition to providing for safe and comfortable spaces to get around for all modes of transportation, road improvements such as intersection widening are important for the safe and reliable movement of all road users. County staff would like to discuss further identification and investment within complete corridors that provide linkages to the unincorporated area. These improvements could assist in providing routes for the County's eastern and northern rural regions that could be essential in the event of accidents or fire evacuation. For example, County staff would like to discuss with SANDAG the option of including safety improvements along the SR-67 corridor on Wildcat Canyon Road, as this road is a relief route to SR-67. Additionally, road improvements on Old Hwy 395 and Pala Temescal Road in the north county may merit further conversation, as both of these roads serve as alternate routes to SR-67 during peak traffic hours.</td>
<td>The 2021 Regional Plan identifies technology and operational improvements to SR-67 to improve safety. During corridor-level and project-level planning, SANDAG will coordinate with the County on the specifics of these improvements.</td>
</tr>
<tr>
<td>1.425</td>
<td>County staff would like to further discuss improvements of low flow crossings that are necessary to limit area flooding as well as the safe passage of motorists.</td>
<td>The 2021 Regional Plan acknowledges the need to address environmental effects, such as flooding, that currently occur and could be exacerbated by climate change. The details of these improvements will be defined during corridor-level and project-level planning.</td>
</tr>
<tr>
<td>1.426</td>
<td>County staff would like to work with SANDAG to identify evacuation routes at a regional level, and the possibility of creating a separate section within the Regional Plan that would identify improvements of these routes and potential funding that could be part of the 2021 Regional Plan.</td>
<td>Appendix A details the funding for rural corridors and how these improvements would support regional evacuation routes.</td>
</tr>
<tr>
<td>1.427</td>
<td>County staff would like to discuss with SANDAG how Smart Infrastructure and Connected Vehicles will address the legal and financial challenges with sharing traffic signal data with private entities and the liability of the potential misuse of signal timing data.</td>
<td>Appendix B details implementation actions for the Regional Plan, including Priority Implementation Action 6 to advance the Next CS by preparing technical and planning studies and initiating pilot opportunities. Near-term actions would establish policies for data sharing and cross-agency procedural guidelines. SANDAG will be working closely with the County on these actions.</td>
</tr>
<tr>
<td>1.428</td>
<td>County staff would like to better understand the impact of Electric Vehicle Infrastructure on County of San Diego public right of way.</td>
<td>SANDAG will continue to collaborate with the County of San Diego on electric vehicle infrastructure. The 2021 Regional Plan does not address details on electric vehicle infrastructure in County of San Diego public right of way.</td>
</tr>

<td>L429</td>
<td>Stormwater Management &amp; Regional Needs Assessment; suggested edits in Appendix R, page R-2: “The County of San Diego has initiated an update of the 2010 Needs Assessment's 40-year water quality cost estimate using more recent water quality planning documents and strategies for achieving regulatory compliance and water quality objectives throughout the region. Since 2010, the Coopermittees have worked to formulate Water Quality Improvement Plans (WQIPs) for the region's watersheds, including strategies, planned projects, and schedules to address their respective water quality objectives and compliance needs. The update to the Needs Assessment is intended to assist the County in planning and decision making and will draw upon the most recent WQIPs, with a focus on incorporated areas to develop updated cost information.”</td>
<td>Thank you for these suggested edits. These are incorporated in the proposed final 2021 Regional Plan. Appendix R.</td>
</tr>
<tr>
<td>L430</td>
<td>Figure AA-1 shows the conserved habitat lands in the San Diego region (light green) and displays the areas included in the four subregional habitat conservation plans (subfigure). The draft PAMA of the draft North County MSCP are labeled as “Proposed Conserved Habitat Lands” (dark green). This label may be misinterpreted by readers. While the PAMA Preserves will be assembled within the PAMA, not all PAMA designated lands will be conserved or are being actively pursued for conservation at this time. The draft Focused Conservation Area (FCA) of the draft East County MSCP was not included in the “Proposed Conserved Habitat Lands” (dark green). This area is equivalent to the draft North County MSCP’s draft PAMA and should be included in this figure. The Rancho Cucamonga property located north of San Pasqual Valley Road will not be included in future iterations of the draft North County MSCP Permit Area. Portions of this property identified within the draft North County MSCP should be changed from dark green to white to reflect this change. In the subfigure, both the draft North County MSCP and Multiple Habitat Conservation Plan (MHCp) are identified by the number 7. The MHCp area should be identified by the number 6 to correspond with the provided key. Although the draft 2021 Regional Plan mentions the importance of protecting habitat corridors and wildlife linkages through land acquisition, it does not appear to include the construction of safe passageways to connect wildlife to preserved lands bisected by existing and future regional transit corridors. It is recommended that SANDAG work with the San Diego Monitoring and Management Program (SDMMP) and community partners to identify the areas along regional transit corridors that would benefit from wildlife crossings and that these improvements be included in future regional projects.</td>
<td>Thank you for these suggested edits to Figure AA-1. The figure has been updated accordingly. Thank you for this recommendation. Appendix AA has been updated to reflect this suggestion.</td>
</tr>
<tr>
<td>L431</td>
<td>For proposed projects that occur adjacent to Department of Parks and Recreation (DPR) County-managed lands, DPR staff would like to coordinate with SANDAG staff to ensure wildlife connectivity is maintained from adjacent lands to preserved County lands, including wildlife-only crossings. For proposed projects that occur adjacent to or near existing or potential future trail connections, DPR staff would like to coordinate with SANDAG staff on trail connectivity throughout the County and incorporate safe multi-use crossings, such as bridges or overpasses for recreational use.</td>
<td>SANDAG looks forward to coordinating with DPR staff to ensure wildlife connectivity is maintained for those proposed projects adjacent DPR County-managed lands. SANDAG looks forward to coordinating with DPR staff on trail connectivity for those proposed projects that occur adjacent to or near existing or potential future trail connections.</td>
</tr>
<tr>

### Draft 2021 Regional Plan Responses to Comments – Letter Sourced

<table>
<thead>
<tr>
<th>ID</th>
<th>Comment</th>
<th>Response</th>
</tr>
</thead>
<tbody>
<tr>
<td>L437</td>
<td>The San Diego County Regional Airport Authority adopted Airport Land Use Compatibility Plans for the eight airports, which included land use compatibility policies related to airspace, noise, safety and overflight. These policies have been adopted by the County of San Diego through its General Plan and Zoning Code. After evaluating the forecasted increases in housing and jobs around the Mobility Hubs, there are several land use assumptions related to safety and noise around Fallbrook Airpark, Jacumba Airport, Gillespie Field and MCcellan Palomar Airport that County staff would like to better understand. For example, there are forecasted incompatible housing increases within the Runway Protection Zones at Gillespie Field. These inconsistencies could result in the assumed intensities and densities increases being unachievable.</td>
<td>The land use pattern proposed in the Draft 2021 Regional Plan focuses growth and development in the mobility hub areas. The allocation of housing units to subregional areas represents general areas projected for future growth and not precise locations for future housing development or housing unit type. The exercise of land use authority is reserved to local jurisdictions.</td>
</tr>
<tr>
<td>L438</td>
<td>The Regional Plan will focus future investment, development, and growth in centralized areas referred to as “mobility hubs.” There are locations in the unincorporated area that the County has forecasted for future growth, which included already designated Regional Housing Needs Assessment (RHNA) sites, and are located within close proximity to a proposed mobility hub. The County would like to work with SANDAG to consider the expansion of proposed mobility hubs to include additional unincorporated north and east county communities. As indicated in Figure 1, these proposed expansions include areas in North County Metro, Lakeside, and Spring Valley. Additional details for these three mobility hub expansions are provided below. The North County Metro community is located between the proposed Vista and San Marcos mobility hubs. Expansion of the San Marcos mobility hub could include the Buena Creek Sprinter Station and additional housing units, including multiple RHNA sites. Lakeside has multiple areas that are identified as efficient areas compared to the regional vehicle miles traveled (VMT) average. These areas are located immediately adjacent to the proposed El Cajon mobility hub. Expansion of the El Cajon mobility hub could include these VMT efficient areas as well as potentially including additional growth areas in Lakeside along the I-8 corridor. Spring Valley is located east of the proposed Lemon Grove mobility hub and south of the proposed La Mesa mobility hub. This community has existing transit access along Jamacha Boulevard and is in close proximity to the MTS Trolley stations in Lemon Grove. Expansion of this mobility hub could include the Spring Valley areas near SR-78 and along Jamacha Boulevard.</td>
<td>SANDAG appreciates these suggestions from the County of San Diego and agrees that these are areas adjacent to the mobility hubs identified in the draft 2021 Regional Plan that should be considered as part of the identified mobility hub areas.</td>

RE: Include Youth Opportunity Passes in the 2021 Regional Plan and Early Actions

Dear Chair Blakespear and SANDAG Board of Directors:

We are excited for the future of transportation in our region. The 2021 Regional Plan includes visionary elements to building an efficient, accessible, and sustainable transportation system. Thank you for everyone’s effort on it. However, we bring to your attention that a key program is missing. We request that you amend the draft 2021 Regional Plan to include Youth Opportunity Passes (YOP), no-cost transit passes for youth ages 24 and under.

For 10 years, the Improving Transportation in City Heights Team (ITCH) has advocated to have no-cost transit passes for youth in San Diego. Mid-City CAN, the ITCH team, and the undersigned supporters request that you include YOP (ages 24 & under) in the 2021 Regional Plan. YOP requires a spot among to priorities in our 30-year vision for transportation in the region.

We ask the Board of Directors to take the following actions:

1. Amend the 2021 Regional Plan to state that Youth Opportunity Passes, no-cost-transit passes for youth ages 24 and under, will be funded when transit subsidies are allocated.
2. Amend the 2021 Regional Plan to state that transit subsidies will be allocated at the earliest implementation possible.
3. Fund Youth Opportunity Passes (24 & under) as an early-action Transit Pilot Program this year.
YOP (24 & under) is a necessary program, as illustrated by the following facts:

1. **Transit-dependent youth have been disproportionately impacted by the COVID-19 pandemic.** In San Diego County, there are approximately 86,000 young workers (ages 16-24) who work in the industries that were hard hit by the COVID-19 epidemic.¹ The industries include hospitality, food services, retail, oil and gas mining, transportation, employment services, travel, and leisure.²

2. **YOP (24 & under) is a way to increase ridership and develop a transit-culture.** Only 10,463 youth (ages 16-24) use public transit in San Diego, but these young commuters use public transit at a rate double that of their older counter parts (adults ages 25-59).³ YOP will further promote transit use among young San Diegans.

3. **YOP (24 & under) helps divert youth away from the school to prison pipeline.** MTS officers decide who to check for fare evasion, YOP prevents the criminalization of youth of color due to their inability to afford a pass. Literature suggests that Black youth are arrested for fare evasion at a rate 5 times higher than their white peers and Latino/a/x youth are arrested at a rate 4 times higher than their white peers.⁴

4. **YOP (24 & under) promotes the reductions of GHGs.** A person who switches from a 20-mile round-trip commute by car to using existing public transit, can reduce his or her annual CO2 emissions by 4,800 pounds per year.⁵ Decreasing greenhouse gas emissions is a matter of equity. Residents in low-income, BIPOC communities are exposed to more pollution than their more affluent counterparts. For example, City Heights residents are exposed to twice the amount of diesel particulate matter from trucks & cars than La Jolla residents.⁶

5. **YOP (24 & under) addresses climate justice.** Mid-City CAN has conducted 250+ conversations with residents in Communities of Concern (CoC). Over 86% of residents noted that climate change directly impacted them. Extreme weather has become a barrier to work and school for CoC residents who already face significant barriers to education and employment. Residents who normally walk or bike to work must increasingly rely on

---

⁶ Major sources of diesel particulate matter include trucks, cars and buses; Source: https://oehha.ca.gov/calenviroscreen/report/calenviroscreen-30)
cars or public transportation that is inaccessible due to cost or distance. YOP eliminates the cost barrier to transportation for youth ages 24 and under.

6. **YOP (24 & under) is a proven program.** Similar programs exist in Alameda County, Los Angeles, Sacramento, San Francisco, and Santa Ana. Youth Opportunity Passes helps ensure youth from all background are connected to their schools, internships, medical care, and early-career opportunities.

Amend the 2021 Regional Plan to include Youth Opportunity Passes (24 & under). Upon your commitment to include no-cost transit for youth ages 24 and under in the Plan, a study may be conducted to begin its implementation. But the community needs a commitment from you TODAY. It’s been 10 years of advocacy. Thank you.

Re: Support Incorporating *Reconnect Logan, 5 Freeway Lid Project* in the San Diego Association of Governments’ (SANDAG) 2021 Regional Plan

Dear Mr. Ikhrata,

My name is Andrew Puls and my wife and I have been Logan Heights residents for approximately five years. I am writing to express my support for the incorporation of a project which goal is to address social and economic inequity, rising levels of health concerns aggravated by greenhouse gas emissions, and transportation injustices in San Diego’s Barrio Logan and Logan Heights communities. Specifically, we request the addition of a Freeway Lid as a priority project as identified in SANDAG’s 2021 Draft Regional Plan (Draft Plan)

Our once united community was devastated by Interstate 5 which forcibly displaced hundreds in the 1950’s and has burdened those who remained. Pursuant to Chapter 1: Equity Focus (p. 11) of Draft Plan, we know *ReConnect Logan Freeway Lid* will transform and reconnect our community. A freeway lid can help our community by dismantling the barriers that the I-5 created by bringing the community together, addressing health concerns by capturing GHG emissions, creating non-existing green spaces, and allowing for development of affordable housing. All goals in line with the Draft Plan of creating efficient movement of people and goods, providing affordable, reliable, and safety mobility options, and allowing for healthier air.

As mentioned, the construction of the I-5 forced many families to be displaced, and while the construction allowed for transportation advancements, since the 1950’s our community has been subject to inequality, misrepresentation, and systemic injustices in transportation and racism, to mention a few. We continue to be a working-class neighborhood composed of nearly 90% Mexican Americans, and while our we are proud of our heritage and activism deeply rooted in our National Landmark of Chicano Park, the reality is that I-5 has created much insecurity by facilitating gang turfs, separating families from places of worship, and limiting children’s access to neighborhood schools. It is time for our community to heal – a freeway lid is the answer.

Given the significant investment and planning of projects in the Barrio Logan/Logan Heights communities in the Draft Plan as identified in Appendix A: Transportation Projects, Programs, and Phasing, it is appropriate to identify and call out *ReConnect Logan Freeway Lid* as a project on this list. A few of the multiple projects that will impact Barrio Logan/Logan Heights are:
● The creation of Managed Lanes on Interstate 5, Project ID CC002 Complete Corridor: ML/Goods Movement (p. A-8)
● Additional cargo due to the Harbor Drive 2.0 proposal that will facilitate cargo in the community of Barrio Logan, Project ID GM06 Goods Movement: Roadways (p. A-11)
● Harbor Drive Corridor, project ID GM05 2050 Goods Movement: Roadways Harbor Drive Multimodal Corridor Improvements that will facilitate Trucks for the Port of San Diego (p. A-12)

Besides being in line with the 2021 Draft Regional Plan, ReConnect Logan Freeway Lid is also pursuant to Appendix H in relation to California Assembly Bill 805 which requires the reduction of pollution exposure in disadvantaged communities. Furthermore, our project is also pursuant to the Sustainable Communities Strategy per California SB 375 since it would help reach the overall goal of reducing GHG emissions of 15% (p. 18 of Draft Plan), as well as allowing for accommodation to the Regional Housing Needs Assessment Determination. For all these reasons, our community is looking forward to the addition of a Freeway Lid as a priority project as identified in SANDAG’s 2021 Draft Regional Plan.

If you have any questions, you may contact me at andypuls@gmail.com.

Sincerely,

Andrew Puls

Subject: 2021 Regional Plan Comment SeanEloRivera@sandiego.gov

Dear Mr. Hasan Ikhrata, Executive Director

Thank you for providing the public and businesses with the opportunity to comment on the draft Regional Plan. Our business, ARCO AM/PM, is located in the City Heights community adjacent to the I-805 Freeway Home Avenue Ramps.

My team members and I daily observe the traffic patterns along Home Avenue and particularly the stacking on the I-805 ramps. We know the travel patterns of our customers at our fuel station and its convenience store. These experiences make clear that local neighborhood traffic is using longer less direct freeway trips to and from the Mt. Hope community and the Gateway employment and shopping centers. Buses, Bicycles, vehicles, and pedestrians cannot go directly Market Street. The Fairmount Park, Azalea Park and Hollywood Parks residents are cut off from the Gateway Centers jobs, visiting deceased loved ones at the Mt. Hope cemeteries, and the significant shopping areas between the I-805 and the SR-15 freeways. Our list of priority projects for our D9/D4 are as follows:

1. Extension of the Home Avenue Route to Market Street for Pedestrians, Bicycles, and Vehicles. The Home / Market connection would provide significant economic development stimulus to the Mt. Hope and City Heights areas. It would assist in congestion relief by providing an alternate to freeway traffic on the SR 94 - Martin Luther King Freeway.

2. Completion of the Transportation markings along Home Avenue. Curbs are not marked for safety, to promote proper parking, traffic movement, and access for Buses and the Disabled. The Bicycle route is not fully painted and warning ramps for the visually impaired are not in place. Bulbing out at key intersections should be funded to increase pedestrian crossing safety.

I believe that the business community, along Fairmount and Home Avenues, would be open to establishment of a Business Improvement and Maintenance Area to assist in cooperative funding of some of these improvements. We would appreciate assistance in establishing such special districts. If you need further information feel free to contact me directly on my mobile 619-977-8485.

Respectfully,

Arkan Somo
President

Executive Director
San Diego Association of Governments
401 B Street, Suite 800
San Diego, California 92101
hasan.ikhrata@sandag.org

Dear Mr. Ikhrata:

California Air Resources Board (CARB) staff appreciate the opportunity to review and engage with the San Diego Association of Governments (SANDAG) staff on the draft Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) known as “2021 Regional Plan.” This work is more important than ever as CARB’s first Senate Bill (SB) 150 report\(^1\) evaluating progress meeting SB 375 goals showed that California is not on track to meet the greenhouse gas (GHG) reductions expected under SB 375 for 2020 and that vehicle miles traveled (VMT) are increasing. To achieve the State’s climate mandates, California needs significant and immediate changes to how we plan, fund, and build our communities and transportation systems. SANDAG has demonstrated important leadership, creativity, and innovation in developing its draft RTP/SCS, and we appreciate your ongoing efforts to work with CARB and other State agencies.

The SCS plays a critical role in supporting the State’s climate efforts, and local objectives to create an economically vibrant region that responds to the needs of its diverse communities and provides better access to jobs and cleaner air for its residents. We appreciate SANDAG’s work to innovate beyond its previous RTP/SCS plan in considering how to better connect the region with a reimagined transportation system and incentivize growth in strategic areas, as well as its approach to increase public engagement in the plan development process.

In reviewing the draft RTP/SCS, CARB staff looked to identify whether additional information would be needed to conduct our final SCS GHG evaluation under SB 375. As discussed with SANDAG staff in meetings this spring and summer, for all third-round RTP/SCSs, like SANDAG’s 2021 Regional Plan, CARB will focus on assessing whether GHG reductions are reasonably supported by the plan. CARB staff will conduct its final evaluation, as outlined in the Final Sustainable Communities Strategy Program and Evaluation Guidelines (SCS Evaluation Guidelines).\(^2\)

\(^1\) CARB’s 2018 Progress Report: California’s Sustainable Communities and Climate Protection Act.
\(^2\) CARB’s 2019 Final Sustainable Communities Strategy Program and Evaluation Guidelines.
CARB staff have identified areas where we would need additional information to complete our evaluation. We request that you include the information below as part of your SCS Submittal to CARB.

**SCS Strategies to Reduce GHG Emissions**

CARB staff request that SANDAG provide further clarification regarding the following highlighted draft strategies to support CARB’s assessment of whether the strategies are likely to be implemented as assumed, and therefore, reasonable for inclusion and credit:

- **Land Use Pattern That Considers Jobs-Housing Balance, Mixing of Uses, Transit-Oriented Development and Housing Needs as Part of The Mobility Hub Framework:** SANDAG’s efforts to plan for and identify ways to incentivize future housing development in transit-rich areas with services and jobs, are vital to helping further State goals for climate, housing, and VMT reduction. CARB staff were able to identify actions in the draft RTP/SCS intended to support local jurisdictions in implementing the SCS land use pattern. As part of CARB’s SCS Policy Commitments evaluation, CARB staff will also need to consider whether and to what extent these actions advance the region’s land use vision. To support this analysis, CARB staff request that SANDAG provide information that summarizes differences between existing residential and commercial density and type assumptions in its Mobility Hub areas, compared to what is currently allowable in local land use plans for the corresponding geographies as part of its final SCS Submittal.

- **Road User Charge Pricing Strategy:** CARB staff notes that the draft RTP/SCS plans for a regionwide road user charge to be operational and generating revenue in the region starting as soon as 2026. CARB staff recognizes both the importance of, and difficulty in, implementing this pricing strategy. While the draft RTP/SCS includes actions committed to support implementation of this strategy (e.g., partnering on pilots, pursuing legislation, and investing in studies), which we support, they appear to be similar to those being pursued by other regions around the state that are assuming operations starting no sooner than 2030. CARB staff requests further clarification from SANDAG on how it may be able to implement sooner than others around the state as part of its final SCS Submittal.

**Strategy Funding and Revenues**

The draft RTP/SCS identifies that $29 billion needs to come from new funding sources in order to implement the plan through 2035. Of those new funding sources, about $18 billion, or 25 percent of the plan’s total funding need through 2035, is attributed to new pricing strategies including Ridehailing Company Service Fees, Future State Revenues for Transportation, Regional Road User Charge, and Future Federal Revenues for Transportation. CARB staff is concerned that other strategies that contribute to the SCS meeting its targets

---

may be at risk if the region is not able to fully secure these new funding sources within the timeline assumed in the draft RTP/SCS. CARB’s evaluation will look at the extent to which the RTP/SCS strategies will be supported by existing revenue sources, as one measure of likely implementation. CARB requests that SANDAG identify whether and to what extent the high-impact strategies for achieving the GHG reduction targets in the plan are reliant on new revenue sources versus existing revenue sources as part of its final SCS Submittal.

Managed Lanes and Complementary Strategies

CARB staff reviewed Appendix A of the draft RTP/SCS and appreciate the detail provided on the region’s transportation project investments by corridor. CARB staff is encouraged to see that the draft RTP/SCS includes planned investments across modes within the region’s key corridors and that when investing in roadway projects, the region is prioritizing conversion of existing free-flow lanes into managed lanes with priority access for transit, carpool, and vanpool users, and fee access for single-occupant drivers. CARB staff observe that the plan also includes some managed lane projects whose scope includes adding new lanes. Specific to those projects, CARB staff requests that SANDAG provide further information that contextualizes the risk, if any, to the region’s ability to achieve, and maintain its 2020 and 2035 GHG targets when adding new lanes in those locations (e.g., clarifying whether and how those projects align with and facilitate the region’s preferred land use pattern, identifying whether other policies or mechanisms that will limit adverse passenger vehicle GHG/VMT emissions impacts are present in those locations) as part of its final Submittal.

CARB staff looks forward to continuing our collaboration with SANDAG staff and are committed to working together on potential approaches to address these requests. If you have any questions, please contact me at Lezlie.Kimura@arb.ca.gov.

Sincerely,

Lezlie Kimura Szeto, Manager
Sustainable Communities Planning and Policy Section

RE: San Diego Forward – Draft 2021 Regional Plan Coastal Commission Staff Comments

To the Honorable Board:

Thank you for the opportunity to review and provide comments on the Draft 2021 Regional Plan (Regional Plan). The Coastal Commission is an independent state agency that regulates development along California’s coastline to protect natural coastal resources and to maximize coastal access and recreation for all. We have a long history of partnership with Caltrans, SANDAG, and other state, regional, and local agencies on transportation issues along California’s coastline, often also in partnership with local county or city governments. Through these partnerships we are striving to provide a safe and resilient transportation network along California’s coastline that also protects and enhances coastal natural resources and public access.

As an initial and overall comment, we want to applaud this document and the important direction it sets on multiple policy issues. Coastal Commission staff specifically appreciate the acknowledgement that bold changes to San Diego’s regional transportation network and compelling alternatives to driving alone are needed to meet greenhouse gas (GHG) emission targets. The Regional Plan will provide a key blueprint for reducing transportation air pollution and greenhouse gas emissions (GHGs), minimizing vehicle miles traveled (VMT), improving multi-modal transportation, addressing the need for greater equity in transportation systems, and enhancing the resiliency of our transportation network in the face of climate change, particularly with respect to sea level rise and our coastal highways. We primarily want to offer ourselves as a partner in this important work to carry forward the Regional Plan. In this letter, Commission staff would like to offer a few broad comments on how the Regional Plan could be modified to strengthen its consistency with the California Coastal Act.

Consistency of the Regional Plan with the California Coastal Act

Overall, the policies of the California Coastal Act that guide our work at the Coastal Commission significantly overlap with the goals of SANDAG’s Regional Plan, including policies to protect marine and coastal land habitats, concentrate urban development, maximize public access and expand multi-modal transportation, reduce VMT, and improve coastal resiliency to sea level rise and other climate-change hazards. For example, Appendix B: Implementation Actions identifies eight 2035 goals drawn from the Regional Climate Action Planning Framework which generally align with the referenced Coastal Act policies:

- “High density, transit-oriented housing” aligns with the Coastal Act policy of focusing development in or near existing developed areas (Coastal Act Section 30250).
- “Conserve open space and agricultural lands” aligns with Coastal Act policies related to conservation of sensitive habitat, open space, and coastal agricultural lands (Coastal Act Sections 30230, 30231, 30233, 30241).
• "100% of new buses are zero-emission,” “400,000+ electric cars on the road,” “Sustainable freight (transitioning to zero emissions where feasible),” and “Up to 100% renewable electricity” aligns with the Coastal Act requirement that new development minimize energy consumption and VMT and be consistent with requirements imposed by an air pollution control district or the State Air Resources Board on each particular development (Coastal Act Section 30253).
• “Walkable and bikeable communities” aligns with Coastal Act policies promoting the protection, addition, and enhancement of public access (Coastal Act Sections 30210, 30212.5, 30252).

Appendix B additionally identifies strategies for the implementation of affordable housing, such as minimum zoning near transit, fee-waiver programs, and accessory dwelling units, which align with Coastal Act Sections 30213 (Lower Cost Overnight Accommodations) and 30013 (Environmental Justice). However, there are aspects of the Regional Plan that could be strengthened to be more consistent with the Coastal Act as described below.

Implementation and Prioritization
Consistent with Senate Bill (SB) 375, the California Air Resources Board (ARB) sets targets for reduction of GHG emissions from passenger vehicles for the target years 2020 and 2035, which Chapter 2, “Sustainable Communities Strategy,” notes the Regional Plan will accomplish. However, as noted in the Regional Plan, Executive Order B-30-15, and California Senate Bill 32 (Pavley, 2016), set a further statewide goal of reducing California’s GHG emissions to 40 percent below 1990 levels by 2030 and the Executive Order B-55-18 set a statewide goal of carbon neutrality by 2045. Recognizing the needs of all residents and visitors to the San Diego region, the Regional Plan rightfully includes improvements to all transportation modes, including roads and parking, but in order to meet or exceed the referenced GHG and climate goals, projects that improve public transit and active transportation to minimize VMT should be completed as quickly as possible, consistent with the Coastal Act (Section 30253). Additionally, active transportation projects that provide emission free transportation options and can be implemented relatively quickly should be prioritized, including completing segments of the California Coastal Trail and Coastal Rail Trail in the near-term (2025) rather than in future phases (2035 or 2050). Specifically, trail segments providing access to major employment centers that would relieve strain on coastal access corridors and that would help relieve congestion on Interstate 5, such as the segments connecting Carmel Valley to Roselle Canyon; Del Mar to Sorrento; and Roselle Canyon/UTC to Rose Canyon, should be prioritized for near-term construction. In general, Coastal Commission staff support greater proportions of investment in transit, active transportation, and environmental enhancement projects as compared to roadway improvements targeting single-occupant vehicles.

Finally, the Coastal Act (Section 30250) encourages new residential, commercial, or industrial development, to be located within, contiguous with, or in close proximity to, existing developed areas. Accordingly, the Regional Plan should prioritize transportation investments which encourage jobs and housing to be concentrated in developed areas and avoid further encroachment into habitat, farmland, and open space recreational areas by moving them forward to earlier construction phases.

Public Access and Recreation – Emphasize and Fund the California Coastal Trail
A pillar of the Coastal Act is the protection and provision of public access to and along the coast. Coastal Act Sections 30210 and 30212 require that maximum opportunities for public access and
and water resources concernin Coastal Commission sta... en to access wee... Further commitment for complete the trail should be provide... still in need of completion, improvements to t... recent update to the CCT map identif... all complete... Transportation, and... reference the recent... lane options, and providing adequate parking.

Given that beaches and coastal resources are major destinations in the San Diego region, the Regional Plan should maximize access to the coast, including expanded investments in bicycle and pedestrian routes. The proposal to dedicate 55% of the anticipated $163 billion in funding over the next 30 years to capital improvements to the transit system will improve public access to and along the coast, and is supported by Commission staff, but projects that specifically facilitate access to beaches and coastal areas from the inland portions of the region should be expedited, as well as options for enhancing connections to public transit, the California Coastal Trail (CCT), the Coastal Rail Trail, and other visitor-serving recreational opportunities. Implementation of the Regional Plan would make significant improvements to the regional bike network, most notably in terms of Class I corridors and in coastal communities that will enjoy enhanced coastal access as a result of these improvements. Coastal Commission staff support these improvements as well as further network and infrastructure enhancements for active transportation, such as widened sidewalks in areas without designated bike lanes, increased funding for bicycle parking and locker facilities, and bicycle-specific signaling integration on local arterials and feeder streets.

Coastal Commission staff acknowledge and appreciate the inclusion of updated information regarding the completeness and deficiencies in the San Diego region’s portion of the California Coastal Trail in the 2021 Technical Addendum to Appendix W: California Coastal Trail. The addendum should also reference the recent work of the California Coastal Commission, California Department of Transportation, and Coastal Conservancy in developing an ArcGIS-based mapping tool that identifies all complete and incomplete segments of the Coastal Trail and classifies them according to trail type, identifies land ownership, and identifies features, such as individual stairways and pathways. The most recent update to the CCT mapping effort is outlined in the California Coastal Commission Memorandum Re: California Coastal Trail Mapping Project, April 2021. In light of these improvements to the available data and SANDAG’s identification of large portions of the CCT that are still in need of completion, a stronger emphasis on pedestrian and bicycle improvements necessary to complete the trail should be provided in Chapter 3 and a stronger and more specific funding commitment for the CCT should be provided in Appendix A: “Transportation Projects, Programs, and Phasing.” Specifically, a portion of the funding identified for “Local Streets and Roads” (9% of the Regional Plan expenditures) should be allocated to funding the completion of the CCT.

Further, Commission staff encourage the integration of data related to weekend peak traffic in the planning phase of projects with potential impacts to congestion on major coastal access corridors used to access weekend recreation, such as Interstate 8, Interstate 5, and Pacific Coast Highway. Commission staff encourage SANDAG to implement enhanced transit alternatives where weekend coastal access will be significantly affected.

Environmentally Sensitive Habitat Areas and Marine Resources
Coastal Commission staff suggest that the Regional Plan include specific reference to Coastal Act Chapter 3 policies requiring the preservation of coastal resources, as well as specific language concerning the importance of protecting and restoring the region’s urban canyons, coastlines, beaches, and water resources. Transportation corridors within the San Diego region bisect or are located directly
adjacent to sensitive marine resources including coastal bluffs, streams, lagoons, and the Pacific Ocean. Many of these coastal systems have already been impacted by historical transportation infrastructure development and additional impacts to these resources are restricted by Coastal Act policies. Except for certain specific instances, fill of a wetland or other coastal waters is prohibited (Section 30233), and the marine resources (Section 30230), water quality (Section 30231), and environmentally sensitive habitat areas (Section 30240) often associated with the coastal environment are also protected.

**Planning for Climate Change and Sea Level Rise**

In addition to requiring new development to minimize VMT, Coastal Act Section 30253 requires that new development minimize risks to life and property from hazards and assure stability and structural integrity without the use of a shoreline protective device. Understanding the potential impacts of climate change and sea level rise (SLR) is of critical importance when beginning long-range planning efforts and evaluating projects that may be at risk from coastal hazards. Given the proximity of key regional infrastructure to the coast, it is imperative that transportation and land use plans carefully anticipate the effects of SLR and associated hazards. Ensuring that new coastal infrastructure is designed to adapt to the effects of SLR throughout the expected life of the infrastructure is a principal concern of the Coastal Commission, as clarified through the Commission’s Sea Level Rise Policy Guidance, which was most recently updated in November 2018, and through recent local government vulnerability assessments and planning efforts related to climate change. In recognition of the importance of this subject, many state directives, guidance documents, and regional planning documents have called for SLR to be included in planning processes.

- **Safeguarding California** (2018), the state’s climate adaptation strategy, recognizes that “Climate change impacts from SLR to storm surge and coastal erosion are imminent threats to highways, roads, bridge supports, airports at or near sea level, seaports, and some transit system and rail lines” (page 118) and calls for vulnerability assessments and adaptation planning at various scales.

- The State Ocean Protection Council (OPC) stated in its 2018 Sea Level Rise Guidance document that “California has an immediate opportunity to make smart, informed, and risk-based decisions that prepare our coastal and inland communities for change while ingrain sustainability, longevity, and resiliency into our planning, permitting, investment, development, transportation, and recreational decisions.” The document provides guidance and guiding principles for SLR planning work. Although the Regional Plan references the potential for 2.5 ft of SLR by 2050 and 6.6 ft of SLR by 2100, OPC’s guidance recommends, and Commission staff agrees, that the H++ scenario should be considered for projects with a lifespan beyond 2050 that have a low tolerance for risk, such as major infrastructure investments, and that could result in threats to public health and safety, natural resources and critical infrastructure, should extreme sea-level rise occur. By 2100, the H++ scenario is 10.2 ft of SLR.

- The California Transportation Plan 2050 calls for sea level rise adaptation planning, notably stating that: “As our population grows to nearly 45 million by 2050, providing high-quality infrastructure also means adapting assets to accommodate changing demand, and leveling the playing field for active transportation, rail, transit, and shared modes. Our infrastructure must also be resilient to the impacts of earthquakes, extreme temperatures, fires, sea level rise, and pandemics” (page 79). It includes a recommendation: “The CTP 2050 calls for expanded
funding for implementing state, local, and regional climate mitigation and adaptation plans, such as the Caltrans District Vulnerability Assessments; increasing multi-jurisdictional collaboration on resiliency and adaptation efforts; creating a statewide transportation risk management plan; and increasing access to data, technical tools, and information sharing to make communities stronger and more resilient to future disruptions” (page 112).

- The 2018 California State Rail Plan calls for similar implementation efforts, noting that “Coastal rail corridors are commonly the first, or second, line of development adjacent to the sea, particularly in central and southern California. If reactive, emergency-based hard-armoring measures are constructed to protect corridors in place, beach loss may result. Thoughtful, long-term adaptation planning for sea-level rise is necessary to identify alternatives, including relocation of corridors where opportunities do so exist, that would protect transportation corridors as well as California’s popular beaches and other coastal resources” (page 224). The Plan highlights segments of rail in San Diego, including along the Del Mar bluffs, which are at risk from sea level rise.

- Finally, Caltrans highlighted the importance of planning for sea level rise in its 2017 Regional Transportation Plan Guidelines for Metropolitan Planning Organizations.

The Regional Plan should include increased funding to adapt and/or relocate existing transportation infrastructure known to be vulnerable to climate change and sea level rise (e.g., Pacific Coast Highway and the rail corridor along Del Mar bluffs). New infrastructure proposed to be funded should be analyzed not only for vulnerability to H++ projections of SLR over the expected life of the proposed project, but also tidal and fluvial hydraulics as applied to the local area and in the context of storm surge, wave run-up, erosion, and other variables. Projects which reduce vulnerability to climate change and sea level rise (e.g., active transportation projects and relocation of the rail corridor from coastal bluffs) should be prioritized and expedited.

**Environmental Justice and Social Equity**

The Coastal Act was also recently amended to add Environmental Justice as a policy to be analyzed in our regulatory work, and to add a designated Environmental Justice commissioner on the Coastal Commission. Accordingly, although we applaud the Regional Plan’s focus on equity and recognize the need to generate revenue for implementation, Commission staff urge SANDAG to carefully analyze the equity implications of the Regional Pricing Strategy, including ensuring that dynamic tolling on managed lanes, parking and curb pricing, and road user charges do not regressively impact low-income community members who may not be able to afford to live in transit-oriented neighborhoods.

Further, the Regional Plan should utilize access to coastal recreation as a metric with which to measure the efficacy of its Environmental Justice programs. This should be accomplished by comparing travel times to coastal resources (e.g., the nearest usable beach) in communities of concern to travel times in other nearby communities. Transit programs should be designed to reduce these travel times and close gaps between communities to achieve equitable coastal access across the San Diego region, consistent with Coastal Act Section 30252.

**Railroad Corridor at Del Mar Bluffs**

Previous Regional Transportation Plans and the North Coast Corridor Public Works Plan / Transportation and Resource Enhancement Program (NCC PWP/TREP) have referenced the need for
relocation of the rail corridor that passes along the Del Mar bluffs to an inland alignment. Erosion due to wave action currently threatens the toe of the Del Mar bluffs and the stability of the railroad tracks at the top of the bluffs. Given that this segment of the LOSSAN rail corridor is already experiencing periodic bluff failures, which will only be exacerbated as sea level rise continues, Coastal Commission staff support relocation of the rail corridor and completion of double tracking as quickly as possible. The Coastal Commission has authorized a series of improvements to existing shoreline protection devices in Del Mar to maintain continued rail operations, including the most recent Consistency Certification No. CC-0004-18 in February 2019 and CC-0001-20 in August 2020; however, these projects are intended to serve as interim measures only. Although these types of repair and maintenance projects may be necessary in the short-term, they should not delay the planning efforts associated with a long-term solution, including identifying a preferred tunnel alignment and allocating funding to initiate environmental review of the rail corridor relocation project. If we continue to rely on reactive, hard-armingoring measures to protect the rail corridor in place, we will lose our coastal beaches in the face of anticipated sea level rise at Del Mar and elsewhere. Therefore, Coastal Commission staff request that the Del Mar tunnel project be prioritized further by being moved to the five-year capital project list. This would allow double tracking to occur sooner, improving coastal access by sustainable modes of transportation while protecting the Del Mar bluffs, a vital visual and habitat resource for the San Diego region.

**Enhanced Rail Service and the California State Rail Plan**

The Coastal Commission has previously approved transportation projects and programs that balance roadway expansion with the provision of transportation alternatives including railway enhancements, bicycle corridors, and pedestrian accessways (e.g., the North Coast Corridor Public Works Plan/Transportation and Resource Enhancement Program). In actions throughout California, the Coastal Commission has found that projects supporting alternative modes of transportation, particularly enhanced rail service, are consistent with Coastal Act policies requiring maximum public access and a reduction in VMT (Coastal Act Sections 30210 and 30253). The Regional Plan proposes funding for high-frequency transit services that incorporate new transit modes and improve existing services. Commission staff supports the vision for vastly improved regional and inter-regional bus and rail corridors, which will offer alternatives to driving and alternatives to roadway expansion in environmentally sensitive areas.

The California State Transportation Agency’s Transit and Intercity Rail Capital Program (TIRCP) (2015) emphasizes the objective of “Expand[ing] and improv[ing] transit service to increase ridership.” In 2020, the TIRCP allocated over $38 million to capital improvements to the LOSSAN corridor, including new maintenance facilities that will allow for longer trains and more frequent and reliable service on the corridor. The Draft 2018 California State Rail Plan website states: “Californians collectively take billions of trips to millions of destinations each year, and the state needs quality modal choices among cars, transit, air travel, and active transportation to efficiently move people and freight to their destinations.” Coastal Commission staff support the expansion of San Diego’s commuter rail network and the double tracking of the LOSSAN corridor funded by the Regional Plan, in addition to other infrastructure improvements that encourage faster and more frequent intercity and intracity rail service such as those identified in the TIRCP.

**Central Mobility Hub**

In previous comment letters, Coastal Commission staff have expressed support for the development of an intermodal transit station along the existing rail corridor to provide visitors with direct connections
to Amtrak, COASTER, Trolley, bus services, and the southern terminus for the proposed high-speed train service. The acquisition of land for the Central Mobility Hub and the completion of the automated people mover airport connection in 2035 (Pages A-17 and A-18, Appendix A) will significantly improve alternative access to the airport, thereby reducing the anticipated traffic impacts associated with redevelopment of Terminal 1 on North Harbor Drive, a major coastal accessway. Please note that Coastal Commission staff request to be included in future planning efforts related to the Central Mobility Hub, as well as the associated transportation infrastructure projects (e.g., automated people mover).

**Pacific Beach Trolley Extension and Streetcar**

Finally, the 2019 Draft Federal Regional Transportation Plan identified a trolley extension from Pacific Beach to the El Cajon Transit Center and a streetcar from Mission Beach to La Jolla via Pacific Beach slated for completion by 2050 (Table A.2, Appendix A). Neither of these projects is identified in the 2021 Draft Regional Plan. The popular beach community of Pacific Beach is already heavily impacted by parking and traffic congestion, which will be exacerbated in the future by redevelopment with increased density and the elimination of parking requirements by the City of San Diego for certain developments located near transit. Coastal Commission staff request the re-inclusion of these projects in the Regional Plan, as the transportation improvements identified for Pacific Beach in the 2021 Regional Plan leave large portions of the community without robust alternatives to single-occupant vehicle travel and increasingly strained access to parking, inconsistent with Sections 30212 and 30212.5 of the Coastal Act.

In general, Coastal Commission staff support improvements to transit alternatives that provide access to coastal areas and recreation. Significant gaps in the regional bus network improvements laid out in the Regional Plan exist in the coastal communities of Encinitas, Solana Beach, La Jolla, Pacific Beach, Mission Beach, and Ocean Beach, whereas other coastal communities are slated to enjoy more robust transit improvements. As such, Coastal Commission staff encourage SANDAG to analyze and prioritize transit improvements that improve coastal access in these communities, and particularly improvements that provide these communities with meaningful alternatives to single-occupant vehicles to access the nearby beaches and recreational areas.

Thank you again for the commitment to a bold new transportation vision for the 2021 Draft Regional Plan and for your ongoing work on other elements of San Diego Forward. We look forward to future collaboration and improvements to the transportation system in the San Diego region. If you have questions or ideas for collaboration, please do not hesitate to contact me at the Coastal Commission’s San Diego Coast District office.

Sincerely,

Trevor Hill

Office of State Planning, Equity and Engagement

Subject: SAN DIEGO FORWARD DRAFT 2021 REGIONAL TRANSPORTATION PLAN (RTP) AND SUSTAINABLE COMMUNITIES STRATEGY (SCS)

Thank you for the opportunity to review and provide comments on the 2021 Regional Plan/ Sustainable Communities Strategy. OSPEE would like to offer the following comments for your consideration:

“A Bold New Vision for the 2021 Regional Plan”:

- With development concentrated at the coastal region, has the scientists’ estimates of a 2.5 sea level rise been taken into account for development in this area? (pdf page 9)
- There was a brief mention of the California Transportation Plan 2050 (CTP 2050) in the bulleted list on Page 14. As the State of California’s transportation roadmap, it might be pertinent to demonstrate with a few sentences as to how the 2021 Regional Plan meets or aligns with the CTP 2050’s Recommendations on Page 6 of the Executive Summary of the CTP 2050 document. Here is language that could be potentially used:
  - Senate Bill 391 (SB 391, 2009) required the California Department of Transportation to prepare the California Transportation Plan (CTP), a statewide to reduce GHG emissions. This system laid out in the CTP 2050 showed reductions in GHG emissions to 1990 levels from current levels by 2020, and 80 percent below the 1990 levels by 2050 as described by AB 32 and Executive Order S-03-05. The CTP 2050 demonstrates how major metropolitan areas, rural areas, and state agencies can coordinate planning efforts to achieve critical statewide goals. SANDAG will work to align with the goals, policies, strategies, and recommendations laid out in the CTP 2050 where applicable.
- Pages 14 and 15 feel a bit out of place and seems like it would be better places after the Table of Contents that is present in the “Forward” section, rather than being right before Chapter 2. The chapter list of Page 15 is essentially the same as the Table of Contents so keeping the nice graphics with the same overview/summary would be good, while having the actual TOC have subsections within the chapters listed, with their corresponding pages as well (5 Big Moves, etc).

Sustainable Communities Strategy:

- It may be beneficial to mention how these goals will contribute to California’s overall State goal of reducing GHGs, with a mention of AB 32’s goal of lowering statewide GHG emissions 80%
below 1990 levels by 2050 as well as SB 32’s mid-point goal of lowering statewide GHG emissions 40% below 1990 levels by 2030. Disregard if this was mentioned but overlooked by the reviewer.

General Comments:

• On Page 44: "The 2015 update of the regional plan was projected to cost $130 billion in 2020 dollars. The 2021 Regional Plan is projected to cost $163 billion. Why the higher cost? As we have detailed in Chapters 1 and 2, the 2021, the Regional Plan completely reimagines our transportation system—". While the 2015 may also be assumed to have taken bold steps to reimagine the transportation system, it might be ideal to refer to the appropriate technical Appendix as to why a newer, updated approach is costing $33 billion more six years later.
• Overall a very good and thorough plan, would just mention of alignment with the CTP 2050.
August 6, 2021

Mr. Hasan Ikhrata
Executive Director
San Diego Association of Governments
401 B Street, Suite 800
San Diego, CA 92191

Dear Mr. Ikhrata:

The California Department of Transportation (Caltrans) appreciates the opportunity to review the San Diego Association of Governments (SANDAG) San Diego Forward: The 2021 Regional Plan including its Sustainable Communities Strategy (SCS) and air quality conformity analysis.

The 2021 Regional Plan presents a data-driven, bold vision that will redefine how people and goods move around the San Diego region. Caltrans, as the owner and operator of the State Highway System, will work in coordination with SANDAG to deliver a world class transportation network that serves all people and respects the environment. It is our seamless partnership that continues to make the region competitive for federal and state funding.

The 2021 Regional Plan will help our region and our state achieve shared goals to provide mobility choices that advance equity and reduce pollution, boost our economy, and make our transportation system accessible for all. SANDAG and Caltrans are currently developing Comprehensive Multimodal Corridor Plans that with input from the public, will further identify and evaluate projects and strategies within transportation corridors defined in the 2021 Regional Plan. Additional refinements to individual corridor project scopes, costs and schedules will be made as these projects are studied under CEQA and NEPA, including any legislative changes needed for the implementation of those projects.

To receive federal transportation funds, SANDAG is required by federal and state law to develop a comprehensive, 20+ year vision of a balanced, multimodal transportation system. A regional plan must be updated at least every four years and allows the region to confirm the transportation plan’s validity and consistency with current and forecasted transportation and land use conditions and trends.

"Provide a safe and reliable transportation network that serves all people and respects the environment"
Caltrans has reviewed the 2021 Regional Plan and found that it has fulfilled all the requirements of the Caltrans 2017 Regional Transportation Plan Guidelines for Metropolitan Planning Organizations pursuant to California Government Code Section 14522. Caltrans offers the following comments:

Climate Action and the Multimodal Network topics
Transportation is the largest source of greenhouse gas (GHG) emissions in the San Diego region; in 2016, on-road light-duty vehicles accounted for 41% of emissions. One strategy to reduce emissions is to reduce Vehicle Miles Traveled (VMT). The Regional Housing Needs Allocation Plan informed development of the SCS land use pattern, and the region’s major employment centers and urban core mobility hubs are expected to take on the most housing and job growth in the region over the next 30 years. It is anticipated this development pattern will support VMT reduction from light-duty vehicles by balancing the ratio of jobs to housing land uses. Additionally, the 2021 Regional Plan proposes expansion of the regional transit network such that thirty-minute transit access from mobility hubs to Tier 1 employment centers increases from 13% to 28% for communities of color and increases from 16% to 33% for residents with low incomes by 2050. This improvement will provide important access to economic opportunities to these communities while incentivizing mode shift.

Caltrans supports SANDAG’s embrace of new and improved mobility management strategies such as developing a smart intersection system, a comprehensive system to manage cross-border trips, and real-time traffic management solutions (including dynamic truck parking) to manage many modes of transportation, including freight movement.

We encourage SANDAG to continue efforts on a recently funded grant to develop a Sustainable Freight Implementation Strategy. This work will help the region execute a road map for a more efficient, economically competitive, and sustainable freight transportation system, establish a framework to transition to a clean freight system, reduce pollution exposure to environmental justice communities, and help implement state sustainable freight efforts such as the California Sustainable Freight Action Plan, the California Freight Mobility Plan, Governor Gavin Newsom's "Zero-Emission by 2035" Executive Order (N-79-20), and Assembly Bill 617 (C. Garcia, 2017) Community Emission Reduction Program.

Caltrans supports consideration and the development of new mechanisms for viable VMT mitigation options for highway capacity projects, such as exploring statewide and regional VMT mitigation bank concepts and evaluating feasibility and exploring potential expansion of an Advanced Mitigation Program to include GHG/VMT mitigation.

“Provide a safe and reliable transportation network that serves all people and respects the environment”
As the 2021 Regional Plan looks to develop performance measures, analyze, and address congestion, please consider presenting data about how travel, delay, and transit use will evolve with the implementation of the plan.

**Equity and Livability topics**

Caltrans is encouraged by the investments outlined in SANDAG’s Supporting Policies and Programs. These investments will support programs that complement the capital and operational investments of the transportation system, encourage sustainable growth and development, and implement innovative demand strategies. Please consider inclusion of a program for Highways to Boulevards Conversion or freeway cap/lid/decks to create new park space, housing, or community amenities to help restore and revitalize communities. Proposed locations will be discussed and determined in the future.

Please consider including in the listing of transportation projects, programs, and phasing the San Diego-Coronado Bridge Suicide Prevention Barrier Project. The Coronado Bridge has the highest concentration of death by suicide for a spot location on the state highway system. Without mention in the regional plan, the project may not be able to compete for state or federal funding.

The 2021 Regional Plan illustrates that in addition to Major Corridors, there are several rural corridors primarily in the eastern two-thirds of the region that provide access and connectivity for rural towns and lands to the interstate system. These roadways are to be improved with a focus on safety through shoulder widening, curve straightening, and technology features, such as active transportation and demand management and smart intersections.

Caltrans recognizes the rural areas of our region play a vital role in California’s economy. Rural communities are often also the gateway to the state’s preserved landscapes that are central to supporting California’s tourism industry. Yet, rural communities are already experiencing the impacts of a changing climate— from unprecedented storms to devastating wildfires. While transportation goals are inherently and fundamentally the same no matter the context— to provide safe access to destinations for people and goods - unique local and regional conditions require tailored solutions to advance these goals, and solutions may look different in varying local contexts.

Please consider including additional examples of sustainable transportation solutions that could be applied in rural settings, understanding that these efforts will require collaboration with the local and Tribal governments that serve the locations, such as:

“Provide a safe and reliable transportation network that serves all people and respects the environment”
• Increasing transit service in a corridor through investments in bus service, vanpools, micro-transit or mobility on demand services, and park-and-ride facilities.
• Roadside land management activities related to wildfire.
• Addressing safety through the multidisciplinary Safe System Approach that employ tools for speed management, such as road diets, conversion of intersections to roundabouts, and signal coordination to slow speeds.
• Improving efforts on coordination for broadband access in transportation and growth, remote work/VMT reduction, economic development, and regional housing strategies. Broadband access remains a critical issue in rural communities and with many Tribal nations.
• Adding and improving connected facilities for walking and bicycling and for first/last-mile connections to local, interregional, and regional transit routes. Rural cores should support walking and biking on commercial corridors and main streets.
• Prioritizing connections to natural areas; Tribal communities may desire access to ceremonial sites outside of the rural core.
• Facilitating emergency evacuations through efficient traffic management strategies, such as the use of contra flow, use of two-way left turn lanes as through travel lanes, construction of full structural sections of shoulders and installation of transportation management systems (TMS) elements, such as closed circuit television (CCTV) cameras, changeable message signs (CMS), and traffic detection equipment.
• Deploying zero-emission vehicle charging or fueling infrastructure —including for battery electric, fuel cell (hydrogen) electric, and other zero-emission vehicle technologies.

Caltrans thanks SANDAG for its leadership and the vision laid out in 2021 Regional Plan. We look forward to working side-by-side in making the San Diego region a place for residents, visitors, and businesses to thrive.

Sincerely,

Ann M. Fox

ANN M. FOX

San Diego, CA 92101

Comments of the Center for Sustainable Energy® regarding SANDAG’s Draft 2021 Regional Plan

The Center for Sustainable Energy® (CSE; www.energycenter.org) is pleased to provide comments regarding SANDAG’s Draft 2021 Regional Plan. CSE commends SANDAG’s efforts in developing a comprehensive and holistic vision for the future of transportation in the San Diego region. CSE encourages SANDAG to adopt the Regional Plan and continue collaborating with regional entities to implement clean technology programs that encourage electrification, prioritize equity, and enhance climate action planning.

CSE is a 25-year-old national nonprofit with a single word mission: Decarbonize. We provide program administration, technical assistance, and policy advisement services to a diverse set of stakeholders across the clean energy and transportation sector. As a nonprofit without members or donors, CSE serves as a trusted resource helping government agencies implement successful technology programs that use funds in the best interest of consumers, ratepayers, and the general public.

CSE provides these comments based on our experience designing, implementing, and evaluating statewide electric vehicle (EV) and EV infrastructure incentive programs across multiple jurisdictions. In the San Diego region, CSE is pleased to work with SANDAG on the administration of numerous programs, including the San Diego County Incentive Project under the California Electric Vehicle Infrastructure Project (CALeVIP).

In response to the Draft 2021 Regional Plan, CSE offers the following recommendations:

• Leverage the Mobility Hubs concept to showcase clean energy and transportation technologies;
• Continue to support regional coordination through SANDAG’s Energy Working Group and Regional Plan Social Equity Working Group by sharing best practices regarding climate action planning, operationalizing equity, and emergency planning; and
• Ensure that the Next OS platform includes data on EV infrastructure availability and transportation emissions impacts and compiles platform insights onto public-facing dashboards.

CSE’s recommendations are discussed in detail below.
Leverage the Mobility Hubs concept to showcase clean energy and transportation technologies

CSE supports SANDAG’s proposed Mobility Hubs concept to provide integrated transportation solutions. CSE recommends that SANDAG utilize these Mobility Hubs to showcase a variety of clean energy and transportation technologies. Specifically, Mobility Hubs could raise awareness of zero-emission transportation alternatives, including EVs and zero-emission buses. Additionally, the mere presence of visible public charging infrastructure can influence consumers’ willingness to pay for an EV by up to $5,000.1 CSE also recommends that additional clean energy technologies be integrated into the Mobility Hubs. For example, EV chargers could be coupled with solar panels and battery storage systems to provide greater utilization of clean electricity. To expand this concept even further, CSE encourages SANDAG to consider deploying microgrids in conjunction with Mobility Hubs. Microgrids can further integrate these technologies to provide additional emissions reductions, while also managing grid impacts and providing resiliency benefits during extreme weather events. Through islanding capabilities, microgrids would enable Mobility Hubs to continue to charge electric fleets during electric grid outages, further alleviating consumers’ concerns about all-electric transportation options.

Continue to support regional coordination through SANDAG’s Energy Working Group and Regional Plan Social Equity Working Group by sharing best practices regarding climate action planning, operationalizing equity, and emergency planning

CSE is pleased to participate in SANDAG’s Energy Working Group (EWG) and strongly supports the EWG’s role in coordinating regional climate action planning, particularly through the use of analytical tools such as the Regional Climate Action Planning Framework (ReCAP).2 CSE encourages SANDAG to continue this work by periodically sharing best practices on climate action planning. For example, CSE suggests that the release of the ReCAP Snapshots be accompanied by targeted policy recommendations for local jurisdictions. Additionally, the EWG is an effective venue for sharing best practices on local climate equity planning initiatives, such as the Climate Equity Index reports prepared by the Cities of San Diego3 and Chula Vista,4 and applying these “lessons learned” on a broader regional scale. CSE also recommends SANDAG engage its Regional Plan Social Equity Working Group (WG) to gather feedback and recommendations on how to operationalize equity throughout the agency, using the Regional Plan as a starting point. Lastly, CSE recommends that the EWG and the Social Equity WG seek to collaborate with emergency planning and land use officials from state, regional, and local agencies, who are often not involved in conventional climate action planning activities. This type of information-sharing and collaborative planning across agencies and departments will be critical to mitigate the impacts of extreme weather events including heat

---

waves, wildfires, and droughts, which are expected to continue to increase in frequency and severity.

**Ensure that the Next OS platform includes data on EV infrastructure availability and transportation emissions impacts and compiles platform insights onto public-facing dashboards**

CSE supports the development of SANDAG’s proposed Next OS platform to incorporate transportation data and streamline individuals’ travel patterns. CSE offers a number of recommendations to integrate EVs into this platform and facilitate better understanding of travel behavior and associated emissions impacts.

First, CSE recommends that SANDAG include data on EV infrastructure locations and availability in the Next OS platform. Lack of access to EV charging is often cited as one of the largest barriers preventing consumers from purchasing EVs. Even EV owners often experience difficulty finding a public EV charger given the number of EV service providers (EVSPs) with proprietary software applications. Additionally, CSE encourages SANDAG to consider integrating information regarding EV charger availability to prevent queues from developing at these sites. While some EVSPs have added waitlist functionalities into their software, there is no uniform approach to addressing this challenge. By integrating these factors into the Next OS platform, SANDAG can support current and prospective EV owners and further promote electrified transportation.

Second, CSE recommends incorporating greenhouse gas (GHG) emissions data into the Next OS platform in order to provide individuals with information regarding the estimated emissions intensity of various transportation modes. For example, an individual could use the Next OS platform to choose between taking transit or requesting ride-hailing services, considering the emissions associated with each mode and making their decision based off of this information. Similarly, the platform could compare the emissions intensity of various options within a specified mode of travel. For example, an individual choosing to use ride-hailing services could assess the emissions impacts of single-occupancy vehicle trips versus pooled trips or the difference between rides in an EV versus in an internal combustion engine vehicle. This functionality could increase public awareness of emissions impacts and encourage greater utilization of clean transportation options.

Third, CSE recommends that the key analytical insights obtained through the Next OS platform be compiled and highlighted on public dashboards, either on the platform itself or on SANDAG’s website. By its nature, the Next OS platform will collect significant levels of data on individual travel patterns and preferences. Analyzing this data will yield key insights that can further inform regional planning and policymaking. Additionally, highlighting these insights through dashboards and visualizations, and thereby making this data accessible and understandable to the general public, will also enable individuals to better understand their transportation options and impacts. These dashboards should be made available in multiple languages and should be updated at regular intervals.

Conclusion

CSE appreciates the opportunity to provide these comments in support of SANDAG’s Draft 2021 Regional Plan. We look forward to continued collaboration with SANDAG and other stakeholders in advancing clean transportation and emission reduction goals within the San Diego region.

Sincerely,

Re: Support incorporating Reconnect Logan, 5 Freeway Lid Project in the San Diego Association of Governments’ (SANDAG) 2021 Regional Plan

Dear Mr. Ikharata,

My name is Josephine S. Talamantez and my family have been Logan Heights residents since 1906 and the CPMCC have been in the area for 6 years. I am writing to express my support for the incorporation of a project which goal is to address social and economic inequity, rising levels of health concerns aggravated by greenhouse gas emissions, and transportation injustices in San Diego’s Barrio Logan and Logan Heights communities. Specifically, we request the addition of a Freeway Lid as a priority project as identified in SANDAG’s 2021 Draft Regional Plan (Draft Plan)

Our once united community was devastated by Interstate 5 which forcibly displaced hundreds in the 1950’s and has burdened those who remained. Pursuant to Chapter 1: Equity Focus (p. 11) of Draft Plan, we know ReConnect Logan Freeway Lid will transform and reconnect our community. A freeway lid can help our community by dismantling the barriers that the I-5 created by bringing the community together, addressing health concerns by capturing GHG emissions, creating non-existing green spaces, and allowing for development of affordable housing. All goals in line with the Draft Plan of creating efficient movement of people and goods, providing affordable, reliable, and safety mobility options, and allowing for healthier air.

As mentioned, the construction of the I-5 forced many families to be displaced, and while the construction allowed for transportation advancements, since the 1950’s our community has been subject to inequality, misrepresentation, and systemic injustices in transportation and racism, to mention a few. We continue to be a working-class neighborhood composed of nearly 90% Mexican Americans, and while we are proud of our heritage and activism deeply rooted in our National Landmark of Chicano Park, the reality is that I-5 has created much insecurity by facilitating gang turfs, separating families from places of worship, and limiting children’s access to neighborhood schools. It is time for our community to heal — a freeway lid is the answer.

Given the significant investment and planning of projects in the Barrio Logan/Logan Heights communities in the Draft Plan as identified in Appendix A: Transportation Projects, Programs, and Phasing, it is appropriate to identify and call out ReConnect Logan Freeway Lid as a project on this list. A few of the multiple projects that will impact Barrio Logan/Logan Heights are:

- The creation of Managed Lanes on Interstate 5, Project ID CC002 Complete Corridor: ML/Goods Movement (p. A-8)
• Additional cargo due to the Harbor Drive 2.0 proposal that will facilitate cargo in the community of Barrio Logan, Project ID GM06 Goods Movement: Roadways (p. A-11)

• Harbor Drive Corridor, project ID GM05 2050 Goods Movement: Roadways Harbor Drive Multimodal Corridor Improvements that will facilitate Trucks for the Port of San Diego (p. A-12)

Besides being in line with the 2021 Draft Regional Plan, ReConnect Logan Freeway Lid is also pursuant to Appendix H in relation to California Assembly Bill 805 which requires the reduction of pollution exposure in disadvantaged communities. Furthermore, our project is also pursuant to the Sustainable Communities Strategy per California SB 375 since it would help reach the overall goal of reducing GHG emissions of 15% (p. 18 of Draft Plan), as well as allowing for accommodation to the Regional Housing Needs Assessment Determination. For all these reasons, our community is looking forward to **the addition of a Freeway Lid as a priority project as identified in SANDAG’s 2021 Draft Regional Plan.**

If you have any questions, you may contact me at jstalamantez@gmail.com.

Sincerely,

Josephine S. Talamantez  
Board Chair

San Diego, Ca. 92170
July 21, 2021

Supervisor Nora Vargas,
Chair, Transportation Committee
SANDAG
401 B Street, Suite 800
San Diego, CA 92101

Dear Transportation Committee Chair Nora E. Vargas,

Chollas Creek Coalition requests SANDAG include Chollas Creek Regional Park active transportation and recreational facilities in the 2021 update of the San Diego Forward Regional Transportation Plan (RTP).

Environmental Justice communities located along the Chollas Creek Watershed have been historically under-invested in and residents are predominantly lower-income people of color with higher-rates of health issues resulting from over-pollution and inequitable access to economic opportunity. These communities bisected by freeways do not have safe mobility connections for people to get around without a car.

The future Chollas Creek Regional Park included in the 2021 draft of the City of San Diego’s Parks Master Plan has approximately 8 miles of parks, trails, recreational amenities, trees, bikeways and stormwater infrastructure improvements along the north and south forks of the Chollas Creek in need of planning and funding. This trail system once completed would connect City Heights, Southeast San Diego and the communities in between all the way to Barrio Logan and the employment centers along the San Diego Bay.

SANDAG has a once in generation opportunity to make a meaningful investment in the many communities along the Chollas Creek by including the Chollas Creek Regional Park and associated bikeway projects in the RTP. These critical active transportation connections to improve community health, resiliency to climate change and link housing to jobs are many decades over-due. We urge SANDAG to invest in the project to advance equity, climate justice and a historic win for communities who have been ignored for far too long.

Regards,

Chollas Creek Coalition

August 4th, 2021

Dear SANDAG Board & Staff,

We appreciate your efforts to facilitate opportunities for community engagement through the 2021 Regional Plan by hosting open house forums, public hearings, and online public comment. The City Heights Built Environment Team is a community group who wants to see a dignified, equitable, efficient and affordable transportation system in our region.

These are the top priorities our group has identified and would like to see implemented in the 2021 Regional Plan:

- Greater transit frequencies (7 min on peak, and 10 mins all day) in Transit Priority Areas; Collaborate with the Built Environment Team on a Pilot Program to identify and test high ridership routes in City Heights
- Late night and weekend service improvements with 24-hour service on major routes
- Supporting the Purple Line alignment through central City Heights
- Bikeways on major corridors with implementation of Early Action Projects in Mid-City by 2023
- Implementing traffic-calming measures including but not limited to: protected bike lanes, roundabouts, raised crossings to improve to ensure a safer biking experience
- Planting more trees throughout City Heights to foster a healthier urban environment
- Ensuring Youth Opportunity Passes for those aged 24 and under by 2023
- Oppose freeway expansions in City Heights that increase Vehicle Miles Traveled while supporting general purpose lane conversions that prioritize transit
- Improve multimodal beach access for urban-core communities
- Plan and implement Bus Rapid Transit Route 550 on 54th St. to be phased for 2025
- Improve and exceed State of California standards for GHG reduction goals
- Maintain transparency with community members by sharing relevant data and progress updates surrounding project phasing, implementation, and funding

We believe these priorities will help build a dignified, equitable, and affordable transportation system in our region.

Sincerely,

RE: City of Carlsbad Comments on Draft 2021 Regional Plan

To whom it may concern,

This letter serves to inform SANDAG that the City does not wish to remove project CB32 from the Regional Arterials Project list.

Please disregard the comment regarding project CB32 from the attached letter sent to SANDAG on Aug. 6, 2021.

Thank you for bringing this to our attention, and please contact me if you have any other questions regarding the 2021 Regional Plan comment letter.

Best Regards,

Tom Frank, PE
Transportation Director/City Engineer

RE: City of Carlsbad Comments on Draft 2021 Regional Plan

To Whom it May Concern,

The City of Carlsbad appreciates the opportunity to provide comments on the draft 2021 Regional Plan ("Plan"). This is an important plan for this region and will guide the next phase of growth for the member agencies of the San Diego Association of Governments ("SANDAG"). An effectively designed and implemented regional transportation plan would help ensure improved transportation options for area residents, businesses and other community members; meaningful reductions in greenhouse gas ("GHG") emissions; and improved quality of life as we grow our communities.

The City of Carlsbad ("city") is submitting comments based on the policies, projects, programs and other improvements included in the Plan. Our agency’s comment letter is divided into two sections. The first section seeks clarity and other considerations that pertain to our agency’s review of the Plan. The second section identifies the city’s preliminary comments and recommendations.

Implementing the regional transportation network outlined in the Plan requires municipalities to support the regional vision and deliver on local infrastructure and services like the priority bus routes, local bus services, and pedestrian and cycling connections to major transit infrastructure. These components, which are delivered by municipalities, are essential to creating a coherent and comprehensive local transportation network that feeds into regional services. For that reason, an effective public review of the Plan should involve a transparent and thorough process for identifying and evaluating potential hazards, physical changes to the environment and indirect (off-site and cumulative) impacts that might result from implementation activities that may reasonably occur with the Plan.

The city’s residents, businesses and other community members will greatly benefit from the involvement and technical assistance from the prospective Draft Environmental Impact Report ("EIR"). Therefore, what follows in this correspondence represents our agency’s preliminary comments and recommendations. The city reserves the right to add, amend, change or replace comments and recommendations based on additional review and understanding of the Plan and the environmental analysis provided under the California Environmental Quality Act ("CEQA").

The city thanks SANDAG staff for meeting with city staff on Aug. 2, 2021, to discuss some of these comments in advance of this letter. Following that meeting, SANDAG provided language that they may recommend adding to the Regional Plan for additional clarification on land use authority. The language is, “Land use authority is reserved to local jurisdictions because they are best positioned to effectively implement the objectives outlined in the Plan through understanding of the unique needs of their communities and geographies.” This language will be helpful to clarify that land use authority rests with...
City of Carlsbad Comments on Draft 2021 Regional Plan
Aug. 6, 2021
Page 2

the local jurisdiction. The city still offers the following comments with the intent to support development of a defensible and realistic regional plan.

SECTION 1: CLARITY AND OTHER CONSIDERATIONS

City staff have attended the series of workshops that SANDAG hosted during the public review period, and respectfully starts this section with several questions related to the process of the Plan and the Draft EIR. By way of introduction, a jurisdiction’s General Plan, such as the city’s General Plan, identifies the expected population of the city and any lands outside of the city limits but within their Sphere of Influence where future growth is anticipated to occur. The city’s General Plan identifies the subject area adjacent to the McClellan-Palomar Airport for development under the designation for limited and light industrial use.

For future land use planning, land use assumptions must reasonably proxy and be generally consistent with local planning standards and programs, to be considered growth accommodating rather than growth inducing. SANDAG has the authority under Government Code Section 65584 to determine existing and projected housing needs, as well as the share of housing needs to be allocated to cities and counties, but it is unclear if SANDAG has jurisdiction to allocate new housing growth to areas in a manner not consistent with Government Code Section 65584. Attachment 1 includes additional information on the applicable Government Code and standards. Therefore, and as indicated above, the build-out of properties within the Business Park and flight activity zone must be done in accordance with the city’s General Plan Land Use Diagram, as amended, in accordance with city approval.

The initial questions on the planning process associated with developing the Plan are provided below:

1. The SANDAG website states, “The SANDAG Sustainable Communities Strategy and Final EIR from its 2015 Regional Plan will remain valid and in compliance for purposes of state funding eligibility and other state and federal consistency purposes until the SANDAG Board of Directors adopts a new Regional Plan and EIR, provided those actions are completed by the end of December 2021.” SANDAG needs to clarify how the Draft EIR, Response to Comments and Adoption will be completed this year and what will occur if they are not completed by the end of this year. Additionally, please clarify when the Draft EIR will be available; it is difficult to completely assess the full impacts of this plan when the public review of the documents is piecemealed.
   a. SANDAG should clarify how public comments on the Plan are going to be addressed in the Draft EIR prior to its release.
   b. In the Draft EIR, SANDAG needs to clearly articulate the impacts to land use and if the Plan will cause a significant environmental impact due to a conflict with any land use plan, policy or regulation adopted for the purpose of avoiding or mitigating an environmental effect. Appendix F: Regional Growth Forecast and Sustainable Communities Strategy Land Use Pattern appears to be inconsistent with the city’s General Plan and rezone program to accommodate the Regional Housing Needs Assessment, as well as the general plans of other jurisdictions such as the cities of Coronado, Del Mar and the County of San Diego. The Draft EIR should clarify how implementation of this Plan can occur if those changes are not made.
2. The city has three mobility hubs, associated with the Employment Centers Published supporting the SANDAG Regional Plan. McClellan-Palomar Airport is the fifth largest employment center in the region, with Carlsbad State Beach and Carlsbad Village as "Tier 3 and Tier 4" employment centers. The city thanks SANDAG for providing data for analysis to determine impacts and provide for accurate comments on the Plan. Attachment 2 shows a summary of the Mobility Hubs and housing units assumed in the Series 14 Growth Forecast for the year 2050. In summary:
   a. The assumptions in the updated Series 14 Growth Forecast contain inconsistencies with the city's General Plan. The Carlsbad Palomar Major Employment Mobility Hub does include increases in density beyond what the citywide numbers appear to show when they are looked at in more detail.
      i. There are three locations in which density is shown to be inconsistent with good planning principles, the city's General Plan and the Airport Land Use Compatibility Plan. The three most problematic areas (shown in Attachment 3) are:
         1. 736 units on parcels immediately adjacent to the McClellan-Palomar Airport runway. The location of the airport within this mobility hub was shared with SANDAG staff multiple times at workshops. This is inconsistent with the regulations provided by the San Diego County Regional Airport Authority and conflicts with standard planning principles for siting housing away from hazards.
         2. 2,755 units on existing developed resort properties and open space dedicated lands adjacent to Legoland.
         3. 65 units in a preserved open space area.
      ii. SANDAG should provide additional detail why units were assumed in these areas, what planning principles those decisions were based on, and how SANDAG expects this to be implemented.
      iii. Concentration of units in the mobility hubs alone appears to conflict with the direction received from the California Department of Housing and Community Development ("HCD") to implement new Affirmatively Furthering Fair Housing ("AFFH"), which seeks to combat housing discrimination, eliminate racial bias, undo historic patterns of segregation, and lift barriers that restrict access in order to foster inclusive communities and achieve racial equity, fair housing choice and opportunity for all Californians. The allocations of land use provided by SANDAG seem to focus all the higher density housing into one area of the city. (This is one of the largest points of analysis that each jurisdiction in the region needs to respond to in order to receive a certified Housing Element.)
   b. Additionally, looking at the detailed data provided by SANDAG, it is now clear why the citywide numbers only show moderate increases in population. Our analysis has shown that there is an assumed reduction of population by 2,310 persons in the areas within the city but outside of the mobility hubs. This is likely due to assumed reductions in persons per household over time, but SANDAG should clarify the source and reasonableness of this assumption. If housing is not provided consistent with these areas, is it still reasonable to assume persons per household will be reduced in 2050?

---

3 SANDAG Website: Employment Centers SANDAG :: PROJECTS :: San Diego's Regional Planning Agency
c. Furthermore, this reduction in population is not limited to the City of Carlsbad. There is an approximately 85,000 reduction in population assumed outside of mobility hubs regionwide. SANDAG needs to address if that is a reasonable assumption and if this will result in other impacts to public and private projects that will rely on this growth forecast, and the associated Activity Based Model (2+) to project future impacts to transportation, GHG, air quality and noise.

d. The forecast has decreased in future population based on current trends, but it is not clear if there is enough housing provided with reductions and increases in some jurisdictions. Will the reduced amount of housing that will be provided result in an increased exacerbation of the affordability crisis?

e. There is a lack of clarity about how the Plan would be implemented at the municipal level. SANDAG should develop an approach for engaging with municipalities to ensure local support for delivering the regional transportation network. Staff from local jurisdiction have the knowledge and ability to share where there are land use assumptions that conflict with planning and zoning laws. Our analysis focused on the City of Carlsbad, but if these types of assumptions are made regionwide, it presents flaws in the overall analysis. These flaws put the assumed reductions in vehicle miles traveled ("VMT") and ability to implement the Regional Plan into question.

3. The area designated is controlled for use and activity density and intensity through its spatial association with the McClellan-Palomar Airport. The McClellan-Palomar Airport is defined by the Federal Aviation Administration ("FAA") as a commercial service airport that, in addition to private aircraft, has regularly scheduled commercial flights to Los Angeles International Airport ("LAX"). The McClellan-Palomar Airport Land Use Compatibility Plan ("ALUCP") is prepared according to FAA requirements and adopted by the San Diego County Regional Airport Authority acting as the Airport Land Use Commission for the County of San Diego.

   a. The ALUCP provides measures to minimize the public’s exposure to excessive noise and safety hazards within areas around the airport and identifies areas likely to be impacted by noise and flight activity created by aircraft operations at the airport. These impacted areas include the Airport Influence Area ("AIA"), the Clear Zone and the Flight Activity Zone.

   b. Within the AIA, the ALUCP establishes six safety zones for the purpose of evaluating safety compatibility of new/future land use actions. The safety zone boundaries depict relative risk of aircraft accidents occurring near the airport and are derived from general aviation aircraft accident location data and data regarding the airport’s runway configuration and airport operational procedures. The ALUCP limits development intensities in these zones by imposing floor area and lot coverage maximums, by incorporating risk reduction measures in the design and construction of buildings, and/or by restricting certain uses altogether. For example, all residential and virtually all non-residential uses are considered incompatible land uses in some zones, while considered to be either compatible or conditionally compatible with the airport in other zones. Attachment 4 shows the McClellan-Palomar Airport, noise contours and SANDAG’s proposed housing units.

   c. If the proposed SANDAG land use assumptions are endorsed, an amendment to the city’s General Plan would be required to change the land use designation to Mixed-Use Commercial or residential land uses within the existing Business Park in order to effectuate the underlying assumptions of SANDAG staff. This is not a realistic
assumption. Further, the protected airspace referenced in the AIA and the ALUCP must also be amended based on SANDAG's regional planning assumptions. (The FAA establishes airspace protection zones in the airspace above and surrounding airports in order to protect aircraft from obstructions such as buildings, towers, etc. in navigable airspace.)

d. When a General Plan is adopted or amended, the allowable growth pattern of an area is identified and the expansion or updating of the various land uses as specified in the General Plan can occur throughout the planning horizon. Without such growth considerations, the expansion or intensification of existing land uses could be considered “growth inducing.” Unplanned and uncontrolled growth may have significant adverse impacts on the environment. CEQA requires a discussion of how a "project" could increase population, employment or housing growth in surrounding areas and the impacts resulting from this growth. The CEQA Guidelines indicate that a “project” would normally have a significant effect on the environment if it would induce substantial growth or a substantial concentration of population.

4. At this point, it is not clear if SANDAG’s assumptions adequately contemplate the development patterns included in the Sustainable Communities Strategy (“SCS”) / Regional Transportation Plan (“RTP”), and Regional Air Quality Strategy (“RAQS”), local climate action planning business-as-usual estimates, sub-regional traffic modeling, or the airspace assumptions of AIA and the ALUCP.

5. The city seeks clarity on the Plan’s underlying assumptions made to justify the proposed extensive high-speed rail network considering the significant changes in travel behavior which have occurred throughout the region as a result of the COVID-19 pandemic and due to the advancements in disruptive technologies such as telecommuting, autonomous vehicles, microtransit, etc.
   a. Recent North County Transit District (“NCTD”) Coaster ridership data show riders are not returning to riding the Coaster in comparison to other modes of travel as shown in Attachment 5.
   b. This question is consistent with comments made by SANDAG’s panel expert Bob Poole regarding the impact of the COVID-19 pandemic on transit ridership and mega-transit projects. (See comments by Bob Poole during the March 12, 2021 presentation to SANDAG starting at timestamp 1:30 p.m.: https://youtu.be/q-e6bNY5J_8t=5410)

6. The city seeks clarity on why an alternatives analysis was not conducted with consideration of other transit alternatives such as automated /shared vehicle technologies and personalized zero emissions transit programs that are capable of utilizing the existing regional freeway infrastructure in response to these recent developments explained in the above comment.

7. The city seeks clarity on why the Plan does not incorporate policies to promote roundabouts over signalized intersections and include a budget line item under the Complete Corridors to fund the construction of roundabouts at new locations and to replace signalized intersections when found feasible. This clarification would support the Federal Highway Administration (“FHWA”)’s project for Accelerating Roundabout Implementation in the United States and the County of San Diego Air Pollution Control Board’s support for implementing roundabouts to address GHG and reduce fatalities.

8. The city seeks clarity on the project phasing proposed within the Plan. Specifically, the city is seeking to understand the timing of implementation of unfunded TransNet projects related to
the new projects presented within the Regional Plan. To support this, the city is requesting that SANDAG input the information requested in Table 1 (Attachment 6).

9. The city seeks specific data on the proposed 200 miles of rail service contemplated in the Plan. To support this, the city is requesting that SANDAG input the information requested in Table 3 (Attachment 7). Specific questions:
   a. Please provide more information about the scope of the high-speed rail alignments, potential vehicle technologies and their cost estimates.
   b. Will the Coaster keep the same rail alignment?
   c. What funding is programmed or planned for the Carlsbad Village railroad trench and the other projects along the current NCTD/Coaster Service right-of-way?
   d. Will some of the tracks be at grade with fencing and trains traveling at 110 miles per hour speeds?

SECTION 2: COMMENTS AND RECOMMENDATIONS

In addition to the comments on process and the Draft EIR provided above, city staff remain concerned that there is not enough detail on the feasibility of implementation of this significant shift in transportation strategy. On specific content in the plans, we outline our recommendations and comments below:

1. **Paying for the Plan:**

   The draft 2021 Regional Plan sets out an ambitious plan to build and operate a region-wide system of transportation projects, programs and other improvements. This is a substantial role for SANDAG to play in supporting both the construction and operation of these projects, programs and other improvements. SANDAG should set annual revenue targets to directly fund everything and should approve any recommended sustainable revenue tools to help meet these targets. Many of the funding strategies will require legislative changes, or voter-approved taxation. SANDAG should clarify what will occur if the funding is not available, if opposition to projects stops them from construction, and if General Plans in the region are not modified to implement the Plan.

2. **Appendix D: Sustainable Community Strategy Documentation:**

   Appendix D includes the Sustainable Communities Strategy, which outlines assumptions included in the Activity Based Model 2+ ("ABM 2+"), updated for this. This model will be necessary for use by publicly and privately initiated land use projects preparing documents for consistency with VMT/CEQA Guidelines and Traffic Impact Analysis ("TIA") Evaluations. City staff respectfully request direction from SANDAG on how to conduct modeling with the service bureau and how to factor in these assumptions applied to ABM 2+. Specifically, the addition of pricing, parking costs for coastal communities, 10% teleworking and micromobility. SANDAG should provide direction on how this could be worked into General Plans that are updated every 5-20 years.

3. **Appendix A: Transportation Projects, Programs, and Phasing:**

   Trips to and from school sites result in a significant congestion, VMT generation, and peak hour delay throughout the region. Additional funding and projects should be recommended with a specific focus on improving safety and multimodal access in and around school sites along with programs to incentivize non-single occupancy vehicle trips to schools.
Table A.11: Given the proven success of the Carlsbad Connector microtransit pilot program, the city agrees with the Plan’s recommendations to provide similar on-demand microtransit systems throughout North County at all mobility hub sites and major transit centers.

Table A.13: The segment of El Camino Real between Poinsettia Lane and Camino Vida Roble is proposed to be widened from two to three lanes to prime arterial standards. With the adoption of the city’s General Plan, the city has determined that the widening of this portion of El Camino Real is not feasible due to constrained right-of-way and would result in negative impacts to other travel modes. City staff recommend removal of this proposed project recommendation CB32 (that is, a ‘do nothing’ scenario, or appraise and evaluate different mobility projects and/or alternative designs).

The preferred Interstate-5 freeway alternative identified in the North Coast Corridor (“NCC”) Final EIR/EIS is the refined 8+4 Buffer alternative, with four freeway lanes and two managed lanes in each direction and completion by 2035. Appendix A, Table A.5 describes NCC project IDs CC004, 007-009 as “8F to 6F+4ML” with completion by 2050. While this might lead to further study, it is not clear why there is a different freeway configuration (i.e., reduction in freeway lanes) proposed. How does a reduction in lanes continue to meet NCC potential project benefits of maintaining or improving traffic operations and improving the safe and efficient regional movement of people and goods?

4. Active Transportation:

The city appreciates the Regional Plan’s overall approach of providing a connected network of high-quality bicycle facilities throughout the region. Regional bikeways are recommended throughout the city including along Palomar Airport Road which will provide a key east-west connection and El Camino Real which will provide a new north-south bikeway connection through the city. Both roadways are proposed to include “on-street bikeways”. Due to the high traffic volumes and vehicle speeds experienced along most of both corridors, the city recommends considering “off-street bikeways” or Class I facilities where feasible in order to stimulate the shift from personal motor vehicle use to people choosing to bike.

It is extremely important that municipal transportation plans align with regional transportation plans to achieve regional goals for land use and transportation and to promote the region working together to build a cohesive regional transportation network. Considering there are currently no mechanisms in place to ensure municipalities coordinate local transportation plans with regional planning documents, the Plan should provide an approach on how SANDAG plans to engage with municipalities, especially in areas of potential disagreement or conflict (as aforementioned in this subsection and others). It is also recommended that the Plan provide additional direction regarding the application of protected bikeways in a variety of applicable contexts. While vertical measures such as soft hit posts may be appropriate in lower volume and lower speed roadways, arterial roadways with high traffic volumes and high speeds warrant much more substantial physical protection from vehicles. In addition, special consideration should be given at intersections and driveways which may be impacted due to the additional width and visibility impacts created by protected bikeways.

City staff look forward to working with SANDAG on improving mobility and land use access in the region and building sustainable, equitable and healthy modes of transportation, and we appreciate the opportunity to comment on the Plan that will help the region realize these goals.
City of Carlsbad Comments on Draft 2021 Regional Plan  
Aug. 6, 2021  
Page 8

If you have any questions related to comments on the transportation network, please contact Tom Frank, Transportation Director/City Engineer, at Tom.Frank@carlsbadca.gov or if you need additional information related to comments on the land use assumptions, please contact Eric Lardy, Principal Planner, at Eric.Lardy@carlsbadca.gov.

Sincerely,

MDS  
For

JEFF MURPHY  
Community Development Director

TOM FRANK  
Transportation Director/City Engineer

Government Code section ("GOV §") 65080, also referred to as California Senate Bill 375 (Steinberg, 2008) ("SB 375"), is one area of law that provides SANDAG with guidance to which a regional transportation plan must be developed.

Among other things, the regional transportation plan that is developed “shall be an internally consistent document” (GOV § 65080 (b)) and shall include a “sustainable communities strategy prepared by each metropolitan planning organizations as follows” (GOV § 65080 (b)(2)(B)):

> Each metropolitan planning organization shall prepare a sustainable communities strategy, subject to the requirements of Part 450 of Title 23 of, and Part 93 of Title 40 of, the Code of Federal Regulations, including the requirement to utilize the most recent planning assumptions considering local general plans and other factors. The sustainable communities strategy shall (i) identify the general location of uses, residential densities, and building intensities within the region, (ii) identify areas within the region sufficient to house all the population of the region, including all economic segments of the population, over the course of the planning period of the regional transportation plan taking into account net migration into the region, population growth, household formation and employment growth, (iii) identify areas within the region sufficient to house an eight-year projection of the regional housing need for the region pursuant to Section 65584, (iv) identify a transportation network to service the transportation needs of the region, (v) gather and consider the best practically available scientific information regarding resource areas and farmland in the region as defined in subdivisions (a) and (b) of Section 65080.01, (vi) consider the state housing goals specified in Sections 65580 and 65581, (vii) set forth a forecasted development pattern for the region, which, when integrated with the transportation network, and other transportation measures and policies, will reduce the greenhouse gas emissions from automobiles and light trucks to achieve, if there is a feasible way to do so, the greenhouse gas emission reduction targets approved by the state board, and (viii) allow the regional transportation plan to comply with Section 176 of the federal Clean Air Act (42 U.S.C. Sec. 7506).

The 2021 draft Regional Transportation Plan includes a Sustainable Communities Strategy ("SCS"), as required by SB 375 for the San Diego region (herein after called “draft Regional Plan”). The draft Regional Plan indicates that “SB 375 requires the SCS to include a pattern for forecasted growth and development that accomplishes the following: 1) When combined with the transportation network, the SCS will achieve the regional GHG emission–reduction targets; 2) The SCS accommodates the Regional Housing Needs Assessment ("RHNA") Determination; and 3) The SCS utilizes the most recent planning assumptions. (Reference p. 19 of the 2021 Regional Plan.)

Predicting the effect of transportation plans or projects on land uses and land use planning is critical to developing context sensitive solutions for transportation projects. Therefore, utilization of the most recent planning assumptions is not only necessary but is required as specifically stated therein GOV § 65080. If inconsistencies are found in the land use assumptions or adverse impacts are anticipated, SANDAG should be actively engaged in the development of measures to address these issues.

The SANDAG Board of Directors approved the final RHNA plan with the final housing unit allocation on July 10, 2020, which was based on the most recent land use planning assumptions and an adopted methodology to allocate housing in accordance with GOV §§ 65584.04(d and m). The City of Carlsbad received a total RHNA allocation of 3,873 units as a result of RHNA plan adoption. The adopted April 6, 2021 city’s Housing Element accommodates its housing needs through current zoning and other programs.
as needed to meet the city’s RHNA obligation at all income levels. The land use inputs derived from this local planning document constitutes the most recent land use assumptions. On July 13, 2021 the Department of Housing and Community Development found “the adopted housing element is in substantial compliance with State Housing Element Law (Article 10.6 of the Gov. Code).

The most recent planning assumptions are critical for the development of the draft Regional Plan as the document must comply with other specific state and federal mandates including a SCS per California Senate Bill 375, which achieves GHG emissions reduction targets set by the California Air Resources Board and compliance with federal civil rights (Title VI) requirements, environmental justice considerations, air quality conformity, and public participation. To monitor compliance and attainment of state reduction goals in GHG, GOV § 65080 (b)(2)) requires that:

(H) Prior to adopting a sustainable communities strategy, the metropolitan planning organization shall quantify the reduction in greenhouse gas emissions projected to be achieved by the sustainable communities strategy and set forth the difference, if any, between the amount of that reduction and the target for the region established by the state board.

(I)(i) Prior to starting the public participation process adopted pursuant to subparagraph (F), the metropolitan planning organization shall submit a description to the state board of the technical methodology it intends to use to estimate the greenhouse gas emissions from its sustainable communities strategy and, if appropriate, its alternative planning strategy.

There is inevitably some uncertainty regarding the use of projected future conditions. However, what is certain is that the project will not operate under the conditions that exist today. There will be new residential and employment growth in the intervening years between now and the proposed build-out of the draft Regional Plan. Nonetheless, projections utilized should represent the best available information assembled by the local agencies with jurisdiction and expertise. Judgments about land use assumptions utilized in the draft Regional Plan should be based on and supported by facts, adopted plans, and “most recent planning assumptions,” rather than speculation and personal opinions. The land use assumptions for “uses, residential densities, and building intensities within the region” (as required by GOV § 65080 (b)(2)(B)(ii)) should also be the same, as that provided to the state board (as required per GOV §§ 65080 (b)(2)(H and J) in estimating and analyzing GHG from the SCS and the effect on growth and whether the effects of that growth would be significant in the context of the region’s plans, natural setting, and growth patterns. Ultimately, the SCS must demonstrate whether SANDAG can meet the per capita passenger vehicle-related GHG emissions targets for 2035 set by the California Air Resources Board (“CARB”).

SB 375 directs CARB to accept or reject the determination of SANDAG that its SCS submitted to CARB would, if implemented, achieve the region’s GHG emissions reduction targets. CARB’s technical evaluation of SANDAG’s draft Regional Plan would be based on all the evidence provided, including the models, the data inputs and assumptions, the SCS strategies, and the performance indicators.

The transportation and planning assumptions are also extremely important as it is relied on for other master planning exercises. The Regional Air Quality Strategy (“RAQS”) relies on information from CARB and SANDAG for information regarding projected growth in the cities and San Diego County. This in turn is utilized to address other state requirements, including the San Diego portion of the California State Implementation Plan (“SIP”) and promulgating their own rules and regulations regarding air quality in the region or to address federal requirements.
The analysis of land use impacts for transportation projects is guided by FHWA Technical Advisory T 6640.8 and the CEQA Guidelines.

Under the FHWA Technical Advisory T 6640.8 (G)(1), Guidance for Preparing and Processing Environmental, states:

- **This discussion [of land use] should identify the current development trends and the State and/or local government plans and policies on land use and growth in the area which will be impacted by the proposed project. These plans and policies are normally reflected in the area's comprehensive development plan, and include land use, transportation, public facilities, housing, community services, and other areas.**

- **The land use discussion should assess the consistency of the alternatives with the comprehensive development plans adopted for the area and (if applicable) other plans used in the development of the transportation plan required by Section [23 U.S. Code §] 134. The secondary social, economic, and environmental impacts of any substantial, foreseeable, induced development should be presented for each alternative, including adverse effects on existing communities. Where possible, the distinction between planned and unplanned growth should be identified.**

There is also a requirement to analyze the land use planning inconsistencies per CEQA Guidelines § 15126.2(a), which specifies that an EIR for a proposed project include:

- **The Significant Environmental Effects of the Proposed Project. An EIR shall identify and focus on the significant effects of the proposed project on the environment. In assessing the impact of a proposed project on the environment, the lead agency should normally limit its examination to changes in the existing physical conditions in the affected area as they exist at the time the notice of preparation is published, or where no notice of preparation is published, at the time environmental analysis is commenced. Direct and indirect significant effects of the project on the environment shall be clearly identified and described, giving due consideration to both the short-term and long-term effects. The discussion should include relevant specifics of the area, the resources involved, physical changes, alterations to ecological systems, and changes induced in population distribution, population concentration, the human use of the land (including commercial and residential development), health and safety problems caused by the physical changes, and other aspects of the resource base such as water, historical resources, scenic quality, and public services. The EIR shall also analyze any significant environmental effects the project might cause or risk exacerbating by bringing development and people into the area affected. For example, the EIR should evaluate any potentially significant direct, indirect, or cumulative environmental impacts of locating development in areas susceptible to hazardous conditions (e.g., floodplains, coastlines, wildfire risk areas), including both short-term and long-term conditions, as identified in authoritative hazard maps, risk assessments or in land use plans addressing such hazards areas.**

Since the new land use assumptions are being utilized, as described by this letter, the EIR that is prepared shall also analyze any significant environmental effects the project might cause by bringing development and people into the area affected. The following are the basic steps in analyzing land use impacts as part of the community impact assessment process:
1. Inventory the existing land use patterns (including undeveloped land), development trends, and transportation systems. The inventory of existing land uses should include the following land use types: residential, commercial, industrial, recreational, institutional, public services, community services, emergency services, transportation, utilities, agriculture, and undeveloped land in the study area. The study area should include the surrounding community that is generally associated with the project area within which community impacts could occur. The inventory should also address development trends and identify recent developments in the study area to include the development’s name, size, status (planned, built, under construction), and the jurisdiction in which it is located. A map showing the location of existing and planned land uses in the area should also be prepared.

2. Determine whether the project is consistent with local and regional policies that govern land use and development. For the consistency analysis, the policies and programs considered in the analysis should include: transportation plans and programs (MTPs/RTPs and MTIPs/RTIPs), regional growth plans, local General Plans that establish land use and growth management policies for the study area, and any specific or pipeline development proposals. This analysis should also include a discussion of consistency with the Coastal Zone Management Act of 1972, California Coastal Act of 1976, the National Wild and Scenic Rivers Act (16 USC 1271) and the California Wild and Scenic Rivers Act (Pub. Res. Code § 5093.50 et seq.). After preparing a preliminary list of relevant plans to be considered in the analysis, the SANDAG planner should meet with the staff of the various agencies to review the list to determine if it is complete and revise the list as necessary.

3. Assess the changes that would occur in land uses and growth with and without the project.

4. The draft Regional plan and each project alternative should be considered separately since the results may be different.

5. Develop measures to avoid, minimize, and/or mitigate potential adverse effects.

The resulting environmental analysis should identify the current development trends and the State and/or local government plans and policies on land use and growth in the area which will be impacted by the proposed project. These plans and policies are normally reflected in local General Plans. If found to be consistent, then the findings in the EIR should be documented in the report and no further analysis or action is necessary. When found not to be inconsistent with a policy or program, then consideration must be given to modifying the draft Regional Plan alternative to make it consistent, or measures to address the inconsistency must be developed. SANDAG should be actively engaged in the development of measures to address these issues and be prepared to assess the consistency of the draft Regional Plan and alternatives with the comprehensive development plans adopted for the area and (if applicable) other plans used in the development of the transportation plan required by Section 23 U.S. Code § 134. For any new land use growth assumptions, the secondary social, economic, and environmental impacts of any substantial, foreseeable, induced development should be presented for the draft Regional Plan and each alternative, including adverse effects on existing communities. The results should be shared with the public during the public involvement process, e.g., at community meetings, etc. Public input should be considered by SANDAG and if necessary, the findings of the analysis should be revised to reflect information gained through the public involvement process.

Subject: Comments on the San Diego Forward: 2021 Regional Plan

Dear SANDAG staff:

Thank you for the opportunity to review the San Diego Forward: 2021 Regional Plan (2021 Regional Plan). The City of Coronado (City) appreciates SANDAG's ambitious plan to improve the San Diego region's mobility options, reduce greenhouse gas emissions, address traffic congestion, advance technology related to transportation services, and improve regional transportation infrastructure. While the City is generally supportive of the 2021 Regional Plan, there are several areas of concern, including the inclusion of a mobility hub in the Orange Avenue Business District / village area, the potential for housing unit allocation to increase given the inclusion of a mobility hub, the assumption that the 2021 Regional Housing Needs Allocation (RHNA) is final, the depiction of new mixed use areas in the City, and the strategy of minimum zoning near transit. These main concerns are summarized below.

First, and most notably, during the South Bay to Sorrento Comprehensive Multimodal Corridor Plan (CMCP) engagement process, City staff expressed concern about the Orange Avenue Business District / village area being designated a Mobility Hub without meaningful engagement with City residents and the City Council. It is highly unlikely the City would agree to construction of a new mobility hub in the Orange Avenue corridor. Therefore, the City requests the mobility hub be removed from both the South Bay to Sorrento CMCP and the 2021 Regional Plan.
As stated in the City’s “Comments on the South Bay to Sorrento Comprehensive Multimodal Corridor Plan” letter dated July 7, 2021, the City has about 23,639 residents (ACS 2019) and a compact, fully developed village area covering about two square miles surrounded by the San Diego Bay and the Pacific Ocean. The City is highly constrained and does not have additional development capacity or any buffer zones to establish a mobility hub in our village area. While the City is supportive of on-demand travel options, it is difficult to imagine where facilities for the “Flexible Fleets” and “Transit Leaps” might be sited, such as ride hailing zones, electric vehicle charging stations, micro-mobility parking areas, parcel delivery lockers, and sidewalk delivery bots. The description of mobility hubs also includes drone technology, which is a concern given the proximity to Naval Air Station North Island (NASNI).

The designation of the City’s village as a mobility hub is also concerning as it relates to the future of housing allocations for Coronado. Presumably, given the State and SANDAG’s priority to increase housing density in transit rich areas, mobility hubs and related transportation investment may have a significant adverse impact in Coronado’s village area. The 2021 Regional Plan refers to mobility hubs as areas “to concentrate future development.” The City is concerned that the designation of the village area as a mobility hub will lead to continued increased regional housing needs allocations, which will negatively impact the City’s character, in addition to the challenge of space and regulatory limitations to accommodate more high-density housing.

In the event that the village area continues to be designated as a mobility hub, the City asks that the use of drone security be removed from the plan due to privacy and safety concerns, that the use of e-bikes or scooters be limited and orderly, and that new facilities not block or impede pedestrian movement. Finally, before any strategies are implemented within the village area, more public outreach and interagency collaboration will be required to inform Coronado residents of the plan.

In addition to the City’s concern for a mobility hub in the village, the City finds that the 2021 Regional Plan presupposes that 2021-2029 RHNA is finalized although there is pending litigation related to the RHNA. To address this issue, the City asks that the following language be inserted as a footnote on p.33 of the 2021 Regional Plan, after the sentence: “The SANDAG Board of Directors adopted the RHNA Plan on July 10, 2020, with the final housing unit allocation” to read:

In September 2020, the cities of Coronado, Imperial Beach, Lemon Grove and Solana Beach filed a Petition for Writ of Mandate in San Diego Superior Court challenging, among other things, the Board’s adoption of the RHNA Plan. SANDAG demurred to the cities’ Petition and the demurrer was sustained by the court in February 2021. The petitioning cities have appealed the ruling on the demurrer to their Writ Petition, and that appeal remains pending in the Fourth District Court of Appeal.
In addition, the City proposes to add the following paragraph to the end of p.14 of Appendix K:

On September 24, 2020, the cities of Coronado, Imperial Beach, Lemon Grove and Solana Beach filed a Petition for Writ of Mandate in San Diego Superior Court, Case No. 37-2020-00033974-CU-MC-CTL, against SANDAG and SANDAG’s Board of Directors seeking an order requiring that SANDAG give those cities a fair hearing on their RHNA appeals and decide the cities’ appeals in a legal manner without bias and without the use of the weighted voting mechanism. Specifically, the petitioning cities asked the court to order: (1) that the final RHNA allocation approval by SANDAG be rescinded; (2) that SANDAG’s denial of the cities’ RHNA appeals be rescinded; (3) that the appeals be remanded to SANDAG for fair consideration; and (4) that SANDAG be prohibited from utilizing a weighted vote on the cities’ RHNA appeals. On February 5, 2021, SANDAG’s demurrer to the Petition for Writ of Mandate was sustained by the Superior Court. The petitioning cities have appealed the ruling on the demurrer to their Writ Petition. That appeal remains pending in the Fourth District Court of Appeal. So long as the litigation is pending, the Board’s adoption of the RHNA Plan cannot be considered final.

Aside from the main concerns of the village area as a potential mobility hub and the presupposition of a finalized RHNA, the City has additional comments about the 2021 Regional Plan:

- A new Rapid route is depicted from Downtown to NASNI. The City would be interested in extending this route further into the commercial village area.
- The description of the Transportation Demand Programs includes language that suggests that employers will be required to provide transportation benefits. The City does not support requiring local businesses to provide specific benefits and would not enforce this or any other mandatory regulatory actions.
- Appendix A identifies a new off-street bike path on Glorietta Boulevard. The City’s Active Transportation Master Plan does not identify such a future improvement, the Bayshore Bikeway Plan recommends no changes to this area, and there is already a bike lane on Glorietta Boulevard. Please update A.12 and A.13.
- In Appendix B one of the strategies to increase housing affordability is to minimize zoning near transit. Since most of the village area is near transit, the City would not implement strategies that adversely alters its community character through reduced zoning requirements or eliminated single family zoning.
- In the land use maps in Appendix F, there are some areas of Coronado shown as mixed use. Although there is some existing, non-conforming mixed-use development in the City, there are no areas in the City that are zoned for mixed use, and there are no plans to zone additional areas for new mixed-use.
- The City generally supports improvements to the public transportation system, but encourages SANDAG to do so in a manner that does not compromise necessary road maintenance and improvement projects.
- The City also supports new waterborne transportation options, such as ferry routes, and encourages SANDAG to prioritize the financing and expansion of waterborne transportation options in its regional planning documents.
Once again, thank you for the opportunity to comment on the 2021 Regional Plan. We look forward to seeing an amended plan in the future.

Respectfully submitted,

Mark Ochenduszko  
Interim City Manager  
Cc: City Councilmembers for the City of Coronado
August 6, 2021

San Diego Association of Governments (SANDAG)

San Diego, CA 92101

RE: San Diego Forward: The Regional Plan

The City of Oceanside Planning Division appreciates the opportunity to provide comment on the Draft 2021 Regional Plan.

- Chapter 1: A Bold New Vision for the 2021 Regional Plan

  o We applaud SANDAG for prioritizing public safety, solutions to traffic congestion, social equity, GHG emission reduction, and air quality. We recommend that SANDAG also acknowledge open space and natural habitat preservation as a key priority of the Regional Plan. The long-term sustainability of the San Diego region, along with the quality of life of its residents, depends on the preservation of these resources. How will the San Diego region help to further the state’s “30 by 30” goal, as outlined in Executive Order EO N-82-20?

  o We encourage SANDAG to consult with the scientific community on the most recent sea level rise projections for the region’s coastline. It is our understanding that NASA now projects sea level rise of less than one foot by 2050, based on roughly three inches of sea level rise over the past decade. While there are many factors that could contribute to significantly greater sea level rise over this period, we believe it important to base regional planning efforts on the most likely sea level rise scenario.

  o The modest goals for mobility mode shift over the planning period (reducing SOV commutes by 18% and increasing transit ridership by 10%) do not seem commensurate with the major changes the Five Big Moves would bring to the region. What are the main impediments to achieving more ambitious mobility mode shift goals? What strategies, if any, are available to overcome these impediments?

  o The regional population forecast for this iteration of the regional plan shows substantially less population growth through 2050 than that projected in prior forecasts. Should this most recent growth forecast prove accurate, there will inevitably be less tax and user fee revenue to support the region’s transportation system. To what extent has lower population growth, and concomitant lower regional funding, been factored into the economic analysis of the Five Big Moves?

  o It is noted that over the next three decades 60% of the region’s population growth will be among those who are 75 years old and older. How well do we understand the current and evolving mobility needs and preferences of this demographic, and
how will transportation infrastructure and services be designed to accommodate these needs and preferences? How will the region’s elderly population benefit from active transportation improvements? How will the elderly access transit? What accommodations will need to be made to ensure that the elderly have equal access to the region’s mobility network?

