- **Conclusions & Future Developments** – A summary of concluding thoughts from the publication as a whole and highlights of important future developments.

- **Additional Resources & References** – A collection of organizations, publications and internet resources, along with citations from this publication.

- **The Case Studies** – In-depth case studies of over 25 examples of demand-side programs underway across the country.
**THE DEMAND-SIDE FRAMEWORK**

This section outlines a framework for understanding demand-side strategies, their impact on traveler choices, and the varied settings where they are applied.

In order to better understand the scope of demand-side strategies, the following section presents a framework outlining three primary areas for discussion of demand-side strategies: the variety of available action strategies, the realm of targeted traveler choices, and the variety of program applications.

The basic framework for how these concepts work together is presented in Figure 1. Essentially, in considering demand management programs:

> A variety of demand-side strategies are implemented in order to impact the travel choices of individuals and organizations, in the context of a wide array of application settings.

Further detail on each of these three areas is provided below, and illustrated in Figure 2 on the following page.

**Demand-Side Strategies.** These are the actual strategies designed and implemented by organizations with a role to play in mitigating traffic congestion, including state/regional/local governments, employers, special event managers, and many others. Organizations frequently tailor packages of both general strategies and targeted strategies to facilitate the most appropriate blend of efficient traveler choices.

**Traveler Choices.** These are the key travel choices made by individuals and organizations that collectively impact the efficiency and performance of the transportation system. Elements include both day-to-day choices about travel mode, departure-time, and travel route, as well trip reduction choices (i.e., telework) and more fundamental residential and business location choices.

**Application Settings.** Demand-side strategies impacting traveler choices are tailored for a wide range of different application settings, each addressing different trip types or travel market segments. Examples are shown in Figure 2, along with some of the case studies included in this document.
FIGURE 2: THE THREE CORE ELEMENTS OF DEMAND-SIDE STRATEGIES
DEMAND-SIDE STRATEGIES

This section describes the scope of programs and policies implemented by organizations to impact the demand for travel. These are the on-the-ground strategies designed and implemented by organizations with a role to play in mitigating traffic congestion, including state/regional/local governments, transportation management associations, non-profit transportation services providers, transit agencies, employers, special event managers, property managers, and many others. Action strategies can include “general” strategies that have a broad impact on a variety of travel choices. For example, financial incentives can be used to impact travel choices in a variety of ways. In addition to the general strategies available, there are also many “targeted” strategies that focus on a specific travel choice. For example, implementation of workplace “flextime” policies is a demand-side strategy specifically targeting travel departure-time choices. Organizations designing and implementing demand-side strategies frequently tailor appropriate packages of both general and targeted action strategies to facilitate the most appropriate blend of traveler choices.

General Strategies

“General” demand-side strategies impact the full range of traveler choices – from mode choices to departure-time choices and route choices. Ranging from infrastructure investments like high-occupancy vehicle lanes and preferential parking spaces, to more programmatic investments like tax-based incentives, these broad-based, general strategies often work in conjunction with the targeted strategies described below. The full range of general demand-side strategies are described in greater detail in the sections below, and are organized in four primary categories:

- Technology Accelerators
- Travel Time Incentives
- Financial Incentives
- Marketing & Education
Targeted Strategies
Often complementing the more broad-based, general demand-side strategies, an array of demand-side strategies are targeted to specific traveler choices – such as choices regarding travel mode or trip departure time. These targeted strategies are described in detail in the sections below, and are organized around the five primary categories of choices that affect overall transportation demand:

- Mode Strategies
- Departure-Time Strategies
- Location/Design Strategies

Route Strategies
- Trip Reduction Strategies

General Strategies
General demand-side strategies impact the full range of traveler choices – from mode choices to departure-time choices and route choices.

Technology Accelerators
Advances in technology are quickly accelerating the ability of transportation organizations to implement effective demand-side strategies. Significant investments in intelligent transportation system (ITS) infrastructure throughout the country are yielding increasingly precise, real-time information about transportation conditions (i.e., current traffic congestion, transit vehicle locations and wait times, etc.), and increasingly user-friendly and robust pre-trip travel planning tools – all of which are making it easier for travelers to make smart transportation mode, route, and departure-time choices. Additionally, rapid advancements in broadband and wireless internet connectivity are making trip reduction strategies, like telework and e-commerce, viable for larger segments of society. While ITS hardware and software technologies will continue to improve – demand-side strategies play a critical role ensuring that advances in transportation information technology translate into more efficient mode, route, and departure-time choices by the users of the transportation system. By developing partnerships with employers, property developers and managers, residential districts, transportation providers and others, organizations that design demand-side programs can ensure full integration of technology accelerators and other complementary demand-side strategies (i.e., financial incentives, travel-time incentives, etc.). Specific technology applications accelerating the scope of demand-side strategies include:

- Real-Time Traveler Information
  The expanded deployment of intelligent transportation system infrastructure and networks, such as road sensors and video cameras, means that accurate, real-time information about traffic congestion, parking availability, transit arrival times, and more are now available to more and more travelers around the country. Real-time traveler information can be provided through a wide variety of communications mediums, including: (1) websites, (2) telephone systems, (3) wireless devices (cell phones, pagers, PDAs, etc.), (4) information kiosks, (5) variable message signs on roadways, at transit stops, and in parking lots, and (6) in-vehicle navigation systems. In order to reach more people before they make travel decisions, transportation organizations are working with a variety of partners to integrate such real-time traveler information resources into corporate intranets at the workplace, building lobbies and elevators, and residential developments through “internet communities.”
By providing better information about current travel conditions, transportation agencies and their partners allow people to make travel mode, route and time choices that best match their individual travel needs. Real-time travel information evaluations show that – armed with real-time travel information – a significant number of travelers alter their original route, departure-time, and even mode choices, reducing the demand for already congested facilities and maximizing the use of underutilized alternatives.

**FAST FACTS:** According to a 2001-2002 survey of real-time travel information users, 68% of users in Pittsburgh and 86% of users in Philadelphia changed their original travel route, while 47% of users in Pittsburgh and 66% of users in Philadelphia changed their original time of travel as a result of the traffic information. The effect on mode choice was less noticeable, 6% in