- **Chapter 2: Sustainable Communities Strategy (SCS)**
  
  - The Draft SCS establishes the overarching goal of a fast, fair, and clean mobility network. It will be important to devise and consistently apply appropriate metrics for evaluating how mobility improvements and services further this goal.
    
    - With regard to the relative speediness of new or enhanced mobility options, it would be worthwhile to consider how travel times associated with alternative modes compare with those associated with SOV automobile trips.
    
    - In addition to evaluating the fairness of a particular improvement or service in terms of access, cost, and functionality, it would be worthwhile to also consider the relative safety and comfort of mobility options as experienced by different user groups.
    
    - While air quality and GHG emissions are fundamental considerations in determining the cleanliness of the mobility network, so too are water quality, soil quality, hazardous materials, and solid waste management.

  - While user fees are both an important revenue source and a potentially powerful means of encouraging more sustainable modes of transportation, it is important that such fees not create financial hardship for lower-income households. To avoid a regressive and inequitable user fee regime, subsidies should be provided to those with both limited financial means and limited mobility options.

  - The efficient movement of goods into and through the San Diego region is essential to the health and stability of the regional economy. Assessment of the efficiency of goods movement should consider how delivery systems contribute to overall VMT and how these systems can further evolve to minimize their environmental impacts, including their contributions to traffic congestion, air pollution and GHG emissions, roadway wear-and-tear, and noise.

  - Preparation and implementation of the sub-regional Comprehensive Multimodal Corridors Plans (CMCPs) is identified as a priority in the Draft Regional Plan. Oceanside staff has been participating in task force meetings on the North County CMCP. In these meetings, we have noted that Caltrans facilities that extend through Oceanside often serve as barriers to active transportation and connectivity between neighborhoods. For example, SR 76 bifurcates neighborhoods in the San Luis Rey Valley, separating residents from commercial areas, recreational facilities, and other community assets. The absence of grade-separated crossings on SR 76 contributes to the highway’s impact as a physical and psychological
barrier. The Planning Division recommends that improvements to SR 76, SR 78, and I-5 incorporate new and upgraded pedestrian and bicycle facilities that enable safer and more convenient crossings of these roadways.

- To a large extent, the success of mobility hubs will depend on the level of comfort and engagement they provide to those who travel through them. The design of mobility hubs should therefore emphasize safety, security, accessibility, visual quality, and a strong sense of place. Mobility hubs have the potential to serve as gathering spaces, cultural venues, and entertainment districts. Improvements and services within mobility hubs should contribute to, and not detract from, the character and appeal of these areas.

- It is noted that the Draft Regional Plan considers air pollution exposure reduction strategies promulgated by AB 805 and other state legislation and guidance. While most of these strategies rightly focus on underserved communities, it is important to note that as smart growth takes hold in the region and new housing is built in closer proximity to major roadways and transit facilities, residents across the socioeconomic spectrum could be exposed to excessive levels of air pollution. As we facilitate cleaner forms of transportation, we can also consider ways to enhance both indoor and outdoor air quality in highly urbanized areas through landscaping, ventilation systems, weather-stripping, etc.

- State Route 76 is identified in the SCS as a “rural corridor.” While much of this highway extends through rural areas, most segments of SR 76 in Oceanside abut urbanized areas. Accommodating both pass-through and local trips, these segments of SR 76 could benefit from some of the same improvements and programming slated for other highways in the region.

- Consider Oceanside as a testing ground for the piloting of Next OS technologies, particularly those that serve lower-income residents and those who reside in areas with limited transit options.

- In partnership with the Orange County Transit Authority (OCTA) and NCTD, consider rapid bus service between southern Orange County and the Oceanside Transit Center.

- The SCS calls for implementation of “innovative demand and system management” programs. The City of Oceanside has recently adopted TDM standards for new non-residential development of certain types and scales. The City is also exploring possible incentives for TDM in existing non-residential development. Regional funding and/or technical support for TDM plans would be a powerful incentive for existing businesses to consider ways to promote alternative commuting options.

- As other local jurisdictions have done, the City of Oceanside intends to reduce lanes and implement roundabouts within one of its major commercial corridors (Coast Highway). One of the biggest challenges to implementing “road diets” is maintaining adequate right-of-way for buses and ample curb space for flex fleet service. Regional guidance on road diet design that supports alternative mobility
options, developed in partnership with regional transit and flex fleet providers, would be helpful.

- The proliferation of warehousing and distribution facilities in the San Diego region has major implications for land use, economic development, and climate mitigation. These facilities tend to occupy large tracts of land while providing relatively few jobs per acre. Vehicle trips generated by these facilities can contribute significantly to VMT and associated GHG emissions. We encourage SANDAG to consider guidelines and incentives that promote innovation in the warehousing and distribution sector (e.g., more efficient land use, zero-emission vehicle fleets, etc.).

- Value pricing of public parking facilities is key to facilitating efficient use of these resources, generating revenue for local transportation improvements, encouraging alternative modes of transportation, and motivating efficient use of private parking facilities. While parking pricing is largely within the authority of local jurisdictions, SANDAG can support localities in navigating the technical and political challenges of implementing value pricing programs.

- Chapter 3: Paying for the Regional Plan, Forming Partnerships and Taking Action, and Monitoring How the Plan Performs

  - Performance monitoring, as illustrated in Table 3.1, should include public health benchmarks, particularly those that provide insight on the public health impacts of air pollution, lack of access to healthy food, sedentary lifestyles, etc.

- Appendix A: Transportation Projects, Programs, and Phasing

  - In Figure A.1, SR 76 and SR 78 are not identified as significant corridor geographies, while SR 56, SR 94, and SR 125 are identified as such. The Planning Division recommends that these two important regional roadways be identified in the same manner as other east-west highways in the region.

  - As identified in Table A.11, the Inland Rail Trail (IRT) through Oceanside is not shown as being implemented until 2035. The IRT is a crucial component of the North County bicycle trails network, facilitating access to NCTD Sprinter rail and Breeze bus services, connecting cyclists to the Coastal Rail Trail, activating north-south bikeways (e.g., El Camino Real, College Boulevard), and contributing to complete streets improvements within the Oceanside Blvd corridor. The Planning Division thus recommends that the Draft Regional Plan commit to implementation of this segment of the IRT by 2025.

  - The Planning Division recommends that acquisition of land in mobility hub areas be identified as a higher priority, as property aggregation will be key to efficient redevelopment of many of these areas.

  - The extension of Melrose Drive and the interchange at Highway 78 and Rancho del Oro are not listed among the arterial improvements in Table A.13. Both of these
improvements are listed in the City’s Circulation Element (CE). While the City is currently contemplating removal of the extension from Santa Fe Avenue to Spur Avenue from the CE, the unconstructed segment between North River Road and State Route 76 will remain.

- Appendix B: Implementation Actions

- Implementation Action 9 calls for expansion of regional programs on low-carbon transportation options, roadway safety and maintenance, and nature-based climate solutions. While the Planning Division supports nature-based climate solutions where feasible, we note that certain stretches of the region's coastline face imminent threat from coastal hazards and are not amenable to nature-based solutions. The Planning Division encourages SANDAG to support near-term coastal adaptation measures that address urgent local conditions and buy time for the development and implementation of long-range adaptation strategies.

- In addition to the enumerated strategies to increase housing availability and affordability (p. 19), the Planning Division encourages SANDAG to consider gap financing for inclusionary housing projects that do not qualify for tax credit financing and/or other federal and state subsidies. In determining eligibility for gap financing, SANDAG should consider key sustainability metrics — e.g., proximity to transit, employment, and essential services, energy efficiency and renewable energy sourcing, pedestrian-oriented design, resilient building materials, etc.

- The Planning Division applauds SANDAG for recognizing that the relatively low resale value of certain electric vehicles presents an opportunity for lower-income households to enter the electric vehicle market. SANDAG can further support EV ownership in low-income and historically disadvantaged communities by coordinating with dealerships in the region on marketing and financing programs.

- The “Fix It First” implementation strategy is described as “bringing transit and road infrastructure back to optimal performance.” The Planning Division questions the notion that the region’s mobility infrastructure has ever demonstrated “optimal performance.” Perhaps a better catch-phrase here would be something akin to “Build Back Better,” as this speaks to more than just perpetuating the status quo.

- In its consideration of tools and strategies that provide for the effective operation and management of regional infrastructure as a coordinated system, SANDAG should work closely with local jurisdictions to identify, enhance, and integrate local data collection and traffic management programs into a regional whole. The City of Oceanside maintains a Traffic Management Center that, with adequate staffing, has the potential to provide real-time traffic data to support signal optimization and other efficiencies.
Appendix F: Regional Growth Forecast and Sustainable Communities Strategy Land Use Pattern

The Planning Division is concerned that the most recent iteration of the regional population forecast may significantly underestimate Oceanside’s capacity for additional population, housing, and employment. We understand that the statewide forecast prepared by the Department of Finance shows considerably less growth in the San Diego region over the next three decades than previously anticipated, and we acknowledge that population and housing growth in Oceanside has been declining over the past 20 years. Nevertheless, housing demand in Oceanside remains strong, and the City is still one of the most affordable housing markets in the San Diego region. Moreover, the local employment base continues to grow, particularly in the manufacturing, health care, and hospitality sectors. We believe Oceanside has the potential to accommodate significant growth through infill and redevelopment, and that the revitalization of the City’s urban corridors will draw new residents and employers. The City’s outdated General Plan has likely contributed to low growth projections over the past three forecast periods (2008, 2012, and 2016). The City is currently in the process of updating its General Plan, with the intent to incentivize infill and redevelopment through new zoning standards, a streamlined review process, CEQA clearance, and targeted infrastructure improvements.

The City of Oceanside Planning Division again thanks SANDAG for the opportunity to comment on the Draft Regional Plan. Planning staff looks forward to working with SANDAG on the refinement and implementation of this important document. Questions and comments can be directed to Russ Cunningham at rcunningham@oceansideca.org or (760) 435-3525.

Sincerely,

Russ Cunningham, Principal Planner

RE: San Diego Forward: The 2021 Regional Plan

The City of Oceanside Traffic Engineering Division appreciates the opportunity to provide comment on the Draft Regional Plan.

1. The SANDAG website states, “The SANDAG Sustainable Communities Strategy and Final EIR from its 2015 Regional Plan will remain valid and in compliance for purposes of state funding eligibility and other state and federal consistency purposes until the SANDAG Board of Directors adopts a new Regional Plan and EIR, provided those actions are completed by the end of December 2021.” SANDAG needs to clarify how the Draft EIR, Response to Comments and Adoption will be completed this year and what will occur if they are not completed by the end of this year. SANDAG should also clarify how comments on the plan are going to be addressed in the Draft EIR prior to its release.

2. Looking at the detailed data provided by SANDAG it is not clear why the citywide numbers only show moderate increases in population. See comments provided by the City’s Planning Division.

3. In Appendix A: Transportation Projects, Programs, and Phasing, it should be noted that Trips to and from school sites result in a significant congestion, VMT generation, and peak hour delay throughout the region. Additional funding and projects should be recommended with a specific focus on improving safety and multimodal access in and around school sites along with programs to incentivize non-single occupancy vehicle trips to schools.

4. Considering FHWA’s project for Accelerating Roundabout Implementation in the United States, and the County of San Diego Air Pollution Control Board’s support for implementing roundabouts to address GHG and reduce fatalities, the Plan should incorporate policies to promote roundabouts over signalized intersections and include a line item under the Complete Corridors to fund the construction of roundabouts at new locations and replace signalized intersections when found feasible.
Specific Comments on the Appendices

Appendix A: Transportation Projects

Descriptions of the following projects are insufficient. In order to provide comments, the City requests that SANDAG provide more detailed project description, information and clarifications for the following projects:

Oceanside Active Transportation Projects

1. **AT030: Coastal Rail Trail Oceanside- Alta Loma Marsh Bridge 2035.**
   The Regional Plan’s cost estimate is $4 million. The actual estimate prepared by the City is $9 million. Please clarify or correct.

2. **AT031: Coastal Rail Trail Broadway to Eaton 2035.**
   The project cost is estimated at $1 million. The Regional Plan recommends trail extension to Eaton Street, with Eaton providing connection to the existing Coastal Trail segment on Coast Hwy. The City’s preferred routing is to extend this trail to the south end of Broadway, then obtain easement from the Buena Vista Audubon Society to continue the trail along the lagoon to connect to the Carlsbad section of the Coastal Rail Trail. We recommend the project description be amended accordingly. We also believe that a higher cost estimate needs to be included; $1M is not an accurate cost estimate for this project.

3. **AT049: Inland Rail Trail 2035.**
   The project cost is estimated at $68M. It is difficult to evaluate the accuracy of this cost estimate without a preliminary engineering study of the potential alignments and the actual field conditions. It is likely the cost of this project will exceed $70M.

4. **AT074: Coastal Rail Trail-Oceanside Segment 1ALT 2050.**
   The project cost is estimated at $6 million, with on-street routing from Neptune/Pacific to the NCTD station. It is difficult to assess this potential trail routing and the project’s impacts potentially creating a need for street widenings in that area.

5. The City requests that the following two projects be added to the Regional Plan:

   A. A **connection between the west and east side of I-5 at the SR-78 interchange for bicycle and pedestrian traffic.** Under existing conditions, there is no safe access for bicyclists and pedestrians across I-5 in this area.

   B. **Bike infrastructure improvements on SR-76,** as repeatedly requested by Caltrans and the City of Oceanside.

Appendix L: Oceanside Workshop

The recommendations made in this section are the results of a conceptual community workshop on what might be considered, and the following recommendations mentioned in this appendix as
a result of this workshop shall by no means be construed as the City of Oceanside’s official request and/or recommendations:

- Oceanside Boulevard reduced to two lanes with protected bikeways.
- The Strand closed to vehicle traffic and available only for bikes and pedestrians.

The City of Oceanside Traffic Engineering Division welcomes the chance to work with SANDAG staff and other stakeholders to ensure that the City’s mobility needs and concerns are adequately addressed in the updated Regional Plan.

Sincerely,

Hamid Bahadori, City Traffic Engineer
hbahadori@oceancityca.org
760-435-5114
Thank you for allowing us to submit comments on the Draft 2021 Regional Plan.

Regarding Scripps Poway Parkway, the City of Poway would like to see vehicle, bike, pedestrian and transit infrastructure improvements and connections to be added from the Highway 67 through Scripps Poway Parkway to the I-15 Freeway. I have spoken to several property and business owners within the South Poway Business Park (SPBP) including Geico and parking is a constant issue. There is currently no public transit route into the SPBP. Having public transit, bike, pedestrian and highway/road improvements/connections providing better more efficient access to the SPBP is essential for future employment growth in the area. Many workers in the Poway area live in Ramona and East County and this is a vital connection for the City and the Region. SANDAG has also identified Scripps Poway as a Tier 3 employment center in their draft Employment Center analysis. Construction is also underway to add thousands of more employees in the SPBP. To be clear, we are recommending that Scripps Poway Parkway become a critical connection and a multimodal corridor (https://www.sandag.org/uploads/publicationid/publicationid_4720_28341.pdf).

Regarding the Hwy 67, please note that the City of Poway’s General Plan Transportation Element includes a multi-use path on the west side of SR-67 (reference p. 3 http://docs.poway.org/weblink/0/doc/50446/Electronic.aspx). This multi-use path would include a separated two-way bike path and a fenced DG equestrian trail. The multi-use path provides a critical and safe pathway for hikers, bikers, runners, walkers, children, and equestrians. A multi-use path also creates a necessary loop between the City’s Iron Mountain trailhead and other destinations (e.g., Mt. Woodson, Lake Poway) which is also a goal within the Transportation Element. We recommend the San Vicente corridor plan is consistent with the City’s plans.

State Route 67 is also designated as a scenic roadway by the Poway General Plan. As a part of the General Plan requirements, a 50-foot wide landscape open space easement is required from adjacent property owners from the ultimate right-of-way line along State Route 67 when development is proposed. This easement shall be landscaped and modified as needed to enhance the scenic quality of the area as discussed in the General Plan Transportation Element Policy B – Scenic Roadways. Providing scenic roadway elements to the design will also help the corridor be more compatible with surrounding open space. To contribute to the General Plan goals, we would suggest that the right-of-way incorporate design elements consistent with a scenic roadway (e.g., naturalized decorative solid walls, native landscaped medians and shoulders, additional landscape areas and trees where feasible, earthen berms).

As a part of the San Diego Forward Plan and the 5 Big Moves Plan, SANDAG established the SR-67 corridor as a Comprehensive Multimodal Corridor Plan (CMCP) calling for a multimodal road along the SR-67 (https://www.sdforward.com/docs/default-source/default-document-library/agenda-june-5-2020.pdf?sfvrsn=891afe65_4). As stated on p. 6-2 of the 2050 RTP, “Our region has consistently supported a multimodal approach to transportation that looks at the overall system and improvements that benefit all modes, rather than prioritizing one over the other. This approach gives all of the transportation system users choices traveling within and through the region.” Further, “A well designed and thoughtfully integrated multimodal transportation system will give people choices, allowing them to select the transportation mode that is best suited for a particular trip. In an area as large and diverse as the San Diego region, this approach is necessary to make the best use of our limited
transportation resources.” As discussed, a multi-modal transportation system provides users transportation options and choices and thereby reduces traffic congestion and ghg emissions. Regional multi-use paths have been a great asset to communities across the country. Here in San Diego, the SR-56 Bike Path is separated from the highway and is often used by runners, walkers, and equestrians. In contrast, it is uncommon to see bikers, walkers, and equestrians in a bike route adjacent to a highway (for instance, SR-76). A multi-use path is also kid friendly because of the separation from the highway and kids are often seen on the SR-56 Bike Path and not commonly seen within bike routes adjacent to a Highway. The multi-use path also accommodates a more rural aesthetic and is safer for users. Multi-use paths have become a critical component to the transportation system and are treasured by the communities they are a part of. The addition of the multi-use path along Hwy 67 is more consistent with the goals and policies of the 2050 RTP. We recommend the San Vicente corridor plan provides a separated mixed-use path throughout the full length of the corridor.

Lastly, during the workshop portion for the Draft 2021 Regional Plan, workshops were provide by area (North, East, Central, etc.). Based on the mapped areas shown, Poway residents and community stakeholders were not represented as a part of any region and that outreach with appropriate comment period should be provided prior to moving forward with Draft. I'd be happy to assist you with what an appropriate outreach should be.

Thank you for considering our comments. Please feel free to reach out to me with any questions.

Thank you,

Coleen Clementson
Director of Regional Planning
San Diego Association of Governments
401 B Street, Suite 800
San Diego, CA 92101

Dear Ms. Clementson,

Subject: San Diego Forward: The 2021 Regional Plan

I am writing to express the City of San Diego’s support for SANDAG’s San Diego Forward: The 2021 Regional Plan (2021 Regional Plan). The 2021 Regional Plan is a major step towards reducing vehicle miles traveled by single occupant vehicles and greenhouse gas (GHG) emissions in the region by incorporating five transformational strategies which will be critical to enabling the City of San Diego to implement its Climate Action Plan. The City applauds SANDAG’s commitment to making infrastructure and technological investments in the mobility system with a greater emphasis on accessibility, transit, bicycling, and walking as well as innovative and bold strategies to manage demand on regional roadways prioritizing safety and aligning with the City’s commitments to Vision Zero. The City’s General Plan is consistent with the 2021 Regional Plan as both focus on development within vibrant mixed-use village centers served by high frequency transit. The City supports the 2021 Regional Plan’s intent to preserve open space from non-sustainable development. The City looks forward to closely working with SANDAG to implement the strategies described in the 2021 Regional Plan.

The City supports the 2021 Regional Plan’s vision to improve the transportation network in the region especially the planning and implementation of a complete network of efficient, convenient, and reliable transit services that connect people from where they live to where they work or go to school. The development of a dynamic management system of traffic flow and transit services, facilities for bicycles, scooters, pedestrians, and flexible micro transit, offer an equitable approach to first and last-mile connections to transit, a vision zero strategy to address safety, and implementation of the City’s Climate Action Plan.

The City also supports the 2021 Regional Plan’s development of mobility hubs throughout the region. As part of our land use planning efforts, the City is providing policies to support the implementation of mobility hubs as vibrant centers of activity where future housing and employment growth are connected by transit. The San Ysidro and Central mobility hubs are critical transportation facilities and having a direct connection to the U.S.-Mexico Border and San Diego International Airport is a vital step towards having a transit system that meets the needs of residents and visitors.

The City shares the 2021 Regional Plan’s goal to provide better transit access and housing opportunities in employment centers. Over the past two years, the City has adopted updated Mission Valley and Kearny Mesa Community Plans to accommodate more housing and existing and future transit improvements in
high employment centers. We are also in the process of updating our community plans for University and Mira Mesa (Sorrento Mesa) which include major high-tech and biotech employment centers. These plans focus additional housing opportunities along existing and planned transit lines needed to support continued economic prosperity. Downtown San Diego has experienced a high level of residential growth as well as a recent resurgence of employment growth. The success of future housing and job growth in these employment centers is predicated on the implementation of rail transit, managed lanes, and bicycle networks, and the technological improvements to our regional arterials. These investments into our infrastructure will also provide jobs for the region’s skilled labor force.

The City strongly supports efforts to increase mobility options including the development of high frequency transit in communities of concern with increased transit infrastructure and service needed to provide convenient access to job centers. The City recommends that SANDAG identify the planning and engineering of the commuter rail (purple line) between San Ysidro and Sorrento Valley, separation of existing light rail at-grade crossings, dedicated and/or flex lanes for Rapid Bus routes within the City, as well as double tracking the LOSSAN corridor as shovel ready projects for future state and federal funding.

The San Ysidro and Barrio Logan communities are affected by truck emissions due to their proximity to the U.S.-Mexico border crossing and the Port of San Diego respectively. The 2021 Regional Plan addresses the needs for air, rail, and port goods movement and smarter border strategies to support trade and international commerce. The City supports San Diego Forward’s goals and policies to reduced air pollution which are needed to meet federal air quality conformity requirements and improve some of our most underserved, low-income communities.

The City has a long history of planning together with SANDAG to creating a land use pattern and transportation network that facilitates greater mobility and increased connectivity between employment and housing. The City encourages SANDAG to continue funding the Smart Growth Implementation Program which provides needed grant funding for planning and capital projects that support the implementation of the Regional Plan. We have included additional recommendations attached to this letter for SANDAG’s consideration and look forward to partnering with SANDAG on its new Housing Incentive Program to achieve the goals of the Regional Housing Needs Assessment Plan. We are committed and look forward to a continued partnership with SANDAG on the long-term implementation of the San Diego Forward: The 2021 Regional Plan.

Sincerely,

[Signature]

City of San Diego’s Specific Recommendations to the San Diego Forward: The 2021 Regional Plan

- The City supports the planning and implementation of future rail projects identified in the 2021 Regional Plan. Appendix A, page A-15 on the note on the bottom of the page, please clarify if the purple commuter rail should be route 582 and not 581 as noted. Commuter rail route 581 as identified on page A-29, project TL-01 is Downtown to/from La Mesa projected to be in the 2050 transit network.

- The future purple commuter rail connection would provide access for people throughout the communities within the southern and central portion of the City to employment centers in Kearny Mesa, University, and Sorrento Mesa. The City recommends considering alignment and station options that would serve the Mid-City communities and SDSU West at Mission Valley. We look forward to working with SANDAG in reviewing ridership information/forecasts based on different proposed alignments for the entire line including with and without stations serving the Mid-City communities and SDSU West.

- The City looks forward to working with SANDAG in evaluating options for grade separation of existing light rail at-grade crossings within the City.

- The City recommends implementing near-term operational improvements such as the use of restriping for providing dedicated and/or flex lanes for Rapid Bus routes while planning for long-term capital improvements. We look forward to working with SANDAG in evaluating near-term and long-term options for dedicated and/or flex lanes for Bus Rapid routes.

- The City recommends including the Via Las Cumbres/I-8 Interchange/Hotel Circle North & South/Fashion Valley Road project in the list of proposed projects in Appendix A. As a regionally significant project that provides freeway and active transportation connections to two light rail transit stations and the San Diego River Trail. This will support the recently adopted Mission Valley Community Plan which increasing housing opportunities near the existing light rail stations.

- While the City supports increasing the amount of Transit Priority Areas (TPAs), the City requests that the existing TPAs be maintained in the 2021 Regional Plan. The TPAs are a critical part of the City planning process for future development to help meet out Climate Action Plan goals for the reduction of vehicle miles traveled. Maintaining future transit routes and the TPAs provides consistency in our land use and mobility planning efforts.

Attn: 2021 Regional Plan
SANDAG
401 B Street, Suite 800
San Diego CA, 92101

SUBJECT: DRAFT 2021 REGIONAL PLAN

The City of Solana Beach appreciates the opportunity to review and comment on the San Diego Association of Governments (SANDAG) Draft 2021 Regional Plan (Draft Plan). It is clear that much time and effort went into this important document. Submitted for your consideration are the following comments:

- **Mobility Hubs** – Page 19 of Chapter 2 of the Draft Plan, the Sustainable Communities Strategy (SCS), describes planned “Mobility Hubs” as areas or communities in the region with “a high concentration of people, destinations, and travel choices” that “offer on-demand travel options and supporting infrastructure that enhance connections to high-quality Transit Leap services.” While the SCS seems to acknowledge that these Mobility Hubs can vary both in size and transit availability and can “span one, two or a few miles based on community characteristics,” the SCS and the Draft Plan do not separately categorize or discuss these Mobility Hubs based on these unique characteristics despite having done so previously as well as in Appendix T (Network Development and Performance). Pages 15 through 18 of Appendix T of the Draft Plan – Network Development and Performance – contains a Propensity Analysis for both Transit Leap Services and Mobility Hubs. These analyses identified which transit routes were most likely to meet the needs of transit riders now and in the future and which communities were most suitable for Mobility Hubs. While it should be noted that Solana Beach ranked at the lower end of both (see Figures 12 and 14), these analyses resulted in the apparent establishment of five (5) distinctive types of Mobility Hubs – Coastal, Gateway, Major Employment Center, Suburban and Urban Core – with Solana Beach identified in Figure 15 as a Coastal Mobility Hub. However, the SCS contains no meaningful discussion of these distinctive and unique Mobility Hub areas referring to them only in Figure 2.5 of the SCS where projected future growth is illustrated. The dramatic difference in projected future growth for each of these distinct Mobility Hub Areas, with Coastal Mobility Hubs well below the other four Mobility Hub Areas in both the percentage of future housing and future jobs (5% and 2%, respectively), clearly demonstrates their
uniqueness with respect to jobs, housing and access to high-quality transit and the extent to which each area should be relied upon (or not) to satisfy the region’s future growth.

The adopted 2021 Regional Transportation Plan (Adopted Plan) and the SCS should contain a detailed discussion of the five (5) Mobility Hub Areas and a description of the unique characteristics and transit needs for each – both now and in the future.

Additionally, by virtue of the fact that the Solana Beach Train Station is within 2 ½ miles of the cities of Del Mar, Encinitas and San Diego and the County of San Diego, this regional Coastal Mobility Hub Area in the Adopted Plan should, for purposes of planning for future housing and job growth, extend into and cover the City of Del Mar and the Del Mar Fairgrounds and areas of the cities of Encinitas and San Diego and the County of San Diego immediately adjacent to Solana Beach.

- **Transit Leap Services** – As noted above, the Propensity Analysis discussed in Appendix T for both Transit Leap Services and Mobility Hubs determined that Solana Beach and its Train Station were at the lower end in the region both in meeting the needs of transit riders now and in the future and for suitability as a Mobility Hub. While the City acknowledges that the presence of the Train Station in Solana Beach might make it reasonable to include as a potential future Mobility Hub in the Adopted Plan, during the recent Regional Housing Needs Assessment (RHNA) allocation process, the City also made it clear that, both now and in the near term, the Train Station does not currently provide adequate Coaster or Amtrak headways, nor does it provide meaningful connections to other transit services to be considered a Mobility Hub now. Indeed, despite the North County Transit District (NCTD) Board recently voting to increase Coaster service beginning in October 2021, such a designation is still largely aspirational. While, again, the City acknowledges that the Draft Plan and the Adopted Plan are just that – a plan for the future – Appendix A of the Draft Plan – Transportation Projects, Programs, and Phasing – appears to support this position. Table A.5 (Interstate 5 North Coastal Corridor) identifies one Transit Leap project (TL40) – Rapid 473 – for implementation in the year 2035. Similarly, Table A.9 (State Route 56) identifies one Transit Leap project (TL026) – Rapid 103 – for implementation in the year 2050. These 15 to 30-year forward-looking Transit Leap projects, while helpful for the future, do not appear to satisfy the near-term objectives of a Coastal Mobility Hub.

In order to justify the designation of the Solana Beach Train Station as a Coastal Mobility Hub, both now and in the future, more immediate Transit Leap service connections should be considered for inclusion in the Adopted Plan.
Appendix B: Implementation Actions – Appendix B provides detail on commitments and key actions to implement elements and strategies of the Draft Plan. Key to this objective is the involvement of and coordination with each member agency as they are most knowledgeable of the needs of their respective communities. Indeed, Near-term Implementation Action No. 2 in Table B.1 identifies the need to partner with local governments to develop five initial Comprehensive Multimodal Corridor Plans (CMCPs). Therefore, the City requests that the following minor edits to Appendix B (page 16) under “Land Use and Regional Growth” be included:

“The 2021 Regional Plan vision for land use focuses on development and growth in Mobility Hub areas urbanized areas near jobs to preserve San Diego’s open space and support transportation investments by reducing vehicle miles traveled (VMT). Mobility Hubs are the an opportunity to provide housing to address the Regional Housing Needs Assessment. Land use authority is reserved to local jurisdictions because they are best positioned to effectively implement the objectives outlined in the 2021 Regional Plan through understanding of the unique needs of their communities and geographies. Because land use authority is reserved to local jurisdictions, SANDAG will leverage partnerships with cities and the county through the Smart Growth Incentive Program and other grants to provide funds for transportation-related improvements and planning efforts that support smart growth in Mobility Hubs to realize their vision for their communities. SANDAG will continue its existing grant programs, partner with member agencies on state funding opportunities, and provide data and technical support to assist local jurisdictions with land use planning efforts in line with the 2021 Regional Plan.”

Regional Housing Needs Assessment – Following adoption of the Draft RHNA allocation by the SANDAG Board in September 2020, appeals of the allocation were filed by the cities of Coronado, Imperial Beach, Lemon Grove and Solana Beach. In order that these appeals are correctly noted for the record, there are two locations in the Draft Plan to which a clarifying footnote and additional language should be added to the Adopted Plan. Specifically, the City requests the following for the Adopted Plan:

- On page 33 of the Draft Plan, after the sentence: “The SANDAG Board of Directors adopted the RHNA Plan on July 10, 2020, with the final housing unit allocation” the following footnote should be added:

  * In September 2020, the cities of Coronado, Imperial Beach, Lemon Grove and Solana Beach filed a Petition for Writ of Mandate in San Diego Superior Court challenging, among other things, the Board’s adoption of the RHNA Plan. SANDAG demurred to the cities’ Petition and the demurrer was sustained by the court in February 2021. The petitioning cities have
On page 14 of Appendix K (Regional Housing Needs Assessment Plan), the following paragraph should be added to the end of this page/section:

On September 24, 2020, the cities of Coronado, Imperial Beach, Lemon Grove and Solana Beach filed a Petition for Writ of Mandate in San Diego Superior Court, Case No. 37-2020-00033974-CU-MC-CTL, against SANDAG and SANDAG’s Board of Directors seeking an order requiring that SANDAG give those cities a fair hearing on their RHNA appeals and decide the cities’ appeals in a legal manner without bias and without the use of the weighted voting mechanism. Specifically, the petitioning cities asked the court to order: (1) that the final RHNA allocation approval by SANDAG be rescinded; (2) that SANDAG’s denial of the cities’ RHNA appeals be rescinded; (3) that the appeals be remanded to SANDAG for fair consideration; and (4) that SANDAG be prohibited from utilizing a weighted vote on the cities’ RHNA appeals. On February 5, 2021, SANDAG’s demurrer to the Petition for Writ of Mandate was sustained by the Superior Court. The petitioning cities have appealed the ruling on the demurrer to their Writ Petition. That appeal remains pending in the Fourth District Court of Appeal. So long as the litigation is pending, the Board’s adoption of the RHNA Plan cannot be considered final.

Once again, the City of Solana Beach greatly appreciates the opportunity to review and comment on the Draft Plan. We also appreciate SANDAG’s consideration of our comments and requested changes for inclusion in the Adopted Plan as noted above.

If you have any questions or comments, please feel free to contact Community Development Director Joseph Lim at jlim@cosb.org or 858-720-2434 or me at gwade@cosb.org or 858-720-2444.

Sincerely,

Gregory Wade

RE: Transportation Network Scenarios for the 2021 RTP

Save Our Forest and Ranchlands (“SOFAR”) and the Cleveland National Forest Foundation (“CNFF”), two organizations dedicated to progressive land use planning and the protection of vital natural resources, are submitting comments for the draft transportation network scenarios for the 2021 Regional Transportation Plan Update. We recognize that SANDAG, under its new leadership and with new board members, has undergone a tectonic shift towards building a regional transit system to serve the urbanized western section of San Diego County. The focus of this letter is centered on the required first step towards building a 21st Century regional mobility system, i.e., a first phase area-complete transit, bike, walk system in the urban core that is competitive with the auto.

Therefore, SOFAR and CNFF urge the SANDAG Board of Directors to include a Climate, Housing, Transit Alternative in the 2021 RTP update—an alternative focused on meeting both the housing needs and greenhouse gas (“GHG”) reduction goals for a qualified land use area that have been set collectively by the State of California, the City of San Diego, and SANDAG:

- 40% reduction in GHG below 1990 levels by 2030 (California AB 32 and SB 32)
- 80% reduction in GHG below 1990 levels by 2050 (Governors Schwarzenegger and Brown)
- 25% reduction in per capita GHG from passenger cars and trucks relative to 2005 by 2035 (California SB 375; California Air Resources Control Board\(^1\))
- 14.3% reduction in total daily VMT per capita, and 16.8% reduction in total light-duty VMT per capita, relative to 2015-2018 average by 2050 (California Air Resources Board\(^2\))
- 50% transit, walk and bike mode share for commuters within \(\frac{1}{2}\) mile of a major transit stop in City of San Diego by 2035 (Climate Action Plan, City of San Diego\(^3\))
- 150% increase in transit mode share (SANDAG’s Urban Area Transit Study\(^4\))

---

• Adequately plan to meet the housing needs of everyone in the community (California)\(^5\)
• SB 743 VMT reduction goals

Meeting these goals is not only reasonable, but also urgently required if we are going to solve some of the unrelenting challenges faced by residents of San Diego. Indeed, SANDAG’s prior RTP was found to be deficient for failing to discuss an alternative which could significantly reduce total vehicle miles traveled (“VMT”) (Cleveland National Forest Foundation v. San Diego Association of Governments. (17 Cal.App. 5th 413, 435-437 (2017)). Heretofore, the San Diego region has met these challenges with clever words, not deeds. These goals are achievable only if land use and transportation are addressed together.

These synergies are recognized in SANDAG’s Urban Area Transit Strategy and the City of San Diego’s General Plan Housing Element which includes this goal:

\[
\text{Ensure the provision of sufficient housing for all income groups to accommodate San Diego’s anticipated share of regional growth ...in a manner consistent with the development pattern of the Sustainable Communities Strategy (SCS), that will help meet regional GHG targets by improving transportation and land use coordination and jobs/housing balance, creating more transit-oriented, compact and walkable communities, providing more housing capacity for all income levels, and protecting resource areas.}^6
\]

The Climate, Housing, Transit Alternative would pick up where SANDAG’s Urban Area Transit Strategy left off in 2011.

**Housing + Transportation Affordability (H+T)**

There is a huge amount of attention on housing affordability but too little focus on housing and transportation (“H+T”) affordability. Outlying housing may be cheaper in the short run than housing in the region’s core because of supply and demand – but any savings often are eaten up by increased transportation costs. Dispersed housing requires more cars per household and more VMT and GHG emissions per household.

The Center for Neighborhood Technologies has modeled H+T costs relative to income for the entire U.S. with support of the U.S. Department of Housing and Urban Development. Figure 1 shows the H+T affordability results for the San Diego region for households with the regional typical household income of $64,309.

---

\(^5\) http://www.hcd.ca.gov/community-development/housing-element/index.shtml

Figure 1: H+T Costs as a Percent of Income

Average Housing + Transportation Costs % Income

Factoring in both housing and transportation costs provides a more comprehensive way of thinking about the cost of housing and true affordability.

- Housing: 43%
- Transportation: 35%
- Remaining Income: 22%

$14,250
Annual Transportation Costs

1.79
Autos Per Household

19,847
Average Household VMT

Figure 1 shows that, on average, transportation costs are about two-thirds as large as housing costs. However, transportation costs vary greatly across the region. Figure 2 maps H+T affordability.

Figure 2: H+T Costs as a Percent of Income

7 Center for Neighborhood Technologies. https://htaindex.cnt.org/fact-sheets/?focus=cbsa&gid=42

8 Center for Neighborhood Technologies. https://htaindex.cnt.org/
As shown in Figure 2, when both housing and transportation costs are considered, the most affordable areas are in the light-colored areas primarily in the region’s core and along major transit corridors. The housing affordability problem cannot be solved by building new housing in the darker-colored areas because high transportation costs make those areas inherently unaffordable. The areas in the more remote locations in San Diego County (i.e., even further from the City center) are not shown in order to make the map more readable, but these areas also tend to be more unaffordable when taking into account H+T.9

Real estate developers and their allies are currently pressuring San Diego County to retain its unlawful and inaccurate thresholds for assessing VMT impacts under SB 743, claiming that mitigation for VMT impacts will make housing in more remote parts of the County unaffordable. But housing in these areas is already unaffordable when transportation costs—that is, costs of driving long distances from locations not served by transit—are taken into account. SANDAG can help facilitate a better approach through the RTP, one that encourages the County to plan for housing in areas where transportation costs are low rather than allowing developers to build in remote areas and then trying to “mitigate” for the resulting VMT.

The answer to housing affordability is H+T affordability. It is building more housing in the H+T affordable light-colored areas and in expanding the supply of H+T affordable areas through increased transit service.

---

9Transportation costs—both in absolute terms and as a percentage of income—are even higher in many North County and East County communities (for example, transportation costs alone range from 25% of income in Alpine and Fallbrook to 27% of income in Borrego Springs and 28% of income in Julian and Pala). See https://htaindex.cnt.org/fact-sheets/.
As shown in Figure 3, the San Diego region currently scores extremely low on location efficient neighborhoods which are defined as “compact, close to jobs and services, with a variety of transportation choices.”

Figure 3: Location Efficiency Metrics for the San Diego Region

**Location Efficiency Metrics**
Places that are compact, close to jobs and services, with a variety of transportation choices, allow people to spend less time, energy, and money on transportation.

| Percent of location efficient neighborhoods | 0% |

**Neighborhood Characteristic Scores (1-10)**
As compared to neighborhoods in all 955 U.S. regions in the Index

Increasing this score will require more housing and jobs in areas served by transit today. It will also require a significant expansion of transit infrastructure and a substantial increase in service. The State of California, SANDAG and the County’s municipalities are working towards increasing the supply of housing in location efficient neighborhoods, but more can and should be done.

The Regional Housing Needs Allocation (“RHNA”) Determination, provided by the California Department of Housing and Community Development (“HCD”) in July 2018, requires the San Diego region to plan for 171,685 housing units in the 6th Housing Element Cycle (2021-2029). This 6th Element Cycle gives significant weight to transit availability. As shown in Figure 4, the 6th Element Cycle makes a substantial shift relative to the previous 5th Element Cycle away from the unincorporated areas and into the cities served by transit including San Diego, Escondido, La Mesa, and National City.

---

10 Center for Neighborhood Technologies. [https://htaindex.cnt.org/fact-sheets/?focus=cbsa&gid=42](https://htaindex.cnt.org/fact-sheets/?focus=cbsa&gid=42)
The City of San Diego’s share of the total has risen from 54% of the total in the previous cycle to 63% in the new cycle. The City has ample capacity for this housing. It has identified capacity to construct 164,142 housing units or 56,241 more than required. A large percentage of this capacity is in transit corridors.

These are positive changes. However, in the past, the housing allocations have been aspirational but not enforced. The State has signaled that it plans to be more aggressive about enforcement during this cycle. SANDAG can help the municipalities achieve their housing goals by shifting all transportation spending towards transit and non-motorized (walk and bike) infrastructure. These investments, which will facilitate getting people out of the cars, will also help the region increase density without large impacts on neighborhoods.

In addition to personal savings on car ownership (e.g., acquisition, registration, and insurance) and costs associated with driving (e.g., gasoline, replacement parts, and repairs), municipalities are beginning to recognize that neighborhoods served by transit require fewer parking spaces. Last year, the City of San Diego passed a parking reform package that eliminated parking requirements for sites located within

---

1/2-mile of a transit stop. This is a tremendously important reform for housing affordability because construction of parking can cost as much as $90,000 per space in structures.\textsuperscript{13}

Building a \textbf{RealRegional Transit System} - the Climate, Housing, Transit Alternative

SANDAG’s Executive Director Hasan Ikhrata said:

\textit{I don’t buy the debate that transit doesn’t work. Transit doesn’t work now because it’s not designed to work. You know, if you come from the border to downtown and it takes you, you know... it’s about 20 some miles... it takes you an hour in transit, that’s not real transit, as far as I’m concerned.}\textsuperscript{14}

The San Diego region’s transit system performs much more poorly than its west coast peers. As shown in Figure 5, a much smaller share of the region’s workers commute by transit than other west coast regions.

Those who do commute by transit in the San Diego region suffer an enormous travel time penalty relative to the other large regions in California (Figure 6).

Figure 6: Ratio of Average Transit Commute Time to Average Auto Commute Time

Source: California Household Travel Survey

Improving the regional transit system is not a new idea in the San Diego region; there just has not been enough follow through. Almost a decade ago, SANDAG prepared the Urban Area Transit Strategy (“UATS”) as part of its 2011 RTP to connect regional housing needs with transit infrastructure:

The overarching goal of the UATS was to create a world-class transit system for the San Diego region in 2050, with the aim of significantly increasing the attractiveness of transit, walking, and biking in the most urbanized areas of the region.

The vision called for a network of fast, flexible, reliable, safe, and convenient transit services that connect our homes to the region’s major employment centers and destinations. Achievement of this vision would make transit a more appealing option for many trips, reducing the impact of vehicular travel on the environment and on public health. Other key goals included:

- Making transit more time-competitive with automobile travel;
- Maximizing the role of transit within the broader transportation system; and
- Reducing vehicle miles traveled and greenhouse gas emissions in the region. (p. TA 7-5)\(^{15}\)

\(^{15}\) SANDAG. Urban Area Transit Study.
The UATS showed a high potential for transit ridership in the region’s urban core (Figure 7).

Figure 7: SANDAG Urban Area Transit Study Figure TA 7.8
For transit to become time-competitive with the automobile, the Climate, Housing, Transit Alternative will require much more than a few isolated projects. It will require comprehensive investments at each of the four levels shown in Figure 8.

Figure 8: Complete Transit System

At the top level, improving rail service in the Los Angeles to San Diego (“LOSSAN”) corridor is a top priority. To this end, an important study by Caltrans and CNFF has just been completed regarding the potential transit ridership on the LOSSAN rail corridor between San Diego and Los Angeles. This study arose as a result of litigation filed by CNFF challenging the planned expansion of the I-5 freeway between La Jolla and Oceanside as inconsistent with California’s GHG emission targets. CNFF and Caltrans reached a settlement that focused on the potential to improve rail service on the LOSSAN corridor. In particular, the parties agreed to study the feasibility of constructing a double-track rail tunnel through Miramar Hill to facilitate transit on the corridor. The parties believed that the Miramar tunnel could reduce travel times and provide improved connections to local transit services in the University Town Center (UTC) area.

The recently-completed study concludes that the Miramar tunnel and rail line straightening would add a critical link to the LOSSAN rail corridor. See Exhibit #1 (Miramar Tunnel Feasibility Study). Critically, it finds that the feasibility criteria for the Miramar tunnel have been satisfied. Its specific findings include the following:

1. The project would increase discretionary passengers by 1,300 to 1,700 per day, thereby reducing annual VMT 200 million to 240 million miles and GHG by 70,000 to 84,000 tons.

2. The project would provide competitive travel times, including a transit system average clock time that is approximately 3% faster than the automobile.

3. The project would be cost competitive, with transit riders cost at $180/month versus automobile costs of $507/month.

4. The project has no fatal engineering flaws.
The study further acknowledges a prior federal study that found construction of the Miramar tunnel along with other corridor improvements would reduce travel time between San Diego and Los Angeles to two hours. In short, construction of the new tunnel, which would provide enhanced access to downtown and the airport, would be a key transportation improvement for the region and the state. As the study notes, the LOSSAN rail corridor— together with the I-5 freeway – is the second-most traveled route in North America. The Miramar tunnel must be considered a key component of the Climate, Housing, Transit Alternative.

At the next level is a network of higher-speed, high frequency transit lines with separate rights of way and fewer stops. In many regions, a light rail service fills this niche, but in the San Diego region the Trolley has not filled this niche well. It operates too slowly and service is not frequent enough. Improvements are needed in both these dimensions. Achieving the required level of service in this higher-speed tier will require a rethinking of the system. As part of the Climate, Housing, Transit Alternative, SANDAG should evaluate speeding up the existing lines through grade separations and eliminating stops, as well as creating new higher-speed lines.

Express buses on managed lanes currently do not serve this higher-speed niche well because they connect freeway interchanges instead of land uses. A typical trip using these express buses will be unattractive because it also will involve connecting bus service on one or more circuitous routes. Express buses and managed lanes can work well for some park-and-ride travelers traveling to major destinations but cannot serve a significant portion of the region’s population well.

Both the regional rail and higher-speed high-frequency tiers need to be well connected. The Climate, Housing, Transit Alternative must include an inter-modal terminal (Grand Central) connecting San Diego’s urban core, the Airport, the LOSSAN corridor, the Sprinter corridor, and the Trolley system.

The Climate, Housing, Transit Alternative must also include efficient connections with frequent local buses (which could possibly be automated in the future). To this end, SANDAG must grapple with the first mile/last mile issue as this reflects a failure in land use and the existing transit system. While higher income travelers may have a choice of Uber-type services to solve this problem, this should not be viewed as a remedy for the average traveler.

Finally, the goal of a functional transit system is to serve an area-complete bike and walkable land use because no trip begins or ends on a transit vehicle. Most transit trips begin and end with a walk trip. In regions with high transit use, there are generally about twice as many walk trips as transit trips. Investments in walk and bike infrastructure should be a top priority. Consistent with the City’s Climate Action Plan, the Climate, Housing, Transit Alternative must model a 50% transit, walk and bike mode share for residents in the central core.

Stop Expanding Freeways

Building a real regional transit network will require all the region’s transportation investment dollars for the foreseeable future. The Climate, Housing, Transit Alternative must not include any freeway expansion.

The billions of dollars spent on freeway expansion the past 20 years have A) failed to reduce congestion, B) caused a substantial increase in VMT and GHG emissions, and C) resulted in a severe housing shortage. The transportation models used to justify these freeway expansion projects have been wrong
on all counts. These models - both in the San Diego region and in regions throughout the U.S. – forecast dire increases in travel time if freeways are not widened, and substantial increases in travel time even if they are widened. In fact, as shown in Figure 9, travel time has stayed remarkably constant in the U.S. for decades.

Figure 9: Average Time Driving (minutes per day) 1990-2017 by MSA Population (NHTS)

![Figure 9: Average Time Driving (minutes per day) 1990-2017 by MSA Population (NHTS)](image)

Source: National Household Travel Survey.

Figure 9 shows the “average time spent driving a private vehicle in a typical day.” There was an increase during the 1990s, a time when many women were joining the labor force, but since 2000 there has been little change. Time spent driving also is very similar across differently sized regions. There is evidence that people have a “travel time budget”. If travel speeds drop, they (on average) will adapt to travel a shorter distance.

In contrast, if travel speeds increase, people (on average) will travel longer distances. This phenomenon is known as “induced travel”. In work for the California Air Resources Board (“CARB”), researchers at the University of California and the University of Southern California reviewed the literature on induced travel and concluded:

_Thus, the best estimate for the long-run effect of highway capacity on VMT is an elasticity close to 1.0, implying that in congested metropolitan areas, adding new_
capacity to the existing system of limited-access highways is unlikely to reduce congestion or associated GHG in the long-run.¹⁶

The SANDAG regional transportation model fails to account properly for induced travel although there now are newer algorithms that could address this deficiency.¹⁷

Senate Bill 743 establishes VMT as the appropriate metric for determining the impacts of transportation projects. This has made properly accounting for induced VMT critical in the regulatory process. The Office of Planning and Research’s (“OPR”) Technical Advisory on Evaluating Transportation Impacts in CEQA recommends:

*Whenever employing a travel demand model to assess induced vehicle travel, any limitation or known lack of sensitivity in the analysis that might cause substantial errors in the VMT estimate (for example, model insensitivity to one of the components of induced VMT described above) should be disclosed and characterized, and a description should be provided on how it could influence the analysis results. A discussion of the potential error or bias should be carried into analyses that rely on the VMT analysis, such as greenhouse gas emissions, air quality, energy, and noise.*¹⁸

The National Center for Sustainable Transportation at the University of California at Davis has produced an *Induced Travel Calculator*¹⁹ to help address the deficiencies in the models. Recently, Caltrans also has issued new draft guidance on accounting for induced travel. It recommends following the OPR recommendations:

*Caltrans recommends using the VMT analysis approaches recommended in OPR’s advisory when evaluating the transportation impacts of projects on the State Highway System (SHS).*²⁰

Neither expanding freeways nor not expanding freeways will have any effect on regional congestion or average travel times. However, expanding freeways will cause significant increases in VMT and GHG emissions, and will continue to starve the transit system of needed investments.

---

¹⁹ [https://ncst.ucdavis.edu/research-product/induced-travel-calculator](https://ncst.ucdavis.edu/research-product/induced-travel-calculator)
A Completely New Direction is Needed

Given that transit in the San Diego region has been and continues to be severely under-funded and under-built compared to roadway projects, as discussed above, the Climate, Housing, Transit Alternative must exclude roadway/freeway funding and expansion. Heretofore, SANDAG’s planning has arbitrarily segmented freeway and transit projects. This artificial segmentation is not only irrational, it is fatal in achieving sustainable housing goals because transit, bike, and walk mobility and auto-based mobility serve contradictory land use purposes. SANDAG’s failure to historically recognize this fundamental truth is the Achilles heel of its planning and lies at the doorstep of the agency’s on-going inability to deliver a plan that truly unites our community on an ecologically sustainable foundation.

It is abundantly clear that SANDAG’s past planning efforts have not only been deficient but have repeatedly failed to heed the ominous warnings from the courts, the public, and the planet itself. With California literally on fire due largely to climate change induced drought and high temperatures, SANDAG has failed the public by not aggressively pursuing a transportation scenario that would meet the State’s GHG and VMT reduction goals.\(^{21}\) The Climate, Housing, Transportation Alternative would help achieve targets set in legislation, the California Air Resources Board’s Climate Change Scoping Plan, and relevant Executive Orders.

Similarly, with regard to the local housing crisis, it is inconceivable that SANDAG’s prior RTPs have not called for a 50% transit, bike, and walk mode share alternative necessary to activate infill housing, especially since the urban core is already zoned for such housing. Here too, the Climate, Housing, Transit Alternative would facilitate this infill housing and help the City of San Diego achieve the targets set forth in its Climate Action Plan.

Additionally, the County’s continued business-as-usual approach to planning makes the need for SANDAG to strengthen guidance regarding future development in the region all the more pressing. In spite of all the talk of a new direction, the County recently unveiled a plan update for the forest community of Alpine which can only be described as a VMT and ecosystem catastrophe. This planning contradiction was noted in Shute Mihaly’s comment letter on the Alpine plan\(^{22}\). The tectonic shift in regional transit mobility mentioned in the opening paragraph of this letter must become a reality soon to avoid irreversible damage to our wild lands and a missed opportunity for the region.

Faced with these pressing social and environmental challenges, SANDAG’s new regional direction can be strengthened by following established judicial, executive, and local legislative guidelines designed to meet the housing and climate crises. The public urgently deserves to see what it would take for the region to build a world-class transit system and to develop reasonably priced infill housing. Common sense dictates that the Climate, Housing, Transit Alternative would necessarily begin with a complete, first phase transit, bike, and walk system with an inter-modal terminal connecting the Airport, the Central Core, the LOSSAN Corridor, the Sprinter corridor, and the Trolley system. It is important to note that the Climate, Housing, Transit Alternative would not only be the “environmentally superior alternative”, it would also be the socio-economic superior alternative because a true transit, bike and walk system reduces both the cost and shortage of housing and the cost of driving.

\(^{22}\) https://drive.google.com/file/d/1Nt6sc7weFGbHCNIHsNOiMFCiQKjcCVfP/view
In conclusion, in the face of a severe, entrenched housing crisis endangering the public welfare and the severe climate crisis endangering the planet, SANDAG owes the public nothing less than a transit alternative that immediately meets these life threatening challenges rather than artificially prolonging them.

SANDAG
401 B Street, Suite 800
San Diego, CA 92101

RE: Climate Action Campaign Comments, SANDAG’s Draft 2021 Regional Plan

Climate Action Campaign is a climate and environmental nonprofit organization based in San Diego and Orange County with a simple mission: stop the climate crisis through effective policy action.

We thank SANDAG staff and Board for their work on the draft 2021 Regional Plan, and are encouraged by the agency’s bold new direction to start the process of transforming the San Diego region’s transportation system so it is more sustainable and equitable.

Please see below for our comments to strengthen the draft plan to secure a transportation future that is climate-safe and climate-just:

**Putting the Region on the Path to Zero Carbon**

The most up to date climate science, including the landmark 2018 UN IPCC Special Report on Global Warming, says that we must eliminate greenhouse gas emissions by mid-century to stave off the most devastating impacts of the climate crisis, such as wildfires, extreme heat, drought, flooding, and more.¹

California’s strongest climate goal, Executive Order B-55-18, calls for carbon neutrality as soon as possible, and no later than 2045.² Meanwhile, CARB’s mandated emissions reduction target for SANDAG, per SB 375, is a 19% reduction of per capita greenhouse gas emissions from cars and light duty trucks below 2005 levels by 2035. Page 13 of Chapter 1 states that the 2021 Regional Plan will achieve a 20% reduction, exceeding the MPO’s state mandate.

Transportation accounts for nearly half of the region’s emissions. To remain on track to achieve carbon neutrality, as climate science says is necessary, SANDAG must go further in exceeding CARB’s target. We believe a reduction from transportation by at least 30% by 2035 is achievable and needed to ensure a climate-safe Zero Carbon future, and urge SANDAG to map out the strategies needed to achieve that target.

¹[https://www.ipcc.ch/sr15/](https://www.ipcc.ch/sr15/)
**Youth Opportunity Passes: No-Cost Transit for Youth 24 and Under**

Page A-51 of Appendix A proposes “subsidies to reduce the fares paid by transit riders.” Appendix A should be amended to include an explicit commitment to Youth Opportunity Passes (YOP)—no-cost transit passes for youth 24 and under—and should be implemented immediately following the adoption of the 2021 Regional Plan. SANDAG should also commit to overseeing YOP in partnership with MTS and NCTD, to ensure successful implementation by the local transit operating agencies.

Community based organizations have been fighting for YOP for nearly a decade, as it is an essential investment in our region’s youth, providing access to education and early career opportunities, while fostering the next generation of sustainable transportation riders.³ We urge you to make YOP a top priority in the 2021 Regional Plan.

**Mode Shift Projections in Transit Priority Areas**

Attachment 6 of Appendix T (Network Development and Performance), includes the “Performance Measure Results Tables.” Page T6-6 includes mode share projections for the 2021 Regional Plan for the benchmark years 2025, 2035, and 2050 for peak period work trips, all day work trips, and all trips.⁴

We request this same set of projections, but specifically for Transit Priority Areas, to be able to compare Climate Action Plan’s mode shift targets with the mode shift that will be achieved through the buildout of the plan.

For example, the City of San Diego’s Climate Action Plan (CAP) set ambitious targets for the percentage of commuters travelling by bike, walk, and transit in Transit Priority Areas (18% by bike, 7% by walk, and 25% by transit by 2035)⁵, and we want to ensure our regional transportation goals and local transportation targets are meaningfully aligned.

**Expedite Transit Leap Timelines, Prioritizing Investments in Communities of Concern**

To maximize mode shift away from fossil fuel cars and towards bike, walk, and transit, Transit Leap timelines must be expedited, and prioritized in the early years of the plan over Managed Lanes and Managed Lane Connector, which will yield an increase in vehicle miles travelled.

Investments in commuter rail, light rail, and bus rapid transit infrastructure should be prioritized in Communities of Concern, to increase access to sustainable mobility options and connections to the region's job centers. The climate crisis and environmental injustice have and will impact Communities of Concern first and worst. Historically underinvested communities are exposed to

---

³https://www.midcitycan.org/aboutyop
the region’s most dangerously polluted air from cars and trucks, and are left with disconnected transit trips or long, expensive car commutes. As such, we support the inclusion of “Social Equity Early Action Transit Pilots” as a mechanism to streamline immediate investments in the communities on the frontlines of these crises.

**Expedite Completion of the Del Mar Tunnel**

Page A-26 of Appendix A states that the Del Mar tunnel will be complete by 2035. Currently, the 1.6 mile stretch of LOSSAN tracks in Del Mar is located dangerously close to the edge of the bluffs, and several bluff failures within feet of the tracks have occurred over the past 2 years alone.

With the bluffs eroding at approximately 6 inches per year, and the ever-intensifying threat of sea-level rise due to the climate crisis, these incredibly dangerous bluff failures will only increase in severity and frequency, putting lives seriously at risk.

Moving the tracks off the bluffs is essential to securing a long-term solution for the LOSSAN corridor, while preventing increased air pollution from shipping trucks, and ensuring economic prosperity for the region. To secure a climate-safe transportation system, we urge you to make the Del Mar tunnel a top priority, and urge for completion as soon as possible, no later than 2025-2030.

**Conclusion**

Thank you for the opportunity to provide comment on this critically important document. The 2021 Regional Plan is a key opportunity for climate action, justice and equity for Communities of Concern, and good union jobs. We look forward to continued engagement with SANDAG on the plan this year.

Sincerely,

Noah Harris
Policy Advocate
Climate Action Campaign

Hasan Ikhrata  
Executive Director  
SANDAG  
401 B Street, Suite 800  
San Diego, CA 92101

Sent via email to: SDForward@sandag.org

REQUEST FOR COMMENTS ON THE DRAFT 2021 REGIONAL PLAN FOR THE SAN DIEGO ASSOCIATION OF GOVERNMENTS (SANDAG)

Dear Mr. Ikhrata,

Thank you to the San Diego Association of Governments (SANDAG) for your efforts to create a Regional Comprehensive Plan and Sustainable Communities Strategy (Regional Plan) to help design a regional transportation system that is fast, fair, clean and reduces greenhouse gas emissions. As County staff, we are committed to working with SANDAG staff on our shared goals of implementing programs and services to improve the quality of life of our residents as we determine where and how we grow, connect people and places, protect the environment, and provide opportunity for all of our region’s residents.

This comment letter outlines areas within the Regional Plan for which County staff would like to request further clarification, exploration, and consideration. Attachment A provides additional comments from County staff for your consideration and incorporates additional information related to County-specific plans or policies that may further inform the Regional Plan.

LAND USE, TRANSPORTATION PLANNING, AND SMART GROWTH
Land use and transportation planning in the San Diego region is evolving to better address the most pressing issues of today, including climate change, quality of life, attainable housing, and social and economic inequities. The County has several planning efforts underway which prioritize addressing these issues, including the Regional Decarbonization Framework, the Climate Action Plan Update, the Electric Vehicle Roadmap, Office of Environmental and Climate Justice, and establishment of VMT thresholds. While independent of the Regional Plan, these efforts are aligned with the goals of the Regional Plan. County staff is interested in further understanding the regional growth modeling assumptions used within the Regional Plan and alignment with these County efforts.
PLANNING FOR THE UNINCORPORATED AREAS

The County represents more than 500,000 residents who live within 34 unincorporated communities throughout the region. County staff would like to better understand how the Regional Plan will address transportation options outside of proposed mobility hubs for those communities. The unincorporated community of Ramona, for example, has a population of 36,000 residents, which is a larger population than the incorporated communities of Imperial Beach, Lemon Grove, Coronado, Solana Beach, and Del Mar.

Less than 1% of the unincorporated area is within the proposed mobility hubs, which is where transit and on-demand travel infrastructure investment will be focused. The unincorporated north and east county communities represent a significant population with higher-than-average VMT in the region. Investment in public transit and other transportation options will make it easier for people to drive less, which results in decreased GHG emissions. However, investment outside of mobility hubs appears to be limited, which would make it difficult for unincorporated residents to use new transit service.

To promote greater equity, County staff see opportunities to expand the proposed mobility hubs to include adjacent unincorporated communities. When we overlay the proposed mobility hubs with the County’s VMT efficient areas (using both the unincorporated and regional averages), North County Metro, Lakeside, and Spring Valley (Attachment B) are adjacent to what appear to be proposed mobility hubs. These unincorporated communities would benefit from additional access and investment associated with inclusion in adjacent mobility hubs, as these communities have few existing alternative options to driving.

County staff is also interested in understanding how Regional Housing Needs Assessment (RHNA) allocations would be assigned. For the current 6th RHNA cycle, which covers 2021 – 2029, SANDAG allocated 6,700 units for the unincorporated area, with a total housing forecast in the Regional Plan of 7,419 units through 2050 for the unincorporated area. This forecast projects the County’s RHNA allocation of 6,700 units being met by 2029, with an additional growth of 719 units by 2035, and projects no further growth in the unincorporated area through 2050. Based on this forecast, it appears that beyond 2035, all future housing needs in the region from RHNA cycles would be allocated to and met by growth in incorporated cities.

In order to fulfill the goals of the Regional Plan in providing access to affordable, reliable, and safe mobility options for everyone in the region, County staff would like to work with SANDAG to ensure consideration is given to future investments and incentives within the unincorporated area that would result in expanded options for transit and active transportation, and to encourage shorter and fewer automobile trips, including locations of mobility hubs, transit leap, flexible fleets, and complete corridors.

COMMUTER PATTERNS AND MOBILITY IN THE UNINCORPORATED AREA

The Regional Plan focuses on five key investment opportunities: Next Operating System (OS), Complete Corridors, Transit Leap, Mobility Hubs, and Flexible Fleets. Many of the Regional Plan investments would be contained within proposed mobility hubs and along identified complete corridors. The majority of infrastructure improvements appear to support a shift to new rail and trolley line infrastructure, largely along the coastal areas. However, Ramona, Lakeside, Spring Valley, and other unincorporated east and north county communities represent a significant population that would benefit from similar consideration for infrastructure improvements as that proposed for the coastal communities with less population. According to SANDAG’s “Commuting Patterns in the San Diego Region” study, a majority of the unincorporated east and north county residents who are employed commute outside the boundaries of their County Supervisorial
district, with 84% of District 2 residents working outside the district and 82% of District 5 residents working outside the district. Vehicle miles traveled could be reduced through greater mobility options for the unincorporated area (i.e., expansion of mobility hubs, increased transit options such as bus rapid transit, and improvements to transit frequency and service areas).

The County worked closely with SANDAG as part of the 2015 Regional Plan to identify roads in the unincorporated areas to include in the Regional Arterial System (RAS). Many of these roads serve as evacuation routes during emergencies, provide access to unincorporated communities from Caltrans roads, and create a link to the larger San Diego region.

County staff would like to continue coordinating with SANDAG to further identify Regional Plan investments in infrastructure, technology, and communication improvements for roads identified in both the County’s Mobility Element and unincorporated roads included in the RAS and how these investments will further connect the unincorporated area to proposed mobility hubs, flexible fleets, or transit leaps. In addition to providing efficient movement of people and goods, these investments would increase the efficiency of evacuation routes, relay important information on evacuation conditions to first responders, and assist in getting residents safely away from hazardous conditions, all important components of resiliency planning.

**FUNDING AND FINANCING**

County staff appreciates the difficulty in forecasting funding and revenue sources for a regional transportation network. The Regional Plan identifies use of TransNet funds as part of the implementation, but it is not clear whether projects that have previously been planned, programmed, or awarded as part of the previous plan using TransNet would retain that funding allocation, or if there would be a reallocation of these funds as part of the Regional Plan. It is also unclear if there would be any changes to the current allocation or use of funds that local agencies receive directly for local road system improvements. The unincorporated area relies on TransNet funding to build, improve, and maintain transportation facilities that enhance roadway safety and support smart growth development, including road infrastructure to support increased transit options. Loss or reallocation of this funding could affect these projects and limit the County’s ability to provide transportation services in support of our goal of reducing greenhouse gas emissions.

The Regional Plan indicates that user fees would help build a transportation system that provides travelers with alternatives to driving. County staff would like to further discuss how the proposed road user charges would be developed, implemented, and applied to ensure that this funding strategy will not disproportionately burden unincorporated communities, which often have longer commutes and less access to alternative transportation options due to lack of regional planning for transit services to these communities. Revenues generated should also be allocated to support additional transportation and mobility options in unincorporated communities, while vehicle use by those with access to alternate modes of transportation should be disincentivized since their communities are receiving significant investments in public transit.

County staff looks forward to learning more about how future funding and investment would be applied to ensure that both the benefits and the costs of the Regional Plan are equitably distributed across the region.

**RESOURCE DISTRIBUTION**

The Regional Plan provides SANDAG with an opportunity to guide future investments in a way that meets smart growth objectives and reduces GHG emissions, but also guides future allocation of resources to achieve equitable outcomes. Several of the unincorporated communities, such as Lakeside, Spring Valley, and Ramona, have larger populations than some of the incorporated
cities that are prioritized in the Regional Plan. In review of the proposed plan expenditures, a
majority of the capital investments (55% of RTP funding) appear to go toward mobility hubs,
complete corridors, and Next OS investments that are primarily outside of unincorporated
communities. It is unclear what proportion of investment would go toward addressing mobility
challenges within unincorporated communities and infrastructure investment that would provide
linkages between the unincorporated areas and the proposed mobility hubs, transit leap, flexible
fleets, and complete corridors. County staff is committed to working with SANDAG to further
identify opportunities to equitably distribute the mobility benefits of the 5 Big Moves and further
reduce GHG emissions regionwide.

The County appreciates the opportunity to comment on the Draft Regional Plan, and staff looks
forward to future discussions regarding these comments. If you have questions regarding this
letter, please contact Rami Talleh, Deputy Director with the Department of Planning and
Development Services at 858-495-5475 or Rami.Talleh@sdcounty.ca.gov.

Sincerely,

SARAH E. AGHASSI

Valley)
ATTACHMENT A
2021 REGIONAL PLAN COMMENTS FROM COUNTY OF SAN DIEGO
DEPARTMENTS AND DIVISIONS

County of San Diego (County) staff in Planning & Development Services, the Department of Public Works, and the Department of Parks and Recreation reviewed the San Diego Association of Governments’ (SANDAG) Draft 2021 Regional Plan (Regional Plan), for applicability to their respective work programs and County initiatives that are planned or currently underway. The County offers the following comments for your consideration.

TRANSPORTATION

1. County staff would be interested to better understand and discuss further with SANDAG the potential for Regional Plan strategies to be used as part of a potential regional mitigation strategy related to Vehicle Miles Traveled (VMT).

2. When would funding be expected to be implemented related to Transit Leap/Flexible Fleet Connections to Mobility Hub areas, as this is a potential opportunity to reduce VMT for residents living in the unincorporated area?

3. The County has developed an Electric Vehicle (EV) Roadmap and is committed to assisting with the deployment of regionwide EV infrastructure to reduce GHG emissions in the transportation sector. Could SANDAG provide additional details on the future development, application, and implementation of the proposed Road User Fees and other proposed road usage revenues? Will consideration be given to exemptions for use of clean mobility strategies?

4. County staff would like to discuss with SANDAG staff the Regional Plan strategies, including funding for Major Transit (for purposes of CEQA, defined as a rail transit station, ferry terminal served by bus or rail, and a bus stop with two or more lines that provide transit service at 15 minute intervals or better during peak commute periods) in areas of the unincorporated area that are identified as “VMT efficient” in the SANDAG VMT Map.

5. There is significant investment in development and infrastructure in the Otay Mesa area, and Otay Mesa is identified as a “Mobility Hub” area in the RTP. County staff would like to better understand what funding has been identified for this “Mobility Hub” area.

6. County staff would like to discuss with SANDAG the potential for “Major Transit” services along the I-15 corridor, such as the potential for buses on shoulders.
ROADS/TRAFFIC/FIELD ENGINEERING

7. Complete Corridors, such as the SR-67 and I-15 Corridors, are envisioned to act as the backbone of the regional transportation system. In addition to providing for safe and comfortable spaces to get around for all modes of transportation, road improvements such as intersection widening are important for the safe and reliable movement of all road users. County staff would like to discuss further identification and investment within complete corridors that provide linkages to the unincorporated area. These improvements could assist in providing routes for the County’s eastern and northern rural regions that could be essential in the event of accidents or fire evacuation. For example, County staff would like to discuss with SANDAG the option of including safety improvements along the SR-67 Corridor on Wildcat Canyon Road, as this road is a relief route to SR-67. Additionally, road improvements on Old Hwy 395 and Pala Temecula Road in the north county may merit further conversation, as both of these roads serve as alternate routes to I-15 during peak traffic hours.

8. County staff would like to further discuss improvements of low flow crossings that are necessary to limit area flooding as well as the safe passage of motorists.

9. County staff would like to work with SANDAG to identify evacuation routes at a regional level, and the possibility of creating a separate section within the Regional Plan that would identify improvements of these routes and potential funding that could be part of the 2021 Regional Plan.

10. County staff would like to discuss with SANDAG how Smart Infrastructure and Connected Vehicles will address the legal and financial challenges with sharing traffic signal data with private entities and the liability of the potential misuse of signal timing data.

11. County staff would like to better understand the impact of Electric Vehicle Infrastructure on County of San Diego public right of way.

WATERSHED

12. Stormwater Management & Regional Needs Assessment; suggested edits in Appendix R, page R-2:
   a. “The County of San Diego has initiated an update of the 2010 Needs Assessment’s 40-year water quality cost estimate using more recent water quality planning documents and strategies for achieving regulatory compliance and water quality objectives throughout the region. Since 2010, the CO permittees have worked to formulate Water Quality Improvement Plans (WQIPs) for the region’s watersheds, including strategies, planned projects, and schedules to address their respective water quality objectives and compliance needs. The update to the Needs Assessment is intended to assist the County in planning and decision making and will draw upon the most recent WQIPs, with a focus on unincorporated areas to develop updated cost information.”
BIOLOGY

13. Figure AA.1 shows the conserved habitat lands in the San Diego region (light green) and displays the areas included in the four subregional habitat conservation plans (subfigure).
   a. The Pre-Approved Mitigation Area (PAMA) of the South County Multiple Species Conservation Program (MSCP) and draft PAMA of the draft North County MSCP are labeled as “Proposed Conserved Habitat Lands” (dark green). This label may be misinterpreted by readers. While the MSCP Preserves will be assembled within the PAMA, not all PAMA designated lands will be conserved or are being actively pursued for conservation at this time.
   b. The draft Focused Conservation Area (FCA) of the draft East County MSCP was not included in the “Proposed Conserved Habitat Lands” (dark green). This area is equivalent to the draft North County MSCP’s draft PAMA and should be included in this figure.
   c. The Rancho Guejito property located north of San Pasqual Valley Road will not be included in future iterations of the draft North County MSCP Permit Area. The portions of this property identified within the draft North County MSCP should be changed from dark green to white to reflect this change.
   d. In the subfigure, both the draft North County MSCP and Multiple Habitat Conservation Plan (MHCP) are identified by the number “4.” The MHCP area should be identified by the number “1” to correspond with the provided key.

14. Although the draft 2021 Regional Plan mentions the importance of protecting habitat corridors and wildlife linkages through land acquisition, it does not appear to include the construction of safe passageways to connect wildlife to preserved lands bisected by existing and future regional transit corridors. It is recommended that SANDAG work with the San Diego Monitoring and Management Program (SDMMP) and community partners to identify the areas along regional transit corridors that would benefit from wildlife crossings and that these improvements be included in future regional projects.

PARKS AND RECREATION

15. For proposed projects that occur adjacent to Department of Parks and Recreation (DPR) County-managed lands, DPR staff would like to coordinate with SANDAG staff to ensure wildlife connectivity is maintained from adjacent lands to preserved County lands, including wildlife-only crossings.

16. For proposed projects that occur adjacent to or near existing or potential future trail connections, DPR staff would like to coordinate with SANDAG staff on trail connectivity throughout the County and incorporate safe multi-use crossings such as bridges or overpasses for recreational use.

17. DPR staff request SANDAG staff coordinate in developing SANDAG’s 5 Comprehensive Multimodal Corridor Plans as mentioned in Appendix B: Implementation near DPR facilities:
   a. Central Mobility Hub and Connections, Coast, Canyons, and Trails – State Route 52, North County – SPRINTER/Palomar Airport Road/State Route 78/State Route 76, San Vicente – State Route 67, South Bay to Sorrento – Purple Line/Interstate 805/Blue Line/Interstate 5 South.
b. Study additional seven corridors to inform the next Regional Continuing Actions.

c. Pursue funding opportunities for projects, programs, and services identified in completed CMCPs.

18. County Staff would like to discuss with SANDAG the possibility of including trails and trail systems within the unincorporated area as part of the 2021 Regional Plan and to consider California Coastal Trail connections to DPR facilities.

AIRPORTS

19. As the owner and operator for eight airports in the region, County Airports continues efforts to safely operate its facilities, ensure future land uses are compatible with aircraft operations, and protect the health and safety of people and property within the vicinity of an airport. The County’s airports serve as transportation hubs, emergency service facilities and economic engines in their communities. McClellan-Palomar Airport is the only commercial airport in North County and has over 145,000 annual aircraft operations. It is also a Customs and Border Protection Port of Entry. In East County, Gillespie Field is the 44th busiest airport in the nation with 240,000 annual operations. Both of these airports support thousands of jobs and generate hundreds of millions of dollars in economic activity. The County looks forward to the integration of these airports into the regional transportation system.

20. The San Diego County Regional Airport Authority adopted Airport Land Use Compatibility Plans for the eight airports, which included land use compatibility policies related to airspace, noise, safety and overflight. Those policies have been adopted by the County of San Diego through its General Plan and Zoning Code. After evaluating the forecasted increases in housing and jobs around the Mobility Hubs, there are several land use assumptions related to safety and noise around Fallbrook Airpark, Jacumba Airport, Gillespie Field and McClellan-Palomar Airport that County staff would like to better understand. For example, there are forecasted incompatible housing increases within the Runway Protection Zones at Gillespie Field. These inconsistencies could result in the assumed intensities and densities increases being unachievable.
ATTACHMENT B
2021 REGIONAL PLAN PROPOSED MOBILITY HUB EXPANSION AREAS

The Regional Plan will focus future investment, development, and growth in centralized areas referred to as "mobility hubs." There are locations in the unincorporated area that the County has forecasted for future growth, which included already designated Regional Housing Needs Assessment (RHNA) sites, and are located within close proximity to a proposed mobility hub. The County would like to work with SANDAG to consider the expansion of proposed mobility hubs to include additional unincorporated north and east county communities. As indicated in Figure 1, these proposed expansions include areas in North County Metro, Lakeside, and Spring Valley. Additional details for these three mobility hub expansions are provided below.

The North County Metro community is located between the proposed Vista and San Marcos mobility hubs. Expansion of the San Marcos mobility hub could include the Buena Creek Sprinter Station and additional housing units, including multiple RHNA sites.

Lakeside has multiple areas that are identified as efficient areas compared to the regional vehicle miles traveled (VMT) average. These areas are located immediately adjacent to the proposed El Cajon mobility hub. Expansion of the El Cajon mobility hub could include these VMT efficient areas as well as potentially including additional growth areas in Lakeside along the I-8 corridor.

Spring Valley is located east of the proposed Lemon Grove mobility hub and south of the proposed La Mesa mobility hub. This community has existing transit access along Jamacha Boulevard and is in close proximity to the MTS Trolley stations in Lemon Grove. Expansion of this mobility hub could include the Spring Valley areas near SR-125 and along Jamacha Boulevard.

Re: Support incorporating Reconnect Logan, 5 Freeway Lid Project in the San Diego Association of Governments’ (SANDAG) 2021 Regional Plan

Honorable SANDAG Board,

On behalf of the residents and community leaders of Barrio Logan and Logan Heights, we submit these letters of support for the creation of a priority not currently identified in the 2021 Draft Regional Plan. It is imperative that you incorporate a project to address social and economic inequity, rising levels of health concerns aggravated by greenhouse gas emissions, and transportation injustices in San Diego’s Barrio Logan and Logan Heights communities. Specifically, we request the addition of a Freeway Lid as a priority project in SANDAG’s 2021 Draft Regional Plan (Draft Plan).

Our once united community was devastated by Interstate 5 which forcibly displaced hundreds in the 1950’s and has burdened those who remained. Pursuant to Chapter 1: Equity Focus (p. 11) of Draft Plan, we know ReConnect Logan Freeway Lid will transform and reconnect our community. A freeway lid can help our community by dismantling the barriers that the I-5 created by bringing the community together, addressing health concerns by capturing GHG emissions, creating non-existing green spaces, and allowing for development of affordable housing. All goals in line with the Draft Plan of creating efficient movement of people and goods, providing affordable, reliable, and safety mobility options, and allowing for healthier air.

As mentioned, the construction of the I-5 forced many families to be displaced, and while the construction allowed for transportation advancements, since the 1950’s our community has been subject to inequality, misrepresentation, and systemic injustices in transportation and racism, to mention a few. We continue to be a working-class neighborhood composed of nearly 90% Mexican Americans, and while our we are proud of our heritage and activism deeply rooted in our National Landmark of Chicano Park, the reality is that I-5 has created much insecurity by facilitating gang turfs, separating families from places of worship, and limiting children’s access to neighborhood schools. It is time for our community to heal – a freeway lid is the answer.

Given the significant investment and planning of projects in the Barrio Logan/Logan Heights communities in the Draft Plan as identified in Appendix A: Transportation Projects, Programs,
and Phasing, it is appropriate to identify and call out *ReConnect Logan Freeway Lid* as a project on this list. A few of the multiple projects that will impact Barrio Logan/Logan Heights are:

- The creation of Managed Lanes on Interstate 5, Project ID CC002 Complete Corridor: ML/Goods Movement (p. A-8)
- Additional cargo due to the Harbor Drive 2.0 proposal that will facilitate cargo in the community of Barrio Logan, Project ID GM06 Goods Movement: Roadways (p. A-11)
- Harbor Drive Corridor, project ID GM05 2050 Goods Movement: Roadways Harbor Drive Multimodal Corridor Improvements that will facilitate Trucks for the Port of San Diego (p. A-12)

Besides being in line with the 2021 Draft Regional Plan, *ReConnect Logan Freeway Lid* is also pursuant to Appendix H in relation to California Assembly Bill 805 which requires the reduction of pollution exposure in disadvantaged communities. Furthermore, our project is also pursuant to the Sustainable Communities Strategy per California SB 375 since it would help reach the overall goal of reducing GHG emissions of 15% (p. 18 of Draft Plan), as well as allowing for accommodation to the Regional Housing Needs Assessment Determination. For all these reasons, our community is looking forward to the **addition of a Freeway Lid as a priority project as identified in SANDAG’s 2021 Draft Regional Plan**.

If you have any questions, you may contact me at 619-887-7292.

Sincerely,

DAVID ALVAREZ

on behalf of ReConnect Logan Community Leaders

Subject: “Draft” 2021 Regional Plan” -- Chapter 3, How the Budget is Built, Road User Charges, Page 47 and Appendix V: Funding and Revenues, TransNet Program, page V-1 and Regional Road User Charges, page V-18

Dear Sir and Madam:

We oppose “Road User Charges” as a funding source that would be incremental / additional to the existing fuel fees and taxes for the transportation infrastructure as outlined in the 2021 Regional Plan Transportation. We request that you oppose implementation of such Road User Charges if they are in addition to the existing fuel fees and taxes.

Road User Charges for all vehicles – Internal Combustion Engine (ICE), Electric Vehicles (EVs), Hydrogen, Hybrid, etc. -- is acceptable only if the State, County and City fuel fees ($0.389/gallon) and taxes (California -- $0.612/gallon)\(^1\) are eliminated. If those fees and taxes are eliminated, then implementing a Road User Charge of $0.27/mile, which would generate the equivalent revenue as the current fuel fees and taxes would be reasonable (calculation assumptions -- average fleet fuel economy of 37.5 miles/gallon\(^2\) and miles driven per year of 12,524\(^3\)). If the fuel fees and taxes are not eliminated, then Road User Charges should be implemented for ICE vehicles. Such charges could be added to the non-ICE vehicle’s license fee – EVs, Hydrogen, Hybrid, etc.

Use the fuel fees and taxes (federal and state of $1.19\(^1\)) as intended by the voters instead of diverting gas fee and tax revenues into other projects. From the Los Angeles Daily News\(^4\), “The gross misspending, waste and diversion of gas tax revenues into projects having nothing to do with roads or highways. Caltrans admits that as it tries to focus available funding on core system assets, it is simultaneously increasing our investment in bicycle and pedestrian transportation. Gov. Newsom signed an executive order in 2019 that redirected gas tax money to fund railway systems and other non-road projects. Although SB 1 raised taxes with the promise that the money would be used to repair crumbling roads and bridges, about 30 percent of the revenue raised by the tax hike is designated for other transportation priorities, including public transit, bike lanes and walk paths.” From the Fresno Bee\(^5\), another disturbing example of diverting funds from their intended purpose, Gov. Gavin Newsom issued executive order N-19-19, which obligates the state transportation agency to leverage transportation spending on projects such as strategically directing discretionary transportation investments in support of housing production near available jobs and in accordance with the state’s smart growth principles. Stop diverting funds from their intended purpose.

If projects for transportation in addition to roads and / or other non-transportation projects are needed, then put such projects on the ballot for a vote by the citizens of San Diego County / California to approve or reject a tax for such needs. Do not use the “bait and switch” tactic on the citizens of San Diego County. Use fees and taxes for their intended purpose – PERIOD!

Thank you for your attention to this matter. We look forward to hearing your opposition to the Road User Charges as outlined in the SANDAG 2021 Regional Plan.

Concerned San Diego County Voters,

San Diego, CA 92101

Re: EHC Comments on SANDAG’S Appendix Y: Goods Movement Planning and Draft 2021 San Diego and Imperial Counties Freight Gateway Study Update

Dear Ms. Robinson:

EHC’s initial comments on SANDAG’s Appendix Y: Goods Movement Planning and Draft 2021 San Diego and Imperial Counties Freight Gateway Study Update are summarized below and subsequently detailed in this letter for your consideration:

High-Level Comments/Recommendations:

- ZE drayage trucks (100 mile + range) are commercially available now and also comparable in costs today along with increasingly positive total cost of ownership (TCO) in years ahead.
- Zero emission drayage trucks should be the focus of regional efforts vs. near zero emission technology.
- Misclassification of workers needs to be explained and addressed in the SANDAG report.
- The Gateway Study should address potential impacts of climate change on 2050 freight projections.
- Policies should be included to support workers whose jobs may be at risk as a result of a shift to automation.
- Short sea shipping (e.g., marine highway) needs further analysis to know how this mode shift would impact air quality in Portside communities.
- Heavy duty charging facilities must be planned and installed in readiness for the transition to ZEV trucks that is mandated in California and the earlier goals established in the Community Emission Reduction Plan and the upcoming Maritime Clean Air Strategy.
- Regarding outbound cargo, it appears unnecessary to develop new imports of sand, gravel, and aggregate into the region.
Detailed Comments/Recommendations:

A. ZE drayage trucks are commercially available now and also comparable in costs today along with increasingly positive total cost of ownership (TCO) in years ahead.

1. In section 4.1 (page Y-165), it states that “Port of SD: ZE vans and trucks are suited to accommodate demand for goods movement in the area while reducing air quality and noise impacts, given the volume of local truck trips and improvements in ZE technologies….”. Data indicates that these local trips, as well as much longer drayage trips, are already feasible today with ZE drayage trucks.

2. Per the Port of San Diego study (November 2020)1, ZE drayage trucks with a range of over 100 miles are commercially available today. The Port study explains that:
   a. Five different ZE drayage trucks are expected to be commercially available by the end of 2020, while another seven should become available by 2022/2023. Each has a range of over 100 miles, which is enough to complete the average drayage truck duty cycle of less than 100 miles on a single charge;
   b. The range of existing electric Class 8 trucks cap out at around a 150-mile range on a single charge;
   c. ZE drayage trucks requiring more than 150 miles will be available soon; and,
   d. Truck ranges are expected to increase as manufacturers develop longer-range batteries with the Tesla semi planned to exceed 500 miles near the 2023 timeframe.

3. ZE drayage trucks are comparable in costs today along with increasingly positive total cost of ownership (TCO) in years ahead.
   a. A Lawrence Berkeley National Laboratory (March 2021)2 study concludes that a Class 8 electric truck operated 300 miles per day when compared to a diesel truck offers a roughly 3-year payback and net present savings of about $200,000 over a 15-year lifetime."
   b. The 2035 Report 2.0: Plummeting Costs and Dramatic Improvements In Batteries Can Accelerate Our Clean Transportation Future from UC Berkeley’s Goldman School of Public Policy (April 2021)3 explains that the TCO for heavy duty electric vehicle starts out as positive compared to diesel and gets substantially better through 2035.

B. ZE drayage trucks (not near-zero) trucks are needed to reach air quality and climate goals.

1. EJ communities and Climate Action Plans require ZE (not near zero) trucks. However, the SANDAG report encourages and/or assumes near zero. On page Y-29, it states “…..In addition to the international gateway forecast, develop a freight forecast to 2050 for three specific urban areas of the Gateway Region that addresses emerging freight trends, such as the transition to zero near-zero-emission freight vehicles….”.

---

1 https://pantheonstorage.blob.core.windows.net/ceqa/MCCW_Vol_1_Final_SEIR.pdf
3 https://2035report.com/transportation/
2. The Luskin Report (2019)\(^4\) specifically warns against meeting any short-term uptick in drayage truck turnover with natural gas trucks. The report explains that if investments focus on natural gas trucks as the primary replacement, more natural gas fueling stations will be needed. Given goals to transition to zero-emission trucks, these investments will inevitably be stranded or the ZE transition will be delayed unnecessarily.

C. Misclassification of truck drivers needs to be explained in report.

1. Misclassification of truck drivers in California needs to be explained in the SANDAG report. On page Y-24, it states “…A large portion of truck operators in the freight industry are independent contractors who own their own vehicles and work for larger corporations. As policies start to implement regulations that discourage the continued use of heavy-duty diesel trucks and enforce the use of zero-emission vehicles, independent truck owners will be left with outdated vehicles they can no longer use, leading to potential unemployment for these operators…”.

2. The drayage, package delivery, and other short-haul segments of the trucking industry are home to ongoing and egregious worker exploitation.\(^5\)

3. Trucking companies, brokers, and other contracting entities often illegally misclassify drivers as independent contractors (when they are employees by law) to avoid paying wages, benefits, equipment costs, taxes, and regulatory compliance costs.\(^6\)

4. Misclassified drivers operate 70 to 90% of California’s drayage trucks, making misclassification the drayage segment’s dominant business model.\(^7\)

D. The Freight Gateway Study should address potential impacts of climate change on goods movement.

1. The Gateway Study did not address potential impacts of climate change on 2050 freight projections. Impacts are difficult to predict, but it would be reasonable to develop scenarios that do not assume simple linear growth in freight volumes, due to disruptions in supply chains, extreme weather events, sea level rise, and potential changes in key industries in the San Diego region such as agriculture, construction, and tourism. As overarching policy directions, the San Diego region must plan for producing critically important goods closer to home, and reducing our dependence on goods movement as an economic driver.

E. Additional Comments on Goods Movement Planning and the Freight Gateway Study.

\(^6\) Viscelli, The Big Rig: Trucking and the Decline of the American Dream, 2016.
1. Appendix Y correctly notes the importance of equity for workers in the freight industry, but mentions the potential impact of automation only in passing, on page Y-5. SANDAG needs to address the challenges of automation more fully. Who makes the decisions to automate unloading, loading, or movement of freight? What opportunities are there for workers and the public to participate in these decisions? What policies are in place, or needed, to support workers whose jobs may be at risk as a result of a shift to automation? Until these questions are answered fully, SANDAG’s goods movement planning will be failing these workers.

2. Marine Highway M-5 is mentioned briefly on page Y-8 as a potential new source of trade. Short sea shipping may be a good option for reducing GHG and truck traffic. At the same time, Portside residents need to know how this mode shift would impact air quality in their communities. Will additional ships be coming to San Diego’s cargo terminals if the project is approved? Will these ships be shorepowered? Goods movement planning requires that local impacts be identified and addressed.

3. Urban warehouses for e-bike deliveries are mentioned as an innovative delivery option on page Y-26. It is important to be clear that if trucks will also be accessing these facilities, they do not belong in residential areas. Residents of Barrio Logan and west National City have struggled for decades to eliminate incompatible land uses such as warehouses from their communities.

4. Regarding infrastructure needs for truck freight hauling, the report, in Section 2.1.2.1. Gaps in Existing Road Infrastructure, correctly notes the lack of dedicated truck parking, staging, and queuing facilities. Another essential piece of freight infrastructure planning: EV charging facilities for MD/HD trucks. Charging facilities must be planned and installed in readiness for the transition to ZEV trucks that is mandated in California.

5. Regarding outbound cargo, Figure 3.14 on page Y-129: Gravel is the largest outbound cargo, by tonnage, at 3,505 tons. This is a category of commodity that also includes aggregate. Sand is also a large outbound commodity, at 1,086 tons. It appears unnecessary to develop new imports of sand, gravel, and aggregate into the region, and unlikely to produce reductions of emissions from trucks.

Thank you for your time and consideration. Please contact Danny Serrano, Campaign Director at dannys@environmentalhealth.org for any additional information.

Sincerely,

Diane Takvorian

Comments on the Draft 2021 Regional Plan - 8/4/2021

Our comments are focused on the geographic area that we are most familiar with: the area within and extending out from the I-805 / SR-52 / I-5 triangle. This includes the Rose Creek watershed (Rose Canyon, MCAS Miramar, San Clemente Canyon and Marian Bear Park, and Rose Creek extending south to Mission Bay) and the Carrol Canyon, Sorrento Valley, and Penasquitos Lagoon watersheds. However, many of the concerns, issues and questions we raise in relation to this area apply to the entire RTP.

Our overall comment is that the 2021 Draft Regional Plan states that it proposes a bold new vision. However, it is based on a massive expansion of our highways. This includes widening many of our highways to add Managed Lanes and adding huge, elevated concrete “Managed Lane Connectors” (MLCs) where highways intersect. These MLCs will require even further highway widening to add lanes where traffic would enter and exit the connectors. In some cases these MLCs connect highways at very different elevations or with multiple other on and off ramps and bridges in the same location. Judging from just the area we focus on, these added MLs and MLCs will have huge direct and indirect environmental impacts on sensitive habitat, MSCP lands, Marian Bear Park, Rose Canyon Open Space Park, MCAS Miramar, and the Rose Creek and Carroll Canyon Creek/Sorrento Valley/Penasquitos Lagoon watersheds. Furthermore, just in the area we focus on, these MLs and MLCs will cost many hundreds of millions of dollars.

We ask: How much induced demand will adding all this highway capacity cause? How sure is SANDAG of their calculations? Will this plan really reduce GHG emissions, and by how much? How sure is SANDAG of those calculations? What is the course correction if we start adding all this highway capacity and the benefits are not there? Do the RTP models rest on the assumption that the projected benefits require that all the highway MLs and all the MLCs be added to achieve the projected benefits? What if we get half way into building this out and find that adding all this highway capacity is not bringing the benefits anticipated?

Based on what we see proposed for just the area we focus on, we see major direct and Indirect Impacts on MSCP lands, open space, habitat, native plant and animal species, wildlife corridors, creeks, and watersheds. Adding Managed Lanes and Managed Lane Connectors means bulldozing land and building extensive new concrete surfaces and retaining walls and drainage ditches, expanding direct impacts and edge effects on habitat and wildlife, increasing storm water run-off, noise and light impacts, invasive species, habitat loss, loss of wildlife connectivity and wildlife corridors, increased erosion, trash, and air and water pollution. “Mitigating” these impacts through projects done in distant mitigation banks does nothing to reduce the impacts in the areas where these impacts occur.
While SANDAG staff have stated in meetings with the QOL coalition that they are not widening outside the highway ROWs, that does not mean there won’t be major highway widening and environmental impacts. In some cases, CALTRANS has sufficient ROW to widen by multiple lanes. And widening even within the ROW extends the damaging impacts and pushes the edge effects closer to and into sensitive habitat.

Meanwhile, the Purple Line (Commuter Rail 582) from Sorrento Mesa to the Border (a true transit project) will not be completed until 2050. In concept, we strongly support this project, assuming it is largely underground through the environmentally sensitive areas we focus on. But despite the importance of this transit project, we know little beyond the vaguest description of its route. Where might it be underground? Where might it be at grade or above grade? Why is it not being completed until 2050 while the RTP prioritizes adding so many highway MLs and MLCs?

**I-805 North Project**

On April 15, 2021, the Sierra Club sent the attached letter to SANDAG Director Hasan Ikhrata, Director of Regional Planning Coleen Clementson, Senior Transportation Planner Jennifer Williamson, and several SANDAG BOD members. At a subsequent meeting with the Quality of Life Coalition’s Transportation Committee, Coleen Clementson stated vehemently, “We agree with you.” We therefore assume and would like confirmation, that the following is not in and will not be added to the RTP for the I-805 North from just south of SR-52 to Carroll Canyon Road:

- Any additional freeway widening beyond what has currently been built (one Carpool/HOV lane in each direction was completed in 2016)
- Widening of the I-805 bridge over Rose Canyon
- Direct Access Ramps (DARs) at Nobel Drive
- A Park & Ride at the southwest corner of Nobel/I-805
- A bus station at the southwest corner of Nobel/I-805

**Project ID CC114 is called I-805 (Nobel Drive) - it should be deleted from the RTP**

**Rationale:** I-805 North should locate access to and from the Managed Lanes at La Jolla Village Drive, not Nobel Drive. La Jolla Village Drive has extensive high density employment and high density housing located between the LJVD/I-805 intersection and Genesee Avenue. At Genesee there are two trolley stations surrounded by existing and planned high density employment and housing. La Jolla Village Drive is the route BRT lines should use to enter and exit the I-805 MLs. Nobel Drive is a poor location for a BRT route to enter or exit I-805 MLs. The location is far from significant employment or housing density. Furthermore, no parking lot or bus station should be located at Nobel/805. The I-805 commute is south to north in the morning, so parking lots near the I-805 should be located in communities well to the south where commuters come from in the morning. The land at the Nobel/I-805 intersection should be protected from any further impacts. Most of it is MSCP, and there are vernal pools and numerous documented sensitive species. That area should have no further disturbance.
The area within and near the SR-52, I-805, I-5

The RTP should reduce the amount of highway expansion and the number of MLCs in this area. SR-52 should not be widened and the MLCs between these highways should be eliminated.

The following projects would cause major environmental damage to MSCP lands and to the area’s critical and already highly constrained wildlife corridors.
This area illustrates our concern about the RTP as a whole. The RTP proposes a massive expansion of highway capacity in the name of creating “Complete Corridors” that will, in theory, carry BRT lines and carpools. While it is true that some existing general purpose lanes will be converted to “Managed Lanes”, the RTP proposes an expansion of all the highways in this area to add MLs plus multiple MLCs between these highways that will further degrade the habitat and wildlife corridors.

CC085: 2035 - MLC I-805 (SR 52) West to North and South to East CCT - $149 mil
This MLC will cause major environmental damage to an area with important wildlife corridors that connect MCAS Miramar, San Clemente Canyon (and Marian Bear Park) and Rose Canyon. These wildlife corridors are identified in the MSCP and in the MCAS Miramar Natural Resource Management Plans. The wildlife corridor between MCAS Miramar and San Clemente Canyon is already highly constrained at the I-805/52 intersection. In addition, the elevation change between the I-805 and SR-52 is significant. A further environmental impact will occur due to adding two MLs to SR-52 east of I-805 and one ML to SR-52 west of I-805.

CC086: MLC I-805 (SR52) North to West and East to South ($126 mil): More environmental impacts in this same area.

CC003 - (by 2035) - I-5 (Pacific Highway to SR 52) 8F to 6F+4 ML ($353 mil) (adding 1 lane in each direction to I-5)

CC004 by 2035 I-5 (SR 52 to I-805) 8F to 6F + 4ML (adding one lane in each direction) ($190 mil)

CC028 by 2050 MLC I-5 (SR 52) South to East and West to North ($202 mil)

CC065 by 2050 Complete Corridor: ML SR 52 (I-5 - I-805) 4F to 4F + 3 ML ($214 mil)
This massive widening of SR 52, with additional width needed to build the Managed Lane Connectors between I-5/52 and SR 52/ I-805 (MLCs in all directions) will have huge negative impacts on the adjacent MSCP lands in San Clemente Canyon and Marian Bear Park and on Rose Canyon and on the wildlife corridors between

CC066 by 2050 I-5 (SR 52) MLC - North to East and West to South ($202 mil)
April 15, 2021 - via email
Re: Sierra Club San Diego Chapter opposition to potential projects on the I-805 North

Dear Chair Blakespear,

Since 1948 Sierra Club San Diego has earned a leadership role in the conservation of our County’s natural resources. Presently, with more than 40,000 members and supporters, the San Diego Chapter is continuously addressing planning by all regional agencies. Particular attention is focused on the avoidance of impacts to the biological diversity which is so crucial to our quality of life. Sierra Club requests consultation and a place at the table whenever SANDAG is considering any of the following proposals.

Sierra Club strongly opposes the following proposed projects for the I-805 North, from just south of SR-52 to Carroll Canyon Road:
- Any additional freeway widening beyond what has currently been built (one Carpool/ HOV lane in each direction was completed in 2016)
- Widening of the I-805 bridge over Rose Canyon
- Direct Access Ramps (DARs) at Nobel Drive
- A Park & Ride at the southwest corner of Nobel/I-805
- A bus station at the southwest corner of Nobel/I-805

We oppose the inclusion of any of these projects in the 2021 Regional Plan.
- These projects (or any projects with a similar footprint) would:
  - Destroy and degrade native habitat in Rose Canyon that is part of the last remaining greenbelt and wildlife corridor connecting habitat west of I-805 with habitat on MCAS Miramar. The important wildlife corridor in Rose Canyon under the existing I-805 bridge is recognized in both the MSCP and the MCAS Miramar Natural Resources Management Plan.

1. Destroy and degrade core MSCP habitat.
2. Destroy and degrade habitat with numerous sensitive plant and animal species, including:
   - Vernal pools
   - Rare Quercus Dumosa (Nuttall’s scrub oak)
   - MHPA habitat with documented California Gnatcatchers as well as numerous other sensitive species

Thank you Chair Blakespear for your attention to our request for inclusion in the process. Retaining San Diego’s reputation as a world renowned “biological hotspot” is a goal we must all strive for.

Sincerely,

Dave Grubb,
Chair, Transportation Committee, Sierra Club San Diego Chapter

George Courser,
Chair, Conservation Committee, Sierra Club San Diego Chapter

8304 Claremont Mesa Blvd., Ste 101 • San Diego, CA. 92119
TEL: 858-569-6005 http://sandiegosierraclub.org
Active Transportation Projects:

The City of San Diego’s chosen alignment for the Coastal Rail chosen between Gilman/La Jolla Colony Drive and Sorrento Valley Coaster Station should be added to the RTP and the old alignment should be deleted (Rose Canyon, “UTC” (along Judicial Drive), Roselle Canyon and Roselle St to the Sorrento Valley Coaster station). This old alignment was thoroughly studied and rejected due to multiple major problems.

The Draft RTP contains inconsistent and out-of-date labeling of a portion of the City of San Diego’s Coastal Rail Trail. The City is the Lead Agency for the Coastal Rail Trail in the City, and it has selected the alignment and completed final design of the alignment along Gilman Drive to UCSD.

The City has deleted from its Bike Master Plan the old Rose Canyon, “UTC”, and Roselle Canyon alignment. The City studied that route for years and rejected it for multiple reasons.

The RTP therefore needs to:

- cut three planned CRT segments and trim one CRT segment
- relabel the CRT route in the RTP to coincide with the approved Gilman Drive CRT segment, adding the UC San Diego CRT segment plus the I-5 Bicycle Corridor.
- Amend Appendix A and Appendix L in the SANDAG RTP to be consistent with this change.

The RTP should make the following changes summarized in the following tables:
## CRT route as presented in the SANDAG RTP

<table>
<thead>
<tr>
<th>SANDAG Project ID</th>
<th>Name/Description</th>
<th>SANDAG 2020 Cost</th>
<th>The RTP should make the following change</th>
<th>RTP Page reference</th>
</tr>

<td>UC San Diego is adding major bike infrastructure improvements through the campus on this route</td>
</tr>
<tr>
<td>CRT - Gilman</td>
<td>Gilman Dr. and La Jolla Village Dr.</td>
<td>Gilman Dr. and I-5 / Rose Creek Bike Path and La Jolla Colony Dr.</td>
<td>Protected bike lanes fully designed by City. Partial construction funding in SD City 2022 CIP budget.</td>
</tr>
</tbody>
</table>
Reallocation of funds and equity

The savings for the three old, out-of-date segments to be cut is $53 million (Rose Canyon, UTC (Judicial Drive) and Roselle Canyon, plus any savings from trimming the route AT032 by cutting Sorrento to Roselle, a segment made unnecessary by the I-5 bike path from the Sorrento Valley Coaster Station to UCSD. Two of the three segments in the City’s chosen CRT route are either complete or funded, so it can be anticipated that almost all of the $53 million in the RTP can be freed up for active transportation projects that address equity, for example, in Chollas Creek, South Bay, or the Midway Corridor.

Community and City of San Diego support and action for the CRT alignment up Gilman:

The CRT route has City and Community support:

- The SANDAG RTP routes do not exist in the City of San Diego Bike Master Plan. They were explicitly deleted by the San Diego City Council in December 2013.
- The approved CRT Project route in San Diego has been selected, with the final Gilman Dr. link ready for construction and on the CIP list for 2020-2021.
- The approved CRT route was developed and selected by a City of San Diego Public Working Group in 2013-2014.
- The approved CRT route is supported by the Community Planning Groups: the UCPG in 2013 and 2021, and the La Jolla Planning Association in 2021.
- The approved CRT route has been supported by the City of San Diego in 2013, 2016 and budgeted in 2021.

The City’s approved CRT route enhances important existing connections:

- With the Rose Creek bikeway open, it is a connecting link to UC San Diego from the south.
- With the existing I-5 Bicycle Corridor, it is a connecting link to UC San Diego from Sorrento and the Coaster.
- The completed UC San Diego Gilman Bridge over I-5 provides comfortable and safe bicycle links to the east UC San Diego Campus, industry along Eastgate Mail, and the commercial center at UTC.

Re: Draft 2021 Regional Plan

Dear Chairperson Blakespear and SANDAG Board of Directors:

This firm represents Lakeview 1, LLC, Lakeview 2, LLC and Moller Lakes Investment, LLC (collectively, Lakeview), owners of the approved Otay Ranch Resort Village Project (Resort Village). On behalf of Lakeview, we have reviewed SANDAG’s Draft 2021 Regional Plan (Draft Plan) and provide the comments that follow below.

As relevant background, the Resort Village is part of the Otay Ranch General Development Plan/Subregional Plan approved by the County of San Diego and City of Chula Vista in 1993. Otay Ranch, portions of which have been built out, is a complete community approved for 24,000 homes; commercial/retail uses; other non-residential uses; schools and public services; parks, recreation facilities, open space and a protected biological preserve; and complementary amenities designed to be developed over a 30-50-year period. Consistent with the land use parameters established in 1993 for Otay Ranch, the County of San Diego Board of Supervisors, in November 2020, approved the Resort Village for 1,938 residential units, a resort, and other complementary uses (such as parks and trails, a public safety site, an elementary school, and resident-serving commercial). As a general matter, development of the approved Otay Ranch planned community—of which the Resort Village is a part—has been accounted for in regional plans and projections since 1993.

As discussed below, it appears that SANDAG’s Draft Plan has omitted from its design assumptions the Resort Village and its approved uses, resulting in a disconnect between the Draft Plan and the legal status of the Resort Village as a fully-entitled project.

We understand that the Draft Plan strives to transform the way San Diegans move through and about the region in an effort to address safety, traffic congestion, social inequities, air pollution and greenhouse gas (GHG) emissions. The Draft Plan includes an updated Sustainable Communities Strategy (SCS), which sets forth a “forecasted development pattern” that is designed to: (i) achieve per capita GHG reduction targets set for the region by the California Air Resources

1 The Resort Village also is referred to as Village 13.
Board (CARB), (ii) accommodate the Regional Housing Needs Assessment (RHNA), and (iii) utilize the “most recent planning assumptions.” (Draft Plan, p. 19). SANDAG reports that its SCS will exceed CARB’s 2035 reduction target for the region by one percent; i.e., a 19 percent reduction is required and the SCS, if implemented, will realize a 20 percent reduction.

We provide the following comments on the Draft Plan, including its SCS:

1. Government Code section 65800, subdivision (b)(2)(B) requires SANDAG “to use the most recent planning assumptions considering local general plans and other factors” (italics added). In this regard, Figures F.7, F.8 and F.9 in Appendix F of the Draft Plan are in error and must be corrected to ensure SANDAG’s compliance with this statutory requirement for its SCS. Specifically, the referenced figures show approved and entitled development located within Otay Ranch—including the Resort Village—as “Vacant” on the SCS’ land use pattern maps for 2025, 2035 and 2050. This is obviously incorrect. The “Vacant” appellation is inconsistent with the County’s approval of its General Plan in 2011, the Otay Ranch General Development Plan/Subregional Plan in 1993, and the Resort Village in 2020. As such, it results in development forecasts that are incorrect and incapable of supporting the Draft Plan’s findings and objectives. Therefore, we respectfully request that SANDAG modify the referenced figures to reflect the land use densities long-approved by the County and long-recognized by its General Plan for this portion of unincorporated South County.

2. The Draft Plan’s forecasted development pattern will not accommodate the RHNA. Specifically, the Draft Plan—in Table F.3 of Appendix F—projects the construction of just 7,419 dwelling units in unincorporated County areas over the next roughly 30 years (through 2050). This number does not accurately represent the amount of approved, planned and reasonably anticipated growth in the unincorporated areas. For example, in the 6th RHNA Cycle, which covers the 2021 through 2029 planning period (and thus does not align with the 2035 horizon year of the SCS modeling), SANDAG assigned 6,700 dwelling units to the unincorporated areas. Therefore, it appears the Draft Plan assumes that a mere 719 additional units will need to be built in unincorporated areas between 2030 and 2050, an assumption that is at odds with reasonable approximations of future RHNA cycles and existing market supply-and-demand evaluations for the San Diego region. The Draft Plan’s assumption of 7,419 units also is approximately 1/8th of the County’s General Plan build-out capacity of approximately 65,000 dwelling units. Thus, we respectfully request that SANDAG reevaluate the reasonableness of its forecasted development pattern by way of housing growth assumptions. It is critical to ensure that all modeling inputs are informed and reasoned, such that the SCS quantification analysis is defensible.

---

3. It is unclear to what extent the SCS and its supporting quantification framework account for the home-to-work, interregional commute reality present in San Diego. We know that the San Diego region’s failure to provide sufficient in-County housing opportunities has resulted in the exportation of some San Diego workers who now must commute into the region from more affordable housing opportunities in Riverside County or Mexico. The spirit of Senate Bill (SB) 375, which created the statutory framework for SANDAG’s SCS, will not be met unless and until we grapple with how land use choices made in the San Diego region affect San Diego workers. The Draft Plan must clarify SANDAG’s strategies for reducing interregional commuting. Such strategies must ensure a sufficient quantity of in-County housing opportunities exists; otherwise, home-to-work, interregional commuting will continue to be a major problem.

In closing, we recognize that the transformation of San Diego’s transportation patterns, long in the making, has been a “slow-and-steady wins the race” undertaking by SANDAG. We appreciate the opportunity to review and provide input on this Draft Plan, and are committed to advancing practical and effective strategies for the reduction of vehicle miles traveled and GHG emissions while developing much needed housing opportunities for the region. Thank you for your consideration of these comments.

Sincerely,

David P. Hubbard

Re: Draft 2021 Regional Plan

Dear Chairperson Blakespear and SANDAG Board of Directors:

This firm represents GDCI Proctor Valley, L.P., owner of the approved, but not yet constructed Adara community located in Otay Ranch’s Village 14 and Planning Areas 16 and 19. On behalf of GDCI, we have reviewed SANDAG’s Draft 2021 Regional Plan and provide the following comments thereon.

As relevant background, Village 14 and Planning Areas 16 and 19 are part of the Otay Ranch General Development Plan/Subregional Plan approved by the County of San Diego and City of Chula Vista in 1993. Otay Ranch, portions of which have been built out, is a complete community approved for 24,000 homes; commercial/retail uses; other non-residential uses; schools and public services; parks, recreation facilities, open space and a protected biological preserve; and complementary amenities designed to be developed over a 30- to 50-year period. Consistent with the land use parameters established in 1993 for Otay Ranch, the County of San Diego Board of Supervisors, in June 2019, approved the Specific Plan and Tentative Map for the Adara community for up to 1,119 residential units and other complementary uses (such as parks and trails, a public safety site, an elementary school, and resident-serving commercial). As a general matter, development of the approved Otay Ranch planned community—of which Village 14 and Planning Areas 16 and 19 is a part—has been accounted for in regional plans and projections since 1993.

As discussed below, however, it appears that SANDAG’s Draft Plan has omitted from its design assumptions the Adara community and its approved uses, resulting in a disconnect between the Draft Plan and the legal status of Adara as a fully-entitled project located within Otay Ranch.

We understand that the Draft Plan strives to transform the way San Diegans move through and about the region in an effort to address safety, traffic congestion, social inequities, air pollution and greenhouse gas (GHG) emissions. The Draft Plan includes an updated Sustainable Communities Strategy (SCS), which sets forth a “forecasted development pattern” that is designed to: (i) achieve per capita GHG reduction targets set for the region by the California Air Resources Board (CARB), (ii) accommodate the Regional Housing Needs Assessment (RHNA), and (iii) utilize the “most recent planning assumptions.” (Draft Plan, p. 19). SANDAG reports that its SCS
will exceed CARB’s 2035 reduction target for the region by one percent; i.e., a 19 percent reduction is required and the SCS, if implemented, will realize a 20 percent reduction.

We provide the following comments on the Draft Plan, including its SCS:

1. Government Code section 65800, subdivision (b)(2)(B) requires SANDAG “to use the most recent planning assumptions considering local general plans and other factors” (italics added). In this regard, Figures F.7, F.8 and F.9 in Appendix F of the Draft Plan are in error and must be corrected to ensure SANDAG’s compliance with this statutory requirement for its SCS. Specifically, the referenced figures show approved and entitlement development located within Otay Ranch—including Village 14 and Planning Areas 16 and 19—as “Vacant” on the SCS’ land use pattern maps for 2025, 2035 and 2050. This is obviously incorrect. The “Vacant” appellation is inconsistent with the County’s approval of its General Plan in 2011, the Otay Ranch General Development Plan/Subregional Plan in 1993, and the Adara Specific Plan and Tentative Map in 2019. As such, it results in development forecasts that are incorrect and incapable of supporting the Draft Plan’s findings and objectives. Therefore, we respectfully request that SANDAG modify the referenced figures to reflect the land use densities long-approved by the County and long-recognized by its General Plan for this portion of unincorporated South County.

2. The Draft Plan’s forecasted development pattern will not accommodate the RHNA. Specifically, the Draft Plan—in Table F.3 of Appendix F—projects the construction of just 7,419 dwelling units in unincorporated County areas over the next roughly 30 years (through 2050). This number does not accurately represent the amount of approved, planned and reasonably anticipated growth in the unincorporated areas. For example, in the 6th RHNA Cycle, which covers the 2021 through 2029 planning period (and thus does not align with the 2035 horizon year of the SCS modeling), SANDAG assigned 6,700 dwelling units to the unincorporated areas. Therefore, it appears the Draft Plan assumes that a mere 719 additional units will need to be built in unincorporated areas between 2030 and 2050, an assumption that is at odds with reasonable approximations of future RHNA cycles and existing market supply-and-demand evaluations for the San Diego region. The Draft Plan’s assumption of 7,419 units also is approximately 1/8th of the County’s General Plan build-out capacity of approximately 65,000 dwelling units. Thus, we respectfully request that SANDAG reevaluate the reasonableness of its forecasted development pattern.

---

1 As noted in our August 3, 2021 comment letter submitted on behalf of Lakeview 1, LLC, Lakeview 2, LLC and Moller Lakes Investment, LLC, the very same mislabeling error has occurred in the Draft Plan’s referenced figures with respect to Otay Ranch’s Village 13.

by way of housing growth assumptions. It is critical to ensure that all modeling inputs are informed and reasoned, such that the SCS quantification analysis is defensible.

3. It is unclear to what extent the SCS and its supporting quantification framework account for the home-to-work, interregional commute reality present in San Diego. We know that the San Diego region’s failure to provide sufficient in-County housing opportunities has resulted in the exportation of some San Diego workers who now must commute into the region from more affordable housing opportunities in Riverside County or Mexico.3 The spirit of Senate Bill (SB) 375, which created the statutory framework for SANDAG’s SCS, will not be met unless and until we grapple with how land use choices made in the San Diego region affect San Diego workers. The Draft Plan must clarify SANDAG’s strategies for reducing interregional commuting. Such strategies must ensure a sufficient quantity of in-County housing opportunities exists; otherwise, home-to-work, interregional commuting will continue to be a major problem.

In closing, we recognize that the transformation of San Diego’s transportation patterns, long in the making, has been a “slow-and-steady wins the race” undertaking by SANDAG. We also appreciate the opportunity to review and provide input on this Draft Plan, and are committed to advancing practical and effective strategies for the reduction of vehicle miles traveled and GHG emissions while developing much needed housing opportunities for the region. In the spirit of continued engagement, we formally request a meeting with the SANDAG staff members principally responsible for preparation of the Draft Plan in order to further discuss our comments herein. I can be reached at 760-431-9501 or dhubbard@gdandb.com for purposes of scheduling the requested meeting. Thank you for your consideration of these comments.

Sincerely,

San Diego, CA 92101

Re: Support incorporating Reconnect Logan, 5 Freeway Lid Project in the San Diego Association of Governments’ (SANDAG) 2021 Regional Plan

Dear Mr. Ikhrata,

My name is John Alvarado and my family has lived in Barrio Logan/Logan Heights for over 100 years. I’m a retired school teacher and founder and Exec Dir of the Good Neighbor Project SD my home and office is located at 2215 Logan Ave. I am writing to express my support for the incorporation of a project which goal is to address social and economic inequity, rising levels of health concerns aggravated by greenhouse gas emissions, and transportation injustices in San Diego’s Barrio Logan and Logan Heights communities. Specifically, we request the addition of a Freeway Lid as a priority project as identified in SANDAG’s 2021 Draft Regional Plan (Draft Plan)

Our once united community was devastated by Interstate 5 which forcibly displaced hundreds in the 1950’s and has burdened those who remained. Pursuant to Chapter 1: Equity Focus (p. 11) of Draft Plan, we know Re-Connect Logan Freeway Lid will transform and reconnect our community. A freeway lid can help our community by dismantling the barriers that the I-5 created by bringing the community together, addressing health concerns by capturing GHG emissions, creating non-existing green spaces, and allowing for development of affordable housing. All goals in line with the Draft Plan of creating efficient movement of people and goods, providing affordable, reliable, and safety mobility options, and allowing for healthier air.

As mentioned, the construction of the I-5 forced many families to be displaced, and while the construction allowed for transportation advancements, since the 1950’s our community has been subject to inequality, misrepresentation, and systemic injustices in transportation and racism, to mention a few. We continue
to be a working-class neighborhood composed of nearly 90% Mexican Americans and while we are proud of our heritage and activism deeply rooted in our National Landmark of Chicano Park, the reality is that I-5 has created much insecurity by facilitating gang turfs, separating families from places of worship, and limiting children’s access to neighborhood schools. It is time for our community to heal – a freeway lid is the answer.

Given the significant investment and planning of projects in the Barrio Logan/Logan Heights communities in the Draft Plan as identified in Appendix A: Transportation Projects, Programs, it is appropriate to identify and call out Re-Connect Logan Freeway Lid as a project on this list. A few of the multiple projects that will impact Barrio Logan/Logan Heights are:

- The creation of Managed Lanes on Interstate 5, Project ID CC002 Complete Corridor: ML/Goods Movement (p. A-8)
- Additional cargo due to the Harbor Drive 2.0 proposal that will facilitate cargo in the community of Barrio Logan, Project ID GM06 Goods Movement: Roadways (p. A-11)
- Harbor Drive Corridor, project ID GM05 2050 Goods Movement: Roadways Harbor Drive Multimodal Corridor Improvements that will facilitate Trucks for the Port of San Diego (p. A-12)

Besides being in line with the 2021 Draft Regional Plan, Re-Connect Logan Freeway Lid is also pursuant to Appendix H in relation to California Assembly Bill 805 which requires the reduction of pollution exposure in disadvantaged communities. Furthermore, our project is also pursuant to the Sustainable Communities Strategy per California SB 375 since it would help reach the overall goal of reducing GHG emissions of 15% (p. 18 of Draft Plan), as well as allowing for accommodation to the Regional Housing Needs Assessment Determination. For all these reasons, our community is looking forward to the addition of a Freeway Lid as a priority project as identified in SANDAG’s 2021 Draft Regional Plan.

If you have any questions, you may contact me at.

“Changing Our World One Neighbor at A Time”
Critique & Comments on 2021 Regional Transportation Plan - [Levine 7/28/21]

I have conducted an in-depth review of the 2021 Regional Transportation Plan and wish to share my observations with the SANDAG Board of Directors and other interested SANDAG personnel. I have had an active interest in local governance, following a career in business management. I have elected to evaluate the RTP using business evaluation skills learned in over six decades in project, portfolio, and business management.

This document is in four parts, following this introduction. There is a general presentation of views and concerns. This is followed by a discussion of individual aspects of the RTP. Section three addresses options and impediments. The ending section is a profile of the author.

I need to preface my comments by expressing my admiration for the product that SANDAG has produced and for the investment that has been made in developing a potentially ideal transit-based solution to the environmental and density challenges with which we are faced in this remarkable county. The professionalism and quality exhibited in the published works are of the highest rank and served me well in my quest to understand the goals of the RTP and the methods to achieve them. It is indeed a visionary expression of a world-class system for a future population. I recognize the seriousness of the challenges and I fear for the future of the planet. I applaud the bold and creative efforts to meet these challenges head on, to work to meet state and federal mandates, and to qualify for state and federal funding and subsidies where available.

Nevertheless, I have to take issue with several assumptions and conclusions, as well as expressing my dismay at the massive investment of time, money and intellectual expertise for something that should have been questioned much earlier in the process.

In my consulting practice I have often been engaged to perform due diligence on business cases for major programs and for proposals for new business initiatives. As I became deeply interested in the 2021 RTP, I couldn’t help seeing items that sounded alarms and triggered reality checks. As I have seen all too often, the search for the ideal has surpassed the practicalities of what is reasonable and achievable. I also am concerned that the sponsors may have based their assumptions on a best case or “wished for” values rather than a most likely set of scenarios. This plan begs for a responsible investigation and evaluation of the RTP by members of the SANDAG board who will carry the responsibility for this investment in the future. There is actually more at risk than an investment. The county appears to be committed to facilitate and mandate a radical change in the culture and behavior of a vast populace whose lifelong belief is that having a personal vehicle to go anywhere, at any time, is an inalienable right. The board is not voting for a transportation plan. It is voting to mandate a change to the very foundation of our lifestyle. They better get it right. We need to do something that will work.

OVERVIEW

The 2021 Regional Plan, as presented in “San Diego Forward”, depicts an environmental utopian paradise. It assumes a coordinated collection of paradigm shifts that support a vision of the ideal sizable urban/suburban metropolis where the government has considered and provided for the mobility of the
populace in the future. A future that requires a major reduction in greenhouse gasses and acceptance of increased housing density. It assumes that the public will readily give up their personal motor vehicles for the common good. SANDAG presents a perfected model that may work on paper. However, there is a huge hurdle to achieving that perfection.

Actually, there are two huge hurdles. One is the nature of people to resist paradigm shifts. Cultures cannot be mandated. They exist by will of the people. The 2021 Regional Plan makes assumptions of colossal culture change that cannot be reasonably presumed. This is a fact of life that governs what can be accomplished, no matter how “good” it is for the people and for the planet. For example we need only look to our current COVID-19 crisis. The only way out of the pandemic is via vaccination. The science is certain. The data is monumentally supportive. Yet, a major portion of the population refuses to do what is good for them and for the nation. Has this artifact of human nature been given adequate consideration in the plan?

The second hurdle, which has led to the demise of even the most seemingly foolproof plans, is the failure to consider the potential downside of the business case. In every plan there is a range of possible outcomes. We can look at the case through three lenses; the optimistic, the most likely, and the pessimistic. Where things fall apart is when exuberant support for the “optimistic” case causes the sponsor to downplay the “most likely” and to ignore the “pessimistic, and the associated risks.”

The pessimistic case fully considers risks. It creates alternate models representing the potential downside. The downside can happen. Even the most infallible plans have collapsed, leading to total failure of the venture, because of the reluctance to use assumptions that consider potential events and conditions that are not of the sponsor’s liking.

Here in San Diego, even in SANDAG, we have a history of inflated assumptions. We have seen it in the forecast of pension funding and in the projection of tax revenues. We have also seen it in the estimates of transit ridership. What assurances can you give the public that the 2021 Regional Plan is not based on inflated assumptions of income, ridership, or even the level of acceptance of change by the public?

Where are the models that represent a lesser level of expectations and what that would mean to accomplishment of the goals? I see a presentation of the ideal. Where is the picture of the realistic?

**DISCUSSION**

I have watched and read a number of SANDAG presentations and publications. It started with the August 14, 2020 SANDAG presentation of the blueprint for the 2021 RTP. I watched the entire four-hour session and then skimmed through the 619 pages of attachments – educating myself in the details of the proposal. More recently, I have downloaded and examined the May 2021 draft of San Diego Forward: the 2021 regional plan (for public review), as well as Appendix B. And I have watched the full videos of the May 21, 2021 presentation to the SANDAG Board of Directors and the June 28, 2021 North County Inland Road Show. I have also held some discussions with board members or their designated staff members working on the SANDAG proposals.
Sifting through the mounds of data and assumptions, I find numerous areas where the expectations cannot be justified or validated. But before getting into the details, we cannot ignore the human factors in the plan. As much as we might want to focus on the data, it is human behavior that will be the biggest factor in whether this paradigm shift in transportation habits can be accomplished.

Director Ikhrata boldly declares that it is the plan’s intention to pressure the public to change its wasteful use of personal motorized vehicles as a response to environmental concerns of growing proportions, as well as to meet various government mandates. He talks about incentives. But when queried about how the change in behavioral culture will come about, he repeatedly brings up “pricing”. He says “it will work if we price it right.” Of course “pricing” is a code word for “fees.” Using a euphemism cannot disguise what it is.

Invoking new fees, to use what has been considered to be something already covered by our taxes and DMV fees, is not an incentive. It is a penalty. The plan openly sets out to punish the public for doing what has been considered one of its most appreciated freedoms – the ability to get places, in the comfort and convenience of our own vehicles, on a timetable of our own choosing. SANDAG would have us give up this sacrosanct right and has set about to force the changes upon a recalcitrant public.

The pricing scheme is so devious that it not only imposes fees and taxes (a penalty, not an incentive) to force people to stop doing what is considered an inalienable right, but then directs the funds it collects away from what is wanted by the public (highway improvements). What kind of incentive sets out to punish rather than reward?

Let us not forget or ignore the penalties already inflicted on the driving public and the failures of previously imposed taxes to deliver what was expected or were diverted to other initiatives. For example I submit my motorcycle registration fee of $233, which would cost me $13 in NY. Or the income from the ½ percent TransNet sales tax that was grossly underestimated and is slated to be diverted from the highway projects it was supposed to support.

Now, looking at some of the initiatives in the RTP, there are data that belies the expected results. Director Ikhrata was asked if he could provide an example of where MANAGED LANES was implemented. Oddly I-15 was used as an example. However, the design calls for Managed Lanes for I-5 and CA-78/56/52 without adding new lanes (except for repurposing shoulders), whereas the I-15 project created four additional lanes for HOV or toll-payer use. Unless all of the lanes are contiguous (which they are not) and narrow bridges are widened, the periodic merging of lanes would create new bottlenecks and backups. So would any breakdowns, public safety vehicles, or emergencies that would impact the travel lanes in the absence of shoulders. Is this really safe or practical? How would traffic control (police radar and traffic stops) operate? What happens in a medical emergency or when a vehicle has a mechanical problem, a flat tire, or runs out of gas or battery power? How is congestion reduction alleviated when a lane is isolated for busses? This model of managed lanes is more like a game of whack-a mole. I am apprehensive of drivers’ attention being diverted from the road by a system of signs and signals directing them to a particular managed lane that changes with traffic conditions.
How effective would the Managed Lanes concept be if it doesn’t involve increased reliable capacity? SANDAG projects an increase in use of mass transit (at peak commuting times) from about 3% to 11.2% (in 2035). Will this be enough to sufficiently impact the carbon reduction goal? SANDAG is also projecting a population growth of 15.2% by 2035. It would seem that the movement of commuters to transit will not be enough to offset the growing demand for roadways. How do we significantly reduce congestion (a key goal) without increasing capacity? Do we gain enough to justify the cost and inconvenience of construction and repurposing plus the imposition of user fees?

On the other hand, there are other conditions that might represent a reduction of emissions-producing vehicles. Among the important forecast values that we must consider for the RTP is the impact of electric vehicles. All manufacturers are making massive investments and commitments to have a majority of their output be EVs, within a decade. Governments are equally committed to replacing petroleum-fueled vehicles by 2035. Are we likely to gain more in the real goal of reduced greenhouse gases through the mandated and incentivized move to EVs?

When the shift to EVs is added to the impacts of more workers not having to drive to an office every day, potentially offsetting the population growth, the expense and “pricing” of the full managed lanes solution may not be warranted. Not if the justification is the reduction in the production of GHG. As an aside, we have to learn not to justify massive, expensive projects because there is government funding earmarked for such programs. Yes, I am thinking of California High-Speed Rail. These programs always end up growing extensively beyond the original (misrepresented) scope and cost, causing the agencies that thought that they were getting a free lunch to bleed real cash.

Let’s get back to the “incentives” to get drivers to shun their cars. The “right” pricing essentially means making it painful to pay the VMT (vehicle miles traveled) fees. What I am hearing now is a charge of two cents per mile for the state plus two cents per mile for the county. So a highway trip from Rancho Bernardo to downtown and back would cost about two dollars. That is enough to make people angry, but not enough for them to use other means for travel. If they don’t meet the HOV criteria, it’s either pay additional fees or be limited to what are designed to be slower lanes. In the latter case, how does that help relieve congestion? It just pushes lower income drivers to use the most congested lanes. How does that support the stated “equality” goals?

The “right” pricing – that is; fees that will cause drivers to shun the controlled highways – may eventually lead to drivers eliminating such trips altogether. That may help the goal of easing congestion. But there will be offsetting penalties if the cancelled trips lead to people not shopping, eating out, or going to entertainment venues. This, in turn, will reduce income from sales taxes as well as impact the bottom line of these businesses (more tax losses). Has this been factored into the equation?

When combined with other initiatives, such as reducing or completely eliminating parking in many areas, both business and residential, the campaign against car owners becomes draconian. The thinking is that if people are using MASS TRANSIT and local connection options there will no longer be a need to own a personal vehicle. So whether you’re going out to the mountains to go hiking, or over to Costco to load up on groceries and a 30-roll package of toilet paper, can you say that you really don’t need a car?
Sure! Hey guys! Let’s grab our beach chairs and umbrellas, the cooler, our cornhole game and a couple of surf boards and take the bus over to Cardiff State Beach (from Green Valley in Poway). And we’ll stop off for dinner in Rancho Santa Fe on the way home, toting all our stuff. Currently, there is no reasonable mass transit to support that (according to MTS trip planner). The software did come up with a solution that would take four hours just to get to the beach, using four busses and the Sprinter (plus some walking) and told me to start 90 minutes earlier than I had specified. Is better coverage in the works? Would the group be able to make the trip in one day? Could they manage with all their gear?

So let’s stop dreaming about a world without cars. Can we be practical and come up with ideas and real incentives to cut down on VMT?

Furthermore, as an “incentive” to dump your car or truck, the plan calls for charging for parking spot use and even to pull over to the curb. Yes, it’s in the plan – see page 40 “Parking and curb pricing.” Pricing is the term that is used for “fees.”

With the estimate of only 11.2% of commuters using mass transit (and less for the general public) what we need is more parking. We shouldn’t need to drive around looking for parking spots or hang out at the curb with the motor running. If you want to change behavior, do it with rewards, not with penalties.

While there are some interesting ideas in this plan, I predict that the overall result will be to nickel and dime car owners in multiple ways without actually achieving the results that are expected.

The concept of MOBILITY HUBS is interesting. Providing flexible transit in selected concentration areas would be sensible and likely take care of some of the “last mile” issues that hinder the practicality of using mass transit. Here again, there are disconnects between wishful thinking and practical outcomes.

The mobility hubs may be considered to be frequent destinations for the public. But what do people do on the other end (their origination point) when it’s not in a mobility hub area. I reside about 1 ½ miles from the eastern edge of the Rancho Bernardo mobility hub (92128). About half of my family travel is to points within that hub. But how do I get to that hub without a car? (I do use my e-bike for some of this, but not if I am shopping or if I have to cross hazardous intersections, such as the I-15 ramps.)

The expectation that businesses will all of a sudden relocate to properties within a mobility hub is speculative, at the most. Where is the evidence? Furthermore, if the new model is for these businesses to not have parking then the people will choose to take their business elsewhere. In the end, SANDAG may achieve their goal to reduce VMT. The public will do their shopping on-line. They’ll enjoy their own cooking at home. And the biggest accomplishment will be a local business decline and more tax losses. The roads will be wall to wall with gas-guzzling Amazon vans.

Bringing usable, frequent mass transit services to San Diego is something that we can all appreciate. But assuming that the car culture will significantly change because of the transit improvements is pie in the sky. No amount of disincentives will remove the need for highways and parking.

From a personal perspective (I live in 92128), I see little that serves my needs or interests. This area and adjacent Poway and places east are hardly served (except for a snippet of the RB mobility hub). The proposed Rapid bus is the same as now, except with improved frequency. But the transit stations are
not easily accessible except by car. With all the plans for commuter rail and light rail, the I-15 corridor is ignored. That is; except for the ghost of the California High-Speed Rail, which surprisingly shows up on Figure 2.3 – the Transit Leap map. I suspect that most of San Diego will have fallen into the Pacific before this foolhardy venture reaches any place where people live, let alone stretching south of I-10. Placing it on the Transit Leap map doesn’t help to generate any confidence in the rest of the plan.

In regard to this Bakersfield/Fresno/Merced rail, I hear horrifying stories of issues with acquiring land rights. Have the experiences from that venture been factored into the land acquisition needs for transit and mobility hubs? If land acquisition is an issue in the sparsely populated SR-99 corridor, have we honestly considered the challenges in coastal San Diego? Is this a deal killer?

Back to my personal travel habits and needs. I recently purchased an e-bike and use it almost daily. I take it to the tennis courts on week days – just less than a mile and with no major intersections. I love the ride and am happy to not use my gas engine vehicles for such short trips. But the e-bike is not practical for most errands and my primary use is for exercise and recreation. There are several areas where I cannot ride because of poorly maintained bike lanes or unmarked bike lanes in high-traffic streets and intersections. The nearest formal bike trail (I-56) is about a ten mile ride over a treacherous, unmaintained bike lane on Carmel Mountain Road in Rancho Penasquitos. The money available for biking would be better spent on improving these impediments than in uprooting city streets to make us look like Holland. Also, I would not be able to use the e-bike with mass transit because the bike is too heavy to put on the bike carriers. (Does anyone ever use these? I never see a bus with a bike. I also never see a bus with more than two passengers.)

I have not addressed the practicality of the proposed high-speed coastal rail or other light rail expansions due to lack of details. Shouldn’t we be looking at a set of alternatives, rather than a single plan? On the LOSSAN corridor segment, I’d like to see figures for a solution based on upgrading the Coaster system, rather than assuming that a new high-speed system is needed to meet our goals. The benefits of a high-speed train tend to be grossly overstated when one considers that the actual rail time is just a small portion of the overall door-to-door trip time. Doubling the speed of a locomotive may equate to a 5% to 10% improvement in trip time. Increasing distances between stations makes the use of high-speed rail less convenient and may add additional time to last-mile segments. Frequency (less waiting time) may contribute more to shortening trips than high speed. It is good to see this in the plan.

On a final note, I am compelled to comment on some disturbing issues relative to the relationships and behavior between the agency (SANDAG), the SANDAG Board of Directors, and the public. There is no way that we can accept the response by Director Ikhrata to criticism voiced by board member Rodriguez (Oceanside), at the 5/21/21 SANDAG presentation. Obviously dismissing the board member’s right to question the RTP, Ikhrata interrupted to say “We are the experts.” It is this attitude that highlights the importance of the Board exercising its responsibility to provide oversight and leadership for this important agency.

We must further question the intent of Director Ikhrata to influence the recent Supervisor election, and hence the selection of board members by making a political contribution to a likely supportive candidate.
in opposition to a candidate that voiced resistance to the developing RTP. How these two incidents can go unchallenged is beyond belief. Where is the oversight?

As I began to follow the RTP, the early news headlines consistently noted the sense that the Board was heavily leaning toward support for the emerging RTP. It appeared to represent a desire to take strong action to deal with the very real concerns regarding global warming and to address how re-envisioned transportation models can contribute to a viable solution.

Politically, it seemed sound to jump on the band wagon. However, as the details of the RTP were meted out to the public, there has been virtually unanimous rejection of the Plan. The public is saying that they do not favor the RTP and cannot see it as something that will produce the stated goals. One comment: “This is NUTS!” The board needs to listen.

As a concerned voter in San Diego County, it is my expectation that our representatives on the SANDAG Board of Governors will ask the type of questions that I highlighted here and to make certain that the RTP is based on honest assessments and assumptions. Due diligence requires that proposals consider a range of outcomes, based on an open-minded assessment of risks and variables. Common sense requires that we fully consider human factors and culture. Transparency should come with honest language that does not sugar-coat the burdens to be placed on the public to gain compliance.

I ask the SANDAG Board of Directors to provide intelligent oversight of SANDAG and the RTP, and to recognize the voice of the people in questioning the rationale and achievability of the proposal.

**OPTIONS AND IMPEDIMENTS TO CONSIDER**

Are there options available to address the goals of the 2021 RTP in more practical ways, with attention to getting the best bang for the buck, while satisfying the wider stakeholder base?

What options should be explored to bring reality closer and the probability of success greater?

What options are available to reward those who go the extra mile to support sensible initiatives, rather to penalize those who may not have the option to comply with these suggested draconian measures?

**High-speed Rail:** Going from 60 MPH to 120 MPH will not deliver a great time savings if distances between stops are greater and time from station to destination is increased. The easiest and most economical way to make train-based travel faster is actually to have stops closer to the “last-mile” and to up the frequency so that travelers don’t have to spend the projected time gained waiting for the next train. Commuter rail, with short distances will not gain much from doubling the top speed. Electrification will help acceleration times and reduce GHG emissions. Can we modify what we already have and still achieve our goal -- faster and cheaper? Urban/suburban rail should run every four minutes in peak travel times and every eight minute at other times. At the least a ten minute interval would free travelers from needing to use timetables. Stations should be closely spaced and easily accessible by walkers and bikers as well as personal vehicles. Adequate parking will be needed. Express trains can be added to accommodate longer distance riders.
Managed Lanes: The biggest cause of highway congestion is the intermittent loss of a traffic lane. You can see that every day in places like I-15 northbound as it approaches the Bernardo Center Dr. and Rancho Bernardo Rd. interchanges. In this very short distance, the main highway loses one lane (due to narrow overpasses) and the traffic will back up at times of heavy use. Other causes of backups are vehicle breakdowns, police activity, and accidents. There MUST be space for vehicles to pull to the side of the road without losing a traffic lane.

The maximum capacity of any highway is determined by the capacity at its most constricted point. The plan calls for increasing capacity on limited access highways, such as SR-56, by utilizing shoulders. SR-56 would increase from four lanes to seven lanes. However, the inner shoulders are only four to eight feet and they do not continue at the six locations where the highway goes over a bridge. It seems that this would require adding lanes on the existing divider and building six new bridges at the overpasses to accommodate the three additional traffic lanes. Without this, the bottlenecks would nullify any gains from the added lanes.

Rapid Bus Plazas: These will have to be considerably upgraded if Rapid Bus is to be a principal component of a four-fold increase in mass transit patronage. As I look at the plaza closest to my residence, Rancho Bernardo, I see some major issues. Parking would have to be significantly increased, since the planned Flexible Fleets in Mobility Hubs will not reach all users. Plazas would likely need to be enlarged. Where will we find the land for this?

Also, at Rancho Bernardo, the transit plaza is not accessible from the east side of I-15. Walkers or bikers cannot readily get to the plaza. This can be remedied by building a pedestrian/biker structure from the east side of the I-15 bus ramp, over the northbound lanes of I-15 to adjacent Iberia Pl. This would provide easy access to the downtown business area of RB and several residential neighborhoods that do not have that access now. For me, the walk or ride would be 1.2 miles, rather than 2.6 mi via dangerous route and 3.0 miles via safer route.

Biking: I have recently joined the population that is using bicycles for short trips, as well as recreation. Mine is an e-bike and I can easily do round trips of up to 30 miles, even with the hills in my area. What I can’t do is to make these trips in safety. The city and SANDAG are hyping their support for biking to alleviate some of the pollution and congestion caused by motor vehicles. But they can’t even maintain the bike paths that we already have. Also, to use bikes for commuting (SANDAG is counting on at least a tripling of biking to work) we need well marked bike lanes and paths that are contiguous. Many of the areas are interrupted by stretches of missing or unmaintained bike lanes. We need more consistent riding paths and much improved driver education and awareness. The recent efforts to use green paint for bike lanes and to add a buffer between the bike lane and car lane need to be expanded as rapidly as possible. Adding a well-marked bike lane at left turns would be a welcome safety addition. I have seen this only at one place, the intersection of Carmel Mountain Rd. and Rancho Carmel Dr (next to Costco).

With 12 deaths to bikers in seven months, more has to be done promote safety. Countless injuries are awaiting bikers that are forced to ride on unmaintained bike lanes, opening up municipalities to large law suites.
Reducing Carbon: The RTP aims to reduce GHG emissions, primarily by penalizing travel with cars and trucks. However, as I interpret the plan, the methodology is aimed at generating new income from road usage fees. The plan bemoans the loss of gas tax income from drivers of EVs. Instead of providing incentives for driving EVs, the plan requires that EV owners pay a fee to cover the gas tax losses and then, adding insult to injury, earmarks that revenue for mass transit.

Would in not make more sense to offer payments to gas and diesel car and truck owners to turn in their cars and get them off the road? Couple this with rebates to exchange their petrol cars for EVs.

California registration rates are backwards. The fees should be based on weight and gas mileage, not property value. A Chevy Tahoe produces more wear and GHG than a Porsche 911. But the Porsche owner pays way more for registration. The owner of a BMW K1600 motorcycle pays more than for a Ford Fiesta. The latter weighs more than three times as much and uses twice the gas, but pays less for the registration. EV owners, with vehicles that are emission free and have less aggressive tires should get a break.

This may be extreme, but if you really want to cut GHG you can go to fuel rationing. There is a direct relationship between the fuel burned and the amount of emissions. But this would not work in the face of a model which is designed to generate usage fees, rather than cut emissions. It would also cut revenue from gas taxes. This may be an underlying factor in a model that is designed to generate income from fuel burners while the goal is to reduce the use of fuel. It is more likely to build the fee income than to achieve the stated goal.

AUTHOR PROFILE

I am a mostly retired homeowner in Rancho Bernardo, and spend part of my time as an opinion columnist for the SDUT Community Press, writing under the “Just Sayin” by-line in papers serving the RB, 4S Ranch and Poway communities.

I am active in the community as a volunteer with political, cultural, homeowner and public service organizations, mostly at the board level. These organizations have included the RB Branch Library (hosting concerts), the Poway Symphony Orchestra, the RB Community Foundation, the SDUT Community Press, and the RB Democratic Club.

My career of over six decades focused on project, program and portfolio management, including strategic planning and business development evaluation. As part of this I was frequently engaged to review corporate-level business cases for potential new business ventures. I have published three books and over 300 papers on project and portfolio management and was a pioneer in the emergence of project portfolio management over the past two decades. I served as President and Chair of the Project Management Institute and am a PMI Fellow. As an odd coincidence, long before I became interested in local governance, I was engaged by a San Diego businessman (who I did not know at the time) to conduct seminars in Washington, D.C., demonstrating how traditional project management techniques could be effectively applied in government.

Thank you for your time and consideration, and for your dedication to our community.
August 6, 2021

Dear Mr. Talleh,

On July 16, 2021, community planning/sponsor groups were asked to provide their comments on the draft May 2021 San Diego Forward-The 2021 Regional Plan and its thirty-one lengthy and detailed appendices. Although this was an exceptionally limited review period, the Jacumba Sponsor Group has the following comments.

This draft plan identifies interdependent transformative strategies designed to address the greatest transportation and mobility challenges that the region faces: safety and traffic congestion; social inequities; and state and federal requirements to reduce greenhouse gas (GHG) emissions and air pollution—and they are noble goals. However, it makes many unsubstantiated assumptions based on inadequate data from which it then draws conclusions.

On page 10, the plan states that in 2019, greater than 90 percent of CA-MEX trade was moved by truck across the international border. A great fact to know, but where does your regional plan address and mitigate for the smoggy trucks registered in Mexico that are hauling those goods? Will the plan only regulate the emissions of vehicles registered in San Diego County (or California) while out-state and out-of-country (Mexican) vehicles get a “free pass?”

On page 12, the plan states: “from 2016 to 2050, nearly 60 percent of population growth will be among those who are 75 years and older.” Will this aging population (60 percent who are projected to be people of color), feel physically safe while using public transit (buses, trams, trolleys) during evening/night time? Will they all have smart phones and be able to navigate a smart phone application that gives them a choice of transportation modality based on a variety factors including CO₂ emissions?

On page 15, the plan states that if the 2021 plan was implemented, “By 2050, this could result in 13 percent of commuters using transit (up from 3 percent today) and that there would be a substantial decline in commuters driving alone to work (from 80 percent today to 62 percent in 2050). Those figures do not reflect any significant behavioral changes regarding transportation choices given that this plan would greatly expand mass transit frequency and routes. In 2021, many city busses are carrying just two to three passengers while trolleys carry more passengers depending on their routes. How realistic are the 2021 plan’s predicted increases? Were urban
residents asked about factors that would actually make them leave their cars and use mass transit instead? Was the current trend of working remotely from home factored into these calculations? What if the public perceives that it is not in their best interests to share a bus or a trolley with a group of strangers who may or may not be healthy? What happens when the next pandemic impacts our region and mass transit shuts down for public safety reasons? Clearly more studies on the current trends in mass transit usage must be analyzed before the predictions contained in this plan can be validated. Also, additional studies on post-COVID mass transit usage figures are critical. Analysts should avoid using the data from any month when all mass transit ridership fares have been waived, as they will skew the data. (This will happen in September 2021.)

On page 25, the 2021 plan calls for providing a variety of transit riders with reduced fares (seniors, low-income, students, youth and the disabled). This is fiscally untenable. What is the actual cost per passenger mile on a bus, trolley, or light rail? Appendix A predicts that in **2020 dollars**, transit fare subsides in 2035 will be $982 million dollars and in 2050, subsides will be **$4 BILLION dollars** which means that the answer to the previous question about the cost per passenger mile must be too high to print!!! This plan cannot seriously contemplate spending $4 billion dollars to possibly achieve a 13 percent increase in mass transit ridership.

The 2021 plan which seeks to “reimagine” regional transportation strategies appears to be a huge and costly wish list of programs and government regulations directed primarily at changing residents’ driving behavior at a tremendous loss of personal freedoms. It envisions spending millions of dollars to create an expanded bike network with corridors by 2050. Again, where is the data that shows that kind of expenditure will get more people out of their cars and onto bicycles? A recent case in point: the removal of 400 parking spaces along the business district on 30th Street in the North Park area so that bike lanes, that are rarely used to commuting to and from work, could be installed. Not only are the merchants upset about the loss of customer parking and business, but delivery trucks are now blocking bike lanes to make their deliveries and handicapped parking has become confusing for those who need it. The 2021 plan will greatly expand on that unpopular and costly transportation strategy.

Under this plan, transportation in and around mobility hubs or areas of concentrated development (cities) would be highly regulated with curb management regulations/fees based on the time of day parking rates, and ride-hailing opportunities. Ride-hailing at mobility hubs is described as offering people on-demand vehicles for short and long-distance trips, possibly subscription-based services which would “allow people to reserve a vehicle that best serves the needs of their trip.” So, it is okay to rent/drive a vehicle but just not to personally own a vehicle?

On page 32, the plan states: “In the San Diego region, almost half of all trips are three miles or less, and most everyday trips are made within neighborhoods using local streets.” Where is the data to back up this statement? This page also states: “On average, one person is killed or seriously injured in traffic violence everyday in the region.” Everyone understands the safety risks that they take when they drive a car and they believe those risks to be acceptable. Again, no
driving statistics are referenced, and of course, the plan does not provide data on the numbers of people who are mugged walking down the region’s streets or at trolley stations, etc.

Everyone agrees that climate change is real. On page 34, several climate strategies are listed. The blue pie chart at the top of the page lists “collecting rainwater” as one viable climate mitigation strategy. Why doesn’t this 2021 plan identify more impactful strategies such as building new reservoirs/expanding existing ones or building additional desalination plants? It should be noted, that even if the 2021 plan is implemented, it will not stop the sea levels from rising.

This plan would require employers and developers to provide transportation benefits and on-site amenities to encourage people to use sustainable transportation choices. Does the County want even more businesses to flee California for a friendlier business climate? Employers can figure out how to use flexible work schedules and tele-work options to attract and sustain their workforce without unnecessary government intervention/regulation.

Of course, of the 2021 plan’s proposed transportation management “strategies” come at a huge cost ($163 billion dollars). The plan identifies $90 billion dollars that will come from local funding sources: sales taxes, impact fees, fuel taxes, roads tolls, increased passenger fares, general funds, housing revenue, ride-hailing fees, value pricing, and road user charges also called vehicle miles travelled (VMT). Road usage fees or VMT, which have yet to be implemented through legislation, are needed to offset the reduction in gasoline taxes as more electric vehicles (EV) use our roadways. Under this plan, VMT fees would come on top of the existing federal, state, and local gasoline taxes, and they would unfairly penalize the drivers of gas-powered vehicles, who frequently are the low-income residents who live in the rural areas of the County. (VMT would not be collected on out-of-state vehicles.) Under the 2021 plan, fees of all kinds would be raised, including variable road tolls based on the time of day (congestion), fees for solo drivers using carpool lanes, and fees for ride-sharing services like Uber. The fees and regulations imposed by this plan will disproportionately impact low-income residents, while the plan claims to promotes social equity. They are the ones who will not be able to afford to park/drive their own private vehicles while transportation choices of more affluent residents will not be affected.

Figure 3.3 on page 50 shows the 2021 Regional Plan Expenditures with an estimated total of $163 billion in 2020 dollars. There needs to be a similar pie chart within the 2021 plan that shows how much money will be spent on each transportation category: Transit Leap (mass transit), mobility hubs, complete corridors, bicycle network, highway improvements etc. Although there may be appendices that list all the funding for a specific category, it is unlikely that most people will wade through all of them to find that important information.

On page 53 of the 2021 Regional plan is a list of a priority implementation actions. Number 1 on the list is “Apply the Social Equity Planning Framework”. Number 10 on the list is: “Advance a data science program to better understand travel behavior in the region.” These priorities should be reversed. **You can’t apply a framework until you have solid, valid, and recent (post COVID) data!**
This very expensive “Lamborghini” transportation plan with its “woke” statements about social equity and its claims to “strengthen a sense of place,” is a direct assault on the personal transportation choices of San Diego County residents. County leaders must choose a less expensive “Toyota” plan that will not transform “America’s Finest City” into a third-rate economy where only the wealthy residents can still afford to drive a car.

Re: Support incorporating *Reconnect Logan, 5 Freeway Lid Project* in the San Diego Association of Governments’ (SANDAG) 2021 Regional Plan

Dear Mr. Ikharata,

My name is James Brown and I have been a Logan Heights business owner for over 12 years. I am writing to express my support for the incorporation of a project which goal is to address social and economic inequity, rising levels of health concerns aggravated by greenhouse gas emissions, and transportation injustices in San Diego’s Barrio Logan and Logan Heights communities. **Specifically, we request the addition of a Freeway Lid as a priority project as identified in SANDAG’s 2021 Draft Regional Plan (Draft Plan)**

Our once united community was devastated by Interstate 5 which forcibly displaced hundreds in the 1950’s and has burdened those who remained. Pursuant to Chapter 1: Equity Focus (p. 11) of Draft Plan, we know *ReConnect Logan Freeway Lid* will transform and reconnect our community. A freeway lid can help our community by dismantling the barriers that the I-5 created by bringing the community together, addressing health concerns by capturing GHG emissions, creating non-existing green spaces, and allowing for development of affordable housing. All goals in line with the Draft Plan of creating efficient movement of people and goods, providing affordable, reliable, and safety mobility options, and allowing for healthier air.

As mentioned, the construction of the I-5 forced many families to be displaced, and while the construction allowed for transportation advancements, since the 1950’s our community has been subject to inequality, misrepresentation, and systemic injustices in transportation and racism, to mention a few. We continue to be a working-class neighborhood composed of nearly 90% Mexican Americans, and while our we are proud of our heritage and activism deeply rooted in our National Landmark of Chicano Park, the reality is that I-5 has created much insecurity by facilitating gang turfs, separating families from places of worship, and limiting children’s access to neighborhood schools. It is time for our community to heal – a freeway lid is the answer.

Given the significant investment and planning of projects in the Barrio Logan/Logan Heights communities in the Draft Plan as identified in Appendix A: Transportation Projects, Programs, and Phasing, it is appropriate to identify and call out *ReConnect Logan Freeway Lid* as a project on this list. A few of the multiple projects that will impact Barrio Logan/Logan Heights are:
• The creation of Managed Lanes on Interstate 5, Project ID CC002 Complete Corridor: ML/Goods Movement (p. A-8)
• Additional cargo due to the Harbor Drive 2.0 proposal that will facilitate cargo in the community of Barrio Logan, Project ID GM06 Goods Movement: Roadways (p. A-11)
• Harbor Drive Corridor, project ID GM05 2050 Goods Movement: Roadways Harbor Drive Multimodal Corridor Improvements that will facilitate Trucks for the Port of San Diego (p. A-12)

Besides being in line with the 2021 Draft Regional Plan, ReConnect Logan Freeway Lid is also pursuant to Appendix H in relation to California Assembly Bill 805 which requires the reduction of pollution exposure in disadvantaged communities. Furthermore, our project is also pursuant to the Sustainable Communities Strategy per California SB 375 since it would help reach the overall goal of reducing GHG emissions of 15% (p. 18 of Draft Plan), as well as allowing for accommodation to the Regional Housing Needs Assessment Determination. For all these reasons, our community is looking forward to the addition of a Freeway Lid as a priority project as identified in SANDAG’s 2021 Draft Regional Plan.

If you have any questions, you may contact me at jb@publicdigital.com.

Sincerely,

James Brown

1955 Julian Ave, San Diego, CA, 92113
Dear Mr. Ikhrata,

My name is Martha Zapata and I have been a Logan Heights resident for 34 years. I am writing to express my support for the incorporation of a project which goal is to address social and economic inequity, rising levels of health concerns aggravated by greenhouse gas emissions, and transportation injustices in San Diego’s Barrio Logan and Logan Heights communities.

Specifically, we request the addition of a Freeway Lid as a priority project as identified in SANDAG’s 2021 Draft Regional Plan (Draft Plan)

Our once united community was devastated by Interstate 5 which forcibly displaced hundreds in the 1950’s and has burdened those who remained. Pursuant to Chapter 1: Equity Focus (p. 11) of Draft Plan, we know ReConnect Logan Freeway Lid will transform and reconnect our community. A freeway lid can help our community by dismantling the barriers that the I-5 created by bringing the community together, addressing health concerns by capturing GHG emissions, creating non-existing green spaces, and allowing for development of affordable housing. All goals in line with the Draft Plan of creating efficient movement of people and goods, providing affordable, reliable, and safety mobility options, and allowing for healthier air.

As mentioned, the construction of the I-5 forced many families to be displaced, and while the construction allowed for transportation advancements, since the 1950’s our community has been subject to inequality, misrepresentation, and systemic injustices in transportation and racism, to mention a few. We continue to be a working-class neighborhood composed of nearly 90% Mexican Americans, and while our we are proud of our heritage and activism deeply rooted in our National Landmark of Chicano Park, the reality is that I-5 has created much insecurity by facilitating gang turfs, separating families from places of worship, and limiting children’s access to neighborhood schools. It is time for our community to heal – a freeway lid is the answer.

Given the significant investment and planning of projects in the Barrio Logan/Logan Heights communities in the Draft Plan as identified in Appendix A: Transportation Projects, Programs, and Phasing, it is appropriate to identify and call out ReConnect Logan Freeway Lid as a project on this list. A few of the multiple projects that will impact Barrio Logan/Logan Heights are:
- The creation of Managed Lanes on Interstate 5, Project ID CC002 Complete Corridor: ML/Goods Movement (p. A-8)
- Additional cargo due to the Harbor Drive 2.0 proposal that will facilitate cargo in the community of Barrio Logan, Project ID GM06 Goods Movement: Roadways (p. A-11)
- Harbor Drive Corridor, project ID GM05 2050 Goods Movement: Roadways Harbor Drive Multimodal Corridor Improvements that will facilitate Trucks for the Port of San Diego (p. A-12)

Besides being in line with the 2021 Draft Regional Plan, *ReConnect Logan Freeway Lid* is also pursuant to Appendix H in relation to California Assembly Bill 805 which requires the reduction of pollution exposure in disadvantaged communities. Furthermore, our project is also pursuant to the Sustainable Communities Strategy per California SB 375 since it would help reach the overall goal of reducing GHG emissions of 15% (p. 18 of Draft Plan), as well as allowing for accommodation to the Regional Housing Needs Assessment Determination. For all these reasons, our community is looking forward to the addition of a Freeway Lid as a priority project as identified in SANDAG’s 2021 Draft Regional Plan.

Re: North County Transit District Feedback and Questions on the Draft 2021 Regional Plan

Dear Chair Blakespear and Mr. Ikhrata:

On behalf of the North County Transit District’s (NCTD) Board of Directors (Board), I commend San Diego Association of Governments (SANDAG) staff for advancing the Draft 2021 Regional Plan (Plan). The Plan proposes to push the region forward by enhancing our transportation network through the integration of roads, transit, land use, and technology via the 5 Big Moves.

Given the importance of updating the Plan, I requested NCTD staff review the Plan and prepare recommendations and clarification on behalf of the NCTD Board to submit to SANDAG during the public review period. As you are aware, the region has significant funding needs to complete current TransNet projects that have been promised, but are unfunded, along with the need to support our future through continued investments in our transportation system that meet or exceed statewide environmental, mobility, social equity, and economic goals.

NCTD understands the importance of the Plan as it relates to the development and prioritization of projects for inclusion in a potential future ballot initiative. NCTD acknowledges that the needs of transit and other modes of transportation are vast and that no single initiative will address all the needs. It is within this context that NCTD staff has compiled feedback and requests for clarification to better understand details of the Plan as it relates to NCTD’s needs and the
regional transportation system so that the NCTD Board can adopt and submit its recommended priorities to SANDAG.

NCTD staff is requesting that SANDAG provide a response to the feedback and questions posed by July 8, 2021 to support potential discussions at the July and September meetings of the NCTD Board of Directors, to which SANDAG staff will be invited to participate.

On behalf of the NCTD Board, I thank you and SANDAG staff for your willingness to provide responses to the feedback and questions. Feel free to contact me or NCTD's Executive Director, Matthew Tucker, if you have any questions.

Sincerely,

Tony Kranz
NCTD Board Chair

NCTD Feedback and Questions Regarding the Draft 2021 Regional Plan

NCTD recognizes the significant amount of data analysis, modeling, and planning that has contributed to the 5 Big Moves and the 2021 Draft Regional Plan (Plan). Based upon the information published on May 28, 2021, NCTD has summarized a series of points below for recommendation, discussion, and clarification.

Questions and Clarifications

Regional Capital Project Prioritization and Implementation

1. NCTD seeks clarity on the status of specific projects that were included in the constrained TransNet funding plan but are at risk due to lack of funding. NCTD is seeking information on how much of the estimated $160 billion proposed plan estimate is allocated to complete these unfunded TransNet projects on a project-level basis. NCTD is seeking more detailed information that expands upon the corridor-level information included in Appendix A: Transportation Projects, Programs, and Phasing of the Plan.

2. NCTD seeks clarity on the project phasing proposed within the Plan. Specifically, NCTD is seeking to understand the timing of implementation of unfunded TransNet projects related to new projects presented within the Plan. To support this, NCTD is requesting that SANDAG input the information requested in Table 1 (Attachment B).

3. NCTD seeks clarity on the assumptions related to the completion of major capital projects, including the assumed percentage level of federal and state match funding required to implement the projects envisioned in the Plan. To support this, NCTD is requesting that SANDAG input the information requested in Table 1 (Attachment B).

4. NCTD seeks specific data on the proposed 200 miles of rail service contemplated in the 2021 Draft Regional Plan. To support this, NCTD is requesting that SANDAG input the information requested in Table 3 (Attachment D)

Operational and Financial Assumptions

1. NCTD seeks specific data on the proposed dedicated source of funding to be used to provide reduced or free fares within the region. NCTD believes that it is important that SANDAG identify a source that is not sales tax based to mitigate impacts to service levels during economic downturns. The source of funding should also match increases in operating costs.
2. NCTD seeks specific data on the proposed level of funding that is proposed to be dedicated to transit operations, preventative maintenance, and state of good repair maintenance and replacements, respectively.

3. NCTD seeks specific data on the assumed transit service frequencies throughout the duration of the plan, and specifically as it relates to local transit bus operations. To support this, NCTD is requesting that SANDAG input the information requested in Table 2 (Attachment C).

4. NCTD seeks specific data on plans and funding that will be allocated to support road, technology, and other infrastructure improvements to advance faster, frequent, and more reliable transit service.

Customer Research Questions

1. NCTD seeks clarity on the transit customer research conducted as part of the Central Mobility Hub planning process, either as part of the Draft 2021 Regional Plan development process or the Central Mobility Hub Comprehensive Multimodal Corridor Plan (CMCP) process. NCTD is specifically seeking information on transit user experience impacts related to the relocation of transit service from Old Town Station to the proposed Central Mobility Hub.

2. NCTD seeks clarity on the transit customer research conducted as part of the Sorrento Mesa spur planning process, either as part of the Draft 2021 Regional Plan development process, SD-LOSSAN Rail Corridor Realignment Study process, or South Bay to Sorrento CMCP. NCTD is specifically seeking information on transit user access and user experience impacts related to the relocation of transit service from the existing Sorrento Valley COASTER Station to a proposed Sorrento Mesa location.

San Diego, CA 92101

SUBJECT: 2021 Regional Plan Comments (sent via email and U.S. Postal Service)

Dear SANDAG Regional Plan Staff,

The Oceanside Bicycle and Pedestrian Committee is a citizen’s advisory committee whose role is to advise the City on programs and projects which improve bicycling and walking in the community. The Committee’s membership includes over 75 Oceanside residents who are concerned about bicycling and walking infrastructure and opportunities. Our goals are to promote bicycling and walking in the community for health, recreation, and transportation, to promote bicycle and pedestrian safety, and to improve bicycling and pedestrian facilities.

Our Committee has reviewed the draft 2021 Regional Plan and wishes to submit several comments for SANDAG consideration. First, as a general statement, the Committee appreciates the Plan’s significant shift in how people move about in the region, as proposed through the “Five Big Moves” and interrelated projects and programs. We concur with SANDAG’s conclusion that the imperative of responding to the climate crisis requires such a significant shift from previous Regional Transportation Plans. We also strongly agree with the statement on page 1 of Appendix L: Active Transportation, that:

Active Transportation is a key element interwoven through the 5 Big Moves; it connects people to all kinds of destinations and defines the infrastructure needs to make the system work for everyone.

With this statement in mind, we have specific input regarding several of the key Active Transportation projects which affect Oceanside, as listed in Appendix A, Page A-35, as follows:

AT031 – Coastal Rail Trail Oceanside – Broadway to Eaton
– This project appears to be off-street from Vista Way/Broadway to Broadway/Eaton (using the railroad right-of-way), then on-street on Eaton to Hwy 101. The existing portions of the Coastal Rail Trail north and south of Cassidy Street in this area are sub-standard (see photo) – the usable width of the trail in this section is only about 7 feet wide and does not provide sufficient space for
cyclists to pass walkers safely without nearly coming to a stop. In addition, in preliminary City discussions with the Buena Vista Audubon Society, the possibility exists that the Society might allow development of the trail through their property south of the end of Broadway Street, connecting to the improved trail on Coast Highway. This would provide a safer and traffic-free connection rather than putting trail users directly on Eaton and Coast Highway. For these reasons, the City of Oceanside, with Committee support, submitted a Caltrans Sustainable Transportation Planning Grant request in February 2021, seeking funding for a “Coastal Rail Trail Morse-Vista Way Improvement Study”. Please see our attached January 27, 2021 letter on same. We await word on the outcome of this grant request. Accordingly, we recommend that SANDAG include the potential for widening the trail in this area and connecting it through the Audubon Society property as part of Project AT031 and revise the budget accordingly.

AT049 – Inland Rail Trail Oceanside – This project is intended to cover the entire Inland Rail Trail segment within Oceanside, from Melrose to west of I-5. The Committee strongly supports this project – completion of the Inland Rail Trail and the Coastal Rail Trail within Oceanside are the two top-priority projects in Oceanside’s adopted Bicycle Master Plan.

The Committee’s concern about this project is SANDAG’s listed “Year Built” of 2035. Completion of the Inland Rail Trail has been an adopted goal of the north county communities it travels through since 1995, through a Memorandum of Understanding (copy attached). In that MOU, the corridor agencies adopted the following vision 25 years ago:

NCTD and the sponsor agencies desire to create a multi-modal transportation facility which will help these communities achieve a higher quality of life by promoting alternative transportation opportunities, reducing automobile trips, improving air quality, reducing congestion, providing recreational opportunities, and increasing access to desired North County destinations.

This trail has also been identified as a priority project in the SANDAG Ride to 2050 Plan and is key in promoting bike commuting in the region. The only nearby alternative to completing this trail in Oceanside is to ride on Oceanside Blvd., which is very challenging if not outright unsafe for cyclists given its narrow bike lane widths, complete disappearance of the bike lane at major intersections, high traffic speeds, and heavy truck volume.

Simply put, the citizens of Oceanside should not have to wait 40 years for their portion of the IRT to be completed, when the communities across North County made it clear in 1995 that completion of this trail was a priority. This delay is not fair to Oceanside on a general basis and is further exacerbated by equity considerations – Oceanside is home to a significant minority population (52% composition) whereas other North County coastal cities have majority white populations ranging from 74% to 90%.

1 Per City of Oceanside’s FY2020-21 Caltrans Sustainable Transportation Planning Grant for an Inland Rail Trail – Oceanside Alignment Analysis and Conceptual Design Study
The proposed SANDAG Regional Plan includes a significant “Focus on Equity”, including the statement,

*In developing and implementing the 2021 Regional Plan, SANDAG has a responsibility to listen to the communities we serve, prioritize equitable solutions in the transportation system, and analyze the burdens and benefits of this system for historically underserved communities*.  

While Escondido and San Marcos had all or portions of their IRT constructed by 2008, and Vista’s segments are completed, in design, or under construction now, the Oceanside segment is not even in preliminary planning at this time. Given the frequent mention throughout the Regional Plan of the importance of bike trail improvements to the overall success of the Plan, and the Focus on Equity, we implore SANDAG to move up the completion of this segment of the IRT commensurate with its importance to the Adopted Regional Bike Network. We believe that this project could be completed in roughly five years if it was prioritized, as follows:

- 18 months for alignment definition and design
- 18 months for any necessary permitting, approvals, and right-of-way acquisition
- 24 months for construction

**AT074 – Coastal Rail Trail Oceanside Segment 1 ALT** – According to the materials provided by SANDAG staff, this segment of the Coastal Rail Trail at the northern connection with the San Luis Rey River Trail would become just an on-street bike lane on Pacific Street, from just west of the railroad tracks underpass to west of the Oceanside Transit Center. This alternative does not appear to take advantage of the currently-built off-street segment adjacent to the tracks from under I-5 to Neptune Way (see photo). Why not incorporate that portion as part of this segment before returning to on-street status?

**AT113 – San Luis Rey River Trail Extension** – This project proposes to extend the east end of the San Luis Rey River Trail from where it returns to surface streets at Andrew Jackson Street near Polk Street, all the way out to Old Hwy 395, mostly adjacent to the river. It should be noted that the proposed alignment does not make use of the already-constructed segment from Tyler Street to Via Manos at Hwy 76. In addition, there may also be City easements along the farmland adjacent to Highway 76, leading from Via Manos to the next neighborhood to the

---

2 Draft 2021 Regional Plan, Page 11.
east. There, another already-constructed trail segment circumnavigates the residential neighborhood, coming out right across the street from Mission Vista High School on Melrose. All of these segments, if linked together, offer the opportunity to create a significant trail extension in the near future at very little cost. We urge SANDAG to consult with long-term Bicycle and Pedestrian Committee members who have extensive historical background on trails in this area.

Additional Proposed Project #1 - SANDAG should consider an improved connection between the Vista Way shopping area east of I-5 and the Oceanside communities west of I-5. Currently, due to the topography of the alternative East/West routes, the freeway is a significant barrier to this community having access to the large shopping area on Vista Way east of I-5. Riding from the shopping center, west to the coast, requires riding up a very steep hill at the back of the shopping center and another one on Cassidy Street. They are both difficult climbs, especially with groceries. Such a project would likely entail a bridge overpass of I-5, in the vicinity of Kelly Street. Travelling East, once the Active Transportation user is past I-5, the optimum route would probably follow the least-elevation-change path, which would entail a
turn to the south. We found that there is a similar bridge in Cupertino, over I-280, on Mary Avenue, that cost only $8 million, approximately 13 years ago.

Additional Proposed Project #2 - SANDAG should consider the Oceanside Coast Highway Corridor Study Road Diet and Incentive Zone, as approved by Oceanside in August 2019 between Harbor Drive and Morse, to be an Active Transportation Project. The project would convert this portion of the road, which is now mostly avoided by the Active Transportation Community, to be one that is safe and desirable.

This “complete street” transformation would provide more room on the road for all roadway users, fewer signalized intersections, and reduced speeds. It would maintain good traffic flow, by having roundabouts at most arterials and a turning lane for streets and driveways between arterials. It would have a desirable mixed-use, smart-growth ambiance, with designated bike lanes, wider sidewalks, community-oriented commercial developments, upscale housing, and shade trees. This project is on the historical Route 101. The street is two blocks East of the Oceanside Transit Center, where new developments are planned. The City Library, a Community Center, and City Hall are on this street, just blocks from the Transit Center. The Bicycle and Pedestrian Committee has been urging Oceanside to expand its Climate Action
Plan (CAP) by giving its City employees a car-parking system that encourages use of alternative modes to driving alone. This complete street project would help City employees get to work without driving.

Thank you for the opportunity to comment on the 2021 Regional Plan.

Sincerely,

Tom Lichterman
Chairman, Oceanside Bicycle and Pedestrian Committee

Ms. Barbara Valentine
Caltrans District 11
4050 Taylor Street
Mail Station 240
San Diego, CA 92110

RE: Requested Funding for a Coastal Rail Trail Morse-Vista Way Improvement Study

Dear Ms. Valentine:

The Oceanside Bicycle and Pedestrian Committee’s purpose is to promote bicycling and walking in the community for health, recreation, and transportation, to promote bicycle and pedestrian safety, and to improve bicycling and pedestrian facilities.

The Committee is pleased to provide a letter of support for the City of Oceanside’s application for funding in response to the Senate Bill 1 Caltrans Sustainable Transportation Planning Grant program. With this requested funding, Oceanside will prepare a Project Study Report to evaluate options for increasing the capacity of the current narrow Coastal Rail Trail segment between Morse and Vista Way that was constructed with SANDAG funds in 2002. This trail was the first segment of the Coastal Rail Trail constructed in the county. The existing width of 7 ft of asphalt with 6” concrete curbs/borders on each side is far below current standards, insufficient to accommodate a mix of cycling and walking trail users. The photos below illustrate how narrow the trail is in this area, with two people walking side-by-side effectively taking up the entire trail. The narrow width will also present issues as other portions are constructed to modern standards.

The City additionally needs to evaluate the best options for connecting the trail from Vista Way to the Oceanside/Carlsbad Coastal Trail on Coast Hwy. Assuming the City will be successful in obtaining funding to bridge Loma Alta Creek, increasing the capacity and connectivity of the southern portion of the trail will be critical. The Coastal Rail Trail has been identified as a priority project in the SANDAG Ride to 2050 Regional Bicycle Network and is key in promoting bike commuting in the region.
A successful Coastal Rail Trail Morse-Vista Way Improvement Study Report will:

- Evaluate options to widen the existing trail to meet current SANDAG design standards, from Morse Street to Vista Way.
- Determine the additional right-of-way that would be required.
- Identify and study options to extend the trail from its current terminus at Broadway Street and Vista Way, to a connection with the Oceanside/Carlsbad Coastal Trail on Coast Hwy. The Buena Vista Audubon Society has indicated an interest in supporting extension of the existing trail south along Broadway street and through the open area to the south, to meet up with the current trail on Coast Highway.
- Determine if any environmental issues exist.
- Provide an order-of-magnitude estimated cost of the project.

The Oceanside Bicycle and Pedestrian Committee urges Caltrans to approve this important grant application request so that the region can continue to make progress toward a completed county-wide Coastal Rail Trail.

Thank you for your consideration.

Sincerely,

[Signature]

NORTH SAN DIEGO COUNTY TRANSIT DEVELOPMENT BOARD

CONSENT CALENDAR
AGENDA ITEM A-8

February 16, 1995

TO: North San Diego County Transit Development Board Members

FROM: Executive Director

SUBJECT: MEMORANDUM OF UNDERSTANDING

STAFF’S RECOMMENDED ACTION: That the Board authorize the Executive Director to enter into a Memorandum of Understanding with the Cities of San Marcos, Escondido, Oceanside, Vista, and the County of San Diego to establish a framework for a partnership to provide a bikeway adjacent to the Escondido Subdivision Railroad Spur line.

BACKGROUND DATA:

A Memorandum of Understanding has been formulated by the City of San Marcos to establish a partnership between the North San Diego County Transit Development Board (NSDCTDB) and the Cities of San Marcos, Escondido, Oceanside, Vista, and the County of San Diego (sponsor agencies) to provide a bikeway adjacent to the Escondido Subdivision Railroad Spur line in conjunction with the development of NSDCTDB's Oceanside - Escondido passenger rail project. The proposed bikeway will provide a continuous Class I bicycle facility between the Oceanside Transit Center and the Escondido Transit Center traversing the Cities of Oceanside, Vista, San Marcos, and Escondido, and a portion of unincorporated San Diego County.

SANDAG's FY94 Regional Transportation Improvement Plan designated the City of San Marcos as the lead agency and Project Administrator for the development of the bikeway portion of the Oceanside - Escondido passenger rail project. The sponsor agencies have obtained federal and state funding for design and construction of the bikeway which they will share with NSDCTDB to complete the Environmental Assessment and design for the joint project. Since the bikeway and the passenger rail projects are being combined, the City of San Marcos will reimburse NSDCTDB a corresponding portion of the consultant contract fee associated with the Environmental Assessment and design.
The bikeway and passenger rail project will continue to be considered a joint project until the construction stage. NSDCTDB and all sponsor agencies will review and approve all plans before construction is permitted. Furthermore, NSDCTDB and the sponsor agencies will adopt a formal agreement which specifies access rights, responsibilities, and duties with regards to the construction, maintenance, and liabilities associated with the bikeway at a point in time before the bikeway construction plans are signed by NSDCTDB.

Attachment

A-8-1
MEMORANDUM OF UNDERSTANDING

between the
North San Diego County Transit Development Board
and the
City of San Marcos
City of Escondido
City of Oceanside
City of Vista
San Diego County

ESCONDIDO TO OCEANSIDE RAIL/TRAIL BIKEWAY PROJECT

-RECITALS-

A. The purpose of this Memorandum of Understanding (MOU) is to establish the framework for a partnership between the North County Transit District (NCTD) and the Cities of San Marcos, Escondido, Oceanside, Vista, and the County of San Diego (Sponsor Agencies), to provide a bikeway adjacent to the Escondido Subdivision Railroad Spur line.

B. NCTD and the sponsor agencies desire to create a multi-modal transportation facility which will help these communities achieve a higher quality of life by promoting alternative transportation opportunities, reducing automobile trips, improving air quality, reducing congestion, providing recreational opportunities, and increasing access to desired North County destinations.

C. The planned bikeway will provide a continuous Class I Bicycle facility between the Oceanside Transit Center and the Escondido Transit Center, and will span the Cities of Oceanside, Vista, San Marcos, and Escondido, including a portion of unincorporated San Diego County.

D. The sponsor agencies have designated San Marcos as the Project Administrator in coordinating project development in partnership with NCTD, and have formalized this relationship by making this designation part of the Regional Transportation Improvement Plan, adopted by the SANDAG Board of Directors on June 25, 1993.

E. The sponsor agencies have obtained funding grants from Federal and State sources for the design and construction of the bikeway portion of the project. The agencies will utilize these funds in assisting NCTD to complete the Environmental Assessment and design of the project.

F. NCTD owns rights of way within which it maintains and operates the rail line, and within which it will be developing and operating passenger railroad service.

G. This memorandum of understanding does not establish a contract or obligation between any of the participating agencies nor shall this memorandum be construed to be an agreement for the joint exercise of powers or creating a joint powers agency under the provisions of Government Code Section 6500 et seq. Each participating agency shall retain full regulatory authority with respect to the subject matter of this memorandum of understanding and full discretionary authority with respect to the provisions of the facilities within their respective jurisdictions.
-BASIC AGREEMENT TERMS-

1. The bikeway will occupy railroad right-of-way except where infeasible due to conflicts with necessary railroad facilities, highway facilities, physical limitations, or conflicts with environmentally sensitive areas.

2. The agencies within which the bikeway exists will be granted rights by NCTD to place and maintain the bikeway facility.

3. NCTD will retain all rights to utilize the bikeway as their primary access for railroad maintenance activities.

4. NCTD will manage a consultant contract which will satisfy the preliminary design and environmental assessment requirements for a project which combines the development of both the passenger railroad service and the bikeway into an integrated transportation facility.

5. NCTD will follow the requirements of the CalTrans Local Programs Manual in managing the consultant contract.

6. San Marcos, as Project Administrator acting for the sponsor agencies, will assist NCTD in managing the consultant contract, supporting NCTD and the consultant in producing project design and environmental assessment necessary to gain authorization from oversight agencies to proceed with preparation of construction plans for the projects.

7. With the grant funding available, the sponsor agencies will share in the expenses associated with the preliminary design and environmental assessment consultant contract, making available to NCTD funds which will reimburse NCTD for an appropriate portion of the consultant contract fee.

8. After the projects have achieved environmental oversight clearance, San Marcos, as Project Administrator acting for the sponsor agencies, will prepare plans, specifications, and estimates for the construction of the bikeway portion of the project. NCTD, and all sponsor agencies, will review and approve these plans before construction is permitted.

9. NCTD, as well as the sponsor agencies, will adopt a formal agreement which specifies access rights, responsibilities, and duties with regard to the construction, maintenance, and liabilities associated with the bikeway at a point in time before the bikeway construction plans are signed by NCTD.

RESOLUTION NO. 94-327

A RESOLUTION OF THE CITY COUNCIL OF THE CITY OF ESCONDIDO, CALIFORNIA, AUTHORIZING THE CITY MANAGER AND CITY CLERK TO ADOPT AND EXECUTE, ON BEHALF OF THE CITY, A MEMORANDUM OF UNDERSTANDING BETWEEN THE CITY OF ESCONDIDO, CITY OF SAN MARCOS, CITY OF OCEANSIDE, CITY OF VISTA, COUNTY OF SAN DIEGO AND NORTH SAN DIEGO COUNTY TRANSIT DEVELOPMENT BOARD

WHEREAS, the cities of San Marcos, Escondido, Oceanside and Vista, and the County of San Diego desire to establish a Class I Bikeway along the SR 78 Rail Corridor; and

WHEREAS, the City of San Marcos has been designated as the project administrator of the Escondido to Oceanside Bikeway project by the SANDAG Regional Transportation Improvement Plan; and

WHEREAS, the City of San Marcos is preparing to complete an Environmental Assessment and to design the bikeway facilities throughout the SR-78 corridor; and

WHEREAS the North San Diego County Transit Development Board is preparing to complete an Environmental Assessment and to design the passenger railway facilities throughout the SR-78 corridor; and

NOW, THEREFORE, BE IT RESOLVED by the City Council of the City of Escondido, California, as follows:

1. That the above recitations are true.

2. That the City Manager and City Clerk are authorized on behalf of the City, to execute a Memorandum of Understanding in substantially the form as submitted on Exhibit "1" with other cities and the North San Diego County Transit Development Board for the development of the Escondido to Oceanside Railway and Bikeway.
PASSED, ADOPTED AND APPROVED by the City Council of the City of Escondido at a regular meeting thereof this 7th day of September, 1994, by the following vote to wit:

AYES : Councilmembers: CAMERON, FOSTER, HARMON, HOLLINS, PFETTLER

NOES : Councilmembers: NONE

ABSENT : Councilmembers: NONE

APPROVED:

[Signature]
SID HOLLINS, Mayor of the City of Escondido, California

Subject: Comments on Draft 2021 Regional Plan

Thank you for the opportunity to comment on the 2021 Regional Plan. I would like to forward a few global comments on the challenges facing us as a region and the general approach to the regional program.

The 2021 Regional Plan is a significant departure from previous approaches in several regards, principally that it would be exorbitantly expensive to the region at a cost $163B should it be implemented. By way of illustration, every one of the 3.3M residents of San Diego County in 2016 could be provided with a $49,000 electric vehicle for less cost than implementing the proposed Regional Plan, without even allowing for tax incentives. Also by way of comparison, the entire Transnet program will generate $15B through the 40 year life of the program from 2008-2048, less than 10% of the cost of the proposed 2021 Regional Plan.

The funding model for the 2021 Regional Plan is also a departure from previous efforts. Where in the past a transportation charges returned a defined benefit (i.e. improved roadway maintenance or the privilege of driving in a less congested Managed Lane), no such pretense is offered with this cost model. Per mile VMT “user fees” (which could be considered by many as taxes or penalties on autos) charged to use a private vehicle on a public roadway are mostly diverted to transit improvements, operations, maintenance, subsidies, and other programs rather than returned to the user in the form of a benefit. Many will view area roadways as bought and paid for with their and their parent’s tax dollars, not as a government-owned resource carrying a toll to be charged back to motorists. Given that the gas tax will not only remain, but most likely escalate, and be piled on to other fees and taxes, including VMT costs passed through by companies transporting daily goods, the situation does not promote equity or provide affordability to San Diego’s working families.

The track record of SANDAG and its partners (principally Caltrans, MTS and NCTD) in delivering major transportation programs for the San Diego region within budget and on schedule has not been stellar, particularly when transparency on the real costs of the programs is factored into the equation. MTS’ Mission Valley East Trolley Extension (or “Green Line”) was pushing 50% over the original budget ($361M vs. $506M) and even that did not approach inclusion of all the costs required for the expansion of the system. Although delivery methods, and consequently cost and risk management, appear to have improved with the Mid-Coast Trolley Extension, no easily accessible “dashboard”

Philip R. Kern, PE M.ASCE CA 40831 NV 9144
Philkern18@gmail.com
or other record of construction Contract Change Orders could be found on SANDAG’s website for the project.

Several other major programs that were supposed to be included in the original Transnet authorization (extensions of State Route 76 and State Route 52, for example) were delayed over a decade with the commensurate increases in cost of the programs, traffic congestion, delays and emissions. The same pattern of deferring promised capital projects (particularly roadways) ad infinitum appears to be repeated in the 2021 Regional Plan. Assuming adoption of the Regional Plan by 2025 it appears highly unlikely given previous efforts that environmental, design and construction for any of the major transportation programs will be completed and ready for revenue service by 2035. Very few, if any, major local highway or transit projects in the region have gone from inception to ribbon cutting in a decade. The Mid Coast Trolley extension will end up taking over twenty years from inception to revenue operations. Accountability in this area is a serious issue.

The single most costly element of the 2021 Regional Plan is the proposed “high speed rail” (HSR) network. Aligning local high speed rail (HSR) facilities underground is not a panacea for avoiding environmental, right of way, utility, acquisition, and relocation costs related to development of a high speed transit network, nor will relying on tunneling technologies that are yet to be developed (and which may ultimately be proprietary) substantially reduce the risk or cost, or automatically render an economically infeasible transportation system more feasible once it goes underground.

Tunneled alignments carry a whole new set of risks and costs, all of which come in to play when you elect to use the earth as a structure supporting your transportation system or the infrastructure above it. Fire and life safety, geologic conditions, surficial settlement, faulting/seismicity, HVAC needs, groundwater, subsurface environmental conditions, and other factors all have the ability to exponentially increase the cost and risk of below grade facilities, as well as kill the project outright. Proposing an underground (and under water) alignment parallel to the eastern shore of San Diego Bay under unstable Bay Mud, with the specter of future sea level rise and across a fault zone would range from ill-advised to sheer lunacy.

Elon Musk’s The Boring Company (TBC) estimates current tunnel costs can range from $100M to $1B per mile. Their ultimate goal is to reduce costs to 10% of the low-end figure, or $10M per mile, to be truly feasible on a large scale and today they are not even close to approaching that figure. TBC recently complete a 1.7 mile “bare” tunnel (no vehicles, track or infrastructure) in the sandy soils under the Las Vegas Convention Center at a cost of $52.5M, or over $30M per mile.

The cost of a fully functioning surface high speed rail system including track, systems, vehicles, stations and support facilities can be expected to be at least $200M per mile in...
2020 dollars, not allowing for more expensive tunneled alignments. The best data points are recently constructed and nearly completed projects, including Mission Valley East and Mid-Coast Trolley extensions. Published per mile costs for several recent programs in the western U.S. are shown in the table below, confirming the roughly $200M per mile plus escalation is the going rate for a high speed, grade separated, electrified surface rail system in an urban setting.

</tbody>
</table>

A major factor in the selection of underground alignments will be the availability of expertise and resources with the San Diego region to prosecute a large-scale tunneling program. With the exception of a very short section of “real” tunnel (as opposed to a “cut and cover” installation) on MTS’ Green Line, regional design and construction experience/expertise on passenger-carrying tunnels is essentially non-existent. Importing consultants and contractors is always an option, but never a good one as it does little for local hiring and talent development, or the ability to favorably negotiate contracts on behalf of the region when there is only one game in town (or worse yet, coming in from out of town). Decades of experience have been developed in the region developing the LRT system, this needs to be leveraged in a local High Speed Rail program.

Another question mark in the development of the Regional Plan is that the proposed high speed rail alignments generally parallel existing transportation corridors (whether
you are talking freeways or LRT) but propose entirely new alignments. This is the worst of both worlds. It is far less expensive to increase capacity by (re)constructing new facilities within existing transportation corridors than by pioneering new alignments. New alignments require connecting infrastructure to be reconstructed and have the potential to introduce new environmental impacts (and mitigation) to areas not previously exposed to transportation activities, which also factors into the environmental justice arena. The entire San Diego Trolley system could be reconstructed as a high(er) speed rail system for a fraction of the cost of a new underground HSR system with the bonus that the same vehicles could be used regionally to phase out the diesel powered DMUs used on the Sprinter. Trolleys can run at 55 mph, how fast do you want to go? On modern transit systems travel time is dictated more by the number of stops rather than the top speed of the vehicles.

Also, to be fair and transparent to the region, the costs for the local HSR and other systems need to account for all costs attributable to the development of the system, rather than the classic “just get program past the point of no return, then they will have to pay for it” approach. In addition to trackways, systems, vehicles, modifications to the existing system and other capital costs, the program needs to account for such esoteric items as new maintenance shop space, technicians, and training as well as specialized equipment required to operate and maintain the new rail vehicles. Adding yet another type of transit vehicle requiring its own maintenance infrastructure to the regional fleet would be violating the first rule of fleet management: maximize commonality.

The “per-mile costs” outlined above should also serve as a yardstick to determine the financial feasibility of the system at a glance, i.e. if you cannot deliver a transportation network by 2050 for less than $500M per mile ($200M per mile escalated 30 years at 3%), you need to seriously consider other alternatives. At costs exceeding $500M per mile the 2021 Regional Plan proposal does not pass the “sniff test” on the high speed rail issue. The planners need to go back to the drawing board on this element to provide better alternatives.

In closing, the magnitude of the expenditures proposed under the 2021 Regional Plan demands independent, professional capital cost accountability, representation and reporting to the public. ITOCs composed of well-intentioned laypersons with little or no authority and “third party independent reviews” conducted by consultants with a vested interest in continuing the program provide little comfort or accountability to the taxpayers and transportation users of the region who are footing the bill.

San Diego, CA 92101

RE: Priorities for the 2021 Regional Transportation Plan

Dear Chair Blakespear and SANDAG Board Members:

The authors of this letter represent thousands of families, residents, and workers throughout the region advocating for an equitable, safe, and healthy transportation system for all communities in our San Diego region.

We are writing in support of seven outcomes we would like to see accomplished in the 2021 Regional Transportation Plan (RTP). As we have noted in prior communications, it is imperative to transform transportation across San Diego County from the ground up, in a manner that goes above and beyond state targets in climate, social justice, and economic justice and gives all in our region the clean and healthy environment they deserve while ensuring high-quality jobs and a world-class transportation network.
Below we have attached seven outcomes the RTP should achieve to support a safe and healthy future for all communities in our San Diego region. We urge the Board to hold these priority outcomes as the measures of success against which any draft RTP should be evaluated.

We look forward to working in partnership with SANDAG staff and the Board of Directors to ensure that the new vision for our regional transportation system supports a just, prosperous, and sustainable future for all.

Sincerely,

Andy Hanshaw, Executive Director, San Diego County Bicycle Coalition
Justin Hammond, Co-Founder and Chief Energy Advisor, Hammond Climate Solutions
Tara Hammond, Manager, San Diego Climate Hub
Bridgette Browning, President, UNITE HERE Local 30
Pamela Heatherington, Director, Environmental Center San Diego
Matt O’Malley, Executive Director and Managing Attorney, San Diego Coastkeeper
Ron Forster, Escondido Neighbors United
Jeremy Abrams, Business Manager, IBEW 569
Diane Nygaard, President of the Board, Preserve Calavera
David Grubb, Transportation Chair, Sierra Club San Diego
Mike McCoy, President, Southwest Wetlands Interpretive Association
Diana Ross, Executive Director, Mid-City CAN
Bee Mittermiller, Transportation Committee Chair, SanDiego350
Andrew Meyer, Conservation Director, San Diego Audubon
Deborah Knight, Executive Director, Friends of Rose Canyon
Kyle Heiskala, Interim Executive Director, BikeSD
Laura Walsh, Policy Coordinator, Surfrider San Diego County
Randy Torres-Van Vleck, Director of Policy and Planning, City Heights Community Development Corporation
Noah Harris, Policy Advocate, Climate Action Campaign
Key Outcomes for SANDAG’s RTP

To secure a healthy, safe, and equitable future, SANDAG must embrace an outcomes-driven RTP and identify priority outcomes aligned with those values. Below are seven key outcomes the Quality of Life Coalition urges SANDAG to prioritize in the 2021 Regional Transportation Plan:

1. Improve public health in disadvantaged communities and prioritize transportation and environmental justice by:

   - Reducing transportation related pollution levels in disadvantaged communities.
     
     ➢ AB 805 requires SANDAG to identify which communities to prioritize in their efforts to reduce pollution levels in this RTP.
     
     ➢ SANDAG must use CalEnviroScreen 3.0 to identify these communities; we recommend defining disadvantaged communities as those in the top 30% of census tracts countywide, but also acknowledge that there are historically underinvested communities in San Diego County that are not adequately represented on this tool.
     
     ➢ Any new transportation vision that successfully reduces pollution levels in disadvantaged communities must include significant reduction in Vehicle Miles Traveled (VMT) and rapid electrification of the bus fleet.

   - Providing infrastructure that:
     
     ➢ Encourages increased physical activity from active transportation
     
     ➢ Reduces the risk of traffic related fatalities and injuries for all modes

   - Analyzing health outcomes that are affected by the regional transportation system in each alternative, such as asthma, cardiovascular and pulmonary disease, lung cancer, type 2 diabetes, physical activity and obesity rates, by demographic group.

2. Align with and exceed cities’ CAP transportation mode shift targets.

   - SANDAG’s plan needs to support those local plans in order for our cities to be able to hit their targets and support transportation alternatives to driving, such as mass transit.

   - Further, AB 805 – the new state law to reform SANDAG – requires that SANDAG align the RTP with local climate action plans.
3. **Achieve a 30% or more per capita GHG reduction from transportation by 2035.**

   - SB 375 requires a minimum of 19% reduction by 2035; however, SANDAG Executive Director Hasan Ikhrata has identified a 30% target as feasible, and SANDAG should pursue the maximum feasible reduction to adequately address the threat of climate change.

   - VMT reduction and mode shift through land use, housing, and transportation planning decisions must play a significant role in GHG reduction.

   - As evidenced by Governor Brown’s Executive Order B-55-18 to Achieve Carbon Neutrality by 2045, and SB 32 and EO S-3-05, which set statewide emissions reductions targets at 40% below 1990 levels by 2030 and 80% below 1990 levels by 2050, the State of California continues to move towards decarbonization. SANDAG should align with these statewide goals in the next RTP.

   - When vegetation is destroyed for transportation facilities the resulting loss of carbon sequestration and storage capability should be counted as a loss in future GHG reduction tabulations.

4. **Create a rate structure that increases ridership and expands access to mobility.**

   - The regional transportation system must include Youth Opportunity Passes, which are no-cost transit passes for students and youth 24 years old and under.

   - It must also include strategically-priced fares that maximize transit usage in all income brackets to increase use of public transit, improve public health, lower greenhouse gas emissions, and enhance social equity.

   - Finally, it must be easier for seniors, people with disabilities, and Medicare users to obtain the discounted passes they are entitled to by making them available online and at more in-person sites.

5. **Ensure that public transit is safe, comfortable, convenient and competitive with automobile travel.**

   - Public transit must be competitive with driving in terms of time, cost, predictability, and convenience.

   - Prioritize urban core and transit-dependent communities, who are frequently low-income communities of color.
● Provide 24-hour service and immediate improvements to bus service, including amenities such as restrooms at transit stations.

● Ensure safe and comfortable bike and pedestrian first and last mile access to transit through funded, comprehensive, low-stress bikeway networks connected to mobility hubs, as well as adequate accommodation for bicycles on transit.

● Prioritize new rail transit that connects underserved communities with job centers such as the blue line express and a purple line alignment through City Heights while evaluating the impacts on communities that are being displaced and gentrified.

● Prioritize relocation of public transit corridors that are vulnerable to erosion and sea level rise, rather than armoring in place.

● Ensure rural communities have access to quality, convenient, sustainable travel options that offer alternatives to fossil-fuel vehicles.

6. Ensure transportation projects are creating high-quality careers in construction in our region through a Project Labor Agreement.

● Major cities including Seattle and Los Angeles have employed project labor agreements to promote their commitment to labor stability, joint labor-management apprenticeship and a diverse, local workforce.

● Encourage construction employment and training opportunities in ways calculated to mitigate the harms caused by geographically concentrated poverty and unemployment in economically disadvantaged areas and among disadvantaged workers.

● Adopt a Community Workforce Policy that is implemented through a Project Labor Agreement with the Building Trades to create career pathways for a skilled and trained workforce for residents of our local communities.

7. Preserve Biodiversity, Natural Habitat, and Open Space

● Ensure transportation projects protect the integrity and contribute to successful implementation of existing and planned multiple species conservation plans (MSCPs) including avoiding sensitive habitat areas within the City of San Diego’s Multi-Habitats Planning Area and County of San Diego’s Pre-Approved Mitigation Area and consistency with MSCPs rules.
● Ensure transportation projects preserve natural habitat and other ecologically sensitive lands not covered by regional MSCPs including: urban canyons, waterways, waterbodies, ecological linkages, and ecologically important greenfields.

● Direct transportation projects away from remote or rural natural lands and into existing developed communities and urban areas.

● Ensure habitat mitigation land related to transportation projects is protected and managed for that ecological benefit.
Quality of Life Coalition Comments on the Draft Regional Plan

Friends of Rose Canyon

Deborah Knight, Executive Director rosecanyon@san.rr.com, 858-525-1489

Comments on the Draft 2021 Regional Plan - 8/4/2021

Our comments are focused on the geographic area that we are most familiar with: the area within and extending out from the I-805 / SR-52 / I-5 triangle. This includes the Rose Creek watershed (Rose Canyon, MCAS Miramar, San Clemente Canyon and Marian Bear Park, and Rose Creek extending south to Mission Bay) and the Carrol Canyon, Sorrento Valley, and Penasquitos Lagoon watershed. However, many of the concerns, issues and questions we raise in relation to this area apply to the entire RTP.

Our overall comment is that the 2021 Draft Regional Plan states that it proposes a bold new vision. However, it is based on a massive expansion of our highways. This includes widening many of our highways to add Managed Lanes and adding huge, elevated concrete “Managed Lane Connectors” (MLCs) where highways intersect. These MLCs will require even further highway widening to add lanes where traffic would enter and exit the connectors. In some cases these MLCs connect highways at very different elevations or with multiple other on and off ramps and bridges in the same location. Judging from just the area we focus on, these added MLs and MLCs will have huge direct and indirect environmental impacts on sensitive habitat, MSCP lands, Marian Bear Park, Rose Canyon Open Space Park, MCAS Miramar, and the Rose Creek and Carroll Canyon Creek/Sorrento Valley/Penasquitos Lagoon watersheds. Furthermore, just in the area we focus on, these MLs and MLCs will cost many hundreds of millions of dollars.

We ask: How much induced demand will adding all this highway capacity cause? How sure is SANDAG of their calculations? Will this plan really reduce GHG emissions, and by how much? How sure is SANDAG of those calculations? What is the course correction if we start adding all this highway capacity and the benefits are not there? Do the RTP models rest on the assumption that the projected benefits require that all the highway MLs and all the MLCs be added to achieve the projected benefits? What if we get half way into building this out and find that adding all this highway capacity is not bringing the benefits anticipated?

Based on what we see proposed for just the area we focus on, we see major direct and indirect Impacts on MSCP lands, open space, habitat, native plant and animal species, wildlife corridors, creeks, and watersheds. Adding Managed Lanes and Managed Lane Connectors means bulldozing land and building extensive new concrete surfaces and retaining walls and drainage ditches, expanding direct impacts and edge effects on habitat and wildlife, increasing storm water run-off, noise and light impacts, invasive species, habitat loss, loss of wildlife connectivity and wildlife corridors, increased erosion, trash, and air and water pollution. “Mitigating” these
impacts through projects done in distant mitigation banks does nothing to reduce the impacts in the areas where these impacts occur.

While SANDAG staff have stated in meetings with the QOL coalition that they are not widening outside the highway ROWs, that does not mean there won’t be major highway widening and environmental impacts. In some cases, CALTRANS has sufficient ROW to widen by multiple lanes. And widening even within the ROW extends the damaging impacts and pushes the edge effects closer to and into sensitive habitat.

Meanwhile, the Purple Line (Commuter Rail 582) from Sorrento Mesa to the Border (a true transit project) will not be completed until 2050. In concept, we strongly support this project, assuming it is largely underground through the environmentally sensitive areas we focus on. But despite the importance of this transit project, we know little beyond the vaguest description of its route. Where might it be underground? Where might it be at grade or above grade? Why is it not being completed until 2050 while the RTP prioritizes adding so many highway MLs and MLCs?

**I-805 North Project**

On April 15, 2021, the Sierra Club sent the attached letter to SANDAG Director Hasan Ikhrata, Director of Regional Planning Coleen Clementson, Senior Transportation Planner Jennifer Williamson, and several SANDAG BOD members. At a subsequent meeting with the Quality of Life Coalition’s Transportation Committee, Coleen Clementson stated vehemently, “We agree with you.” We therefore assume and would like confirmation, that the following is not in and will not be added to the RTP for the I-805 North from just south of SR-52 to Carroll Canyon Road:

- Any additional freeway widening beyond what has currently been built (one Carpool/ HOV lane in each direction was completed in 2016)
- Widening of the I-805 bridge over Rose Canyon -Direct Access Ramps (DARs) at Nobel Drive
- A Park & Ride at the southwest corner of Nobel/I-805 -A bus station at the southwest corner of Nobel/I-805

**Project ID CC114 is called I-805 (Nobel Drive) - it should be deleted from the RTP**

**Rationale:** I-805 North should locate access to and from the Managed Lanes at La Jolla Village Drive, not Nobel Drive. La Jolla Village Drive has extensive high density employment and high density housing located between the LJVD/I-805 intersection and Genesee Avenue. At Genesee there are two trolley stations surrounded by existing and planned high density employment and
housing. La Jolla Village Drive is the route BRT lines should use to enter and exit the I-805 MLs. Nobel Drive is a poor location for a BRT route to enter or exit I-805 MLs. The location is far from significant employment or housing density. Furthermore, no parking lot or bus station should be located at Nobel/805. The I-805 commute is south to north in the morning, so parking lots near the I-805 should be located in communities well to the south where commuters come from in the morning. The land at the Nobel/ I-805 intersection should be protected from any further impacts. Most of it is MSCP, and there are vernal pools and numerous documented sensitive species. That area should have no further disturbance.

2

The area within and near the SR-52, I-805, I-5

The RTP should reduce the amount of highway expansion and the number of MLCs in this area. SR-52 should not be widened and the MLCs between these highways should be eliminated.

The following projects would cause major environmental damage to MSCP lands and to the area’s critical and already highly constrained wildlife corridors.

This area illustrates our concern about the RTP as a whole. The RTP proposes a massive expansion of highway capacity in the name of creating “Complete Corridors” that will, in theory, carry BRT lines and carpools. While it is true that some existing general purpose lanes will be converted to “Managed Lanes”, the RTP proposes an expansion of all the highways in this area to add MLs plus multiple MLCs between these highways that will further degrade the habitat and wildlife corridors.

**CC085**: 2035 - MLC I-805 (SR 52) West to North and South to East CCT - $149 mil

This MLC will cause major environmental damage to an area with important wildlife corridors that connect MCAS Miramar, San Clemente Canyon (and Marian Bear Park) and Rose Canyon. These wildlife corridors are identified in the MSCP and in the MCAS Miramar Natural Resource Management Plans. The wildlife corridor between MCAS Miramar and San Clemente Canyon is already highly constrained at the I-805/52 intersection. In addition, the elevation change between the I-805 and SR-52 is significant. A further environmental impact will occur due to adding two MLs to SR-52 east of I-805 and one ML to SR-52 west of I-805.

**CC086**: MLC I-805 (SR52) North to West and East to South ($126 mil): More environmental impacts in this same area.

**CC003** - (by 2035) - I-5 (Pacific Highway to SR 52) 8F to 6F+4 ML ($353 mil) (adding 1 lane in each direction to I-5)
April 15, 2021 - via email
Re: Sierra Club San Diego Chapter opposition to potential projects on the I-805 North

Dear Chair Blakespear,
Since 1948 Sierra Club San Diego has earned a leadership role in the conservation of our County’s natural resources. Presently, with more than 40,000 members and supporters, the San Diego Chapter is continuously addressing planning by all regional agencies. Particular attention is focused on the avoidance of impacts to the biological diversity which is so crucial to our quality of life. Sierra Club requests consultation and a place at the table whenever SANDAG is considering any of the following proposals.

Sierra Club strongly opposes the following proposed projects for the I-805 North, from just south of SR-52 to Carroll Canyon Road:
- Any additional freeway widening beyond what has currently been built (one Carpool/ HOV lane in each direction was completed in 2016)
- Widening of the I-805 bridge over Rose Canyon
- Direct Access Ramps (DARs) at Nobel Drive
- A Park & Ride at the southwest corner of Nobel/I-805
- A bus station at the southwest corner of Nobel/I-805

We oppose the inclusion of any of these projects in the 2021 Regional Plan.
- These projects (or any projects with a similar footprint) would:
  - Destroy and degrade native habitat in Rose Canyon that is part of the last remaining greenbelt and wildlife corridor connecting habitat west of I-805 with habitat on MCAS Miramar. The important wildlife corridor in Rose Canyon under the existing I-805 bridge is recognized in both the MSCP and the MCAS Miramar Natural Resources Management Plan.

1. Destroy and degrade core MSCP habitat.
2. Destroy and degrade habitat with numerous sensitive plant and animal species, including:

- Vernal pools
- Rare Quercus Dumosa (Nuttall’s scrub oak)
- MHPA habitat with documented California Gnatcatchers as well as numerous other sensitive species

Thank you Chair Blakespear for your attention to our request for inclusion in the process. Retaining San Diego’s reputation as a world renowned “biological hotspot” is a goal we must all strive for.

Sincerely,

Dave Grubb,  
Chair, Transportation Committee, Sierra Club San Diego Chapter

George Courser,  
Chair, Conservation Committee, Sierra Club San Diego Chapter

Put General Comments not tied to a specific section here:

The Southwest Wetlands Interpretive Association (SWIA) is extremely invested in seeing that SANDAGs newest version/update of its Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) is the most effective and feasible approach for this region. The plan must present land use and transportation strategies to achieve the Air Resources Board’s SB 375 San Diego Region greenhouse gas (GHG) emission reduction targets, improve the transportation system, facilitate efficient land use and housing, and address long-standing inequities related to those issues. Our coastal wetlands are particularly vulnerable to climate change and associated sea level rise, both of which are primarily affected by continued high GHG emissions.

Overall, we believe the draft RTP/SCS – the 5 Big Moves – represents a fundamental and necessary break from past approaches. The basic strategy to focus on improvements to the infrastructure that give real incentive for reducing sprawl and vehicle use (mobility hubs, transit leap, complete corridors – assisted by flexible fleets), integrated via the Next Operating System, appears to be both forward-looking and pragmatic.

We are submitting these comments and recommendations that we believe are necessary to ensure the RTP/SCS is an appropriate and feasible strategy to achieve its required objectives. [SWIA]
Chapter 1: A Bold New Vision for the 2021 Regional Plan

We like it!

“The 2021 Regional Plan reduces per capita GHG emissions from cars and light duty trucks to 20% below 2005 levels by 2035, exceeding the region’s state mandated target of 19%. The 2021 Regional Plan also meets federal air quality conformity requirements” - This means our 29 year plan is barely ambitious enough to meet our insufficient state mandate. SANDAG should independently acknowledge the need to act on climate instead of stating from the outset that they are mandated to do so, and therefore meet the bare minimum with no margin for error. Less than 2% change annually is in the realm of noise in measurement. We need more bold commitment to change. (Karl A. channeling CM J. Shu)

Page 9. The brief description of this region’s natural resources, biodiversity, cultural history and other unique assets should be expanded and include a short description of the relationship of the regional transportation planning and multiple species conservation planning and permitting. This could be simply done by adding a short summary from Appendix AA.

In the early 2000’s, SANDAG and the state/federal wildlife agencies entered into unique agreements linking regional conservation commitments with expedited transportation project permitting (and mitigation). How does this plan continue and support those agreements and commitments?

Page 13. Provide more description regarding how the anticipated increases in peak period transit use from 3% (2020) to 13% (2050) will result in a reduction in solo commuter vehicle use from 80% (2020) to 62% (2050); what are the expected contributions from other mode shifts required to achieve this goal? Add a summary table (or cross reference an existing table) that shows all mode shifts (carpool/rideshare, active transit, etc.) for 2025, 2035 and 2050. In addition, the plan’s performance metrics must include tracking of the (housing) density and transportation infrastructure improvements in smart growth areas as well as what actual/calculated GHG reductions are occurring compared to what was projected. Also briefly introduce and describe the plan’s adaptive management approach for triggering and implementing measures to correct failings in meeting the plan’s goals.

Page 13. The plan states that it is expected to exceed the current vehicle-based per capita GHG emissions requirement for 2035, but as annotated in the list of state GHG emission reduction legislation/executive orders on Page 14, aggressive overall GHG emission reduction targets have been established for 2030, 2040 and 2050. Provide explanation of how the plan will continue to contribute to reducing vehicle per capita (and overall) GHG emissions to complement the overall GHG emission reduction goals after the 2035 target date. [As noted in our comment on Appendix D (Page D-4), the plan’s post-2035 contribution to reducing GHG emissions remains flat after 2035, implying that the current measures will not contribute substantially to those higher GHG emission reduction targets.] [SWIA]
Page 23. The plan states that, to the extent feasible, it will stay within rights-of-way to minimize impacts and would produce other environmental benefits (water quality, air quality, reduced flooding, etc.). How does the infrastructure system that is proposed in the 5 Big Moves compare to the transportation infrastructure system that was anticipated in 2004 when the original RTP and MSCP agreements were established? More specifically, because SANDAG agreed to mitigate (and has mitigated?) for expected upland and wetland habitat impacts in advance of projects impacts – based on a previous set of projects/infrastructure, will the new infrastructure have new impacts that are beyond or not mitigated by the previous agreements? For example, adding many connectors among the freeways and expanding some state routes could directly and indirectly impact habitat and wildlife corridors in excess of what was anticipated in the initial agreements. If so, how will the plan ensure no net losses of habitat acres, functions and values (including to movement corridors)?

Page 25. The plan has the potential to produce and encourage environmental benefits (climate change mitigation, air and water quality improvements) as summarized in this section. Include more discussion about the plan’s commitments to meet or improve upon the longstanding habitat and conservation agreements (e.g., NCCP/HCP permits), avoid new/unpermitted impacts to habitat/species, and mitigate for any significant unavoidable impacts.

Page 27. To assist the public’s understanding of the essence of the plan, add several figures to show the relationships (by time period) among transportation infrastructure, mobility hubs, and smart growth/increased housing density areas. More specifically, provide a set of diagrams to illustrate – at the system/regionwide perspective - which projects are to be completed by 2025, 2035, and 2050 and which mobility hub/ Smart Growth areas they serve. Because Smart Growth areas are expected to increase their housing densities, the plan must provide justifications and demonstrable commitments (e.g., policies, funding, incentives) that support the presumptions that the cities and county will make those density increases in step with the basic transportation improvements (transit leap, active transportation, mobility hubs, complete corridors).

Previously, SANDAG produced a short list/explanation of its incentives for smart growth (https://www.sandag.org/uploads/publicationid/publicationid_1187_5188.pdf), but it is unclear how effective those incentives have been. How does the plan improve on those incentives?

Page 31. Goods movement comprises a relatively small part of the region’s GHG emissions (Appendix X), but its associated on-road use by heavy trucks and allied freight rail access/rail car storage – especially through/near disadvantaged communities and the Port District terminals – creates significant impacts to local transportation, air quality and quality of life. The RTP/SCSs transportation infrastructure system improvements must be fully integrated with the Port’s implementation of its proposed maritime operations strategy and additional actions to relocate (to the extent feasible) truck parking and freight rail car storage away from the coastal area.
Pages 32-33. The essence of the plan’s sustainable communities strategy is expressed in the introduction to the region’s growth and development: “The 2021 Regional Plan envisions a regional pattern of growth and development that reflects smart growth, transit-oriented development, preserving natural resources, and building communities that are resilient to the consequences of climate change and other environmental changes. Ensuring social equity and the availability of housing that is affordable for everyone are also top priorities.” Those goals will only be achieved when the cities and county, which constitute SANDAG, fully acknowledge the necessity to amend their general plans to accommodate and implement the identified changes.

The forecasted concentration of jobs and housing (and population) in the urban areas that are necessary to implement the plan would create a more efficient, livable region that supports the proposed transportation system. It would also alleviate pressure for development in the unincorporated county, reduce impacts on the natural landscape, and lessen the risks from wildfire to people and structures.

If the plan is approved, then how are the cities and county proposing to commit to implement those changes? What ramifications are there to the plan – and for a jurisdiction’s ability to benefit from the transportation system improvements – if a jurisdiction does not make those needed general plan changes?

Pages 34-35. The global threat from continued GHG emissions and unique threats, conditions, and opportunities to reduce GHGs within our region are recognized in this plan. The GHG inventory and calculation of anticipated reductions by sector illustrate how the plan would be able to meet and exceed the region’s SB 375 GHG emission reduction target for 2035. As noted in preceding comments, achieving that goal requires significant cooperation from each of SANDAGs member jurisdictions through changes to their general plans (especially land use/zoning) as well as how their Climate Action Plans support and augment the RTP/SCS.

While this plan demonstrates that is could meet/exceed the mandated GHG emission reduction target for 2035, the projected emissions out to 2050 in Appendix X suggest that the region will be far from “carbon neutrality by 2045.” That is not a region-by-region requirement, but it is critical that this plan incorporate goals and policies - and at least propose possible actions/projects – that would put the region on a more aggressive GHG emission reductions pathway post-2035.

Decisions pertaining to which and when to initiate projects should balance the basic GHG emission reduction priority and their effectiveness in promoting the more broad actions (i.e., specific local jurisdiction actions) to optimize system buildout. However, as noted on Page 14 of the plan, SANDAG has a specific requirement to identify disadvantaged communities, include strategies to reduce pollution exposure in those communities, and use of a skilled and trained workforce (via the RTP/SCS). So, the “balancing” decision must have a larger frame of reference than just GHG emission reductions. [SWIA]
Chapter 3: Paying for the Regional Plan, Forming Partnerships and Taking Action, and Monitoring How the Plan Performs

Page 44. The plan should clarify that the region’s projected population growth will result in continued – albeit slowing - total VMT, but implementing the plan will result in a significant net reduction in VMT/capita that is consistent with the requirements of SB 375.

Page 45. As described, there are real constraints on the allowable uses (types of project investments) and timing (when available) of the known and reasonably anticipated funding sources. Our prior comments (e.g., Pages 19, 27, 32-33) raised concerns about how the RTP/SCS will ensure concurrent and effective linking of the growth in the mobility hubs (smart growth areas) with the transportation infrastructure. This is particularly of concern because growth in the mobility hub areas may occur – based on local jurisdictions’ requirements and needs - even if the transportation infrastructure and operational improvements are not able to be funded concurrently. How will the RTP/SCS ensure (and measure/monitor) that the housing/jobs/transportation linkage will occur as needed?

Pages 45-47. The projected costs to implement the revised transportation infrastructure and operations, combined with SCS strategies, will require SANDAG to evaluate and adopt new revenue funding sources. The plan does not provide sufficient descriptions of how SANDAG will evaluate the effectiveness of implementing the identified potential new revenue sources. For example, charges for Managed Lane use and a general Road User Fee potentially overlap costs for drivers; paying the premium for managed lane access may induce more VMT as well as be cost-prohibitive to lower income populations; there is no discussion about how local jurisdictions could/should adopt parking cost strategies to both promote transit (reduce vehicle use) and increase revenues that can be then incorporated into their local funding share.

Page 50. Successfully implementing the regional plan will require cooperation with and incentives for participation by the member jurisdictions and cooperating agencies that comprise SANDAG. The plan needs to provide more description of how SANDAG’s current incentives programs (https://www.sandag.org/uploads/publicationid/publicationid_1187_5188.pdf) will be augmented and prioritized to ensure that the necessary infrastructure and operational investments correspond to the projected growth (e.g., location of new housing and jobs).

Page 53. The plan proposes a reasonable list of priority implementation actions. One item that is not discussed in the plan but is referenced in Item 9 is to expand nature-based climate solutions. As recommended in our prior comment on Page 9 of the plan, it should provide more description about the regional environment, which would then establish the context for “nature-based solutions.” Though the assessment/analysis of what those solutions are and how they advance the goals of the RTP/SCS will be part of the subsequent CEQA EIR, this document needs to better describe (at a general level) what this action involves.

Pages 54-55. Monitoring must address both implementation and performance. The proposed performance indicators align with the regional plan’s goals and would collate/integrate relevant existing measurement/data and reporting sources. But the
corresponding implementation monitoring needs to be better described and some additional monitoring considered. As noted in our comment on Pages 13, 27 and 32-33, the plan does not effectively illustrate how the key components are expected to integrate. Specifically, the plan needs to monitor and report (and provide simple illustrative mapping) how the actual growth in housing/jobs within the mobility hubs/SMART growth areas and the associated transportation infrastructure/operational improvements are in alignment and how they are advancing compared to their anticipated advancement per this plan. This type of implementation tracking and reporting is essential and it does not appear to be covered by the proposed performance indicators in Table 3.1. [SWIA]

Appendix A: Transportation Projects, Programs, and Phasing

(Sierra Club) The ever-increasing urgency to prevent a climate catastrophe demands fast action to reduce greenhouse gas emissions. One of the most significant ways to do that is to quickly reduce driving. In light of this, projects that fail to reduce vehicle miles traveled (VMT) must be deferred until the vehicle fleet has mostly been replaced by zero-emission vehicles. Otherwise well-intentioned projects like HOV to HOV connectors will actually increase VMT by reducing travel times, encouraging more people to drive and pay whatever fees are required to use the HOV lanes. Vehicles powered only by internal combustion engines must be banned from any form of managed lanes.

There is no need to expand freeways when it is clear that driving must be reduced. Managed lanes must replace existing general purpose lanes. Adding lanes for any reason is unacceptable while driving is the largest source of GHG emissions.

Table A.5: Interstate 5 North Coast Corridor

Item TL06

(Sierra Club)

Realignment of the LOSSAN segment through the University Community to a tunnel between Rose Canyon and Sorrento Valley would improve rail efficiency and travel times by avoiding Miramar Hill and would improve connections to other public transportation with a station at University Town Center. Realignment of the LOSSAN segment through Del Mar to a tunnel under Del Mar Heights between Sorrento Valley and the Del Mar Fairgrounds would also improve rail efficiency and travel times, improve public access to the coast, and accommodate managed retreat from eroding bluffs by avoiding the unsustainable current alignment on the delicate bluffs of Del Mar.

Sierra Club generally supports realignment of the two segments of the LOSSAN rail corridor to the extent that the new alignments and tunnels are located and constructed in a manner that fully minimizes impacts and maximizes preservation and restoration of natural habitat, open space, and wildlife corridors in Los Penasquitos and San Dieguito lagoons, Carroll Canyon, Crest Canyon, Rose Canyon, and Torrey Pines State Natural Reserve Extension.
The following are a number of Sierra Club recommendations on how Caltrans and SANDAG should accomplish these goals through selection of locations for the realigned LOSSAN segments and measures to fully minimize and mitigate project impacts.

**Protect & restore Los Penasquitos & San Dieguito lagoons**

- Realigned track across or near Los Penasquitos Lagoon should be located as close as possible to old Sorrento Valley Road and I-5 and, if located in the Lagoon, should be on an elevated bridge across the entire Lagoon to protect and maintain lagoon hydrology. An existing hill portion of Carmel Valley Road between Caminito Pointe Del Mar and Portofino Drive should be lowered as necessary to accomplish these goals.

- The Project should not impede tidal flow in Los Penasquitos or San Dieguito lagoons.

- The Project should include maintenance of open Los Penasquitos and San Dieguito lagoon channels to the ocean.

**Remove old track infrastructure & restore lagoons & native habitats**

- Old track infrastructure should be fully removed and restored to wetlands, coastal bluff scrub, coastal sage scrub, and other location-appropriate native habitats and vegetation. Removal of old track infrastructure includes removal of all Del Mar bluff stabilization structures to allow for natural bluff erosion, removal of all berms and bridges across Los Penasquitos Lagoon, and removal of all tracks, berms, trenches, and retaining walls in Carroll and Rose Canyons[1] and in Sorrento Valley.

  - Fill soils in the berm across Los Penasquitos Lagoon may have originated from the Del Mar bluffs and should be returned and incorporated into restoration of the old track cut on the Del Mar bluffs if soils are appropriate.

**Protect and restore wildlife corridors**

- Realigned track should be below grade in a tunnel or covered trench capped with native vegetation to protect wildlife movement in and between the Crest Canyon Preserve and San Dieguito Lagoon.

  - Realigned track above Carmel Valley Creek and Carmel Valley Road should not restrict deer and other wildlife movement in and between Torrey Pines State Natural Reserve, Los Penasquitos Lagoon, and Carmel Valley (under I-5).

  - Realigned track should emerge in Sorrento valley from the tunnel under the University Community elevated on a bridge over Carroll Canyon Creek.
Old track infrastructure should be removed and berms and slopes should be recontoured and planted with native vegetation to restore a wildlife connection between MCAS Miramar and Carroll Canyon and Sorrento Valley.

Establish a Del Mar bluffs park

The old LOSSAN right-of-way on the Del Mar bluffs should include a linear park with a public walkway and connections to the beach. However, park and beach access infrastructure should not interfere with natural bluff erosion and managed retreat.

Protect existing preserves and open space

Tunnel vents should not be located in Crest Canyon Preserve, Torrey Pines State Natural Reserve Extension, or any University Community open space.

Control invasive non-native plants

The Project should bar deliberate planting of invasive non-native plants and provide for long-term control of any colonizing invasive non-native plants.

Retain and improve pedestrian and bicycle infrastructure

The Project should retain and improve pedestrian and bicycle infrastructure and connections including between Sorrento Valley Road and Carmel Valley Road, the San Dieguito River Park Coast to Crest Trail, and between the Coast to Crest Trail and Crest Canyon.

[1] Old track infrastructure could be retained in either Carroll Canyon or Rose Canyon if needed to maintain a rail connection to Miramar Marine Corps Air Station Miramar.

- (Katie) Many of the Active Transportation projects listed are from the Early Action Plan that they adopted in 2013 and were supposed to be completed within 10 years. There was $200 million allocated for these bikeways, most of which are yet to be fully built. I’d like to understand if this is new funding and the timing of when these projects that are already in the works are supposed to open. It seems a bit like double dipping and now the build date is 2025 at the earliest but some say 2035, which is unacceptable (Jacob -- you may be able to help with the open dates since you just did a review!)

- (Katie) I only see mention of the San Ysidro and Central Mobility Hub specifically. Is Table A.14 in reference to those or amenities for mobility hubs for all of the other new lines? We need a commitment to ensure transit accessibility for those on foot and bikes.
Several projects that were in the Early Action Plan appear in Appendix A. How do the projects in the EAP differ from the projects here?

In general, the dollar amount spent on managed lanes rather than mode-shift is concerning. More funding and increased timelines for active transportation & transit leap projects should be prioritized.

How does the San Diego - Coronado Military Ferry connect to the Central Mobility Hub?

In general, the Arterials section neglects to mention active transportation and public transportation facilities along arterial corridors. If SANDAG wants to get San Diegans out of their cars, then arterial streets need to prioritize pedestrians, bicycles, and public transportation over cars.

This intersection's bike lanes are in need of protection and better visibility for drivers. NCTD Bus 309 stops at this intersection as well, is SANDAG planning on providing any infrastructure improvements for bus and pedestrian connectivity?

SANDAG should prioritize building safe active transportation infrastructure to and from the Carlsbad Poinsettia Station along this corridor. Sidewalks and bike lanes heading north disappear at the station, and this project makes it appear that SANDAG isn't planning on including those elements. SANDAG should not widen Avenida Encinas from Palomar Airport Road to Embarcadero Lane. Instead, SANDAG should keep the current configuration and build wide sidewalks and protected bicycle facilities.

The bike lane along this segment of El Camino Real is often subject to vehicle intrusion. SANDAG should add protection to the bicycle facility here to keep cyclists safe.

SANDAG must include in this project upgrades the existing bicycle connection to the North Island Credit Union Amphitheatre. The currently existing Class II lanes on Heritage Road are often subject to vehicle intrusion.

SANDAG must build Class IV protected bike lanes in addition to pedestrian safety improvements along this corridor to improve connectivity to the Sprinter and NCTD Busses 305 & 332.

Additional pedestrian safety measures are needed for the Overpass at SR-67, including bulb-outs and more visible crosswalks.

SANDAG must be specific about what bike facilities are planned for the Dye Road Extension in Ramona.

The current condition of Otay Lakes Road has Class III bike facilities. What facilities are planned for this project?

SANDAG has forgotten to include what happens to the currently-existing Class II buffered bike lanes with this project. Bicycle lanes should be included in the bridge design over Escondido Creek.

### Appendix B: Implementation Actions

#### BICYCLE COALITION:

| B-4  | 3 (b) | Support updating the evaluation and monitoring procedures of projects using TransNet local streets and roads funds, including prioritization of safety for vulnerable road users in the development of complete streets. The procedures should include a mechanism for the public to comment. |
| B-4  | 3 (c) | Support the development of a Regional Active Transportation Plan, including updating the San Diego Regional Bike Plan to reflect need for safe bicycle infrastructure county-wide. |
| B-4  | 3 (d) | Support the development of a Regional Vision Zero Action Plan, including a Regional Safety Policy. This regional safety policy should establish clear procedures that allow for the collection of accurate crash data, and the usage of that data to make changes to dangerous designs. |
| B-7  | 7 (a) | Support building projects with an emphasis on safety for all road users to implement Vision Zero |
| B-7  | 7 (d) | Support for updating evaluation criteria and provisions of SANDAG grant programs to improve social equity, advance roadway design with an emphasis on safety for vulnerable road users, implement climate action plans, and others listed. |
| B-8  | 8 (b) | Support for incentivizing the implementation of complete streets projects that complement regional investments within Mobility Hubs, along Complete Corridors, and supporting Flexible Fleets. We absolutely support a formalized Quick Build implementation program that develops complete streets solutions. |
| B-9  | 9 (g) | Support for transportation demand management grant and incentive programs, including e-bike, carpool, and vanpool incentives |

Support for policies outlined under this heading

General Comment. This appendix is essentially a matrix of SB 375, AB 805 and other legislative/legal requirements and a compilation of past documents that were used to prepare specific components of the RTP. Providing a conformance matrix of those requirements and what is in the RTP does not explain how the RTP comprises a sustainable communities strategy. At a minimum, this appendix should provide a short (a page or two) summary of how the plan integrates critical elements or summarize sections from Chapter 2 in the main body of the RTP/SCS where an explanation of that integration (the basic strategy) is provided.

Page D-4. While the state does not set a 2050 target for GHG emissions reduction and the MPOs are not required to produce an official GHG reduction target for 2050, the projected regional reduction of 20.3% from the 2005 baseline is alarming. That is only 0.3% below the 2035 regional reduction, which implies that all of the anticipated new GHG reductions within the region “max out” their effectiveness by 2035. One can assume that between now and 2035 there will be additional regulations and technologies that will force/enable the region to improve upon that projected 2050 reduction. In that vein, this document should include more extensive discussion about how and what future iterations of the RTP/SCS will commit to doing to continue to identify relevant GHG reduction options for the region. Presenting this number and then not providing further discussion about how SANDAG will be addressing what appears to be a “stalled” GHG reduction effort post-2035 is neither sufficient nor acceptable.

The relevance of this concern is clearly illustrated by the data provided in Appendix F (Figure 1) regarding the projected population growth, which is estimated to be 437,000 between 2016 and 2050 –about a 13% increase. Even if the region added only roughly 100,000 people from 2035-2050, absent a more aggressive RTP/SCS that is initiated well before 2035, the region would be totally incapable of attaining the state’s “target reduction” of 80% below baseline by 2050 or the more recently cited statewide goal of net zero by 2040. The RTP/SCS should, at the least, provide a discussion about how future versions of the document will be addressing post-2035 GHG emission reductions.

Page D-20. The legend for this figure should be revised to “Existing and Proposed/Potential San Diego Region Habitat Conservation Lands.” [SWIA]
Appendix E: Performance Monitoring

</tbody>
</table>

This appendix provides only a minimal level of information and it is unclear when the appropriate level of detail necessary to implement the performance monitoring will be developed and made available. The types of issues subject to monitoring (e.g., Health and Environment; Energy and Water; Housing; Quality of Life; and Transportation Planning) address issues relevant to SB 375 and other mandates, and the Indicators and Sources of Information seem reasonable. But the appendix does not provide any discussion or examples of how the indicators will be used. For example, which components of “Air Quality” are to be used, what are the relevant standards, etc. When a general indicator is to be used (e.g., Percentage of households with housing costs greater than 35% of income), what is the RTP/SCS intending to do with that number?

For all Indicators, one presumes that there is a threshold or trigger point (for when the plan is failing to meet an objective) at which the plan would be required to begin to initiate actions in response to reaching the trigger/threshold. Or conversely, if the threshold indicates that the plan has successfully achieved a goal, what if any additional effort is required?

The RTP/SCS performance monitoring plan will likely have to be periodically updated to reflect new requirements (e.g., air quality standards may change), new technologies may allow for improvements to the current indicators, and conditions may warrant changes in the types of issues relevant to the plan and/or the identified indicators may need to be revised or replaced. Regardless of that reality, the public, stakeholders and jurisdictions/agencies that will be reporting, evaluating and relying on the performance monitoring to determine how the RTP/SCS is functioning must be provided a more complete description of the performance monitoring plan. [SWIA]

Appendix F: Regional Growth Forecast and Sustainable Communities Strategy Land Use Pattern
Pages F-10-12 (Tables F.1-3). While there appears to be a similarity in the relative growth in population, jobs and housing among the jurisdictions, the Unincorporated County’s projected population growth (0.9%), jobs growth (23.2%) and housing growth (4.3%) seem to be noticeably different. In particular, there is a very high projected growth in jobs compared to population and housing. How does that seeming disparity in jobs growth with population and housing growth (which has implications for transportation to housing) impact transportation planning? Are there other jurisdictions for which the “disparity” in projected population, jobs and housing pose challenges to the RTP/SCS’s 5 Big Moves approach?

Page F-15 (Figure F-5) – Five areas that appear to support significant jobs but are outside of mobility hubs are Camp Pendleton, MCAS Miramar, Pt. Loma and North Island (military employment) and East Otay Mesa. How are SANDAG and the military services planning to address this? [SWIA]

with social media accounts for local news information, so SANDAG should research where they could make an impact through social media channels besides their own.

Appendix H: Social Equity: Engagement and Analysis

**BICYCLE COALITION:**

| H-15 | Existing Conditions in Disadvantaged Communities in the Region | SANDAG notes that 5.7% of households in the region have "zero vehicles available" but hasn't defined what a vehicle is outside of being "dependent on transit services." How does SANDAG define "transit services?" If a person didn't own a car, but used a personal bike, skateboard, or rented a micro-mobility solution to travel, would that person be considered as "not having access to a vehicle"?

| H-33 | Defining Performance Measures for Social Equity Analysis | Support using percentage of population within 0.25 miles of a Bike Facility as a social equity performance measure.

| H-55 | Access to Basic Needs | Why were biking and walking metrics only included for parks and retail sections, but not for access to employment or education centers?

| H-58 | Table H.11 | The bicycle statistics laid out in this table are inaccurate and out-of-touch with reality. While theoretically true that a bicycle could use the existing network to access parks, our current street network is dangerous for cyclists due to the lack of safe infrastructure and most parks are not considered accessible by regional bicycle advocates. How was "Access" by bike defined and used in these calculations? Did safety, comfort, bike parking, and ridership play a part in defining "access" by bicycle?

| H-60 | Table H.12 | This table has the same issue with Table H.11. The bicycle statistics laid out in this table are inaccurate and out-of-touch with reality. While theoretically true that a bicycle could use the existing network to access retail spaces, our current street network is dangerous for cyclists due to the lack of safe infrastructure and most retail/commercial areas are not considered bicycle-friendly by regional bicycle advocates.

Appendix I: Tribal Consultation Process for San Diego Forward: The 2021 Regional Plan – Communication, Cooperation, and Coordination
### Appendix J: Megaregion and Borders Planning and Collaboration

### Appendix K: Regional Housing Needs Assessment Plan

**BICYCLE COALITION:**

| K-29 | 5: Objectives and Factors | Support the promotion of shared-use mobility, including bike sharing |

### Appendix L: Active Transportation

**BICYCLE COALITION:**

| L-6 | Complete Streets in Mobility Hubs | What does "enhanced bike and micromobility parking" mean? |
| L-7 | Vision Zero | What are the details of SANDAG's plan to collect and analyze crash data for bicycle traffic? |
| L-7 | Riding into the Future | What is the timeline for SANDAG developing a new, comprehensive Regional Active Transportation Plan as a near-term action from the 2021 Regional Plan? |
| L-10 | Significance of Reduced Speed Limits | What is SANDAG's plan to reduce speed limits in San Diego County? |
| L-15 | Principle(s) by Layer: General | Add: Limit bicycle interaction with mixed traffic wherever possible |
| L-15 | Principle(s) by Layer: | All Transit Leap nodes should be served by bicycle routes. |
SANDAG should ensure that Bicycle Facility Selection Plan tool is used consistently throughout the region, and that any arterial/TransNet funds follow this tool.

Appendix M: Progress on Near-Term and Continuing Actions

**BICYCLE COALITION:**

<table>

## Bikeways in the Community

<table>
<thead>
<tr>
<th>M-33</th>
<th>Continuuing Action #22</th>
<th>Support for continuing to apply social equity and environmental justice considerations in the implementation of SANDAG projects and programs.</th>
</tr>
</thead>
</table>

| M-33 | Continuuing Action #23 | Support for collaboration with key partners and stakeholders, including representatives from low-income and minority communities, and actively involve the public in the planning process. SANDAG should create guidelines for conducting outreach and collaboration, and gather data to improve performance. SANDAG should also continue to provide ongoing outreach across many languages to ensure communities that were traditionally underrepresented have a voice in the process. |

### Appendix N: SANDAG Federal Congestion Management Process

### Appendix O: Federal System Performance Report

### Appendix P: Travel and Tourism

#### BICYCLE COALITION:

<table>
<thead>
<tr>
<th>P-1</th>
<th>Year-Round Tourism</th>
<th>San Diego has a thriving tourism industry that unfortunately relies on tourists renting cars to visit popular tourist destinations. This appendix does not present any strategies to mitigate VMT from car rental services, nor does it lay out any strategies to provide alternative transportation access to any of San Diego's major tourist attractions that rely on vehicle access. Tourist destinations are not only places to visit, but many of them are major employment centers that could benefit from efficient transportation connections.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>P-1</th>
<th>Year-Round Tourism</th>
<th>SANDAG should also consider other services that tourists use in San Diego County and how they interact with the Regional Plan. This includes hotels, the airport, the cruise ship terminal, and alternative tourist mobility solutions such as the Old Town Trolley, GoCar City Tours, hotel and airport shuttles, etc.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>P-1</th>
<th>Year-Round Tourism</th>
<th>San Diego is a world-class bike tourism destination. The 2021 Regional Plan should reflect the need for facilities to accommodate bicycle tourism.</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>P-3</th>
<th>Special Events</th>
<th>SANDAG should consider adding pop-up safe bicycle parking to special events to incentivize San Diegans to ride their bicycles to special events.</th>
</tr>
</thead>
</table>

| P-4 | Next Steps | SANDAG should study traffic patterns of major tourist destinations and devise strategies to reduce VMT and incentivize public/active transit usage. |

### Appendix Q: Transportation Security and Safety
The five classification types described in this section don't seem to match anywhere else in the SANDAG RTP, and should be rethought to better fit the language throughout the document. For example, this appendix references bike boulevards as Class IV facility, but Appendix L-25 describes a bicycle boulevard as "most similar to the Class 3 facility." If SANDAG is going to change classification types for modelling purposes exclusively, this appendix should specify that. In addition, the Active Transportation Network Input should take into account the surrounding infrastructure (speed limits, driveways, and other bikeway intrusions) to determine the comfortability of riders using the facility.

The bicycle statistics laid out in this table are inaccurate and out-of-touch with reality. While theoretically true that a bicycle could use the existing network to access parks or retail within 15 minutes, our current street network is dangerous for cyclists due to the lack of safe infrastructure and most parks and retail spaces are not considered accessible by regional bicycle advocates. How was "Access" by bike defined and used in these calculations? Did safety, comfort, bike parking, and ridership play a part in defining "access" by bicycle?

Appendix U: Cost Estimation Methodology
Appendix V: Funding and Revenues
Appendix W: California Coastal Trail Technical Memoranda and 2021 Technical Addendum
Appendix X: 2016 Greenhouse Gas Emissions Inventory and Projections for the San Diego Region

Projected emissions from GHG of Natural Gas use doesn’t assume a reduction in use by 2050 but instead assumes unabated use. Appreciate that it's pessimistic and not optimistic, but these numbers will be very inaccurate, given changes in building code for 2022. (Table X.16) (Karl A.)
Wanted to visualize the numbers from table X.3 better. Note that methane gas is the second highest contributor after 2025, and it becomes 20% of the emissions by 2050, with no expectations of abatement. (Karl A)

Appendix Y: Goods Movement Planning and draft 2021 San Diego and Imperial Counties Freight Gateway Study Update

Appendix Z: California State Wildlife Action Plan

Appendix AA: Regional Habitat Conservation Vision
Where is the habitat funding? We need a strong commitment to a regional funding source for habitat.

Page AA-1. The introductory paragraph – or a new second paragraph - should include a brief description of the relationship of SANDAGs existing TransNet program, the regional Multiple Species/Multiple Habitat Conservation programs and regional funding for habitat conservation and preserve management. Any significant differences in the proposed RTP/SCS from previous versions should be discussed later in this appendix.

Page AA-3. Figure AA.1. Recommend the map title be revised to “Existing and Proposed/Potential San Diego Region Habitat Conservation Lands” and change the legend to conform.

Page AA-6. The Regional Habitat Conservation Vision presumably applies across all of the lands within the SANDAG member agencies. Because the local jurisdiction and agencies have their own General Plans/Open Space Element, Climate Action Plans, and other
planning processes that would have direct effects on a regional vision, please provide more
discussion regarding how this vision is expected to be integrated into the local jurisdictions’
and agencies’ plans. Such as, will SANDAG add staff to coordinate this effort, what new
policies and projects would this require, will additional funding be identified and provided,
etc.

Page AA-6. The Regional Funding section should add more information. We recommend
adding more to the introduction of this issue. Begin the section with a new introduction: “A
functioning and adequately funded set of regional habitat preserves is essential to this
region’s overall capability to address climate change. The benefits from habitat preserves
range from meeting regulatory requirements associated with future development and
ongoing operations and maintenance by the local jurisdictions; improving/enhancing the
long-term potential for rare/threatened species and their habitats to adapt to climate
change; providing for movement by species and vegetation communities as a response to
climate change; and serving as a carbon sink. While these conserved and managed lands
are part of the “baseline” condition relative to GHG emissions, they are valuable because
natural areas remove CO2 and eliminate development potential.” Also, revise the last part
of this paragraph to state: “A regional funding source was proposed as part of a ballot
measure (that failed) in 2016 to help offset the preserve implementation costs to local
jurisdictions. Without a new regional funding source, securing crucial land acquisitions and
long-term management and monitoring, which are essential to the success of these plans to
protect species and their habitats from extinction, falls into question. In 2011, the estimated
unfunded regional cost to ensure implementation of the regional habitat conservation plans
was $3.0 billion. SANDAG will work with the member agencies to develop and promote the
establishment of the regional funding source that complements the infrastructure and
operations components of the 5 Big Moves.”

(Sierra Club) The Regional Plan must include a strong commitment to provide adequate
funding for the Habitat Conservation Plans.

Page AA-6. Recommend revising the sentence “Connect habitat areas through wildlife
corridors and linkages and connect people to local species and San Diego’s natural
habitats.” to “Connect habitat areas through wildlife corridors and linkages, and enhance
peoples’ access, where appropriate, to natural habitat areas.”

Page AA-7. Recommend adding a sentence to the end of the paragraph: “It is essential
that the remaining habitat conservation plans be completed, which will then establish the
necessary core habitat areas and key connections across the region.”

Page AA-8. Recommend revising the following sentence “In addition to acquiring more
properties to connect wildlife, in the following years, San Diego’s North County will complete
their MSCP, which will prioritize acquisitions that establish critical connections for high-risk
species that reside in North County communities.” To state “In addition to acquiring more
properties to connect wildlife, in the following years, when the North and East County
MSCPs are completed, they will prioritize acquisitions that establish critical connections for
high-risk species that reside in North/East County as well as connections to preserve lands
in Orange and Riverside counties.”
Page AA-10. The paragraph that describes regional funding should reference - or reiterate - our recommended new statement (Page AA-6) regarding SANDAG’s commitment to work with its member agencies to develop and establish a new regional funding source for habitat conservation.

Please incorporate these comments into the revised RTP/SCS and include them in the project’s public record. Our contact for these comments is Bill Tippets (billtippets@gmail.com).[SWIA]

</tbody>
</table>
### A-45 SM69
The intersection of Twin Oaks Valley Road and Barham Drive in San Marcos is currently hostile to pedestrian and bicycle traffic, with slip-lanes and disappearing bicycle lanes. What plans are in place to increase use of active transportation at this intersection?

### A-45 CB212
What classification of bicycle facilities are being planned for College Boulevard Reach A?

### A-45 CNTY35
What classification of bicycle facilities are being planned for the Ramona Street Extension? SANDAG should also consider re-striping and adding more signage to Ramona Street’s currently-existing lanes.

### A-45 SD190
What bicycle facilities will SANDAG include in the Palm Avenue Bridge project?

### A-54 Table A.17
Support for increased funding for GO by BIKE, and an e-bike incentive program.

### A-54 Table A.18
SANDAG should consider incentivising alternative cargo delivery vehicles for local delivery services under this table. For example, incentivise the usage of cargo e-bikes for parcel delivery in dense, urban neighborhoods.

### A-68 Figure A.11
Segments of the Bayshore Bikeway that are already completed seem to be missing from this map.

### B-4 3 (b)
Support updating the evaluation and monitoring procedures of projects using TransNet local streets and roads funds, including prioritization of safety for vulnerable road users in the development of complete streets. The procedures should include a mechanism for the public to comment.

### B-4 3 (c)
Support the development of a Regional Active Transportation Plan, including updating the San Diego Regional Bike Plan to reflect need for safe bicycle infrastructure county-wide.

### B-4 3 (d)
Support the development of a Regional Vision Zero Action Plan, including a Regional Safety Policy. This regional safety policy should establish clear procedures that allow for the collection of accurate crash data, and the usage of that data to make changes to dangerous designs.

### B-7 7 (a)
Support the implementation of the 2021 Regional Transportation Improvement Program (ETIP) & building bike early action program projects.

### B-7 7 (d)
Support building projects with an emphasis on safety for all road users to implement Vision Zero.

### B-7 8 (b)
Support for updating evaluation criteria and provisions of SANDAG grant programs to improve social equity, advance roadway design with an emphasis on safety for vulnerable road users, implement climate action plans, and others listed.

### B-8 8 (e)
Support for incentivizing implementation of complete streets projects that complement regional investments within Mobility Hubs, along Complete Corridors, and supporting Flexible Fleets. We absolutely support a formalized Quick Build implementation program that develops complete streets solutions.

### B-9 9 (g)
Support for transportation demand management grant and incentive programs, including e-bike, carpool, and vanpool incentives.

### B-10 10 (a)(b)(c)(d)(e)
Support for policies outlined under this heading.

### D-8 Table D.3
This table lists micromobility costs as $0 for access/egress to transit. Does this mean SANDAG is planning on subsidizing micromobility rides as a last mile solution?

### D-8 Table D.3
What model is SANDAG using to determine that 36% of privately owned bikes will be e-bikes by 2035?

### E-2 Housing
Support the addition of using Housing as a Performance Indicator.

### E-2 Quality of Life
Support the addition of using unemployment, social equity, telework, and homelessness as a Performance Indicator.

### E-3 Transportation Planning
Support the addition of using Bike Lane Miles and Annual Transit Ridership as a Performance Indicator.

### G-50 3.0
Support the inclusion of SANDAG’s Commitment to Equity Statement.

### G-50 3.1
Support for Social Equity and Environmental Justice Considerations.

### G-51 & G-52 3.2 - 3.5
Support for working in partnership with Tribes, Mexico, Military, and other stakeholder agencies.

### G-53 4.0, Table 1, Public Workshops
Rather than increasing the amount of public workshops by an arbitrary number (10%), SANDAG staff should use data to calculate public engagement by geographic region throughout the county, and use that data to determine low engagement rates where more public workshops are needed.
<p>| G-53 | 4.0, Table 1, Pre-document consultation | Add: &quot;Gather an additional&quot; to &quot;5,000 individual remarks&quot; so context is more clear |
| G-53 | 4.0, Table 1, Opportunities for engagement | Rather than &quot;increasing variety of platforms for public engagement by 15%&quot;, the goal should be to re-evaluate the effectiveness of current platforms being used during a certain time period and then determine if another platform could be more effective. In addition, special topic/targeted workshops should be made available in as many languages as possible and include dedicated outreach to stakeholder groups who have not participated in or have been historically excluded from the public engagement process prior to the 2021 Draft Regional Plan. |
| G-57 | Appendix A.1 | In order to reach a younger audience, &quot;San Diego County Media Outlets&quot; should be expanded to include student publications at the region's school systems and colleges/universities. In addition, many young people engage with social media accounts for local news information, so SANDAG should research where they could make an impact through social media channels besides their own. |
| H-15 | Existing Conditions in Disadvantaged Communities in the Region | SANDAG notes that 5.7% of households in the region have &quot;zero vehicles available&quot; but hasn't defined what a vehicle is outside of being &quot;dependent on transit services.&quot; How does SANDAG define &quot;transit services?&quot; If a person didn't own a car, but used a personal bike, skateboard, or rented a micro-mobility solution to travel, would that person be considered as &quot;not having access to a vehicle&quot;? |

SANDAG should also continue to provide ongoing outreach across many languages to ensure communities that were traditionally underrepresented have a voice in the process.</td>
</tr>
</tbody>
</table>

| **P-1** Year-Round Tourism | San Diego has a thriving tourism industry that unfortunately relies on tourists renting cars to visit popular tourist destinations. This appendix does not present any strategies to mitigate VMT from car rental services, nor does it lay out any strategies to provide alternative transportation access to any of San Diego's major tourist attractions that rely on vehicle access. Tourist destinations are not only places to visit, but many of them are major employment centers that could benefit from efficient transportation connections. |
| **P-1** Year-Round Tourism | SANDAG should also consider other services that tourists use in San Diego County and how they interact with the Regional Plan. This includes hotels, the airport, the cruise ship terminal, and alternative tourist mobility solutions such as the Old Town Trolley, GoCar City Tours, hotel and airport shuttles, etc. |
| **P-1** Year-Round Tourism | San Diego is a world-class bike tourism destination. The 2021 Regional Plan should reflect the need for facilities to accommodate bicycle tourism. |
| **P-3** Special Events | SANDAG should consider adding pop-up safe bicycle parking to special events to incentivize San Diegans to ride their bicycles to special events. |
| **P-4** Next Steps | SANDAG should study traffic patterns of major tourist destinations and devise strategies to reduce VMT and incentivize public/active transit usage. |

| **S-21** Active Transportation Network Input | The five classification types described in this section don't seem to match anywhere else in the SANDAG RTP, and should be rethoughted to better fit the language throughout the document. For example, this appendix references bike boulevards as Class IV facility, but Appendix L-25 describes a bicycle boulevard as "most similar to the Class 3 facility." If SANDAG is going to change classification types for modelling purposes exclusively, this appendix should specify that. In addition, the Active Transportation Network Input should take into account the surrounding infrastructure (speed limits, driveways, and other bikeway intrusions) to determine the comfortability of riders using the facility. |
The bicycle statistics laid out in this table are inaccurate and out-of-touch with reality. While theoretically true that a bicycle could use the existing network to access parks or retail within 15 minutes, our current street network is dangerous for cyclists due to the lack of safe infrastructure and most parks and retail spaces are not considered accessible by regional bicycle advocates. How was "Access" by bike defined and used in these calculations? Did safety, comfort, bike parking, and ridership play a part in defining "access" by bicycle?

RE: Airport Authority Comments on Draft 2021 Regional Plan

Ms. Clementson:

On behalf of the San Diego County Regional Airport Authority (Airport Authority), I am submitting this comment letter in response to the Draft 2021 Regional Plan (Draft Plan) released by the San Diego Association of Governments (SANDAG) for public review on May 28, 2021. The Airport Authority acknowledges SANDAG’s hard work over the last 3 years in developing a new vision for the region’s surface transportation system and appreciates the opportunity to provide productive feedback on it.

Created in 2003, the Airport Authority is responsible for operating San Diego International Airport (SAN) and planning for the region’s long-term air transportation needs. SAN is the only major commercial airport in the region, connecting San Diego to over 70 domestic and international markets and generating over $12 billion annually in local economic benefit. In addition, the Airport Authority acts as the Airport Land Use Commission in the County of San Diego, pursuant to the California State Aeronautics Act, to help ensure compatibility between all 16 airports in the region and future land use development in the surrounding areas.

As SANDAG further refines the 2021 Regional Plan, and completes its environmental review under the California Environmental Quality Act, the Airport Authority requests that the following items be considered:

1. **Aligning Air & Surface Transportation Planning**
   In 2011, the Airport Authority and SANDAG led the development of a Regional Aviation Strategic Plan (RASP) and Airport Multimodal Accessibility Plan (AMAP), respectively, to ensure a seamless and efficient connection between the region’s air and surface transportation infrastructure. The Draft 2021 Regional Plan’s Appendix BB (page BB-1) states that “routes included in the 2011 AMAP continue to be identified in the 2021 Regional Plan.” However, the following
ground access improvements, which were prioritized in the 2011 AMAP, do not appear to be programmed into the Draft Plan:

San Diego International Airport
- Heavy Rail Grade Separation (Whitherby St. to Laurel St.)
- I-5 Direct Access Ramps

McClellan-Palomar Airport
- Palomar Airport Road Widening (I-5 to Hidden Valley Rd.)
- Additional Airport Access at Owens Ave.
- Modification of Future Route 445

Gillespie Field
- Gillespie Field Trolley Station Relocation
- New Bus Rapid Transit (BRT) Station
- Marshall Avenue Intersection Improvements
- BRT Routes (90, 870, & 890) Modifications

Cross Border Xpress
- SR 905/Britannia Interchange Capacity Increase
- Britannia Road Widening
- Siempre Viva Road Widening
- Local Bus Route (661) Modifications

As such, the Airport Authority requests that the 2021 Regional Plan clarify whether these AMAP-identified priorities will be implemented or have been substituted with alternative implementation options.

2. Connecting Regional Transit Network to SAN
The Airport Authority has been working closely with SANDAG and other public agency partners to identify opportunities to better connect SAN to the regional transit network. As noted in the Draft 2021 Regional Plan, one of the concepts is a fixed-rail transit connection, such as an Automated People Mover (APM), between a Central Mobility Hub at the Old Town Campus and the SAN terminal area. This airport transit connection is anticipated in the Draft Plan to be built in 2035. The Airport Authority looks forward to continuing its collaboration with SANDAG to further refine the APM’s alignment and station location concepts.

The 2016 Airport Transit Plan, which was developed in partnership between the Airport Authority, Metropolitan Transit System (MTS), and SANDAG, identified more near-term opportunities for increasing ridership on public transit to and
from SAN. As recommended in the Airport Transit Plan, the Airport Authority will be launching a new all-electric shuttle service to Old Town Transit Center this fall, in conjunction with the start of the Mid-Coast Trolley Extension operations and increased Coaster service frequency.

Another recommendation in the Airport Transit Plan is the transition of MTS Bus Route 992, which is currently the main transit connection to the Airport, to a Rapid Bus service. It also suggested that combining the new Rapid 992 with other Rapid bus routes, such as the 215 along the El Cajon Boulevard corridor and 235 along the Interstate 15 corridor, could improve airport transit ridership by better linking to major regional destinations and by increasing single-seat access to the San Diego International Airport.

As such, the Airport Authority requests that the 2021 Regional Plan assess the potential ridership benefits from upgrading MTS Bus Route 992 to a Rapid service and extending other existing and planned Rapid routes to serve the SAN terminal areas.

3. **Considering Airport Compatibility in New Development Siting**

All 16 public-use and military airports in the San Diego region now have an adopted Airport Land Use Compatibility Plan (ALUCP), which provides guidance on appropriate land uses surrounding them to protect the health and safety of people and property within their vicinity. The Draft 2021 Regional Plan states in Chapter 1 (Page 12) that 3.7 million people will be living in the San Diego region by 2050 (13% greater than 2016 levels), creating a need for 440,000 more jobs and 274,000 more homes. Figure 2.4 (Page 27) in the Draft Plan identifies regional mobility hub areas that could accommodate this increased demand for jobs, housing, shopping, and recreation, while being served by expanded transit networks. In the Airport Authority’s initial review, it appears that many of these hub areas are in close proximity to airports.

As such, the Airport Authority requests that the 2021 Regional Plan ensure that new incompatible land uses are not introduced near airports, as outlined in each ALUCP. The Draft Plan’s Environmental Impact Report should also formally assess any land use conflicts with the applicable ALUCPs. Important factors include:

- Limiting new noise-sensitive development within an airport’s noise contours and ensuring that any new noise-sensitive development includes sound insulation
- Prohibiting certain sensitive land uses within an airport’s safety zones and limiting the number of people in areas subject to the highest risk of aircraft accidents
- Assuring aircraft safety and preserving airport operations by limiting the height of new structures and objects

4. Clarifying SAN Air Cargo Information

The Draft 2021 Regional Plan acknowledges the importance of air cargo in moving goods into and out of the region. Specifically, Appendix Y of the Draft Plan discusses freight movement between the region’s highways and arterials, rail corridors, land ports of entry, maritime port, and the San Diego International Airport. The Airport Authority has identified the following inaccuracies in the presented narrative and data:

- Page 21 in Appendix Y states that “when combined with the rate at which trucks produce emissions per day, neighborhoods in close proximity to the airport are put at a higher [air quality] risk” without citing any environmental impact study to substantiate this conclusion.

The Airport Authority has ensured that current and future emissions from the San Diego International Airport’s activities are included in the most recent 2020 State Implementation Plan (2020 SIP) for attaining air quality standards in the San Diego region under the federal Clean Air Act. The 2020 SIP determined that SAN’s emissions can be accommodated without causing the region to experience additional exceedances of criteria pollutant standards.

- Figure 2.10 in Appendix Y is an outdated map of SAN, which doesn’t properly reflect the airport property boundaries and onsite aeronautical uses.

- Page 78 in Appendix Y incorrectly states that Capital International Cargo operates at SAN.

- Page 78 in Appendix Y includes statements that air cargo operations are constrained due to limited airport space for expansion.

As identified in its 2013 Northside Improvements Environmental Assessment, the Airport Authority is proposing a new SAN Northside Cargo Development project. The project would include a consolidated
warehouse to fully accommodate onsite cargo sorting and staging, as well as expanded apron to accommodate additional cargo aircraft parking.

Additionally, the Airport Authority opened a new 93,000-square-foot Airline Support Building on North Harbor Drive this year, which will allow for more efficient processing of bulky cargo items shipped in the bellies of passenger jets. Approximately 15% of SAN’s freight volumes are transported as “belly cargo.”

- Page 78 in Appendix Y relies on the outdated 2009 Destination Lindbergh Study to estimate SAN’s air cargo capacity and identify cargo operational deficiencies.

The FAA approved the most recent SAN aviation activity forecast in June 2019, which is publicly available at www.san.org/plan. The forecast anticipates that the number of cargo aircraft operations (i.e. takeoffs or landings) will increase by nearly 71% by 2050, even with the Airport’s single-runway configuration.

As such, the Airport Authority requests that the 2021 Regional Plan be updated to incorporate the more accurate information presented above.

5. Updating Airport Ground Access Modeling Assumptions

Similar to other regional transportation plans, the Draft 2021 Regional Plan relies on an integrated forecasting model to determine future population, housing, and employment growth. This information is then applied to an activity-based model to simulate detailed transportation behaviors, such as where, when, and how people travel on a daily basis.

On page 20 in Appendix C, the Draft Plan states that its model relies on airport passenger survey data from 2008 to estimate airport-related travel patterns and demands on local and regional transportation facilities. The Airport Authority notes that ground access characteristics have changed dramatically over the last decade, especially with the introduction of rideshare companies. The Airport Authority also noticed that the modeling appears to be based on SAN aviation activity forecasts that were developed in 2013 (Figure S.18 in Appendix S). As previously stated, the FAA approved the most recent aviation activity forecast in June 2019, which is publicly available at www.san.org/plan. The new “constrained demand scenario” forecast estimates that SAN will serve approximately 20.3 million enplaned passengers in 2050.
As such, the Airport Authority requests that the 2021 Regional Plan’s modeling be updated to be based on more accurate modal assumptions for airport users and the more recent SAN aviation activity forecast.

Again, the Airport Authority appreciates the opportunity to provide feedback on the Draft 2021 Regional Plan. Please feel free to contact me at breed@san.org, if you have any questions or need additional information.

Sincerely,

Brendan Reed  
Director of Airport Planning & Environmental Affairs

Questions Regarding the 2021 RTP- Revenue and Cost Estimates

1. What assumptions (i.e. debts service and length of projects) are going into estimating costs in YOE dollars?

2. All existing TransNet funding has been claimed by currently running projects. How is the $15 billion in TransNet funding estimated? Is the $15 billion based on the assumption that San Diego voters will approve of a new extension to the program in 2024? How much of the $15 billion relies on the assumption that there will be TransNet revenue between 2048 and 2050?

3. Is the Quarterly TransNet Forecast a reliable source for estimating revenue from the Transportation Development Act (TDA) even though there have been observed “small differences” in TransNet and TDA growth rate? Is TDA growing faster than TransNet, or is it the other way around?

4. Has the growth of General Fund/Miscellaneous Local Road Funds been linear historically? Are you assuming that they will continue to be linear (why or why not)? If the 5-year average growth in these funds is 2.7, how did you derive a 3% growth during the period of the 2021 RTP implementation? Is this a weighted average or an average of averages across jurisdictions?

5. How much of the value capture estimate (2.7 billion) relies on the estimated value of Central Mobility Hub Enhanced Infrastructure Financing as opposed to existing agreements and programs?

6. What is the Managed Lanes Feasibility Tool mentioned in Appendix V? What model or data did SANDAG use to estimate the $22 billion from FasTrak revenue?

7. How did SANDAG achieve a passenger farebox recovery rate of 35%, and what is the basis of SANDAG’s assumption that the recovery rate will be linear? Is the assumption that operating costs would be linear and that farebox recovery would follow the same linear growth? With proposed free fares, how will the estimated revenue be achieved?

8. What will be the source of funding for reduced or free fares? Is it sales tax based?

9. What source of revenue is each project listed in Appendix A tied to? If a source of revenue runs low, are there alternative ways to fund the projects associated with that source of revenue?

10. What is the timeline for the development of each of the projects in Appendix A? Are delays in these timelines considered in the cost estimates?

11. Have there been or will there be changes in the 2021 RTP to account for the impacts of the Covid-19 pandemic? Is SANDAG assuming that the effects of the pandemic on people’s lifestyles and the economy will be short term? How do SANDAG’s assumptions about the pandemic impact the RTP?

12. Are there technological assumptions as well in the RTP? Is the plan based on all current technology, or are there plans that are based on expected future technology? If some plans are dependent on future technology, how are you making sure that people will feel comfortable with using the new technology?

13. Have there been changes related to the 2021 RTP already? If so, is there any feedback from users? Please provide a detailed response.
14. What assumptions are made in the Transit Leap Capital Cost Estimate? Based on observed figures in the SF Bay Area, it seems that, for commuter rail alone, every mile requires $1 billion. How does $55 billion for all Transit Leap capital costs break down into its modes? Answer to question 9 would probably address this if sufficiently detailed.

15. Since $27.7 billion of the total estimated revenue will depend on the Regional Road User Charge, it seems that SANDAG is confident that the fee will be implemented in 2026. Why does SANDAG think that this fee would be popular among San Diego voters? Is the $27.7 billion based on the assumption that every kind of vehicle will be charged? If the fee is not approved by voters, is there a source of revenue that would replace it?

16. The total estimated revenue is about $30 billion more than the total estimated expenditure (in YOE dollars) for the 2021 RTP. Where would the extra revenue go?

17. What is the assumption for increase in construction costs? What is the assumption for inflation? Do the construction cost estimates take into account both an increase in construction costs and inflation in the conversion to $2020?

18. Who participated in the peer review of your models and assumptions?

19. What is the time period when State Transit Assistance funding is expected to grow at 3% per year versus 5% per year? Is SANDAG’s goal to encourage use of public transportation being considered in making assumptions about the growth rate of STA revenue?

20. Does the State Highway Operations Protection Program only last for 10 years? When did it start, and, if it only lasts a decade, how will it be able support the 2021 RTP projects throughout their lifetimes?

21. How much of the Cap-and-Trade Revenue is, separately, from the Transit and Intercity Rail Capital Program, Affordable Housing and Sustainable Communities program, and Carbon Transit Operations program? Given that the Transit and Intercity Rail Capital Program and AHSC are competitive programs, how are revenues from these programs estimated through 2050? Is there a source that shows prior success in receiving the competitive funds?

22. What percentage of total revenues are assumed to come from competitive funding sources?

23. Why are Motorist Aid Services mentioned twice as a source of revenue (once as state and once as local revenue)? Are they referring to different sources of revenue?

24. SANDAG assumes that the State FASTLANE will receive 20% of the state share of TCEP. In 2020, the revenue reflected 19% of the shares. How much does 1% represent in funding money? Also, what is the basis for the different growth rate estimates?

25. How much of the $2.8 billion in revenue estimate from State Managed Federal Programs come from each of the programs? What is the basis for the assumption that there would be additional revenue from Federal Highway Administration discretionary funds, and how much of the $2.8 billion depends on it? What is the basis for each of the estimated growth rates?

26. What is the short-term growth rate of the Solutions for Congested Corridors program that funds the Road Maintenance and Rehabilitation Account?
27. How much of the revenue from the Federal Transit Administration Formula programs go to Sections 5307, 5337, 5339, and 5310 each? What is the basis for the change in the growth rate of this revenue from 2% per year to 10% per six years?

28. What is the basis for the assumption that the growth rate of CMAQ and regional STP revenue will change from 5% annually to 10% per six years in 2030?

29. What is the growth rate of the Federal Highway Administration Discretionary revenue before 2030? What is the basis? What is the basis of the growth rate estimation beyond 2030? What years are the estimates based on?

30. How was the $294 million in Grant Anticipation calculated?

31. Are Ridehailing Company Service Fees anticipated to be on the 2024 ballot? Do ride-hailing companies, separately, have to pay for the Road User Charge? What is the basis of the assumption that Ridehailing Company Service Fees would be popular among voters?

32. Have other states been successful so far in transitioning to a Road User Charge?

33. How is the growth rate of Regional Road User Charge revenue 2.7% until 2050 when the assumption is that more people will use transit, as opposed to personal vehicles, with the success of the 2021 RTP?

34. Which projects would be eliminated if Federal and State discretionary grants were not received?

35. What projects would be impacted if the New Sales Tax and MTS Local Revenues measures do not pass?

36. How do the Federal Transit Administration and CMAQ estimated growth rates reflect revenue from recent years?

37. What is the impact of reduced VMT on revenues from fuel taxes and tolls. Is this accounted for?

38. Current Transportation Development Act (TDA) funds are currently used to support existing transportation services and state of good repair capital projects. Are the $7.6 billion TDA revenues in Appendix V existing TDA revenues or new sources of TDA revenues?

39. Where can we find the “2021 Regional Plan Transit Operations Costing” Excel workbook mentioned in Appendix U?

Please Fill out the tables on the following pages.

RE: Recommendations on how to include San Diego’s 10 Transit Lifelines in the Regional Plan

Respected Chair Blakespear and Board Members,

The San Diego Transportation Equity Working Group (SDTEWG) and ally organizations support the 10 Transit Lifelines and request their inclusion in the 2021 Regional Plan (RP). They represent the priorities that residents at the frontlines of the climate crisis in Barrio Logan, City Heights, and National City have identified through a community-driven process. Though identified by South Bay residents, the 10 lifelines reflect a vision to advance affordable and frequent transit solutions that will benefit all San Diegans.

The San Diego Transportation Equity Working Group was established in 2018 by community-based organizations in an effort to elevate transportation and environmental justice opportunities in Mid-City and South Bay for years to come. The core organizations are the Center on Policy Initiatives (CPI), City Heights Community Development (CH CDC), Environmental Health Coalition (EHC), Mid-City CAN (MCC), and San Diego 350 (SD350). Supporting organizations include Casa Familiar (CF) and the Urban Collaborative Project (UCP). The SDTEWG core organizations took a closer look at the Draft Regional Plan and would like to offer recommendations on how to best reflect inclusion of the 10 Transit Lifelines in the RP.

The 10 Transit Lifelines & Recommendations

1. A Regional Plan that Prioritizes environmental justice:
   Demonstrate environmental justice (EJ) communities are a priority by identifying projects that will improve their access to public transportation by 2025. These primarily low-income communities of color face the most pollution in the San Diego region and rely most on transit. The projects should include the development of a Safe Routes To Transit strategy and an early action project Mobility Hub at Euclid Transit Center.

   Recommendation:
   Include an equity specific project list as part of Appendix A: Transportation Projects, Programs, and Phasing document that provides all details including the expected project completion year.

2. Youth opportunity Passes (YOP):
   Provide no-cost transit passes for all youth ages 24 and under to build generations of lifelong transit riders and connect youth to school, work, internships, and early career opportunities.
Recommendation:
Amend the Plan to explicitly state that transit fare subsidies will be allocated to fund no-cost transit for youth ages 24 and under. The plan currently lacks a commitment to no-cost passes for this age group.

3. Bus service every 10 minutes:
Make bus service reliable and affordable now – we can’t afford to wait. Buses are one of the most cost-effective ways to get us where we need to go while cutting climate pollution. We need immediate solutions while big infrastructure projects are being built.

Recommendation:
Projects TL63, TL64, and TL65 on page A-52 of Appendix A should include cost and bus frequency improvement details to demonstrate they will be prioritized, particularly those planned to be completed 2025. Simultaneously, only one of all the Transit Leap projects within the South Bay to Sorrento Corridor has a 2025 year implementation. The Transit Leap rapidst listed on page A-12 through A-14 that will service environmental justice communities should be prioritized for a 2025 completion. Finally, MTS should be included as an agency to collaborate as part of the partnerships listed on page B-3 of Appendix B and near-term actions for the implementation of bus frequency enhancements.

4. Blue Line express:
Build a 24-hour Express Blue Line. The Blue Line already has the highest ridership and is one of the best-performing transit lines in the region. However, it is overcrowded, has limited frequency, delayed connections, and no 24-hour service.

Recommendation:
The RP needs to outline clear construction of an additional track that can provide express 24-hour service. Currently, the project details fail to demonstrate that a third track will be implemented. According to project description TL13 on page A-14, a Blue Line (San Ysidro to UTC, Double/Third tracking and Grade Separations at Taylor/Ash) are planned for a 2050 implementation.

5. 24-hour service:
By 2025, provide 24-hour service on popular transit routes to connect workers to their destinations. Participants in San Diego’s MTS community engagement efforts ranked this as their highest priority.

Recommendation:
Project ID TL63, TL64 and TL65 should include bus frequency increase to 24 hours. As well as all the Transit Leap projects within the South Bay to Sorrento that will service environmental justice communities.

6. The Purple Line:
Fund the planning, environmental, engineering, and construction work for the Purple Line as a rail line that connects environmental justice communities in central City Heights and the South Bay to Sorrento.

Recommendation:
The detailed ridership analysis of the Purple Commuter Rail alignment listed on page A-15 is promising and points to a purple line that will include stations in City Heights. The RP should include project phasing that prioritizes the development of stations in central City Heights and the South Bay region with a 2035 project completion.

7. **An all-electric bus fleet by 2030:**
Accelerate the electrification of buses, because our communities cannot afford to wait 20 years to breathe cleaner air and reduce climate pollution.

**Recommendation:**
The transition to zero-emission buses, including rapid routes, should be accelerated for a 2030 completion with the support of recently approved state and federal funding sources. Page A-53 outlines program investments for Zero-Emission Buses and Infrastructure. The funding should be redistributed to prioritize the program’s implementation to meet the 2030 completion goal.

8. **Anti-displacement strategies:**
Protect low-income communities of color living near transit corridors from gentrification with proactive strategies that include building affordable housing while preserving naturally occurring affordable housing, community ownership, and tenant protections. We need comprehensive solutions!

**Recommendation:**
We commend SANDAG for including a Regionwide Displacement Study for near-term implementation. The study is listed on page B-3 of Appendix B and should be completed before the adoption of the RP in order to truly inform and prevent displacement due to the plan’s implementation.

9. **Restroom access:**
Create a plan to make restrooms available to the public and provide MTS with funding for a clean and accessible restroom network with access at all major transit stations.

**Recommendations:**
Include restroom access as an item in the capital operations budgets. The 2021 Regional Plan states that “mobility needs to be widely accessible, affordable, easy to use, and tailored to a person’s individual needs. In short, mobility must be viewed as a basic human right”. State-of-the-art bathrooms are mobility and key to a successful transit system.

10. **Emergency-ready transit system:**
Provide transit for environmental justice communities to evacuate during emergencies. EJ communities are more vulnerable to climate disasters and more likely to live near industries, military operations and other dangerous activities that may have accidents that cause fires, leak toxins, and other crises.

**Recommendations:**
Include a study and implementation strategies to establish an emergency-ready transit as part of the near-term action in Appendix B within the Social Equity Planning Framework section.

Finally, the SDTEWG strongly recommends that SANDAG develop an equity pricing program, a Next OS equity plan, and policies that safeguard the privacy of Black, Indigenous, People of Color (BIPOC). The SDTEWG supports the efforts to implement a regional pricing strategy and the Next OS as long
as they are implemented with an equity framework, which is not reflected in the Draft RP. All regional pricing strategies must include mechanisms to protect low-income families who cannot afford to pay to be able to drive. All Next OS infrastructure should give development priority to environmental justice communities. And, policies must be in place to ensure data collected does not target BIPOC or use the information to over-police our communities.

Sincerely,

The San Diego Transportation Equity Working Group (SDTEWG)

RE: Include the 10 Transit Lifelines in the 2021 Regional Plan

Chair Blakespear and Honorable Members of the SANDAG Board of Directors:

The San Diego Transportation Equity Working Group and ally organizations support the 10 Transit lifelines and request their inclusion in the 2021 Regional Plan (RP). They represent the priorities that residents at the frontlines of the climate crisis in Barrio Logan, City Heights, and National City have identified through a community-driven process. Though identified by South Bay residents, the 10 lifelines reflect a vision to advance affordable and frequent transit solutions that will benefit all San Diegans.

Environmental Justice (EJ) communities are at the frontlines of toxic air pollution and the nearing climate disaster. The RP is the region’s biggest opportunity to dramatically address the course of climate change in the region. According to Appendix X of the SANDAG 2021 Draft Regional Plan, “passenger car and light-duty vehicles emissions category is the largest contributor of GHG emissions in the San Diego region, accounting for 41% of total GHG emissions.” In addition, “only 7% of our region’s low-income residents have access to fast and frequent transit”. According to the American Lung Association, San Diego has the seventh - worst

Ozone pollution in the U.S.\(^2\) and EJ communities are disproportionately impacted. Inadequate investment in the mass transit system harms our most vulnerable communities' health and quality of life.

The RP should include EJ specific solutions to be completed by the year 2025. The climate emergency is here and frontline communities cannot continue to wait for relief. The RP is a visionary document by nature, however, it must outline immediate benefits to improve the region's economy, quality of life and sharply reduce air pollution and GHGs in most climate-impacted communities.

10 Transit Lifelines Summarized Descriptions

1. **A Regional Plan that Centers Environmental Justice:**
   Prioritize environmental justice (EJ) communities by identifying projects that will improve their access to public transportation by 2025, which should include the development of a Safe Routes To Transit strategy and an early action project Mobility Hub at Euclid Transit Center.

2. **Youth Opportunity Passes (YOP):**
   Provide no-cost transit passes for all youth ages 24 and under to build generations of lifelong transit riders and connect youth to school, work, internships, and early career opportunities.

3. **Bus Service every Ten Minutes:**
   Make bus service reliable and affordable now – we can’t afford to wait. Buses are one of the most cost-effective ways to get us where we need to go while cutting climate pollution.

4. **Blue Line Express:**
   Build a third track for a 24-hour Express Blue Line. The Blue Line already has the highest ridership and is one of the best-performing transit lines in the region.

5. **24 Hour Service:**
   Connect late-night and early-morning workers by 2025. Provide 24-hour service on popular transit routes to connect workers to their destinations.

6. **The Purple Line:**
   Fund the planning, environmental, engineering, and construction work for the Purple Line as a rail line that connects environmental justice communities in central City Heights and the South Bay to Sorrento Valley.

7. **An All-electric Bus Fleet:**
   Accelerate the electrification of buses, because our communities cannot afford to wait 20 years to breathe cleaner air and reduce climate pollution.

8. **Anti-displacement Strategies:**
   Protect low-income communities of color living near transit corridors from gentrification with proactive strategies that include building affordable housing while preserving naturally occurring affordable housing, community ownership, and tenant protections. We need comprehensive solutions!

9. **Restroom Access:**
   Create a plan to make restrooms available to the public and provide MTS with funding for a clean and accessible restroom network with access at all popular transit stations.

10. **Emergency-ready Transit System:**
    Provide transit for environmental justice communities to evacuate during emergencies. EJ communities are more vulnerable to climate disasters and more likely to live near industries, military operations and other dangerous activities that may have accidents that cause fires, leak toxins, and other crises.

We urge the SANDAG Board to support the 10 Transit Lifelines and ensure their inclusion in the 2021 RP.

SanDiego350 is an inclusive, mostly volunteer organization building a movement to prevent the worst impacts of climate change and climate injustice. We strive to create a future that supports a livable planet and just society through education and outreach, public policy advocacy, and mobilizing people to take action.

Previous regional transportation plans, including the 2015 plan, mistakenly prioritized freeway expansion over public transit, which resulted in increased air pollution and greenhouse gas emissions and the inability for those without cars to get where they need to go. Public transportation is a critical lifeline for many, especially the residents of environmental justice and low-income communities and people of color, to get to work, school, and services.

Only 7% of low-income residents have access to fast and frequent transit. Frontline communities have disproportionately experienced harm from transportation and land use policies, so solutions to restore equity to these groups should be prioritized, incentivized, and subsidized in SANDAG’s climate strategy. Additional coordination with equity-based planning efforts will further support integrated and collaborative solutions. The infrastructure that links our network of homes, businesses, parks, and schools, must allow community members to meet their needs without driving.

The SANDAG Board has the power and responsibility to implement the bold vision that our communities need for universal mobility, and to reduce pollution and emissions. Therefore, SanDiego350 requests that the SANDAG Board ensures the 2021 Regional Plan recognizes and addresses, as described below, the climate challenges our region is facing and the needs of historically marginalized segments of our society.
1: Reduce GHG emissions from cars and light trucks to fight the Climate Crisis

We ask you to meet bolder GHG emission reduction targets. Climate change is accelerating and its effects are devastating environmental justice communities. For our families and children to have a liveable future we cannot wait any longer to respond. Transportation accounts for half of the GHG emissions in the San Diego region. The targeted 20% reduction per capita of GHG emissions from cars and light trucks below 2005 levels by 2035 will have only a small impact on the GHG emissions from transportation, even if we successfully reach that goal. The emissions reduction goal must be at least 50% by 2030.

To rapidly reduce GHG emissions, we ask you to accelerate the timeline for development and improvement of transit (trolleys, trains, and buses) and active transportation (biking and walking). Also, the plan must include effective strategies to encourage a rapid shift away from cars to public transit and from fossil fuel burning vehicles to zero-emission vehicles. Managed lanes on freeways should be implemented to enable buses to run faster and on-time and so that they are a more attractive means of transportation than cars.

2. By 2023 or sooner, implement no-cost youth transit passes for those 24 and younger.

This would advance social justice by helping youth, who often lack resources, to travel to education, employment, and services. This would immediately improve transit ridership numbers and contribute to transit being seen as a viable alternative to car travel.

Youth passes are an investment in the success of transit, as youth who are accustomed to using transit become adults who will choose buses and trains over cars.

3: Improve the transit system now to make it more frequent, reliable, accessible, affordable and fast.

The 2021 Regional Plan must prioritize improvements in public transit. We need a real alternative now in order to begin the transition away from cars without delay. The current transit system needs to improve by increasing passenger capacity, frequency and service hours on popular lines to make it more convenient, reliable, accessible, and fast. This means 24 hour service and 10 minute frequency on many popular bus routes currently in service. This should be done immediately to introduce the public to a new transit era by providing MTS and NCTD with the necessary financial support.
3: Prioritize the needs of Disadvantaged, Environmental Justice Communities.

Disadvantaged, Environmental Justice Communities, which disproportionately suffer from the effects of climate change, cannot afford to wait; they need immediate improvements while long-term infrastructure projects are developed. This means not building new roads, accelerating the Purple Line, and collaborating with MTS and NCTD to make improvements to the Blue Line and Sprinter and add Bus Rapid Transit routes to serve those communities.

We ask for the completion of the Purple Line via City Heights all the way to the border by 2035 instead of stopping in National City per the draft Regional Plan. That is because half of the Purple Line ridership will come from Chula Vista, Imperial Beach, and Tijuana. We also ask for enhancement to the Blue Line to reduce travel time from the border and South Bay region to downtown to provide faster access to the jobs in the downtown area.

Road improvements such as grade separations at railroad crossings should be included in the plan to reduce traffic gridlock, congestion, and idling that cause air pollution and health problems.

4: Transition to a Zero Emission Bus Fleet by 2030

Fund the implementation of California’s Innovative Clean Transit rule. Our communities of concern suffer with high levels of toxic pollution and cannot wait 20 years to reduce toxic and greenhouse gas emissions. Investment in zero emission buses now will improve residents’ health and help people thrive in San Diego County. These actions taken now will save money in the long term. The scale of our ambitions must reflect the magnitude of the challenge. SANDAG must invest heavily in infrastructure to continue and accelerate that transition.

5: Identify Anti-Displacement strategies:

Develop an anti-displacement strategy that includes affordable/low-income housing and preservation of existing affordable housing, community ownership, and tenant protections as part of the comprehensive solutions for any possible impacts of new transit infrastructures. We ask SANDAG to provide an update on the status of the anti-displacement study.
6: Develop an Emergency Ready Transit System:

There is a need for Environmental Justice Community residents to have an escape route from a community-wide emergency situation such as occurred recently in a ship fire at the Port. We ask for planning and implementation of a transit emergency response strategy that is fully funded. Communities of concern are most vulnerable to climate disasters.

7: World Class Transit System with Amenities

We ask for a truly world class transit system that all members of our society and visitors, regardless of their age and physical condition, can use without hesitation. This requires amenities including clean bathrooms at major transit stations and hubs, electronic information on trolley, train, and bus schedules, routes, and transfer information, seats and sun shelters at all stations and stops, safety provisions for all transit users including persons with disabilities. These amenities would provide comfort and dignity to all transit riders.

We urge the SANDAG Board to align the final 2021 Regional Plan with these recommendations.

Sincerely,

SanDiego350 Transportation Committee

RE: Comments on the 2021 Regional Plan Sierra Club San Diego Chapter

Dear Mr. Greer:

Sierra Club San Diego has been a consistent voice for conservation and sustainable planning in the San Diego region for more than 70-years. Sierra Club is pleased to provide comments regarding the SANDAG 2050 Regional Transportation Plan (RTP). The scope and breadth of the RTP is immense and beyond mere descriptors of bold, aggressive, and futuristic. The concepts, scale and anticipated budget of the RTP are unprecedented, possibly in the entire state of California. The takeaway from this letter is this: SANDAG must work to procure the same aggressive funding for environmental protection and mitigation that was devoted to capital projects.

Sierra Club San Diego supports the goals and conceptual components of the RTP with a cautionary approach. There are concerns with the inherent capabilities of the Sustainable Communities Strategy (SCS) should the plans be revenue starved, bled, or never funded. These essential strategies are the underpinnings of future RTP project success, designed as guides for the San Diego region towards a more sustainable future by integrating land use, housing, and transportation planning to create communities that are conducive to being sustainable, walkable, transit-oriented, and compact.

The requirements of Senate Bill 375 codify the essential features of the RTP to protect and sustain our region’s vital social, environmental, and economic resources, while making significant reductions in Greenhouse Gas (GHG) generation from autos and small trucks. All aspects of the RTP are important, although consistent and reliable funding of the plan requirements are essential to achieving the RTP goals. The very backbone of RTP realization is early environmental mitigation, planned, funded and ready to be implemented within San Diego County. The same careful planning should include provisions
for maintenance of the Multi Species Conservation Program (MSCP) and conserving Multiple Habitat Planning Areas (MHPA). Not only are these lands invaluable in their own right for the preservation of plant and animal species, they are essential to any Climate Action Plan due to their ability to sequester carbon.

This initiative for early environmental mitigation is expected to expedite the implementation of transportation projects and reduce the costs associated with mitigation or permit delays.

To be absolutely clear, Sierra Club endorses the earliest possible environmental conservation, mitigation, or remediation. Any delays associated with Capital projects should not reflect on the mitigation capabilities of the environmental community or SANDAG.

In the introductory section of the RTP numerous potential funding sources are provided. On the subject of funding, we are reminded of the fragility of transportation appropriations at the state and regional level. Gasoline sales tax revenue offers a lesson on the ephemeral nature of voter approved gasoline sales tax revenue increases. In this instance, cars and light trucks have simultaneously improved in miles per gallon along with the advent of increased electric vehicles (EVs) both of which have contributed to a substantial reduction in gasoline sales tax revenue. This eye-opening shortfall at the state level reflects a local focus when evaluating ballot box funding. The San Diego region failed to fund the proposed 2016 Proposition A Transnet sales tax increase of one quarter cent, although vigorously supported by SANDAG and numerous environmental organizations. At that point SANDAG was left with the barest of funding options.

This stark demonstration of the unreliability of voter support for tax increases should not be lost on SANDAG Board members. Reliance on temporary budget sources are unstable and insufficient if they are based on assumption of bond debt refinancing, stock market appreciation, population increases, or property or sales tax increases. Funding must be secured with initial and sustainable investments for a minimum of the first 10-years of the RTP approved environmental mitigation projects. Without such funded safety measures the RTP is confronted with speculative-by-nature “Revenue Assumptions”. The below italicized and bolded statements are taken directly from the RTP supporting documents.

Appendix V: Funding and Revenues Assumptions
The assumptions made for each major revenue source included in the Plan’s financial analysis are provided below. All revenues have been escalated to the year that dollars are expended, and they are based on the escalation factor appropriate for that specific revenue source. Additional details for each fund source also are included in Technical Appendix 1.

By its very definition, the conjecture surrounding proposed long-term financing and funding is apparent in the fundamental terms Assumptions and Escalation, which indicate the uncertainty regarding this 29-year duration RTP. The SANDAG Board members must do everything possible to remove the associated uncertainty and doubts of reliable and assured revenue. This initiative for early environmental mitigation is the keystone to the RTP realization and must be securely funded upon SANDAG Board approval and initiation of the RTP 2050 Transportation Plan.

“Without a regional funding source, the implementation—and ultimately, the success—of these plans to protect species and their habitats from extinction falls into question.” Regional funding:AA-6

The environmental community has repeatedly advised SANDAG staff and Board members that this SANDAG statement is clearly factual, warranted, and long predicted. It would behoove senior staff,
under direction of the Board of Directors, to lobby for state and federal environmental grant funding or appropriations. The current, unprecedented state budget surplus is too great an opportunity to ignore in light of the devastating consequences of doing nothing for lack of funding and planning.

$2.59 billion is the sum of potential grants from the year 2018 titled Transportation Funding in the San Diego Region. While this budget would be stunning news in the environmental community, this grant funding is only available for SANDAG’s CAPITAL projects. This would include new construction, expansion, renovation, or replacement projects for an existing facility, however there would be no mitigation funding for the environmental impacts of the new infrastructure or associated construction. It appears staff went to a great effort in meticulous searches to locate these CAPITAL grants. We request that staff accomplish the same depth of research for environmental mitigation and remediation grants. The rhetoric of “early environmental mitigation” will be far more convincing when SANDAG becomes a proactive source of grant funding information for San Diego’s NGOs. The equity chasm between Capital projects and the mitigation funding to initiate projects is breathtaking and unacceptable.

“The estimated unfunded regional cost to implement the regional habitat conservation plans was $3.0 billion.”

SANDAG Board members please compare this TransNet EMP land grant program to the CAPITAL projects multibillion dollar budget. To say the environmental community is “challenged” speaks to this massive funding and equity disparity. Please consider that in 2011 the deficit was $3 billion. In 2021 the equivalent dollar shortfall is $3.62 billion.

“Allocation of $4 million is done annually by the SANDAG Board of Directors pursuant to a two-year work plan. A portion of this funding is allocated and distributed through a competitive TransNet EMP Land Management Grant Program to maintain the integrity of existing regional habitat preserves through enhanced land management.”

While the environmental community is grateful, $4 million a year will require 75-years to catch up to 2011 environmental standards and funding deficit, to say nothing of funding the present Regional Habitat Conservation Vision:

A steady, secure regional funding source is needed to complete the land acquisitions as proposed and to provide for ongoing land management. San Diego Forward: The 2021 Regional Plan AA-10

Simply stated, SANDAG’s PROTECT, RESPECT and CONNECT current environmental theme will largely remain a slogan until funding becomes a serious SANDAG Board of Directors priority. As San Diego’s premier and leading planning organization, the environmental community is mystified by the seeming lack of Board direction for the required environmental reviews and mitigation for CAPITAL projects.

When developing the Regional Habitat Conservation Vision, several barriers were identified that have slowed efforts to fully address regional habitat conservation within the region, including a lack of ongoing secure regional funding, a lack of institutional knowledge and public awareness, and waning political focus on habitat conservation.

Similarly, the focus on habitat conservation as a major public policy issued (SIC) has waned since the 1990s. Public policy focuses on imminent issues. Over the years, environmental public policy has
shifted towards stormwater issues and climate adaption as the top-of-mind issues. Ironically, habitat conservation contributes towards resolving each of these issues. In some respects, regional habitat conservation is a victim of its own success; being perceived as an issue that has been resolved by the region without an understanding of the current gaps.

As we evaluate potential funding for existing conserved lands, MSCP Preapproved Mitigation Areas (PAMA), defined reserves, preserve and managed properties, it becomes abundantly clear that there are no planned funding objectives of substance for the San Diego Region’s natural lands. Natural lands protection is currently limited to $4 million. This defect is delineated in the void of conservation funding in Appendix U: Cost Estimation Methodology of 18 different forecast costs budget totaling $163,536,000,000. In this unprecedented budget no funds are planned for maintaining MSCP conservation lands and the required mitigation for Capital projects. https://sdforward.com/docs/default-source/2021-regional-plan/appendix-aa---regional-habitat-conservation-vision.pdf?sfvrsn=bb44fd65_2 AA-4

The TransNet Environmental Mitigation Program (EMP) also established the San Diego Management and Monitoring Program (SDMMP) to provide a coordinated, scientific approach to management and biological monitoring of conserved lands in San Diego County. Appendix AA, addressing The Regional Habitat Conservation Vision contradicts the illusion of effective planning by the $3.0 billion funding deficiency from 2011 to date. Essentially, the natural lands preservation budget is bereft of new funding sources, relying exclusively on the existing $4,000,000 per year of the original TransNET sales tax funding.

Without a regional funding source, the implementation—and ultimately, the success—of these plans to protect species and their habitats from extinction falls into question. In 2011, the estimated unfunded regional cost to implement the regional habitat conservation plans was $3.0 billion. This SANDAG RTP statement could not be more timely or appropriate for discussions and decisions to cure the unfunded regional cost. Hesitation to address funding requirements accomplishes nothing. Sierra Club can only speculate on the huge shortfall confronting SANDAG and the San Diego region environment the RTP claims to safeguard. The 2011 deficit in today’s dollar value would be $3.62 billion and climbing.

The bottom line of this Sierra Club communication, is that the RTP plan does not address the on-the-ground reality of SANDAG acting as though the agency did not bear planning responsibility for the huge, and growing, natural land MSCP conservation and preservation costs. Instead, regardless of environmental mitigation first claims, SANDAG has devoted their economic resources solely to CAPITAL projects, disregarding the costs of maintaining already preserved and reserved MSCP lands and mitigating the carbon associated with these capital projects.

With a $196 billion California budget passed, it is inappropriate that the entirety of San Diego’s MSCP conserved and MHPA protected lands are hobbled with a $4 million spending limit. SANDAG must exert the same efforts researching state and federal environmental protection grants or state appropriations as it demonstrates with the vastly more expensive CAPITAL project grants.
Most sincerely,

George Courser, Chair,
Conservation Committee
Sierra Club San Diego

Peter Andersen, Vice Chair
Conservation Committee
Sierra Club San Diego

Re: Support incorporating Reconnect Logan, 5 Freeway Lid Project in the San Diego Association of Governments’ (SANDAG) 2021 Regional Plan

Dear Mr. Ikharata,

My name is Teresa Montero and I have been a Logan Heights resident (OR BUSINESS OR NON PROFIT) for 10 years. I live 1 blocks from Interstate 5writing to express my support for the incorporation of a project which goal is to address social and economic inequity, rising levels of health concerns aggravated by greenhouse gas emissions, and transportation injustices in San Diego’s Barrio Logan and Logan Heights communities. Specifically, we request the addition of a Freeway Lid as a priority project as identified in SANDAG’s 2021 Draft Regional Plan (Draft Plan)

Our once united community was devastated by Interstate 5 which forcibly displaced hundreds in the 1950’s and has burdened those who remained. Pursuant to Chapter 1: Equity Focus (p. 11) of Draft Plan, we know ReConnect Logan Freeway Lid will transform and reconnect our community. A freeway lid can help our community by dismantling the barriers that the I-5 created by bringing the community together, addressing health concerns by capturing GHG emissions, creating non-existing green spaces, and allowing for development of affordable housing. All goals in line with the Draft Plan of creating efficient movement of people and goods, providing affordable, reliable, and safety mobility options, and allowing for healthier air.

As mentioned, the construction of the I-5 forced many families to be displaced, and while the construction allowed for transportation advancements, since the 1950’s our community has been subject to inequality, misrepresentation, and systemic injustices in transportation and racism, to mention a few. We continue to be a working-class neighborhood composed of nearly 90% Mexican Americans, and while our we are proud of our heritage and activism deeply rooted in our National Landmark of Chicano Park, the reality is that I-5 has created much insecurity by facilitating gang turfs, separating families from places of worship, and limiting children’s access to neighborhood schools. It is time for our community to heal – a freeway lid is the answer.

Given the significant investment and planning of projects in the Barrio Logan/Logan Heights communities in the Draft Plan as identified in Appendix A: Transportation Projects, Programs, and Phasing, it is appropriate to identify and call out ReConnect Logan Freeway Lid as a project on this list. A few of the multiple projects that will impact Barrio Logan/Logan Heights are:
• The creation of Managed Lanes on Interstate 5, Project ID CC002 Complete Corridor: ML/Goods Movement (p. A-8)
• Additional cargo due to the Harbor Drive 2.0 proposal that will facilitate cargo in the community of Barrio Logan, Project ID GM06 Goods Movement: Roadways (p. A-11)
• Harbor Drive Corridor, project ID GM05 2050 Goods Movement: Roadways Harbor Drive Multimodal Corridor Improvements that will facilitate Trucks for the Port of San Diego (p. A-12)

Besides being in line with the 2021 Draft Regional Plan, ReConnect Logan Freeway Lid is also pursuant to Appendix H in relation to California Assembly Bill 805 which requires the reduction of pollution exposure in disadvantaged communities. Furthermore, our project is also pursuant to the Sustainable Communities Strategy per California SB 375 since it would help reach the overall goal of reducing GHG emissions of 15% (p. 18 of Draft Plan), as well as allowing for accommodation to the Regional Housing Needs Assessment Determination. For all these reasons, our community is looking forward to the addition of a Freeway Lid as a priority project as identified in SANDAG’s 2021 Draft Regional Plan.

If you have any questions, you may contact me at labucky.montero@gmail.com(email or phone).

Sincerely,

Teresa Montero

2029 Julian Avenue, San Diego ca 92113.

RE: 10 Transit Lifelines

Respected Chair Blakespear and Board Members:

As President of UPTE-CWA 9119 UCSD Local 9 (representing UCSD Hospital Professionals, Researchers, and Technical Employees), I am writing in support of the San Diego Transportation Equity Working Group’s (SDTEWG) proposed changes to the 2021 Regional Plan. While the Regional Plan is the boldest that SANDAG has proposed in decades, it is still highway first, which perpetuates a state of structural immobility, and will take too long to create necessary changes for public transit to be an alternative to cars and address our climate crisis. As transportation accounts for 41% of greenhouse gas emissions in San Diego, we have the opportunity to greatly reduce GHG emissions and create a more socially equitable region, by improving our transit system.

Therefore, I urge you on behalf of the SDTEWG to support these proposed changes:

1. Meet the required greenhouse gas emission targets, and ensure measures actually get us to those goals, by using the federal and state funds available to create high quality union jobs. Climate change is accelerating and we are currently seeing the results, which is especially devastating to frontline communities, so the emissions reduction goal of 40% by 2030 is inadequate to meet the climate crisis.

2. Accelerate the timeline for all transit (trollies, buses, rail) and biking infrastructure improvements and prioritize the Environmental Justice communities that need transit solutions the most. Environmental Justice communities cannot afford to wait; they need immediate improvements while the long-term infrastructure projects are being planned. This means no new roads but rather accelerating the purple line and collaborating with MTS to make improvements to the blue line, both of which serve these communities.

3. Develop a transit system that is fast, frequent, reliable, and accessible by increasing passenger capacity and frequency on popular lines. This should be done immediately to introduce the public to a new transit era by providing MTS and NCTD with the necessary financial support for implementation.

4. Create and fund an anti-displacement strategy to protect vulnerable communities living near transit corridors by developing new affordable housing, preserving existing affordable housing, encouraging community ownership.

5. Make immediate improvements to current amenities surrounding transit stops with dedicated funding. Amenities include benches, shade from the elements, and bathrooms which should all be accessible according to ADA regulations.

6. Begin no-cost transit passes for youth 24 years old and younger in 2023, not 2027. No-cost transit passes encourage significant participation in public transportation and help shift expectations for how San Diegans use transit.

Please incorporate the SDTEWG proposed changes into the 2021 Regional Plan.

Sincerely,

Sarah Martin, President, UPTE-CWA 9119, Local 9 UCSD
June 28, 2021

Chair Catherine Blakespear  
Executive Director Hasan Ikhrata  
San Diego Association of Governments  
401 B Street, Suite 800  
San Diego, California 92101

Dear Chair Blakespear and Executive Director Ikhrata:

We are writing in regards to the current draft of the San Diego Forward: The 2021 Regional Plan. We are very concerned that the plan does not address both AB 686 Affirmatively Furthering Fair Housing and Sustainable Communities Strategy as interpreted by the California Air Resource Board (CARB) “to reduce greenhouse gas emissions from driving, which can also foster healthier and more equitable and sustainable communities.”

In 2018, the California Legislature passed AB 686 (Author: Assembly-member Miguel Santiago; Co-Author: Assembly-member Todd Gloria) - Affirmatively Furthering Fair Housing (AFFH) which requires public agencies to administer their programs and activities relating to housing and community development in a manner of "taking meaningful actions ... that overcome patterns of segregation and foster inclusive communities" and "address significant disparities in housing needs and in access to opportunity."

In 2018, California Air Resources Board released their Progress Report analyzing the progress made under SB 375 - Sustainable Communities and Climate Protection Act of 2008. The report stated that, “California will not achieve the necessary greenhouse gas emissions reductions to meet mandates for 2030 and beyond without significant changes to how communities and transportation systems are planned, funded, and built.” The report further identified the need to “increase homes in high-opportunity areas for low-income households.”

LISC San Diego and a coalition of nonprofits has requested that the City of San Diego allow all 5000 – 7000 square foot parcels of land to be subdivided into 4 individual land parcels for sale or rent in high-wealth, low-crime neighborhoods and concentrated areas of affluence. This would satisfy AB 686 - AFFH to take “aggressive” actions that “overcome...contributing factors [to fair housing problems, and thus] meet the ‘meaningful impact’ requirement in statute” (HCD AFFH Guidance Memo, p. 52).

Our coalition of nonprofits will soon be launching a first-time homebuyer grant program targeted at BIPOC families. We have commitments from charitable foundations totaling $2.5 million to
support this program. Our goal is to build for-sale homes in high wealth, low crime neighborhoods and concentrated areas of affluence that are accessible to households making 80% AMI. The single greatest barrier we face is restrictive single-family zoning that makes it impossible to construct smaller, more affordable homes in these neighborhoods.

SANDAG through the 2021 Regional Plan has an opportunity under AB 686 and the CARB 2018 Progress Report to begin the process of ending the current legal apartheid that exists in our communities and ensure that California meets its greenhouse gas emissions reductions targets for 2030 and beyond with how communities are “planned, funded, and built.” We strongly urge SANDAG to use their role as the Metropolitan Planning Organization and with the 2021 Regional Plan to comply with AB 686 and Sustainable Communities Strategy to encourage and assist cities like the City San Diego to begin desegregating their neighborhoods and provide meaningful opportunities for all residents and families while lowering car emissions and climate change.

Finally, we strongly urge SANDAG to create an Office of Equity that will ensure that proposals like the Regional Plan and are advancing equity and reducing barriers to inequality, structural racism while enhancing opportunity.

Thank you,

Subject: PUBLIC COMMENT, 2022 REGIONAL TRANSPORTATION PLAN

Ladies and Gentlemen:

I write to you on behalf of the eight hundred homes in the Webster Community; all of us vote and we are interested in the future of our community as regards to the 2022 Regional Transportation Plan. Our demand for goods and services delivered to the urban section of a sprawled city are unique. We are an aged community with traditional values commensurate with our gentry.

We see development of our region occurring as planned, as an impediment to our traditional lifestyle and as such, desire a more gentle approach to the conversion a sprawled California city to a high-density commuter city. The use of transportation agency owned parking lot lots next to noisy, government-owned, transit center facilities such as trolley lines is objectionable as is the obvious feeling that our automobiles are being taken away from us. Yes we believe in growth, but it must be phased to include our life styles. We request a plan that will be prepare our community to receive proposed changes occurring in the near future.

Our voice is changing! We have a sophisticated community council who now has experienced the flawed logic of, “oh you are not ready,” for changes that are inclusive in the new modal plans. We ask for a mobility center/hub located within our existing fledgling transportation center near the intersection of Euclid Avenue and Market Street. This together with communication and information system infrastructure requires fiber optic cable readiness equal to that of other San Diego communities. We ask for assurance that the community will be ready for the state of the art transportation system that is in the design stage at this time. At the very least we ask for an inventory of our existing transportation facilities to demonstrate how far we have been left behind. We want all of our streets to be designed with “Complete Streets” designs enabling all modes of transportation, including unshared bicycle paths where appropriate. We ask for coverings for all of our MTS bus stops.

Thank you for the opportunity to comment on the proposed plan.

Please call with any questions, or if I may provide additional information.

Sincerely,

Stephen Lamprides

Deriving a Climate-Stabilizing Solution Set of Fleet-Efficiency and Driving-Level Requirements, for Light-Duty Vehicles in California

Paper #796315

Mike R. Bullock
Retired Satellite Systems Engineer, 1800 Bayberry Drive, Oceanside, CA 92054

ABSTRACT
An Introduction is provided, including the importance of light-duty vehicles (LDVs: cars and light duty trucks) and the top-level LDV requirements to limit their carbon dioxide (“CO2”) emissions. Climate crisis fundamentals are presented, including its cause, its potential for harm, California mandates, and a greenhouse gas (GHG) reduction road map to avoid disaster.

A 2030 climate-stabilizing GHG reduction target value is calculated, using statements by climate experts. The formula for GHG emissions, as a function of per-capita driving, population, fleet CO2 emissions per mile, and the applicable low-carbon fuel standard is given. The ratio of the 2015 value of car-emission-per-mile to the 2005 value of car-emission-per-mile is obtained.

Internal Combustion Engine (ICE) mileage values from 2000 to 2030 are identified, as either mandates or new requirements. A table is presented that estimates 2015 LDV fleet mileage.

Zero Emission Vehicle (ZEV) parameters are given. Methods are derived to compute equivalent 2030 mileage. Four cases are defined and overall equivalent mileage is computed for each. Those equivalent fleet mileage values are used to compute their corresponding required per-capita driving reductions, with respect to 2005. Measures to achieve the most reasonable per-capita driving reduction are described, with reductions allocated to each measure.

A conclusion is presented.

INTRODUCTION
Humanity’s top-level requirement is to stabilize our climate at a livable level. This top-level requirement must flow down to cars and light-duty trucks, also known as Light-Duty Vehicles (LDVs), due to the significant size of their emissions. As an example, LDVs emit 41% of the GHG in San Diego County. From a systems engineering perspective, the needed top-level LDV requirements are an upper bound on greenhouse gas (GHG) emissions per mile driven, applicable to all of the vehicles on the road, in the year of interest, and an upper bound on per-capita driving, given population growth. These two upper bounds must achieve the climate-stabilizing GHG emission target level. This paper will do a calculation of required driving levels, based on calculations of how clean our cars and fuels could be, predicted population growth, and the latest, science-based, climate-
stabilizing target, or requirement. All three categories of LDV emission-reduction strategies will be used: cleaner cars, cleaner fuels, and less driving. Four cases will be considered.

BACKGROUND: OUR CLIMATE PREDICAMENT

Basic Cause

Our climate crisis exists primarily because of these two facts: First, our combustion of fossil fuels puts “great quantities” of CO\textsubscript{2} into our atmosphere; second, atmospheric CO\textsubscript{2} traps heat.

California’s Primary CO\textsubscript{2}_e Emission-Reduction Mandates

California’s Governor’s Executive Order S-3-05\textsuperscript{3} is based on the greenhouse gas (GHG) reduction limits that were recommended by climate scientists, for industrialized nations, in 2005. In 2005, climate scientists believed that if the industrialized nations of the world achieved the reduction-targets of S-3-05 (and other nations did something less), the Earth’s climate could be stabilized at a livable level, with a reasonably high level of certainty. More specifically, this executive order aims for an average, over-the-year, atmospheric, temperature rise of “only” 2 degree Celsius, above the preindustrial temperature. It attempts to do this by limiting atmospheric CO\textsubscript{2}_e to 450 PPM by 2050 and then reducing emissions further, so that atmospheric levels would come down to more tolerable levels in subsequent years. The S-3-05 emission targets are the 2000 emission level by 2010, the 1990 level by 2020, and 80% below the 1990 level by 2050.

It was thought that if the industrialized world achieved S-3-05 (and the non-industrialized world achieved an easier task), there would be a 50% chance that the maximum temperature rise will be less than 2 degrees Celsius, thus leaving a 50% chance that it would be larger than 2 degrees Celsius. A 2 degree increase would put over a billion people on the planet into a position described as “water stress” and it would mean a loss of 97% of our coral reefs.

There would also be a 30% chance that the temperature increase would be greater than 3 degrees Celsius. A temperature change of 3 degree Celsius is described in Reference 3 as being “exponentially worse” than a 2 degree Celsius increase.

The second California climate mandate is AB 32, the Global Warming Solutions Act of 2006. It includes provisions for a cap and trade program, to ensure meeting S-3-05’s 2020 target, which is to be emitting at no more than the 1990 level of emissions. AB 32 was to continue after 2020. AB 32 required CARB to always implement measures that achieved the maximum technologically feasible and cost-effective (words taken from AB 32) greenhouse-gas-emission reductions.

In 2015 Governor Brown signed B-30-15. This Executive Order established a mandate for 40% below 2020 emissions by 2030, as can be seen by a Google search. If S-3-05 is interpreted as a straight line between its 2020 and its 2050 targets, then the B-30-15 target of 2030 is the same as the S-3-05 implied target of 2035, because 2035 is halfway between 2020 and 2050 and 40% is halfway to 80%. More recently, California adopted SB 32, which made achieving B-30-15 legally binding. Finally, in 2018, the Governors Executive Order B-55-18 established a mandate of zero net emissions by the year 2045.
California achieved the second GHG emission target of S-3-05 (to emit at the 1990 level by 2020) in 2018, which is two years early. However, the world emission levels have, for most years, been increasing, contrary to the S-3-05 trajectory. Because the world has been consistently failing to follow S-3-05’s 2010-to-2020 trajectory, if California, still wants to lead the way to human survival, it must do far better than S-3-05, going forward, as will be shown.

**Failing to Achieve these Climate Mandates**

What could happen if we fail to achieve S-3-05, AB 32, and B-30-15 or if we achieve them but they turn out to be too little too late and other states and countries follow our example or do less?

It has been written⁴ that, “A recent string of reports from impeccable mainstream institutions - the International Energy Agency, the World Bank, the accounting firm of PricewaterhouseCoopers - have warned that the Earth is on a trajectory to warm by at least 4 Degrees Celsius and this would be incompatible with continued human survival.”

It has also been written⁵ that, “Lags in the replacement of fossil-fuel use by clean energy use have put the world on a pace for 6 degree Celsius by the end of this century. Such a large temperature rise occurred 250 million years ago and extinguished 90 percent of the life on Earth. The current rise is of the same magnitude but is occurring faster.”

**Pictures That Are Worth a Thousand Words**

Figure 1 shows (1) atmospheric CO₂ (in blue) and (2) averaged-over-a-year-then-averaged-over-the surface-of-the-earth, atmospheric temperature (in red). This temperature is with respect to a recent preindustrial revolution value. The data starts 800,000 years ago. It shows that the current value of atmospheric CO₂, which is over 410 PPM, far exceeds the values of the last 800,000 years. It also shows that we might expect the corresponding temperature to eventually be over 12 degrees above preindustrial temperatures. This would bring about a human disaster³, ⁴, ⁵.

Figure 2 shows the average yearly temperature (in blue) with respect to the 1960-to-1990 baseline temperature. It also shows atmospheric levels of CO₂ (in red). The CO₂ spike of Figure 1 is seen on Figure 2 to be an accelerating ramp up, starting at the time of our industrial revolution. The S-3-05 goal of 450 PPM is literally “off the chart”, in Figure 2. Figure 2 shows that, as expected, temperatures are starting to rise along with the rising levels of CO₂. The large variations in temperature that are observed are primarily due to the random nature of the amount of solar energy being received by the earth.

**FURTHER BACKGROUND: CALIFORNIA’S SB 375 AND AN IMPORTANT DATA SET**

As shown in the Introduction, LDVs emit significant amounts of CO₂. The question arises: will driving need to be reduced or can cleaner cars and cleaner fuels arrive in time to avoid such behavioral change? Steve Winkelman, of the Center for Clean Air Policy (CCAP), worked on this problem and his results probably inspired California’s SB 375.
SB 375, the Sustainable Communities and Climate Protection Act of 2008

Under SB 375, the California Air Resources Board (CARB) has given each Metropolitan Planning Organization (MPO) in California driving-reduction targets, for the years 2020 and 2035. “Driving” means yearly, per capita, vehicle miles travelled (VMT), by LDVs, with respect to 2005. The CARB-provided values are shown at this Wikipedia link, http://en.wikipedia.org/wiki/SB_375. It is important to note that although this link and many other sources show the targets to be “GHG” and not “VMT”, SB 375 clearly states that the reductions are to be the result of the MPO’s Regional Transportation Plan (RTP), or, more specifically, the Sustainable Communities Strategy (SCS) portion of the RTP. Nothing in the SCS will improve average mileage. That will be done by the state and federal governments by their Corporate Average Fleet Efficiency (CAFÉ) standards and any other laws or regulations that they might adopt. The SCS can only reduce GHG by reducing VMT.

Figure 1  Atmospheric CO₂ and Mean Temperature from 800,000 Years Ago

Figure 2  Atmospheric CO₂ and Mean Temperature, Over the Last 1,000 Years
Under SB 375, every Regional Transportation Plan (RTP) must include a section called a Sustainable Communities Strategy (SCS). The SCS must include driving reduction predictions corresponding to the CARB targets. Each SCS must include only feasible transportation, land use, and transportation-related policy data. If the SCS driving-reduction predictions fail to meet the CARB-provided targets, the MPO must prepare an Alternative Planning Strategy (APS). An APS uses infeasible transportation, land use, and transportation-related policy assumptions. The total reductions, resulting from both the SCS and the APS, must at least meet the CARB-provided targets.

**Useful Factors from Steve Winkelman’s Data**

Figure 3 shows 5 variables as a percent of their 2005 value and also the 1990 emission value (turquoise) related to the 2005 CO2 emission value (the blue line). All of the variables are for LDVs. The year 2005 is the baseline year of SB 375. The red line is the Caltrans prediction of VMT. The purple line is California’s current mandate for a Low Carbon Fuel Standard (LCFS). The LCFS also can be used to get the equivalent mileage from the actual mileage by dividing the actual mileage by the LCFS. The LCFS can be used to get the equivalent CO2 per mile driven by multiplying the actual CO2 per mile driven by the LCFS. As shown, by 2020, fuel in California must emit 10% less per gallon than in 2005. As written above, the turquoise line is the 1990 GHG emission in California. As shown, it is 12% below the 2005 level. This is important because S-3-05 specifies that in 2020, state GHG emission levels must be at the 1990 level. The green line is the CO2 emitted per mile, as specified by AB 1493, also known as “Pavley 1 and 2” named after Senator Fran Pavley. The values shown do not account for the LCFS. The yellow (or gold) line is the S-3-05 mandate, referenced to 2005 emission levels. The blue line is the product of the red (miles), the green (CO2 per mile), and the purple line (LCFS, which reduces emission per mile) and is the percentage of GHG emissions compared to 2005. Since VMT is not being adequately controlled, the blue line is not achieving the S-3-05 line. Figure 3 shows that driving must be reduced. For this reason, Steve Winkelman can be thought of as the true father of SB 375.

![Figure 3: The S-3-05 Trajectory (the Gold Line) AND the CO2 Emitted from Personal Driving (the Blue Line), where that CO2 is a Function (the Product) of the California-Fleet-Average CO2 per Mile (the Green Line), The Predicted Driving (VMT, the Red Line), and the Low-Carbon Fuel Standard (the Purple Line)](source: Steve Winkelman, based on CALTRANS VMT forecasts, AB 1493 and LCFS)
Figure 3 provides inspiration for a road map to climate success for LDVs. Climate-stabilization targets must be identified (from the climate scientists) and achieved by a set of requirements that will increase fleet efficiency and another set that will reduce per-capita driving.

**THE DERIVATION OF CALIFORNIA’S TOP-LEVEL LDV REQUIREMENTS TO SUPPORT CLIMATE STABILIZATION**

It is clear that more efficient (less CO2 emitted per mile) LDVs will be needed and this can be achieved with appropriate requirements. Significant improvements in efficiency will be needed if driving reductions are going to remain within what many people would consider politically achievable. Mileage and equivalent mileage will need to be specified. A significant fleet-fraction of Zero-Emission Vehicles (ZEVs, either Battery-Electric LDVs or Hydrogen Fuel Cell LDVs) will be needed. Since mileage and equivalent mileage are more heuristic than CO2 emissions per mile, they will be used in the derivations. CO2 per mile driven will not appear in the final equations.

Since the SB-375 work used 2005 as the reference year, that convention will be used. It will be assumed that cars last 15 years.

**GHG Emission Target to Support Climate Stabilization**

The primary problem with S-3-05 is that California’s resolve and actions have been largely ignored by other states, our federal government, and many countries. Therefore, rather than achieving 2000 levels by 2010 (the first target of S-3-05) and 1990 levels by 2020 (the 2nd target of S-3-05), world emission has been increasing for nearly all of the years since 2010. (California, on the other hand achieved its 1990 emission level in 2018. This is two years sooner than the 2nd target of the S-3-05 requirement.) Reference 7 states on Page 14 that the required rate of reduction, if commenced in 2020, would be 15%. That rate means that the factor of 0.85 must be achieved, year after year. If this were done for 10 years, the factor would be \((0.85)^{10} = 0.2\), by 2030. This reduction of 80% down from the 2020 value matches the 2050 target requirement of S-3-5, which is 80% below the 1990 value. According to S-3-05, the 2020 emission value should be the same as the 1990 emission value. As noted above, the S-3-05 emission of 2050 was designed to support capping atmospheric CO2 at 450 PPM\(^3\). “Capping” means that the sum of all emissions (anthropogenic and natural) equals the sum of all sequestration (mostly photosynthesis.) Therefore, the author of the Reference 7 statement wanted the world to achieve the third target of S-3-05 to get the atmospheric CO2 to stop going up 20 years sooner than what S-3-05 was written to achieve. This shows the urgent nature of our climate crisis. Therefore, if California wants to do its part by setting an example for the world, the correct requirement for California is to achieve emissions that are reduced to 80% below California’s 1990 value by 2030. The world’s reduction rate is not anywhere near the needed 15% as we move towards the end of 2020. Therefore, the target, of 80% below 1990 levels by 2030 is considered to be correct for California. Reference 7 also calls into question the advisability of aiming for a 2 degree Celsius increase, given the possibilities of positive feedbacks that would increase warming. This concern for positive feedbacks is another reason that this paper will work towards identifying LDV requirement sets that will support LDVs achieving 80% below the 1990 value by 2030.
Thinking that LDVs can, for some reason, fail to achieve this target is dangerous thinking. As stated above, LDVs emit, by far, the most CO2 of all categories.

**Notes on Methods**

The base year is 2005. An intermediate year of 2015 is used. The car efficiency factor of 2015 with respect to 2005 is taken directly from Figure 3. The car efficiency factor of 2030 with respect to 2015 is derived herein, resulting in a set of car-efficiency requirements.

It is assumed that cars last 15 years. This is equivalent to assuming that the effect of the cars that last more than 15 years, thus increasing emissions, will be offset by the effect of the older cars that don’t last as long as 15 years, thus reducing old-car emissions. As will be seen, there will also have to be some sort of an additional action to remove many of the older Internal Combustion Engine cars that are 15, through just 8 years old. Natural attrition will take care of some of this since as cars get older the probability that they will be taken out of service increases. However, some sort of “cash for gas guzzlers” program will be needed. How this is done is not covered in this paper. This is not unique. As another example, the car manufacturers will have to figure out how to produce the needed cars and batteries.

**Primary Variables Used**

Table 1 defines the primary variables that are used.

**Fundamental Equations**

The emissions are equal to the CO2 per mile driven multiplied by the per-capita driving multiplied by the population, since per-capita driving multiplied by the population is total driving. This is true for any given year.

Future Year $k$:

$$e_k = c_k \times d_k \times p_k$$  \hspace{1cm} (Eq. 1)

Base Year $i$:

$$e_i = c_i \times d_i \times p_i$$  \hspace{1cm} (Eq. 2)

Dividing both sides of Equation 1 by equal values results in an equality. The terms on the right side of the equation can be associated as shown here:

$$\frac{e_k}{e_i} = \frac{c_k}{c_i} \times \frac{d_k}{d_i} \times \frac{p_k}{p_i}$$  \hspace{1cm} (Eq. 3)

**Table 1  Variable Definitions**

</tbody>
</table>
8

\[ P_k \quad \text{Population, in Year “k”} \]
\[ d_k \quad \text{Per-capita LDV driving, in Year “k”} \]
\[ D_k \quad \text{LDV Driving, in Year “k”} \]
\[ M_k \quad \text{LDV Mileage, miles per gallon, in Year “k”} \]
\[ m_k \quad \text{LDV Equivalent Mileage, miles per gallon, in Year “k” accounting for Low Carbon Fuel Standard (LCFS) Factor, so this is } M_k/L_k \]
\[ N \quad \text{Number of pounds of CO2 per gallon of fuel but not accounting for the Low Carbon Fuel Standard (LCFS) Factor} \]

Since CO2 per mile (“c”) is a constant (use “A”, noting that it is equal to about 20 pounds per gallon) multiplied by the number of Gallons (“G”) and since number of gallons is distance (use “D”) divided by mileage (use “m”), then \( c = A \cdot D/m \). this shows that the ratio of the “c” values in different years is going to be equal to the reciprocal of the “m” values in those different years because the other variables will cancel out. Therefore:

To work with mileage: \( \frac{m_i}{m_k} = \frac{c_k}{c_i} \) \hspace{1cm} (Eq. 4)

Putting Equation 4 into Equation 5 results in the following equation:

\[ \frac{e_k}{e_i} = \frac{m_i}{m_k} \cdot \frac{d_k}{d_i} \cdot \frac{p_k}{p_i} \] \hspace{1cm} (Eq. 5)

Showing the base year of 2005, the future year of 2030, introducing the intermediate year of 2015 and the year of 1990 (since emissions in 2030 are with respect to the 1990 value) results in Equation 6.

\[ \frac{e_{2030}}{e_{1990}} \times \frac{e_{1990}}{e_{2005}} = \frac{c_{2030}}{c_{2015}} \times \frac{c_{2015}}{c_{2005}} \times \frac{d_{2030}}{d_{2005}} \times \frac{p_{2030}}{p_{2005}} \] \hspace{1cm} (Eq. 6)

The ratio on the far left is the climate-stabilizing target, which is the factor of the 2030 emission to the 1990 emission. It has been shown that this is 0.20 or 80% less. The next ratio is the emission of 1990 compared to 2005. It is the turquoise line of Figure 3, which is 0.87. The first ratio on the right side of the equation is the fleet emission per mile in 2030 compared to the value in 2015. This ratio will be derived in this report and it will result in a set of car-efficiency requirements. Moving to the right, the next ratio is the car efficiency in 2015 compared to 2005. It can obtained by multiplying the purple line 2015 value times the green line 2015 value, which is 0.90 * 0.93. The next term, still going from right to left, is the independent variable. It is the per-capita driving reduction required, with respect to the 2005 level of driving. The final term on the far right is the ratio of the population in 2030 to the population in 2005. Reference 8 shows that California’s population in 2005 was 35,985,582. Reference 9 shows that California’s population in 2030 is predicted to be 42,263,654. Therefore,

\[ \frac{P_{2030}}{P_{2005}} = \frac{42263654}{35985582} = 1.17446076 \] \hspace{1cm} (Eq. 7)

Putting in the known values results in Equation 8:
\[ 0.20 \times 0.87 = \frac{c_{2030}}{c_{2015}} \times 0.90 \times 0.93 \times \frac{d_{2030}}{d_{2005}} \times 1.17446076 \quad (Eq. 8) \]

Combining the values, solving for the independent variable (the per-capita driving ratio), and changing from emission-per-mile to equivalent-miles-per-gallon results in the following:

\[ \frac{d_{2030}}{d_{2005}} = 0.177004896 \times \frac{m_{2030}}{m_{2015}} \quad (Eq. 9) \]

With the coefficient being so small, it is doubtful that we can get the equivalent mileage in 2030 to be high enough to keep the driving ratio from falling below one. The mileage of the 2015 fleet will be based on the best data we can get and by assuming cars last 15 years. The equivalent mileage in 2030 will need to be as high as possible to keep the driving-reduction factor from going too far below 1, because it is difficult to reduce driving too much. The equivalent mileage will be dependent on the fleet-efficiency requirements in the near future and going out to 2030. Those requirements are among the primary results of this report.

**Internal Combustion Engine (ICE) Mileage, from Year 2000 to Year 2030**

The years from 2000 to 2011 are taken from a plot produced by the PEW Environment Group, [http://www.pewenvironment.org/uploadedFiles/PEG/Publications/Fact_Sheet/History%20of%20Fuel%20Economy%20Clean%20Energy%20Factsheet.pdf](http://www.pewenvironment.org/uploadedFiles/PEG/Publications/Fact_Sheet/History%20of%20Fuel%20Economy%20Clean%20Energy%20Factsheet.pdf)

The plot is shown here as Figure 6. The “Both” values are used.

**Figure 4** Mileage Values From the PEW Environment Group

The values from 2012 to 2025 are taken from the US Energy Information Agency (EIA) as shown on their website, [http://www.c2es.org/federal/executive/vehicle-standards#ldv_2012_to_2025](http://www.c2es.org/federal/executive/vehicle-standards#ldv_2012_to_2025). They are the LDV Corporate Average Fleet Efficiency (CAFÉ) values enacted into law in the first term of President Obama. From 2025 to 2030, it is assumed that the yearly ICE improvement in CAFÉ will be 2.5 MPG.
Overall Mileage of California’s LDV Fleet in 2015

Table 2 uses these values of the Internal Combustion Engine (ICE) LDV mileage to compute the mileage of the LDV fleet in 2015. It assumes that the fraction of ZEVs being used over these years is small enough to be ignored. The 100 miles driven, nominally, by each set of cars, is an arbitrary value and inconsequential in the final calculation, because it will divide out. It is never-the-less used, so that it is possible to compare the gallons of fuel used for the different years. The “f” factor could be used to account for a set of cars being driven less. It was decided to not use this option by setting all of the values to 1. The Low Carbon Fuel Standard (LCFS) values are taken from Figure 3. The gallons of fuel are computed as shown in Equation 10, using the definition for Lk that is shown in Table 2.

\[
\text{Gallons Used per } f \times 100 \text{ miles} = \frac{fx100}{(\text{CAFE MPG})/L_k} \quad (\text{Eq. 10})
\]

As shown in Table 2, using the definitions in Eq. 9:

\[
m_{2015} = 27.63
\]

If it is deemed acceptable to have per-capita driving in 2030 be reduced 32% with respect to 2005 driving, then the left side of Eq. 9 becomes 0.68 and it is possible to use Eq. 9 to solve for the 2030 mileage as:

\[
m_{2030} = (27.63) \times 0.68 \times \left(\frac{1}{0.177004896}\right) = 106.1462 \quad (\text{Eq. 11})
\]

Likewise if it is decided that the per-capita driving in 2030 should equal the per-capita driving in 2005 then:

\[
m_{2030} = (27.63) \times 1.00 \times \left(\frac{1}{0.177004896}\right) = 156.0974 \quad (\text{Eq. 12})
\]

These values will provide the targets for the tables that compute the mileage values for 2030.

How ICE Mileage Values Will Be Used with ZEV Equivalent Mileage Values

To have LDVs achieve our climate-stabilizing target, after 2015, the net (computed using both ICE and ZEV vehicles) mileage values for each year will need to greatly improve by having a significant fraction of ZEVs. The ICE CAFÉ standards are used in this report as just the ICE contribution to fleet MPG. The ICE MPG values are inadequate by themselves and will therefore need to become less important; the ZEVs sales will need to overtake the ICE sales.

Federal requirements will need to change significantly. Currently, federally-mandated corporate average fuel efficiency (CAFÉ) standards have been implemented, from 2000 to 2025. These standards require that each corporation produce and sell their fleet of cars and light-duty trucks in the needed proportions, so that the combined mileage of all of the cars they sell (total miles driven in all cars sold in the year of interest divided by the total gallons used by all those cars, for any arbitrary distance) at least meets the specified mileage.
The car companies want to maximize their profits while achieving the required CAFÉ standard. In California, the car companies are already be required to sell a specified number of electric vehicles, which have a particularly-high, equivalent-value of miles-per-gallon. If the laws are not changed, this situation will allow companies to take advantage of their ZEV vehicles to sell more low-mileage, high-profit cars and light-duty trucks, and still achieve the federal CAFÉ standard.

It will be better to apply the CAFÉ standards to only the ICEs and then require, in addition to the CAFÉ standards, that the fleet of LDVs sold achieve some mandated fraction of ZEVs. The ZEVs will get ever-improving equivalent mileage, as our electrical grid is powered by a larger percent of renewable energy. In other words, their equivalent mileage is not fixed, but will improve over the years. Requirements developed here are for 2030. Therefore a high percentage of all the electricity generated in the state, including both the “in front of the meter” (known as the “Renewable Portfólio Standard” or “RPS”) portion and the “behind the meter” portion is assumed to come from sources that do not emit CO2. The values of 85% and 90% are assumed. The values become one of the important fleet-efficiency requirements for cases that are considered. Hopefully these assumptions are reasonable. San Diego’s Climate Action Plan (CAP) was the first to specify 100% renewable energy by 2035. Many other cities have followed San Diego’s lead in this regard.
How to Compute the ZEV Equivalent Mileage Values

To calculate the equivalent mileage of the 2030 fleet of LDVs, it is necessary to derive a formula to compute the equivalent mileage of ZEVs, as a function of the percent of electricity that is generated without emitting CO2 (the mixed case), the equivalent ZEV mileage if the electricity is from 100% fossil fuel (the “West Virginia” case), and the equivalent ZEV mileage if the electricity is from 100% renewable sources (the ideal case), which is not infinity because it is assumed that the manufacturing of the car emits CO2. The variable definitions in Table 3 are used.

Table 3 Variables Used in the Calculation of ZEV Equivalent Mileage

<table>
<thead>
<tr>
<th>Variable</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>$m_z$</td>
<td>ZEV Equivalent mileage</td>
</tr>
<tr>
<td>$m_{zr}$</td>
<td>ZEV Equivalent mileage if the electricity is from renewables</td>
</tr>
<tr>
<td>$m_{zf}$</td>
<td>ZEV Equivalent mileage if the electricity is from fossil fuels</td>
</tr>
<tr>
<td>$r$</td>
<td>fraction of electricity generated from renewable sources</td>
</tr>
<tr>

<td>Num</td>
<td>$m_{zr} \times m_{zf}$</td>
</tr>
<tr>
<td>Den</td>
<td>$r \times m_{zf} + (1-r) \times m_{zr}$</td>
</tr>
</tbody>
</table>

The derivation of the equation for equivalent ZEV mileage is based on the notion that the ZEV can be imagined to travel “$r$” fraction of the time on electricity generated from renewables and “(1-r)” fraction of the time on fossil fuel. If the vehicle travels “$D$” miles, then, using the definitions shown in Table 4, the following equation can be written.

$$G = \frac{r \times D}{m_{zr}} + \frac{(1-r) \times D}{m_{zf}} \quad \text{(Eq. 13)}$$

$$m_z = \frac{D}{G} = \frac{D}{\left(\frac{r \times D}{m_{zr}} + \frac{(1-r) \times D}{m_{zf}}\right)} \quad \text{(Eq. 14)}$$

Dividing the numerator and the denominator by D and multiplying the numerator and the denominator by the product of the two equivalent mileage values ($m_{zr}$ and $m_{zf}$) results in Equations 31.

$$m_z = m_{zr} \times m_{zf} / \left( r \times m_{zf} + (1-r) \times m_{zr} \right) \quad \text{(Eq. 15)}$$

Using the definitions in Table 3:

$$m_z = \frac{\text{Num}}{\text{Den}} \quad \text{(Eq. 16)}$$
Table 4 shows 3 assignments of assumed values in which the fraction of electricity generated from renewables is varied and the results, using Equations 15 and 16, results in the three values of ZEV equivalent mileage. This shows the urgent need to move towards cleaner electricity.

Computing an LDV Overall Equivalent Fleet Mileage, for the Balanced_1 Case

Table 6 shows the calculation for the overall equivalent mileage for all the cars on the road, in the year of 2030, for the Balanced_1 case.

The name, Balanced_1, comes from the attempt to balance the difficulty of achieving the fleet efficiency-related requirements with the difficulty of achieving the driving-reduction related requirements. The Balanced_1 case assumes that electricity is 85% renewable, which is also difficult.

There will also be a Balanced_2 case that assumes that electricity is 90% renewable. Both the Balanced_1 and the Balanced_2 cases assume that it is reasonable to have per-capita driving in 2030 reduced 32%, with respect to 2005 per-capita driving. That assumption, along with the 85% renewable electricity assumption, was used to select the $z$ values of Table 6 to result in the Equation 11 value of overall 2030 mileage, which is 106.1263 Miles Per Gallon (MPG). From Table 4, 85% renewable electricity results in a ZEV equivalent mileage of 432.37 MPG. That value of equivalent ZEV mileage in 2030, when electricity is 85% renewable, is used for all of the ZEV model years, for
this case. Note that this is overlooking the fact that not all BEVs are equally efficient. In order to simplify this analysis, the Table 4 values of \( m_{zf} \) are considered to be applicable to all the ZEV models. Therefore, the 432.37 MPG value can be divided into each \( D_z \) value to compute the corresponding \( G_z \) value, in all of the model years being considered.

To reduce the miles driven in poor-milage ICE’s, the “f” factor is used. For example, if “f” is set to 0.30, as it is in 2016, then the miles driven is reduced by 70%. Achieving the required “f” values may require some type of “cash-for-gas-guzzlers” program. However, it could also be noted that when older cars are second or third cars in multi-car families in which family members have the luxury of choosing which car to drive, family members will usually choose the car that is cheaper to operate, thus making the “f” factors easier to achieve. Finally, the Low Carbon Fuel Standard (LCFS) is assumed to continue to improve from the currently mandated value of 0.9 by the end of 2019. This is another method of reducing the CO2 emissions of the ICE vehicles.

For the ICE vehicles, the \( G_i \) values are computed as the \( D_i \) value divided by the equivalent MPG value. The equivalent MPG is the CAFÉ MPG divided by the LCFS factor.

It is arbitrarily assumed that the cars, for each year being considered (the models for that year, both ZEVs and ICEs), go a total of 100 miles. Although this is an extremely small fraction of the actual miles that will be driven, it doesn’t change the result because the number of gallons of equivalent gasoline is always proportional to miles. The fraction of cars that are ZEVs \( (z) \) is used to divide up this value of 100 Miles. However, the factor “f” reduces the miles driven by the ICE vehicles and this brings down the total miles driven for the years in which the “f” term is less than 1. For each year, the total miles per gallon (MPG) is computed as the total miles driven divided by the total gallons used. However, this value is not used in the calculation of the entire fleet equivalent mileage. The overall equivalent mileage is computed as the total miles driven divided by the total gallons used, where these quantities are summed over all of the 15 categories (years) of LDVs.

The following formulas are used to compute the overall equivalent mileage in 2030, of all of the LDVs on the road.

For the ICE calculations, for 2016, where

- “\( L_k \)” is defined in Table 1 (LCFS factor for year “k”) and is the value in the “LCFS” column of Table 6 and
- “\( z \)” is from the “\( z \)” column and is the fraction of cars sold in the year that are ZEVs and
- “\( m_i \)” is the value from the CAFÉ MPG column:

\[
D_i = 100 \times f \times (1 - z) \quad \text{(Eq. 17)}
\]

\[
G_i = D_i / (m_i / L_{2016}) \quad \text{(Eq. 18)}
\]

For the ZEV calculations:

\[
D_z = 100 \times z \quad \text{(Eq. 17)}
\]

\[
G_z = D_z / (432.37) \quad \text{(Eq. 18)}
\]

In updating this report from its 2015 version, the fleet fraction of ZEVs (“\( z \)”), from 2015 to 2019, had to be reduced to approximate the low values that actually occurred from 2015 to 2019. However,
in 2020, it is assumed that the fraction will be at least as large as 8%, which is not such a trivial value. If it is actually larger than 8%, then there will be some margin built into the requirements derived in this report.

</table>

Sum of Miles and then Gallons of Equivalent Fuel: 1235.60 11.64

Equivalent MPG of LDV Fleet in 2030: 106.17

Sum of ZEV Miles = 795. Fraction of Miles Driven by ZEVs = 64.3%
There is probably some margin from the 2016 to 2019 values as well. The difficult values are for 2022, 2023, and 2024, with 2024 requiring that ZEV sales are 80% of all the cars purchased in California. The purple color of the \( z \) values denotes difficulty. This shows that the government will need to require that the car companies achieve the \( z \) values or buy credits from a company such as Tesla, which sells 100% ZEVs.

The Table 6 \( z \) values were put into an EXCEL spread sheet that looks like Table 6. It produced the values shown in Table 6. The values were selected to try to get to the 106.1462 value that was computed in Eq. 11.

Using the result of 106.17 MPG into Equation 9, gives the following result:

\[
\frac{d_{2030}}{d_{2005}} = 0.17700 \times \frac{m_{2030}}{m_{2015}} = 0.17700 \times \frac{106.17}{27.63} = 0.68016 \quad (\text{Eq. 19})
\]

This is the 32\% reduction desired. It will be difficult to achieve. However, the required schedule of ZEV adoption is also difficult. The values of \( z \) from the years 2021 to 2025 will be at least as difficult as achieving the 32\% reduction. This situation motivates the next case. If electricity could be made cleaner sooner, the years from 2021 to 2025 could be less difficult.

**Computing an LDV Overall Equivalent Fleet Mileage, for the Balanced_2 Case**

The *Balanced_2* case is shown in Table 7.

The *Balanced_2* case is the same as the *Balanced_1* case except it includes an assumption that electricity is 90\% renewable in 2030 instead of 85\%. Table 7 shows the results using that assumption, which becomes a requirement for this case. For the *Balanced_2* case, the values of \( z \) are once again assigned to achieve the desired driving-reduction value of 32\%.

From the second line of Table 4, this means that the equivalent mileage of the ZEV vehicles is 621.67 MPG.

Eq. 18 becomes:

\[
G_z = \frac{D_z}{(621.67)} \quad (\text{Eq. 20})
\]

This is used to compute the gallons of equivalent fuel from the distance, for the ZEV vehicles in Table 7.

The Table 7 \( z \) values were put into an EXCEL spread sheet that looks like Table 7. It produced the values shown in Table 7. The \( z \) values were selected to try to get to the 106.1462 value that was computed in Eq. 11.

Using the Table 7 result of 106.22 MPG into Equation 9, gives the following result:
\[
\frac{d_{2030}}{d_{2005}} = 0.17700 \times \frac{m_{2030}}{m_{2015}} = 0.17700 \times \frac{106.22}{27.63} = 0.68045 \quad \text{(Eq. 21)}
\]

</tbody>
</table>

Sum of Miles and then Gallons of Equivalent Fuel: 1233.60 11.61

Equivalent MPG of LDV Fleet in 2030: 106.22

Sum of ZEV Miles = 761. Fraction of Miles Driven by ZEVs = 61.7%
This is the 32% reduction desired. It will be difficult to achieve. However, the required schedule of ZEV adoption is also difficult. The values of \( z \) from the years 2021 to 2025 will be at least as difficult as achieving the 32% reduction. However, they are easier to achieve than the values needed in the Balanced_1 Case. This quantifies the benefit of increasing the renewable fraction of electricity from 85% to 90%.

**Computing an LDV Overall Equivalent Fleet Mileage, for the 2005_Driving Case**

When climate change and transportation policies are discussed, the opinion that we should simply electrify our fleet as soon as possible is often expressed. The idea is that the per-capita driving level does not have to be reduced, if we electrify our fleet fast enough. The relationships developed in this paper enable an analysis to see how this would work. This gives rise to the 2005_Driving Case. For this case, it is assumed that electricity is 90% renewable.

From the third line of Table 4, this means that the equivalent mileage of the ZEV vehicles is 621.67 MPG. Therefore, the relationship shown in Eq. 20 is used.

The 2005_Driving case is shown in Table 8.

For the 2005_Driving case, the values of \( z \) are assigned to achieve the overall equivalent mileage (MPG) value computed in Eq. 12, which is 156.0974, because that value was computed for there being no change in the per-capita driving from the 2005 value.

Using the result of 155.99 MPG into Equation 9, gives the following result:

\[
\frac{d_{2030}}{d_{2005}} = 0.17700 \times \frac{m_{2030}}{m_{2015}} = 0.17700 \times \frac{155.99}{27.63} = 0.99930 \quad \text{(Eq. 22)}
\]

This is the 0% reduction desired. However, the required schedule of ZEV adoption is not possible. Jumping from 8% in 2020 to 82% in 2021 defies reason. It appears that our best bet, to do our part to avoid human extinction, is to proceed with the assumption (and thus requirement) that we are going to have to reduce per-capita driving, as shown in either the Balanced_1 or the Balance_2 case.

**Computing an LDV Overall Equivalent Fleet Mileage, for the Mary_Nichols Case**

Mary Nichols was first appointed to the California Air Resource Board (CARB) in 1975 and became Chair in 1979. After leaving CARB, she founded the Los Angeles Chapter of the Natural Resources Defense Council (NRDC) in 1989. She was reappointed to the position of Chair of
CARB in 2007 by Governor Arnold Schwarzenegger and she is still serving in that position today.

Sum of Miles and then Gallons of Equivalent Fuel: 1254.20 8.04
Equivalent MPG of LDV Fleet in 2030: 155.99
Sum of ZEV Miles = 990.0  Fraction of Miles Driven by ZEVs = 78.9%

The following quote inspires the *Mary_Nichols* Case:
Regulations on the books in California, set in 2012, require that 2.7 percent of new cars sold in the state this year be, in the regulatory jargon, ZEVs. These are defined as battery-only or fuel-cell cars, and plug-in hybrids. The quota rises every year starting in 2018 and reaches 22 percent in 2025. Nichols wants 100 percent of the new vehicles sold to be zero- or almost-zero-emissions by 2030.

The mathematical relationships developed in this paper make it possible to determine the driving reduction that would be required if it is desired to stabilize the climate at a livable level, assuming the schedule of fleet electrification implied by the above quote. Electricity is required to be 90% renewable. The results of the Mary_Nichols Case are shown in Table 9.

The corresponding driving reduction is computed using Eq. 9.

\[
\frac{d_{2030}}{d_{2005}} = 0.177005 \times \frac{m_{2030}}{m_{2015}} = 0.177055 \times \frac{77.24}{27.63} = 0.495 \quad \text{(Eq. 14)}
\]

This means that the per-capita driving will need to be about 50% less in 2030 than in year 2005. It is not known if CARB understands this.

The official policy of the California Democratic Party (CDP) is expressed in its Platform. A statement that applies to this report and to CARB can be viewed by looking at the California Democratic Party (CDP) website, then select “About Us”, “Standing Committees”, “Platform Committee”, “2020 Platform”, and finally “Energy and Environment Plank”. In that Plank, the following statement is found

- Demand a state plan specifying how cars and light-duty trucks can meet climate-stabilizing targets by defining enforceable measures to achieve necessary fleet efficiency and per-capita driving limits;

However, your author’s efforts to get CARB to do such a “state plan”, or to convince a state legislator to write legislation to direct CARB to do such a plan, have not been successful.

If CARB would do such a plan or would consider the results of this report, they would perhaps decide to push for a more ambitious fleet electrification schedule and would also push for state legislation and regulation to enact measures to reduce VMT.

### Preliminary Conclusions Drawn from the Results of the Four Cases Run

Table 10 is a summary showing the most important results of the four cases considered. The purple-colored entries denote difficult requirements; red denotes nearly impossible.

Considering the Balance_1 and the Balanced_2 cases and the fleet electrification schedules for each, it is first concluded that California needs to work to get its electricity to be at least 85% renewable by 2030 and furthermore that getting it to be 90% from renewables by 2030 would make the electrification schedule much easier.

Sum of Miles and then Gallons of Equivalent Fuel: 1236.00  16.00
Equivalent MPG of LDV Fleet in 2030: 77.24
Sum of ZEV Miles = 457.9. Fraction of Miles Driven by ZEVs = 37.0%

Certainly, achieving a 32% reduction in driving in 2030 compared to the 2005 level will be difficult. However, increasing the rate of fleet electrification, from what is shown in the Balanced_1 and Balanced_2 cases (\(z\), in Tables 6 and 7) would be even more difficult.

</table>
Besides that, it should be recognized that California alone cannot stabilize our earth’s climate. California’s best hope is to set an example for other states and other countries. Taking too many of the world’s production of electric vehicles will not work. For a more specific example, lithium batteries may be in short supply and so it may be counterproductive for California to have more than its fair share, thus preventing other states and countries from electrifying their fleet at the required rate. The rates of electrification shown for the Balanced_1 and the Balanced_2 cases are aggressive enough, as shown by the purple-colored entries.

California needs to adopt a set of requirements to achieve the 32% reduction. If CARB wants to work to have California legislate requirements to achieve the Mary Nichol’s case of a 50% reduction in driving, that would also work and allow more electric cars to go to other states and countries. However the 50% reduction in per-capita driving might be politically impossible at this time.

Since the 32% reduction seems prudent, it begs the question as to what this means in terms of roadway congestion.

The net (as opposed to the per-capita) driving change, going from 2005 to 2030 can be computed by multiplying the per-capita driving factor corresponding to the 32% reduction, which is 0.68, by the population factor of 1.1744, computed in Equation 7. The product of these two values is 0.7986. This means that, even with the 17% increase in California’s population, the net driving will have to drop by the factor of about 0.80, or by 20%. If this LDV-driving-reduction requirement (of 0.68) is selected, all of California’s transportation money can be used to improve transit, improve active transportation (mainly walking and biking), and maintain, but not expand, roads. There can be little or no congestion because California highway capacity now is larger than it was in 2005 while the state’s net driving must drop by 20%.

**ACHIEVING THE REQUIRED DRIVING REDUCTION OF THE**

**BALANCED_1 AND THE BALANCED_2 CASES**

As shown in Equation 19, for the Balanced_1 case, and in Equation 21 for the Balanced_2 Case, in 2030, the per-capita driving will need to be 32% below the 2005 value. As shown in this link, [https://en.wikipedia.org/wiki/Sustainable_Communities_and_Climate_Protection_Act_of_2008](https://en.wikipedia.org/wiki/Sustainable_Communities_and_Climate_Protection_Act_of_2008), California’s Metropolitan Planning Organizations (MPOs) are adopting Region Transportation Plans (RTPs) that will achieve reductions in year 2020 and 2035. The convention adopted in this report for these reductions, specifically the per-capita driving reduction with respect to the per-capita driving in 2005, matches the SB 375 convention. As shown in the link, the targets, for year 2035, range from 0% for the Shasta MPO to 16% for Sacramento Area Council of Governments. However, it may be true that some of the 2035 requirements have been revised upwards, to be as large as 19% for some MPOs. Since the climate stabilization target year here is 2030 instead of 2035, and to be reasonably conservative, it is assumed here that the state (this is for all MPOs) will achieve a 12% reduction in per-capita driving, in 2030, compared to 2005. This leaves approximately 20% to be achieved by new requirements.

The title of each of the following subsections contains the estimated per-capita driving reduction each strategy will achieve, by 2030.

23
Reallocate Funds Earmarked for Highway Expansion to Transit and Consider Transit-Design Upgrades (2%)

San Diego County has a sales tax measure called “TransNet”, which allocates approximately one-third for highway expansion, one-third for transit, and one-third for road maintenance. It has a provision that allows for a reallocation of funds, if supported by at least two-thirds of SANDAG Board members, including a so-called weighted vote, where governments are given a portion of 100 votes, proportional to their population. This requirement would be to reallocate the TransNet amount, earmarked for highway expansion, to transit and to do similar reallocations throughout California.

This money could be used to fund additional transit systems; improve transit operations; and/or fund the redesign and implementation of the redesign of existing transit systems. The redesign could include electrification and automation (including automation of fare collection and such features as screening passengers to prevent them from boarding if they have a fever or are in a “test positive” database) or even upgrading to a different transit technology.

A Comprehensive Road-Use Charge (RUC) Pricing and Payout System to Unbundle the Cost of Operating Roads (10%)

Comprehensive means that pricing would be set to cover all costs (including road maintenance and externalities such as harm to the environment and health); that privacy and the interests of low-income drivers doing necessary driving would be protected; that the incentive to drive fuel-efficient cars would be at least as large as it is under the current fuels excise tax; and finally, as good technology becomes available, congestion pricing is used to protect critical driving from congestion.

The words payout and unbundle mean that some of the money collected would go to people that are losing money under the current system.

User fees (gas taxes and tolls) are not enough to cover road costs\(^\text{10}\) and California is not properly maintaining its roads. Reference 10 shows that in California user fees amount to only 24.1\% of what is spent on roads. Besides this, the improved mileage of the ICEs and the large number of ZEVs mean that gas tax revenues will drop precipitously.

This RUC system could be used to help reduce the ICE LDV miles driven in 2016 to 2022, as shown in the “f” column of Tables 6 through 9. This system could probably be implemented in less than 2 years if the urgency of our climate crisis is recognized.

Unbundling the Cost of Car Parking (8%)

Unbundling the cost of car parking\(^\text{11}\) throughout California is conservatively estimated to decrease driving by 8\%, based on Table 1 of Reference 11. That table shows driving reductions that occur in response to introducing a price, for 10 cases. Its average reduction in driving is 25\% and its smallest reduction is 15\%. However, these numbers are for individual cases whereas the 8\% is the decrease in driving in California, due to introducing value pricing where there is a zero price today, or where the price is below its value price. These concepts are explained in Reference 11.

The first such systems should be installed by a (RFP is Request for Proposal) RFP-process-identified, third-party vendor, such as Google, Qualcomm, Uber, or Lime Bicycle, for municipal government employees, as part of the government’s Climate Action Plan. The system would be operated for the financial gain of the employees, with a hard requirement in the RFP that even
employees that continue to drive every day would at least break even. The winning third-party vendor would be skilled at monetizing parking whenever it is not being used by the employees and skilled at monetizing data. The parking system would be fully automated, like Uber, except with a more useful phone app that would find the best parking at the user-specified price and walk-distance. The parking would be available to all drivers driving a car registered in the system. Briefly stated, the system is value priced, shared, automated, and provides earnings to all the people that are effectively losing wages or paying higher costs because the parking is being provided. The vendor would also be good at expanding the system both geographically and over all types of uses, in an economically disruptive way; as Uber and Lyft did to the taxi cab industry. The system would be as easy to use as “free” parking, once the car is registered. It would utilize congestion pricing to protect the desired maximum-occupancy rate.

**Good Bicycle Projects**

The best criterion for spending money for bicycle transportation is the estimated reduction in driving per the amount spent. The following strategies may come close to maximizing this parameter.

*Projects to Improve Bicycle Access (1%)*

All of the smart-growth neighborhoods, central business districts, and other high-trip destinations or origins, both existing and planned, should be checked to see if bicycle access could be substantially improved with either a traffic calming project, a “complete streets” project, more shoulder width, or a project to overcome some natural or made-made obstacle. For example, in some cases, long stretches of freeways cut off bicycle passage on surface streets that are perpendicular to the freeway. In some of these cases, a bicycle bridge over the freeway would be cost effective.

*League-of-American-Bicyclist-Certified (LCI) Instruction of “Traffic Skills 101” (1%)*

Most serious injuries to bike riders occur in accidents that do not involve a motor vehicle\(^\text{12}\). Most car-bike accidents are caused by wrong-way riding and errors in intersections; the clear-cut-hit-from-behind accident is rare\(^\text{12}\).

After attending *Traffic Skills 101*, students that pass a rigorous written test and demonstrate proficiency in riding in traffic and other challenging conditions, in passing an on-road-riding test, would be paid for their time and effort.

As an example of what could be done in San Diego County, if the average class size was 3 riders per instructor and each rider passes both tests and earns $100 and if the instructor, with overhead, costs $500 dollars, for a total of $800 for each 3 students, that would mean that $160M could teach $160M/$800 = 200,000 classes of 3 students, for a total of 600,000 students. The population of San Diego County is around 3 million.

*Eliminate or Greatly Increase the Maximum Height and Density Limits Close to Transit Stops that Meet Appropriate Service Standards (2%)*

As sprawl is reduced, more compact, transit-oriented development (TOD) will need to be built. This strategy will incentivize a consideration of what level of transit service will be needed, how it can be achieved, and what levels of maximum height and density are appropriate. Having no limits at all is reasonable if models show that the development can function without harming the existing adjacent
neighborhoods, given the level of transit service and other supporting transportation policies (such as car parking that unbundles the cost and supports the full sharing of parking\textsuperscript{12}) that can be assumed.

**Complete Streets (Streets designed for all users), “Road Diets”, and “Traffic Calming”, Such as Replacing Signalized Intersections with Roundabouts (1%)**

These projects will encourage active transportation, such as bicycling and walking. These projects also fit well with the addition of TOD and increasing density. They will reduce speeds and therefore reduce noise. The noise reduction and increased safety will encourage people to want to live on and around the redesigned arterials where they would not want to have lived before. People will also be more inclined to shop and to work in such surroundings.

**Net Driving Reduction from All Identified Strategies**

By 2030, the sum of these strategies should be realized as shown in Table 11.

**CONCLUSION**

The urgency of our climate crisis dictates that California should develop plans such as the cases considered in this paper for a climate-stabilizing target year of 2030. The state needs to select a case and move forward with legislation and implementation. The cases considered in this paper indicate that California should achieve electricity that is at least 85% from renewable sources and a per-capita driving reduction of at least 32% with respect to 2005 driving levels. The eight driving-reducing requirements described in this paper are an example of how this could be done.

mike_bullock@earthlink.net
Why pick on cars?

Greenhouse Gas (GHG) Emissions, SD County
Source: Energy Policy Initiatives Center (EPIC, USD)

On Road Transportation: 46%

Cars and light-duty trucks: 41%

Heavy Duty Vehicles: 5%
Why is there a Climate Problem?

Atmospheric CO2 traps heat
- CO2 molecules absorb and then emit, in a random direction, infrared radiation, heat given off by the Earth’s surface
- This effect is significant

Combustion of fossil fuels adds great quantities of CO2 to our Earth’s atmosphere
- The amount of CO2 in the atmosphere is well known
- Our yearly emissions are well known

How Bad Could It Get?

• *Scientific American* June 2008 issue
  – 550 PPM CO2 possible in several decades
  – This could (5% probability) lead to 8 Deg. Celsius of warming
  – 8 Deg. Celsius could lead to “a devastating collapse of the human population, perhaps even to extinction”

• December 24/31 2012 Issue of Nation magazine:

A recent string of reports from impeccable mainstream institutions—the International Energy Agency, the World Bank, the accounting firm of PricewaterhouseCoopers—have warned that the Earth is on a trajectory to warm by at least 4 Degrees Celsius.

[4 Degrees Celsius] would be **incompatible with continued human survival.**

Winter, *UU World* magazine (p. 57) “Lags in the replacement of fossil-fuel use by clean energy use have put the world on a pace for 6 degree Celsius by the end of this century. Such a large temperature rise occurred 250 million years ago and extinguished 90 percent of the life on Earth. The current rise is of the same magnitude but is occurring faster. We must reduce or eliminate all uses of fossil fuels.
Climate Data

• Keeling Curve:
  http://en.wikipedia.org/wiki/An_Inconvenient_Truth#Scientific_basis

Atmospheric Carbon Dioxide
Measured at Mauna Loa, Hawaii

Burning a gallon of gasoline releases about 19 #’s of CO2!
Likewise
A barrel of oil, about 700 #’s
A ton of coal, about 3 tons
Etc.

Currently around 415 PPM!
Climate Change, Mostly Normal

This spike is not normal. It is anthropogenic (man made).

Currently over 410 PPM!!
Let’s Zero In on that Spike

- Earth & Space Research (ESR) website: http://www.esr.org/outreach/climate_change/mans_impact/man1.html

Current level over 410 PPM

Start of Industrial Revolution
We must *stabilize* the value of the earth’s atmospheric \( \text{CO2}_e \).

**CO2\(_e\) Emissions**

\[
\begin{align*}
E_N &= \text{Natural: rotting, fire, digestion, respiration} \\
E_A &= \text{Anthropogenic: combustion of fossil fuel, methane, other} \\
E_{WFB} &= \text{Warming Feed Back: such as methane from melting permafrost}
\end{align*}
\]

\( S \) = **Growth of plants on Earth**

\( S > \) \( \rightarrow \) Positive Slope
\( S = \) \( \rightarrow \) Zero Slope
\( S < \) \( \rightarrow \) Negative Slope

**The Warming Feed Back** term, \( E_{WFB} \), is the wild card. It must not become dominant.
We must stabilize the value of the earth’s atmospheric CO2_e. Here is Step 1:

If Anthropogenic emissions were sufficiently low, the slope would be zero, thus capping the value of the Earth’s atmospheric CO2_e. To achieve this, industrialized nations must limit their emissions to 80% below their 1990 levels.

Warning: The Warming Feed Back terms must not become dominant.
A. Parties and Amici. Except for the following, all parties, intervenors, and amici appearing before the district court and in this Court are listed in the Brief for Plaintiffs-Appellants. James Hansen, David Beerling, Paul J. Hearty, Ove Hoegh-Guldberg, Pushker Kharecha, Valérie Masson-Delmotte, Camille Parmesan, Eelco Rohling, Makiko Sato, Pete Smith, and Lise Van Susteren are amici curiae in this appeal (referred to hereinafter as “Amici Scientists.”).
From the Climate Scientists

From Page 21: . . . the required rate of emissions reduction would have been about 3.5% per year if reductions had started in 2005, **while the required rate of reduction, if commenced in 2020, will be approximately 15% per year.**

• My math:
  – 15% means a factor of 0.85, year after year
  – Consider the 10 years from 2020 to 2030
  – \((0.85)^{10} = 0.20\), which is 80% down
  – Other articles, describing Hansen’s work: “decarbonization by 2030”
New Climate-Stabilization Prescription

Shown with 3 California Mandates: **EO S-3-05 (Red Line & 4 Square Points)**, **SB 32** and **EO B-55-18**

- **SB 32**: 40% down by 2030
- **EO B-55-18**: 100% down by 2045
- **Climate Stabilizing Target**: 80% Below 1990 Value by 2050

Area 1 is the net CO2_e emitted from Year 2010 to 2020.

Area 2 is the net CO2_e emitted from Year 2020 to 2050.

A&WMA Conference & Exhibit, 2020; Paper 796315
How, for LDVs:

**Deriving a Climate-Stabilizing Solution Set of Fleet-Efficiency and Driving-Level Requirements, for Light-Duty Vehicles in California**

We have the climate scientist’s target. We must now derive the LDV Requirements.

A&WMA Conference & Exhibit, 2020; Paper 796315
Notes on Methods

• Base year 2005
• Intermediate year 2015
• Car Efficiency Factor from 2005 to 2015
  – Steve Winkelman’s data
• Car Efficiency Factor, 2015 to 2030
  – Derived in paper (and here)
  – Results in car-efficiency requirements
• Cars last 15 years

From a California law (SB 375) giving per-capita driving reduction targets to be achieved in Regional Transportation Plans.

Cars that survive beyond 2030 are balanced out by those that don’t survive to 2030.

Report on SB 375 See its Table 1.
Data Relating 1990, 2005, & 2015 Data

Purple (Low carbon fuel), Green (CO2/Mile), & Gold (S-3-05)

</table>
Fundamental Equations

Future Year k:

\[ e_k = c_k \times d_k \times p_k \]

Base Year i:

\[ e_i = c_i \times d_i \times p_i \]

\[ \frac{e_k}{e_i} = \frac{c_k}{c_i} \times \frac{d_k}{d_i} \times \frac{p_k}{p_i} \]

To work with mileage:

\[ \frac{m_i}{m_k} = \frac{c_k}{c_i} \]
Solution Overview

From the known 1990-to-2005 factor and the Climate-Stabilizing Target, which is the factor of 2030 emissions to 1990 emissions

\[ \frac{e_k}{e_i} = \frac{m_i}{m_k} \times \frac{d_k}{d_i} \times \frac{p_k}{p_i} \]

The Independent Variable
It becomes the required per-capita driving reduction with respect to 2005 driving

“k” denotes Year 2030
“i” denotes Year 2005

Car Efficiency Factor
From existing mileage requirements and the requirements defined herein

From existing and predicted population

A&WMA Conference & Exhibit, 2020; Paper 796315
Solution Using Intermediate Year of 2015

From the **Climate-Stabilizing-Target**, which is the factor of 2030 emissions to 1990 emissions

\[
\frac{e_{2030}}{e_{1990}} \times \frac{e_{1990}}{e_{2005}} = \frac{c_{2030}}{c_{2015}} \times \frac{c_{2015}}{c_{2005}} \times \frac{d_{2030}}{d_{2005}} \times \frac{p_{2030}}{p_{2005}}
\]

Taken from the Winkelman data: the known 1990-to-2005 factor of emissions (the light blue line)

**Car Efficiency Factor**
From existing mileage requirements and the **requirements defined herein**

From Winkelman. It is the product of the factor from the green line and the purple line.

**The Independent Variable**
It becomes the *required 2030 per-capita driving reduction with respect to 2005 driving*
Putting In the Easy-to-Get Values

From the **Climate-Stabilizing-Target**, which is the factor of 2030 emissions to 1990 emissions ("80% down")

From existing mileage requirements and the **requirements defined herein**

From Winkelman. It is the product of the factor from the green line and the purple line. There is less CO2 per mile, thanks to the LCFS

Taken from the Winkelman data: the known 1990-to-2005 factor of emissions (the light blue line)

\[
0.20 \times 0.87 = \frac{c_{2030}}{c_{2015}} \times 0.90 \times 0.93 \times \frac{d_{2030}}{d_{2005}} \times 1.17446
\]

This ratio is the **Independent Variable.** It is the required per-capita 2030 driving reduction with respect to 2005 driving
Combining the Easy-to-Get Values, Solving for the Independent Variable, and Changing the 2015-to-2030 Car Efficiency from CO2-Per-Mile to Equivalent-Miles-Per-Gallon

\[
0.17700 = \frac{c_{2030}}{c_{2015}} \times \frac{d_{2030}}{d_{2005}}
\]

\[
\frac{d_{2030}}{d_{2005}} = 0.17700 \times \frac{c_{2015}}{c_{2030}}
\]

The required per-capita 2030 driving with respect to 2005 driving

Equivalent Mileage in 2030 is what we make it. It better be as high as possible, because a large driving reduction will be difficult. = “NUMERATOR MILEAGE”

2015 Fleet Mileage is computed = “DENOMINATOR MILEAGE”
Some **Requirements** Defined to Achieve 2030 Fleet Equivalent-Mileage

- Low-Carbon Fuel Standards (LCFS)
- Corporate Average Fuel Efficiency (CAFÉ) Standards from 2015 to 2030
- Driving Reduction Factors ($f_n$) for bad-mileage years (Year $n$)

- Both California’s existing and extended, “L_k”
- Existing, to 2025 Specified to 2030
- For example, 0.75 means 25% less driving
- **Cash for Gas-guzzlers?**
Three More Requirements

*Defined to Achieve 2030 Fleet Equivalent-Mileage*

- CAFÉ Standards only apply to Internal Combustion Engine (ICE) LDVs
- New Requirement: Fraction of fleet sold that must be *Zero Emission Vehicles* (ZEVs)
- In 2030, only 15%, or (the other case) 10% of electricity is from fossil fuels

Define “z” to be the fraction of fleet sold that must be ZEVs

A&WMA Conference & Exhibit, 2020; Paper 796315
Four Variable Definitions & Selecting a Target Numerator Mileage Value

The driving reduction, \( \frac{d_{2030}}{d_{2005}} \), was set to 0.68, corresponding to a 32% reduction in driving.

Then, using the previously-computed \( m_{2015} = 27.63 \) mile per gallon (MPG), the **Numerator Mileage** \( (m_{2030}) \) was computed to be around **106 MPG**.

Finally, the \( z \) values were selected in the following table, by trial and error, to get the **Numerator Mileage** \( (m_{2030}) \) to be close to that **106 MPG** value.

Sum of Miles and then Gallons of equivalent fuel: **1235.60** | **11.64**

Equivalent MPG of LDV Fleet in 2030: **106.17**

ZEV Miles Driven = 795.0  Fraction of Miles Driven by ZEVs = 64.3%
Computing the Ratio of Per-Capita 2030 Driving to Per-Capita 2005 Driving

Equivalent Mileage in 2030 = “NUMERATOR MILEAGE”

\[ \frac{d_{2030}}{d_{2005}} = 0.1770 \times \frac{106.17}{27.63} = 0.68 \]

2015 Fleet Mileage was computed before = “DENOMINATOR MILEAGE”

The factor of 0.68 means there is a 32% reduction in per-capita driving, from 2005 to 2030.

Again, for the next case, the values were selected by trial and error, to get the 106 MPG value, corresponding to a 32% decrease in driving.

**Sum of Miles and then Gallons of equivalent fuel:** 1233.60 | 11.61

**Equivalent MPG of LDV Fleet in 2030:** 106.22

ZEV Miles Driven = 761.0

Fraction of Miles Driven by ZEVs = 61.7%
Selecting a Target Numerator Mileage Value to Get a 0% Reduction in Driving

This previously-derived equation was used.

\[
\frac{d_{2030}}{d_{2005}} = 0.17700 \times \frac{m_{2030}}{m_{2015}}
\]

The driving reduction, \( \frac{d_{2030}}{d_{2005}} \), was set to 1.00, corresponding to a 0% reduction in driving.

Then, using the previously-computed \( m_{2015} = 27.63 \) mile per gallon (MPG), the Numerator Mileage \( m_{2030} \) was computed to be around 156 MPG.

Finally, the \( z \) values were selected in the following table, by trial and error, to get the Numerator Mileage \( m_{2030} \) to be close to that 156 MPG value.

**Sum of Miles and then Gallons of equivalent fuel:** 1254.20 8.04

**Equivalent MPG of LDV Fleet in 2030:** **155.99**

**ZEV Miles Driven = 990.0**  
**Fraction of Miles Driven by ZEVs = 78.9%**
Computing the Ratio of Per-Capita 2030 Driving to Per-Capita 2005 Driving

Equivalent Mileage in 2030 is what we made it by selecting the “z” values in the previous table. = “NUMERATOR MILEAGE”

\[
\frac{d_{2030}}{d_{2005}} = .1770 \times \frac{155.99}{27.63} = 1.00
\]

2015 Fleet Mileage was computed = “DENOMINATOR MILEAGE”

For the next case, the \(z\) values were taken from a published article describing values selected by the Chair of the California Air Resources Board, Mary Nichols.

**ZEV Miles Driven:** 457.9

**Fraction of Miles Driven by ZEVs:** 37.0%

---

**“Mary Nichols Case”, 90% Renewable Electricity**
Computing the Ratio of Per-Capita 2030 Driving to Per-Capita 2005 Driving

Equivalent Mileage in 2030 is what resulted from the Mary Nichols statement. It is the “NUMERATOR MILEAGE”

\[
\frac{d_{2030}}{d_{2005}} = 0.1770 \times \frac{77.24}{27.63} = 0.495
\]

2015 Fleet Mileage was computed = “DENOMINATOR MILEAGE”

CARB may not understand that the fleet electrification schedule suggested by their Board Chair would require that per-capita driving be about half what it was in 2005, if LDVs are to achieve climate-stabilizing targets.
Net Driving Decrease with Respect to 2005 Driving for the “Balanced” Cases

\[(\text{Per-Capita Driving Factor}) \times (\text{Population Factor}) = \text{Net Driving Factor}\]

\[(.68) \times (1.1744) = .80\]

Therefore, even though the population will grow 17%, net driving must decrease by 20%.

Therefore, why add highway lanes?

We need enforceable measures to reduce driving so much there will be no more congestion!
4 Cases that Support Climate Stabilization

Note: Purple denotes difficult; red, impossible.

California designs and implements this

Local governments do this with a 3rd party vendor
An Important Pricing Strategy

A Road-Usage-Charge (RUC) Pricing & Payout System

THEREFORE, BE IT RESOLVED, that the Democratic Club of Carlsbad and Oceanside (DEMCCO) supports a road-usage charge (RUC) pricing & payout system that would (1) cover all road-use costs, including the environmental & health costs caused by driving; (2) mitigate impacts on low-income users; (3) protect privacy; (4) include congestion pricing; (5) keep the per-mile price incentive to drive energy-efficient cars at least as large as it is with today’s fuel excise tax; and (6) send its earnings to all citizens and institutions that are currently losing money by subsidizing road use.
Another Important **Pricing** Strategy

A good car-parking system: value-priced (with congestion pricing), shared, automated, and providing earnings to those losing money because the parking is being provided.

The first such systems should be installed by a third-party vendor (such as **Google, Qualcomm, Uber, or Lime Bicycle**), selected by a RFP (Request for Proposal) process, for municipal government employees, as part of the government’s **Climate Action Plan**. It would be operated for the financial gain of the employees. The RFP would specify that even employees that continue to drive every day would at least break even. The winning third-party vendor would be skilled at monetizing parking, whenever it is not being used by the employees; at monetizing data; and at expanding the system. The system would be automated with a useful phone app to find the best parking at the user-specified price and walk-distance.
From the 2020 California Democratic Party (CDP) Platform

- Work to ensure that all graduating high school students are climate literate, including knowing
  - reasons for anthropogenic climate change and its potential for harm;
  - the difference between climate stabilization and destabilization;
  - climate-stabilizing greenhouse gas (GHG) reduction targets;
    - the basis for those targets, and
    - the measures needed to achieve them; and
  - the primary categories of emissions, including the most problematic category: cars and light-duty trucks;

- Demand a state plan specifying how cars and light-duty trucks can meet climate-stabilizing targets by defining enforceable measures to achieve necessary fleet efficiency and per-capita driving limits;

- Demand Regional Transportation Plan (RTP) driving-reduction targets, shown by science to support climate stabilization;

- Work for equitable and environmentally-sound road and parking operations; smart growth; “complete streets”; teaching bicycling traffic skills; and improving transit, from local systems to high-speed rail;

- Support the design and implementation of a single, environmentally-sound technology system that will collect and distribute fees for the use of roads, parking, and transit that is both economically fair and convenient and protects user privacy and the interests of low-income users;

- Work for the electrification of all trucking and transit systems;

- Work to ensure that freeway expansion projects are subordinate to more sustainable alternatives that will result in more jobs and growth.

From the 2016 & 2018 Platform (*Dividend Account Parking*)

- Work for shared, convenient, and value-priced parking, operated with a system that provides earnings to those paying higher costs or receiving a reduced wage, due to the cost of providing the parking.

*Please email comments or questions to* mike_bullock@earthlink.net
Support for an Equitable, Convenient, and Environmentally-Sound Car-Parking System that Protects Privacy and the Economic Interests of Low-Income Drivers

WHEREAS, (1) our greenhouse gas (GHG) emissions must be reduced, (2) about 40% of California’s emissions are from on-road transportation; (3) reducing car parking subsidies would (a) reduce GHG emissions, air-pollution, and congestion by reducing vehicle trips, (b) give employees more control over their potential earnings, and (c) give renters and consumers more control over their costs; and furthermore,

WHEREAS, (1) Too often, non-drivers lose money due to parking facilities being provided; (2) “free” employee parking is paid for by lower wages for all workers, including those who do not drive; (3) properly pricing parking would reduce the need to build so much parking and the resulting lower construction costs would help everyone; and (4) “free” parking at an apartment complex can sometimes increase rent by over $75 dollars per month, for all renters, even those that do not own a car; and finally,

WHEREAS, (1) methods to automatically charge car owners based on when and where their car was parked, could be implemented, while having safeguards to protect privacy and the economic interests of low-income drivers; (2) methods to automatically provide car-parking earnings to renters, residents, shoppers, train riders, employees, those residing on streets that have on-street parking, and others, could be implemented, using algorithms tailored to each group; (3) earnings algorithms for employees could ensure that even those that drive everyday would break even; (4) parking is optimized if it is available to all user groups, (5) pricing algorithms for on-street parking could protect neighborhoods from the excessive intrusion of parked cars, and (6) a car-parking phone app could direct users to the best parking space, given the driver’s willingness to pay and walk, thus reducing cars being driven around to look for parking.

THEREFORE, BE IT RESOLVED, that that the San Diego County Democratic Party supports researching a car-parking system in which the parking is valued-priced, shared; convenient to drivers, provides earnings to those losing money because the parking is being provided, protects privacy by requiring a search warrant to get parking location information, and protects the economic interests of low-income drivers.

BE IT FURTHER RESOLVED, that this support be communicated as a co-sponsor for the resolution sent to California Democratic Party (CDP) Resolutions Committee and Platform Committee.

Mike Bullock, 76 AD, 760-754-8025, mike_bullock@earthlink.net

DEMCCO adopted a similar resolution in 2014 and supports this resolution.

Dividend-Account Parking: Feasible & Enforceable Mitigation

Updated from Air and Waste Management Association Paper 2010-A-554-AWMA

Mike R. Bullock
Satellite Systems Engineer (36 years), now retired, 1800 Bayberry Drive, Oceanside, CA 92054

ABSTRACT

Bundled-cost and bundled-benefit car-parking systems (generally called “free parking”) are defined, showing that they are not free and that they increase the drive-alone mode, since non-drivers lose just as much money as those that use the parking.

Dividend-Account Parking (DAP) is defined as a parking system in which all of the parking spaces are shared by all drivers that are driving a car that is registered in the system. “Registered” means that the car can be associated with a person having an account in the system. The parking is value-priced, with an option for a congestion pricing overlay. The critical final feature is that the earnings (dividends) are given to the people, for whom the parking is built, such as employees, shoppers, residents of apartments or condominiums, students, or train riders. It is stated that this system is defined in the California Democratic Party (CDP) Platform, making it the official policy of the largest political, environmental, and public-policy-advocacy organization in California. It is also at the center of the Sierra Club’s lawsuit against the San Diego County’s Climate Action Plan (CAP). The court has found in multiple rulings that DAP is feasible mitigation.

Motivations for change are provided, mostly based on an Air and Waste Management Association paper, Climate-Stabilizing California Light-Duty-Vehicle (LDV) Requirements. The following is shown:

1. Parking reform is needed, since fleet electrification, while critically needed (ASAP), cannot, under even the most wildly-optimistic assumptions, achieve the needed GHG emission reduction, for light-duty vehicles (LDVs), soon enough to achieve climate-stabilizing targets.

2. Per-capita driving must be reduced.

It is asserted that parking reform has a large role to play.

DAP is presented as a feasible, enforceable, mitigation measure for any Climate Action Plan or for any application where sustainability is a goal.

100 word summary:

Bundled-cost and bundled-benefit car-parking systems (erroneously called “free”) are defined, showing that they are not free and that they increase the drive-alone mode, since non-drivers lose just as much money as drivers, due to the parking.

Dividend Account Parking (DAP) is presented as a mitigation measure for any Climate Action Plan (CAP) or for any application where sustainability is a goal. The parking is shared, convenient, fully automated, and value priced with a congestion-pricing algorithm. Earnings go to those losing money because the parking is provided.

Motivations are provided, based on an Air and Waste Management Association (AWMA) paper.
*Dividend-Account Parking* (DAP) is defined as a parking system in which all of the parking spaces are *shared* by all drivers that are driving a car that is registered in the system. “Registered” means that the car can be associated with a person having an *account* in the system. The parking is *value-priced*, with an option for a *congestion pricing overlay*. The critical final feature is that the earnings (dividends) are given to the people, for whom the parking is built, such as employees, shoppers, residents of apartments or condominiums, students, or train riders. It is stated that this system is defined in the California Democratic Party (CDP) Platform, making it the official policy of the largest political, environmental, and public-policy-advocacy organization in California. It is also at the center of the Sierra Club’s lawsuit against the San Diego County’s Climate Action Plan (CAP). The court has found in multiple rulings that DAP is feasible mitigation.

Motivations for change are provided, mostly based on an Air and Waste Management Association paper, *Climate-Stabilizing California Light-Duty-Vehicle (LDV) Requirements*. The following is shown:

1. Parking reform is needed, since fleet electrification, while critically needed (ASAP), cannot, under even the most wildly-optimistic assumptions, achieve the needed GHG emission reduction, for light-duty vehicles (LDVs), soon enough to achieve climate-stabilizing targets.

2. Per-capita driving must be reduced.

It is asserted that parking reform has a large role to play.

DAP is presented as a feasible, enforceable, mitigation measure for any Climate Action Plan or for any application where sustainability is a goal.

It shows documented driving reductions due to the pricing of parking. It notes that although the benefits of priced and shared parking are known, such parking has not been widely implemented, due to understandable concerns. It states that a system solution, called *Dividend-Account Parking*, can overcome these concerns, because it would be is easy to use, share, understand, and support. The system operates the parking to maximize the financial gain of those losing money because of the parking. Eight background informational items are provided, including how value-priced parking would help California achieve greenhouse gas (GHG) reduction targets. Arguments for less parking, shared parking, and priced parking are made. Barriers to progress are identified. The fair pricing of parking is described. Seven goals of *Dividend-Account Parking* are listed. Eleven definitions and concepts that define *Dividend-Account Parking* are given. This includes a method to compute a baseline price of parking and how to adjust that price instantaneously to keep the vacancy above 15%. That price adjustment implements “Congestion Pricing.” This information is sufficient to support a “Request for Proposal” (RFP) process to get a *Dividend-Account Parking* design. An implementation strategy is provided.

**INTRODUCTION:**

It has been well established that appropriately priced parking will significantly reduce driving\(^1\). Most case studies presented in Table 1 are evaluations of the most general type of “car-parking cash-out”: *a program that pays employees extra money each time they get to work without
driving. They show that a price differential between using parking and not using parking will significantly reduce driving, even when transit is described as poor. Since driving must be reduced, the pricing of parking is desirable.

Shared parking is also recognized as desirable because it can sometimes result in less parking being needed.

Although the advantages of pricing and sharing parking have been recognized for many years, these practices are still rare. This paper identifies some of the reasons for this lack of progress. The pricing and sharing method of this paper has a natural transparency and ease of use that would reduce many of the concerns. This paper also suggests that those governments that have the necessary resources can take the lead role in developing and implementing the described systems. These governments will recover their investments, over time.

This paper describes how parking facilities could be tied together and operated in an optimum system, named Dividend Account Parking (DAP). The description of Dividend Account Parking (DAP) is sufficient to support a “Request for Proposal” process, leading to full implementation.

There are two distinct parts to Dividend Account Parking (DAP). The first is how to set the price. The second is how to distribute the earnings. Briefly, the earnings go to the individuals in the group for whom the parking is built.

### Table 1: Eleven Cases of Pricing Impact on Parking Demand

</table>
Bellevue, WA case was not used in the averages because its walk/bike facilities also improved and those improvements could have caused part of the decrease in driving.

PERTINENT BACKGROUND INFORMATION

- Vehicle miles traveled (VMT) are a major cause of global warming and pollution\textsuperscript{2,3}.
- California’s Metropolitan Planning Organizations (MPOs) will need to adopt strategies that reduce vehicle miles traveled (VMT), in order to meet SB375 GHG reduction targets, to be issued by the California Air Resources Board in late 2010, for years 2020 and 2035\textsuperscript{2}.
- The appropriate pricing of parking is one of the least costly documented tools to reduce VMT.
- New technologies, such as sensors feeding computer-generated billing, offer the potential to efficiently bill drivers for parking and alert law enforcement of trespassers.
- Reformed parking policies can increase fairness, so that, for example, people who use transit or walk do not have to pay higher prices or suffer reduced wages, due to parking.
- Methods to unbundle parking cost are inefficient unless they support the spontaneous sharing of parking spaces. Shared parking with unbundled cost would ultimately allow cities to require significantly less parking.
- Typical systems of timed parking and metered parking are far from ideal. Parking has no automated record keeping, so it is difficult to know where there is too much or too little.
- Good policies will eventually let cities turn parking minimums into parking maximums.

A GLIMPSE INTO A POSSIBLE FUTURE

Jason is driving to work for the first time in several years. He has decided to save money by carrying home a new 3-D, big-screen computer, which he plans to purchase at a store near his office after work. He wanted to avoid paying delivery charges.

Things have been changing around his office development since they unbundled the cost of parking at the near-by train station. Many people who caught the early trains and lived close to the station stopped driving and parking in the best parking spaces; demand for housing close to the station went up; and wealthy riders, who insisted on driving, did so, confidant that they could always find parking as close to the platform as their schedules required, due to congestion pricing. Who would have guessed how much those people were willing to pay? It was shocking. Parking-lot earnings, paid to round-trip train riders, meant that the net cost to ride the train went significantly down. Ridership and neighborhood vitality both went significantly up. All Jason knew was that the price to park at his office had been going up yearly because of increased land values. His parking-lot earnings from his office had been increasing almost every month, due to the ripple effect of train riders parking off-site at cheaper parking. Some of them were using his office parking.

As he pulls out of his driveway, he tells his GPS navigation unit his work hours (it already knew his office location), the location of the store where he plans to buy the computer, and his estimated arrival and departure times at the store. He tells the GPS unit he wants to park once, park no more than 1 block from the store, walk no more than 1 mile total, and pay no more than an average of $2 per hour to park. He is not surprised to hear the GPS tell him that his request is
impossible. He tells the GPS he will pay an average of $3 per hour and learns that the GPS has located parking.

It guides him into a church parking lot. He hopes the church will use his money wisely. The GPS tells him the location of a bus stop he could use to get to work and the bus’s next arrival time at the stop. With automatic passenger identification and billing, the bus has become easy to use, except that it is often crowded. Jason gets out of the car and walks to work, with no action required regarding the parking.

Three weeks later, when Jason gets his monthly statement for his charges and income for automotive road use, transit use, parking charges, and parking earnings, he finds that the day’s parking did indeed cost about $30 for the 10 total hours that he parked. He notes that the parking-lot earnings for his office parking averaged about $10 per day that month. He then notices the parking lot earnings from the store, where he spent about $1000 dollars. He sees that the parking-lot earnings percent for the store that month was 1.7%, giving him about $17. So for the day, Jason only spent a net of about $3 on parking. Then he realized that he should have had the computer delivered after all. If he would have bicycled that day, as he usually did, he would have still gotten the $27 earnings from the two parking facilities and he would have paid nothing for parking. So the choice to drive cost him $30. He remembers that the delivery would have only been $25 dollars. Oh well. He enjoyed his before-work and after-work walks.

THE CASE FOR LESS PARKING

Less parking will support more compact development. This makes walking and biking more enjoyable and less time consuming. There would certainly be less “dead space”, which is how parking lots feel to people, whether they arrive by car or not, after they become pedestrians.

Since parking can be expensive, less parking can reduce overhead costs significantly, such as leasing expense and parking-lot maintenance cost. Less overhead means more profit and less expense for everyone. A need for less parking can create redevelopment opportunities at existing developments and reduce project cost at new developments.

At new developments, car-parking costs could prevent a project from getting built.

THE CASE FOR SHARED PARKING

Shared parking for mixed uses means that less parking is needed. For example, shared parking could be used mostly by employees during the day and mostly by residents at night.

Fully shared parking means that very little parking would be off limits to anyone. In a central business district with shared parking, drivers would be more likely to park one time per visit, even when going to several locations. Pedestrian activity adds vitality to any area.

THE CASE FOR APPROPRIATELY-PRICED PARKING

_____________________

1 This is especially true of surface parking, which only accommodates 120 cars per acre.

2 On September 23, 2008, a panel of developers reviewed the Oceanside, Ca. “Coast Highway Vision” http://www.ci.oceanside.ca.us/pdf/chv_finalvisionsstrategicplan.pdf. Parts of this plan were described as smart growth.

At the review, developer Tom Wiegel said, “Parking is the number 1 reason to do nothing,” where “do nothing” meant “build no project.” The other developers at the meeting agreed.
To Reduce Driving Relative to Zero Pricing

*Traditional Charging or Paying Cash-out Payments*

As shown in the Introduction, this relationship (pricing parking reduces driving) is not new.\(^3\)

Using results like Table 1, at least one study\(^4\) has used an assumption of widespread pricing to show how driving reductions could help meet greenhouse gas (GHG) target reductions. Dr. Silva Send of EPIC [http://www.sandiego.edu/epic/ghgpolicy/](http://www.sandiego.edu/epic/ghgpolicy/) assumes that all work locations with 100 employees or more in San Diego County will implement cash-out, to result in 12% less driving to work. Currently, almost all employees in San Diego County “park for free”, unless they happen to work in a downtown core area.

**Current, Best-Practice “Unbundling”**

The “best-practice” use of the phrase, “unbundled parking cost”, is to describe the case where either the cost of parking, for the case of a condominium, or the rent for parking, for the case of an apartment, is separated from either the purchase price and common fees or the rent of the dwelling unit.

This gives the resident families the choice of selecting the number of parking spaces they would like to rent or buy, including the choice of zero. This would tend to reduce the average number of cars owned per dwelling unit and, in this way, would also tend to reduce driving. Its major drawback is that this method does not encourage sharing.

**To Increase Fairness and Protect the US Economy**

It is stated above that almost all employees in San Diego County “park for free”. Of course there is really no such thing as “parking for free”. So-called “free parking” always reduces wages or increases costs. At a work site, it reduces everyone’s wage, even those employees that never drive. At an apartment complex, so-called “free parking” increases the rent. Therefore, “free parking” at work or at apartments violates the fundamental rule of the free market, which is that people should pay for what they use and not be forced to pay for what they do not use. Parking should at least be priced to achieve fairness to non-drivers.

The US economy would also benefit. Reductions in driving would lead to reductions in oil imports, which would reduce the US trade deficit.\(^4\)

\(^3\) For many years the Victoria Transport Policy Institute (VTPI) has been recognized as a source of reliable information on “Transportation Demand Management”, or TDM.

> Even a relatively small parking fee can cause significant travel impacts and provide significant TDM benefits. “TDM Benefits” refers to the many public and private benefits of having fewer people choosing to drive.

> “The U.S. trade deficit is a bigger threat to the domestic economy than either the federal budget deficit or consumer debt and could lead to political turmoil. Right now, the rest of the world owns $3 trillion more of us than we own of them.”
BARRIERS TO PROGRESS

Given all this, it might seem that the widespread pricing of parking should have happened by now. However there are barriers. In 2007, a majority of the City Council of Cupertino, Ca. indicated that they wanted their City Manager to negotiate reduced parking requirements with any company that would agree to pay sufficient cash-out payments. To this date, no company, including Apple Inc., has expressed an interest. Most companies probably perceive cash-out as expensive. Even if they realize they could get a reduced parking requirement in exchange for paying sufficient cash-out amounts and even if the economics worked in support of this action (quite possible where land is expensive), they want to stay focused on their core business, instead of getting involved in new approaches to parking, real estate, and redevelopment.

On the other hand, simply charging for parking and then giving all the employees a pay raise is probably going to run into opposition from the employees, who will feel that they would be losing a useful benefit.

In addition, neighbors fear the intrusion of parked cars on their streets. Permit parking, which could offer protection, is not always embraced. City Council members know that a sizable fraction of voting citizens believe that there can actually never be too much “free parking”, Professor Shoup’s famous book notwithstanding. Some Council members probably feel that way themselves.

It doesn’t help that current methods of charging for downtown parking are often very inefficient. For example, downtown Oceanside, California has parking meters that will only accept coins. Besides this, all their on-street, downtown parking is timed, with maximums from 10 minutes to 4 hours. These time limits are enforced by a city employee, who applies chalk from a tire to the street and then records the time. However, by watching the time and moving their car soon enough, drivers can avoid getting a ticket. Of course, they could instead drive to the mall and not have to worry about having coins or elapsed time since parking. It is not surprising that downtown merchants often object to charging for parking.

In summary, those that resist charging for parking, based on their perceptions, include

- Companies, who fear the complexity and expense of paying cash-out payments;
- Employees, who fear losing a current benefit;
- City leaders, who fear the political repercussions;
- Downtown patrons, who dislike the inconvenience and worry;
- Downtown business owners, who fear that it will drive away customers.

THE COST, VALUE, AND FAIR PRICE OF PARKING

Estimated and Actual Capital Cost

Surface Parking

One acre of surface parking will accommodate 120 cars. Land zoned for mixed use is sometimes expensive. At $1.2 million per acre, the land for a single parking space costs $10,000. Construction cost should be added to this to get the actual, as-built cost of each parking space.

---

5 According to Bern Grush, Chief Scientist of Skymeter Corporation [http://www.skymetercorp.com/cms/index.php](http://www.skymetercorp.com/cms/index.php), often two-thirds of the money collected from parking meters is used for collection and enforcement costs.
Estimated cost can be determined by using appraised land value and construction estimates. For new developments, after the parking is constructed, it is important to note the actual, as-built cost.

**Parking-Garage Parking**

One acre of parking-garage will accommodate considerably more than 120 cars. The construction cost of the garage and the value of its land can be added together to get the total cost. Dividing that total cost by the number of parking spaces yields the total, as-built cost of each parking space. Adding levels to a parking garage may seem like a way to cut the cost of each parking space, for the case of expensive land. However, there is a limit to the usefulness of this strategy because the taller the parking garage, the more massive the supporting structural members must be on the lower levels, which increases total cost. Parking-garage parking spaces are often said to cost between $20,000 and $40,000. The actual costs should be noted.

**Underground Parking**

In order to compute an estimate for the cost of a parking space that is under a building, it is necessary to get an estimate of the building cost with and without the underground parking. The difference, divided by the number of parking spaces, yields the cost of each parking space. The cost or value of land plays no role in the cost of this parking. However, it does not follow that this parking is cheap. Underground parking spaces are often said to cost between $60,000 and $90,000 dollars each. Although there will be an “as built” cost of the building with the parking, there will never be an “as built” cost of the building without the parking. However, after the construction is done, the estimate for the cost of the underground parking should be reconsidered and re-estimated if that is needed. The final, best-estimate cost should be noted.

**Value**

Initially, value and cost are the same. For surface parking and parking-garage parking, the value would initially be the same as the as-built cost. For underground parking, the value would initially be the same as the best-estimate cost. However, over time, the value must be updated. Both construction costs and land-value costs will change. The value assigned to a parking place should always be based on the current conditions.

**Fair Pricing**

Parking space “values”, as described above, must first be converted to a yearly price by using a reasonable conversion factor. This conversion factor could be based on either the “cost of money” or the “earnings potential of money”. It is expected that this conversion factor would be 2% to 5% during times of low interest rates and slow growth; but could be over 10% during times of high-interest and high growth. For example, if the surface parking value is $12,000 and it is agreed upon to use 5% as the conversion factor, then each parking spot should generate $600 per year, just to cover capital costs. The amount needed for operations, collection, maintenance, depreciation, and any special applicable tax is then added to the amount that covers capital cost. This sum is the amount that needs to be generated in a year, by the parking space.

The yearly amount of money to cover capital cost needs to be re-calculated every year or so, since both the value and the conversion factor will, in general, change each year. The cost of operations, collection, maintenance, depreciation, and any special applicable tax will also need to be reconsidered.

Once the amount generated per year is known, the base price, per unit year, can be computed by dividing it (the amount generated per year) by the estimated fraction of time that the space will
be occupied, over a year. For example, if a parking space needs to generate $900 per year but it will only be occupied 50% of the time, the time rate charge is $1800 per year. This charge rate per year can then be converted to an hourly or even a per-minute rate. The estimated fraction of time that the parking is occupied over a year will need to be reconsidered at least yearly.

NEW DEFINITIONS TO PROMOTE AN OBJECTIVE VIEW OF PRICING

- The “fair price” means the price that accounts for all costs.
- The “baseline amount of driving” means the driving that results from the application of the fair price.
- “Zero transportation demand management” (“zero TDM”) is the amount of demand management that results when the fair price is used. It will result in the baseline amount of driving.
- “Negative TDM” refers to the case where the price is set below the fair price. This will cause driving to exceed the baseline amount. Since TDM is commonly thought to be an action that reduces driving, it follows that negative TDM would have the opposite effect.
- “Positive TDM” refers to the case where the price is set above the fair price. This would cause the amount of driving to fall below the baseline amount.

Clearly, so-called “free parking” is an extreme case of negative TDM. The only way to further encourage driving would be to have a system that pays a driver for the time their car is parked.

GOALS OF THE “DIVIDEND ACCOUNT PARKING” CAR-PARKING SYSTEM (FORMERLY “INTELLIGENT PARKING”)

- There is only one third-party vendor (or several, collaborating so closely that users are unaffected compared to a single operator) operating all parking. (“All parking” does not include driveways and garages in single-family homes.) Dividend Account Parking is designed and installed by regional or state government, using low-bid contractors, with design and start-up costs covered by the overhead portion of collection fees.
- Nearly all parking is shared. Almost always, anyone can park anywhere. Those who want exclusive rights to parking will pay “24/7” (all day, every day).
- Parking is operated so that the potential users of parking will escape the expense of parking by choosing to not use the parking. This characteristic is named “unbundled” because the cost of parking is effectively unbundled from other costs.
- Parking is priced and marketed to eliminate the need to drive around looking for parking.
- Parking at any desired price is made as easy as possible to find and use.
- Records of the use of each parking space are kept, to facilitate decisions to either add or subtract parking spaces.
- The special needs of disabled drivers, the privacy of all drivers, and, if desired, the economic interests of low-income drivers are protected.

DEFINITIONS & CONCEPTS OF DIVIDEND ACCOUNT PARKING (DAP)

Parking Beneficiary Groups

There are at least 7 types of beneficiary groups. Note that in all cases, members of beneficiary groups must be old enough to drive.
1.) People who have already paid for the capital cost of parking. An example of this type of beneficiary group would be the owners of condominiums, where parking has been built and the cost is included in the price of the condominium. Note that although they have technically already paid for the parking, if they borrowed money to pay for some portion of the price, the cost is built into their monthly payment. This illustrates why the value of parking and the cost of borrowing money (rate of return on money) are key input variables to use to compute the appropriate base, hourly charge for parking.

2.) People who are incurring on-going costs of parking. An example of this type of beneficiary group is a set of office workers, where the cost of “their” parking is contained in either the building lease or the cost of the building. Either way, the parking costs are reducing the wages that can be paid to these employees.6

3.) People who are purchasing or renting something where the cost of the parking is included in the price. Examples of this beneficiary group are people that rent hotel rooms, rent an apartment, buy items, or dine in establishments that have parking.

4.) People who own off-street parking as a business. They could be the individual investors or could be a government or government-formed entity.

5.) People who are said to benefit from parking, even though the money for the parking has been supplied by a source that may have very little relationship to those that are said to benefit. An example of this group would be train riders that make round trips from a station which has parking that is said to be “for riders”. Students at a school with parking would be another example.

6.) People who are considered by many to be the logical beneficiaries of on-street parking. Owners of single-family homes are the beneficiaries of the parking that is along the boundaries of their property. The same status is given to residents of multi-family housing.

7.) Governments. Since they build and maintain the streets, they should get a significant benefit from on-street parking.

**Unbundled Cost and Spontaneous Sharing**

“Unbundled cost” means those who use the parking can see exactly what it costs and those who don’t use the parking will either avoid its cost entirely or will get earnings to make up for the hidden parking cost they had to pay. This conforms to the usual rule of the free market where a person only pays for what they choose to use. Unbundled cost is fair.

“Spontaneous sharing” means that anyone can park anywhere at any time and for any length of time. Proper pricing makes this feasible.

**How to Unbundle**

The method of unbundling can be simply stated, using the concept of “beneficiary group” as discussed above. First, the fair price for the parking is charged. The resulting earnings7 amount is

---

6 Such parking is often said to be “for the benefit of the employees”. Defining this beneficiary group will tend to make this statement true, as opposed to the common situation where the employees benefit only in proportion to their use of the parking.

7 The earnings amount is the revenue collected minus the collection cost and any other costs that will have to be paid due to the implementation of Dividend Account Parking (DAP). The costs associated with the parking, paid **before**
given to the members of the beneficiary group in a manner that is fair to each member. Methods are described below.

**Why this Supports Sharing**

Members of a beneficiary group benefit financially when “their” parking is used. They will appreciate users increasing their earnings. They are also not obligated to park in “their” parking. If there is less-expensive parking within a reasonable distance, they might park there, to save money. This is fine, because all parking is included in the *Dividend Account Parking (DAP)* system.

**Computing the Earnings for Individuals**

*Dividend Account Parking (DAP)* must be rigorous in paying out earnings\(^7\). For a mixed use, the total number of parking spaces must first be allocated to the various beneficiary groups. For example in an office/housing complex, 63.5% of the parking might have been sold with the office. If so, the housing portion must be paying for the other 36.5%. For this case, it would follow that the first step is to allocate 63.5% of the earnings to the workers and 36.5% to the residents.

How the monthly earnings are divided up among the members of the beneficiary group depends on the beneficiary group type. For each member, the group’s total monthly earnings amount is always multiplied by a quantity and divided by the sum (the sum is the denominator) of that quantity, for all members.

For example, for each employee, the multiplier is the number of hours that the employee worked over the month while the denominator is the total number of hours worked by all employees over the month. At a school, for each student, the numerator is the total time spent at the school, over the month, while the denominator is the sum of the same quantity, for all the students.

For a train station with parking being supplied for passengers that ride on round trips of one day or less, the numerator is the passenger’s monthly hours spent on such round trips, over the month; while the denominator is the total number of hours spent by all passengers on such round trips, over the month. Radio Frequency Identification (RFID) units on passengers could support an automated calculation of monthly charges for fares, as well as monthly hours on round trips.

At a shopping center, the numerator is the sum of the money spent by the shopper, over the month, while the denominator is the total amount of money spent by all shoppers over the month.

At a condominium, the numerator is the number of parking places that were paid for (directly or indirectly) by the resident family and the denominator is the total number of parking places at the condominium project; similarly, for apartment complexes.

**Where Earnings Are Low**

The goal is that if someone doesn’t park, they don’t pay, either directly or indirectly, because the earnings that they get will balance out their losses (like reduced wages, for example). However, charging for parking that few want to use will not sufficiently compensate the people that have been forced, or are being forced, to pay for such parking. The only remedy in this case is to redevelop the parking or lease the parking in some other way, for storage, for example. The

---

the implementation of *Dividend Account Parking (DAP)*, should not be subtracted from the revenue because they will continue to be paid as they were before the implementation of *Dividend Account Parking (DAP)*. Therefore, these costs will continue to reduce wages and increase the prices of goods and services.
earnings from the new use should go to those that are in the beneficiary group that was associated with the low-performing parking.

**Why This Method of Unbundling Will Feel Familiar to Leaders**

Developers will still be required to provide parking and will still pass this cost on, as has been discussed. There will be no need to force an owner of an exiting office with parking to break his single business into two separate businesses (office and parking).

Parking beneficiaries are identified that conform to traditional ideas about who should benefit from parking.\(^8\)

**Unbundling the Cost of On-Street Parking**

The revenue from on-street parking in front of businesses will be split evenly between the city and the business’s parking beneficiaries. All of the earnings from on-street parking in front of apartments or single-family homes will be given to the resident families.\(^9\)

**Special Considerations for Condominiums**

Unbundling for a condominium owner means that, although their allocated amount of parking has added to their initial cost, their allocated amount of parking also earns money for them. Unbundling for a condominium could also mean that an owner can choose to have control over a single or several parking places. Such parking spaces could be equipped with a red light and a green light. If the red light is lit, this will mean that the space is not available for parking, except for the person who is controlling the spot. If the green light is lit, it will mean that the space is available to anyone. A space that is being reserved with a red light is charged at the full price to the condominium owner that has control over the space. The owner that controls these spaces can change the state of the parking space (available or not available) by either a phone call, online, or at any pay station system that might be in use for the system. After condominium owners experience the cost of reserving a space for themselves, they might give up on the idea of having their own, personal, unshared parking space; especially since Dividend Account Parking (DAP) will give most owners and their guests all the flexibility they need in terms of parking their cars.

Some people think that condominium parking should be gated, for security reasons. However, parking within parking garages needs to be patrolled at the same frequency level as on-street parking, which is enough to ensure that crime around either type of parking is very rare. Cameras can help make parking garages that are open to the public safe from criminal activity.

**Special Considerations for Renters**

Unbundling for renters means that, although their allocated amount of parking increases their rent, their allocated amount of parking also earns money for them. Therefore, their traditional rent (includes parking) is effectively reduced by the money earned by those parking spaces allocated to them. Renters will be motivated to either not own a car or to park in a cheaper

---

\(^8\) Showing exactly where parking earnings go will reduce the political difficulties of adopting pay parking in a democracy where the high cost of parking is often hidden and rarely discussed.

\(^9\) Although governments own the streets, often, back in history, developers paid for them and this cost became embedded in property values. Admittedly, how to allocate on-street parking earnings is somewhat arbitrary. With congestion pricing and efficient methods, governments may earn significantly more than they are under current practices.
Parking in a cheaper location is not a problem because all parking is part of the Dividend Account Parking (DAP) system. Renters will welcome anyone to park in “their” parking, because it will increase their earnings.

Special Considerations for Employers

At first, companies may want the option of offering “free parking” to their employees so as to be able to compete with traditional job sites. This means giving employees that drive every single day an “add-in” amount of pay so that the sum of the add-in and their parking-lot earnings equals their charge, for any given monthly statement. The operator of the parking, which sends out statements, can pay out the “add in” amount, in accordance with the company’s instruction. The company will then be billed for these amounts. There could be no requirement for the company to provide any such “add-in” amount to the employees that don’t drive every day. This would allow the company to treat its every-day drivers better than other employees and so this would be a negative TDM. However, this economic discrimination would be substantially less than the current, status-quo, economic discrimination, where drivers get “free” parking and non-drivers get nothing.

Clusters of Parking

Clusters are a contiguous set of parking spaces that are nearly equal in desirability and thus can be assigned the same price. They should probably consist of from 20 to 40 spaces. For off-street parking, they could be on either side of the access lane to the parking spaces, so that an observer could see the 20 to 40 cars, and get a feel for the vacancy rate. At a train station, clusters will normally be organized so that their parking spaces are approximately an equal distance from the boarding area. On-street clusters would normally conform to our current understanding of what a block is, which is to say from one cross street to the next cross street. The width of the street and the length of the block should be taken into account in defining on-street clusters of parking and in deciding if the parking on either side of the street should or should not be in the same cluster of parking spaces.

Examples of Good and Bad Technology

Parking Meters or Pay Stations

Parking meters are a relic of an earlier period, before computers. Pay stations do not add enough usefulness to merit their inclusion in Dividend Account Parking (DAP), except as a bridge technology. Once good systems are set up, pay stations should cost additional money to use because of their expense. It would be best to devise an implementation strategy that will minimize their use when the system is first put into effect and will take them out of service as soon as possible.

Radio Frequency Identification Backed Up by Video-Based “Car Present” and License Recognition

Government will eventually enter into an RFID (Radio Frequency Identification) age. Organizers of large athletic events already have. Organizers that put on large open-water swims, foot races, and bike rides have routinely used RFID for many years. An RFID vendor in San Diego

For example, over 20,000 people ran the 2008 Bay-to-Breakers foot race in San Francisco. Each runner had a “chip” in their shoe lace. Each runner’s start time and finish time were recorded and all results were available as soon as the last runner crossed the finish line.
states that passive RFID units cost less than $5, are reliable, are durable, and they could be used to identify cars as well as people. He also sees no problem in implementing most of the features of Dividend Account Parking (DAP).\textsuperscript{12}

**Automatic Data Collection and Sending Out Statements**

Note that the “back end database” of Dr. Carta’s written statement\textsuperscript{12} refers to the ability to send statements of earnings and billing to students.\textsuperscript{13}

**Putting it Together**

Certainly, government, and in particular transit agencies and parking agencies, could use RFID-based technology. For example, when a person with an RFID unit which is tied to a billable address or a credit card with an open account gets on a bus or a train, they should not have to pay at that time, visit a pay station, or “swipe a card” that has a positive balance. Utility customers that pay their bills are not required to pre-pay. The same courtesy should be extended to transit riders, people that drive on roads, people that get parking-lot earnings, and people that park cars. There should be one monthly bill or statement, for all four activities.

**Global Positioning Systems GPS**

An alternative model is to have GPS systems in cars that would detect the car’s parking location, that location’s current charge rate, and would perform all of the charging functions in the car. The only information the parking-lot-enforcement system would need is whether or not a car being parked is owned by a bill-paying owner. The car owner’s responsibility would be to pay the bills indicated by the box in the car. The box would need to process a signal that a bill had been paid. It would also need to process pricing signals.

**Not Picking Winners**

The purpose of this report is to describe what an ideal system would do, not how it is done. How a proposed system works is left to the systems, software, and hardware engineers that work together to submit a proposal based on this description of what an ideal system does.

---

\textsuperscript{11}David R. Carta, PhD, CEO Telaeris Inc., 858-449-3454

\textsuperscript{12} Concerning a Final Environmental Impact Report-approved and funded new high school in Carlsbad, California, where the School Board has signed a Settlement Agreement to consider “unbundled parking”, “cash-out”, and “pricing”, Dr. Carta wrote, in a January 13\textsuperscript{th}, 2010 written statement to the Board,

I wanted to send a quick note discussing the technical feasibility of tracking cars into a lot without impacting students or requiring the need for gates. Mike Bullock and I have discussed this project; it can be accomplished straightforwardly by utilizing Radio Frequency Identification and/or Video Cameras integrated with automated license recognition systems. The cars would need to register with the system at the start, but it would be fairly painless for the users after the initial installation. The back end database system can also be implemented both straightforwardly and at a reasonable price.

This is not necessarily a recommendation of the proposal for unbundled parking. Rather it is strictly an unbiased view of the technical feasibility of the proposal to easily and unobtrusively track cars, both registered and unregistered, into a fixed lot.

\textsuperscript{13} In an earlier email on this subject, Dr. Carta wrote,

This is not too tough - we probably would integrate with a service that already sends physical mail from an electronic submission instead of re-inventing this wheel.
Privacy

Privacy means that no one can see where someone has parked, without a search warrant. Also, the level of the detail of information that appears on a bill is selected by the customer.\(^\text{14}\)

Ease of Use for Drivers

For credit-worthy drivers that have followed the rules of the system, pay parking will not require any actions other than parking. Paying for all parking fees over a month is then done in response to a monthly billing statement. Parking will feel to the consumer like a service provided by a municipality, such as water, energy, or garbage. One important difference is that users belonging to a “beneficiary group” will get an earnings amount in their monthly statement. Those that earn more than what they are charged will receive a check for the difference. This ease of use will make all parking less stressful.

Base Price

Off-Street

Off-street parking is priced so that even if demand does not threaten to fill the parking beyond 85%, the money generated will at least equate to an agreed-upon return on the parking value and pay all yearly costs. Equation 1 shows the calculation of the hourly rate.

\[
\hat{r}_{\text{Baseline Hourly}} = \frac{(r_{\text{Investment}} \times v_{\text{Parking}}) + c_{\text{YOPD}}}{n_{\text{Hours Per Year}} \times f_{\text{TO}}}
\]  
(Eq. 1)

where:

\[
\begin{align*}
\hat{r}_{\text{Baseline Hourly}} & = \text{the computed baseline hourly rate to park} \\
r_{\text{Investment}} & = \text{yearly return on investment, such as .06} \\
v_{\text{Parking}} & = \text{value of a parking space, such as (parking garage) $40,000} \\
c_{\text{YOPD}} & = \text{yearly operations}\(^\text{15}\) plus depreciation, per space, such as $100 \\
n_{\text{Hours Per Year}} & = \text{number of hours per year, 24 x 365 = 8760 Hours per Year} \\
f_{\text{TO}} & = \text{fraction of time occupied, such as 0.55}
\end{align*}
\]

For the example values given, the base hourly rate of parking, to cover the cost of the investment, operations\(^\text{15}\), and depreciation is $0.519 per hour. This could be rounded up to $0.52 per hour. This price could also be increased to result in positive TDM, to reduce driving more than the fair-price, zero-TDM amount.

On-Street

\(^{14}\) License plates that have no RFID tags fail to use the best technology to accomplish the primary purpose of license plates, which is to identify and help intercept cars used in a crime. Identifying cars is a legitimate government goal. Protecting privacy is also a legitimate goal. Both goals can be realized with good laws, good enforcement, and good systems engineering.

\(^{15}\) This includes money for policing, cleaning, maintenance, any applicable parking tax, and all collection costs. Collection costs will need to include an amount to recover the development and installation costs of Dividend Account Parking (DAP).
If on-street parking is located within walking distance (one-quarter mile) of off-street parking, its base price is set equal to the closest off-street parking’s base price. Otherwise, it is set to some agreed-upon value, like fifty cents per hour. However, on-street parking has a special meaning for downtown merchants and for neighborhoods, two powerful political forces in any city. Merchants that have few cars parking on their street, even though it is permitted, are probably failing in their businesses. They would like free parking to help draw visitors to their store front. Neighborhoods that are not impacted by parking would probably prefer no pricing. For these reasons, for any on-street parking cluster, no price is charged until the cluster occupancy reaches 50%. (Time of day is irrelevant.)

**Congestion Pricing**

The time-rate price of parking is dynamically set on each cluster of parking, to prevent the occupancy rate from exceeding 85% (to reduce the need to drive around looking for parking). An 85% occupancy rate (15% vacancy) results in just over one vacant parking space per city block. If the vacancy rate is above 30%, the price is left at the baseline hourly rate. If vacancies fall below 30%, the price can be calculated in a stair-step method, such as shown in Table 2.

Equation 2 is an alternative method.

In either case, the total charge is time parked, multiplied by the time-averaged, time-rate price. The base multiplier would be adjusted to be just large enough to keep the vacancy rate from falling below a desired level, such as 15%, so it is always easy to find parking.

$$r_{HourlyRate} = r_{BaselineHourly} \times \left(B^{(30-V)/5}\right), \text{ for } V < 30; \quad r_{BaselineHourly}, \text{ otherwise} \quad (\text{Eq. 2})$$

where:

- \(r_{HourlyRate}\) = the congestion-priced hourly rate to park
- \(r_{BaselineHourly}\) = the baseline hourly rate to park, such as $0.52 per hour (taken from from Eq. 1.
- \(B\) = the base of the multiplier being computed, such as 2.50
\[ V = \text{the vacancy rate percent, such as 17.5, for 7 vacancies in a cluster of 40 spaces, } 100 \times \frac{7}{40} = 17.5 \]

For the example values given, the hourly rate of parking would be $9.88 per hour.

**Pricing Predictions and Notifications**

Drivers will develop strategies for their routine trips. The computer system that keeps records of parking use will also provide help for users. The *Dividend Account Parking (DAP)* website will direct a user to an appropriate cluster of parking if the user provides the destination location or locations, the time and date, and the hourly rate they wish to pay. If the walk is going to be long, the website could suggest using transit to get from the cheaply-priced parking to the destination. In such cases, the website may also suggest using transit for the entire trip.

Another user option is to specify the time, location, and the distance the user is willing to walk. In this case, the computer would give the cheapest cluster of parking available at the specified walk distance. The price prediction would be provided.

All price predictions would also have a probability of correctness associated with them. If a user can show that a computer has predicted a much lower price than what actually occurred, with a sufficiently high probability, it would be reasonable to charge the user the predicted price rather than the actual price.

Websites could routinely inform viewers when occupancy rates are expected to be unusually high, due to a special event (for example, a sporting event). The parking system website will always give current and predicted hourly rates for all locations. The hourly rates of parking will also be available at a phone number and possibly at pay stations. The base-price hourly rate, for any parking cluster, would be stable and could therefore be shown on signs. Parking garage entrances could have large video screens showing both predicted and existing price. Users will also learn to look at parking and judge whether congestion pricing applies, or could apply, while their car is parked. It would not be long before these capabilities are added into GPS navigation systems.

**Prepaid RFID**

To be inclusive, pay stations or convenience stores will offer a pre-paid RFID that can be set on the dashboard of a car. This will support drivers with poor credit or drivers who have not obtained the necessary equipment to support the normal, trouble-free methods. This will also work for drivers that do not trust the system to protect their privacy for a certain trip (by removing or disabling the permanent RFID) or for all trips. No billing would occur.

**Enforcement**

The system would notify the appropriate law enforcement agency if an unauthorized car was parked. Authorized cars would need either a pre-paid RFID or equipment indicating that their owners had *Dividend Account Parking (DAP)* accounts and were sufficiently paid up on their bills.

**IMPLEMENTATION**

This description of *Dividend Account Parking (DAP)* will help to implement efficient parking systems. Parking at train stations, schools, and government buildings could introduce many of these concepts. This description of *Dividend Account Parking (DAP)* is sufficient to support a “Request for Proposal” process, which could lead to full implementation. Widespread
installation should be done by a government agency, to minimize actions required on the part of the private sector. Laws would simply require the cooperation of all private-sector and government entities.

SUMMARY

A parking plan, Dividend Account Parking (DAP) has been described.

1. Technology will make it easy to use for most drivers.
2. Its parking is almost always shared, to support mixed uses.
3. It unbundles cost by charging and having earnings go to the parking beneficiaries.
4. Traditional groups, such as single-family home owners, employees, tenants, train riders, and students benefit from parking. The benefit is equal for drivers and non-drivers.
5. Baseline prices are computed primarily from the value of the parking and an agreed-upon rate of return. On-street parking is free until it is half full, at which time its base price often matches that of the closest off-street parking.
6. For all parking, price is dynamically increased to guarantee availability. Earnings are therefore only limited by what people are willing to pay.
7. Technology helps drivers find parking and decide if they want to drive or use transit.
8. Prepaid RFIDs provide service to those who have poor credit or don’t want to be billed.
9. Disabled and perhaps low-income drivers will have accounts that allow them to park at reduced prices and perhaps avoid congestion pricing. Specially designated spots might also be required for disabled drivers.
10. The system will provide reports showing where additional parking would be a good investment and where it would be wise to convert existing parking to some other use.
11. Privacy will be protected. Law enforcement officials would need a search warrant to see where someone’s car has been parked. The level of detail on billing would be selected by the car’s owner.
12. Implementations could begin in carefully selected locations and expand.

Global warming, air pollution, trade deficits, and fairness are some of the significant reasons that governments have a responsibility to implement Dividend Account Parking (DAP).

ACKNOWLEDGEMENTS

The following people have offered encouragement, specific information, and/or special insights.

A&WMA, Parking, Unbundled, Shared, TDM, cash-out, pricing, beneficiary, greenhouse gas, GHG, GPS, RFID
After two introductory slides, the presentation starts with the definition of two commonly-used, car-parking systems: the bundled-price system and the bundled-cost system. The flaws of these systems are exposed. The Dividend Account Parking (DAP) parking system is introduced; with the motivation for its implementation: the importance of cars in reducing GHG and how DAP fits into a plan to ensure that cars support climate-stabilization.

The rest of the slides present a specific DAP proposal, in downtown Oceanside, CA, for city employees. Outcomes, an overview, and a definition of DAP are given. Charge & payout formulations are specified. Methods to prevent cheating are described. A brief, simplified example of a DAP implementation is shown, where it would be difficult to not drive to work, showing DAP to still be a good choice. Results from cases of car parking cash-out (where employees are paid to get to work without driving) are given, showing that if a price differential (between driving and not driving to work) is introduced (DAP does this), driving alone to work is significantly reduced.

Money cash flow calculations are presented, using reasonable simplifying assumptions and then reasonably-conservative assumptions of how much money could be earned from employee parking, whenever it is not being used by an employee. The results from three cases (“Baseline”, “Worse”, and “Better”) are shown.

Twenty six back up slides appear, but they are NOT part of the presentation.
COVID-19 Lessons Learned (Or Not)

1. Bad things *can* happen*

2. Ignoring science can be deadly

*Suffering from childhood catechism? Catechism fix: If there is a God, he or she will **NOT** protect us from physics.

*Say this 10 times daily for moderate relief 😊*
6 Painful Facts

1. To avoid climate destabilization (human extinction), industrialized nations must reduce their Greenhouse Gas (GHG) emissions by 80%, by 2030

2. Congress-member Ocasio-Cortez: “World’s gonna end in 12 years . . . “ (2030 target meant she had a point!)

3. Cars are the biggest category of GHG emissions

4. Internal combustion engine cars last 15 years

5. We will not have a sufficiently-electrified fleet by 2030

6. We must reduce vehicle-miles-travelled (VMT)
Eliminating the Harm of Bundled-Cost or Bundled-Benefit Parking

- Definitions of Parking Systems
- New System: *Dividend-Account Parking*
  - Motivations for change
  - Definition and features
  - A demonstration project

Mike Bullock
mike_bullock@earthlink.net
760-754-8025
A Bundled-Cost Parking System

The most common of all parking systems. Erroneously called “free”

The cost of the parking is contained within some other payment, such as:

• Rent
• Train fare (at least 1 train station with so-called “free” parking)
• Price of consumer items, including food
A Bundled-Benefit Parking System

The 2\textsuperscript{nd} most common of all parking systems. Erroneously called “free”

The parking is part of a benefit package being provided, such as:

- Compensation for work
- Public education
- Public anything, such as a library or park
The harm of a *Bundled-Cost* or a *Bundled-Benefit* car-parking system is that they take *money* from people without their knowledge or consent.

**These systems also increase the choice to drive alone.**

Sierra Club Resolution: *Appropriate pricing of parking is the least costly way to reduce vehicle miles travelled.*
Bundled-Cost or Bundled-Benefit systems should be replaced with the DAP Car-Parking system!

Dividend Account Parking (DAP)

Brief System Definition

1. Automated (nothing to do; just park and run)
2. Value-priced, with a congestion-pricing option
3. Earnings (AKA “Dividends” or “Financial Support”) go to the people for whom the parking is built (for example, employees)
4. Cars must be recognizable & associated with an Account
5. Parking is available to all ("Shared Parking") driving such a car
From the California Democratic Party (CDP) 2018 Platform

Transportation Sub-Plank Statement

• Work for shared, convenient, and value-priced parking, operated with a system that provides financial support to those paying higher costs or getting a reduced wage, due to the cost of providing the parking  Note: this is DAP!
Motivation for Change, 1 of 4

Cars and Light-duty vehicles (LDVs) emit the most GHG of any category

Cars and light-duty trucks: 41%
Motivation for Change, 2 of 4

- Fleet Efficiency *Will Not Come Soon Enough*, as shown in this peer-reviewed report:

Driving as much as we did in 2005 might seem nice, but these % ZEV jumps are not possible.

Air Resources Board Mary Nichols has a nice electrification schedule but it would require a very difficult reduction in driving.

Difficult but possible
### Motivation for Change, 4 of 4

Requirements to Achieve the Needed **32% Reduction** in Per-Capita Driving, With Respect to 2005

</table>
Conclusion & Path Forward

• A big part of the needed 32% reduction will need to come from car-parking reform.

• The first step will be a simplified demonstration project of a Dividend Account Parking System at a work location.

• A proposal is now be presented.
A Dividend-Account Parking System for Oceanside’s Civic Center Garage

A System to Eliminate the Harm of Bundled-Benefit Car Parking for City Employees
300 North Coast Highway

- Top-Level Outcome & Overview
- Some Top-Level Calculations
- Who gets to use the system
- Overcoming problems & perceptions
- Outcomes of a new incentive
- Cash flow (“Hey, where does the $$ come from?”)

Mike Bullock
mike_bullock@earthlink.net
760-7548025

EUEC 2020
Top-Level Outcomes

• Employees that drive every day break even (Lose no money!)

• Employees that don’t drive every day get paid to not drive (Make more money!)

• Fewer employees drive, reducing Greenhouse Gas (GHG) emissions (Less GHG!)
Overview

• Fully-automated parking system, implemented by a 3rd-party vendor (RFP selection process)
• operated for the financial gain of employees
  – Earnings = Money Generated Minus Vendor Earnings
  – Earnings go to employees
• Price is cost per minute
  – Such as 1.85 cents per minute (= $1.11 per hour)
• An employee’s Earnings (“Dividend”) is proportional to their time spent at work
Calculations of an Employee’s Earnings

• An employee’s earning is proportional to time spent at work (automatic collection of enter/exit times, using employee RFID)

<table>
<thead>
<tr>
<th>Definitions to Compute an Employee's Monthly Earnings</th>
</tr>
</thead>
<tbody>
<tr>
<td>$T_{\text{Employee}}$</td>
</tr>
<tr>
<td>$T_{\text{AllEmployees}}$</td>
</tr>
<tr>
<td>$E_{\text{AllEmployees}}$</td>
</tr>
</tbody>
</table>

Employee Earnings = $E_{\text{AllEmployees}} \times \left( \frac{T_{\text{Employee}}}{T_{\text{AllEmployees}}} \right)$
“Add In” Payment so Those that Drive Every Day Will Lose No Money

Note: This is for an individual employee, “Joe”

Joe’s Parking Payment =

Joe’s Earnings – Price per Minute x Minutes Joe Parked + Joe’s “Add In”

“Add In” is zero, unless it must take on a positive value so that Joe loses no money

“Add In” payments will be easily covered by Dividend Account Parking parkers that are not employees.
Charge, Earnings, & Add-In, Payment
For Each Employee

• **Charge**
  – Total Minutes Parked x Cost per Minute

• **Earnings**
  – As shown on earlier slide (proportional to employee’s time spent at work)

• **Add-In**
  – Zero, unless **Charge** > **Earnings**
  – If **Charge** > **Earnings**, **Add-In** = **Charge** – **Earnings**

• **Payment** = **Earnings** – **Charge** + **Add-In**
Who Gets To Use Dividend-Account Parking

• **Anyone** (not necessarily an employee) driving a car registered in the system
  – There is a person with an account associated with the car
  – The car will be identified
    • License plate reader and/or
    • RFID tag not needed
  – Account can be established on the spot, in less than 5 minutes: credit card info and license number
Employee Behavior 1 of 2

Employees Must Park in Their Parking Lot if they Drive to Work

Measures to Reduce “Cheating” = Parking in the Neighborhood

• Soft, pre-emptive measure: messaging
  – **Perceived integrity** is every employee’s responsibility
  – **Insufficient perceived integrity** can cost employees
    • Reduced chance of promotion
    • Smaller pay raises
    • More chance of terminated employment
  – Parking free in the neighborhood will not be tolerated
  – The City wants to be a good neighbor: this is the reason for off-street parking ordinances

Russ was worried!
Employee Behavior 2 of 2

Employees Must Park in Their Parking Lot if they Drive to Work

Measures to Reduce “Cheating” = Parking in the Neighborhood

• Soft, pre-operational measure: data collection
  – Operate the system for a time, perhaps even a year, before actually collecting or distributing money
  – Self-identified non-drivers are recognized, thanked, and asked to provide details as to how they are getting to work without driving

• Soft, In-Operation Mode: New non-drivers are thanked and interrogated as to how they do it

• Hard: cameras or RFID sensors can identify employees walking into the work perimeter from the neighborhoods
Hard-to-Not-Drive Example
Fictional, Simplified Case with Pricing and Payout Considered per Day, Page 1

• Employment Center (factory and office)
• Outside Hemet, California
• 100 employees; parking lot has 100 spaces
• No Transit, 110 degree temperature with poor roads for biking, culture of not car-pooling
• Before installing
  – 99 drive
  – 1 bikes
Hard-to-Not-Drive Example
Fictional, Simplified Case with Pricing and Payout Considered per Day,  Page 2

• Dividend-Account Parking charges $10/day
• After installing
  – 99 drive
  – 1 bikes
• Total collected each day: $990
• Each employee gets $9.90 earnings per day ($990/100)
• Each driver loses 10 cents per day
• The “crazy” bike rider gets $9.90 per day extra

Hey, isn’t this an improvement? I would say the “crazy” bike rider is earning his money!

If another employee bikes, the drivers would lose 20 cents per day and the bike riders would get $9.80 per day. If the company president rented out the 2 extra spaces for $10 per day, the drivers would lose nothing and the bike riders would get $10 per day. Biking would increase by 100%! What’s wrong with that?
Results of 3 Actions, Including Cash-out
Case (#1), Reference Patrick Siegman’s article in Bicycle Pedestrian Federation

- Company: CH2M Hill
  - Location: Bellevue, WA (Seattle suburb)
  - Engineering Firm with 430 employees

- Actions
  - $54/month (1995 $’s), to not drive
  - Improved Transit
  - Improved Bike/Ped facilities

Money Flow Calculations

Simplifying Assumptions

1. All workers are at this location for 9 hours, each day they report to work (8 hours of work and 1 hour for lunch)
2. All workers work 8 AM to 5 PM
3. Evening hours are 5 PM to 9 PM
4. All workers that work on week-ends also work on week days, for a total of 7*9 = 63 hours at the work location per week

Measures to Get 32%

- Predictions, Regional Transportation Plans 10%
- Stop expanding most roads and all freeways 2%
  - No need, Eliminate congestion with less driving 2%
- Reallocate freeway-expansion $$$ to transit 2%
- Payment methods, to increase fairness & choice 2%
  - Demonstration projects: Dividend-Account Parking 2%
  - Legislation 2%
    - Replace Bundled-Cost or Bundled-Benefit Parking 8%
    - Equitable and environmentally-sound road-use fees 8%
- Smarter growth, complete streets, bike classes 2%
Climate Literacy

THEREFORE BE IT RESOLVED, that the California Democratic Party reinforces the need for all high school students to know, before they graduate, and elected officials to know, acknowledge, and address, as soon as possible, (1) both the existence of and the reason for anthropogenic climate change; (2) its potential for harm; (3) the difference between stabilizing the climate at a livable level and destabilization; (4) science-based, climate-stabilizing, GHG reduction targets; (5) the primary variables and considerations in identifying those targets and (6) the approximate amount of life style and technology change required to achieve those climate-stabilizing targets.
The City could have the vendor operate the system, for the first 10 years. Over those years, the vendor would be motivated to debug the system and continue to look for operational efficiencies. The vendor could receive 10% of the revenue, for the first 5 years; 5% of the revenue, for the next 3 years; and 2%, for the final 2 years. If 600 cars are parked for 8 hours, 200 days per year, at 50 cents per hour, then the yearly revenue would be $480,000. The vendor would collect $240,000 over the first 5 years, $72,000 over the next 3 years, and $28,800 over the last two years.
How Bad Could It Get?

Governor Brown to the Pope:

*Humanity must

Reverse Course*  or  Face Extinction

*Must be quantified
Climate Data

• Keeling Curve:
  http://en.wikipedia.org/wiki/An_Inconvenient_Truth#Scientific_basis

Burning a gallon of gasoline releases about 19 #'s of CO2!
Likewise
A barrel of oil, about 700 #'s
A ton of coal, about 3 tons
Etc.
Our Climate Crisis

![Temperature and CO₂ Records](chart.png)

**S-3-05 Achievement Outcomes**
- X% chance > 4 (Extinction?)
- 30% chance > 3 (very bad)
- 50% chance > 2 (bad)

Current Level of CO₂ is 400 PPM

S-3-05’s goal is to cap CO₂ at 450 PPM
Our Climate Crisis

- Earth & Space Research (ESR) website: http://www.esr.org/outreach/climate_change/mans_impact/man1.html

Current level = 400 PPM

S-3-05’s Goal is to cap CO2 at 450 PPM, which is off this chart.

Start of Industrial Revolution

EUEC 2020
We must stabilize the value of the earth’s atmospheric CO2_e

CO2_e Emissions

\[ E_N + E_A + E_{WFB} \]

- **Natural**: rotting, fire, digestion, respiration
- **Anthropogenic**: combustion of fossil fuel, methane, other
- **Warming Feed Back**: such as methane from melting permafrost

Sequestration (Photosynthesis)

- \( \geq \) Positive Slope
- \( = \) Zero Slope
- \( \leq \) Negative Slope

Growth of plants on Earth

If Anthropogenic emissions were to be sufficiently low (80% below 1990 levels has been allocated to developed countries), the slope would be zero, thus capping the value of the Earth’s atmospheric CO2_e

The Warming Feed Back term is the wild card. It must not become dominant.
Motivation for Change

• Fairness to individuals
  – Costs no longer hidden
  – Costs avoided or recovered, by not using parking

• Less driving, to reduce environmental harm
  – Motivates choosing alternative modes
  – Less driving to find parking

• Cost Effective Development
  – Less parking needed reduces land and building costs
Goals, 1 of 2

• One agency operates all parking
• Nearly all parking is shared
• Parking costs are effectively unbundled
  – From wages and rents
  – From costs of goods and services
• No change to how parking gets built
  – Generally, municipalities require & developers build
Goals, 2 of 2

• Priced right
  – Value Priced: Base price derived from costs
  – Driver demand determines a congestion price

• No need to search for parking
  – Directions to parking that meets user’s needs
  – Accurate price predictions

• Each parking space’s use is archived
  – Supports informed decisions

• Privacy and the needs of the disabled are supported
Definitions and Methods, 1 of 6

• Definition & Examples of *Parking Beneficiary Group*
  – Owners
    • Private investors or governments operating public parking
  – Those losing money due to provided parking
    • Employees
    • Apartment renters or condominium owners
    • Hotel or restaurant patrons
    • Shoppers
  – Those offered specific parking
    • Driving-age students at a school with parking
    • Driving-age train riders using a station with parking
Definitions and Methods 2 of 6

• How to Effectively Unbundle the Cost or the Benefit
  – Price charged per minute
    • Base price rate established to cover all costs
    • Congestion price rate
      – Dynamically set as a function of occupancy rate
      – Charge is time average, if rate changes, while car is parked
  – Parking generally available to all drivers
  – Earnings distributed to members of **Beneficiary Group**
    • Calculation of individual’s earnings depends on situation
• Calculation of monthly earnings
  – If parking is provided for several groups, each group’s portion of the earnings is proportional to its original contribution to cost (Mixed use case)
  – Each beneficiary group’s total is divided up among its members
    • Condominium owners: proportional to spaces effectively purchased
    • Renters: proportional to spaces effectively renting
    • Shoppers: proportional to money spent
    • Employees or students of driving age: proportional to time spent at work or school
    • Train riders of driving age: proportional to time spent on round trips
For congestion pricing, define **Cluster of Parking**
- 20 to 40 contiguous spaces nearly equal in desirability
- Assigned the same price

**Pricing**
- Base price
  - Covers all costs
    \[ r_{Baseline\, Hourly} = \frac{(r_{Investment} \times v_{Parking}) + c_{YOPD}}{(r_{Hours\, Per\, Year} \times f_{TO})} \]
  - Report’s Page 13 & 14 provides details
- Congestion price, for each cluster
  \[ r_{Hourly\, Rate} = r_{Baseline\, Hourly} \times \left(B^{(30-v)/5}\right), \text{ for } V < 30; \ r_{Baseline\, Hourly}, \text{ otherwise} \]
  - \( B \) is nominally 2; adjusted to keep vacancy above 15%
  - \( V \) is the vacancy % rate (Report’s Eq. 2, Table 2, Pages 14 & 15)
Definitions and Methods, 5 of 6

• Pricing predictions
  – For any set of dates, start times, durations, and destinations
  – Availability of predictions
    • Broadcast into navigational units
    • Website or phone
• Help to find desired parking
  – Driver gives times and locations and stipulates . . .
    • Max price, to get space at minimum walk distance
    • Max walk distance, to get space at minimum price
  – Voice-activated navigational system for ease and safety
Definitions and Methods, 6 of 6

- Monthly statements
  - All parking charges and earnings
    - First, within state
    - Then, within nation
    - Finally, within North and South America
  - Customer selects presentation detail
    - Less detail for ease and more privacy
    - More detail to know and adjust parking decisions
  - Packaged with other statements
    - All utilities, transit use, road use
Implementation Plan, 1 of 3

• Prototype design
  – Most likely a Climate Action Plan Mitigation Measure
• Requirements document to support request for proposal (RFP)
• Winning proposal leads to design
  – Hardware selection and design
  – Software generation
• Prototype installation
  – Most likely a Climate Action Plan Mitigation Measure
  – Debug
  – Adjustments to satisfy stakeholders
Implementation Plan, 2 of 3

- Government agency develops and executes full installation strategy
  - To minimize impact on institutions
  - To maximize early success and driving reductions
    - Large employment centers with “free” parking
    - Train stations with large, “free” parking lots
  - Supported by new law that requires cooperation but very little effort, from . . .
    - Private and public institutions
    - Individuals
Implementation Plan, 3 of 3

• Basis for a new law supporting installations
  – To provide equal protection of the law
    • Government has required parking for 50 years
    • Those driving less than average often lose money
  – Prototype will have demonstrated feasibility
  – Global warming considerations show subsidized parking to be a public nuisance
    • Global warming will likely cause a human catastrophe
    • Short term strategies are critical
    • Electric cars and getting most electricity from renewables will take decades
    • Properly pricing parking is relatively cheap and quick (5 years)
## Unbundle Flow Diagram Definitions

<table>

ATTACHMENT 1 ............................................................................................................................14
I. INTRODUCTION

The City of Encinitas, or one of the other entities shown above, may want, at some future date, to request information that will aid in the selection of a vendor for a possible Dividend-Account Car-Parking System Demonstration pilot on behalf of the themselves and other entities, such as Oceanside, Carlsbad, Encinitas, Solana Beach, and Del Mar, the United States Marine Corps Base at Camp Pendleton, and the North County Transit District (collectively referred to as “Partners”). The Partners may seek to evaluate the benefits, effectiveness, and popularity of a Dividend-Account Car Parking System for employees in the north coastal region of San Diego County through the operation of a temporary pilot program lasting from twelve (12) to thirty-six (36) months. It could become the goal of the Partners to determine whether permanent Dividend-Account Car-Parking systems would be successful in our region based on the outcome of a pilot program. Partners may decide to be actively coordinating with the San Diego Association of Governments (SANDAG), the agency that may be leading regional Dividend-Account Car-Parking Systems coordination around topics including data collection and monitoring, public outreach, policy/regulations. The partners are more likely to want to proceed if there is an identified interest on the part of vendors to respond to an actual RFI. To save time, the rest of this document is written as if one of the Partners has already decided to issue an RFI. However, that is not currently the case. This document, perhaps best described as Request for Indication of Interest has been adapted from a dock-less bike share RFI. Thank you for considering this concept. Please indicate if you would be interested in designing and operating such a system.

Mike Bullock

Oceanside, CA 92054
760-754-8025; Cell: 760-421-9482

A. Location

The study area includes the cities of Oceanside, Carlsbad, Encinitas, Solana Beach, and Del Mar, and the United States Marine Corps Base at Camp Pendleton, all of which are located in northern San Diego County along the coast. The region has a mild climate with average temperatures ranging from the mid-60s in the winter to mid-80s in the summer. The terrain is relatively flat along the coast, particularly when traveling in the north-south directions. Each of the cities have dense urban centers of varying sizes with grid street plans and relatively flat terrain. Generally, most of the cities in the study area have more hilly terrain and a suburban layout east of Interstate 5 (I-5). The combined population of the cities is approximately 365,000 and the combined geographical area of the cities is approximately 106 square miles. Highway 101 runs along the coast through each of the cities for a contiguous distance of approximately 20 miles. Highway 101 is one of the most popular bicycling routes in the San Diego region. North County Transit District (NCTD) operates two rail lines and 34 bus routes throughout North County. Thirteen rail and/or bus transit centers are located within the study area. Total annual NCTD ridership is approximately 10.7 million passengers. The Camp Pendleton Marine Corps base is located just north of Oceanside and serves as a major employer for both enlisted and non-enlisted personnel. The southwest corner of the base adjacent to Oceanside Harbor and west of I-5 features relatively flat terrain and could benefit from increased biking connections.

1. SANDAG Current Estimates, 2016
2. U.S. Census Bureau, 2015

### B. Background

The cities in the North County coastal region of San Diego County are increasingly aware of the need to reduce local greenhouse gas (GHG) emissions to limit the effects of climate change.
while offering viable transportation alternatives to driving alone. Many of the cities have adopted Climate Action Plans (CAPs) or are in the process of developing CAPs. CAPs establish environmental initiatives by which cities aim to achieve GHG emissions reduction goals and targets. Transportation, especially travel via single occupancy vehicle, is a major source of GHG emissions in North County. Facilitating safe, convenient, and affordable alternative transportation options is often a component of these plans and initiatives. Car parking systems that increase economic fairness and choice, compared to bundled-employee-benefit car parking systems (erroneously called “free parking”) at places of employment will reduce single occupancy vehicle (SOV) commuting and increase the need for first/last mile solutions. For this reason, this RFI will be provided to those firms that would benefit from increasing the demand for first/last mile solutions.

The Marine Corps Mobility Transformation Strategy calls for demonstration projects at installations like Camp Pendleton to meet official business mobility with capabilities that are smarter, more efficient, more accessible, and cheaper.

Partners will seek to coordinate with SANDAG on Dividend-Account Car-Parking Systems data analysis while ensuring the selected Dividend-Account Car-Parking Systems vendor can meet data sharing requirements that assist in quantifying the impacts of Dividend-Account Car-Parking Systems on vehicle miles traveled (VMT), access to transit, economic development, and other benefits.

Offering and promoting programs, like Dividend-Account Car-Parking Systems, that replace vehicle trips with active transportation and/or transit trips, is one of the ways the Partners can help to reduce emissions while offering more efficient and more affordable transportation modes for residents, employees, and visitors. A Dividend-Account Car-Parking System is a system which operates employee car parking for the financial gain of the employees by value-pricing the parking and distributing the earnings, which are the revenue minus a fair cost of operation, among employees. The earnings are provided in proportion to the time an employee spends on the work premises. There may also be an “add in” payment provided by either the employer or from a grant, such as a Greenhouse Gas Reduction Fund (GGRF) grant, sized so that an employee that continues to drive every day will lose no money under the system. This system will in effect pay each employee an additional amount of income for each day they get to work without relying on the single occupancy vehicle (SOV) mode. See Reference 1 for more details on the Dividend-Account Car Parking System. The References are listed at the end of Section II, Request for Information.

C. Purpose and Objectives of the RFI

The purpose of this Request for Information (RFI) is to identify vendors with the resources to pilot a Dividend-Account Car-Parking System program in the Partners’ jurisdictions, in accordance with the objectives set forth in this RFI.

The Partners seek a qualified vendor to design, establish, implement, operate, and maintain an innovative, valuable, and mutually-beneficial Dividend-Account Car-Parking System pilot program. The pilot should enable and encourage residents, employees, and visitors to affordably and conveniently travel by car pool, transit, active transportation or some combination of these modes. The pilot should also facilitate a decrease in vehicular parking demand, vehicular traffic, and (GHG) emissions, while promoting active and healthy transportation options.
Qualified vendors are invited to submit proposals based on the information provided in this RFI.

This RFI is a mechanism for gathering information and does not constitute a binding procurement process, however, selection of goods and/or services may result from information obtained through this RFI process, where deemed appropriate. The Partners, jointly or individually, are not obligated to make an award or issue a Request for Proposal as part of this process. In addition, the Partners, in their sole discretion, may decide to engage in direct question and answer sessions with one or more vendors and may decide to enter into an agreement or issue permits based upon those discussions/interviews or a resulting proposal.

If a single demonstration pilot project or multiple demonstration pilot projects were successful, given the severity of our anthropogenic climate change crisis, it is anticipated that other employers will decide to install Dividend-Account car-parking systems. Since municipal governments are required under CEQA to adopt General Plan Updates (GPUs) that include, perhaps using a Climate Action Plan, a set of enforceable measures that will achieve climate-stabilizing targets, and since cars and light-duty trucks (LDVs) are the largest category of GHG emissions, it is further anticipated that municipal governments will, over time, update their off-street parking ordinances to include requirements for Dividend-Account Car Parking systems. Reference 2 shows that this system is adaptable to all types of parking. A selected vendor would have access to a market of more than 365,000 residents living in the north coastal region, more than 135,000 employees that work in the region, and others that visit the region for leisure.

Potential Dividend-Account Car-Parking Systems program marketing opportunities may include, but are not limited to: being listed as a preferred vendor on the Partners websites, co-branded sustainability campaigns, signage, event sponsorship, press releases, and social media announcements.

D. Obtaining RFI Documents

The website for this RFI and related documents is: PlanetBids (http://www.encinitasca.gov/bids). All correspondence will be posted on the PlanetBids website. It is the responsibility of Proposers to check the website regularly for information updates and RFI clarifications, as well as any RFI addenda. To submit a proposal, a Proposer must be registered with the City of Encinitas as a vendor. To register as a vendor, go to the following link (http://www.encinitasca.gov/bids), and then proceed to the “New Vendor Registration” link. All addenda will be available on the PlanetBids website.

E. RFI Contact

The City of Encinitas will receive questions and information requests on this RFI up to 5:00 p.m. on some TBD Month “n”, 2018. All questions regarding the RFI documents shall be submitted through PlanetBids. All project correspondence will be posted on the PlanetBids website. It is the responsibility of the Proposers to check the website regularly for information updates, clarifications, and addenda.

II. REQUEST FOR INFORMATION or REQUEST FOR INDICATION OF INTEREST

This section describes the information being requested by the Partners to learn about prospective Dividend-Account Car-Parking System (“System”) vendors and optionally to select a vendor to operate in the Partners’ jurisdictions. Interested vendors must include all
information outlined below in a submitted proposal.

A. **Dividend-Account Car-Parking System (“System”) Pilot Program Requirements**

Vendors responding to this RFI must describe their proposed system that is capable of providing the following services and shall describe these services in their submission:

1. System pilot program(s), as described in Reference 1, to include the following installed and maintained capabilities:

2. A capability to establish and maintain a database of System Vehicles, System Members, System Parking and System Accounts. A System Account includes the mailing name and address of a person that has agreed to receive payments and pay bills that are the result of the implementation of the System and the actions taken by the person, or some other person driving the System Vehicle or System Vehicles, as described herein. Such a person is a “System Member.” A “System Vehicle” is one that can be identified when it is parked in the System and one that is associated with a System Account and System Member. A System Member may take responsibility to pay for the cost of parking for multiple System Vehicles.

3. A capability to provide an easy method for Employees and others to become System Members by establishing a System Account with their chosen System Vehicles.

4. A capability to provide signage to designate System Parking areas well enough to prevent nearly all accidental entries by unauthorized vehicles, meaning vehicles that are not System Vehicles.

5. A capability to provide written materials to explain to employees and others that may want to become System Members how the System will work and why it is an important improvement to economic fairness and environmental outcomes, assuming a reasonable level of cooperation with the City and other affected groups, such as City vendors and sub-contractors.

6. A capability to operate the system for an agreed-upon amount of time, with no money exchanges, to establish a pre-install database of commute behavior including using questionnaires to determine how non-drivers say they are getting to work.

7. A capability to identify a System Vehicle within a minute of its being parked in a System Parking space and to store the System Vehicle identifier and the time it was recognized as being parked.

8. A capability to recognize when a System Vehicle exits a System Parking space, within a minute and to store the vehicle identifier and the recognized exit time.

9. A capability to identify vehicles that are NOT System Vehicles when they are in the System Parking area and are therefore trespassing, while they are in the System Parking area.

10. A capability to record the start time and end time of the trespassing vehicle’s trespassing, to within an accuracy of 1 minute, as well as its license plate image, sufficient to support a conviction of trespassing.

11. A capability to send the license plate of the trespassing vehicle and its start time and end time of its trespassing to law enforcement officials with 5 minutes of the recorded start time of the trespass.

12. A capability to provide notice and evidence of this trespassing in real time and as stored
information for law enforcement so that they can then ticket and prosecute the owners of any and all vehicles that have been illegally parked in a System Parking space. It is anticipated that this would include the capture and storage of the license plate numbers of the vehicles that are parked in the System Parking lot whenever it is the case that the vehicle is not a System Vehicle.

13. A capability to compute an instantaneous charge rate (cost per minute) for the case of an application of "congestion pricing", whereby an agreed-upon base price is increased by an agreed-upon congestion-pricing algorithm, designed to prevent the occupancy rate from exceeding an agreed-upon upper bound value, such as 90% occupied. An example of such an algorithm is in Reference 2.

14. A capability to compute and store the time that the charge rate changes, for the case of an application of a congestion-pricing algorithm. Note that this time is called the Rate Change Time. At these times, the rate could either increase, by the addition of a car being parked in a System Space or the rate could be decreased, by the subtraction of a car in a System Space.

15. A capability to accumulate a total charge for each System Member, where the total charge is the sum of the products of each parked duration time over which a fixed charge rate applies and the length of that time duration, for all the System Vehicles associated with the System Member, over a month. This total charge is called the System Member Monthly Charge ("SMMC"). Note that the Member may or may not be an employee.

16. A capability to compute the total charges, for all System Members over a month for the System. This amount is the Total System Monthly Charge ("TSMC").

17. A capability to compute a Total System Monthly Earnings ("TSME"), which is the TSMC, reduced by a agree-to amount, such as 5%, where the 5% is taken out of the TSMC to cover the operator's expenses.

18. A capability to record all the times an employee enters and leaves the work premises. One way to do this is to require employees to have an RFID. There may also be an GPS or a license plate reading solution. Note that a privacy requirement will prevent this information from being shared with the employer, for example, with the exception of providing it to a law enforcement person, in the event a warrant is signed by a presiding judge.

19. A capability to use the times an employee enters and leaves the work premises to compute the time, over a month, an employee has spent at or within the work premises. This time is known as the Employee Monthly Time ("EMT").

20. A capability to compute the total time all employees spent at the premises over a month, to be known as the Total Employee Monthly Time ("TEMT").

21. A capability to compute an Employee’s Monthly System Earnings (“EMSE”) as the Total System Monthly Earnings ("TSME"), multiplied by the employee’s Employee Monthly Time, EMT divided by the TEMT. This is also described in Reference 1.

22. A capability to compute an Employee’s Add-In “EAI”, as follows. If the employee’s System Member Monthly Charge, SMMC, value is greater than the employee’s earnings, TSME; then, for that case, the EAI is equal to the employee’s SMMC minus the employee’s TSME. If the employee’s System Member Monthly Charge, SMMC value is not greater than the employee’s earnings, TSME; then the employee’s EAI is equal to zero. This is also described in Reference 1.

23. A capability to accept Employee’s Add-In, EAI money from the Employer, with the
expectation that the money would originate from a grant funded by, for example, the Greenhouse Gas Reduction Fund (GGRF), or could come from the Employer's budget, as a Climate Action Plan (CAP) or other expense. It could also be generated by converting some “free” parking to be a different Account Parking System Parking (System Parking), thereby generating new money to the City.

24. A capability to compute an employee’s monthly payment (“EMP”), as follows: It is equal to the Employee’s Monthly System Earnings, EMSE plus the employee’s Add-In, EAI minus the System Member Monthly Charge, SMMC. This is also described in Reference 1.

25. A capability to automatically send out monthly statements to all System Members. System Members who are not employees will receive a bill if they have parked in the System parking during the month. The bill will then be for the member’s SMMC. Each employee will receive a statement showing SMMC, EMSE, and EAI. If the employee’s EAI is zero, then the employee will receive a payment in the form of cashable check for the employee’s EMP. This is also explained in Reference 1.

26. A capability to protect employee privacy where privacy means that the employee’s data will never be shared, with the sole exception of sharing with law enforcement officials in accordance with a valid court order requesting the data. For example, at no time will the data be shared with other employees, including those working in the management of the employer that is providing the employee parking that is the System Parking.

27. A capability to protect System Member privacy where privacy means that the System Member’s data will never be shared, with the sole exception of sharing with law enforcement officials in accordance with a valid court order requesting the data.

28. A capability to allow visitors, vendors, and others, that are identified by the Company management, to be treated as employees. There could also be “visitor” parking that is not associated with the System.

29. A capability to identify System Vehicles that are parked in the visitor parking or other inappropriate parking places, since it is expected that it will required as a part of City Policy that System Vehicles that are associated with employees will be required to be parked in the System Parking. Since employees are earning money from the System Parking, it would be inappropriate for them to not use the System Parking. This information would be shared with City Management, as soon as it is collected.

30. A capability to perform regular inspection, maintenance, and repair of all System Parking facilities and associated capabilities often enough to eliminate nearly all system failures.

31. A capability to perform vendor-managed methods of enforcement.

32. A capability to have demonstrated secured financial backing with the ability to operate at full capacity for the life of the pilot program and beyond with a sustainable business model.

33. A capability to provide close coordination with all Partners, including real-time sharing of System Parking data collected, active promotion of the Dividend-Account Car-Parking Systems program in coordination with each Partner, and timely response to any complaints received or requests made by the Partners and Dividend-Account Car-Parking Systems users. Describe the type of data that is collected and can be provided to the Partners. Promotion and advertisement of the Dividend-Account Car-Parking Systems program must comply with all Partners’ municipal codes and ordinances.

34. A capability to offer a Dividend-Account Car-Parking Systems program that can be deployed, operated, managed, and maintained by the vendor at no cost, except for the
possibility of the EAI payments, to the Partners and with minimal oversight needed from the Partners.

35. A capability to establish and operated multiple Dividend-Account Car-Parking Systems programs including for for cases other than employee parking, as described in Reference 2, that can be deployed, operated, managed, and maintained by the vendor at no cost, except for the EAI payment, for employee parking, to the Partners and with minimal oversight needed from the Partners.

36. A capability to conform to contract specifications, including general liability insurance, worker’s compensation, automobile liability insurance, indemnification, and termination clauses. Sample contract attached.

B. Proposal Elements

Vendors interested in responding to this RFI must prepare a proposal that includes the following information:

1. Describe how drivers can become System Members.

2. Provide a detailed System maintenance plan.

3. Describe the vendor’s capability to provide data and reports to the Partners, including raw and summarized data. Summarized data could include both user data (e.g., demographics, trip purpose, repeat usage, percent of trips starting and ending in close proximity to transit, mode shift, and transit usage) and trip data (e.g., average trip length, average trip time, trip start and end hotspots, trip path, estimated GHG emissions per trip). Ideally, this data should be provided via a publicly accessible API in your suggested General Dividend-Account Car-Parking Systems Feed Specification (GBFS) format. Describe vendor’s ability to collect quantitative and qualitative data and report out findings from users (e.g. in-app surveys).

4. Describe how the vendor will employ anti-theft and anti-vandalism measures to ensure Systems do not pose a nuisance to the community.

5. Since the establishment of Dividend-Account Parking systems will increase bike usage, describe how the vendor will address bicycle safety concerns, including helmet use, riding at night and other safety concerns that may or may not be regulated by state vehicle codes.

6. Describe how the Dividend-Account Car-Parking Systems program may operate in conjunction with existing bike rental businesses operating in the Partners’ cities.

7. Describe the vendor’s plans for future growth and expansion, including possible anticipated increases in demand for good car parking systems as the public becomes more aware of the threat of anthropogenic climate change and how good systems improve economic fairness, etc.

8. Provide an estimated timeline for a twelve-to-twenty-four-month pilot Dividend-Account Car-Parking System program, including any needed permitting, set-up, promotion, advertising, maintenance and servicing, data delivery to Partners, summary and reporting on the outcome of the pilot program and possible continuation of the program.
9. Describe a recommended minimum Dividend-Account Car-Parking Systems size for the North County Coastal operating area.

10. Describe strategies for effectively educating users on proper System Parking use and the reason that society needs to improve the way we pay for the use of car parking.

11. Describe any approach you would recommend to enhance access and fairness for disadvantaged communities.

12. Describe time required to deploy a Dividend-Account Car-Parking Systems pilot program if selected based on System Parking size, etc.

13. Describe an approach to increasing the use of Dividend-Account Parking to include most city car parking, then across City boundaries, and then across County, State, and international boundaries, with the final system being one wherein nearly all System Vehicles have a single, world-wide, System Account.

III. INSTRUCTIONS

A. Proposal Due Date

Proposals must be submitted electronically no later than 5:00 p.m. on TBD Month 2018 or 2019. Proposals must be submitted electronically via the PlanetBids system used to download the RFI. The maximum file size for submittal is 50 megabytes, and the file type shall be Portable Document Format (PDF). The electronic system will close submissions exactly at the date and time set forth in the RFI or as changed by addenda.

B. Proposal Acceptance

Respondents are responsible for submitting and having their submittal accepted before the closing time set forth in this RFI or as changed by addenda. NOTE: Pushing the submit button on the electronic system may not be instantaneous; it may take time for the Respondent’s documents to upload and transmit before the submittal is accepted. It is the Respondent’s sole responsibility to ensure their document(s) are uploaded, transmitted, and arrive in time electronically. The City of Encinitas will have no responsibility for submittals that not arrive in a timely manner, no matter what the reason. 
C. Page Limit

No submissions exceeding twenty-five (25) pages will be accepted (excluding attachments). In addition, attachments may not exceed twenty-five (25) pages. The City of Encinitas discourages “padding” of proposals with brochures, extensive literature, and boilerplate material not applicable to a pilot Dividend-Account Car-Parking Systems program.

D. Proposal Format

Proposals must be organized in the following format and include the following content:

1. Letter of transmittal signed by an individual authorized to bind the proposing entity stating the firm has read and will comply with all terms and conditions of the RFI.

2. General information about the firm, including the size of the organization, location of offices, number of years in business, organizational chart, name of owners and principal parties, number and position titles of staff.

3. Qualifications of principals, project managers and key personnel who would be assigned to this project. Include their position in the firm, and types and amount of relevant experience operating a Dividend-Account Car-Parking Systems program or similar program. Identify the primary contact that will be the overall project manager. Resumes are not required, but may be included as attachments. The selected respondent may not substitute personnel without written authorization from the Partners.

4. A work plan that establishes the Respondent’s understanding of, and ability to satisfy Partners’ objectives. Respondent shall succinctly describe the proposed approach for implementing a Dividend-Account Car-Parking Systems program, outlining the activities, including innovative ideas that would be undertaken in completing the various tasks and specifying who would perform them.

5. A preliminary estimated schedule for deployment of a pilot Dividend-Account Car-Parking Systems program. Show all critical paths, major milestones, and decision points in pilot schedule.

6. A list of the municipal or other government agencies your firm has worked with during the past three years. Provide the following information for at least one operational system that has at least some of the similar components as would a Dividend-Account Car-Parking System program that is managed by the respondent:

   a) Name, address, and telephone number of the agency;
   b) Time period for the project;
   c) Brief description of the scope of the services provided;
   d) Identify the staff members on the project and their specific responsibilities; and
   e) Person and contact information for a reference.

IV. PROPOSAL EVALUATION

A. Proposal Evaluation
A review committee comprised of representatives from each of the potential Partner cities will judge the merit of proposals received in accordance with the general criteria defined herein. Failure of proposers to provide in their proposal any information requested in this RFI may result in disqualification of the proposal. The sole objective of the review committee will be to select the proposal that is most responsive to the Partners’ needs. The Partners reserve the right to elect to not proceed with a pilot Dividend-Account Car-Parking System program and reject all proposals received through this RFI process.

1. Experience of the vendor and proposed staff. Experience of project staff with similar scope of services. Level of education, training, licensing and certification of staff.

2. Approach to the project. Demonstrated understanding of the Partners’ needs and solicitation requirements. Approach is well organized and presented in a clear, concise and logical manner.

3. Availability and proposed use of technology and methodologies. Quality control and thoroughness is well defined.

4. Capability to Perform. Ability to complete work within deadlines. Availability and continuity of staff during the course of the project, if selected. Unsatisfactory past performance with the City of Encinitas (or any of the Partner cities) may be considered as determined by the City of Encinitas (or any of the Partner cities) in their sole and absolute discretion.

5. Relevant Experience. Experience in performing similar services for organizations of similar size to the Partner cities. Experience with public agencies. Years of experience with these types of services.

B. Final Negotiation

As reflected above, vendor selection will be based on a combination of factors as determined to be in the best interest of the Partners. After evaluating the proposals and discussing them further with the finalists, or the tentatively selected vendor, the City of Encinitas reserves the right to further negotiate the proposed program.

V. CONDITIONS GOVERNING THIS PROCUREMENT

A. Scope Changes, Additions and Deletions

All changes in proposal documents shall be through written addendum and furnished to all proposers. Verbal information obtained otherwise will NOT be considered in the evaluation process.

B. Rejection of Proposals

The City of Encinitas reserves the right to reject any or all Proposals and to waive informalities and minor irregularities in Proposals received and to accept any portion of Proposal or all items of Proposal if deemed in the best interest of the City of Encinitas to do so.
C. Proprietary Information

Any restrictions on the use of data contained within a Proposal must be clearly stated in the Proposal itself. Proprietary information submitted in response to this RFI will be handled in accordance with applicable City of Encinitas Procurement Regulations and the California Public Records Act.

D. Response Materials Ownership

All materials submitted regarding this RFI become the property of the City of Encinitas. Responses may be reviewed by any person at Proposal opening time and after final selection has been made. The City of Encinitas has the right to use any or all ideas presented in reply to this request, subject to the limitations outlined in Proprietary Information above. Disqualification of a proposer does not eliminate this right.

E. Acceptance of Proposal Content

The contents of the Proposal of the successful proposer will become contractual obligations if contractual agreements action ensues. Failure of the successful proposer to accept these obligations in a permit to operate, purchase agreement, purchase order, contract, delivery order or similar acquisition instrument may result in cancellation of the award and such proposer may be removed from future solicitations.

F. Cost of Proposal Preparation

The City of Encinitas shall not be liable for any pre-contractual expenses incurred by any submitting vendor. Each submitting vendor shall protect, defend, indemnify, and hold harmless the City of Encinitas from any and all liability, claims or expenses whosoever incurred by, or on behalf of, the entity participating in the preparation of its response to this RFI. Pre-contractual expenses are defined as expenses incurred by vendors in:

1. Preparing the proposal in response to this RFI;
2. Cost to acquire a permit; and
3. All other expenses incurred by a vendor related to preparation of proposal or establishment of a Dividend-Account Car-Parking System program.

G. Interview

Interviews with the top respondents may be requested. The selection of vendors invited to interview will be solely based on the Partners’ discretion. The vendors asked to interview will be notified in advance.
ATTACHMENT 1

Sample License Agreement for Dividend-Account Parking Services

This License Agreement for Dividend-Account Car-Parking System Services ("Agreement") is made this this day of September 2017, by and between the City of Encinitas ("City") and ___ ("Dividend-Account Car-Parking System Vendor").

RECITALS

1. A goal of City is to provide safe and affordable multi-modal transportation options to all residents, reduce traffic congestion, and maximize carbon free mobility.
2. Dividend-Account Car-Parking System services are a component to help the City achieve its transportation goals and the City desires to make this System available to residents and those who work or otherwise drive and park in the City.
3. Dividend-Account Car-Parking System Vendor proposes to operate a Dividend-Account Car Parking program within the City at an agreed-to location with an agree-to number of System parking spaces within the designated location or locations. As an example, based on Reference 3, there could be 239 spaces designated as System Parking, out of a total of 284 spaces in the Oceanside Civic Center Parking Garage. Note further, that if there are 259 employees that work for the City and are given parking spaces, there would be a need to establish 20 additional System Parking spaces outside of the Oceanside Civic Center Parking Garage.
4. Dividend-Account Car-Parking System Vendor will abide by all City ordinances and rules governing the use of public space.
5. Dividend-Account Car-Parking System Vendor possesses the technology necessary to install, operate, maintain, and expand such a system and multiple systems as demand expands.

AGREEMENT

1. Initial Term. This Agreement is effective for twelve to eighteen months from the date of execution ("Initial Term, Phase 1"), which will include a duration of installation during which no money is exchanged so as to establish a baseline of modal splits for employee commuting, and then a year of full operation to document the modal split changes and an estimated amount of greenhouse gas (GHG) emissions saved by the program. At the conclusion of the Initial Term Phase 1, the Agreement may be extended by mutual written agreement of the parties for an additional two-year term (Initial Term, Phase 2), subject to any new terms agreed between the parties, unless either party notifies the other party of its intent not to continue with the Agreement no later than 30 days before the expiration of the Initial Term, Phase 1 and Phase 2.
2. Exclusive Operator. During the Initial Term’s Phase 1 and Phase 2, the City designates Dividend-Account Car-Parking Systems Vendor as the exclusive provider of the System services within its city limits. This designation is personal to Dividend-Account Car-Parking Systems Vendor and may not be assigned or transferred to any party. This exclusivity provision shall expire and not be renewed past the Initial Term’s Phase 1 and Phase 2 unless agreed in writing by the parties.
3. **Use of City Property.** City authorizes Dividend-Account Car-Parking Systems Vendor to use ("License") City property, including the public right-of-way and System Parking areas that are suitable, solely for the purposes set forth in Section 4 of this Agreement. This authorization is not a lease or an easement, and is not intended and shall not be construed to transfer any real property interest in City Property.

4. **Permitted Use.** Dividend-Account Car-Parking System’s System Members may use City Property solely for parking System Vehicles. The City Property is maintained by the City. Dividend-Account Car-Parking Systems Vendor may operate an agree-to-amount of System Parking places on City Property as set forth in Exhibit A. If at any time during the term of the Agreement Dividend-Account Car-Parking Systems Vendor desires to place additional System Parking within the City limits, Dividend-Account Car-Parking Systems Vendor must request and receive authorization from the city to do so in writing. The City may limit the number of System Parking places upon identifying a potential harm to public health or safety. Dividend-Account Car-Parking Systems Vendor shall not place or attach any personal property, fixtures, or structures to City Property without the prior written consent of City.

   a. Use of City Property and Dividend-Account Car-Parking Systems Vendor's operations within the City, shall, at a minimum: a) not adversely affect City Property or the City's streets, or sidewalks; b) not adversely affect the property of any third parties; c) not inhibit pedestrian or vehicular movement, as applicable, within City Property or along other property or rights-of-way owned or controlled by the City; d) not create conditions which are a threat to public safety and security. Dividend-Account Car-Parking Systems Vendor shall instruct its customers not to park or leave any System Vehicle where they would impede pedestrian or vehicular traffic.

   b. Upon termination of this Agreement by either party, Dividend-Account Car-Parking Systems Vendor shall, at its sole cost and expense, immediately restore City Property to a condition which is visually and structurally indistinguishable from the immediately surrounding area.

5. **System Parking.** The City, at its own discretion, may support the System with the installation of signs and painting to further the orderly operation of the System Parking.

6. **Condition of City Property**

   a. City makes City Property available to Dividend-Account Car-Parking Systems Vendor in an "as is" condition. City makes no representations or warranties concerning the condition of City Property or its suitability for use by Dividend-Account Car-Parking Systems Vendor or its customers, and assumes no duty to warn either Dividend-Account Car-Parking Systems Vendor or the System Members concerning conditions that exist now or may arise in the future.

   b. City assumes no liability for loss or damage to Dividend-Account Car-Parking Systems System Members. Dividend-Account Car-Parking Systems Vendor agrees that City is not responsible for providing security at any location where Dividend-Account Car-Parking Systems Vendor's System Vehicles are parked, and Dividend-Account Car-Parking Systems Vendor hereby waives any claim against City in the event Dividend-Account Car-Parking System's System Vehicles or other property are lost, stolen, or damaged.

7. **Maintenance and Care of Portion of City Property;** Dividend-Account Car-Parking Systems Vendor shall be solely responsible for: (i) maintaining City Property to the City standards applicable for use by the Dividend-Account Car-Parking Systems Vendor as
permitted under Section 3; and (ii) obtaining from the City any applicable permits or approvals required by the City. Dividend-Account Car-Parking Systems Vendor shall exercise due care in the use of City Property and shall be responsible for maintaining City Property in good condition and repair. Dividend-Account Car-Parking Systems Vendor shall not act, or fail to act, in any way that result in excessive wear or damage to City Property. Dividend-Account Car-Parking Systems Vendor expressly agrees to repair, replace or otherwise restore any part or item of real or personal property that is damaged, lost or destroyed as a result of the Dividend-Account Car-Parking Systems Vendor's use of City Property. Should the Dividend-Account Car-Parking Systems Vendor fail to repair, replace or otherwise restore such real or personal property, Dividend-Account Car-Parking Systems Vendor expressly agrees to pay City's costs in making such repairs, replacements or restorations. The obligations under this Section apply to all City facilities, infrastructure, or appurtenances located on City Property.

8. Operations & Maintenance. Dividend-Account Car-Parking Systems Vendor will cover all maintenance costs for the System and maintenance to minimum level of service and reporting outlined in Exhibit A.

9. License Fee. The parties intend to agree to a license fee before the Agreement may be extended beyond the Initial Term.

10. Indemnification. Dividend-Account Car-Parking Systems Vendor shall defend, pay, indemnify and hold harmless City, its officers, officials, employees, agents, invitees, and volunteers (collectively "City Parties") from all claims, suits, actions, damages, demands, costs or expenses of any kind or nature by or in favor of anyone whomsoever and from and against any and all costs and expenses, including without limitation court costs and reasonable attorneys' fees, resulting from or in connection with loss of life, bodily or personal injury or property damage arising directly or indirectly out of or from or on account of:

   a. Any occurrence upon, at or from City Property or occasioned wholly or in part by the entry, use or presence upon City Property by Dividend-Account Car-Parking Systems Vendor or by anyone making use of City Property at the invitation or sufferance of Dividend-Account Car-Parking Systems Vendor, except such loss or damage which was caused by the sole negligence or willful misconduct of City.

   b. Use of Dividend-Account Car-Parking Systems Vendor's System Parking by any individual, regardless of whether such use was with or without the permission of Dividend-Account Car-Parking Systems Vendor.

11. Insurance. Dividend-Account Car-Parking Systems Vendor shall procure and maintain for the duration of this agreement insurance against claims for which Dividend-Account Car-Parking Systems Vendor has indemnified the City pursuant to Section 10 of this Agreement. Dividend-Account Car-Parking Systems Vendor shall maintain general liability and automobile liability insurance policies with limits of no less than one million dollars ($1,000,000.00) per occurrence for bodily injury or death, personal injury and property damage, and two million dollars ($2,000,000.00) aggregate. Each insurance policy shall name the City as an additional insured and it shall be endorsed to state that:

   (i) coverage shall not be suspended, voided, or cancelled by either party, or reduced in coverage or in limits except after thirty (30) calendar days prior written notice by certified mail, return receipt requested, has been given to City; and (ii) for any covered claims, the Dividend-Account Car-Parking Systems Vendor's insurance coverage shall be primary insurance as respects the City and any insurance or self-insurance maintained by the City shall be in excess of the Dividend-Account Car-Parking Systems Vendor's
insurance and shall not contribute with it. The insurance required to be provided herein, shall be procured by an insurance company approved by City, which approval shall not be unreasonably withheld. Additionally, before Dividend-Account Car-Parking Systems Vendor shall employ any person or persons in the performance of the Agreement, Dividend-Account Car-Parking Systems Vendor shall procure a policy of workers' compensation insurance as required by the Labor Code of the State of California, or shall obtain a certificate of self-insurance from the Department of Industrial Relations.

12. Compliance with Law. Dividend-Account Car-Parking Systems Vendor at its own cost and expense, shall comply with all statutes, ordinances, regulations, and requirements of all governmental entities applicable to its use of City Property and the operation of its System program, including but not limited to laws governing operation of vehicles. If any license, permit, or other governmental authorization is required for Dividend-Account Car-Parking Systems Vendor's lawful use or occupancy of City Property or any portion thereof, Dividend-Account Car-Parking Systems Vendor shall procure and maintain such license, permit and/or governmental authorization throughout the term of this Agreement. City shall reasonably cooperate with Dividend-Account Car-Parking Systems Vendor, at no additional cost to City, such that Dividend-Account Car-Parking Systems Vendor can properly comply with this Section and be allowed to use City Property as specified in Section 4, above.

13. Business License. Dividend-Account Car-Parking Systems Vendor is required to obtain and maintain a City Business License during the duration of this Agreement.

14. Required Reports. Dividend-Account Car-Parking Systems Vendor shall provide reports to the City concerning utilization of its System Parking not less than monthly, and shall cooperate with the City in the collection and analysis of any aggregated data concerning its operations.

15. No Joint Venture. Nothing herein contained shall be in any way construed as expressing or implying that the parties hereto have joined together in any joint venture or liability company or in any manner have agreed to or are contemplating the sharing of profits and losses among themselves in relation to any matter relating to this Agreement.

16. Termination. This Agreement may be terminated prior to the expiration date set forth in Section 1, above, upon the occurrence of any of the following conditions:

   a. Upon delivery of written notice from City to the Dividend-Account Car-Parking Systems Vendor terminating this agreement for any reason, or for no reason, by giving at least sixty (60) days' notice to the Dividend-Account Car-Parking Systems Vendor of such termination.

   b. An attempt to transfer or assign this Agreement.

Dividend-Account Car-Parking Systems Vendor shall not terminate this Agreement without first by giving at least 180 days' written notice of plans for termination.

17. Amendment. This Agreement may be amended by mutual agreement of the parties. Such amendments shall only be effective if incorporated in written amendments to this agreement and executed by duly authorized representatives of the parties.

18. Applicable Law and Venue. The laws of the State of California shall govern the interpretation and enforcement of this Agreement. Any action to interpret or enforce the terms or conditions of this Agreement shall be brought in the Superior Court for the County of San Diego, or in the United States District Court for the Southern District of California. Dividend-Account Car-Parking Systems Vendor hereby waives any right to remove any such action from San Diego County as is otherwise permitted under
California Code of Civil Procedure Section 394.

19. **Counterparts.** This Agreement may be executed simultaneously or in any number of counterparts, each of which shall be deemed an original, but all of which together shall constitute one and the same agreement.
IN WITNESS WHEREOF THE PARTIES HERETO have executed this Agreement on date first above written.

Description of Dividend-Account Car-Parking Systems Vendor’s Service Level Agreement

The following performance indicators shall be met and reported to help the City measure our success serving its citizens and improving the livability and mobility of Encinitas. Dividend-Account Car-Parking Systems Vendor will maintain its System in an excellent state of functionality and repair, with a minimum of error-free operation 95% of the time.

Support for a Road Use Charge (RUC) that Protects Privacy and the Economic Interests of Low-Income Drivers

WHEREAS, (1) greenhouse gas (GHG) emissions must be significantly reduced by 2030; (2) about 40% of California’s GHG is emitted by on-road vehicles; and (3) even given the most ambitious estimates for fleet efficiency and fleet electrification, to support climate-stabilization requirements, it will be necessary to reduce per-capita driving; and furthermore,

WHEREAS, (1) California’s current road-use fees (our gas tax, our toll roads and our bridge-use tolls) do not cover the full cost of operating and maintaining roads; (2) having the full cost of road use hidden from users increases driving, thus adding significantly to air pollution, congestion, sprawl, and GHG emissions; (3) an assessment conducted by the California Transportation Commission (CTC) found that 58 percent of our state’s roads are in need of maintenance, 20 percent of our bridges need major or preventive maintenance, and 6 percent of our bridges require replacement; (4) a RUC has been shown to be feasible by the CTC; and (5) construction jobs are needed; and finally,

WHEREAS, (1) our gas tax is our most significant road-use fee; (2) state-mandated increases in battery-electric vehicles reduces gas-tax revenue; (3) a gas tax is inherently regressive because low-income drivers tend to drive older cars; and (4) a gas tax does not account for time, place, driver income, vehicle weight, vehicle pollution level, or instantaneous roadway congestion;

THEREFORE, BE IT RESOLVED, that the San Diego County Democratic Party supports researching a road-use charge (RUC) pricing and payout system that (1) would cover all road-use costs; (2) would protect the economic interests of low and middle-income drivers by use of a progressive price structure that also recognizes the needs of rural drivers; (3) would protect privacy by requiring a search warrant to obtain location or travel information; (4) would include an instantaneous congestion-pricing algorithm; (5) would ensure that the per-mile price incentive to drive energy-efficient cars would still be sufficient to support necessary fleet electrification; and (6) would send earnings to those losing money under the current system.

BE IT FURTHER RESOLVED, that this support be communicated as a co-sponsor for the resolution sent to California Democratic Party (CDP) Resolutions Committee and Platform Committee.

Mike Bullock, 76 AD, 760-754-8025, mike_bullock@earthlink.net
DEMCCO adopted a similar resolution in 2014 and supports this resolution.
Endorsed by Rob Howard, Oceanside Mayoral Candidate, SD Labor E-Board, Former North County NAACP President; Nora Vargas SDC BOS D1 Candidate; Kyle Krahel-Frolander, NAC Chair and Oceanside Planning Commissioner (Former Chair); Lela Panagides, Carlsbad City Council Candidate D2
Discussion Draft
CEQA and Climate Change Advisory

I. INTRODUCTION

The role of the California Environmental Quality Act (CEQA)\(^1\) in addressing climate change and greenhouse gas (GHG) emissions continues to be the topic of much discussion. That was true in June 2008 when the Governor’s Office of Planning and Research (OPR) first prepared an advisory on greenhouse gas impacts, and it continues to be true today. Since 2008, there have been developments in statutes, regulations, and science, as well as a growing body of case law focused on addressing climate change and greenhouse gas emissions.

This discussion draft contains initial thoughts on updates to the 2008 advisory. This document incorporates developments since June 2008, including regulatory changes made to the regulations that implement CEQA (commonly known as the “CEQA Guidelines”\(^2\)) in late 2018 by the California Natural Resources Agency (Agency).\(^3\) Although this document largely focuses on project-level analyses of greenhouse gas impacts, Section IV briefly addresses community-scale greenhouse gas reduction plans as one pathway to streamline CEQA analyses. This discussion draft is intended to address some common issues and topics that arise in greenhouse gas emissions analyses under CEQA, but is not intended to address every single issue and topic.

OPR seeks your input on this discussion draft document. In particular, we seek comments on the following:

1. Are there any important points that we missed that we should address?
2. Do you have any suggestions on how to clarify the topics that we did address?

Since this discussion draft addresses the existing provisions in the CEQA statute and Guidelines as well as case law, OPR encourages commenters to focus their input on those directives.

\(^1\) The CEQA statute is found at Public Resources Code section 21000 and following.
\(^2\) The CEQA Guidelines are found at the California Code of Regulations, Title 14, section 15000 and following.
\(^3\) The California Office of Administrative Law (OAL) is currently reviewing the Agency’s rulemaking package for the updates to the CEQA Guidelines. OAL is anticipated to complete its review in late December 2018.
Input may be submitted electronically to comments@opr.ca.gov. Please submit all comments before Friday, March 15 at 5:00 pm.

OPR issues technical assistance on issues that broadly affect the practice of land use planning and CEQA. (Gov. Code, § 65040, subds. (g), (l), (m).) This discussion draft does not alter lead agency discretion in preparing environmental documents subject to CEQA. This document should not be construed as legal advice. OPR is not enforcing or attempting to enforce any part of the recommendations contained in this draft document. (Gov. Code, § 65035 [“It is not the intent of the Legislature to vest in the Office of Planning and Research any direct operating or regulatory powers over land use, public works, or other state, regional, or local projects or programs.”].)

The CEQA Guidelines do not require specific methodologies for determining environmental impacts, prescribe specific thresholds of significance, or require specific mitigation measures. Instead, the CEQA Guidelines acknowledge lead agency discretion in determining the appropriate methodologies, thresholds, and if necessary, mitigation measures that are tailored to the project. Approaches and methodologies for calculating greenhouse gas emissions and addressing the environmental impacts through CEQA review continue to improve and are increasingly available to assist public agencies to prepare their CEQA documents and make informed decisions. Many public agencies—along with academic, business, and community organizations—are striving to determine the appropriate means by which to evaluate and mitigate the impacts of proposed projects on climate change. Once finalized, the purpose of this document will be to provide advice and recommendations, which public agencies and other entities may use at their discretion.

II. BACKGROUND

The impacts of climate change pose an immediate and growing threat to California’s economy, environment, and to public health. Cities and counties will continue to experience the effects of climate change in various ways, including increased likelihood of droughts, flooding, wildfires, heat waves and severe weather. Climate change may result from natural factors, natural processes, and human activities that change the composition of the atmosphere and alter the surface and features of the land. Significant changes in global climate patterns are associated with global warming, an average increase in the temperature of the atmosphere near the Earth’s surface, attributed to accumulation of greenhouse gas emissions in the atmosphere. Greenhouse gases trap heat in the atmosphere, which in turn heats the surface of the Earth. Some greenhouse gas emissions occur naturally and are emitted to the atmosphere through natural processes, while others are created and emitted solely through human activities. The emission of greenhouse gases through the combustion of fossil fuels (i.e., fuels containing carbon) in conjunction with other human activities is the leading cause of climate change.
State law defines greenhouse gases to include the following: carbon dioxide (CO$_2$), methane (CH$_4$), nitrous oxide (N$_2$O), hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride (Health and Safety Code, section 38505(g).) The most common greenhouse gas that results from human activity is carbon dioxide, followed by methane and nitrous oxide. Other contributors to climate change, such as black carbon, may also be appropriate for lead agencies to consider as part of the environmental analysis.

A. Regulatory Background, Relevant Statutes, Executive Orders, and Planning Documents

Various legislative mandates and state policies address the reduction of greenhouse gas emissions and establish quantitative emission reduction targets. For example:

- **Executive Order S-3-05** (2005) established a progressive series of targets: by 2010, reduce greenhouse gas emissions to 2000 levels; by 2020, reduce greenhouse gas emissions to 1990 levels; and by 2050, reduced greenhouse gas emissions to 80 percent below 1990 levels.

- **Assembly Bill 32** (2006, Nunez) requires statewide greenhouse gas reductions to 1990 levels by 2020 and continued reductions beyond 2020. The law requires the California Air Resources Board (CARB) to establish a program to track and report greenhouse gas emissions; approve a scoping plan for achieving the maximum technologically feasible and cost effective reductions from sources of greenhouse gas emissions; adopt early reduction measures to begin moving forward; and adopt, implement and enforce regulations to ensure the required reductions occur.

- Pursuant to **Senate Bill 375** (2008, Steinberg), CARB establishes greenhouse gas emissions reduction targets for metropolitan planning organizations (MPOs) to achieve based on land use patterns and transportation systems specified in Regional Transportation Plans and Sustainable Community Strategies. Current targets for the State’s largest MPOs call for a 19 percent reduction in greenhouse gas emissions from cars and light trucks from 2005 emissions levels by 2035.\(^4\)

- **Senate Bill 391** (Liu, 2009) requires the California Transportation Plan to support 80 percent reduction in greenhouse gas emissions below 1990 levels by 2050.

- **Executive Order B-16-12** (2012) specifies a greenhouse gas emissions reduction target of 80 percent below 1990 levels by 2050 specifically for transportation.

\(^4\) See the California Air Resources Board’s February 2018 Updated Staff Report, p. 34, available at https://www2.arb.ca.gov/our-work/programs/sustainable-communities-program/regional-plan-targets.
• Executive Order B-30-15 (2015) extends the goal of AB 32 and sets a greenhouse gas emissions reduction goal of 40 percent below 1990 levels by 2030. The executive order also addresses the need for climate adaptation and directs state governments to take a number of actions, including factoring climate change in state agencies’ planning and investment decisions.

• Senate Bill 32 (2016, Pavley) codifies the 2030 emissions reduction goal of Executive Order B-30-15 by requiring a reduction goal of 40 percent below 1990 levels by 2030.

• CARB’s Mobile Source Strategy (2016) describes California’s strategy for containing air pollutant emissions from vehicles, and quantifies growth in vehicle miles traveled that is compatible with achieving state climate targets.

• CARB’s 2017 Climate Change Scoping Plan (2017 Scoping Plan) describes California’s strategy for achieving the 2030 greenhouse gas emissions reduction target established by SB 32. The Scoping Plan also recognized the critical and complementary role of local governments in achieving the State’s climate goals. (CARB, 2017, Scoping Plan, p. 97; see also Chapter 8 of OPR’s General Plan Guidelines.)

• Senate Bill 100 (2018, De León) establishes a state goal of 100 percent clean electricity goal by 2045, and advances the Renewables Portfolio Standard to 50 percent by 2025 and 60 percent by 2030.

• Executive Order B-55-18 (2018) directs the state to achieve carbon neutrality no later than 2045 and achieve and maintain net negative emissions thereafter.

B. Requirements of CEQA and CEQA Guidelines Section 15064.4

CEQA is a public disclosure law that requires public agencies to make a good-faith, reasoned effort, based upon available information, to identify the potentially significant direct and indirect environmental impacts—including cumulative impacts—of a proposed project or activity. The CEQA process is intended to inform the public of the potential environmental effects of proposed government decisions and to encourage informed decision-making by public agencies. In addition, CEQA obligates public agencies to consider less environmentally-damaging alternatives and adopt feasible mitigation measures to reduce or avoid a project’s significant impacts.

The lead agency is required to prepare an Environmental Impact Report (EIR), a Mitigated Negative Declaration (MND), or equivalent document, when it determines that the project’s
impacts on the environment are potentially significant. This determination of significance must be based upon substantial evidence in light of all the information before the agency. The lead agency’s evaluation of a project’s environmental impacts “need not be exhaustive, but the sufficiency of an EIR is to be reviewed in the light of what is reasonably feasible.” (CEQA Guidelines, § 15151.)

Although the CEQA Guidelines, at Appendix G, provide a checklist of suggested issues that should be addressed in an EIR, neither the CEQA statute nor the CEQA Guidelines prescribe thresholds of significance or particular methodologies for performing an impact analysis. This is left to lead agency judgment and discretion, based upon factual data and guidance from regulatory agencies and other sources where available and applicable. A threshold of significance is essentially the level at which a lead agency finds a particular environmental effect of a project to be significant. Compliance with a given threshold means the effect normally will be considered less than significant. Lead agencies are encouraged but not required to adopt thresholds of significance for environmental impacts. (CEQA Guidelines, § 15064.7, subd. (b).) Lead agencies may also use thresholds adopted or recommended by other agencies or recommended by experts, provided the lead agency’s decision to use such thresholds is supported by substantial evidence. (Id., subd. (c).) A lead agency may also use thresholds on a case-by-case basis. (Id., subd. (b).) Even in the absence of clearly defined thresholds for greenhouse gas emissions, such emissions must be disclosed and mitigated to the extent feasible whenever the lead agency determines that the project contributes to a significant, cumulative climate change impact.

Through SB 97 (2007, Dutton), the Legislature acknowledged that greenhouse gas emissions and the effects of those emissions are appropriate subjects for CEQA analysis. SB 97 directed OPR to develop amendments to the CEQA Guidelines to address analysis and mitigation of the potential effects of greenhouse gas emissions in CEQA documents and processes. (Pub. Resources Code, § 21083.05.) The Agency adopted those amendments at CEQA Guidelines section 15064.4 in 2009. In late 2018, the Agency adopted further revisions to section 15064.4 that are intended to reflect recent case law and existing practice.

The revised CEQA Guidelines section 15064.4 states:

(a) The determination of the significance of greenhouse gas emissions calls for a careful judgment by the lead agency consistent with the provisions in section 15064. A lead agency shall make a good-faith effort, based to the extent possible on scientific and factual data, to describe, calculate or estimate the amount of greenhouse gas emissions resulting from a project. A lead agency shall have discretion to determine, in the context of a particular project, whether to:

(1) Quantify greenhouse gas emissions resulting from a project; and/or
(2) Rely on a qualitative analysis or performance based standards.

(b) In determining the significance of a project’s greenhouse gas emissions, the lead agency should focus its analysis on the reasonably foreseeable incremental contribution of the project’s emissions to the effects of climate change. A project’s incremental contribution may be cumulatively considerable even if it appears relatively small compared to statewide, national or global emissions. The agency’s analysis should consider a timeframe that is appropriate for the project. The agency’s analysis also must reasonably reflect evolving scientific knowledge and state regulatory schemes. A lead agency should consider the following factors, among others, when determining the significance of impacts from greenhouse gas emissions on the environment:

(1) The extent to which the project may increase or reduce greenhouse gas emissions as compared to the existing environmental setting;

(2) Whether the project emissions exceed a threshold of significance that the lead agency determines applies to the project.

(3) The extent to which the project complies with regulations or requirements adopted to implement a statewide, regional, or local plan for the reduction or mitigation of greenhouse gas emissions (see, e.g., section 15183.5(b)). Such requirements must be adopted by the relevant public agency through a public review process and must reduce or mitigate the project's incremental contribution of greenhouse gas emissions. If there is substantial evidence that the possible effects of a particular project are still cumulatively considerable notwithstanding compliance with the adopted regulations or requirements, an EIR must be prepared for the project. In determining the significance of impacts, the lead agency may consider a project’s consistency with the State’s long-term climate goals or strategies, provided that substantial evidence supports the agency’s analysis of how those goals or strategies address the project’s incremental contribution to climate change and its conclusion that the project’s incremental contribution is not cumulatively considerable.

(c) A lead agency may use a model or methodology to estimate greenhouse gas emissions resulting from a project. The lead agency has discretion to select the model or methodology it considers most appropriate to enable decision makers to intelligently take into account the project’s incremental contribution to climate change. The lead agency must support its selection of a model or methodology with
substantial evidence. The lead agency should explain the limitations of the particular model or methodology selected for use.

The CEQA Guidelines generally address greenhouse gas emissions as a cumulative impact due to the global nature of climate change. (Pub. Resources Code, § 21083, subd. (b)(2).) As the California Supreme Court explained, “because of the global scale of climate change, any one project’s contribution is unlikely to be significant by itself.” (Cleveland National Forest Foundation v. San Diego Assn. of Governments (2017) 3 Cal.5th 497, 512.) A project’s significant greenhouse gas impacts must be disclosed and mitigated to the extent feasible whenever the lead agency determines that the project contributes to a significant, cumulative climate change impact. (CEQA Guidelines, §§ 15064.4, subd. (b), 15183.5.) Thus, “[t]he question therefore becomes whether the project’s incremental addition of greenhouse gases is ‘cumulatively considerable’ in light of the global problem, and thus significant.” (Cleveland National Forest Foundation San Diego Assn. of Governments, supra, 3 Cal.5th at 512, citation omitted.)

III. POTENTIAL APPROACHES

Each public agency that serves as a CEQA lead agency should develop its own approach to performing a climate change analysis for projects that generate greenhouse gas emissions. A consistent approach should be applied for the analysis of projects, and the analysis must keep pace with scientific knowledge and regulatory schemes. (Cleveland National Forest Foundation v. San Diego Assn. of Governments, supra, 3 Cal.5th at 519.) For these projects, compliance with CEQA entails three basic steps: identify and quantify the greenhouse gas emissions; determine the significance of those emissions in the context of climate change; and if the impact is found to be significant, identify alternatives and/or mitigation measures that will reduce the impact below significance.

Lead agencies must use their best efforts to determine whether greenhouse gases may be generated by a proposed project, and if so, quantify or estimate the GHG emissions by type and source. (CEQA Guidelines, § 15064.4, subd. (a).) Second, the lead agency must determine whether the project’s incremental contribution is cumulatively considerable. (Id., § 15064.4, subd. (b), 15183.5.) When determining whether a project’s effects on climate change are “cumulatively considerable” even though its greenhouse gas contribution may be individually limited, the lead agency must consider the impact of the project when viewed in connection with the effects of past, current, and probable future projects. Finally, if the lead agency determines that the greenhouse gas emissions from the project as proposed are potentially significant, it must investigate and implement ways to avoid, reduce, or otherwise mitigate the impacts of those emissions.
The following discussion includes some general factors, based on existing laws and regulations, for lead agencies consider when analyzing whether a proposed project has the potential to cause a significant climate change impact on the environment.

A. Establish an Appropriate Methodology and Identify Greenhouse Gas Emissions

- Lead agencies shall make a good-faith effort, based on available information, to describe, evaluate, calculate, or estimate the amount of CO₂ and other greenhouse gas emissions from a project, including, but not limited to, the emissions associated with vehicle use, energy consumption, water usage and construction activities, and the impact on natural environments that sequester carbon. CEQA defines a “project” broadly to include “whole of an action, which has a potential for resulting in either a direct physical change in the environment, or a reasonably foreseeable indirect physical change in the environment.” (CEQA Guidelines, § 15378, subd. (a).) Thus, the analysis must consider all phases of the project.

- Lead agencies have the discretion to use a model or methodology to analyze greenhouse gas emissions that is appropriate for the project. (Center for Biological Diversity v. Department of Fish & Wildlife (2015) 62 Cal.4th 204, 228; see, e.g., Eureka Citizens for Responsible Gov’t v. City of Eureka (2007) 147 Cal.App.4th 357, 371-372) Various models exist that could be used in a greenhouse gases analysis, but not every model will be appropriate for every project. (CEQA Guidelines, § 15204, subd. (a).)

- A lead agency may take either a quantitative or qualitative approach to the environmental analysis. Under either approach, the lead agency’s analysis must demonstrate a good-faith effort to disclose the amount and significance of greenhouse gas emissions resulting from a project, based to the extent possible on scientific and factual data. (CEQA Guidelines, § 15064.4, subd. (a).) In preparing an EIR, a lead agency’s evaluation of project impacts need not be exhaustive, but an EIR’s sufficiency will be viewed in light of what is reasonably feasible. (Id., § 15151.)

- A qualitative analysis may be appropriate in some circumstances. For instance, in some cases, methods do not exist to model project emissions, or the project is small in scale and quantification of emissions may not reveal information that would assist the lead agency in determining the significance of emissions. A lead agency is not required “to conduct every test or perform all research, study, and experimentation recommended or demanded by commentors.” (CEQA Guidelines, § 15204, subd. (a).) That said, a qualitative approach must still be based to the extent possible on scientific and factual data and demonstrate a good-faith effort at disclosure of project impacts. (Ibid.)
Although a lead agency may use a qualitative approach to the impacts analysis, when possible, lead agencies should quantify the project’s construction and operational greenhouse gas emissions, using available data and tools, to determine the amount, types, and sources of greenhouse gas emissions resulting from the project. Quantification may allow the lead agency to more accurately evaluate the project’s emissions compared to state greenhouse gas reduction targets, which are in turn based on scientific consensus on the greenhouse gas emissions reduction needed to avert the worst effects of climate change. Even where a lead agency does not apply a numeric threshold of significance to a proposed project, quantification may still be useful for lead agencies to determine the significance of the project’s greenhouse gas emissions. (See Berkeley Keep Jets Over the Bay v. Bd. of Port Commissioners (2001) 91 Cal.App.4th 1344, 1367-1370; but see Mission Bay Alliance v. Office of Community Investment & Infrastructure (2016) 6 Cal.App.5th 160, 200-202.) Additionally, quantification may be useful in indicating to the lead agency and the public whether emissions reductions are possible, and if so, from which sources. Thus, if quantification reveals that a substantial portion of a project’s emissions result from energy use, a lead agency may consider whether design changes could reduce the project’s energy demand.

Technical resources, including a variety of modeling tools, are available to assist public agencies to quantify greenhouse gas emissions. (See Section IV below.) Emissions models for particular types of projects continue to improve. Lead agencies must make a good-faith effort to describe or calculate a project’s greenhouse gas emissions based to the extent possible on available data. (CEQA Guidelines, § 15064.4, subd. (a); see also § 15151 [standards for adequacy of an EIR].) Perfection is not required.

To determine transportation-generated greenhouse gas emissions in particular, lead agencies may decide it is appropriate to use the same method or methodology used to determine the transportation impacts associated with a project’s vehicle miles traveled (VMT). For more information, lead agencies should refer to Appendices A and B of this discussion draft, and to OPR’s Technical Advisory on Evaluating Transportation Impacts in CEQA, which provides a potential method for connecting the greenhouse gas assessment to thresholds of significance based on state greenhouse gas emissions reduction goals. Using a consistent approach for both the greenhouse gas and transportation analyses can provide efficiency and consistency in the environmental analysis.

There is no standard format for including the analysis in a CEQA document. A greenhouse gas/climate change analysis can be included in one or more of the typical
sections of an environmental document (e.g., air quality, transportation, energy) or may be provided in a separate section on cumulative impacts or climate change.

- When determining a project’s greenhouse gas emissions, lead agencies must describe the existing environmental conditions or setting, without the project, which normally constitutes the baseline physical conditions for determining whether a project’s impacts are significant. (CEQA Guidelines, § 15125.)

B. Determine Significance

- As with any environmental impact, lead agencies must determine what constitutes a significant impact on climate change that may be caused by the project’s physical changes. (Pub. Resources Code, § 21002; CEQA Guidelines; § 15064, subd. (d); *Protect the Historic Amador Waterways v. Amador Water Agency* (2003) 116 Cal.App.4th 1099, 1106-07.) Because the issue of climate change is discussed in a cumulative context, an important consideration in selecting and developing significance thresholds is identifying the level at which a project’s individual emissions would be cumulatively considerable. In the absence of regulatory standards for greenhouse gas emissions or other scientific data to clearly define what constitutes a “significant impact”, individual lead agencies may undertake a project by-project analysis, consistent with available guidance and current CEQA practice.

- The potential effects of a project may be individually limited but cumulatively considerable. (CEQA Guidelines, § 15064.4, subd. (b); *Cleveland National Forest Foundation v. San Diego Assn. of Governments*, supra, 3 Cal.5th at p. 515 [“The fact that a regional plan’s contribution to reducing greenhouse gas emissions is likely to be small on a statewide level is not necessarily a basis for concluding that its impact will be insignificant in the context of a statewide goal.”].) Lead agencies should not dismiss a proposed project’s direct and/or indirect climate change impacts without careful consideration, supported by substantial evidence. Documentation of available information and analysis should be provided for any project that may significantly contribute new greenhouse gas emissions, either individually or cumulatively, directly or indirectly (e.g., transportation impacts).

- Although climate change is ultimately a cumulative impact, not every individual project that emits greenhouse gases must necessarily be found to contribute to a significant cumulative impact on the environment.

- A number of models exist to quantify greenhouse gas emissions, and Guidelines section 15064.4, subdivision (b), provides a list of non-exhaustive factors that can be utilized by the lead agency when conducting an impacts analysis. Although the
sufficiency of an EIR is viewed in light of what is reasonably feasible, lead agencies must ensure that greenhouse gas impact analyses “stay in step with evolving scientific knowledge and state regulatory schemes.” (Cleveland National Forest Foundation v. San Diego Assn. of Governments, supra, 3 Cal.5th at p. 504.) As with the analyses for other environmental impacts under CEQA, the lead agency must support its analysis with substantial evidence.

- CEQA authorizes reliance on previously approved plans and mitigation programs that have adequately analyzed and mitigated greenhouse gas emissions to a less-than-significant level as a means to avoid or substantially reduce the cumulative impact of a project. (See Section D.)

1. Thresholds of Significance

A lead agency has the discretion to select and develop appropriate thresholds of significance to analyze a project’s environmental impacts, or rely on thresholds developed by other agencies that it deems applies to the project. The CEQA Guidelines define a “threshold of significance” as “an identifiable quantitative, qualitative or performance level of a particular environmental effect, non-compliance with which means the effect will normally be determined to be significant by the agency and compliance with which means the effect normally will be determined to be less than significant.” (CEQA Guidelines, § 15064.7, subd. (a).) The selection and development of thresholds requires a lead agency to “make a policy decision in distinguishing between substantial and insubstantial adverse environmental impacts based, in part, on the setting.” (North Coast Rivers Alliance v. Marin Municipal Water Dist. Bd. of Directors (2013) 216 Cal.App.4th 614, 625.”) The California Supreme Court further explained that “[a]lthough lead agencies have discretion in designing an EIR, the exercise of that discretion must be ‘based to the extent possible on scientific and factual data.’” (Cleveland National Forest Foundation v. San Diego Assn. of Governments, supra, 3 Cal.5th at p. 515, quoting CEQA Guidelines, § 15064, subd. (b).)

The following discussion includes some of the methods that a lead agency may use in selecting the appropriate threshold below which the lead agency may find an impact is less than significant. The lead agency has the discretion to select the appropriate significance threshold, which may differ among projects depending on the project design, location, and other circumstances. Each case must be analyzed in light of its own facts and circumstances. The discussion below merely provides information on some of the significance thresholds that are currently in practice and have been identified by the courts as acceptable methods.

In the context of analyzing greenhouse gas emissions, the threshold of significance will assist the lead agency in determining whether a project’s incremental contribution of emissions is cumulatively considerable in light of the global issue. A lead agency should be able to
conclude that an impact on climate change is less than significant if, based on substantial evidence, the lead agency determines that a project’s incremental contribution is not cumulatively considerable. That said, a lead agency must evaluate any substantial evidence supporting a fair argument that, despite compliance with thresholds, the project’s impacts are nevertheless significant. (Protect the Historic Amador Waterways, supra, 116 Cal.App.4th at pp. 1108-1109.)

A lead agency may choose to review a project’s environmental impacts using more than one threshold of significance. (Cleveland National Forest Foundation v. San Diego Assn. of Governments, supra, 3 Cal.5th at p. 507 [EIR proposed three different significance thresholds and applied each to three different years].) Regardless of which threshold or combination of thresholds the lead agency uses, the agency must support its analysis and significance determination with substantial evidence. (CEQA Guidelines, § 15064.7.)

a. Significance Threshold Based on Efficiency

A significance threshold that is based on an efficiency metric—rather than an absolute number—would allow lead agencies to compare projects of various types, sizes, and locations equally, and determine whether a project is consistent with the State’s reduction goals. For example, an efficiency metric for a residential project can be expressed on a per-capita basis, and a metric for an office project can be expressed on a per-employee basis. A lead agency may use a threshold that another agency has developed or the lead agency may develop its own. In the context of analyzing greenhouse gas emissions, the California Supreme Court has explained that an efficiency metric is an appropriate method to measure impacts that are global, such as greenhouse gas emissions:

... the global scope of climate change and the fact that carbon dioxide and other greenhouse gases, once released into the atmosphere, are not contained in the local area of their emission means that the impacts to be evaluated are also global rather than local. For many air pollutants, the significance of their environmental impact may depend greatly on where they are emitted; for greenhouse gases, it does not. For projects, like the present residential and commercial development, which are designed to accommodate long-term growth in California's population and economic activity, this fact gives rise to an argument that a certain amount of greenhouse gas emissions is as inevitable as population growth. Under this view, a significance criterion framed in terms of efficiency is superior to a simple numerical threshold because CEQA is not intended as a population control measure.

(Center for Biological Diversity v. Department of Fish & Wildlife, 62 Cal.4th at pp. 219-220.)
A lead agency relying on an efficiency metric derived from statewide data should be careful to support with substantial evidence how the selected metric appropriately applies to the lead agency’s impacts analysis for a particular project. Additionally, if relying on consistency with state plans as a basis for determining significance, a lead agency should align its quantitative metrics and locally-appropriate emission reductions goals with the methodology used to derive CARB’s statewide per capita targets of no more than six metric tons CO₂e per capita by 2030 and no more than two metric tons CO₂e per capita by 2050. (CARB, 2017 Scoping Plan, pp. 98-99.)

b. Compliance with State Goals and Percentage Reduction from BAU Emissions

Pursuant to the California Supreme Court’s decision in Center for Biological Diversity v. Department of Fish & Wildlife, supra, 62 Cal.4th 204, a lead agency may use compliance with state goals as a threshold. The most recently codified goal is contained in SB 32 (2016, Pavley), which codified the 2030 emissions reduction goal of Executive Order B-30-15 by requiring a reduction goal of 40 percent below 1990 levels by 2030. A lead agency may also choose to advance towards the State’s goal of carbon neutrality by 2045 established by Executive Order B-55-18. This goal was established following the completion of the 2017 Scoping Plan and reflects the global scientific community’s consensus of what is needed to avoid the worst impacts of climate change and maintain a climate of less than 2 degrees Celsius above the 20th century average. For a complete list of state goals, please see pages 3-4 of this document.

Agencies may also look to the state’s percentage goal of reducing emissions below the “business as usual” (BAU) scenario discussed in CARB’s Scoping Plan as the basis for a project’s significance threshold. (Center for Biological Diversity v. Department of Fish & Wildlife, supra, 62 Cal.4th at p. 216.) The BAU scenario represents the forecast of greenhouse gas emission levels in the absence of conservation or regulatory efforts beyond what was in place when the forecast was made. (CARB, 2017 Scoping Plan, p. 22.) If a lead agency relies on the BAU scenario, the agency must be careful to support with substantial evidence the identified project-level percentage reduction of greenhouse gas emissions compared to BAU with achieving the statewide goal of percentage reduction from BAU emissions. The lead agency should rely on local or regional inventories of emissions that include land uses relevant to the project at hand. Notably, correlating the project-level percentage reduction with the statewide goals may be difficult to achieve in practice and thus this particular threshold may not be readily implemented.

c. Consistency with Relevant Regulations, Plans, Policies, and Regulatory Programs

Relevant regulations, plans, and policies adopted to reduce greenhouse gas emissions can assist in establishing a significance threshold. “Such requirements must be adopted by the
relevant public agency through a public review process and must reduce or mitigate the project’s incremental contribution of greenhouse gas emissions.” (CEQA Guidelines, § 15064.4, subd. (b).) In *Center for Biological Diversity v. Department of Fish & Wildlife*, supra, the court noted that “[a] significance analysis based on compliance with such statewide regulations, however, only goes to impacts within the area governed by the regulations. That a project is designed to meet high building efficiency and conservation standards, for example, does not establish that its greenhouse gas emissions from transportation activities lack significant impacts.” (*Id.* at p. 229.)

A lead agency may also consider project compliance with community-scale climate action plans or other greenhouse gas emissions reductions plans prepared pursuant to CEQA Guidelines section 15183.5. (See *Center for Biological Diversity v. Department of Fish & Wildlife*, supra, 62 Cal.4th at 230 [discussing climate action plans or greenhouse gas emissions reduction plans as appropriate means to analyze a project’s greenhouse gas impact].) As discussed briefly in Section III.D. below, a lead agency may be able to streamline the environmental analysis if the proposed project is consistent with a greenhouse gas emissions reduction plan that meets the requirements of CEQA Guidelines section 15183.5.

d. Absolute Numerical/Quantitative Threshold

A lead agency may establish a numerical threshold of significance for greenhouse gas emissions expressed as an absolute number, or use an existing threshold that another agency has developed that it deems applies to a project, such as a local air district. (CEQA Guidelines, § 15064.4, subd. (b)(2); *Center for Biological Diversity v. Department of Fish & Wildlife*, supra, 62 Cal.4th at p. 230 [“a lead agency may rely on existing numerical thresholds of significance for greenhouse gas emissions, though . . . use of such thresholds is not required.”].) The numerical threshold would be the emissions level below which a project’s incremental contribution to global climate change would be less than “cumulatively considerable.” A lead agency may establish a threshold on a case-by-case basis, or apply a general-use threshold for different land use types and projects that the lead agency adopted pursuant to Guidelines section 15064.7, subdivision (b). (See CARB, 2017 Scoping Plan, p. 102 [“[l]ead agencies have the discretion to develop evidence-based numeric thresholds (mass emissions, per capita, or per service population) consistent with this Scoping Plan, the State’s long-term greenhouse gas goals, and climate change science.”].) A quantitative threshold should be based on compliance with statewide emission reductions targets, and the lead agency would need to ensure that the quantitative project-level threshold was properly correlated to statewide targets.
2. Timeframe for the Analysis of Impacts

The CEQA Guidelines acknowledge lead agency discretion in establishing the timeframe for the analysis of project impacts that is appropriate for the proposed project. (CEQA Guidelines, § 15064.4, subd. (b).) CEQA does not prescribe a particular horizon year or years. Lead agencies, however, must consider a project’s direct and indirect significant impacts on the environment, “giving due consideration to both the short-term and long-term effects.” (CEQA Guidelines, § 15126.2, subd. (a).) The Legislature also declared that state policy requires “governmental agencies at all levels to consider . . . long-term benefits and costs, in addition to short-term benefits and costs[.]” (Pub. Resources Code, § 21001, subd. (d).) Thus, a lead agency should be careful to select an appropriate timeframe for the analysis to adequately addresses all potentially significant short-term and long-term effects.

For some projects, a lead agency may determine that a timeframe of a few years is appropriate for the impacts analysis, such as for a project with only short-term impacts. But projects with a longer-term implementation period, such as a long-range planning document, will likely require a longer time horizon for the impacts analysis. For such projects, it would be appropriate for lead agencies to analyze the project’s greenhouse gas impacts for horizon years that are consistent with existing state policy and goals for greenhouse gas emission reductions. In analyzing a project’s impacts, a lead agency may also consider multiple horizon years.

In the past, lead agencies generally have analyzed project consistency with AB 32, which requires statewide greenhouse gas reductions to 1990 levels by 2020. But for longer-term projects, a 2020 time horizon will not be adequate in the near future because we will soon surpass that year. The California Supreme Court explained that for EIRs using a climate goal-consistency approach, “year 2020 goals will become a less definitive guide, especially for long term projects that will not begin operations for several years.” Rather, these EIRs “may in the near future need to consider the project’s effects on meeting longer term emissions reduction targets.” (Center for Biological Diversity v. Department of Fish & Wildlife, supra, 62 Cal.4th at p. 223.) The appropriate scope and timeframe for a lead agency’s greenhouse impacts analysis will likely evolve and shift over time. Thus, in developing and preparing evidence-based impact analyses, lead agencies “must ensure that CEQA analysis stays in step with evolving scientific knowledge and state regulatory schemes.” (Cleveland National Forest Foundation v. San Diego Assn. of Governments, supra, 3 Cal.5th at p. 519.)

C. Mitigate Impacts

• The lead agency must impose all mitigation measures that are necessary to reduce greenhouse gas emissions to a less-than-significant level. CEQA does not require mitigation measures that are infeasible for specific legal, economic, technological, or other reasons.
Mitigation measures will vary with the type of project being contemplated, but may include alternative project designs or locations that conserve energy and water, measures that reduce vehicle miles traveled by fossil-fueled vehicles, measures that contribute to established regional or programmatic mitigation strategies, and measures that sequester carbon to offset the emissions from the project.

In some cases, greenhouse gas emissions reduction measures will not be feasible or may not be effective at a project level. Rather, it may be more appropriate and more effective to develop and adopt program-level plans, policies and measures that will result in a reduction of greenhouse gas emissions on a community or regional level. Further, it may be more effective to incorporate greenhouse gas-reducing elements into the proposed project, such as using renewable non-emitting energy generated on-site and siting a project near transit.

If there are not sufficient mitigation measures that the lead agency determines are feasible to achieve a less-than-significant level, the lead agency should adopt those measures that are feasible, and adopt a Statement of Overriding Considerations that explains why further mitigation is not feasible. A Statement of Overriding Considerations must be prepared when the lead agency has determined to approve a project for which certain impacts are unavoidable. These statements should explain the reasons why the impacts cannot be adequately mitigated in sufficient detail and discuss the project benefits that outweigh the unavoidable impacts. This discussion must be based on specific facts, so as not to be conclusory.

Lead agencies may want to consider the loading order of mitigation measures to reduce or avoid greenhouse gas emissions that may be appropriate for a proposed project. OPR notes, however, that lead agencies have the discretion to determine the precise method of mitigation for their projects. (CEQA Guidelines, § 15126.4, subd. (a)(1)(B).) Additionally, the effectiveness and feasibility of any proposed mitigation measure is within the lead agency’s discretion based on the substantial evidence before it.

As a first level of mitigation, lead agencies may determine it is appropriate to focus on all reasonable and feasible on-site strategies to reduce or avoid greenhouse gas emissions such as on-site design features. As the Scoping Plan recommends, lead agencies should “prioritize on-site design features that reduce emissions, especially from VMT, and direct investments in GHG reductions within the project’s region that contribute potential air quality, health, and economic co-benefits locally.” (CARB, 2017 Scoping Plan, p. 102; see also, OPR’s General Plan Guidelines.) Additionally, there may be practical reasons to prefer on-site mitigation. There may be
circumstances in which requiring on-site mitigation may result in various co-benefits for the project and local community, and that monitoring the implementation of such measures may be easier.

Next, if the project requires further mitigation, lead agencies may consider off-site measures that are additional to on-site measures. A lead agency has the discretion to select off-site mitigation measures that are based locally, regionally, or in-state over investments in out-of-state or international mitigation measures. As with on-site mitigation measures, there may be practical reasons related to prefer local off-site measures over measures farther afield. Examples of off-site mitigation could include funding a local or regional off-site greenhouse gas mitigation project or purchasing verifiable carbon credits. CEQA does not prohibit off-site mitigation measures, but lead agencies must support with substantial evidence in the record their determination that mitigation will be effective and fully enforceable. (CEQA Guidelines, § 15126.4.) To do so, lead agencies may need to require more stringent protocols to verify the effective and enforceability of off-site mitigation measures. (Id., §§ 15126.4, 15364.)

The Legislature has made it clear that lead agencies should tier or streamline their environmental documents whenever feasible, specifically stating that tiering “will promote construction of needed housing and other development projects” by streamlining regulatory procedures and avoiding repetitive analyses. (Pub. Resources Code, § 21093.) The Legislature’s declaration for tiering or streamlining is applicable to greenhouse gas emissions analyses because emissions resulting from individual projects may be best analyzed and mitigated at a programmatic level. To streamline the environmental analysis, a lead agency may consider preparation of a greenhouse gas emission reduction plan, such as a climate action plan, that is compliant with CEQA Guidelines section 15183.5. Later project-specific environmental documents may tier from and/or incorporate by reference the existing programmatic review so long as the plan meets the requirements in section 15183.5. (CEQA Guidelines, 15183.5, subd. (a); Center for Biological Diversity v. Department of Fish & Wildlife, supra, 62 Cal.4th at p. 230.) More detailed information and guidance on greenhouse gas emission reduction plans is contained in Chapter 8, Climate Change, of OPR’s General Plan Guidelines.

IV. GREENHOUSE GAS EMISSIONS TOOLS

Quantification would assist lead agencies in preparing an adequate analysis of greenhouse emissions using currently available data and tools. Quantification is possible using currently available tools for most, if not all, projects.
The following includes a list of some of the more useful climate change tools and resources that a lead agency can use to quantify greenhouse emissions and determine the significance of project impacts to climate change. Not every tool or resource will be appropriate for every project.

- **General Plan Guidelines:** State of California developed guidance on how to develop a general plan, and contains specific information on developing a qualified climate action plan (see Chapter 8, Climate Change), available at [http://www.opr.ca.gov/planning/general-plan/guidelines.html](http://www.opr.ca.gov/planning/general-plan/guidelines.html)

- **Cool California website:** State of California supported online resource that hosts links to various tools and case studies, available at [https://coolcalifornia.arb.ca.gov/](https://coolcalifornia.arb.ca.gov/). This website also includes the Climate Action Map Portal (CAPMap), an open data tool provided by the California Air Resources Board to help local governments learn more about other climate action plans and climate change policies being implemented across the state.

- **California State Energy Efficiency Collaborative:** Outlines the steps to reduce greenhouse gas emissions and includes templates supported by the State of California, available at [http://californiaseec.org/](http://californiaseec.org/)

- **California Emissions Estimator Model (CalEEMod):** Widely used for project-level greenhouse gas emissions quantification, available at [http://www.caleemod.com](http://www.caleemod.com)

- **CARB’s Emission Factors (EMFAC) Web Database:** Database containing emissions and emission rates data from motor vehicles, available at [https://www.arb.ca.gov/emfac/](https://www.arb.ca.gov/emfac/)
Appendix A: Analyzing Greenhouse Gas Emissions from Transportation

To streamline the analysis of transportation-generated greenhouse gas (GHG) emissions, lead agencies may use the same method or methodology used to determine the transportation impacts associated with a project’s vehicle miles traveled (VMT). However, lead agencies have the discretion to use a model or methodology to analyze greenhouse gas emissions that is appropriate for the particular project. (*Center for Biological Diversity v. Department of Fish & Wildlife* (2015) 62 Cal.4th 204, 228.)

The following sections provide some guidance summarized from OPR’s *Technical Advisory on Evaluating Transportation Impacts in CEQA*, which may be useful to lead agencies when determining the greenhouse gas impacts associated with transportation. Lead agencies may refer to the technical advisory on transportation impacts for more detailed information on assessing vehicle travel and selecting an appropriate threshold. That technical advisory is non-regulatory and lead agencies may use the advisory at their discretion.

This appendix is a *discussion draft*. OPR invites the public to provide comments on this document.

**Avoid truncating or discounting vehicle trips.** CEQA requires environmental analyses to reflect a “good faith effort at full disclosure.” (CEQA Guidelines, § 15151.) Thus, where methodologies exist that can estimate the full extent of vehicle travel from a project and associated greenhouse gas emissions, the lead agency should apply them to do so. Where vehicle miles traveled impacts will grow over time, analyses should consider both a project’s short- and long-term effects associated with vehicle miles traveled and greenhouse gas emissions. Lead agencies should also consider all impacts and not truncate analyses because of jurisdictional or other boundaries. For additional details, see the “Consideration for All Projects” section of OPR’s technical advisory.

**Approach for Residential and Office Projects.** Tour- and trip-based approaches are sound methods for assessing both vehicle miles traveled and greenhouse gas emissions from residential/office projects. These approaches are also the most straightforward methods for assessing reductions in vehicle miles traveled and greenhouse gas emissions from mitigation measures. For additional details, see the “Technical Considerations in Assessing Vehicle Miles Traveled” section of OPR’s technical advisory.

---

5 See OPR’s *Technical Advisory on Evaluating Transportation Impacts in CEQA*, “Appendix 1: Considerations About Which VMT to Count”, for a description of these approaches.
Approach for Retail and Transportation Projects. Generally, lead agencies should analyze the effects of a retail or transportation project by assessing the greenhouse gas emissions resulting from the change in total vehicle miles traveled because retail projects typically re-route travel from other retail destinations. A retail project might lead to increases or decreases in vehicle miles traveled and associated greenhouse gases, depending on previously existing retail travel patterns. For additional details, see the “Technical Considerations in Assessing Vehicle Miles Traveled” and “Considering the Effects of Transportation Projects on Vehicle Travel” sections and Appendix 2 of OPR’s technical advisory.

Land Use Plans. For land use plans, lead agencies should analyze the associated vehicle miles traveled and greenhouse gas emissions across the full area over which the plan may substantively affect travel patterns. This may include looking beyond the boundary of the plan or jurisdiction’s geography. Lead agencies should avoid under-counting the vehicle miles traveled and emissions associated with travel between the project and destinations that are located outside of the boundary of the plan or the jurisdiction’s geography. Lead agencies should count, in full, a project’s vehicle miles traveled and associated greenhouse gas emissions.

Analysis of specific plans may employ the same thresholds as the thresholds used for projects. A general plan, area plan, or community plan may have a significant greenhouse gas emissions impact if the proposed new residential, office, or retail land uses in the plan would exceed, in the aggregate, the respective vehicle miles traveled threshold recommended in OPR’s technical advisory.

Where the lead agency tiers from a general plan environmental impact report pursuant to CEQA Guidelines sections 15152 and 15166, the lead agency generally focuses on the environmental impacts that are specific to the later project and were not analyzed as significant impacts in the prior EIR. (Pub. Resources Code, § 21068.5; Guidelines, § 15152, subd. (a).) Thus, in analyzing the later project, the lead agency should focus on the greenhouse gas impacts that were not adequately addressed in the prior environmental impact report. In the tiered document, the lead agency should continue to apply the thresholds recommended above.

Using Vehicle Miles Traveled Data to Determine Greenhouse Gas Emissions. A lead agency may calculate transportation-generated greenhouse gas emissions from a project’s vehicle miles traveled either by using a CO₂ per vehicle miles traveled multiplier, or by using methods that factor in variations in vehicle speed (such as used in the Emission Factors (EMFAC) model).

---

6 See OPR’s Technical Advisory on Evaluating Transportation Impacts in CEQA, “Appendix 1: Considerations About Which VMT to Count” and the “Assessing Change in Total VMT” section, for a description of this approach.
Appendix B: Potential Streamlining of the Greenhouse Gas Emissions Analysis for Transportation-Efficient Projects and Projects that Reduce Vehicle Miles Traveled

This appendix is a discussion draft of one potential pathway to streamline the project-level CEQA analyses for operational impacts associated with greenhouse gas emissions and vehicle miles traveled. This discussion draft appendix does not address potential streamlining for construction-related impacts. In addition to the main body of the discussion draft advisory, OPR invites the public to provide comments on this discussion draft appendix.

Most greenhouse gas (GHG) emissions that result from land use development in California come from transportation and building energy use. Building in a more transportation-efficient manner, so long as it is in accordance with best practices and building standards focused on building energy conservation, leads to overall energy savings and minimization of greenhouse gas emissions.

A path to streamline the transportation and greenhouse gas analyses may be possible for some projects, depending on the project-specific circumstances. Projects that produce low vehicle miles traveled (VMT) can be expected to have low transportation greenhouse gas emissions. Research shows that low-VMT land uses also tend to produce low levels of emissions associated with building energy. Further, in California, building energy efficiency standards and greenhouse gas emissions are moving toward carbon neutrality. Finally, appliance efficiency programs such as the United States Environmental Protection Agency’s Energy Star program can also help reduce energy use.

Therefore, a land use development project that produces low vehicle miles traveled, achieves applicable building energy efficiency standards, uses no natural gas or other fossil fuels, and includes Energy Star appliances where available, may be able to demonstrate a less-than-significant greenhouse gas impact associated with project operation.

---

9 See, e.g., Title 24 of the California Code of Regulations, Executive Order B-55-18, and SB 100 (2018, de León).
Greenhouse Gas Emissions Associated with Transportation

California policy efforts to reduce transportation greenhouse gas emissions generally can be divided into three broad categories:

1. Addressing vehicle energy efficiency
2. Addressing carbon content of fuels
3. Addressing the amount of vehicle miles traveled

Land use development does not affect vehicle energy efficiency or the carbon content of fuels, but contributes to greenhouse gas emissions by adding vehicle travel or modifying vehicle travel patterns.

Pursuant to SB 743 (Steinberg, 2013), the CEQA Guidelines were amended to establish vehicle miles traveled as the metric of transportation impact statewide, replacing level of service (LOS). To provide technical assistance in implementing this change, OPR provides information that users can use at their discretion in its Technical Advisory on Evaluating Transportation Impacts in CEQA. This technical advisory includes non-regulatory recommended approaches and methods for using the vehicle miles traveled metric for various project types. A lead agency could use the recommended methods and thresholds in OPR’s technical advisory on transportation to help correlate the assessment of both vehicle miles traveled and transportation-sector greenhouse gas emissions. The recommendations for thresholds in that technical advisory are based on state climate goals.

For example, to streamline the CEQA analyses of both transportation greenhouse gas emissions and transportation impacts using the vehicle miles traveled metric, a lead agency could consider the following when analyzing the operation of proposed land use development projects:

Residential. A residential project that would generate vehicle travel that is 15 or more percent below existing residential vehicle miles traveled per capita, measured against the region or city, may have a less-than-significant impact both for transportation and the greenhouse gas emissions associated with transportation.

Office. An office project that would generate vehicle travel that is 15 or more percent below existing office vehicle miles traveled per employee, measured against the region, may have a less-than-significant impact for both transportation and the greenhouse gas emissions associated with transportation.
Retail. A retail development that leads to a reduction in vehicle miles traveled may have a less-than-significant impact both for transportation and the greenhouse gas emissions associated with transportation.

These potential suggested thresholds are based on the recommended methodology for calculating vehicle miles traveled in OPR’s Technical Advisory on Evaluating Transportation Impacts in CEQA. Because OPR’s recommendations are non-binding and non-regulatory, a lead agency may use its discretion to undertake a different approach to analyzing transportation impacts. Accordingly, the potential suggested thresholds may not apply or be appropriate in those cases.

**Greenhouse Gas Emissions Associated with Building Energy Use**

The preceding section addressed greenhouse gas emissions from transportation associated with operation of a land use project. This section discusses greenhouse gas emissions associated with energy use associated with operation of project buildings.

Greenhouse gas emissions from buildings in California are generated mostly from the use of electricity and natural gas, mainly from space heating and cooling, water heating, use of lighting and electronics, and refrigeration. Title 24 of the California Code of Regulations, known as the California Building Standards Code or simply “Title 24,” addresses the energy efficiency of buildings, while Title 20, known as the Appliance Efficiency Regulations, addresses the energy efficiency of federally and non-federally regulated appliances.

As stated earlier, in California, building energy efficiency standards and greenhouse gas emissions are moving toward carbon neutrality. Therefore, one can expect greater reductions in greenhouse gas emissions associated with electricity use in the future. Still, electricity use is likely to generate greenhouse gas emissions through approximately 2045, so it remains important to consider programs like the United States Environmental Protection Agency’s Energy Star program, which certifies appliances that are particularly energy efficient. Meanwhile, appliances powered directly by natural gas or another fossil fuel would continue to emit greenhouse gas emissions.

In conclusion, a building designed to use electricity as its sole energy source (e.g., is not powered by natural gas), follows applicable Title 24 building standards codes, and uses only Energy Star-rated appliances for appliance types that are offered Energy Star ratings, may have a less-than-significant greenhouse gas impact with respect to energy use during building operations.
Greenhouse Gas Emissions Associated with Construction and Other Sources

In some situations, cumulative greenhouse gas emissions associated with construction from a land use development project may be orders of magnitude lower than the operational emissions from the project, simply because construction emissions are generally short term in duration compared to the project’s overall lifetime. But due to differences in projects, it is difficult to make these conclusions in all cases. For example, some projects may have long construction periods (e.g., 20 years) and may result in a large amount of emissions that may be considered significant. Thus, while a lead agency may be able to streamline the greenhouse gas emissions analysis associated with a project’s operational emissions, a lead agency should still carefully consider whether a project’s construction emissions are cumulatively considerable.

Similarly, operational greenhouse gas emissions associated with water consumption and solid waste disposal are typically nominal in comparison to the operational emissions from transportation and building energy. However, a lead agency should consider whether there are unique circumstances associated with the project that would lead to significant emissions from water consumption and solid waste disposal.

Summary of Vehicle Miles Traveled and Greenhouse Gas Emissions Streamlining for Land Use Development Projects

In sum, a land use development consisting of residential, office, and/or retail, which meets the following criteria may have less-than-significant operational greenhouse emissions with respect to transportation and building energy:

1. Results in below threshold vehicle miles traveled, either without mitigation or after mitigation;
2. Uses only electricity (no natural gas or other fossil fuels), for energy in all buildings that constitute the project;
3. Uses Energy Star appliances for any appliance category where they are available; and
4. Is in alignment with applicable Title 24 building standards codes in effect at the time the project is constructed.

Transportation Projects

Generally, transportation projects affect greenhouse gas emissions mostly through their effect on vehicle miles traveled. Therefore, a transportation project that leads to a reduction in vehicle miles traveled, such as a transit or active transportation project, may be able to demonstrate a less-than-significant impact both for transportation and for the greenhouse gas emissions associated with project operations. Transit and active transportation projects
generally reduce vehicle miles traveled and greenhouse gas emissions from transportation operations.
INVITED REVIEW

Genetic consequences of habitat fragmentation in plant populations: susceptible signals in plant traits and methodological approaches

Abstract

Conservation of genetic diversity, one of the three main forms of biodiversity, is a fundamental concern in conservation biology as it provides the raw material for evolutionary change and thus the potential to adapt to changing environments. By means of meta-analyses, we tested the generality of the hypotheses that habitat fragmentation affects genetic diversity of plant populations and that certain life history and ecological traits of plants can determine differential susceptibility to genetic erosion in fragmented habitats. Additionally, we assessed whether certain methodological approaches used by authors influence the ability to detect fragmentation effects on plant genetic diversity. We found overall large and negative effects of fragmentation on genetic diversity and outcrossing rates but no effects on inbreeding coefficients. Significant increases in inbreeding coefficient in fragmented habitats were only observed in studies analyzing progenies. The mating system and the rarity status of plants explained the highest proportion of variation in the effect sizes among species. The age of the fragment was also decisive in explaining variability among effect sizes: the larger the number of generations elapsed in fragmentation conditions, the larger the negative magnitude of effect sizes on heterozygosity. Our results also suggest that fragmentation is shifting mating patterns towards increased selfing. We conclude that current conservation efforts in fragmented habitats should be focused on common or recently rare species and mainly outcrossing species and outline important issues that need to be addressed in future research on this area.

Introduction

The development of human civilization throughout the last two centuries has resulted in the transformation of vast natural areas into anthropogenic landscapes, resulting in a process of habitat fragmentation that alters the structure, distribution, and functioning of natural ecosystems (Saunders et al. 1991). Immediate consequences of this process include habitat loss, the formation of remnant habitat patches of varied forms and sizes, a reduction of population sizes, and an increase in the degree of isolation of the remaining populations immersed in an anthropogenic matrix (McGarigal & Cushman 2002; Fahrig 2003). These persistent phenomena are well recognized as the main current driving forces of biodiversity loss in terrestrial ecosystems across the planet (Sala et al. 2000).

Studies of fragmentation effects in plants have largely concentrated on population demographic processes,
especially evaluating plant reproductive dynamics in fragmented habitats (Hobbs & Yates 2003; Ghazoul 2005; Honnay et al. 2005; Aguilar et al. 2006). However, within the last decade there has been an increased interest in assessing the genetic consequences of habitat fragmentation in plants as stated by initial and recent reviews on this subject (Young et al. 1996; Lowe et al. 2005; Ouborg et al. 2006; Honnay & Jacquemyn 2007). The expected genetic consequences of fragmentation, which creates small, discrete, and isolated populations, are based on traditional island biogeography and metapopulation theories (MacArthur & Wilson 1967; Levins 1969). Thus, habitat fragmentation is expected to erode genetic variability and to increase interpopulation genetic divergence of plant populations due to increased random genetic drift and inbreeding, and reductions in gene flow (e.g. Young et al. 1996; Sork et al. 1999; Lowe et al. 2005).

The most immediate effects of fragmentation on the genetic composition of plant populations depend on two factors: the effective population size within fragments and the patterns of genetic variability of the original populations previous to fragmentation (Nason et al. 1997; Hamrick 2004). Once a continuous forest is cleared and subdivided into small patches, from a metapopulation viewpoint, the distribution of genetic variability within and between the remaining populations in the landscape will depend on the spatial scale of fragmentation relative to the spatial scale of the pre-existent breeding neighbourhood (Nason et al. 1997; Hamrick 2004). Some hypotheses have been proposed to address the effects of habitat fragmentation on plant population genetics. As an immediate result, the genetic variation of populations is reduced due to genetic bottlenecks; specifically, a lower proportion of polymorphic loci and a reduction in the number of alleles per locus are expected within the fragments (Nei et al. 1975; Ellstrand & Elam 1993; Young et al. 1996). If fragmentation conditions persist over successive generations, decreased heterozygosity due to random drift and increased inbreeding are expected resulting in the accumulation of deleterious recessive alleles, lowering the fecundity of individuals, increasing seed/seeding mortality, and reducing the growth rate of individuals, eventually driving populations to extinction (e.g. Lande 1988; Young et al. 1996). The loss of genetic variation may reduce a population’s ability to respond to future environmental change, such that the probability of extinction is increased or, at best, opportunities for evolution are limited (Caro & Laurenson 1994; Young et al. 1996; Nason et al. 1997; Booy et al. 2000).

The hypotheses concerning the negative impact of fragmentation on genetic diversity are the basis for the conservation genetic paradigm (Ouborg et al. 2006). The field of conservation genetics is relatively recent, and one of its main concerns is to develop basic and applied knowledge to create tools and strategies for conserving the genetic resources and the evolutionary potential of species (Amos & Balmford 2001; Ouborg et al. 2006; Pertoldi et al. 2007). In order to develop such tools for effective conservation efforts, it is crucial to arrive to generalizations of plant genetic response patterns of plant species to habitat fragmentation.

Nevertheless, the empirical evidence from the literature provides inconsistent results to support these hypotheses, implying that not all fragmentation episodes necessarily result in genetic erosion of plant populations (e.g. Young et al. 1996; Collevatti et al. 2001; Lowe et al. 2005; Kettle et al. 2007). In this regard, quantitative statistical approaches are especially useful tools to integrate and synthesize the body of evidence from published literature (Arnqvist & Wooster 1995). Quantitative reviews such as meta-analysis allow us to reach general conclusions about a domain of research despite the apparent contradictory response patterns of individual studies (Gurevitch & Hedges 2001). This is accomplished by treating individual published results as if they were subjected to sampling uncertainty; thus, we are able to obtain not only the magnitude and direction of each effect (regardless of their P values), but also the variability of effects among individual studies (Hedges & Olkin 1985; Arnqvist & Wooster 1995; Gurevitch & Hedges 2001). Consequently, we can estimate the average magnitude of the effect across all studies, test whether the effect is significantly different from zero, and examine potentially causative differences in the effects among studies (Gurevitch & Hedges 2001).

Particular life-history traits of plants may confer different vulnerability to fragmentation effects. Because genetic erosion in fragmented habitats should be more pronounced after several generations, it is expected to find stronger negative effects on the adult generation of short-lived species compared to long-lived species (Young et al. 1996); or more precisely, in any plant population subjected to fragmentation conditions for several generations. Similarly, the ability of plants to reproduce clonally, via vegetative spread, may also buffer the genetic effects of fragmentation as a result of delaying the time between generations (Honnay & Bossuyt 2005). Also, the ploidy level of plants may influence the effects on genetic diversity due to fragmentation; as theory predicts, autotetraploids are less subject to the loss of genetic diversity by genetic drift than diploids (Bever & Felber 1992; Moody et al. 1993). Finally, the mating system of plants determines the spatial distribution of genetic variation within and among populations (Loveless & Hamrick 1984). Outcrossing plants typically show higher genetic variation within populations, whereas in selfing plants most of the genetic variation is found among populations (Loveless & Hamrick 1984; Hamrick & Godt 1989). Sudden decreases in effective population sizes due to habitat fragmentation would then have stronger negative effects on within-population genetic diversity of outcrossing
species. The fewer individuals remaining after fragmentation, the more severe the genetic bottleneck, which will have particularly large effects on the maintenance of rare alleles (Nei et al. 1975).

Likewise, some ecological processes, especially pollination and seed dispersal of plants, can shape the level of demographic and genetic connectivity among populations in fragmented habitats (Nason et al. 1997; Nathan & Muller-Landau 2000; Tewksbury et al. 2002; Hamrick 2004). The ability of vectors to move pollen and seeds through the fragmented landscape will determine the potential of plant species to offset the effects of genetic drift. In animal-pollinated or animal seed-dispersed plants, the level of genetic connectivity among fragments will depend on vector distribution, abundance, composition, and behaviour (Nason et al. 1997), attributes of pollinators and seed dispersers that are usually affected by habitat fragmentation (Didham et al. 1996; Graham 2001; Aizen & Feinsinger 2003; Griscom et al. 2007). Therefore, animal-pollinated and animal seed-dispersed plant species are expected to show decreased genetic connectivity due to habitat fragmentation compared to abiotically pollinated and abiotically seed-dispersed plants (Nathan & Muller-Landau 2000; García et al. 2007). The rarity of species can also determine susceptibility to genetic erosion. Naturally rare species, defined by their narrow geographical range, restricted habitat specificity or small local population sizes (sensu Rabinowitz 1981) are usually genetically less diverse than more widespread or common species (Karron 1987; Hamrick & Godt 1989; Ellstrand & Elam 1993). Then, common species may be more susceptible to lose genetic variation due to habitat fragmentation compared to rare species. Including rarity in models is problematic because authors do not uniformly assess rarity; species categorized as rare are not always naturally rare, but rather recently rare as a consequence of anthropogenic disturbance and habitat fragmentation (Gitzendanner & Soltis 2000). Thus, this categorization usually overlaps with the conservation status of the species (i.e. recently rare species are typically threatened or endangered). Once common and now rare species are expected to show stronger effects on genetic diversity than naturally rare species, as the former have suffered recent (i.e. in non-evolutionary time) decreases in regional or local abundance of populations (Huenneke 1991; Gitzendanner & Soltis 2000).

Certain characteristics of published studies may also influence the sensibility to find fragmentation effects. The ability to find fragmentation effects on genetic parameters may be different when using allozymes vs. DNA-based genetic markers. Specifically, because DNA-based genetic markers such as microsatellites have higher mutation rates (and consequently higher levels of variation), they may have higher resolution to detect changes in inter- and intra-population genetic variation compared to allozymes. Also, fragmentation effects on genetic erosion may not be detected on adult individuals of long-lived woody species, but may be detected in their progeny. Thus, in species of long generational time, the type of tissue used by authors to measure genetic diversity (either from adult or progeny) may determine the magnitude of fragmentation effects. Finally, the time elapsed since fragmentation occurred should be an important factor to assess genetic erosion in plants. Effects are expected to be stronger in plant populations subjected to fragmentation conditions for larger periods of time, where a few or several generations have passed.

In this paper, we conduct a quantitative review to assess the overall effects of habitat fragmentation on plant population genetic parameters and test the predictions of the conservation genetic paradigm. Specifically, we determined (i) the overall magnitude and direction of fragmentation effects on the genetic variability of plant populations; (ii) whether longevity, ploidy level, mating system, clonal growth, type of pollen and seed dispersal vector, and rarity status of plants determine differential susceptibility to genetic erosion in fragmented habitats; (iii) whether different methodological approaches used by the authors determine the ability to find fragmentation effects; and (iv) whether there is a relationship between time elapsed in fragmentation conditions and the magnitude of fragmentation effects in genetic parameters.

**Methods**

**Literature search**

We surveyed the literature through different databases using a combination of ‘fragment*’ AND ‘genet*’ AND ‘plant’ as keywords. Searches were conducted in the Science Citation Index and Biological Abstracts databases and also in the main editorials (Blackwell Science, Springer-Verlag, and Elsevier) and scientific societies that group the most relevant indexed journals of ecological genetics and conservation biology. We obtained a large number of papers that were examined for suitability in the meta-analyses. Considering that habitat fragmentation produces three main outcomes in the landscape (namely habitat loss, decreased population sizes, and increased isolation among populations), we included studies using any of these measures of fragmentation, which were statistically compared to assess whether any one of them had particularly stronger effects on genetic parameters. Thus, we included studies conducted in real habitat fragments, in natural plant populations of different sizes and/or degrees of isolation. We also considered a few studies evaluating the effects of fragmentation due to selective logging on genetic parameters. This type of disturbance introduces changes in population density of adult trees, a measure of population size (Kunin 1997; Lowe
et al. 2005), without necessarily creating habitat fragments. We excluded articles that exclusively analysed correlations among population size and genetic variability without any explicit mention to the effects of habitat fragmentation (see Leimu et al. 2006). We included only studies that correlated genetic variability with population size as an indirect assessment of habitat fragmentation effects.

As measures of genetic variability, we considered expected heterozygosity ($H_E$), percent polymorphic loci ($P$), number of alleles ($A$), and inbreeding coefficient ($F_IS$). In cases where heterozygosity was not given (typically in studies using random amplified polymorphic DNA or amplified fragment length polymorphism), we used molecular variance or gene diversity and analysed these parameters together with expected heterozygosity. These four genetic parameters were not necessarily evaluated all together in each study, thus sample sizes for each meta-analysis differed. In several studies, we were able to calculate inbreeding coefficients from observed and expected heterozygosity values ($F_IS = H_E - H_O / H_E$). Whenever available, we also included measures of outcrossing rate (OR) in fragmented habitats.

For each plant species studied, we gathered information on several life-history traits and ecological aspects as well as on the methodology used by the authors of each study as potential predictors of the genetic responses to habitat fragmentation. We determined: (i) the longevity associated to the different life forms (woody long lived, herbaceous perennial or herbaceous short lived); (ii) whether vegetative reproduction occurred; (iii) the ploidy level (polyploid or diploid); (iv) the mating system, whether a species was mainly outcrossing (which included strictly self-incompatible species, as well as self-compatible species with a predominant outcrossing mating system) or selfing (including species with predominant selfing mating system and some self-compatible species with mixed mating system with clear capability of selfing) as explicitly declared by the authors; (v) pollen dispersal vector (biotic or wind); (vi) seed dispersal vector (biotic or abiotic); (vii) rarity (common, naturally rare or recently rare). We also evaluated the type of genetic marker (allozyme or DNA based) and the plant tissue used for each study (either from adult individuals or progenies). We further searched in each paper for information regarding the time elapsed in fragmentation conditions; this included rough estimates given by authors (expressed as a few decades or centuries, more than or between certain amount of time) and also more precise dates or time periods elapsed. With this information, we created three categories (less than 50 years, between 50 and 100 years, and more than 100 years) to compare the magnitude of effect sizes. Furthermore, within the group of publications where authors gave a more precise date of when fragmentation started, we searched for the approximate lifespan of each species. We found information on lifespans in the same or different publications for 35 out of 47 species. For some species, we used genus-level lifespan information. For the remaining 12 species, we conservatively assigned a tabulated lifespan for woody and non-woody perennials following Ehrlén & Lehtilä (2002). For these species, we calculated the number of generations under fragmentation conditions by dividing the time period of fragmentation by the lifespan of the species, and ran correlation analyses between the number of generations and the effect sizes for $H_E$ and $F_IS$. Based on theoretical grounds, these two genetic parameters are expected to be correlated with the number of generations under fragmentation conditions, showing stronger negative effects as more generations pass by. All the species’ information was obtained from the same article, from other publications on the same species, or by contacting the authors. However, not every species’ characteristic was available, thus predictor variables within a meta-analysis do not necessarily share the same sample size.

Seven articles evaluated the effects of fragmentation on genetic parameters in two species simultaneously and we included each of these species in the same analysis. Because the magnitude and sometimes direction of the responses of each species to habitat fragmentation within the same study were quite different, it is reasonable to assume that the effects are independent for each species (Gurevitch & Hedges 2001).

Data analysis

We used a categorical meta-analytical approach due to the large majority of studies evaluating population genetic parameters of plants in contrasting conditions (i.e. fragmented vs. non-fragmented). We obtained the mean value ($X$) and standard deviations (SD) of each genetic parameter ($H_E$, $A$, $P$, OR, and $F_IS$) from plant populations ($n$) in each of the two conditions (fragmented and continuous habitats) in each published study. These data were taken either from text, tables or graphs (data from graphs were scanned using Datathief II software available online).1 For each study, the magnitude of the effect of fragmentation on each of the genetic parameters ($d_i$) was estimated as the unbiased standardized mean difference (Hedge’s $d$) between the mean value of the genetic parameter in fragmented and continuous habitats:

$$d_i = \frac{\bar{X}_F - \bar{X}_C}{SD_{Fc}}$$

where $\bar{X}_F$ is the mean value of a given genetic parameter in fragmented habitats, $\bar{X}_C$ is the mean value of the same genetic parameter in continuous habitats, $SD_{fc}$ is the pooled standard deviation, of both groups and $J$ is a term
that corrects for bias due to small sample size (see Gurevitch & Hedges 2001). The effect size \( d \) can be interpreted as the difference between the genetic diversity of plants in fragmented habitats and continuous conditions, measured in units of standard deviations. Thus, large differences and low variability generate the largest effect sizes (Gurevitch & Hedges 2001). For each genetic parameter, the overall weighted mean effect size estimate \( \bar{d}_{+} \) was calculated as:

\[
\bar{d}_{+} = \frac{\sum_{i=1}^{n} w_i d_i}{\sum_{i=1}^{n} w_i}
\]

where \( d_i \) is the effect size of the \( i \)th study and \( w_i \) is the weight (reciprocal of the sampling variance) of the \( i \)th study.

Positive values of the effect size \( d \) for \( H_E, A, P, \) and \( OR \), imply positive effects of habitat fragmentation on these parameters whereas negative \( d \) values imply negative effects of fragmentation on these parameters. The interpretation of effect sizes for inbreeding coefficients is exactly the opposite: positive values of \( d \) imply negative effects of habitat fragmentation (i.e. higher inbreeding) whereas negative \( d \) values imply positive effects of fragmentation (i.e. lower inbreeding). For studies using correlational approaches to evaluate fragmentation effects (typically using population size as the independent variable), we calculated the mean value, standard deviation and sample size by pooling the data points for the lower-half (used as fragmented condition values) and higher-half values (used as non-fragmented condition values) of the continuous independent variable.

We used MetaWin 2.0 (Rosenberg et al. 2000) to run the analyses and bootstrap re-sampling procedures as described in Adams et al. (1997) to calculate confidence intervals of effect sizes. An effect of habitat fragmentation was considered significant if the 95% biased-corrected bootstrap confidence intervals (CI) of the effect size \( d \) did not overlap zero (Rosenberg et al. 2000). Confidence intervals based on bootstrapping methods are generally wider than standard CI, which implies that re-sampling estimates of CI are more conservative (Adams et al. 1997). Data were analysed using random-effect models (Raudenbush 1994). This model assumes that differences among studies are due to both sampling error and random variation, which is usually the rule in ecological data (Gurevitch & Hedges 2001). The heterogeneity among effect sizes was assessed with \( Q \) statistics. Specifically, we examined the \( P \) values associated with \( Q_{between} \) statistics, which describe the variation in effect sizes that can be ascribed to differences between the categories of each predictor variable (i.e. species’ life history and ecological traits, and studies’ methodologies). We also used these statistics to compare the effect sizes between studies that used different factors of analyses (e.g. fragment size, logging, population size) to evaluate habitat fragmentation. Within the species used for the meta-analyses, we found few congeneric species (Table S1, Supporting information). We re-ran analyses using data pooled by congeneric species and found no difference in magnitude or direction of effects compared to the analyses performed using all the species as independent data points. We also tested for potential interactions among predictor variables by measuring their pairwise level of dependence with chi-squared tests.

Quantitative reviews of published studies have the intrinsic problem of potential publication bias. That is, studies showing significant results may have a greater probability of publication than those showing non-significant results. We explored this possibility graphically (weighted histograms and funnel plots), and by calculating weighted fail-safe numbers. If the fail-safe number is larger than \( 5n + 10 \), where \( n \) is the number of studies, then publication bias may be safely ignored (i.e. results are robust regardless of publication bias; Rosenberg 2005).

**Results**

**Sample of studies**

From the literature search, we obtained 101 publications from 28 international indexed journals throughout the period of 1989–2008 that evaluated the effects of habitat fragmentation on plant population genetic parameters (Appendix S1, Supporting information). These studies measured at least one parameter of genetic variability on 102 unique plant species to conduct the meta-analyses, which yielded 101 data points for expected heterozygosity \( (H_E) \), 77 data points for number of alleles \( (A) \), 57 data points for percent polymorphic loci \( (P) \), 18 data points for outcrossing rate \( (OR) \), and 62 data points for inbreeding coefficients \( (F_I) \). Although the species included in this review comprise a wide sample of plants with different biological and ecological attributes, there is some bias in these characteristics and also in the approaches used by authors to study genetic consequences of habitat fragmentation. Herbaceous perennial and woody long lived (shrubs and trees) represent 53% and 40% of the studied species, respectively, while herbaceous short-lived species comprised only 7% of the studied species. There are larger proportions of insect pollinated species (72%) and abiotically seed-dispersed species (77%). Diploid species are also a majority (84%). Although self-compatible (54%) and self-incompatible (46%) plants are approximately equally represented in the sample, within self-compatible plants there is a high number of mainly outcrossing plants as declared by the authors. Hence, there is a higher proportion of mainly outcrossing species (75%) compared with selfing plants (25%). Species without the capability of vegetative reproduction are slightly
more represented (61%). Common species represent 48%, whereas naturally and recently rare species represent 25% and 27% of the sample, respectively. We found no significant pairwise associations among any of these predictor variables (not shown), which indicate they can be considered statistically independent. Most of the studies evaluate the effects of habitat fragmentation on the genetic variability of adult individuals (72%), using mainly allozymes (60%) as genetic markers.

A comparison of the different factors of analysis used by the authors as measures of habitat fragmentation showed no significant differences in the effect sizes for $H_E$ (Q\textsubscript{between} = 1.35; $P = 0.493$), $A$ (Q\textsubscript{between} = 1.68; $P = 0.441$), $P$ (Q\textsubscript{between} = 2.05; $P = 0.162$), and $F_{IS}$ (Q\textsubscript{between} = 0.76; $P = 0.652$). That is, fragmentation effects on each of these genetic parameters are comparable whether considering fragment size, degree of isolation, habitat loss, population size, or density of conspecifics (i.e. logging) as factors of analysis.

Weighted histograms showed unimodal distributions with the highest frequency around zero (not shown) and funnel plots of effect sizes vs. sample sizes showed no skewness (not shown), which indicates no bias in reporting results (cf. Aguilar et al. 2006 for details of interpretation). Similarly, the calculated weighted fail-safe numbers for each meta-analysis were larger than $5n + 10$ [H\textsubscript{E}: 2249.4 > (5 * 101) + 10 = 515; A: 2805.4 > (5 * 78) + 10 = 400; $P$: 1444.2 > (5 * 57) + 10 = 295; OR: 168.3 > (5 * 18) + 10 = 100; $F_{IS}$: 1306.6 > (5 * 62) + 10 = 320], reinforcing the robustness of these results.

**Habitat fragmentation and genetic variability**

Overall weighted-mean effect sizes of habitat fragmentation on $H_E$, $A$, and $P$ were negative and significantly different from zero (Fig. 1). The OR, which was only consistently assessed in 18 studies, also showed an overall negative weighted-mean effect size (Fig. 1). Habitat fragmentation showed non-significant overall effects on $F_{IS}$ (Fig. 1), despite the small positive value implying a slight trend of increasing inbreeding due to habitat fragmentation.

From the evaluation of all predictor variables associated with the species’ life history and ecological attributes for each of the genetic parameters, we present only the results that showed significant $P (<0.05)$ values of Q\textsubscript{between} statistics in text and figures. We found that fragmentation effects were significantly different for $H_E$ between common, naturally rare and recently rare species (Q\textsubscript{between} = 23.18; $P < 0.001$). On average, common and recently rare species showed strong, negative and significant effects of fragmentation on $H_E$, whereas naturally rare species showed non-significant effects on $H_E$ (Fig. 2a). The same trend was found for $A$ and $P$, although the heterogeneity among effect sizes was only marginally significant (for $A$: Q\textsubscript{between}
studies evaluating adult and progeny tissues (not shown). Furthermore, for adult and progeny tissues, there were significant differences in mean effect sizes between outcrossing and selfing species (Q_{between} = 14.96; P = 0.028 and Q_{between} = 9.17; P = 0.05 for A and P, respectively). Outcrossing species showed stronger negative effects of fragmentation on A and P compared to selfing species (Fig. 2b). A similar but marginally significant trend was observed for H_{E} [d_{outcrossing (n=69)} = -0.57, d_{selfing (n=24)} = -0.22; Q_{between} = 3.24; P = 0.071]. In the case of inbreeding coefficients, none of these predictor variables showed significant heterogeneity, implying that fragmentation not only does not have an overall effect on inbreeding, but also no particular life-history trait is showing susceptibility to fragmentation (not shown). Surprisingly, fragmentation effects on inbreeding were only studied in one short-lived species, which precluded the formal comparison between short- and long-lived species. None of the other life history (life form, vegetative growth capability, and ploidy level) and ecological traits (pollination and seed dispersal vector types) evaluated as predictor variables showed significant heterogeneity in effect sizes of fragmentation on these genetic parameters (not shown).

The use of different genetic markers (allozymes vs. DNA based) did not significantly alter the magnitude of effect sizes for each of the genetic parameters evaluated in fragmented habitats (not shown). Furthermore, effect sizes of fragmentation on H_{E}, A, and P were also homogeneous among studies sampling adult or progeny tissues (not shown). For inbreeding coefficients, on the contrary, there was a significant difference in mean effect sizes between studies evaluating adult and progeny tissues (Q_{between} = 16.80; P = 0.012; Fig. 3): progenies showed a significant positive overall mean effect size value while adults showed a non-significant mean effect size (Fig. 3). This result implies that progenies generated in fragmented habitats (which comprised mostly non-established seeds) presented higher inbreeding coefficients than progenies produced in continuous habitats; whereas for adult individuals no difference in mean F_{IS} values were observed between fragmented and continuous habitats. Depending on the parameter evaluated, between 53% and 64% of the studies gave at least rough information on the time elapsed in fragmentation condition. Overall, species subjected for more than 100 years in fragmentation conditions had significantly stronger effects on H_{E} (Q_{between} = 17.72; P = 0.009), A (Q_{between} = 6.68; P = 0.05), and P (Q_{between} = 15.57; P = 0.018; Fig. 4) compared to species evaluated in fragmented systems of less than 50 years, which showed non-significant mean effect sizes on these three genetic parameters (i.e. CI’s overlapping zero value; Fig. 4).

Finally, we were able to estimate the number of generations elapsed in fragmentation conditions for 47 and 35 case studies evaluating H_{E} and F_{IS}, respectively. We logarithmically transformed the number of generations and ran correlations with the effect sizes of fragmentation on these two parameters. We found a significant negative correlation between the number of generations elapsed and the species’ effect sizes for H_{E} (r = -0.36, P = 0.012, Fig. 5). That is, the more generations elapsed in fragmentation conditions for any given plant population, the stronger negative magnitude of effect sizes on H_{E}. In the case of fragmentation effects on inbreeding coefficient, we found a non-significant positive correlation with the number of generations (r = 0.29, P = 0.102, n = 35), suggesting a trend of higher inbreeding as more generations pass by in fragmentation conditions.
Anthropogenic habitat fragmentation is a recent phenomenon in evolutionary time but a pervasive feature of modern landscapes (Fahrig 2003). Plant populations that remain in habitat fragments are confronted with modified environments of reduced area, increased isolation, and new ecological boundaries, potentially affecting their biotic and abiotic interactions (e.g. Fahrig 2003; Ewers & Didham 2006). The genetic consequences of fragmentation on plant populations have been studied for over two decades and no clear response patterns have emerged from the literature. Recently, two reviews have focused on the relationship between genetic diversity and population size (Leimu et al. 2006; Honnay & Jacquemyn 2007), one of the immediate possible demographic consequences of habitat fragmentation. Nevertheless, fragmentation is a complex process that involves several different factors simultaneously (McGarigal & Cushman 2002; Fahrig 2003; Ezard & Travis 2006; Leblois et al. 2006; Ouborg et al. 2006); thus analyzing solely reductions of population size may not fully reflect what is happening in real fragmented scenarios. Population size per se may not be very important for animal pollinators and seed dispersers, whereas the degree of population isolation or the matrix characteristics surrounding the fragments may have more influence on their foraging behaviour (Kunin 1997; Ricketts 2001), affecting their ability to maintain gene flow among fragmented populations. These different factors, which often interact in diverse ways, are difficult to separate in observational or non-experimental designs, the rule in fragmentation studies. Authors tend to focus on one factor and do not usually control for the others (Leblois et al. 2006; Ouborg et al. 2006; but see e.g. Prober & Brown 1994; Honnay et al. 2007). Thus, the cause of reduced genetic diversity in fragmented habitats should not be adjudicated to one single factor, but rather to the interacting effects of, at least, population size, degree of isolation and matrix characteristics (Ezard & Travis 2006).

In this review, we explicitly focused on fragmentation studies and arrived at a conclusive generalization: habitat fragmentation decreases the genetic diversity of plant populations. The vast majority of studies were conducted on adult populations of long-lived species in relatively recently fragmented systems, which indicates the effects observed on genetic diversity, especially on A and P, are probably mainly the result of genetic bottlenecks, the most immediate consequence of fragmentation (e.g. Young et al. 1996; Nason et al. 1997; Oostermeijer et al. 2003; Lowe et al. 2005). These species and studies’ characteristics may also be the reason for the absence of overall significant effects on inbreeding coefficients (i.e. most sampled adults have probably established before fragmentation took place) and the comparatively smaller mean effect size observed on $H_p$, which may be mostly due to the overall reduction in number and frequency of alleles (Barret & Kohn 1991; Nason et al. 1997). In a closer examination of the subset of studies that provided dates of fragmentation events, it was clearly observed that time and, more precisely, the number of generations elapsed under fragmentation conditions, are crucial in determining stronger genetic diversity reductions in plant populations, especially in heterozygosity, which may take a number of generations to become apparent (Young et al. 1996; Lowe et al. 2004, 2005). Studies conducted in more than 100-year-old fragmented systems presented significantly stronger negative effects on genetic diversity (Fig. 4). This notion was more specifically supported by the significant correlation between the estimated number of generations for a subset of species and the magnitude of negative fragmentation effects on $H_e$ (Fig. 5), primarily as a result of random genetic drift (e.g. Young et al. 1996; Young & Clarke 2000; Lowe et al. 2004).

**Gene flow and mating patterns in fragmented habitats**

The amount of gene flow among remnant populations is a key element that will ultimately determine the genetic consequences of habitat fragmentation (Sork et al. 1999; Frankham et al. 2002; Hamrick 2004; Sork & Smouse 2006). Moderate or even relatively low levels of gene flow via pollen or seeds between fragmented populations can significantly alleviate the loss of genetic diversity by preventing the effects of genetic drift (e.g. Sork et al. 1999; Couvet 2002). In this regard, we found no evidence of any particular pollinator or seed dispersal vector type (either biotic or abiotic) to confer differential susceptibility to the loss of genetic diversity. Although this result does not give

*Fig. 5* Correlation between the log-transformed number of generations of plant populations in fragmented habitats and the effect sizes of fragmentation on $H_e$ for 47 plant species. Correlation coefficient $r = -0.36$, $P = 0.012$.

us information about the patterns of gene flow per se in fragmented habitats, it does indicate there is no obvious type of vector able to conduct consistently extensive gene flow between fragments within the studies analysed.

In the present review, we were not able to evaluate contemporary gene flow due to the current paucity of this kind of study and the difficulty of generating effect size measures from gene flow parameters. However, the results observed for outcrossing rates and inbreeding coefficients may indirectly support the possibility of disrupted gene flow and/or changes in mating patterns of fragmented plant populations. Outcrossing rates in fragmented populations showed a significant overall decrease compared to populations in continuous habitats (Fig. 1), suggesting that fragmented plant populations are suffering changes in mating patterns towards increased selfing. Moreover, inbreeding coefficients will increase immediately in the first generation of progenies if mating patterns are biased towards higher selfing or mating among related individuals (e.g. Young et al. 1996; Lowe et al. 2005; Kettle et al. 2007). Precisely, we found that progenies in fragmented habitats presented significant mean higher inbreeding coefficients than progenies in non-fragmented habitats (Fig. 3), indicating adult individuals in fragmented populations are mating more frequently among related individuals and/or through autogamous pollination.

In addition to reduced heterozygosity due to random genetic drift in populations that remain fragmented for several generations, heterozygosity erosion is more severe when inbreeding accompanies fragmentation (e.g. Young et al. 1996; Nason et al. 1997; Young & Clarke 2000). The few species subjected to fragmentation conditions for many generations presented quite strong negative effect sizes on $H_e$ (Fig. 5), probably as a result of both drift and increased inbreeding. In the hypothetical scenario of anthropogenic fragmentation ceasing and landscapes remaining as they are today, the effects on genetic diversity of plants will still be much stronger in the future than we have estimated here if mating patterns continue shifting towards selfing.

**Mating systems**

Self-incompatible (SI) and mainly outcrossing self-compatible species, which contain most of their genetic variability within populations, suffered greater losses of alleles and polymorphic loci than non-outcrossing self-compatible and selfing species. For self-incompatible species in particular, this may result in the loss of low-frequency self-incompatibility alleles ($S$) (Wright 1965; Nei et al. 1975). In genetically controlled self-incompatibility systems, sharing of even a single $S$ allele can prevent mating between individuals (De Nettancourt 2001). Thus, SI plants surviving in small, isolated populations may experience mate limitation due to reduced $S$ allele diversity so that the effective population size is further reduced (Byers & Meagher 1992; Glémín et al. 2008). Such synergism between genetic and demographic processes has great potential to influence population viability of these species (Young & Clarke 2000; Glémín et al. 2008). In fact, animal-pollinated SI species are also strongly negatively affected in terms of effective pollination service and seed production by habitat fragmentation (Aguilar et al. 2006), thus these species are exceptionally vulnerable to fragmentation as a consequence of both, ecological and genetic mechanisms. These results represent a clear example of how genetic erosion can have short-term impacts on individual fitness and population viability (e.g. Cascante et al. 2002; Fuchs et al. 2003).

**Rarity status**

Our results support the initial hypothesis regarding the rarity status of plants: because common species have comparatively higher levels of genetic variability than naturally rare species, they are expected to lose more diversity due to recent fragmentation processes. Whether rarity is a cause or a consequence of evolutionary and ecological processes is still an open question (Rabinowitz 1981; Gitzendanner & Soltis 2000). In this regard, naturally and recently rare species may represent different timescales and origins of disturbance, which affect the genetic characteristics they possess in the present (Karron 1987; Ellstrand & Elam 1993; Gitzendanner & Soltis 2000; Oostermeijer et al. 2003). If this is true, it would be important to distinguish in the system under study whether habitat fragmentation is a consequence of natural phenomena, and thus occurred through evolutionary time, or whether is the result of anthropogenic activity, occurring in recent ecological times. While evolutionary fragmentation may be a more gradual and slower process that may also ‘have an end’, ongoing ecological fragmentation is a much faster increasing, non-random process (Saunders et al. 1991; McGarigal & Cushman 2002; Fahrig 2003). Given the ubiquitous nature of anthropogenic habitat fragmentation in today’s landscapes, the results presented here are important and of interest to conservation biology as they situate common species in potential risk of genetic erosion, which is counterintuitive to current conservation principles that almost exclusively emphasize efforts on rare or threatened species (Honmay & Jacquemyn 2007; Gaston & Fuller 2008).

**Conservation implications and future directions**

Conservation of genetic diversity within populations has direct implications not only for ecosystem functioning but also for providing resilience in the face of environmental change (Luck et al. 2003; Reusch & Hughes 2006). The
controversy about whether ecological and demographic factors are more important than genetic factors in driving species to extinction (Lande 1988; Frankham et al. 2002) has been recently quantitatively assessed: most taxa are not driven to extinction before genetic factors affect them adversely (Spielman et al. 2004), an assertion also supported by further research on plants in fragmented habitats (e.g. Endels et al. 2007). Thus, revealing which plant traits are more susceptible to suffer genetic erosion in fragmented habitats is crucial to detect lowered evolutionary potential, compromised reproductive fitness, and elevated extinction risks of wild populations, which should help generate criteria to prioritize conservation efforts (Young et al. 1996; Young & Clarke 2000; Amos & Balmford 2001; Lowe et al. 2005). Our results indicate that such efforts should be directed to common or recently rare species and mainly outcrossing species. Strictly self-incompatible, animal-pollinated species are at even greater risk due to their additional reproductive impairment in fragmented habitats (Aguilar et al. 2006).

Despite these unequivocal signals of susceptibility in plants, there is a clear gap in the literature of plant population genetics in fragmented habitats that precluded us making further generalizations. Such is the case of the poor representation of short-lived species as study targets and the dearth of studies evaluating contemporary gene flow via pollen and seeds on plant species with different life forms coupled with ecological information on the biotic dispersal vectors. Also, special attention should be given to the study of established progenies (seedlings and saplings) in fragmented habitats. Most of the progeny tissue evaluated up to now comes from non-established seeds (personal observation) and their genetic composition may differ markedly from that of the progeny that is actually being recruited in fragmentation conditions if they are subjected to selective pressures shaped by seed predators and herbivores (e.g. Cascante et al. 2002) and/or if they come from seed banks of previous reproductive episodes (Mandák et al. 2006; Honnay et al. 2008). Increasing these types of studies may allow us to determine whether gene flow mediated by animals is in fact changing and how changes in mating patterns will affect the genetic diversity of future generations of plant populations. Including precise measures and information on the history and characteristics of fragmented systems is particularly important, not only to determine timescales of fragmentation but also to test for possible fragmentation thresholds below which genetic variation is lost (e.g. Prober & Brown 1994; Ezard & Travis 2006). These approaches imply the merging of population genetics, plant–animal interaction ecology, and landscape ecology, a multidisciplinary endeavor that will provide knowledge-based tools for conserving the evolutionary potential of species and for managing ongoing anthropogenic modified landscapes.

ABSTRACT

Biodiversity is being lost at an increased rate as a result of human activities. One of the major threats to biodiversity is infrastructural development. We used meta-analyses to study the effects of infrastructure proximity on mammal and bird populations. Data were gathered from 49 studies on 234 mammal and bird species. The main response by mammals and birds in the vicinity of infrastructure was either avoidance or a reduced population density. The mean species abundance, relative to non-disturbed distances (MSA), was used as the effect size measure. The impact of infrastructure distance on MSA was studied using meta-analyses. Possible sources of heterogeneity in the results of the meta-analysis were explored with meta-regression.

Mammal and bird population densities declined with their proximity to infrastructure. The effect of infrastructure on bird populations extended over distances up to about 1 km, and for mammal populations up to about 5 km. Mammals and birds seemed to avoid infrastructure in open areas over larger distances compared to forested areas, which could be related to the reduced visibility of the infrastructure in forested areas. We did not find a significant effect of traffic intensity on the MSA of birds. Species varied in their response to infrastructure. Raptors were found to be more abundant in the proximity of infrastructure whereas other bird taxa tended to avoid it. Abundances were affected at variable distances from infrastructure: within a few meters for small-sized mammals and up to several hundred meters for large-sized mammals.

Our findings show the importance of minimizing infrastructure development for wildlife conservation in relatively undisturbed areas. By combining actual species distributions with the effect distance functions we developed, regions sensitive to infrastructure development may be identified. Additionally, the effect distance functions can be used in models in support of decision making on infrastructure planning.

1. Introduction

Global biodiversity is changing at an unprecedented rate as a result of several human-induced changes in the global environment (Vitousek, 1994; Pimm et al., 1995; Sala et al., 2000; MEA, 2005). Biodiversity loss at the species level tends to result in the so-called homogenisation process (Lockwood and McKinney, 2001). This process is generally characterised by a decrease in the abundance of many species, culminating into an increase in the number of threatened species and the extinction of others, in combination with a simultaneous increase in the abundance of a few species.

The main drivers of biodiversity change are land-use and land-cover change, climate change, pollution, fragmentation and infrastructure development (UNEP, 2001; Sala et al., 2000; Sanderson et al., 2002; Alkemade et al., 2009).

The ubiquity of road networks and the growing body of evidence of the negative impacts that roads and other linear infrastructure have on wildlife and ecosystems suggest that infrastructure represents a major driving factor of biodiversity loss. The most commonly reported impacts from roads and utility corridors include habitat loss, intrusion of edge effects in natural areas, isolation of populations, barrier effects, road mortality and increased human access (Andrews, 1990; Forman and Alexander, 1998; Spellerberg, 1998; Trombulak and Frissell, 2000; Forman et al., 2003). Road construction leads to habitat destruction and creates open spaces in otherwise closed forests (Gullison and Hardner, 1993; Reed et al., 1996; Santos and Tabarelli, 2002). The open spaces may fragment populations (barrier effect), attract light-demanding species and may be avoided by others (edge effect).
(Kroodsma, 1984; Vos and Chardon, 1998; Bolger et al., 1997; Ort
ega and Capen, 1999). Additionally, the use of infrastructure by
cars or trains increases the risk of collisions with wildlife and the
stress on (breeding) individuals (due to noise and visual stimuli),
both of these risks affecting animal populations (Van der Zande
et al., 1980; Reijnen et al., 1996; Romin and Bissonnette, 1996; Boar
man and Sazaki, 2005; Parris and Schneider, 2009).

Besides roads, other types of infrastructure, such as railways,
powerlines, pipelines, hydroelectric developments, oil wells, seis
mic lines and wind parks, have an impact on wildlife populations
(Dunthorn and Errington, 1964; McLellan and Shackleton, 1989;
Cameron et al., 1992; Van Dyke and Klein, 1996; Mahoney and
Schaefer, 2002; Nellesmann et al., 2003a; Barrios and Rodriguez,
2004). All these impacts may influence the long-term viability of
populations and, eventually, biodiversity.

Qualitative reviews provide a broad understanding of the eco-
logical effects of infrastructure that affect a range of taxa and eco-
systems, but lack quantitative evidence (Trombulak and Frissell,
2000; Forman et al., 2003). However, the few attempts to quantify
the effects of infrastructure (UNEP, 2001; Nellesmann et al., 2003b;
Fahrig and Rytwinski, 2009), or to model the vulnerability of ani-
mal populations to road effects (Jaeger et al., 2005), are not based
on meta-analysis, which is the statistical procedure for combining
the results of independent studies in a quantitative way (And
Arqvist and Wooster, 1995). In this study, we aim at estimating the decline
of animal populations in relation to proximity to infrastructure by
using a meta-analytical approach.

Among all animal taxa, mammal and bird populations were cho-

en for our analysis since both have been widely reported to be
decline in relation to their distance from infrastructure. However,
large differences in disturbance sensitivity seem to exist between
and within these groups. Bird populations seem to be affected with-
in a few hundred metres from infrastructure, whereas a reduction in
mammal populations has been found at distances of a few hun-
dred metres up to several kilometres from infrastructure (McLellan
and Shackleton, 1989; Cameron et al., 1992; Ortega and Capen,
1999; Nellesmann et al., 2003a). Additionally, traffic intensity seems
to play a role in the decline of both bird and mammal populations
close to roads (Van der Zande et al., 1980; Reijnen et al., 1995,
1996; Dyer et al., 2001; Rheindt, 2003; Gagnon et al., 2007).

To quantify the patterns of reduced population densities in rela-
tion to infrastructural development, we searched the scientific and
non-scientific literature for quantitative data on mammal and bird
populations at varying distances from infrastructure. As the metric
of effect size, we calculated the ratio between the species abun-
dance at varying distances to infrastructure (Disturbance or Effect
distance) relative to the species abundance at the largest (control)
distance reported in the study. This ratio is a form of the biodiver-
sity indicator mean species abundance (MSA) which represents the
mean abundance of (remaining) original species in an area related
to an undisturbed situation (Alkemade et al., 2009). Meta-analysis
was used to combine the effect sizes (MSA values) across all stud-
ies for several distance intervals and test their level of significance.
Furthermore, meta-regression was applied to model the relation-
ship between distance to infrastructure and MSA for birds (MSA_b)
and mammals (MSA_m) (infrastructure–distance effect), and to
examine sources of heterogeneity in this relationship.

2. Methods

2.1. Search and selection of published studies on infrastructural effects

Relevant studies were searched by using the following electronic
databases: EbSCO, ISI Web of Knowledge, JSTOR, Omega (Utrecht
University Digital Publications Search Machine), Science Direct, Scopus,
Springer Link and Wiley InterScience. The search terms were: road-
AND impact+ AND biodiversity OR mammal; bird; infrastructure
AND impact+ AND biodiversity OR mammal; bird; road- AND dis-
tance AND biodiversity OR mammal; bird; road-effect zone AND
mammal abundance, bird abundance; road- AND disturbance+ AND
biodiversity OR mammal, bird; powerline AND impact AND biodi-
versity OR mammal, bird; wind park AND biodiversity OR mammal,
bird; road traffic+ AND impact+ AND biodiversity+ OR mammal, bird;
infrastructure AND disturbance AND biodiversity OR mammal, bird.
An Internet search was also performed using the meta-search engine
Google scholar. Bibliographies of articles viewed at full text were
searched for relevant secondary articles. Authors and recognized ex-
erts in the field of infrastructure development, road establishment
and effects on biodiversity (Christian Nellesmann, UNEP-Grid Aren-
dal, and Rien Reijnen, Alterra) were also contacted for further recom-
mendations, and for provision of any unpublished material or
missing data that may be relevant (grey literature). Foreign language
searches were undertaken by using cross-reference.

2.2. Study inclusion criteria

From this bulk of literature we selected those studies of which
Title and keywords were associated to the objective of this review.
Subsequently, information contained in the abstracts was exam-
ined to further narrow down the selection to those studies that
met the following criteria:

- Relevant study objects: Populations of any mammal or bird spe-
cies. Studies were included irrespective of habitat or spatial
scale.
- Types of intervention: Disturbance distances or distances close
to infrastructure at which mammal and bird populations might
be reduced compared to larger distances or control distances
(see Types of comparator).
- Types of outcome: Species abundance (density and/or counts) at
varying distances to infrastructure.
- Types of comparator: Control distances or distances at which
mammal and bird populations are unaffected by infrastructure
and roads.

2.3. Data extraction

Finally, 49 studies met the selection criteria for data extraction,
from which 90 datasets were extracted and stored in a database,
resulting in 2107 data points. The data included the mean abun-
dance at disturbance distances close to infrastructure and at a lar-
gest control distance; furthermore we recorded the sample size,
the variance, and standard deviation or standard error, depending on
the study. These data were used to estimate an effect size and its
variance as required in meta-analysis (Osenberg et al., 1999). Addi-
tionally, we stored data on location, habitat, infrastructure type,
taxon (order) and traffic intensity to explore sources of heteroge-

neity (see Table 2 in Supplementary material, available at http://
www.environmentalevidence.org/SR68.html). These variables are
considered biologically meaningful and could affect the way differ-
ent taxa respond to infrastructure. Thus, we expected that different
taxa would respond differently to different infrastructure types
(linear and clustered) and that different habitat types according to
tasking visibility of infrastructure, while traffic intensity could af-
ict the response due to the influence of noise and visual stimuli.

2.4. Effect size calculation: Mean Species Abundance (MSA)

For each study, individual effect sizes were calculated as the ratio
between the abundance of each species close to the infrastructure
(Disturbance distance) and the abundance of the same species at the largest (control) distance, as reported in the study. Individual effect sizes were aggregated for each study and distance, resulting in an estimate of the mean species abundance (MSA), which is the metric of effect size for the meta-analysis (see Eq. (1))

$$\text{MSA}_d = \frac{\sum R_{isd}}{N_s}$$  \hspace{1cm} (1)

where MSA\(_{isd}\) is the relative mean species abundance estimated in study \(s\) at a distance \(d\); \(R_{isd}\) is the ratio between the abundance or density of species \(i\) at distance \(d\) and the abundance or density of species \(i\) at the control distance, calculated as: \(A_{isd}/A_{isc}\) for \(A_{isc} > 0\). \(N_s\) is the number of species considered in study \(s\). MSA values ranged from 0 to 1 and declined at shorter distances from infrastructure. For species with higher densities at short distances from infrastructure compared to the control distance, the MSA value was truncated to 1; therefore, if \(A_{isd} > A_{isc}\), then \(R_{isd} = 1\).

2.5. Estimation of variation in MSA values

The variance of the MSA value for each distance and study was estimated by calculating the variance of the external error (2), and of the internal error (3), which are both forms of the variance of a sample mean (Mood et al., 1973). The largest variance was used in the meta-analysis, thus taking into account the largest error associated with each data point (DerSimonian and Laird, 1986). For single species’ studies, only the variance of the internal error could be calculated.

The variance of the external error was calculated as:

$$\sigma^2_{exc} = \frac{\sum (MSA_{isd} - R_{isd})^2}{N_s(N_s - 1)}$$  \hspace{1cm} (2)

The variance of the internal error was calculated as:

$$\sigma^2_{int} = \frac{\sum \sigma^2_{isd}}{N_s^2}$$  \hspace{1cm} (3)

where \(\sigma^2_{isd}\) is the individual variance for each ratio, which was calculated by using the Delta Method (4), a first-order approximation of the variance of a ratio of two random variables (Oehlert, 1992; Winzer, 2000).

$$\sigma^2_{isd} = \frac{A^2_{isd} \cdot \sigma^2_{A_{isd}} + A^2_{isc} \cdot \sigma^2_{A_{isc}}}{\sigma^2_{A_{isd}} \cdot \sigma^2_{A_{isc}}} + \frac{2 \cdot \rho \cdot \sigma_{A_{isd}} \cdot \sigma_{A_{isc}}}{\sigma^2_{A_{isd}} \cdot \sigma^2_{A_{isc}}}$$  \hspace{1cm} (4)

In this equation \(\sigma^2_{A_{isd}}\) and \(\sigma^2_{A_{isc}}\) are the variances of \(A_{isd}\) and \(A_{isc}\), respectively, and \(\rho\) their correlation coefficient. We assume \(A_{isd}\) and \(A_{isc}\) to be independent and, therefore, the correlation coefficient \(\rho\) to be zero. Variances of \(A_{isd}\) and \(A_{isc}\) were obtained from studies, when available; where this was not the case, the data was assumed to follow a Poisson distribution, in which \(\mu = \sigma^2\) and, therefore, \(A_{isd} = \sigma_{A_{isd}}\) and \(A_{isc} = \sigma_{A_{isc}}\) (Sokal and Rohlf, 1981).

Finally, as some species had a density of zero at the disturbance distance (\(A_{isd} = 0\)), a continuity correction factor (k = 1/2) was added to the numerator and denominator of the ratio of all species, resulting in slightly higher variance estimates (Cox, 1970; Sweeting et al., 2004).

2.6. Study quality assessment

Study characteristics were summarized and experimental design (control and treatment plots) and data availability for extraction (means, standard errors and sample sizes) were used as criteria for determining study quality (low; medium–low; medium; medium–high; high) (Supplementary material available at http://www.environmentalevidence.org/SR68.html). A sensitivity analysis was done by removing studies scoring “medium–low” or “low”.

2.7. Data analyses

Meta-analyses were performed separately for mammal and bird studies by using the package “metafor” in R 2.9.1 software (Viechtbauer, 2009). A random effects meta-analysis was done to derive a pooled effect size for all datasets allowing pseudoreplication. Additionally, meta-analyses were done per distance interval containing non-duplicated independent datasets.

Heterogeneity was assessed by inspection of Forest plots and formal tests of heterogeneity Q and I\(^2\) (Thompson and Sharp, 1999). Publication bias was also assessed using Funnel plots of asymmetry along with formal tests (Egger et al., 1997; Supplementary material available at http://www.environmentalevidence.org/SR68.html).

To explore factors introducing heterogeneity we built several Generalized Linear Mixed Models (GLMM), accounting for several alternative nested ecological hypotheses that included the following a priori selected explanatory variables: distance to infrastructure (DIST or LOGDIST when log-transformed), presence of forest cover (FOR), traffic intensity (TRAF). All GLMM were built in S-Plus 7.0 and fit by restricted penalised quasi-likelihood (Pinheiro and Bates, 2000). Each MSA value was weighed by its variance. Study was introduced as random effect since we expected similar but not identical effects of infrastructure across studies.

Models were compared and selected by means of information theoretic criteria, including Akaike's Information Criterion corrected for sample size (AICc) and Akaike weights. AIC corrected for overdispersion (QAIc) was not needed since the random effects of the GLMM accommodate any possible overdispersion in the data. This was ad hoc checked by calculating a scale parameter (sigma) for our models using package “lme4” in R 2.9.1. (Bates and Maechler, 2009). The model selected was that minimizing the loss of Kullback–Leibler information.

Additionally data was disaggregated and GLMM were built to examine differences in the relationship between MSA and distance for different habitats, for forested and non-forested habitats, for different infrastructure types (linear and clustered) and for different taxa.

3. Results

3.1. Data availability and selected studies: review statistics

More than 600 studies contained relevant titles and abstracts. Of these, 50 studies corresponded to the selected criteria for data extraction. Two studies referred to the same data and were treated as one (Noel et al., 2004; Joly et al., 2006), resulting in 49 studies used for the meta-analysis. Some geographical bias was found since most of the studies were from either North America (21) or Europe (23), while a few studies from Africa (3) and Oceania (2) were found.

Twenty-seven studies included 201 bird species, and 49 independent datasets were extracted for the meta-analysis. The other 22 studies included 33 mammal species, and 41 independent datasets were extracted. Some species were repeated more than once (Appendix 3, Supplementary material available at http://www.environmentalevidence.org/SR68.html). Of the 49 datasets for birds, 10 contained relevant information on traffic intensities. Of the 41 datasets for mammals, five included information on traffic intensity, which was considered insufficient for the inclusion of this variable in the analysis (Supplementary material available at http://www.environmentalevidence.org/SR68.html).
Bird datasets frequently included a large number of species (mean = 9.1 (1–54)), compared to mammal datasets, which (with some exceptions, e.g. Newmark et al., 1996; Goosman and Marsh, 1997; Yost and Wright, 2001) usually focused on a single species (mean = 3.7 (1–11)). The most represented habitat types within the bird datasets were grasslands and agricultural lands (each of them in 15 datasets), and the least represented was boreal forests (1 dataset). The most represented habitat type in the mammal datasets was arctic tundra (12 times) and the least represented habitat types were grasslands and semi-arid habitats (1 time each).

The most represented bird taxon was Passeriformes (21 datasets) and the least represented mammal taxon was Artiodactyla (25 datasets) and the least represented bird taxa were Coraciiformes, Psittaciformes and Trochiliformes (1 dataset each).

Reported distances in bird datasets were in the range of 0–2580 m whereas data points for mammals were obtained within a range of 0–17,000 m.

3.2. Meta-analysis

3.2.1. Combination of all distances with pseudoreplication

The pooled effect size derived from an all-encompassing meta-analysis of MSA values for birds indicated that bird abundance declined within ca. 2600 m from infrastructure (MSAm = 0.677; 95% CI 0.608–0.742, P < 0.0001). Likewise for mammals, MSAM decreased within 17,000 m from infrastructure (MSAm = 0.675; 95% CI 0.627–0.740, P < 0.0001; Tables 1 and 2). Fail-safe numbers indicated that a large number of studies reporting neutral or positive effects of the proximity of infrastructure on species abundance would be needed to overturn these results and so even with some publication bias, the results for mammals and birds can be considered a reliable estimate of the true effect (Rosenthal, 1979).

Sensitivity analyses were performed and the results remained similar after removing studies that scored “medium–low” in the study quality assessment. The pooled effect size for bird data increased slightly, heterogeneity was lower but still statistically significant and there was evidence of publication bias (MSAb = 0.683; 95% CI 0.627–0.740, P < 0.0001; Q = 2653.70, P < 0.0001; Egger test = 4.699, P < 0.0001; Appendix 4, Supplementary material available at http://www.environmentalevidence.org/SR68.html). For mammals the pooled effect size was similar, heterogeneity decreased slightly and there was publication bias (MSAm = 0.678; 95% CI 0.608–0.7472, P < 0.0001; Q = 3401.70, P < 0.0001; Egger test = 4.006, P < 0.0001; Appendix 4, Supplementary material available at http://www.environmentalevidence.org/SR68.html).

3.2.2. Effect size per distance interval

Pooled effect sizes calculated per distance interval for independent datasets were significant for mammal and bird data, but considerable heterogeneity and publication bias existed for most of the intervals. Lower MSA values were obtained at shorter distance intervals to infrastructure for both mammals and birds.

Note: a Total number of MSA values included in the meta-analysis for bird species. The total number of studies is 27, from which 49 datasets were extracted containing 288 MSA calculated values for different distances.
The number of datasets per distance interval decreased as the distance from infrastructure increased (Tables 1 and 2).

Sensitivity analyses for mammal and bird data resulted in similar MSA values per distance interval with the exception of the distance intervals 300–320, 340–375 and 380–490 m for the bird data, which had larger MSA values (Appendix 4, Supplementary material available at http://www.environmentalevidence.org/SR68.html). Heterogeneity was not statistically significant in these intervals, but there was publication bias.

### 3.2.3. Exploration of reasons for heterogeneity: meta-regression

The relationship between MSA and distance to infrastructure was positive for both mammals and birds (Fig. 1 and 2). When the data was subgrouped per habitat, all relationships were also positive except for temperate forests in the case of mammal species, and Mediterranean forests in the case of bird species (Tables 6 and 7). In forests both bird and mammal species abundances were affected in the proximity of infrastructure whereas in non-forested areas the effect extended over a larger distance (Tables 6 and 7). All relationships had lower AICc when “LOGDIST” was chosen as explanatory variable, except for Tundra.

There existed also differences in the relationship between MSA and distance to infrastructure for different taxa. Accipitriformes and Falconiformes were the only bird taxa which were unaffected or positively affected by the presence of infrastructure, whereas for other bird taxa proximity to infrastructure seemed to exert a negative effect on species abundance, or the magnitude of the effect was unknown due to low sample size (Supplementary material available at http://www.environmentalevidence.org/SR68.html). From all mammal taxa, a positive relationship between MSA and distance to infrastructure could only be found for Artiodactyla and Rodentia, but abundances of the latter were only reduced at short distances from infrastructure while this effect extended over a large distance for the former.

Several **ad hoc** models were built to explore the high heterogeneity between effect sizes. We worked on several biological hypotheses to explain the variability in the relationship between MSA and distance to infrastructure. For bird species the most parsimonious model was that containing only the explanatory variable “LOGDIST” (Akaicke weight: 0.78, Table 3). For mammal

* Total number of observations points or MSA values included in the meta-analysis for mammal species. The total number of studies is 22, from which 41 datasets were containing 151 MSA calculated values for different distances.

---

![Fig. 1](image1.png) Logistic regression between mean species abundance of birds and distance from infrastructure. Open dots represent the pooled results of the meta-analysis per distance interval ± S.E. The black line denotes the estimated curve for the decline of MSA, related to distance. Dashed lines are the 95% upper and lower limits of the confidence bands of the curve.

![Fig. 2](image2.png) Logistic regression between mean species abundance of mammals and distance from infrastructure. From all mammal taxa, a positive relationship between MSA and distance to infrastructure could only be found for Artiodactyla and Rodentia, but abundances of the latter were only reduced at short distances from infrastructure while this effect extended over a large distance for the former.
The most parsimonious model for the subset of bird data containing information on traffic intensity was that including only “LOGDIST” as explanatory variable (Akaike weight: 0.99, Table 5).

4. Discussion

4.1. Effect of distance from infrastructure on bird and mammal species abundance

Our analyses suggest that infrastructure can have a negative impact on bird and mammal abundance and that this impact is more evident in the proximity of the infrastructure. Pooled results for pseudoreplicated data indicated a decline in species abundance of 28–36% and 25–38% for birds and mammals within 2.6 km and 17 km from infrastructure, respectively. Pooled results per distance interval showed that MSA of birds and of mammals became higher for distance intervals far away from infrastructure. The meta-regression also indicated a positive relationship between MSA of birds and mammals and distance to infrastructure. A second conclusion that can be obtained from these results is that bird populations are likely to be more affected at short distances from infrastructure while the effect on mammal populations seems to extend over larger distances. These results confirm the effect distances reported in other studies, which were larger for mammals (Cameron et al., 1992; Newmark et al., 1996; Nellemann et al., 2003a; Joly et al., 2006) than for birds (Van der Zande et al., 1980; Madsen, 1985; Reijnen et al., 1996; Rheindt, 2003). However, considerable heterogeneity was found in our results, especially for birds, and also publication bias, both limiting the robustness of these conclusions.
The sensitivity analyses resulted in a slightly (but not statistically significant) larger pooled effect size for pseudoreplicated data in the case of bird species. Sensitivity analyses per distance interval showed similar results to the full meta-analyses except for the distance intervals between 300 and 480 m from infrastructure, with larger effect sizes. Yet, fail-safe numbers indicate that a large number of non-significant studies would be needed to overturn the pooled effect sizes calculated for these distance intervals. Thus, we decided to maintain these studies in the meta-regression following Wolf and Guevara (2001), who advocate for the use of all available data when doing meta-analysis.

The high heterogeneity underlying the results of our meta-analysis indicates that infrastructure development can have negative impacts on bird and mammal abundance within a certain distance depending on a number of factors which we further explore in Section 4.2.

4.2. Exploration of sources of heterogeneity

Meta-regression helped us to elucidate that “LOGDIST” was the main explanatory variable for the decline in abundance of bird populations due to infrastructure. For mammals, “DIST” was the main variable but the variable “FOR” seemed to add important information to the model. Meta-regression on subgroups divided by habitat type and taxa indicated that in open habitats, both mammal and bird populations seem to avoid infrastructure over larger distances, compared to those in forested biomes, which could probably be related to reduced visibility of infrastructure. Forman and Deblinger (2000) showed similar results for breeding birds in open grasslands and in woodlands (data adapted from Reijnen et al. (1995, 1996)).

For the subset of bird data including information on traffic intensity, the most parsimonious model was that which contained
only “LOGDIST” as explanatory variable. Therefore it seems that traffic intensity has no effect on the reduction of bird populations nearby roads. These results are contrary to the findings of a number of authors that have highlighted the pernicious effects of traffic intensity and noise on bird populations (Reijnen and Foppen, 1994; Reijnen et al., 1995, 1996, 1997; Forman et al., 2002; Rheindt, 2003). However, there are other studies which found a decline in bird populations near roads with low traffic intensity (Räty, 1979; Madsen, 1985; Develey and Stouffer, 2001) and others which found no clear relationship (Peris and Pescador, 2004). Finally, some authors claim that there exists a trade-off between traffic intensity and velocity, with low traffic intensity being related to higher velocities (Martínez-Abrain, 1994; Drews, 1995). Yet, traffic velocity seems to be related to bird mortality, which occurs on the road itself. To the best of our knowledge, studies that deal with this topic usually do not report on bird densities at increasing distances from roads (or include a control distance for comparison). As none of the studies included in our analysis contained data on traffic velocity, the influence of this variable could not be evaluated.

Not all species showed a decline in abundance nearby infrastructure: species abundance of Accipitriformes and Falconiformes was larger in the proximity of infrastructure. This was not a surprising outcome since other studies have reported the presence of raptors nearby roads searching roadkill carrion (Forman and Alexander, 1998; Lambertiucci et al., 2009) and hunting (Dönazar et al., 1993; Fajardo et al., 1998; Dean and Milton, 2003), with some exceptions during the breeding season (Martínez-Abrain et al., 2008).

In the case of mammals, we could detect that Rodentia populations were slightly affected within few meters from infrastructure. By contrast, Artiodactyla species were affected up to distances of several hundred meters. Within Artiodactyla wild reindeer (Rangifer tarandus) was one of the most studied and sensitive species, with their population abundance being reduced up to several kilometres from infrastructure (Nellemann and Cameron, 1996; Nellemann et al., 2001, 2003a,b). These outcomes are consistent with the fact that small-sized mammals usually have smaller home ranges and migration distances compared to medium- and large-sized mammals, the latter being more sensitive to infrastructure development and habitat fragmentation (Harestad and Bunnel, 1979; Buskirk, 2009).

4.3. Review limitations

Only some of the included studies used Before-After-Control-Impact (BACI) experimental designs, so we decided to use the largest reported distance in the study as control distance. Although the sensitivity analyses allowed us to remove some of the studies of lower quality and indeed the results did not vary in most of the cases, we acknowledge that our conclusions are restricted by the lack of proper comparators in some of the studies.

The identified publication bias is another of the weaknesses of our review. A few studies did not find negative effects of infrastructure on bird and mammal populations and were not included due to lack of proper data on the selected variables (e.g. Adams, 1984; Evans and Gates, 1997; Ballard et al., 2000); and there may exist many others that were never published due to non-significant results or that we were unable to obtain (grey literature). However, fail-safe numbers indicated that our results are sufficiently robust.

Many of the studies initially considered in our systematic review lacked suitable data for extraction and had to be left out of the analysis. Therefore we may have excluded potentially relevant studies and included lower quality studies due to availability of data on the selected variables.

The scope of the study was intended to be global and covered different types of biomes and habitats; nevertheless there is a geographical bias in the studies included in our review. Most studies were done in Europe and North America and therefore the applicability of the results to other geographic areas remains unknown.

4.4. Conclusions and management implications

Changes in wildlife populations in the proximity of infrastructure have been reported for decades in a number of studies (see Table 2 in Supplementary material, available at http://www.environmentalevidence.org/SR68.html), and have been pointed out in relevant authors’ reviews (Spellerberg, 1998; Trombulak and Frissell, 2000; Forman et al., 2003). Additionally, there have been previous attempts to quantify wildlife population decline in relation to distance from infrastructure, either locally (Forman and Deblinger, 2000) or at the global scale (UNEPI, 2001; Nellemann et al., 2003b; Fährig and Rytwinski, 2009), but none of them followed the guidelines for systematic reviews (Pullin and Stewart, 2006) or summarized the information by means of a meta-analysis. Our study represents a step forward within the field of road ecology research that may contribute to the understanding of the magnitude of the pernicious effects of infrastructure development on animal populations. Reported effects for most bird populations extend over distances up to about 1 km, and for most mammal populations up to about 5 km, with variation according to taxa and habitat type (Fig. 1 and 2). However, the evidence shown by our results is somewhat hampered by the limitations mentioned in Section 4.3. We therefore encourage researchers to perform BACI studies whenever possible and make their data available for researchers pursuing a systematic review. Should new studies that include these recommendations be released in the future, the review can be updated by including the new available evidence.

Although the patterns found in our analysis are clear, we would like to emphasise that these only represent a partial estimate of the actual effect of infrastructure on wildlife. Therefore, we highlight the importance of broadening the analysis to other taxonomic groups, such as herpetofauna, plants and invertebrates (e.g. Przybylski, 1979; Angold, 1997; Auerbach et al., 1997; Haskell, 2000; Shine et al., 2004; Barrows et al., 2006). Further research on these taxonomic groups would add up to the current models presented in this study, contributing to eventually produce a model that would provide an accurate estimate of the effects of infrastructure development on biodiversity.

The results of our meta-analysis will be implemented in the next version of the GLOBIO3 model, which is used to estimate the biodiversity loss at global, regional and national level at current state and for possible future scenarios and policy options (Allemade et al., 2009). The results of the GLOBIO3 model have been reported in global assessments such as the second Global Biodiversity Outlook and the fourth Global environmental Outlook and are aimed to support policy makers on the elaboration of biodiversity conservation policies (sCBD and MNP, 2007; UNEP, 2007). The method is also used at the regional level (Verboom et al., 2007) and at the country level (e.g. in Viet Nam, Ecuador and Nicaragua).

Our study shows the importance of minimizing infrastructure development for wildlife conservation in relatively undisturbed areas. By combining actual species distributions with the effect distance functions we developed as a form of dose–effect relationship, regions sensitive to infrastructure development may be identified. More specifically, the effect distance functions can be used in models in support of decision making on infrastructure planning. This would mean a substantial improvement of the current situation in which, in most cases, results of previous studies on ecological impacts are barely taken into account (OECD, 2002; Roedenbeck et al., 2007).
Acknowledgements

We thank Christian Nellmann of NINA and Rien Reijnen of Alterra for their useful comments in an early stage of the paper. Hendrik Boshuizen provided her expertise with the meta-analysis. The text was improved by Annemieke Righart, the English text editor at the Netherlands Environmental Assessment Agency (PBL). We also thank two anonymous reviewers whose comments improved the manuscript.

Individual and Population Level Resource Selection Patterns of Mountain Lions Preying on Mule Deer along an Urban-Wildland Gradient

Abstract

Understanding population and individual-level behavioral responses of large carnivores to human disturbance is important for conserving top predators in fragmented landscapes. However, previous research has not investigated resource selection at predation sites of mountain lions in highly urbanized areas. We quantified selection of natural and anthropogenic landscape features by mountain lions at sites where they consumed their primary prey, mule deer (Odocoileus hemionus), in and adjacent to urban, suburban, and rural areas in greater Los Angeles. We documented intersexual and individual-level variation in the environmental conditions present at mule deer feeding sites relative to their availability across home ranges. Males selected riparian woodlands and areas closer to water more than females, whereas females selected developed areas marginally more than males. Females fed on mule deer closer to developed areas and farther from riparian woodlands than expected based on the availability of these features across their home ranges. We suggest that mortality risk for females and their offspring associated with encounters with males may have influenced the different resource selection patterns between sexes. Males appeared to select mule deer feeding sites mainly in response to natural landscape features, while females may have made kills closer to developed areas in part because these are alternative sites where deer are abundant. Individual mountain lions of both sexes selected developed areas more strongly within home ranges where development occurred less frequently. Thus, areas near development may represent a trade-off for mountain lions such that they may benefit from foraging near development because of abundant prey, but as the landscape becomes highly urbanized these benefits may be outweighed by human disturbance.
Introduction

Identifying environmental conditions associated with specific activities that influence fitness of animals, such as foraging, is a fundamental pursuit in ecology and conservation biology [1, 2]. Understanding extrinsic influences on the acquisition of food resources is especially critical for the management of small populations in human-altered landscapes because suitable habitat may be limited, and fluctuations in demography due to environmental stochasticity can have serious, rapid consequences for extinction risk [3–5]. Thus, quantifying habitat and landscape features associated with successful foraging provides valuable information regarding the spatial ecology and habitat requirements of populations of conservation concern.

Large carnivores, such as mountain lions (Puma concolor), are sensitive to habitat fragmentation because they occupy large home ranges within which they must acquire sufficient large prey [6]. However, mountain lion populations are able to persist within urbanized landscapes in some situations, especially where protected lands exist within or adjacent to developed areas [7–9]. In these situations, it becomes imperative to understand predator-prey interactions and how they may be influenced by development and other landscape features encountered by mountain lions while foraging for preferred prey along urban-wildland gradients. Despite considerable interest in maintaining populations of mountain lions in ecosystems altered by anthropogenic activities (e.g., [7, 10, 11]), there is little information about predator-prey interactions and resource selection of mountain lions at predation sites within and adjacent to highly urbanized landscapes.

Ecologists are increasingly recognizing the importance of considering individual-level variation in resource selection studies [12]. A common source of variation for mountain lions are sexual differences, as males and females often use space and select resources differently [13–14]. However, most studies of resource selection specifically at foraging sites of mountain lions have not investigated sex-specific patterns [15–18], but see [14]. Another common source of individual variation in resource selection stems from spatial variation in the distribution and abundance of resources. For instance, selection of a resource may vary as a function of its availability on the landscape, often referred to as a functional response in resource selection [19]. Several studies have found that large carnivores exhibit functional responses to anthropogenic landscape features or activity, which may represent trade-offs between mortality risk and foraging success (e.g., [13, 20]). Knopff et al. [20] suggested that mountain lions in Alberta, Canada benefited from human-altered landscapes primarily through prey acquisition and found that mountain lions selected some anthropogenic features more strongly in areas where these features were more prevalent. Recently, Smith et al. [21] found that male and female mountain lions responded differently to increasing development in terms of kill rates and handling time of prey. Thus, both intrinsic (sex) and extrinsic (resource availability) sources of individual-level behavioral variation may influence mountain lion-prey interactions and resource selection in human-altered landscapes. Investigating mountain lion predation in more highly urbanized landscapes than previous studies, such as in areas within and adjacent to major metropolitan areas, may identify novel behavioral responses of these top predators to human disturbance.

We quantified selection of natural and anthropogenic landscape features at sites where mountain lions consumed mule deer (Odocoileus hemionus) across home ranges in and adjacent to the city of Los Angeles. Specifically, we addressed several questions. 1) What natural and anthropogenic landscape features were selected and avoided by mountain lions at foraging sites? 2) Were there differences in resource selection patterns between males and females? 3) Was there substantial additional individual-level variation in the responses of mountain lions to anthropogenic land-uses due to spatial variation in the level of human disturbance? Our
results are important because they provide novel information about environmental conditions
that facilitate successful predation by mountain lions in a highly urbanized landscape. This
information will be valuable for managers attempting to conserve healthy populations of
mountain lions, and naturally-functioning ecosystems, along urban-wildland gradients sur-
rounding metropolitan areas.

Methods

Ethics statement

Animal capture and handling protocols were approved by the National Park Service Institu-
tional Animal Care and Use Committee. We conducted research according to the conditions of
animal capture and handling protocol PWR_SAMO_Riley_Mt.Lion_2014.A3. Mountain lions
are not an endangered species in California. However, they are a specially protected species
that cannot be legally killed in California except under specific circumstances with a state
approved permit.

Study area

We conducted research in and adjacent to the city of Los Angeles in Los Angeles and Ventura
Counties, California (Fig 1). The study was focused on the Santa Monica Mountains National
Recreation Area (SMMNRA; 34°05’N, 118°46’W), a unit of the National Park Service, and sur-
rounding areas. Most research was carried out on public lands managed by the National Park
Service who granted us access to the properties. When access was needed to private land this
was obtained from private landowners in advance. The SMMNRA encompassed 600 km² and
included an assemblage of federal, state, and privately-owned lands largely in the Santa Monica
Mountains. The Santa Monica Mountains were bordered by the Pacific Ocean to the south; by
US 101, an 8–10 lane freeway, and various urban and suburban communities to the north; by
the highly urbanized Los Angeles basin to the east; and by agricultural and developed areas in
Ventura County to the west. Additionally, we studied mountain lions in areas north and east of
the Santa Monica Mountains in the Simi Hills, the Santa Susana Mountains, Griffith Park, and
the Verdugo Mountains (Fig 1). Griffith Park was a municipal park lying within the city of Los
Angeles in the western portion of the Santa Monica Mountain range (Fig 1). The Verdugo
Mountains were a small, rugged mountain range spanning several cities adjacent to Los Ange-
les including Glendale and Burbank (Fig 1). All patches of natural habitat in the study area
were bordered by major freeways, urbanization, or agricultural development. The study area
was characterized by a Mediterranean climate, with cool, wet winters and hot, dry summers.
There were multiple land uses throughout the area including federal, state, and local parklands,
urban and suburban areas with commercial and residential (both high and low density) devel-
opment, and agricultural areas (Fig 1). Natural vegetation consisted of mixed chaparral, coastal
sage scrub, oak woodlands and savannas, riparian woodlands, and non-native annual grass-
lands. Bobcats (Lynx rufus) and coyotes (Canis latrans) occurred throughout most of the study
area and the only wild, large ungulates were mule deer.

Capture and telemetry

We captured mountain lions using Aldrich foot-snares or cable-restraints, baited cage-traps, or
by treeing them with trained hounds during 2002–2015. We immobilized mountain lions with
ketamine hydrochloride combined with either xylazine hydrochloride or medetomidine hydro-
chloride administered intramuscularly. Animals were monitored for the duration of the time
they were immobilized. We deployed global positioning system (GPS) collars (Followit AB,
Simplex and Tellus models, Stockholm, Sweden; North Star Science and Technology LLC, Globalstar Tracker model, King George, Virginia, USA; or Vectronic Aerospace, GPS Plus model, Berlin, Germany) equipped with VHF beacons on adults. Fix schedules of GPS collars varied but we programmed most collars to obtain 1–2 day locations and 5–7 night locations per 24-hour period. Additional details of our capture, handling, and tracking of mountain lions are available elsewhere [8].

Feeding site investigations

We found carcasses of prey eaten by mountain lions by visiting clusters of GPS or VHF telemetry locations \((n = 520)\) and searching the area for prey remains. When we found prey remains \((n = 473)\) we identified the species, sex, and age of the prey when possible. We obtained coordinates at the prey remains with a handheld GPS unit. Previous research has indicated that clusters of mountain lion locations with locations from \(>1\) night had a high probability of containing a kill, and that increasing numbers and the proportion of night locations in GPS clusters were strong predictors of sites where mountain lions fed on kills [18, 21, 22, 23]. Our protocol for finding prey remains was to visit clusters of telemetry locations that contained \(\geq 2\)
night (sunset-sunrise) locations within \( \leq 50 \) meters of each other and spanning periods \( \geq 24 \) hours. We found prey remains at 91\% of the clusters we visited. We reduced the likelihood of bias in the location of these carcasses with respect to landscape features because we visited clusters of locations regardless of the topography or their proximity to habitat features or roads.

A previous study of mountain lions in southern California found that large prey are generally dragged 0–80 m from the kill site [24]. Thus, we recognize that most of the locations where we found carcasses were probably not the exact locations where the deer were killed. However, our distance-based analysis was robust to location error [25] which ensured that our results should provide reliable inferences regarding areas where deer were killed and consumed. Nonetheless, we refer to the locations where we found carcasses as feeding sites to reflect that the deer were not necessarily killed exactly at these sites.

Resource use and availability

We investigated resource selection with an approach similar to Johnson’s (1980) 3\textsuperscript{rd} order of selection by comparing locations used by mountain lions at feeding sites to those available within their annual home ranges. The use-available design for resource selection models estimates the relative probability of use of resource variables (i.e. relative to their availability). For the used locations, we identified 30 m pixels (30 x 30m) on the landscape within which we found carcasses of mule deer preyed upon by mountain lions. We also occasionally found carcasses of smaller prey species \( (n = 54, 11\% \) of kill sites) but we chose to focus our analysis on deer because they comprised the majority of carcasses and because mountain lions rely on large ungulates to survive and reproduce [13]. We had small sample sizes for smaller prey species \( (n \leq 33 \) for each individual prey species smaller than deer). Additionally, given that mountain lions likely spent considerably less time at sites where smaller prey items were consumed, we assumed we missed more of the smaller prey.

To estimate availability, we estimated adaptive local convex hull home ranges in R version 2.15.1 with the package ‘adehabitat’ using GPS telemetry data for each mountain lion included in our analysis. We set the ‘a’ parameter as the maximum distance between any 2 points in each dataset [26]. In total, we estimated 49 home ranges for 26 mountain lions with telemetry data (mean number of locations = 1814, range = 166–5507) collected across 1–12 months (mean number of monitoring days = 247, range = 30–365). In most (90\%) cases we estimated home ranges with data specific to a single calendar year that matched the year of the feeding sites identified for that mountain lion. In the remaining cases (10\%) we combined continuous data from 2 consecutive calendar years (if < 40 days of data were available within a single year) to provide a better estimate of space use for that individual. We used calendar year as our temporal unit rather than season because seasonal variation in climate and conditions was relatively subtle in our southern California study area.

We systematically sampled 30 m pixels separated by 150 m throughout each annual home range resulting in 44 pixels/ km\(^2\) to estimate resources available to each mountain lion [27]. We calculated distances to habitat types, land use designations, and roads from the centroid of all 30 m pixels used by (feeding sites) and available to (systematic locations across each individual’s home range) mountain lions while preying on deer. Additionally, we classified the slope and elevation values associated with used and available pixels. We modified 2 existing habitat/vegetation layers (Santa Monica Mountains National Recreation Area Vegetation Layer, 2007 and the CALVEG—South Coast Layer [CALVEG, USDA-Forest Service, Pacific Southwest Region, 2013]) by combining similar habitat types to produce a layer with 6 broad habitat classes: chaparral, coastal sage scrub, prairie/meadow, upland woodland, riparian woodland, and water (Table 1). For areas where natural habitat was developed or otherwise altered for
anthropogenic activities, we generalized a digital land-use map for 2 classes of anthropogenic land use: developed areas (3% of mountain lion home ranges) and altered-open areas (9% of home ranges). Developed areas included commercial and residential areas with ≥1 house/acre. Altered-open areas were modified by humans to a lesser extent than developed areas and included golf courses, schools, landscaped areas such as city parks, low-density residential areas (<1 house/acre), cemeteries, horse ranches, and other moderately developed areas. We calculated distances from the centroid of all used and available pixels to the closest pixel of the 6 habitat classes and 2 land-use classes using the Euclidean Distance tool in the Spatial Analyst toolbox in ArcGIS 10.2.2 (ESRI, Redlands, CA, USA) using Geographic Information System (GIS) methods described by Benson [27]. We also estimated distances from used and available locations to 3 classes of paved roads, as well as a single class of unpaved roads and trails (hereafter referred to as trails). Additionally, we estimated slope and elevation from digital elevation models (DEM) in ArcGIS (Table 1). DEM data were estimated at 9.5 m resolution, but we averaged these data across 30 m used and available pixels for our analyses. These distance and classification based values allowed us to compare resources used by and available to lions while preying on deer.

Distance-based variables are effective for assessing habitat selection [28] and using continuous, distance-based variables for habitat classes (rather than categorical variables) also eliminated the need to base inference on subjectively chosen reference categories in our regression models [29]. Distance-based approaches for habitat selection analysis are also robust to error in location data [26] and mitigate GIS error. Thus, even though mountain lions likely dragged carcasses short distances from the actual kill sites, our distance-based analysis should capture selection of areas where lions killed and consumed deer. Distance-based analyses are especially effective for assessing resource-selection at individual sites on the landscape, such as feeding sites, because the proximity to specific resource variables (e.g., water or developed areas) is quantified even if the sites of interest rarely or never actually fell within the habitat types or land-use types being considered.

Resource-selection models

We modeled resource selection at feeding sites with generalized linear mixed models (GLMMs) implemented in the R (version 3.1.1) package lme4 with a binary (0 = available, 1 = used) response variable. We included random intercepts for individual and year in each model, with year nested in individual. Including random intercepts for individuals mitigated
the effects of the unbalanced feeding site data across individuals (range 1–77) and the lack of independence between used locations from the same individual [30]. The random intercept of year accounted for correlation between sites used within a given year by a given individual and paired the year-specific used and available data appropriately within our models. We did not include the paved road classes in our resource selection models because of 1) the infrequency of major highways (primary roads) within mountain lion home ranges, and 2) correlation of intermediate-sized paved roads (secondary roads) and smaller paved roads (tertiary roads) with developed \((r = 0.53)\) and altered-open \((r = 0.57)\) areas, respectively. Secondary and tertiary roads were also correlated with each other \((r = 0.55)\). Finally, we excluded the coastal sage-scrub habitat class because it was correlated \((r = 0.63)\) with elevation. We were more interested in investigating and accounting for the general influence of elevation on selection of feeding sites than the influence of the specific habitat-type of coastal sage-scrub. Correlation between other predictor variables was modest or low \((r < 0.44)\) so we included all remaining variables in our global model (Table 1). Prior to modeling, we rescaled values for all continuous variables by subtracting their mean and dividing by 2 standard deviations following Gelman [31].

The terms “selection” and “preference” have sometimes been used synonymously or inconsistently in the resource selection literature [29, 32]. To avoid confusion, we use the term selection throughout to indicate 1) that used locations (feeding sites) were significantly closer to distance-based resource variables (habitat types, land-use types, trails) than were available locations, or 2) that values of classification-based resource variables (elevation and slope) were significantly greater at used locations relative to available locations. Specifically, we inferred selection or avoidance of resource variables when 95% or 90% confidence intervals of fixed-effect beta coefficients did not overlap 0.

We investigated potential sex-specific patterns in resource selection at feeding sites by including a dummy-coded ‘male’ variable \((0 = \text{female}, 1 = \text{male})\) and fitting interactions between ‘male’ and each resource variable. We compared the fit of the null model, the global model with all resource variables, a model with interactions between ‘male’ and each resource variable, and a reduced interactions model retaining only interactions that indicated or approached significance (i.e. when 85% confidence interval did not overlap 0) using Akaike’s Information Criteria (AIC; [33]). This allowed us to evaluate support for models of varying complexity by calculating differences \((\Delta)\) in AIC values (lower values indicate better fit). We concluded there was strong empirical support for more complex models if \(\Delta \text{AIC} > 5\). We investigated the significance and marginal significance of fixed effects and interactions in strongly supported models with 95% and 90% confidence intervals, respectively.

We tested the predictive ability of our models using k-fold cross validation implemented in ‘lme4’ as described by Boyce et al. [34]. Specifically, we used 80% of the data (training data) to build a model that was then used to predict the relative probability of use of the remaining 20% (test data). This procedure was repeated 5 times until all data had been used as both training and test data. We ran Spearman rank correlations to assess relationships between the frequency of cross-validated feeding site locations and 10 probability bins of equal size representing the range of predicted values. A model with good predictive ability is expected to show a strong correlation with higher numbers of locations falling into higher probability bins [34].

**Functional responses to human disturbance**

We also explored additional individual variation in selection of areas modified by humans. Specifically, we hypothesized that distance of mule deer feeding sites to developed or altered-open areas might vary as a function of the availability of these areas, consistent with a functional response in resource selection as defined by Mysterud and Ims [19]. To test these
hypotheses, we constructed resource-selection proportions by dividing the mean distance at used locations by the sum of the mean used and available locations (mean used distance / [mean used + mean available]). Proportions of 0.5 represented no difference between used and available, proportions < 0.5 indicated mountain lions were closer to the feature than expected, and proportions > 0.5 indicated mountain lions were farther from the feature than expected. We averaged selection proportions and availability values across years for individuals with feeding sites documented in multiple years. We only constructed these proportions for mountain lions for which we documented ≥ 5 feeding sites (n = 19). We explored potential functional responses by modeling these resource-selection proportions (response variable) as a function of distance-based resource availability of the same resource (predictor variable, i.e. mean distance to the feature of interest across home ranges) using beta regression models with a ‘probit’ link which is appropriate for conducting regression on a proportional response variable. We fit 2 separate models for developed and altered-open areas using generalized additive models (GAMs) in the R package ‘mgcv’ version 1.8–0. We specified predictor variables as non-parametric smooth functions (splines) in the GAMs to allow for the possibility of non-linear relationships, which are often observed with functional responses [12]. However, if the relationship between the response and predictor variables was better modeled as linear (i.e. estimated degrees of freedom [edf] = 1) then predictor terms were included as parametric fixed effects [35]. Thus, because semi-parametric GAMs do not assume a linear response, they allowed us to evaluate whether selection of anthropogenic resources by individual mountain lions varied as a linear or non-linear function of availability. Small samples precluded testing for differences in functional responses between sexes. However, we visually inspected plots of the raw data to ensure that pooling sexes was not disguising obvious differences and that these relationships were qualitatively similar between sexes.

Results

Feeding sites

We included the locations of 420 mule deer killed by 26 mountain lions (16 males, 10 females) in our analysis. We found 229 mule deer killed by mountain lions in chaparral (55%), 91 in coastal sage-scrub (22%), 52 in upland forest (12%), 14 in prairie-meadow (3%), 8 in riparian-woodland (2%), 8 in disturbed areas (2%), 8 in altered-open areas (2%), 5 in exotic vegetation (1%), 2 in rocky outcrops (<1%), 2 in developed areas (<1%), and 1 in water (<1%). In reality, the 1 kill classified as being in water was located close to (rather than in) water. This kill was < 5m from the edge of a water patch in our habitat layer and was classified as water because it fell within the boundary of a pixel classified as water.

Population-level and sex-specific resource selection

Model fit for models with resource variables was considerably better than for the null model, indicating that the resource variables provided substantial information regarding resource selection at mule deer feeding sites (Table 2). There was also support for considering differences in resource selection at feeding sites between male and female mountain lions (Table 2). Model fit was best with the reduced interactions model which accounted for sex-specific differences in selection of riparian woodland, water, and developed areas (Table 2). Males selected riparian woodland and water more than females, whereas females selected developed areas marginally more than males (Table 3, Figs 2 and 3). Main effects for the resource variables fit with interactions indicated that females significantly selected developed areas, whereas they avoided riparian woodlands (Table 3). Females did not select or avoid water (Table 3). There were not significant sex-specific differences for other resource variables. Mountain lions
avoided higher elevations, whereas they selected steeper slopes, chaparral, and upland forests at mule deer feeding sites (Table 3). Mountain lions also marginally selected trails at mule deer feeding sites (Table 3). Sex-specific maps of the relative probability of use of mule deer feeding sites by males and females are shown in Figs 2 and 3. The best resource-selection model, with 3 sex-specific interactions, had good predictive ability as the frequency of cross-validated locations within probability bins were highly correlated with bin ranks ($r_s = 0.85$).

### Functional response modeling

Mountain lions exhibited a functional response to developed areas at feeding sites as there was a significant, negative relationship between selection of developed areas and mean distance to developed areas within individual home ranges ($\chi^2 = 7.89, P = 0.005$, Deviance explained = 32.7%, $n = 19$) which did not differ from a linear trend (edf = 1.0; Fig 4). In general, mountain lions selected developed areas at mule deer feeding sites more within home ranges where developed areas were less common (Fig 4). Mountain lions did not select altered-open areas as a function of their availability ($\chi^2 = 1.0, P = 0.541$, edf = 1.6, $n = 19$).

doi:10.1371/journal.pone.0158006.t003
Discussion

Our results indicate that multiple environmental variables influence the location of mountain lion-mule deer predation events in the fragmented landscape along the urban-wildland gradient in the greater Los Angeles metropolitan area. Unfortunately no studies of mule deer have been conducted within our study area, so there is little information about mule deer abundance and distribution relative to habitat types and other environmental variables. Nonetheless, our results clearly reflect areas where mule deer were present, as well as where they were vulnerable to predation by mountain lions. Given the importance of obtaining sufficient large ungulate prey for maintaining healthy populations of mountain lions [13], understanding where mountain lions are able to kill mule deer is a valuable first-step in understanding the spatial ecology and resource selection of mountain lions in and adjacent to the Santa Monica Mountains.

Females selected mule deer feeding sites closer to developed areas at the population-level, and fed on deer marginally closer to developed areas than males, relative to availability. We point out that this selection was in a distance-based context and that no feeding sites for females were actually located within developed areas (mean distance to developed areas = 1316 m, range = 95–5165 m, n = 186 sites from 10 females). Thus, female mountain lions fed on mule deer closer to developed areas than expected, rather than within developed areas. We did find 2 feeding sites for males within developed areas (mean = 1304 m, range 0–4773, n = 234 sites from 16 males). Wilmers et al. [14] also documented female mountain lions selecting

![Relative probability of use of mule deer feeding sites by female mountain lions in the Santa Monica Mountains and Simi Hills, southern California, 2002–2015. Relative probability of use predicted by generalized linear mixed model of resource selection.](image)

doi:10.1371/journal.pone.0158006.g002
developed areas more than males (while traveling) and suggested that deer may be more abundant in developed areas in central California. Indeed, deer are often attracted to disturbed areas and cultivated vegetation [36]. In southern California, mule deer might also be abundant near developed areas due to the paucity of natural water sources, as residences provide water from sprinklers, swimming pools, and other sources. The extreme drought in southern California from 2012–2015 may have made these anthropogenic water sources, and the relatively lush vegetation they support, particularly important to deer.

However, there was additional individual variation in the selection of developed areas at the individual-level that was consistent with a functional response in resource selection. Mountain lions with home ranges with greater availability of developed areas selected developed areas less than those in more remote areas. This finding suggests that some developed areas can be beneficial to mountain lions and further supports previous contentions that anthropogenic disturbance is associated with greater prey availability [14, 20]. However, developed areas may also represent increased mortality risk for mountain lions [37]. Thus, there may be a trade-off for mountain lions associated with development as the potential negative effects of human disturbance appeared to outweigh the benefits at higher levels of urbanization. The developed

![Figure 3. Relative probability of use of mule deer feeding sites by male mountain lions selection in the Santa Monica Mountains and Simi Hills, southern California, 2002–2015. Relative probability of use predicted by generalized linear mixed model of resource selection.

doi:10.1371/journal.pone.0158006.g003](https://www.plosone.org/doi/10.1371/journal.pone.0158006)
areas in the highly urbanized portions of the study area, such as the densely populated neighborhoods surrounding Griffith Park and the Verdugo Mountains were characterized by higher levels of human activity and tended to be larger than developed areas in remote areas such as the Santa Monica Mountains (see Fig 1). Thus, both the size (as seen in Fig 1) and availability (quantified in our functional response analysis) of developed areas may influence where mountain lions kill mule deer. Killing and consuming deer farther from developed areas in more populated areas appears to be one way that mountain lions minimize interactions with humans in southern California.

The functional response we documented was contrary to the response exhibited by mountain lions in Alberta, where individuals decreased their avoidance of oil and gas pipelines and well sites as these features became more prevalent on the landscape [20]. There are several potential explanations for this apparent discrepancy. First, human populations and activity were considerably greater in the Los Angeles area (18.5 million people) than in west-central Alberta where populations in communities and rural areas ranged from 515–7231 people [20]. Thus, in rural areas that are relatively sparsely populated, mountain lions may select anthropogenic features more as these features become more abundant to compensate for reductions in natural habitat and to exploit potentially greater prey availability in these areas, as suggested by
Knopff et al. [20]. When human presence and development reaches higher levels, as in southern California, mountain lions may stop selecting these features or even avoid them. Second, although deer may be attracted to lower and intermediate levels of disturbance and development [14, 36], they may be less common in highly developed areas in southern California making these areas less attractive to mountain lions.

Mountain lions in general resource selection studies in Washington and central California did not exhibit functional responses to development [14, 38]. Although these studies were conducted in human-altered landscapes, the mountain lions they studied almost certainly did not encounter human population densities as high as those found within and adjacent to Los Angeles, the second largest metropolitan area in the United States. That our results differ from areas where human population sizes are lower highlights the important and unique nature of our study area where mountain lions can be studied across a steep gradient of human disturbance that spans areas from within the city of Los Angeles, to relatively remote areas of protected lands within the Santa Monica Mountains. Understanding the range of behavioral responses of mountain lions to varying levels of urbanization and human disturbance is critically important if we are to maintain healthy populations of top predators, and relatively intact ecosystems, as development, urbanization, and human populations continue to increase.

In the strongest intersexual difference documented by our analyses, males showed strong selection of riparian woodlands, whereas females avoided these areas. Riparian woodlands might be attractive to male mountain lions because they are visited by mule deer taking advantage of the relative abundance of lush vegetation in these habitat patches in the dry Mediterranean landscape. Indeed, previous studies have shown that mule deer select riparian habitat types and that they are distributed in close proximity to water and succulent vegetation [39–41]. Additionally, riparian woodlands may be used by males because they represent corridors that facilitate travel across their large home ranges as these woodlands offer vegetative cover and terrain that is likely easier to traverse than the steep ridges and rugged canyons that are common throughout the study area. Although riparian woodlands may also be attractive to females, we suspect females may have avoided them to minimize encounters with aggressive males. The leading cause of death for mountain lions in our study area is intraspecific aggression, as males often kill other mountain lions including females and their offspring [8]. Confrontations over prey carcasses are thought to be a major reason why male mountain lions kill conspecifics [13]. Interestingly, an earlier study of general habitat selection by mountain lions in the Santa Ana Mountains adjacent to Los Angeles showed that riparian woodlands were selected above all other habitats by a sample of mountain lions that was mostly females [42]. This apparent discrepancy may be explained by the fact that we studied feeding sites specifically, or because intraspecific aggression does not appear to be a major source of mortality for mountain lions in the Santa Ana Mountains [43]. Thus, the higher intraspecific mortality risk in our study area may lead to stronger intersexual differences in resource selection.

The difference in the use of water by males and females may also reflect a trade-off made by females between selecting feeding sites where prey are abundant and vulnerable, and avoiding encounters with males. Standing water in ponds and streams is relatively rare in our study area and these water sources, and the vegetation they support, likely attract abundant mule deer. Indeed, proximity to water sources was a strong predictor of mule deer fawn and doe distribution in San Diego County [40]. However, anthropogenic sources of water (e.g., pools and sprinklers) are available in our study area and also may attract deer. It is possible that males prey on deer closer to natural water sources, whereas females prey on deer closer to developed areas which represent alternative areas where water is available and deer congregate. Given that mountain lion hunting is illegal in California, and that human activity in many developed areas would be relatively low at night when mountain lions are killing and eating deer, this
trade-off could be beneficial from a fitness standpoint. However, Smith et al. [21] recently showed that females left mule deer kills sooner and compensated with higher kill rates in areas of greater development in central California. This suggests that there could be energetic costs for females preying on mule deer near developed areas. Although avoiding areas of natural habitat where deer are abundant and vulnerable may reduce intraspecific mortality risk, increased energetic expenditures associated with foraging near developed areas could potentially negatively influence fitness of females by lowering reproductive output or offspring survival.

Finally, previous studies have found that mountain lions select habitats with dense under-story vegetation and noted the importance of adequate stalking cover to allow for successful hunting [14, 25, 38, 42]. Our results support these findings as chaparral, a habitat-type characterized by extremely dense shrubs, was selected by mountain lions at mule deer feeding sites and males strongly selected riparian woodlands which would also have dense stalking cover. Correlation between elevation and distance from coastal sage scrub habitat prevented us from completely separating avoidance of higher elevations and selection for coastal sage scrub. Exploratory analyses suggested both variables were important when included separately in different models, although the avoidance of higher elevation was considerably stronger than selection for coastal sage scrub. We chose to include elevation in our final model to avoid conducting regression with strongly correlated variables, but we do not suggest that coastal sage scrub is not potentially important foraging habitat for mountain lions in southern California. That 22% of the mule deer carcasses killed by mountain lions we documented were discovered in coastal sage scrub habitat highlights this point.

Our results and maps of relative probability of use of mule deer feeding sites should be incorporated into land management decisions in the Santa Monica Mountains National Recreation Area, as well as in other state, federal, city, and private parks and protected areas across the greater Los Angeles area to conserve mountain lions and naturally-functioning predator-prey dynamics. Our finding that mountain lions feed on their primary prey farther from development relative to availability as a function of increasing urbanization is broadly important because it extends understanding of how anthropogenic disturbance influences mountain lion resource selection at feeding sites with data in and around a major metropolitan area. Our results suggest that continued development in areas used by mountain lions adjacent to Los Angeles and other metropolitan areas could reduce the quality of foraging habitat for mountain lions, as they feed on mule deer farther from development when there was greater availability of developed areas within their home ranges. This functional response also indicates that, at least with respect to their behavior while preying on mule deer, mountain lions in and adjacent to Los Angeles appear to exhibit behavior that should reduce encounters and potential conflicts with humans. Our current results should be linked with analyses of resource selection by mountain lions during other activities, such as traveling and denning, to provide a more comprehensive understanding of how mountain lions use the landscape along the urban-wildland gradient in southern California. Our current model, combined with additional resource-selection analyses, could be used to evaluate the potential influence of new development projects on the relative probability of use of these areas by mountain lions.

Acknowledgments

We thank the many NPS biologists and interns who assisted with fieldwork, including: J. Moriarty, J. Brown, E.C. York, C. Schoonmaker, E. Lara, C. Bromley, P. Roby, K. McCurdy, J. Fitzgerald, J. Golla, E. Bohling, and J. Dorcy. We thank B. Clarke, D. Kamradt, and L. Lee for assistance with GIS layers. We thank the La Kretz Center for California Conservation at
UCLA, California State Parks, the Santa Monica Mountains Fund, Santa Monica Mountains Conservancy/Mountains Recreation and Conservation Authority, and the Calabasas Landfill for funding support.

Abstract. Extinction risk is elevated in small, isolated populations due to demographic and genetic interactions. Therefore, it is critical to model these processes realistically in population viability analyses (PVA) to inform local management and contribute to a greater understanding of mechanisms within the extinction vortex. We conducted PVA’s for two small mountain lion populations isolated by urbanization in southern California to predict population growth, extinction probability, and loss of genetic diversity with empirical data. Specifically, we (1) provide the first PVA for isolated mountain lions in the Santa Ana Mountains (SAM) that considers both demographic and genetic risk factors and (2) test the hypothesis that variation in abundance and mortality between the SAM and Santa Monica Mountains (SMM) result in differences in population growth, loss of heterozygosity, and extinction probability. Our models predicted 16–21% probability of local extinction in the SAM due purely to demographic processes over 50 yr with current low levels or no immigration. Our models also predicted that genetic diversity will further erode in the SAM such that concern regarding inbreeding depression is warranted unless gene flow is increased, and that if inbreeding depression occurs, rapid local extinction will be highly likely. Dynamics of the two populations were broadly similar, but they also exhibited differences driven by larger population size and higher mortality in the SAM. Density-independent scenarios predicted a rapidly increasing population in the SMM, whereas growth potential did not differ from a stable trend in the SAM. Demographic extinction probability and loss of heterozygosity were greater in the SMM for density-dependent scenarios without immigration. However, higher levels of immigration had stronger, positive influences on both demographic viability and retention of genetic diversity in the SMM driven by lower abundance and higher adult survival. Our results elucidate demographic and genetic threats to small populations within the extinction vortex, and how these vary relative to demographic structure. Importantly, simulating seemingly attainable increases in connectivity was sufficient to greatly reduce extinction probability. Our work highlights that conservation of large carnivores is achievable within urbanized landscapes, but requires land protection, connectivity, and strategies to promote coexistence with humans.

Key words: demographic stochasticity; extinction; heterozygosity; inbreeding; mortality; population viability analysis; Puma concolor; urbanization.

INTRODUCTION

Demographic and genetic processes, and interactions between them, influence probability of extinction for small, isolated populations (Saccheri et al. 1998, O’Grady et al. 2006). Specifically, deterministic stressors, demographic and environmental stochasticity, and inbreeding depression can all contribute to increased extinction probability (Mills and Smouse 1994, Beissinger et al. 2008). However, the relative influence of these processes in different wildlife populations remains difficult to predict and empirical demonstrations are rare (Palomares et al. 2012, Wootton and Pfister 2013). The predicted decline to extinction of small populations from these interacting processes is referred to as the extinction vortex (Gilpin and Soulé 1986). Modeling dynamics of small, isolated populations provides critical information to local conservation efforts and also
contributes to a more general understanding of the forces influencing extinction.

All populations with small numbers of breeding individuals are likely to be destabilized by demographic stochasticity (Lande 1993, Morris and Doak 2002) and are also the most likely to suffer from inbreeding depression (Mills and Smouse 1994). However, variation in local environmental conditions, and resulting differences in demographic structure, can influence population growth, the rate at which genetic diversity is lost, and extinction probability (Stacey and Taper 1992, Reed 2005). Prior to the onset of inbreeding depression, some small populations continue to exhibit strong survival and reproduction (Benson et al. 2016a), while others suffer from poor demographic performance due to ongoing deterministic stressors (Caughley 1994). Comparing dynamics of isolated populations of the same species but of varying abundance, and with different vital rates and associated deterministic stressors, will increase our understanding of demographic and genetic processes of small populations.

Mountain lions (Puma concolor) exist at low density, have female-biased sex ratios, and often exhibit highly skewed male reproductive success (Johnson et al. 2010, Riley et al. 2014). These traits reduce effective population size (Mills and Smouse 1994) and have made mountain lions important study species for investigating small population dynamics (Johnson et al. 2010, Benson et al. 2016a). Indeed, one of the clearest demonstrations of inbreeding depression driving a population to the brink of extinction was with endangered Florida panthers (a subspecies of mountain lions, Puma concolor coryi; Johnson et al. 2010). Panthers exhibited reduced fitness from inbreeding depression and declined to fewer than 30 individuals; however, extinction was avoided and the population rapidly increased following genetic restoration (Johnson et al. 2010).

Small, isolated populations of mountain lions have also persisted within the highly urbanized landscape of southern California in the Santa Monica Mountains (SMM) and Santa Ana Mountains (SAM) northwest and southeast of Los Angeles. These two populations exhibit the lowest genetic diversity documented for the species aside from Florida panthers (Ernest et al. 2014, Riley et al. 2014). Recently, a population viability analysis (PVA) indicated that mountain lions in the SMM population exhibited strong survival and reproduction and predicted generally stable population growth for the next 50 yr (Benson et al. 2016a). However, this PVA also predicted potential for extinction due purely to demographic factors, as well as rapid loss of genetic diversity that raised concern about inbreeding depression (Benson et al. 2016a). An earlier PVA for mountain lions occupying the SAM indicated that the population was demographically unstable and that additional habitat loss would lead to a high risk of extinction (Beier 1993). This PVA explicitly considered the influence of corridors and habitat loss on extinction probability due to demographic processes, but ignored potential effects of inbreeding depression. Furthermore, most of the demographic rates came from the literature rather than from empirical data collected within the SAM (Beier 1993). Given the isolation and low genetic diversity documented for this population (Ernest et al. 2014, Gustafson et al. 2017), as well as additional fragmentation of the available habitat that has occurred (Burdett et al. 2010), an updated PVA constructed with empirical genetic and demographic data is needed for mountain lions in the SAM to evaluate the influence of interactions between genetics, demography, and landscape connectivity in this heavily human-dominated landscape.

The SMM and SAM are both occupied by small populations of mountain lions in similar habitats isolated by anthropogenic barriers and exhibiting low levels of genetic diversity (Ernest et al. 2014, Riley et al. 2014). However, there are notable differences in demographic structure of the two populations that could have consequences for population dynamics and viability. First, the estimated number of breeding adults in the SAM was approximately twice that estimated for the SMMs (Beier 1993, Ernest et al. 2014, Riley et al. 2014, Benson et al. 2016a). Differences in abundance were clearly related to the smaller patch of available habitat within the SMM relative to the SAM (Beier 1993, Benson et al. 2016a). Importantly, smaller population and habitat island size are strong predictors of reduced genetic diversity (Frankham 1995). Second, survival rate of radiocollared adult mountain lions in the SAM, where the main cause of death was collisions with vehicles, was lower than other unhunted populations (Vickers et al. 2015). In contrast, adult survival in the SMM was as high or higher than most unhunted populations and the main cause of death was intraspecific strife (Riley et al. 2014, Benson et al. 2016a). This could have important implications because mountain lion population growth is most strongly influenced by adult female survival (Lambert et al. 2006, Benson et al. 2016a). Thus, comparing the dynamics of these populations will inform conservation efforts and provide empirical insight into the influence of variation in demographic structure (i.e., abundance and survival rate) on the relative influence of demographic and genetic processes, and how they interact to influence extinction risk. Such research would represent an important case study for understanding the dynamics of isolated populations and provide insight into management strategies for maintaining viable populations of top predators within human-dominated landscapes.

We used the individual-based population model of Benson et al. (2016a) parametrized with empirical demographic and genetic data collected during long-term studies of mountain lions in our focal populations to model dynamics and viability. We constructed starting populations with empirical, multi-locus genotypes that reflected the age, sex, and genetic structure of the current populations and projected models forward to estimate
stochastic population growth, extinction probability, and measures of genetic diversity over the next 50 yr. We used these model projections to address multiple questions regarding the viability of populations of top predators in isolated mountain ranges within highly urbanized landscapes. First, we investigated the dynamics and viability of mountain lions in the SAM to evaluate the influence of demographic and genetic processes on probability of extinction. Second, we hypothesized that variation in population abundance and mortality patterns in small, isolated mountain lion populations would result in differences in population growth, the rate of loss of genetic diversity, and extinction probability. We predicted that reduced adult survival would result in lower population growth and greater extinction probability due purely to demographic processes (P1a). We also tested the alternative prediction that the greater number of breeding adults and carrying capacity in the SAM would offset the lower survival and result in similar growth and extinction probability between the two populations (P1b). Next, we predicted that genetic diversity would erode more quickly in the SMM population given the smaller number of individuals and smaller amount of available habitat (P2). Finally, we predicted that reductions in vital rates due to inbreeding depression would result in high probability of extinction for both populations (P3). We provide the first PVA for mountain lions in the SAM that explicitly models both demographic and genetic processes. More broadly, our results elucidate how variation in abundance, carrying capacity, vital rates, and sources of mortality influence mechanisms underlying the extinction vortex for isolated populations in fragmented landscapes. Thus, our work provides a case study that will help to inform conservation of isolated wildlife populations in human-dominated landscapes.

MATERIALS AND METHODS

Study area

We studied mountain lions in two isolated mountain lion populations occupying mountain ranges southeast (SAM: Orange, Riverside, and San Diego Counties) and northwest (SMM: Los Angeles and Ventura Counties; Fig. 1) of the city of Los Angeles. The SAM population

Fig. 1. Greater Los Angeles, southern California, USA showing the location of the Santa Monica (blue polygon) and Santa Ana (red polygon) Mountains within which we studied population dynamics of mountain lions. Also shown are other nearby mountain ranges, major (white lines) and more minor (gray lines) roads, and areas where natural habitat has been replaced by urbanization (dark gray) and agriculture (lighter gray).
inhabited approximately 1,533 km² in the SAM, a portion of the Peninsular Ranges including federal, state, county, and private lands. The SMM population inhabited approximately 600 km² in the Santa Monica Mountains, part of the Santa Monica Mountains National Recreation Area, a unit of the National Park Service that included an assemblage of federal, state, and privately owned lands. The areas occupied by both populations were bordered by a combination of anthropogenic (freeways, development, agriculture) and natural (Pacific Ocean) barriers that have drastically restricted movement of mountain lions between the populations and surrounding areas. Both were characterized by a Mediterranean climate, with cool, wet winters and hot, dry summers. Vegetation consisted mainly of mixed chaparral, coastal sage scrub, oak woodlands and savannas, riparian woodlands, and nonnative annual grasslands. Mountain lions were the only remaining large carnivore and the only wild ungulates were mule deer (Odocoileus hemionus). Both study areas have been described extensively elsewhere (Burdett et al. 2010, Riley et al. 2014, Vickers et al. 2015, Benson et al. 2016b).

Capture and monitoring

We captured mountain lions using Aldrich foot-snares or cable restraints, baited cage-traps, or by treeing them with trained hounds. We deployed global positioning system (GPS) or very high frequency (VHF) radio-collars on adult and subadult mountain lions. In the SMM, we also captured 3–5 week old kittens at natal dens by hand and implanted VHF transmitters in their peritoneal cavities (Moriarty et al. 2012). We monitored survival and determined causes of mortality of radio-instrumented mountain lions as described previously (Beier and Barrett 1993, Vickers et al. 2015, Benson et al. 2016a). We monitored reproduction of all collared females in the SMM using GPS telemetry to locate natal dens and count kittens (Moriarty et al. 2012). In the SAM, all capture and handling was conducted under Protocol 10950/PHS, Animal Welfare Assurance number A3433-01, with capture and sampling procedures approved in Protocol number 17233 by the Animal Care and Use Committee at the University of California, Davis, and Memoranda of Understanding and Scientific Collecting Permits from the California Department of Fish and Wildlife (CDFW). In the SMM, all capture and handling protocols were approved by the National Park Service Institutional Animal Care and Use Committee under protocol PWR_SAMO_Riley_Mt.Lion_2014.A3.

Genotyping

We genotyped all captured mountain lions at 44 (SAM) or 54 (SMM) microsatellite loci using laboratory methods and markers described previously (Ernest et al. 2014, Riley et al. 2014). Briefly, we extracted DNA from blood or tissue using DNeasy Blood & Tissue Kit (QUIAGEN, Valencia, California, USA). The loci used for genotyping mountain lions in both populations conformed to expectations for Hardy-Weinberg and linkage equilibria (Ernest et al. 2014, Riley et al. 2014). We used many of the same genotypes analyzed by Ernest et al. (2014) and Riley et al. (2014) to parameterize our model but also included genotypes from mountain lions captured more recently. We also genotyped mountain lions from samples obtained from areas adjacent to our focal populations to simulate immigration in our models.

Demographic parameters

We separated mountain lions into three age classes for parameter estimation. Kittens were dependent offspring with their mother (0–14 months), subadults were independent animals prior to reproduction (females, 14–25 months; males, 14–42 months), and adults were breeding animals (females, >25 months; males, >42 months; Benson et al. 2016a). We estimated sex and age-class specific survival rates using the Kaplan-Meier estimator generalized for staggered entry (Pollock et al. 1989) implemented in R version 3.1.3 (R Development Core Team 2015) with the package “survival”. We estimated survival for adults and subadults separately for the SMM and SAM using empirical data from each population. We used survival data collected during 1987–1993 (Beier and Barrett 1993) and 2003–2016 (Vickers et al. 2015; T. W. Vickers et al., unpublished data) for the SAM, and during 2002–2015 for the SMM (Riley et al. 2014, Benson et al. 2016a). Females in the model bred in the first month after reaching adulthood and again following loss or independence of kittens, consistent with documentation in our field study (Benson et al. 2016a). We estimated the probability of females having two, three, or four kittens in a litter based on the proportion of these litter sizes documented in the SMM during 2004–2017 (all input demographic parameters are shown in Appendix S1: Table S1). Although the samples sizes used to estimate demographic parameters were relatively small numerically, they should be representative given the small size of the populations.

Model overview

We used the individual-based population model for mountain lions of Benson et al. (2016a) that incorporated demographic and environmental stochasticity, as well as a simple form of density dependence. We did not have data to understand the influence of catastrophes on vital rates of mountain lions in these populations, so our model assumes these unpredictable events do not occur during our projections. We began models with starting populations of individuals that reflected the sex, age, and genetic structure of the populations and projected the models forward to estimate the demographic and genetic structure of future populations. In the SAM, we
combined information from published estimates of population density and available habitat, as well as information from our ongoing 15-yr field study to assemble the starting population. Beier and Barrett (1993) and Beier (1993) estimated 2,070 km$^2$ of available habitat for the SAM population. We adjusted this estimate by subtracting 506 km$^2$ to remove the Chino Hills that are now isolated from the SAM by highway 91 and no longer occupied by mountain lions (Fig. 1). We further reduced the available habitat by 2% to reflect habitat loss during 1993–2017 based on estimates of Burdett et al. (2010). Thus, our estimate of available habitat for mountain lions in the SAMs was 1,533 km$^2$. Beier and Barrett (1993) estimated mountain lion density to be 0.7 females and 0.35 males/100 km$^2$. We applied estimates of mountain lion density (0.7 females and 0.35 males/100 km$^2$; Beier and Barrett 1993) to our habitat area estimate, which yielded 11 adult females and 5 adult males. We also included 9 kittens and 4 subadults. Although we did not formally estimate population density in our study, the abundance:habitat area ratios we used from Beier and Barrett (1993) agreed with observations made using telemetry, genetic analysis, and camera trapping during our intensive 15-yr study. We assigned empirical genotypes at 44 loci to all starting individuals in the SAM. The starting population for the SMM population was 15 mountain lions (including 5 adult females and 2 adult males) with empirical genotypes at 54 loci as described by Benson et al. (2016a).

We ran simulations consisting of 5,000 population projections of 50 yr unless noted otherwise. Although researchers sometimes attempt to predict extinction probability farther into the future (e.g., 100 yr), we followed the recommendation of Morris and Doak (2002:452) to avoid projecting population viability far into the future because of the increased uncertainty of predictions made over longer time periods. The population dynamics simulated by the model were a reflection of individual-based demographic processes specified by empirical probability distributions estimated with data collected in both populations. We imposed mortality (survival senescence) on all mountain lions of both sexes in the model that reached 15 yr of age (Benson et al. 2016a). We incorporated density dependence by imposing a maximum number of adult, breeding males (SMM, $n = 2$; SAM, $n = 5$) and females (SMM, $n = 6$; SAM, $n = 11$) that could exist in the population at any given time. For the SMM, we felt confident that our estimates were the maximum numbers of breeding individuals that could occupy the available habitat. The greater area and size of the SAM population contributed to uncertainty in our carrying capacity estimates; thus, we also explored an alternate scenario with a greater carrying capacity of 7 adult males and 14 adult females. For all scenarios, when all the adult slots of a given sex were occupied, we eliminated individuals of that sex that would have otherwise transitioned from sub-adults to adults. This process simulated density-dependent population regulation through death or dispersal. Although the upper limits for adult males and females were fixed, the number of adults varied stochastically during model projections due to variation in survival and reproduction. When breeding occurred within the model, we assigned genotypes to resulting offspring based on principles of Mendelian genetics (i.e. 1 allele randomly inherited from each parent at each loci). Additional details of the model and submodels are provided by Benson et al. (2016a).

**Submodels**

**Survival.**—We incorporated environmental and demographic stochasticity into age-class-specific survival rates as in Benson et al. (2016a). Specifically, we generated environmentally stochastic monthly survival probabilities by transforming survival rates and their standard deviations estimated from each study population into beta shape parameters using the betaval function in the R package popbio. At each monthly time step, we drew a random survival value from this beta distribution, which was used as the environmentally stochastic survival probability for all individuals of the same sex and age class during that time step. We then assessed demographically stochastic survival of each individual using a Bernoulli trial with the monthly survival probability as the threshold between survival and mortality.

**Reproduction.**—We designated reproductive males and females in the starting population and, thereafter, randomly selected breeding animals from subadults eligible to transition to adults when openings became available. Female age at first reproduction varied stochastically between 25 and 33 months in our model. Males reaching breeding status remained reproductive until death. If no adult males were present in our simulated populations, males were allowed to begin breeding at 36 months as the reason for delayed breeding in males is presumably due to social constraints imposed by dominant adult males. Breeding females were eligible to become pregnant until death whenever they did not have dependent offspring. Litter size varied stochastically by generating a random, uniform value between 0 and 1 for each reproductive female and comparing the value to a cumulative probability distribution for litter sizes we documented. We determined the sex of each offspring using a Bernoulli trial with a probability of 0.5.

**Immigration.**—We assigned a fixed annual immigration rate prior to starting a simulation. We transformed this into a monthly probability and assessed immigration stochastically using Bernoulli trials during each monthly time step. We restricted immigration to subadult males. Subadult males are more likely to disperse and to undertake longer and riskier dispersal events than females (Sweanor et al. 2000). Indeed, all immigration documented into the SMM and SAM populations has involved subadult males (Riley et al. 2014, Gustafson...
et al. 2017). We assigned genotypes to immigrants from mountain lions genotyped in adjacent areas north and east of the SMMs (n = 18) and east of the SAM (n = 83). We modeled different immigration scenarios ranging from no immigration to a rate of one immigrant per year for our main analyses. We also modeled immigration rates for both populations based on immigration observed with radio-tracking and genetic analysis of mountain lions within and adjacent to our focal populations. Specifically, we observed two immigrants in 15 yr in the SMM (Riley et al. 2014; S. Riley et al., unpublished data) and three immigrants in 15 yr in the SAM (Gustafson et al. 2017). We were conservative with respect to modeling how much additional immigration could occur in our main analyses so we limited these to 1 immigrant per year. However, we also conducted additional scenarios to explore the hypothetical influence of two immigrants per year. For additional details of all submodels see Benson et al. (2016a).

**Model outputs**

**Demography and extinction.**—We estimated \( \lambda_t \) (stochastic lambda) across time periods of interest with the formula:

\[
\frac{\sum_{\text{years}} \ln(\lambda_t)}{\text{years}}
\]

We report median \( \lambda_t \) from the distribution of values across all projections for simulations of interest. We estimated credible intervals for \( \lambda_t \) using the highest posterior density (HPD) derived using the R package coda (v. 0.17-1). We estimated probability of extinction as the proportion of projections that went extinct during a given simulation and derived estimates of variability by conducting a nonparametric bootstrapping procedure implemented in the R package boot (v. 1.3-17). We ran 1,000 bootstraps of 5,000 population projections to estimate uncertainty regarding extinction probability with 95% HPD intervals. We estimated the effective population size based on a census of the breeding animals in simulated populations using the formula: \( N_e = (4 \times N_{BF} \times N_{BM})/(N_{BF} + N_{BM}) \) (Crow and Kimura 1970), where \( N_e \) is the effective population size, \( N_{BF} \) is the number of breeding females, and \( N_{BM} \) is the number of breeding males.

**Genetic parameters.**—We estimated measures of genetic diversity from genotypes of mountain lions in populations simulated by our models 1–50 yr in the future using mean values across all projections. Specifically, we estimated expected (\( H_e \)) and observed (\( H_o \)) heterozygosity, individual inbreeding coefficient (\( F_i \)), the mean number of alleles per loci (\( N_a \)), and the proportion of polymorphic loci using the R package adegenet v. 2.0.0.

Our genetic predictions varied stochastically because they were realistically linked to the stochastic demographic processes we modeled. Thus, by running 5,000 projections for each scenario, our models captured considerable environmental, demographic, and genetic stochasticity.

**Elasticity analysis.**—We investigated proportional sensitivity (elasticity) of \( \lambda_t \) to small (5%) increases in vital rates (Morris and Doak 2002). We conducted these analyses with the density-independent model to investigate which demographic parameters had the greatest influence on \( \lambda_t \) in the absence of density-dependent limitations. We calculated sensitivity values (\( S \)) for each demographic parameter:

\[
S = \frac{\log(\lambda_t(\text{increased}) - \log(\lambda_t(\text{original}))}{\text{parameter(adjusted) - parameter(original)}}
\]

and elasticity (\( E \)) for each demographic parameter following Morris and Doak (2002):

\[
E = S \times \frac{\text{parameter}_\text{original}}{\text{parameter}_\text{adjusted}}
\]

**Inbreeding depression.**—We simulated inbreeding depression by running population projections with input parameters reduced to reflect proportional changes in age- and sex-specific survival rates documented between inbred and outbred Florida panthers following the genetic restoration program (Hostetler et al. 2010, Benson et al. 2011; see Appendix S2: Table S1).

**Results**

**Population viability in Santa Ana Mountains**

Density-dependent simulations predicted stable median stochastic population growth over the next 50 yr in the SAM, regardless of the level of immigration (Table 1). However, there was an 11–21% probability of extinction across all immigration scenarios in the density-dependent simulations, inversely related to the level of immigration (Table 1, Fig. 2). The scenarios without immigration, or with the low level observed in our study, resulted in substantial loss of genetic diversity (e.g., 28–49% of expected heterozygosity) over 50 yr (Fig. 3; Appendix S3, S4). Predicted loss of heterozygosity decreased with higher levels of immigration, and heterozygosity was largely maintained with one immigrant per year (Fig. 3; Appendix S3: Table S1, Appendix S4: Fig. S1). Other measures of genetic diversity including percent polymorphism, inbreeding coefficient, and the number of alleles per loci responded to varying degrees of isolation and immigration similarly over time (Appendix S3: Table S1). When we explored the influence of a larger carrying capacity in the SAM (7 adult males and 14 adult females), population growth
rate was similar ($\lambda_s = 1.01$ [0.92, 1.02]), but extinction probability was reduced (10% with observed level of immigration; Appendix S5: Table S1). All immigration scenarios with higher carrying capacity yielded lower probability of extinction, ranging from 12% with no immigration to 5% with one immigrant per year (Appendix S5: Table S1). Loss of genetic diversity slowed slightly and effective population size increased with greater carrying capacity, although diversity still declined substantially with no immigration or the observed level (Appendix S5: Table S2). Simulating inbreeding depression in the SAM by reducing age-specific survival rates proportional to reductions documented in inbred Florida panthers, resulted in rapidly declining population growth ($\lambda_s = 0.84$, [0.61, 0.96]), 100% probability of extinction over fifty years, and median time to extinction of 11.7 yr (5.2, 23.5; Fig. 4).

**Comparing dynamics of SAM and SMM**

Median stochastic population growth rate predicted by the density-dependent scenarios was similarly stable in the two populations (Table 1, Fig. 2). However, the density-dependent scenarios for both populations also predicted extinction probabilities of 16–28% over 50 yr with no or observed immigration (Table 1, Fig. 2). Extinction probability due purely to demographic processes was reduced for both populations with higher levels of immigration, but more so for the SMM (Table 1, Fig. 2). Density-independent scenarios predicted a rapidly increasing population in the SMM ($\lambda_s = 1.17$ [1.11, 1.22]), whereas the predicted trend in the SAM did not differ from stable ($\lambda_s = 1.06$ [0.89, 1.12]; Fig. 5). Sensitivity and elasticity analysis showed that adult female survival had the strongest influence on density-independent population growth in both populations (Appendix S6: Table S1). Female subadult survival, female kitten survival, and litter size had moderate influence on population growth for both populations, whereas male survival parameters had little influence (Appendix S6: Table S1). When we explored the influence of two immigrants per year, extinction probability was further reduced and genetic diversity increased beyond the starting values in 50 yr (Appendix S7: Tables S1, S2).

Genetic diversity declined rapidly in both populations with no or observed immigration (Fig. 3; Appendix S3, S4). No immigration resulted in a greater loss of genetic diversity for SMM (57% loss expected heterozygosity) compared with SAM (49% loss; Fig. 3; Appendix S3, S4). However, the SMM population responded more strongly to increased levels of immigration as with one immigrant every 1–2 yr, the SMM retained more of its genetic diversity over 50 yr relative to the SAM (Fig. 3; Appendix S3, S4). Similar to the SAM, simulating inbreeding depression in the SMM resulted in predictions of declining population growth ($\lambda_s = 0.89$, [0.75, 0.96]), high probability of extinction (>99%) over 50 yr, and rapid median time to extinction (15.1 yr; Fig. 4).

**DISCUSSION**

Our modeling predicted a 16–21% probability of local extinction for mountain lions in the SAM over the next 50 yr with the low level of immigration observed in our study or no immigration. Thus, demographic and environmental stochasticity leave the SAM population vulnerable to extinction even before considering inbreeding depression, consistent with earlier predictions for this population (Beier 1993). Furthermore, our results...
suggest that, unless gene flow is increased, genetic diversity will rapidly erode in the SAM, and that, if inbreeding depression occurs rapidly, local extinction will be highly likely. We acknowledge that it is impossible to predict exactly when inbreeding depression will occur in a wild population, but our predictions with respect to genetic diversity are alarming and far surpass proportional losses of heterozygosity suggested by previous researchers to warrant concern regarding inbreeding depression (e.g., 5–10% loss in 100 yr; Soulé et al. 1986, Allendorf and Ryman 2002). Importantly, our predictions suggest that the loss of genetic diversity in SAM mountain lions in the next 50 yr will approach proportional losses experienced in another population of the same species (Florida panthers) that nearly went extinct due to poor demographic performance associated with inbreeding depression (Johnson et al. 2010; Appendix S4). Simulating a higher carrying capacity of 7 adult males and 14 adult females resulted in reduced extinction probability and slowed the loss of heterozygosity, highlighting benefits of even small increases in additional habitat and number of breeding adults (Frankham 1995). However, even with higher carrying capacity and abundance, the model predicted a 10% probability of extinction and 24% loss of expected heterozygosity over 50 yr.

Dynamics of the SAM and SMM populations were broadly similar, but our simulations revealed differences in their dynamics caused by variation in deterministic stressors, survival rates, and population abundance. The density-independent scenarios provided partial support for our prediction that lower survival in the SAM would negatively influence growth rate (P1a). Clearly, density independence is unrealistic given the space limitations experienced by both populations; however, these scenarios were instructive to compare growth potential and dynamics. Density-independent models predicted a rapidly increasing population for the SMM, whereas density-independent $\lambda_s$ in the SAM did not differ significantly from a stable trend. Extinction probability was approximately three times greater (5.6%) in the SAM compared to the SMM (1.8%) in the absence of density dependence. Furthermore, in our density-dependent scenarios, higher levels of immigration (1–2 per year) in the SMM raised the credible interval of $\lambda_s$ above 1, predicting a slightly increasing trend, whereas credible intervals overlapped 1 for all predictions of $\lambda_s$ in the SAM, even with similarly high levels of immigration (Table 1; Appendix S7: Tables S1, S2). Clearly, realized population growth is limited by available habitat in both populations, but growth potential also appears to be limited by high human-caused mortality in the SAM. The leading cause of death for radiocollared mountain lions in the SAM was vehicle strikes, which did not differ in frequency by age or sex class, and resulted in high mortality of adults (Vickers et al. 2015). Although poor adult male survival had relatively little influence on density-dependent population growth, it influenced extinction probability by causing male extinction in some simulations for this small population with a female-biased adult sex ratio. These dynamics appear to be realistic as there was evidence of occasional male extinction in the SAM during previous research (Beier 1993). Conversely, adult survival of both sexes was high in the SMM where population growth appears to be mainly limited by the lack of additional habitat. Subadults survive poorly in the SMM due to the difficulty of successfully
dispersing, as many young animals are killed by breeding males or hit by vehicles before or during dispersal (Riley et al. 2014). The difficulty of dispersal, combined with high survival of breeding adults in a space-limited population provides few opportunities for mountain lions born in the SMM to breed.

FIG. 3. Estimated expected heterozygosity over 50 yr for mountain lion populations in the Santa Ana and Santa Monica Mountains from an individual-based population model based on 5,000 projections and varying levels of immigration.
The SMM population had a slightly higher probability of extinction with no immigration than the SAM in our density-dependent scenarios, but increasing immigration resulted in a more pronounced reduction in extinction probability for the SMM. In fact, with one immigrant per year, extinction probability in the SMM did not differ from that predicted by the density-independent model suggesting that increased connectivity could largely mitigate the effects of isolation and limited habitat in the SMM, at least with respect to demographic extinction risk. The lesser positive impact of immigration on demographic extinction probability in the SAM was likely associated with the lower survival of adult males, which meant that tenure of immigrants successfully establishing as breeding adults was often short-lived. Although these comparisons were useful for evaluating the influence of variation in demographic structure on the dynamics of small populations, we recommend cautious interpretation of these differences for practical purposes. Indeed, predictions regarding extinction probability from PVA are probably best viewed as relative assessments (Morris and Doak 2002).

The greatest long-term threat to both populations appears to be the rapid loss of genetic diversity associated with their isolation from mountain lions in surrounding areas. With no immigration, the predicted rate
of loss of expected heterozygosity over 50 yr was greater for the smaller SMM population relative to the SAM population. This provided support for our prediction (P2) and is consistent with theoretical and empirical work indicating that population abundance and habitat island size are strong, positive predictors of genetic diversity (Crow and Kimura 1970, Frankham 1995). However, with immigration rates observed during the last 15 yr, predicted loss of heterozygosity was similar in the two populations. Importantly, simulating increased immigration and gene flow had a stronger positive influence on heterozygosity in the smaller SMM population. Thus, although heterozygosity is lost more rapidly in smaller populations, immigration events can also more quickly reverse these losses and restore diversity. In the SMM, only one or two males generally breed at any one time, such that when a radiocollared male immigrant entered the population in 2009 and began breeding it resulted in a rapid increase in population-level genetic diversity (Riley et al. 2014). A single breeding immigrant also positively influenced genetic diversity in the SAM (Gustafson et al. 2017), and relatively few immigrants have similarly influenced small populations of other large mammals (Vilà et al. 2003, Hogg et al. 2006, Adams et al. 2011). However, the key to maintaining diversity in small populations is to ensure that immigration occurs consistently (Mills and Allendorf 1996), to prevent reversal of short-term diversity gains as immigrants begin breeding with their offspring (Riley et al. 2014, Benson et al. 2016a). In addition to the larger population size, lower adult survival likely contributed to a reduced positive influence of immigration on genetic diversity in the SAM by limiting the reproductive success of immigrants. This finding further highlights the link between demographic and genetic factors in terms of influencing extinction in small populations. Despite interesting differences, we stress that our models predict rapid loss of diversity in both populations, indicating that viability will likely be compromised by interactions between genetics and demography unless gene flow is increased.

Mountain lions are not endangered in southern California and genetically diverse populations of mountain lions exist in areas such as the Sierra Nevada Mountains and other mountain ranges in southern California (Ernest et al. 2014, Riley et al. 2014). However, there is value to conserving viable populations of a native top predator within the SAM and SMM to maintain stable predator–prey dynamics and naturally functioning ecosystems within these isolated mountain ranges. This contention echoes growing recognition among ecologists and managers that conservation efforts should prioritize ecological function and maintaining ecosystem processes across extensive geographic areas, rather than simply preserving minimum viable populations somewhere across the range of a species (Soule et al. 2003, Ritchie et al. 2012). Predators and other highly interactive species may be especially important to conserve in as many places as feasible to maintain important species interactions and ecosystem functions (Soule et al. 2003, Lindenmayer et al. 2008, Cadotte et al. 2011). Indeed, research from around the world has begun to highlight the potential for conserving large predators within human-dominated landscapes (Athreya et al. 2013, Chapron et al. 2014, Riley et al. 2014). Our work suggests that conserving mountain lions in isolated mountain ranges in greater Los Angeles is feasible with relatively modest increases in landscape connectivity. If achieved over the long-term, this would be an important step toward maintaining intact, functioning ecosystems in these mountain ranges that lie within one of the most human-impacted landscapes in the world.

Our results suggest mitigation strategies for mountain lions in SAM and SMM should target two main threats: isolation and mortality. Increasing connectivity between both populations and the areas across the freeways should (1) decrease extinction probability due purely to demographic processes, and (2) maintain genetic diversity and prevent the onset of inbreeding depression. Translocation of outbred animals can be effective to quickly increase genetic diversity in threatened mountain lion populations (Johnson et al. 2010), but strategically located highway crossing structures (Gloyne and Clevenger 2001) allowing for dispersal and gene flow could be a more comprehensive long-term strategy. Our results suggest that maintaining genetic diversity in these populations would require at least one migrant every 1–2 yr. Given the expense of erecting highway crossing structures, translocation would certainly be a less expensive strategy, especially in the short-term. Indeed, the estimated cost for a bridge to connect the SMM population with habitat north of the 101 Freeway (Fig. 1) is approximately US$60 million. However, our results indicate that animals would need to be translocated frequently and indefinitely if connectivity is not improved, whereas a highway crossing structure would provide long-term connectivity once erected. Furthermore, populations of other species are also isolated by the freeways and other barriers surrounding these habitat islands (Delaney et al. 2010, Riley et al. 2006). Thus, construction of highway crossing structures, although unquestionably an expensive initial investment, would likely provide regular, consistent immigration of mountain lions and many other species that should increase the likelihood of maintaining healthy populations and intact ecosystems within these isolated mountain ranges. However, we certainly do not discount the value of translocation as a management tool. Translocation may be an especially valuable option if proposed development further degrades or prevents improvement of currently available passageways, and if the significant financial challenges delay construction of new crossing structures. As a specific example, extensive residential and resort development projects have been proposed for construction in the primary corridor area that has facilitated some movement of mountain lions between the SAM and habitat east of the
Interstate Highway 15 (Gustafson et al. 2017). Our results show that further reduction in immigration and gene flow, which are likely to occur with new development in corridor areas, would increase demographic extinction probability and hasten the loss of genetic diversity.

Our sensitivity analyses and inbreeding simulations show that increased mortality could have rapid, negative consequences for population growth and extinction probability in both populations, supporting our prediction (P3). Despite the smaller population size, predicted demographic extinction probability in the SMM was generally similar to that in SAM under the current levels of immigration largely because of the strong growth potential afforded by higher adult female survival. If female mortality increases in future years from the multitude of mortality agents documented in the SMMs (e.g., aggression from males, vehicle strikes, rodenticide poisoning) this could destabilize the population and increase extinction probability. Thus, reducing mortality in both populations is important and should decrease probability of extinction due to environmental and demographic stochasticity. In addition to highway crossing structures, exclusionary fencing strategically implemented along roadways where mountain lions are killed can be effective at reducing mortality (Foster and Humphrey 1995), such as that recently constructed along SR 241 in the SAM (Vickers et al. 2015). Strategies to promote best practices for housing domestic animals could reduce mortality from depredation permits issued to kill mountain lions threatening livestock (Vickers et al. 2015). To reduce mortality in the SAM and SMM from depredation mortality, the California Department of Fish and Wildlife (CDFW) has recently changed policies regarding depredation permit issuance in these two populations such that non-lethal deterrence methods must be attempted before lethal removal can occur (CDFW 2017).

Differences in demographic structure between the two populations revealed important aspects that have contributed to their persistence and highlighted management priorities for both populations. The greater demographic vigor of the SMM population is critical to its persistence, as a population with six to eight adults would clearly be at much higher risk of local extinction if survival and reproduction declined. Thus, in addition to management efforts to reduce mortality from documented causes such as vehicle strikes and rodenticide poisoning (Riley et al. 2014), it would be prudent to evaluate and monitor population dynamics of their main prey (mule deer) in the SMM to ensure the prey base remains adequate to support strong survival and reproduction. Greater population abundance in the SAM reduced demographic extinction probability and slowed the erosion of genetic diversity in simulations without immigration. Thus, the larger population size is beneficial to the persistence of mountain lions in the SAM, especially during periods when no immigration occurs. If additional habitat loss or fragmentation reduced the number of breeding adults that could occupy the SAM, this would have negative consequences for both demographic extinction risk and loss of genetic diversity. For instance, a population as small as the SMM population, but with the poor survival of the SAM would have a higher probability of extinction than we documented for either population. As noted above (see Model overview), both habitat loss and isolation appear to have reduced the population size over the last 25 yr. Our model results suggest it is critical to ensure that future habitat loss in the SAM is prevented and that fragmentation does not isolate portions of the current population.

Although our model realistically models demographic and genetic processes in these small populations with empirical data, we acknowledge that our model and data have limitations. For instance, although we were able to account for demographic and genetic processes, density dependence, and varying levels of immigration, we did not have sufficient data to understand the influence of catastrophes on the vital rates and viability of these populations. Two unpredictable forces that could potentially cause catastrophes include wildfires and disease outbreaks. Wildfires have become larger and more frequent in southern California shrubland ecosystems, and increasingly destructive wildfires appear to be linked to expansion of the urban–wildland interface (Keeney et al. 1999). Wildfires have directly caused mortality of mountain lions within our study populations (Vickers et al. 2015) and can also temporarily displace mountain lions (Jennings et al. 2016; S. P. D. Riley and J. A. Sikich unpublished data). Previous research on Iberian lynx (Lynx pardinus) has noted the potential that outbreaks of disease such as feline leukemia and reduced immune response associated with low genetic diversity could negatively affect population viability (Millán et al. 2009, Palomares et al. 2012). We note that catastrophic mortality associated with wildfires, disease, or other unpredictable events could substantially increase extinction probability above the predictions generated by our model.

Our results demonstrate that small populations isolated by freeways and urbanization are subjected to elevated extinction risk due to interactions between demography and genetics. We agree with previous authors that demographic and genetic risk factors for small populations should not be considered in isolation (Mills and Smouse 1994, Soulé and Mills 1998) and that both must be addressed in any comprehensive wildlife conservation strategy within urbanized landscapes (Benson et al. 2016a). Indeed, other small, isolated populations of felids are threatened by a combination of limited habitat and mortality, such as the highly endangered Iberian lynx (Ferreras et al. 2001). Inbreeding depression and extinction vortex dynamics are also concerns for Iberian lynx, and their conservation will require restoring habitat and improving demographic parameters (Palomares et al. 2012). As urbanization increases globally, it
will be necessary to (1) protect habitat patches large enough to facilitate persistence of populations of large carnivores, (2) mitigate anthropogenic deterministic stressors, and (3) restore and maintain connectivity within and between habitat patches if we are to maintain populations and ecosystem processes (e.g., predator-prey interactions) within urban landscapes (Crooks 2002). Our results also show that relatively small changes in abundance and key demographic parameters can influence loss of genetic diversity as well as extinction probability due to non-genetic processes. The difficulty of conserving top predators in the modern world are well documented (Woodroffe 2000, Ripple et al. 2014) and our work further details the demographic and genetic challenges facing large carnivores in human-dominated landscapes. Yet our results also provide reason for optimism, as seemingly realistic increases in gene flow appear sufficient to substantially reduce probability of extinction of top predators due to combined demographic and genetic threats within the second largest metropolitan area in the United States. Long-term conservation of mountain lions in greater Los Angeles would provide compelling evidence that large carnivores and abundant human populations are compatible, even within the most intensely developed landscapes.

Acknowledgments

We thank the many people who assisted with fieldwork. We thank R. Wayne, K. Gustafson, L. E. K. Serieys, J. Pollinger, D. Fraser, and T. Drazenovich for assistance with DNA laboratory work. We thank all of the land owners and managers who allowed field activities on their properties. Research in the SAM was supported by California State Department of Parks and Recreation, California Department of Fish and Game, The Nature Conservancy, The McBeth Foundation, The Anza Borrego Foundation, The Nature Reserve of Orange County, The National Science Foundation, The Foothill/Eastern Transportation Corridor Agency, San Diego County Association of Governments Environmental Mitigation Program, The San Diego Foundation, Felidae Conservation Fund, The Mountain Lion Foundation, The Santa Rosa Plateau Foundation, the Institute for Wildlife Studies, and private donors. Research in the SMM was supported by the La Kretz Center for California Conservation Science at UCLA, California State Parks, the Santa Monica Mountains Conservancy/Mountains Recreation and Conservation Authority, and the Calabasas Landfill.

An evaluation of a mitigation strategy for deer-vehicle collisions

John A. Bissonette & Silvia Rosa

High mule deer *Odocoileus hemionus* mortality in southwestern Utah led to the establishment of a mitigation strategy with two major objectives: 1) reduction of wildlife-vehicle collisions and 2) restoration of landscape connectivity to facilitate wildlife movement across the roaded landscape. During our study, we assessed the effectiveness of the mitigation measures in reducing mule deer mortality in the following ways: 1) we compared the number of deer-vehicle collisions in the newly fenced area with a control area without fencing; 2) we analyzed the 'end-of-the-fence' problem, defined here as increased mortality of mule deer at the ends of the 2.4-m high exclusion fences; and 3) we evaluated the frequency of animal crossings of the new underpasses using remotely-sensed cameras and compared them with crossing frequency rates for a 20-year-old control underpass. We compared six years of pre-construction mortality (during 1998-2003) with two years of post-construction data on mortality (during 2005-2006) and found a 98.5% decline in deer mortalities in the treatment (i.e. fenced, jump-outs and underpasses) vs a 2.9% decline in the control (i.e. no fences, no jump-outs and no underpasses). We detected no end-of-the-fence problems related to deer mortality. Migratory movements during fall and spring were clearly reflected in the use of underpass. Overall results demonstrated that the mitigation strategy was effective and reduced the number of deer-vehicle accidents, while allowing wildlife movement across the landscape.

Key words: crossing structures, end-of-the-fence problem, escape ramps, exclusion fencing, landscape connectivity, mitigation, mortality, mule deer, *Odocoileus hemionus*, road-kill, underpasses, wildlife-vehicle collisions

The increase in animal-vehicle collisions worldwide is a reflection of the increased anthropogenic transformation of the landscape. Current estimates of the total landscape transformed by human influences (e.g. forest removal, agricultural activities including crop planting and livestock grazing) range from 39 to 50% of the total earth surface (Vitousek et al. 1997). When Rüitters & Wickham (2003) measured the proximity of different land-cover types in the U.S. to the proximity of a road using nine distance classes, they found that the proportion of land area within a defined distance to a road increased rapidly with distance. Of all land area in the U.S., 50% was within 382 m of a road; only 18% was > 1,000 m of a road. Clearly, as road density increases as a function of human development, so does mean animal proximity to roads. The U.S. has a mean road density of 0.75 km/km² with concomitant habitat loss, animal mortality, isolation and barrier effects (Jaeger & Fahrig 2004, Jaeger et al. 2005, Row et al. 2007).

As road networks have expanded, so have traffic volumes, which have been linked to deer mortality (Gunson et al. 2006). In the U.S., traffic volumes in 1998 totaled 2,625,367 × 10⁶ vehicle miles; in 2007 traffic volume had increased to 3,003,218 × 10⁶, ~ a 14.4 % increase (Available at: http://www.fhwa.dot.gov/ohim/tvtw/07dectvt/page2.htm). For Utah, annual vehicle-miles traveled (VMT) in 2007 totaled 26.8 billion miles (Available at: http://www.udot.utah.gov/main/?p=100:pg:0:::V,T:::530), an in-
crease of ~ 26.4 % from the 1998 VMT of 21.2 billion miles.

One of the most evident effects of the increased traffic volume on wildlife is the increased number of wildlife-vehicle collisions (Bissonette & Cramer 2008, McCollister & van Manen 2010). Even though Skölding (1987), Berthoud (1987) and Seiler (2005) suggested that high traffic volumes tended to cause road avoidance by animals; nevertheless, nationwide estimates of 1.1 million deer-vehicle collisions (DVCs) during the period between 1 July 2008 and 30 June 2009, or ~ 21,150/week (State Farm Insurance Company® 2009), reveal the growing importance of the problem in the U.S. When seven years of data were recalculated in 3-year time steps to smoothen extraordinary high or low years of DVCs, 2006-2009 showed a 15.3% increase over the previous three years. The comparable figure for Utah is 25%. State Farm® estimated that the likelihood of any vehicle colliding with a deer in 2010 was 1:208 for the U.S. and 1:404 for Utah. In the Intermountain West, wildlife-vehicle collisions primarily involve ungulates in general and mule deer Odocoileus hemionus in particular. In Utah, mule deer numbers have declined generally over the past several decades with current estimates of < 300,000 animals, from an estimated 500,000 deer in the 1950s (Utah Department Wildlife Resources 2009).

In 2003, to increase driver’s safety, reduce deer mortality and provide deer access to their traditional seasonal ranges across I-15, three agencies (Utah Division of Wildlife Resources (UDWR), Utah Department of Transportation (UDOT) and the Bureau of Land Management (BLM)) jointly created a mitigation strategy that included three integrated actions: 1) construction of two wildlife underpasses, 2) construction of exclusion fencing and 3) installation of 1-way earthen escape ramps. The underpasses were constructed to allow below-grade road crossing, thereby reducing the putative barrier effect created by wildlife exclusion fencing and the road (Foster & Humphrey 1995, Bruinderink & Hazebroek 1996, Jaeger & Fahrig 2004). Exclusion fencing is seldom, if ever, 100% effective, even with continued maintenance (Putman 1997), so earthen 1-way escape ramps were constructed being spaced ½ mile apart to allow deer that accessed the fenced right-of-way (ROW) an escape route. The overall objectives of the mitigation were to improve driver safety, reduce the number of DVCs and to restore landscape connectivity for migrating deer.

For the mitigation strategy to be considered effective and because formally established criteria were unavailable, we established three a priori criteria. First, DVCs on the treatment section needed to be reduced by ≥ 70%. We chose this threshold based on studies of mule deer in northern Utah (Lehnert 1996, Lehnert et al. 2008) and reductions in mortality observed in successful mitigations strategies elsewhere (McDonald 1991, Clevenger et al. 2001). Second, there should not be an increase in DVCs at the ends of the exclusion fencing (i.e. the so-called 'end-of-the-fence' problem; Bellis & Graves 1971, Clevenger et al. 2001). Third, because of habituation, there should be an increase in underpass use by deer, and use should increase with time (Ward 1982).

We conducted a study using six years of pre-construction data (1998-2003) and three years of post-construction data (2004-2006). We examined if fences and escape-ramps jointly reduced deer mortality on the road, and if underpasses were used by mule deer during seasonal migrations. We evaluated the prediction that the average change in mortality in the treatment area was equal to or lower than in a control area.

Study area

Our study area was located on I-15 in southern Utah, between the I-15 and I-70 interchange at Mile Post (MP) 132 and MP 112 just north of Beaver (Fig. 1). This area was paired with a control area located between MP 137 and MP 144. I-15 is a four-lane divided paved interstate highway. These stretches of road historically have had heavy deer mortality (Kassar 2005). In this area, deer traditionally migrated east to summer ranges at higher elevations, and west to winter ranges at lower elevations, frequently crossing I-15. The upgrade of this road to an Interstate in the 1960s and 1970s blocked the traditional migratory route, causing considerable deer mortality (B. Bonebrake, Utah Division of Wildlife Resources, pers. comm. and unpubl. data), and coupled with heavy traffic volumes disrupted the migratory routes. Annual Average Daily Traffic (AADT) for the study site in 1998 was 12,835 vehicles/day; in 2009 it was 16,680 vehicles/day, an increase of 30% (Available at: http://www.udot.utah.gov). Despite the high kill, deer continued to cross the highway during the spring and autumn migrations and as a consequence, a 9.6 km stretch of road (MP 121-126) still recorded heavy mortality. The surrounding habitat included patches of big sagebrush Artemisia tridentata, pinyon pine Pinus edulis, juniper Juniperus osteosperma, agricultural
fields and small towns. The posted speed limit on I-15 in the area was 120.7 km/hour (75 mph).

Mitigation strategy description
Mitigation construction started in spring 2004 and ended in autumn 2004. Construction crews erected a 2.44-m (eight feet) deer-exclusion fence on both sides of the road during summer 2004 from MP 112 to 132. Additional fencing extended the northern end of the fence to MP 133 during the summer of 2005 to prevent deer from accessing the highway via the I-15 - I-70 interchange. Construction crews installed earthen escape ramps (N = 64) throughout the 32.2 km stretch of the study area at approximately 0.81 km (0.5 mile) intervals. Two underpasses specifically designed for wildlife were constructed and placed at the hotspot areas of greatest kill according to prior data on mortality of deer. Underpass 1 (UP1) was constructed at MP 126, and Underpass 2 (UP2) at MP 124 (see Fig. 1). Both structures were oval-shaped tunnels, made of corrugated metal, with large open middle areas. UP 1 (Fig. 2A) had an openness-ratio score of 3.68 (6.55 m height x 11.13 m width/19.82 m length) in each tunnel section and incorporated a dirt road with recreational traffic. UP2 (Fig. 2B) had an openness-ratio score of 1.62 (4.23 m height x 8.12 m width/21.23 m length) in each tunnel section and was designed solely for wildlife use. Foster & Humphrey (1995) and Clevenger & Waltho (2005) suggested that crossings with higher openness ratios were more likely to be used by large mammals. UP 2 followed the topography of Wildcat Creek (but was not impacted by the stream) and hence the two parts of the underpass were not aligned (see Fig. 2B). We baited the new structures irregularly with alfalfa hay, apples and salt blocks placed near the entrances at the beginning of the migrations in spring and fall to encourage use by deer.

Method
Mitigation monitoring

Deer-vehicle collisions
To assess the joint effects of fencing and escape ramps in reducing mortality of mule deer on the road, we analyzed carcass-removal counts before and after mitigation. Data from carcass-removal surveys from UDOT databases were available. Contract personnel removed deer carcasses from the road in an average of four times per month from 1998 to 2006. To distinguish mitigation effects from the usual yearly fluctuation of road mortality, we monitored a similar control area located north of the study area (MP 137-144; see Fig. 1). This area had high mortality, but no exclusion fencing. We used a Before-After-Control-Impact (BACI) approach to assess if variation on road mortality was related to the intervention (Eberhardt 1976, Green 1979). By itself, a drop in mortality on the treatment area would not necessarily be a consequence of the mitigation, but a higher proportional decrease of mortality when compared...
with a control area would reflect a successful mitigation. We compared the annual DVC average for six years before and two years after construction. For each year, we estimated difference in mortality counts between control and treatment areas by using T-tests, and corrected for multiple comparisons. We compared mortality before and after mitigation for the duration of the study, averaged by year and during autumn (October-January) and spring migrations (April-July), and we assessed whether the mitigation was effective in reducing mortality at the hotspot area (MP 120-126) by comparing annual averages of deer mortality before and after the mitigation. To test if end-of-the-fence problems existed (mortality that occurred within 2.4 km (1.5 miles) at either end of the fence), we compared annual deer mortality before and after the mitigation at the northern (MP 131-134) and the southern (MP 111-113) ends of the fence.

**Underpass use**

We monitored a 20-year-old control underpass (Control UP) to compare mule deer use between new and established structures. The Control UP was located south of the study area (MP 103) in a similar mule deer migration area (see Fig. 1). The Control UP (see Fig. 2C) was comprised of two double-span bridges with an openness-ratio score of 4.43 each (4.12 m height $\times$ 21.49 m width/20 m length) and a large open median area. This Control UP was in a more remote area, did not have a dirt road under it and an exclusion fence was present. Mule deer and elk *Cervus elaphus* use had been previously reported.

We placed Reconyx® cameras (digital, triggered by motion and heat, with infrared illumination) inside the median of each underpass to record animal crossings. We chose camera placement to assure approximately equal photo capture probabilities in all the structures and camouflaged them by mounting inside locked urban electric boxes to reduce the probability of damage or theft. We equipped cameras with 512 Mb memory cards, which were examined on average twice each month from October 2004 to August 2006. We set the cameras for maximum sensitivity, with a 2-second lag between triggers and one picture/trigger. We sampled four migration periods (autumn: October - November 2004; spring: April - June 2005; autumn: September - November 2005; spring: April - June 2006).

We used camera data to: 1) characterize overall use of the structures and 2) estimate deer crossing frequency and temporal variation. We categorized all photos into classes (mule deer, humans, cattle and other wildlife). We used photos taken of mule deer to estimate use and changes with time. Because all cameras were fully functional for > 90% of the monitoring period (i.e. a total of 678 days), the results constitute a census rather than sample data. As a result, null hypotheses and significance testing have
little theoretical interpretation (Berger 1985, Gill 2001). Thus, analysis of underpass use and changes over time are primarily descriptive, using summary statistics and simple $\chi^2$ tests. Throughout this paper, we employed simple statistics, following the advice of Guthery (2008) and Thompson (2010).

Generally speaking, mule deer are not individually identifiable by unique external characteristics (e.g. pelage markings). This impeded the estimation of the exact number of different individuals using the structures and the frequency at which the same individuals crossed. Therefore, we only counted the total number of crossings detected. We also noted direction of the crossings: west to winter ranges and east to summer ranges. We calculated the net number of crossings from the difference between crossings recorded in each direction. We used net crossings to monitor changes in movement in either direction through time. This allowed the detection of migration periods as well as changes in use of new underpasses.

We used SPSS 15.0.1 (2006) for all analyses. Animal welfare protocols were followed according to Utah State University IACUC Protocol Number 1139. Any use of trade names is for descriptive purposes only and does not imply endorsement by the U.S. Government.

Results

**Deer-vehicle collisions**
The BACI analyses of carcass removal data indicated that reduction in DVCs was related to the mitigation and not to stochastic annual oscillations in mortality in the study area. To be conservative, we included 2004 in the post-treatment analysis, even though the mitigation was not completed until late in the year. We documented a significant decrease in annual DVC levels ($t = 4.244, P = 0.004, df = 7$) that corresponded to a 77% reduction in mortality after the mitigation (Fig. 3A). We calculated a Cohen's $d$ of 2.32 with an effect size $r = 0.757$. DVC levels in spring decreased ($t = 2.903, P = 0.027, df = 7$) corresponding to a 96% mitigation-induced reduction in mortality (Fig. 3B). Finally, DVC levels in autumn were similarly reduced ($t = 2.463, P = 0.049, df = 7$) to levels that corresponded to 76% of the original mortality (Fig. 3C). If we consider 2004 as a transition year and include only 2005 and 2006 mortality in our post-construction analysis, with 1998-2003 as the pre-construction period, we found a 98.5% decline in deer mortalities in the treatment and a 2.9% decline in the control (i.e. from a $\bar{x} = 93$ kills pre-construction to a $\bar{x} = 3$ mortalities post-construction). Additionally, we did not document an increase of mortality at the ends of the exclusion fences. We observed lower levels of mortality at the northern end ($t = 2.831, P = 0.022, df = 7$) and equal levels of mortality in the southern end ($t = 1.274, P = 0.238, df = 7$); thus, DVC levels were not higher at either end of the fence when compared to non-fenced areas.

**Underpass use**
We documented considerable differences in underpass use between the underpasses. From a total of 47,759 pictures (UP1: 18,829, UP2: 14,421 and Control UP: 14,509, respectively), we noted similar-
ities between UP2 and the Control UP and a different pattern of use in UP1. UP1 had the highest level of human use, differing significantly from UP2 ($\chi^2 = 7,910, P < 0.001$) and the Control UP ($\chi^2 = 8,010, P < 0.001$). It also had the lowest number of mule deer detections both in absolute and proportional terms when compared with UP2 ($\chi^2 = 5,528, P < 0.001$) and to the Control UP ($\chi^2 = 1,782, P < 0.001$). In UP2 and the Control UP, we recorded a higher proportion of deer use and frequently detected other wildlife (e.g., coyotes *Canis latrans*, desert cottontail rabbits *Silvilagus audubonii* and birds). Elk were detected only in the Control UP. UP 2 and the Control UP differed in proportion of cattle ($\chi^2 = 1,687, P < 0.001$) and mule deer ($\chi^2 = 906, P < 0.001$). Deer and cattle used the Control UP simultaneously < 10 times. Occasionally, deer and elk were detected using the structure at the same time.

Deer exhibited similar crossing behaviour in all the structures. They would either enter the structure to cross the road directly, or remained in the proximity of the structure, crossing several times in either direction. In the new structures, some photos showed active use of alfalfa, with deer groups frequently spending up to an hour feeding. In the Control UP, movements were direct, but water and salt accumulations often caused deer to remain inside the structure for periods of > 2 hours. Photo evidence showed that deer were often startled by traffic when inside the structures.

We identified two different types of deer movement (Fig. 4A). During certain periods, deer exhibited what appeared to be residential daily movements, crossing in equal numbers east and west. For example, in the Control UP (see Fig. 4A) from December through March, deer displayed a similar number of crossings in each direction. During migration (October-May), however, deer crossed disproportionately more in one direction than the other. When we analyzed UP1 (Fig. 4B) and UP2 (Fig. 4C), we noted that higher numbers of crossings during migratory periods were not as evident in the new structures compared with the control. Nonetheless, both UP1 and UP2 showed spring migratory movements in May 2005 and 2006.

We documented four migratory movements (Fig. 5). We did not detect migratory activity through UP1 and UP2 during the first migration period in autumn 2004 when the mitigation activities were not yet complete. Subsequent migrations, however, did occur through the new crossing structures and were similar in timing to the Control UP. The frequency of crossings during spring migrations was generally higher than during autumn migrations, but autumn migrations extended over a longer time with some migration movements occurring from January to March. Finally, net crossings during migration indicated an increasing use with time of UP1 and UP2 (Fig. 6). Our results show that the number of crossings in the new structures gradually approached the number of crossings in the Control UP. During the first migration period (autumn 2004), UP1 registered 12.6% of the movement observed in the...
Control UP, whereas during the last migration sampled (spring 2006) crossings increased to 33%. Similarly, UP2 increased from 5.9% in the first migration to 71.7% in the last migration, nearly matching crossings documented at the Control UP.

Discussion

Based on the three *a priori* established criteria, we considered the I-15 mitigation strategy to be effective in reducing DVC without attendant end-of-the-fence problems. Even when we included the 2004 transition year, when the exclusion fencing was not yet in place until autumn, annual mortality in the study area was reduced by 77%. During most of 2004, the fences had several gaps that were used by deer to gain access to the road. Our mortality reduction of 98.5% is perhaps better than ordinarily expected. This outcome may have been related, in part, to the close spacing of 0.81 km (1/2 mile) of ROW exit ramps that allowed deer easy escape to the wild side of the fence.

A qualitative examination of tracks on the escape ramps near the crossings during winter with snow on the ground indicated infrequent use, suggesting that few deer accessed the ROW during the first year post construction. The area in which we worked was also relatively flat, so erosion did not have serious impact on fence integrity. The additional carcass collections conducted in the years 3 and 4 post study (autumn 2006-2008) suggest that the mortality reductions were likely to be long-term (Fig. 7).

The significance of our observed reduction in mortality on the deer population is best understood.
with data on vital rates, however; when survivorship and recruitment data are lacking, it is still possible to estimate how much reduction in mortality is required to reverse population declines. In another study in Utah, Lehnert (1996:62) conducted simulations based on a partial compensation (50%) model and reported that a 60% reduction in road kill was required to halt the population decline displayed by the simulated population using pre-treatment mortality rates. Population information for the I-15 deer herd was insufficient to define a data-based reduction threshold; however, from Lehnert’s (1996) research, a 70% reduction was most likely adequate to reverse the declining population trend. Clevenger et al. (2001) reported reductions of 80% in levels of ungulate-vehicle collisions in Banff National Park; Braden (2005) reported a reduction of 83-92% in Key deer Odocoileus virginianus-vehicle collisions in Florida and McDonald (1991) described a 70% reduction in moose Alces alces mortality in Alaska after mitigation.

An important result is that the mitigation did not cause an end-of-the-fence problem, indicating that deer used the new available underpasses; these deer that may have entered the ROW were able to escape using the ramps. Apparently, exclusion fences extended far enough from deer-kill hotspots (~11.3 km (7 miles) north and ~19.3 km (12 miles) south of the underpasses) so that few deer moved around the end of the fence. To our knowledge, our study is the only one in which mitigation-exclusion fencing did not cause end-of-the-fence problems. Our results clearly demonstrated that a multi-faceted mitigation combining exclusion fencing, escape ramps and wildlife underpasses was effective in reducing DVCs and should help maintain landscape connectivity for mule deer. We argue that the use of exclusion fencing is justified only in the areas where traffic volumes are high, DVCs are otherwise unavoidable, and where effective structures to promote passage are present.

Management implications

Many factors influence use of crossing structures including location, availability of approach cover, disturbance and the dimensions of the structure itself (Grilo et al. 2010, Clevenger & Waltho 2005). Additionally, human disturbance can interfere with use (Clevenger & Waltho 2000, Rosa 2006); in our study, the very large UP1 showed little use when our cameras recorded human traffic through it. Structures with high openness-ratios are more likely to be used. The most effective structures appear to be rela-
tively short and less tunnel-like. For example, the Nugget Canyon section of Route 30 (M.P. 30-42) in southwestern Wyoming, USA, historically has had high deer mortality, especially during the spring and fall migrations. In 2001, the Wyoming Department of Transportation installed game fencing and a concrete box structure underpass. Its approximate dimensions were 6.1 m wide by 3.1 m high by 18.3 m long (i.e. an openness ratio of 1.02). It received heavy deer use (Gordon & Anderson 2003). Accordingly, six additional underpasses of similar size were built between MP 35 and 40. From 1 October 2009 to 31 May 2010, Sawyer & LeBeau (2010) documented 13,362 mule deer crossings using these underpasses and a bridge span. The relatively short length of the underpasses appeared to facilitate deer passage. A large number of elk ($N = 487$) also passed through one of the Nugget Canyon underpasses during 2008 and 2009. In our study, the two separate sections of UP2 were short (21.23 m length with an openness ratio score of 1.62 for each section) and had continual use and the lowest repel rate (failure to cross) of all underpass crossings in Utah (C. Cramer, Utah State University, unpubl. data). No vehicular traffic passed through UP2. It appears that given at least a minimum height and width, the most effective crossings for mule deer are short (20-25 m) and have little human disturbance.

Understanding what is required to reduce DVCs and increase landscape connectivity is not necessarily difficult. To get the appropriate state agencies to act in coordination and cooperation is essential. Effective mitigation requires recognition of the extent of the problem as well as cooperation between agencies in mitigating human-wildlife conflicts. Transportation and wildlife agencies bring different perceptions and perspectives to solutions for solving animal-vehicle collision problems. Transportation agencies are primarily concerned with human safety, whereas the goal of wildlife agencies with regards to roads is reducing DVCs and maintaining the traditional movement patterns (Beckman et al. 2010). Mitigation is less likely to solve the problem if it only accounts for traffic issues and disregards wildlife concerns. Our results should be applicable for other areas if the following are incorporated into mitigation: 1) exclusion fences are maintained and extend well beyond the hotspot(s) of deer mortality, 2) ROW escape ramps are provided to allow animals to escape the right-of-way and 3) the crossing structures are of appropriate configuration to allow animals to cross.

Acknowledgements - we thank the Utah Department of Transportation, the Utah Division of Wildlife Resources and the Bureau of Land Management (B. Bonebrake) for providing funding for this project. We also thank M. Conner, R. Cutler and S. Durham for their helpful suggestion on the project. We thank B. Bonebrake for his help, suggestions and hard work on every aspect of this project. Our profound appreciation goes to R. Taylor for making our research efforts easier. We also thank D. Ferrieria, P. Cramer, K. Kassar, D. Auer, C. Stewart, S. Kelly, F. Loureio, N. Merill and B. Frandsen for their help. We very much appreciate D. Marques’ illustrations of the underpasses and thank her for her artwork. We thank the Dedicated Hunter Program in the Southern Region for their help in the project. Thanks also to T. Boyer, N. Snow, T. Messmer, J. Jenks and R. Kirby for their helpful comments and edits. Finally, many thanks go to the anonymous reviewers for their constructive criticisms.

Abstract: A primary objective of road ecology is to understand and predict how roads affect connectivity of wildlife populations. Road avoidance behavior can fragment populations, whereas lack of road avoidance can result in high mortality due to wildlife-vehicle collisions. Many small animal species focus their activities to particular microhabitats within their larger habitat. We sought to assess how different types of roads affect the movement of small vertebrates and to explore whether responses to roads may be predictable on the basis of animal life history or microhabitat preferences. We tracked the movements of fluorescently marked animals at 24 sites distributed among 3 road types: low-use dirt, low-use secondary paved, and rural 2-lane highway. Most data we collected were on the San Diego pocket mouse (Chaetodipus fallax), cactus mouse (Peromyscus eremicus), western fence lizard (Sceloporus occidentalis), orange-throated whiptail (Aspidoscelis hyperythra), Dulzura kangaroo rat (Dipodomys simulans) (dirt, secondary paved), and deer mouse (Peromyscus maniculatus) (highway only). San Diego pocket mice and cactus mice moved onto dirt roads but not onto a low-use paved road of similar width or onto the highway, indicating they avoid paved road substrate. Both lizard species moved onto the dirt and secondary paved roads but avoided the rural 2-lane rural highway, indicating they may avoid noise, vibration, or visual disturbance from a steady flow of traffic. Kangaroo rats did not avoid the dirt or secondary paved roads. Overall, dirt and secondary roads were more permeable to species that prefer to forage or bask in open areas of their habitat, rather than under the cover of rocks or shrubs. However, all study species avoided the rural 2-lane highway. Our results suggest that microhabitat use preferences and road substrate help predict species responses to low-use roads, but roads with heavy traffic may deter movement of a much wider range of small animal species.

Keywords: avoidance, connectivity, conservation planning, habitat fragmentation, heteromyid, reptiles, road ecology, urban ecology

Resumen: Un objetivo principal de la ecología de caminos es entender y predecir cómo afectan los caminos la conectividad de las poblaciones silvestres. El comportamiento de evitación de caminos puede fragmentar poblaciones, mientras que la falta de evitación puede resultar en alta mortalidad debido a colisiones. Muchas especies animales pequeñas enfocan sus actividades a microhábitats particulares dentro de su hábitat mayor. Buscamos estudiar cómo los diferentes tipos de caminos afectan el movimiento de pequeños vertebrados y conocer si ciertas respuestas hacia los caminos pueden ser predecibles basándose en la historia de vida del animal o el microhábitat. Rastreamos los movimientos de animales marcados con fluorescencia en 24 sitios distribuidos entre 3 tipos de caminos: tierra de bajo uso, camino secundario pavimentado de bajo uso, y carretera rural de 2 carriles. La mayoría de los datos que colectamos fueron sobre Chaetodipus fallax, Peromyscus eremicus, Sceloporus occidentalis, Aspidoscelis hyperythra, Dipodomys simulans (tierra, pavimentación secundaria), y P. maniculatus (solamente en carretera). C. fallax y P. eremicus se movían hacia los caminos de tierra pero no hacia una carretera de baja pavimentación de anchura similar o hacia la carretera, indicando que evitan los caminos con sustrato pavimentado. S. occidentalis y A. hyperythra se movían hacia la tierra y los caminos secundarios pavimentados pero evitaban la carretera rural de 2 carriles, indicando que pueden evitar el ruido, las vibraciones o el disturbio visual de un constante flujo de tráfico. D. simulans no evitaba el camino de tierra ni los caminos secundarios con pavimento. En general, el camino de tierra y los caminos...
secundarios fueron más permeables para las especies que prefieren forrajear o tomar el sol en áreas abiertas de su hábitat en lugar de bajo rocas o arbustos. D. simulans no evitó el camino de tierra ni los caminos secundarios pavimentados. Sin embargo todas las especies estudiadas evitaron la carretera de 2 carriles. Nuestros resultados sugieren que las preferencias de uso de microhábitat y sustrato de caminos ayudan a predecir las respuestas de las especies hacia caminos de bajo uso, pero los caminos con tráfico pesado pueden disuadir el movimiento de un rango mucho mayor de especies animales pequeñas.

Introduction

Terrestrial and aquatic areas have become increasingly permeated by roads. Roads affect movement patterns, demographics, and spatial distribution of local species. They can adversely affect wildlife by fragmenting habitats, creating population sinks, and acting as conduits for the spread of invasive species (e.g., Forman et al. 2003; Fahrig & Rytwinski 2009; Taylor & Goldingay 2010). They can positively affect wildlife by increasing connectivity between suitable habitat patches and food resources (e.g., Huey 1941; Getz et al. 1978; Forman et al. 2003).

A current need in the field of road ecology is to understand and predict how roads affect the probability wildlife populations will persist (Roedenbeck et al. 2007; Fahrig & Rytwinski 2009; Rytwinski & Fahrig 2012). This will likely require the development of demographic and spatial-movement models that incorporate behavioral responses to roads (e.g., Jaeger et al. 2005; Tracey 2006; Frair et al. 2008). Roads are highly variable, ranging from rarely traveled dirt roads to multilane highways with heavy traffic. Correspondingly, the responses of animals to different road types are expected to be highly variable.

To address variation in animal responses to different road attributes and traffic patterns, Jaeger et al. (2005) incorporated 3 types of road-specific avoidance behavior (road-surface avoidance related to road substrate and width, and, noise and car avoidance related to traffic) in their model for predicting when animal populations are at risk from roads. However, data to test these models are lacking because much of the current literature on road-related movement behavior typically focuses on either a single species or road type (e.g., Fahrig & Rytwinski 2009; Taylor & Goldingay 2010). There are also relatively few data available on reptiles, although this taxon is thought to be substantially and negatively affected by roads (Andrews et al. 2008). Finally, few researchers have incorporated both multiple road types and taxonomic classes in their studies to ascertain how animal communities respond to these linear features of the landscape.

Scrublands are distributed throughout mid-latitude deserts and areas with Mediterranean-type climates. Scrublands are characterized by low-growing shrubs adapted to arid conditions and range from open habitats with sparse vegetation cover to areas with dense vegetation (Kellman 1980). Our study area was in coastal sage scrubland of southern California (U.S.A.). Much of this area is fragmented by urbanization, disturbed, or permeated with highways, secondary roads, dirt roads, and trails (O’Leary 1995; Noss et al. 2000).

We sought to understand how roads affect habitat connectivity for small vertebrate populations within these scrublands. We assessed the movement patterns of 4 small-mammal species and 2 lizard species relative to 3 types of roads: low-use dirt roads, a secondary paved road, and a primary paved highway. We also examined whether animal responses to roads differed among species with different life-history strategies and whether species’ microhabitat-use preferences could be used to predict their responses to roads.

Methods

Study Site

Our study area was in San Diego County, California, within the San Diego National Wildlife Refuge (Otay-Sweetwater Unit) and in Rancho Jamul, a 1915-ha ecological preserve managed by the California Department of Fish and Game. The coastal sage scrub (CSS) vegetation was dominated by California sagebrush (Artemisia californica), buckwheat (Eriogonum fasciculatum), and a variety of herbs and grasses. The region has a Mediterranean-type climate characterized by hot, dry summers and cool, wet winters. Average annual precipitation is 350 mm, and approximately 95% of the annual mean rainfall occurs from November through April. The CSS vegetation averaged 63% shrub cover, 30% grass and herb cover, and 28% open ground (total greater than 100% due to measures at multiple height categories [Brehme 2003]). There were 3 road types in the study area: 1.8 km of low-use unimproved dirt roads with an average width of 4.7 m (SD 1.3) and traffic volume of 0–20 vehicles/day; a 1.6-km low-use, secondary, 2-lane paved road (Millar Ranch Road) with an average width of 6.6 m (SD 0.2) and traffic volume of 200–500 vehicles/day (Traffic Section of San Diego County Public Works); and over 24 km of high-use, primary, 2-lane paved highway (State Highway 94) with an average width of 11.2 m (SD 0.9) and traffic volume of 7,400–18,000 vehicles/day.
(California Department of Transportation). Road widths were measured as the width of grading for dirt roads and width of pavement for paved roads. Native soil or vegetation extended to the road edge for all unimproved and improved road types. During the study, there was no evidence of mowing or other vegetation-management activities.

**Data Collection**

Eight linear trapping arrays were installed along the length of each of the 3 road types. We chose sites where CSS vegetation extended at least 50 m from both sides of the road to avoid confounding the presence of a road with any other edge. Linear trapping arrays consisted of 3, 9-L pitfall traps connected by a 15-m drift fence (7.5 m between each bucket), 4 Sherman live traps (along both sides of fence halfway between each bucket), and one funnel trap. We baited all traps with birdseed and rolled oats. Arrays were diagonal to the road to increase effectiveness of intercepting animals moving both parallel and perpendicular to the road. At one end of the array, the pitfall trap was 1 m from the road edge, and at the other end, the pitfall trap was 11 m from the road edge. The middle pitfall trap was 5 m from the road edge. Pitfall-array materials and installation procedures are described in Fisher et al. (2008). Trap arrays remained open during each trapping period and were checked every morning at sunrise. We conducted ten 3-night trapping sessions at each array from April to December of 2001.

We used fluorescent-powder tracking (Lemen & Freeman 1985; Fellers & Drost 1989) to track the movements of small mammals and reptiles captured in the trap arrays. The fluorescent powder (Radiant Color, Richmond, California, U.S.A.) is nontoxic and is a safe and effective means of tracking small-scale animal movements (Stapp et al. 1994). The powder-tracking technique allowed us to study species’ direct responses to roads. Tracking movements over longer distances and periods of time (e.g., with radiotelemetry) would better document infrequent crossings, but the use of fluorescent dye allows for documentation of fine-scale movement activity that telemetry does not (Lemen & Freeman 1985).

To differentiate among individuals, we dusted each animal released from an array with 1 of 20 base colors or unique mixtures of base colors. We were careful to dust only the body and to avoid the head area to prevent the animal from breathing in the powder (Stapp et al. 1994). Prior to their natural activity period, we placed it on the lid of the center bucket 5 m from the road edge. This allowed for a standard release distance from the road for all animals without the drift fence acting as a barrier to movement in any direction. When releasing an animal, the handler crouched down parallel to the animal and the road, released the animal, slowly backed away staying parallel to the road, and then left the area. This release strategy was to prevent the handler from scaring the animal toward or away from the road. We traced the fluorescent powder tracks at night with a portable 12-watt long-wave ultraviolet lamp. We laid a 50-m measuring tape over the trail until the powder could no longer be traced. For each animal, we recorded the total distance of the fluorescent track and made a diagram of the animal’s movements in relation to the road. We recorded locations of burrows where tracks ended at burrow entrances. We tracked the movement of most individuals only one time to avoid problems with pseudoreplication (Hurlbert 1984). We traced a small number of animals on several occasions to examine the variability of results for individuals. For these animals, only the result of their first tracking occasion was used in statistical analyses.

We categorized all movements as either road use or habitat use. Road use was when an animal moved over the road for any distance of the track length. Habitat use was when an animal stayed in the scrubland during the entire tracking period. We included in our analyses only animals tracked for a minimum of 10 m. For the Dulzura kangaroo rat (Dipodomys simulans), we included 2 movements of approximately 9.5 m because there were a low number of total tracks. Because all animals were released within 5 m of the road, this minimum track distance allowed us to document movements relative to the road or well away from the array in any direction. We calculated permeability as the number of animals that exhibited road use divided by the total numbers of animals tracked for each species and road type.

**Analyses**

To test whether animals avoided or used the roads more than expected by chance, we compared observed species movement paths with paths simulated from species-specific correlated random walk (CRW) models. The CRW models represent predicted movement without any behavioral response to the roads. We parameterized CRW models with tracking data from at least 3 individuals of each species. We used only paths within the interior scrubland and well away from the road to represent typical movements within an animal’s habitat. We used recorded spatial coordinates at 1.0-m intervals along the path to calculate move and turn angles. The move angle was the direction of movement, and the turn angle was the angle of the current move step minus the angle of the previous move step.

We parameterized the simulations in 2 stages. First, for each individual animal’s movement path, we estimated the mean turn angle and concentration parameter that determined the dispersion of a von Mises distribution (Fisher 1993). Second, we fitted a von Mises distribution to the mean turn angles for all paths and a gamma distribution to the concentration parameter of the turn angles for all paths. When simulating a path, we randomly...
drew a mean turn angle from the von Mises distribution and a concentration parameter from the gamma distribution. We added the turn angle to the move angle of the previous move step to obtain the move angle for the current move step. The move-step length was 1.0 m, and the total length was constrained to the average length of the observed paths for each species. We simulated 1000 paths for each species. To determine the expected number of animal movements onto roads if there was no barrier effect, we determined the number of CRW paths that transected a line 5 m from the start point. We parameterized and simulated all CRW models with a program written in R (R Development Core Team 2010). We compared the number of observed versus expected road movements with Fishers’ exact tests. A significant result suggested the animals moved onto roads more or less than expected under the null hypothesis.

Individual animal movement behavior may be affected by population density (Swihart & Slade 1984; Hanski 1999). Therefore, we determined whether relative abundance differed among the roadside habitats with one-way analysis of variation for each species. For our index of species abundance, we used the minimum number of animals known alive. We calculated this index by removing all recaptures within each 3-day trapping session at each array. Although minimum number known alive can be biased as an abundance estimator, it is proportional to population sizes and is thus a reasonable index of abundance (Slade & Blair 2012).

Results

We dusted 306 animals with fluorescent powder and released them 5 m from the road edge. One-third of the animals were not included in our analyses because their track lengths were <10 m. Most of the small mammals that were not used in the analyses were tracked to a nearby burrow on the side of the road on which they were released, and there were no obvious tracks coming out of the burrow. Small reptiles and those with smooth scales (many snakes, skinks, side-blotched lizards [Uta stansburiana], and whiptails [Aspidoscelis spp.]) did not retain the powder dye well; thus, many of their tracks were lost within several meters. Some species were excluded due to too few captures. The 181 individuals we used in the analyses (125 small mammals, 56 lizards) were followed an average of 20.7 m (SE 0.8).

We also tracked 19 animals on a second occasion to test the repeatability of individual results. All these animals repeated their initial movement types. Seventeen (12 mammals and 5 lizards) stayed within the scrubland on both tracking occasions, whereas 2 (1 mammal and 1 lizard) repeatedly crossed the road. We present the results for 4 small mammal species and 2 lizard species. These species represent movements of 54 San Diego pocket mice (Chaetodipus fallax), 57 cactus mice (Peromyscus eremicus), 6 Dulzura kangaroo rats (dirt and secondary paved road only), 8 deer mice (Peromyscus maniculatus) (highway only), 26 western fence lizards (Sceloporus occidentalis), and 30 orange-throated whiptail lizards (Aspidoscelis hypertybra) (secondary paved road and highway only).

Small Mammals

San Diego pocket mice were tracked an average distance of 25.1 m (SE 1.6) from the point of release. Species-specific movement simulations predicted a permeability of 42% (percentage of animals moving onto road) if the roads had no effect on movement. Twenty-seven percent of San Diego pocket mice movements were tracked onto the dirt roads (Fisher’s exact test, n = 22, p = 0.194). The majority of these movements (4 out of 5) were crossing events to the habitat on the other side of the road. The percentage of movements onto the secondary road was significantly lower than expected at 9.5% (n = 21, p = 0.003). The 2 movements onto the secondary road were not crossings, but along the edge of the road returning to the habitat on the same side of the road. There were no movements of San Diego pocket mice onto the primary highway (n = 11, p = 0.004) (Fig. 1). The relative abundance of pocket mice did not differ significantly among the 3 road types (F1,21 = 1.493, p = 0.248).

Cactus mice were tracked an average distance of 19.0 m (SE 1.2). Species-specific movement simulations predicted an expected road permeability of 30%. All the movements onto the dirt road were direct crossing events to the other side of the road (Fig. 2). Although 25% of the individuals went onto the dirt road (meaning there was no significant barrier effect [n = 20, p = 0.626]), no individuals were tracked onto the secondary paved road or primary highway (n = 18, p = 0.003 and n = 19, p = 0.002, respectively). Relative abundance of cactus mice did not differ significantly among the 3 road types (F2,21 = 0.676, p = 0.522).

Dulzura kangaroo rats were tracked an average of 14.6 m (SE 2.4). Movement simulations for this species predicted a road permeability of 41%. Although there were few animals tracked, most of them went onto the roadways. Of the 3 individuals tracked near the dirt road, all went onto the road (n = 3, p = 0.070), which indicates the road was more permeable to this species than the surrounding habitat. One individual’s burrow entrance was in the middle of the roadway. Two out of 3 individuals tracked went onto the secondary paved road (n = 5, p = 0.572), which indicates this road was not a barrier to movement. One individual ran along the length of the road and the other crossed the road (Fig. 3).

Deer mice were tracked adjacent to the highway for an average length of 19.9 m (SE 2.3). Species-specific
movement simulations predicted a road permeability of 37%. No deer mice went out onto the road, which indicates the rural highway was a significant barrier for this species ($n = 8, p = 0.030$). Many individuals were tracked to burrow entrances that were within a few meters of the road.

**Lizards**

Western fence lizards were tracked an average distance of 17.4 m (SE 2.2) from point of release. Species-specific movement simulations predicted an expected road permeability of 31%. The permeability of the dirt roads to movement of western fence lizards was higher than expected; 66% of lizards went onto the dirt road ($n = 9, p = 0.030$). These were a mixture of crossing events and movement along the road. A high percentage (56%) of individuals also went onto the secondary paved road ($n = 9, p = 0.146$). These movements were all along the road and no crossing events were recorded. However, most of these tracks were lost on the pavement, so we could not determine which side of the road the animal went to. In comparison, not a single western fence lizard went onto the highway (Fig. 4). Although permeability between the expected and observed values for the highway was not significant ($n = 6, p = 0.186$), the permeability of the highway to fence lizard movements was significantly lower than permeability of the dirt ($p = 0.028$) and secondary paved roads ($p = 0.044$) to movements of fence lizards. Their relative abundance did not differ among road types ($F_{2,21} = 0.006, p = 0.994$).

Movement simulations predicted road permeability of 31% for orange-throated whiptail if the roads had no effect on movement behavior. The average track length was 17.0 m (SE 1.3) by the secondary and primary paved roads. Although 33.3% of orange-throated whiptails crossed the secondary paved road ($n = 6, p = 1.00$), none were tracked out onto the highway ($n = 24, p \leq 0.001$) (Fig. 5). Only one whiptail was captured by the dirt road, and its track length was <10 m. Whiptail abundance next to the paved road and highway did not differ significantly ($t_{14} = 1.612, p = 0.129$). However, the
success rate in tracking the whiptail for distances >10 m was significantly greater by the highway (24/32) than by the paved road (6/20, \( p = 0.002 \)).

**Discussion**

Although they live in open scrub habitats, San Diego pocket mice and cactus mice prefer to move and forage under microhabitats of shrub and rock cover rather than open areas (Meserve 1976; Price & Kramer 1984). Thus, they may quickly pass through or avoid areas of open ground. This is consistent with their movements relative to the dirt road, which were primarily direct crossings to shrub and rock cover on the other side of the road. One cactus mouse crossed the dirt road on 2 occasions. This result indicates the dirt road was within its home range. In contrast to the dirt road, there were no documented movements of either species across the secondary paved road or highway even though the distances required to cross either road were well under the average tracked distances of the species. The secondary road differed from the dirt roads by an average added width of 1.9 m, the addition of pavement, and an increased traffic volume averaging one vehicle every 5 minutes. It is unknown which of these factors or combination thereof resulted in their avoidance of this road. However, because of the low traffic volume and little difference in width, it is likely that these species were avoiding the road substrate. White-footed mice (*Peromyscus leucopus*) and eastern chipmunks (*Tamias striatus*) avoid crossing paved roads regardless of traffic volume (McGregor et al. 2008). By comparing roads with different substrates and traffic volumes, our results support the hypothesis that many small mammal species avoid paved road substrates. The reasons for this are not understood and deserve further study. However, mammals are particularly sensitive to odors in their environment. Road pavement surfaces, such as asphalt and coal tar, contain complex mixtures of volatile and non-volatile compounds. Even very minute concentrations of smells and chemicals that mimic pheromones may elicit instinctive behavioral...
responses in some species (e.g., Leinders-Zufall et al. 2000).

However, the avoidance of pavement is not generalizable to all species of small mammals. The yellow-necked mouse (*Apodemus flavicollis*) regularly crossed both dirt and paved roads of similar width (Rico et al. 2007). In our study, 2 out of 3 Dulzura kangaroo rats went out onto the secondary paved road. Although we did not capture any Dulzura kangaroo rats by the highway, this species accounted for the majority of dead animals we observed on the highway (3 out of 7) (Brehme 2003), which indicates the highway was also somewhat permeable to movement for this species. The higher than expected permeability of dirt roads to movements of the Dulzura kangaroo rat is consistent with results of a previous study on the Stephens’ kangaroo rat (*D. stephensi*) (Brock & Kelt 2004). Kangaroo rats may preferentially use dirt roads for movement within their habitat. These bipedal heteromyids prefer to move and forage within open-ground areas of scrub habitats and respond positively to disturbances such as fire (e.g., Meserve 1976; Price & Kramer 1984; Brehme et al. 2011). In areas with denser vegetation, low-use dirt roads and trails may provide an increased opportunity for kangaroo rats to disperse to open scrub habitats. Alternately, we would expect negative effects from high-traffic roads on kangaroo rats. Traffic noise can disrupt communication in kangaroo rats (Shier et al. 2012) and nonavoidance of these roads would very likely result in increased mortality rates from vehicular traffic.

Because many reptiles may be attracted to open spaces and paved surfaces for thermoregulatory purposes, it is often hypothesized that these animals do not avoid roads (e.g., Klauber 1939; Jochimsen et al. 2004; Andrews et al. 2008). The dirt and secondary paved roads in our study were highly permeable to movement of western fence lizards (67% and 56%, respectively). Their movements on the dirt roads consisted of crossings and movements along the road; thus, the road was in part used as a conduit for movement. In contrast, their

---

**Figure 3.** Predicted (correlated random walk, CRW) and observed permeability (Pe) of road types to movement of Dulzura kangaroo rat (*Dipodomys simulans*). Each drawing shows movements tracked at multiple independent release sites superimposed onto a single frame (gray circle, burrows; *p* < 0.10).
Figure 4. Predicted (correlated random walk, CRW) and observed permeability (Pe) of road types to movement of the western fence lizard (Sceloporus occidentalis). Each drawing represents movements tracked at multiple independent release sites that are superimposed onto a single frame (*p < 0.05).

movements on the secondary road were often erratic and irregular along the road edge. This suggests the paved road was used for basking which was regularly observed during the study. The complete absence of movements onto the highway was in stark contrast to their response to the dirt and secondary paved roads. Similarly, although the secondary road was permeable to movement of the orange-throated whiptail, this species also completely avoided the highway.

Delaney et al (2010) found that genetic diversity is lower in populations of western fence lizards that are separated by a highway than in populations in continuous habitat. Because of the high permeability of the secondary paved road to these 2 species, we think it is unlikely that the additional width of the highway (4.6 m) alone adequately explains their marked avoidance of the highway. However, the level of traffic (average 1 vehicle/7 seconds) was 40-fold higher on the highway than on the secondary paved road; thus, the constant stream of vehicular traffic and corresponding noise and vibration may have been sufficient to deter use of the highway. On the basis of our own literature search and recent reviews on responses of reptiles to roads (Andrews et al. 2008; Rytwinski & Fahrig 2012), we believe ours is the first study to document behavioral road avoidance in lizards.

All the study species exhibited increased road avoidance and thus experienced decreased connectivity as road improvement and traffic increased. By studying both small mammals and reptiles we were able to make direct comparisons of behavior between taxa with different microhabitat preferences and life-history strategies. Species microhabitat-use preferences within their habitat may be an important predictive factor for road permeability (Fig. 6). Animals that are more likely to focus their activities in open areas within their habitat were more likely to venture out onto low-use roads. In our study, the 3 species (Dulzura kangaroo rat, western fence lizard, orange-throated whiptail) that use open areas for foraging
or thermoregulation ventured onto dirt and secondary paved roads more than the species (San Diego pocket mouse, cactus mouse) that prefer to forage within or under the cover of rocks and shrubs.

Thus, one would predict that the populations of small animals with closed microhabitat preferences would be in most danger of becoming fragmented by any type of road. For instance, small mammal and reptile species that avoid open ground, such as the cotton rat (*Sigmodon hispidus*), prairie vole (*Microtus ochrogaster*), Eastern massasauga rattlesnake (*Sistrurus c. catenatus*), rosy boa (*Lichanura trivirgata*), and many rainforest species, avoid crossing even narrow dirt roads (Swihart & Slade 1984; Weatherhead & Prior 1992; Goosem 2001; Rochester et al. 2005). Whereas generalist species and those with open microhabitat preferences would be more likely to cross roads, use roads for activity, and as conduits for movement. However, even these species may avoid roads with heavy traffic due to the constant disturbance from noise, vibrations, and lights. Therefore, roads with moderate traffic would be expected to pose the greatest risk of vehicular mortality for generalists and open microhabitat specialists due to the use of roads by both animals and vehicles (Seiler 2003). Our results pertain to small mammals and lizards with home ranges that are small relative to the road matrices within the study area. It is expected that movements onto roads would be more common for animals that make long migratory movements or that have large home ranges relative to the road matrices within their habitat.

Our results show that a 2-lane rural highway through open scrubland can create a significant movement barrier for species of small mammals and reptiles. Behavioral mechanisms appear to be road surface avoidance for some small mammal species and traffic avoidance for lizard species. Avoidance of improved roads may be a beneficial response in that mortality from vehicular traffic is avoided or minimized. However, networks of
roads throughout a landscape may divide habitat into fragments that are too small to sustain some populations over the long term. Barrier fencing and safe-crossing structures may reduce the effects of habitat fragmentation for species that avoid roads and reduce road mortality for species that do not avoid roads (e.g., Boarman & Sazaki 1996; Dodd et al. 2004).

More research is needed to determine whether road response patterns are consistent across other habitats and small animal species, whether microhabitat-use preferences can also help predict the use of road-crossing structures, and to further understand the population-level effects of movement-behavior decisions (Fahrig 2007; Rytwinski & Fahrig 2012). If generalizations are found, they will help us to identify vulnerable species and potentially detrimental roads within their habitat, inform population and spatial-movement models, and inform management decisions and mitigation measures for both studied and unstudied species.

Acknowledgments

We thank J. Diffendorfer and J. O’Leary for guidance throughout the project. This manuscript was improved by the helpful comments of S. Riley, E. Boydston, D. Ouren, K. Miles, and an anonymous reviewer. We thank D. Palmer, K. Sullivan, S. Millus, A. Holman, S. Black, J. Ordonio, D. Stokes, C. Rochester, S. Hathaway, A. Atkinson, W. Boarman, C. Haas, M. Mendelsohn, R. Lovich, A. Hember, A. Herring, and D. Clark for field and other project assistance. We are grateful to A. Pigniolo for conducting the archaeological survey. Finally, we thank Caltrans, California Department of Fish and Game, and the U.S. Fish and Wildlife Service for allowing us to conduct this study on their lands. An objective road risk assessment method for multiple species: ranking 166 reptiles and amphibians in California

Cheryl S. Brehme · Stacie A. Hathaway · Robert N. Fisher

Context Transportation and wildlife agencies may consider the need for barrier structures and safe wildlife road-crossings to maintain the long-term viability of wildlife populations. In order to prioritize these efforts, it is important to identify species that are most at risk of extirpation from road-related impacts.

Purpose Our goal was to identify reptiles and amphibians in California most susceptible to road mortality and fragmentation. With over 160 species and a lack of species-specific research data, we developed an objective risk assessment method based upon road ecology science.

Methods Risk scoring was based upon a suite of life history and space-use characteristics associated with negative road effects applied in a hierarchical manner from individuals to species. We evaluated risk to both aquatic and terrestrial connectivity and calculated buffer distances to encompass 95% of population-level movements. We ranked species into five relative categories of road-related risk (very-high to very-low) based upon 20% increments of all species scores.

Results All chelonids, 72% of snakes, 50% of anurans, 18% of lizards and 17% of salamander species in California were ranked at high or very-high risk from negative road impacts. Results were largely consistent with local and global scientific literature in identifying high risk species and groups.

Conclusions This comparative risk assessment method provides a science-based framework to identify species most susceptible to negative road impacts. The results can inform regional-scale road mitigation planning and prioritization efforts and threat assessments for special-status species. We believe this approach is applicable to numerous landscapes and taxonomic groups.

Introduction

There have been many attempts to better characterize and quantify threat criteria in order to classify species at higher risk of extinction at state, national, and global levels (Congress 1973 (U.S. Endangered Species Act); Mace et al. 2008; Hobday et al. 2011; Thomson et al. 2016; IUCN 2017). Roads are a significant threat to wildlife populations (e.g., Forman et al. 2003;
Andrews et al. 2015a; van der Ree et al. 2015), causing both barrier (habitat fragmentation) and depletion (road mortality) effects. Barrier effects occur when animals avoid crossing roads, in which case roads essentially fragment species habitat. Barrier effects include reduced size and quality of available habitat, reduced effective population size, reduced ability to find mates and resources, increased genetic structuring, and increased probability of local extirpation (e.g., Forman et al. 2003; Fahrig and Rytwinski 2009; D’Amico et al. 2016). Depletion effects occur when animals attempt to cross roads and are killed by vehicles. Depletion effects include all of the risks from barrier effects as well as reduced survivorship, making high road mortality an even greater concern (Jackson and Fahrig 2011). Among other stressors, such as habitat loss and fragmentation, invasive species, pesticide use, changing climate, and disease, the negative impacts from roads may independently or cumulatively threaten the persistence of populations and even species.

Amphibians and reptiles have been identified as being particularly susceptible to the negative effects of roads within their habitat (e.g., Klauber 1931; Forman et al. 2003; Rytwinski and Fahrig 2012; Andrews et al. 2015a, b; D’Amico et al. 2016). Many are slow moving, do not avoid roads, and are simply too small for drivers to see and avoid. During rains many amphibians make long linear terrestrial movements regardless of the presence of intersecting roadways (Glista et al. 2008), and because paved roads typically absorb and retain more heat than the surrounding habitat, snakes and lizards are often attracted to roads for thermoregulation (Case and Fisher 2001; Jochimsen et al. 2004). In fact, road surveys are one of the most common methods for surveying these reptiles (e.g., Sullivan 2012). Many herpetofauna species utilize both aquatic and terrestrial habitat for breeding, development, foraging, and overwintering and therefore require connectivity within and between both aquatic and terrestrial habitats to support basic life history requirements.

The primary goal of this study was to provide information to transportation and other planning agencies in California to assist them in prioritizing road mitigation efforts for amphibian and reptile species. Although there is still a lot to learn about the effectiveness of different designs of road mitigation systems, the use of barrier systems, underpasses, and overpasses can reduce road mortality and help to maintain connectivity and safe passage across roads for herpetofauna and other wildlife (Jochimsen et al. 2004; Colino-Rabanal and Lizana 2012; Langton 2015; Langen et al. 2015b). Because it is currently unrealistic and cost prohibitive to mitigate all roadways for all species, it is vital to identify species most susceptible to road-related impacts. Within species ranges, risks to populations and need for mitigation can then be evaluated based upon local road densities and matrix, road-types, traffic, and road locations in relation to species habitat and movement corridors (e.g., Jaeger 2000; Litvaitis and Tash 2008; Langen et al. 2015b; Zimmermann Teixeira et al. 2017).

Here we describe a road risk assessment methodology applied to native amphibian and reptile species in California, a global biodiversity hotspot (Myers et al. 2000). We also included analysis of subspecies if they had special federal or state protection status. This includes 166 species and subspecies of frogs, toads, salamanders, snakes, lizards, turtles, and tortoise. Rankings and prioritizations such as these can be very subjective. In order to avoid including low risk species that may be favored by the assessors or to unintentionally overlook species that are at high risk, it was important for this be done in an objective manner informed by current road ecology literature.

Very few quantitative data are available on the impact of roads on population persistence. Jaeger et al. (2005) were the first to develop a relative ranking system to compare the impact of roads on wildlife populations. Their ranking system was largely based upon behavioral responses of animal species to the road surface, road size, traffic noise, and vehicles with varying road sizes and traffic volumes. However, knowledge of these detailed behavioral responses to ranges in road and traffic characteristics is rarely found in literature and the link between individual behavior and population-level effects has not been clearly established (Rytwinski and Fahrig 2012, 2013).

Rytwinski and Fahrig (2012) performed a meta-analysis of wildlife groups to test whether certain life history characteristics were related to negative responses to roads. High reproductive rate (fecundity) was negatively associated with the magnitude of population-level effects for amphibians. No associations were significant in reptiles, although there were...
few studies to inform this analysis. However, a strong link was shown between body size, greater mobility, lower reproductive rates and the magnitude of negative road effects in mammals, the most studied wildlife group. Conversely, simulations predicted populations of species with small home ranges and high reproductive rates were the least likely to be affected by roads (Rytwinski and Fahrig 2013).

We used these findings as a basis for creating a multi-tiered system to rank and identify reptile and amphibian species that may be most susceptible to road impacts. We based our ranking upon a suite of species life history and space-use characteristics associated with negative road effects, as well as including species distribution and conservation status. We evaluated risk to both aquatic and terrestrial connectivity and include buffer distances that were calculated to encompass 95% of population movements. Relative confidence in these distances is given for each species based upon the amount of support from scientific studies. We solely focused on the direct effects of roads as barriers and sources of road mortality and not impacts from road construction and maintenance or indirect effects from increased human use of the landscape once a road is in place (see review by Langen et al. 2015a).

Because we based the risk assessment solely upon space-use and life history characteristics, this represents a species relative susceptibility to road impacts. It is understood that circumstances associated with particular populations (e.g., local road types, locations, densities) may elevate or reduce the risk for certain populations and species.

Methods

Road risk assessment (overview)

We assessed the relative risk of California herpetofauna species to negative road-related impacts at three scales in a hierarchical fashion. We first assessed risk at the scale of an individual animal and then expanded the risk to the population and then to species (Fig. 1).

At the individual-level, we based road risk primarily upon the likelihood that an individual would encounter one or more roads. We considered this a product of movement distance (home range, seasonal migrations) and movement frequency (e.g., active foragers, seasonal migrants, sit-and-wait predators vs. sedentary species) (e.g., Bonnet et al. 1999; Carr and Fahrig 2001). Because many species are semi-aquatic, movement distance and frequency were scored separately for both aquatic and terrestrial habitats.

There is a theorized higher risk associated with depletion effects (i.e., road mortality) in comparison to barrier effects (Fahrig and Rytwinski 2009; Jackson and Fahrig 2011). Therefore, we gave additional weight to those species more likely to go out onto a road surface and be killed by vehicular traffic. For this we considered factors of habitat preference (e.g., open vs. closed), roads as potential attractants (e.g., for basking), and movement speed (e.g., slow vs. fast). However, individuals within and among species may respond differently to roads (attraction vs. avoidance) based upon local landscape features, road width, traffic volume, and perceived danger (Forman et al. 2003; Andrews 2005; Brehme et al. 2013; Jacobson et al. 2016). Because a state-wide analysis encompasses extreme variation in landscape and road characteristics, the extent to which roads act as barriers or sources of direct mortality within a species range is unknown. The risk disparity between depletion and barrier effects could also be highly variable. Therefore, we limited the additional weight for potential depletion effects to twenty percent of the individual risk score.

We assessed population-level road risk by multiplying individual risk with scores representing: (1) the relative proportion of the population at risk; and (2) the species ability to sustain higher rates of mortality. For instance, the proportion of the population at risk was expected to be higher for migratory species than for territorial species. Highly fecund species were expected to better withstand (or more quickly recover from) higher mortality in comparison to those with few annual offspring.

Finally, we assessed species-level road risk by multiplying population road risk with scores for range size (both within and outside of California) and conservation status according to the U.S. Fish and Wildlife Service (USFWS 2016) and the California Department of Fish and Wildlife (CDFW 2016a; Thomson et al. 2016). Species with smaller ranges typically have fewer populations and are thus less resilient to population-level stressors. Endangered, threatened, and special concern species have already been designated at risk of extirpation, often due to
multiple stressors, and are thus thought to be less likely to be resilient to additional road impacts. Although we present both aquatic and terrestrial risk scores for semi-aquatic species, we used the higher of the two scores for the overall risk ranking.

Literature review

Species life history data were primarily taken from and cross-checked among the following species account review sources:

2. California Amphibian and Reptile Species of Special Concern (ARSSC; Thomson et al. 2016).
3. A Field Guide to Amphibians and Reptiles of California (Stebbins and McGinnis 2012)

When these reviews were lacking life history information needed for the road risk assessment, we then searched for supplementary peer-reviewed literature using the Google Scholar search engine. Because movement distances (terrestrial, aquatic, home range, migratory) were so important for the risk assessment, we acquired referenced articles from the species accounts and independently searched the literature to acquire these data. Search terms included the species common name, scientific name, or genus and terms such as “movement”, “home-range”, “spatial”, and “telemetry”. We also reviewed articles for citations of other studies to find more recent information on movement. This literature included published articles,
book chapters, M.S. Theses, Ph.D. dissertations, agency reports, and consultant reports. In the case that specific life history or movement information was not found for a species, we chose a surrogate species based upon phylogeny, habitat, and body size. We first looked for the closest related species within the genus or family and chose a closely related surrogate based upon similar habitat and body size. If surrogates were used, these are clearly reported.

Road risk metrics

The following section describes in detail the rank scoring used for Individual-level Road Risk, Population-level Road Risk, and Species-level Road Risk. All rank values are meant to represent the relative contribution of each attribute to either additive or multiplicative road risk.

**Individual-level risk (100 points possible)**

Out of a total of 100 points for individual road mortality risk, we attributed up to 80 points (80%) to the risk of encountering a road and up to 20 points (20%) for the risk of an individual moving onto a road and being killed by a motor vehicle.

The risk of encountering a road was based on a combination of movement distance and general movement frequency. Movement distance was ranked 1–40 based upon home range movement distances (diameter) for non-migrants or migration distances for seasonal migrants that spanned from 0 to > 1200 m (Table 1). The scores are linearly correlated with increasing movement distance.

For species that use both terrestrial and wetland/stream/riverine habitats, such as frogs, toads, aquatic snakes and turtles, we scored aquatic and terrestrial movement distances and frequencies separately. This was necessary as some species move much larger distances and at different frequencies in one habitat versus the other. This also informs the type(s) of mitigation structures that may be warranted based upon habitat type, buffer distances and risk scores for each species. Aquatic movement distances were not calculated for pond-breeding amphibians. Ponds are typically small ephemeral bodies of water and terrestrial movements of amphibians to and among ponds account for the majority of movement for these species.

The calculations and rankings for movement distances were well considered and deserve further explanation. Our original thinking was that maximum distances should reflect relative movement distances across species and these data were commonly reported in species accounts. However, it became increasingly difficult to determine whether maximum distances reported were seasonal migration movements, home range movements or rarer dispersal events. We believed this assessment should reflect annual movement distances and not rare dispersal events. We considered using average/median movement distances; however, these often underestimate the movement of seasonal migrants because in many cases a sizeable portion of the population may remain close to a breeding site, while another sizable portion make longer distance migrations causing an average or median to be uninformative. Therefore, we decided to use a buffer distance that incorporates the movement distances of 95% of the population studied. A 95% population movement distance is commonly accepted for the delineation of terrestrial buffer zones for amphibians (i.e., Semlitsch 1998; Semlitsch and Bodie 2003) and we believe it was the most biologically

meaningful and useful measure for this study. This measure, which we will refer to as Maximum Population Movement Distance (MPMD), should include almost all population movements, such as seasonal migration distances and annual home ranges (diameter), but not rare dispersal events. The MPMD should also be useful for local risk assessments as these distances can be used to aid in mapping and mitigation decisions.

The calculation we used for MPMD is commonly known as the 95% upper tolerance interval (Vangel 2015). A tolerance interval is an interval that is meant to contain a specified percentage of individual population measurements. This should not be confused with a confidence interval, which is an interval that is meant to contain the population mean. We chose a 50% confidence level for the upper 95% confidence limit of movement distances which is equal to the 95% prediction interval for future observations and is the mean $\pm 1.645 \times$ standard deviation. In cases where a standard deviation was not reported, we back calculated standard deviation from the standard error and sample size, calculated it from the individual data, or estimated it based on the methods recommended by Hozo et al. (2005). Although non-parametric tolerance intervals would be more appropriate for non-normally distributed movement data, the data required to calculate these is rarely reported in the published literature. In the case of non-normally distributed data where medians, sample sizes and ranges are reported, Hozo et al. (2005) methods allow for approximation of means and standard deviations with no assumption of the underlying data distribution. We found the resulting MPMDs to be reasonable in excluding large outliers but including multiple long distance movements below the maximum movement distance.

We recognize that for any species there can be substantial variability in movement distances that depend upon varying local, landscape, and climatic factors. This was often reflected in studies with sometimes widely varying estimates of home range and migration distances. We attempted to be conservative by using the study data for calculation of MPMD in which the largest population movement distances were observed. For studies where movement distance significantly varied between females and males, we used the information from the wider ranging sex. For migratory distances, we did not use distances from extreme environments, such as Canada, where suitable overwintering sites are typically much farther away from breeding and summer activity areas than in milder California climates (e.g., Gregory 1984). We did use study data from adjacent states or lower estimates of migration distances from those reported in Midwestern states. In some cases where little information was available, we made an educated guess based upon limited study data and/or closely related species and noted these in the tables. For all MPMDs, we report a relative confidence level based upon the number and quality of studies, sample sizes, and locations in or adjacent to California. It is intended that the scores be adjusted as new information becomes available.

To compute the risk of encountering a road, the MPMD was multiplied by a relative index of the expected frequency of longer distance movements (1–2 points; Table 1). We defined three frequency categories largely based upon annual migratory movements or foraging strategies for non-migratory species. The highest category included actively foraging predators which are characterized by frequent wandering movements throughout their home range (Pianka 1966). Less frequent movers included seasonal migrants traveling among breeding, summer foraging, and/or overwintering sites and non-migratory ‘sit-and-wait’ predators that remain still for long periods of time to ambush prey (Pianka 1966). Finally, low frequency included highly sedentary species with high site fidelity, particularly specialized rock, crevice, soil, or tree dwellers that may rarely traverse terrestrial or aquatic habitats.

The risk of an individual moving onto a road and being killed by a moving vehicle was ranked by attributes of habitat preference, road use, and movement speed (Table 2). Habitat preference represents the degree to which an individual is expected to go out onto or avoid an open road as predicted from their habitat and microhabitat preferences. Open habitat specialists and generalists were expected to more readily move onto a road than species that prefer cover (e.g., Forman et al. 2003; Brehme et al. 2013). Although many amphibians are closed habitat specialists, most readily move through open habitats during rain events, when most overland migratory movements tend to occur (Glista et al. 2008). Therefore, amphibians were considered open habitat specialists for this ranking. An additional factor that may increase road use is for thermoregulation for lizards.
and snakes, as roads often retain more heat than the surrounding environment (Colino-Rabanal and Lizana 2012; Mccardle and Fontenot 2016). Finally, there is an increased risk of road mortality for slow versus fast moving species (see Andrews and Gibbons 2005; Mazerolle et al. 2005; Andrews et al. 2015b).

### Population-level Road Risk (400 points possible)

To assess the risk of negative road impacts on the persistence of a population we incorporated scores for population-level movement behavior and fecundity (Table 3). For the proportion of a population expected to encounter a road, we scored the greatest risk to species that seasonally migrate to overwintering and breeding areas (Jackson et al. 2015). For those that do not migrate, we expected higher proportions of non-territorial or loosely territorial species (“wandering”) to encounter roads than species that defend distinct territories.

Species with low fecundity are less resilient to road mortality impacts than highly fecund species (Rytwin-ski and Fahrig 2013). Relative fecundity was simply calculated from the average number of potential offspring per year whether the animals were oviparous or live-bearing. For egg-laying species, the number of potential offspring was calculated by multiplying the average clutch size by the average number of clutches per year.

Individual mortality risk (1–100 points) was multiplied by the sum of these population-level factors (1–4 points) to calculate population-level road risk.

### Species-level road risk (1200 points possible)

In comparison to population-level risk, we considered the overall risk of roads to species to be negatively associated with species range and conservation status. Although some populations may be at high risk, species with a wide distribution and many populations should be more resilient to localized declines and extirpations. Therefore, we assigned a range isolation score ranging from 0 to 1 that considered species distributions range-wide (North America) and within California (CA) (Table 4). Range-wide distribution varied from “CA only” to “widespread” (> 4 states). If the species range extended into Mexico and/or Canada, these countries were counted as another state for calculation of the index. California-wide distribution was calculated based upon the number of CA geographic regions occupied out of twelve regions defined by Hickman (1993) and used in Stebbins and

McGinnis (2012). These two scores (Range-wide isolation, CA isolation) were summed and divided by two in order to normalize the overall range isolation score to a 0 to 1 scale.

At the species-level, we also incorporated conservation status (Table 4). Some species are declining and are at higher risk of extinction often due to multiple stressors. Federal and State Threatened and Endangered Species were given the highest score (1.0). In California, forty-five species are designated “Species of Special Concern (SSC)” with a ranking of 1, 2, or 3 based upon severity and immediacy of threats affecting each taxon (Thomson et al. 2016). SSC species were given a conservation status score ranging from 0.25 to 0.75 based upon their SSC ranking. Population-level Road Risk (score range 1–400) was multiplied by (1 + Range Isolation Score + Conservation Status Score; score range 1–3) to calculate the final Species-level Road Risk.

Range and conservation status were only used as a multiplier for species-level road risk if the population-level road risk was greater than 80 (20% of possible population score). This helped to prevent false inflation of the road risk metrics for low road susceptible species.

Because all members of the genus *Batrachoseps* (slender salamanders) are similar in body size, range size and general life history characteristics, we scored

*Population-level risk > 80 only*
the genus as whole with the most conservative estimates and conservation status but included all 20 species in the final count and calculations.

Once all 166 species (including subspecies with conservation status) were scored for species-level road risk within both terrestrial and aquatic habitats, we took the maximum score for each species and sorted them from the highest to lowest scores. We grouped species into categories of risk (Very high, high, medium, low, and very low) based upon ranges of values that represented frequency distributions in 20% increments of all species scores (Table 5, Fig. 2).

As a way to support the results of our ranking model with species literature, we focused on special status species. We reviewed recovery plans and 5-year reviews for federally listed species and state species accounts for California listed species and species of special concern (collectively referred to as special status species). For each rank group (i.e., “very low” to “very high”), we calculated the percentage of special status species where roads were specifically listed as a threat. Similarly, we tallied the number of species identified in a recent California preliminary road risk assessment (Levine 2013, Amy Golden pers. comm.) and compared the number of species that fell within each of our road risk categories.

### Results

All chelonids, 72% of snakes, 50% of anurans, 18% of lizards and 17% of salamander species were ranked as high or very high risk from negative road impacts. (Table 6, Fig. 3).

Review of species accounts, recovery plans, and 5-year reviews for all special status species showed
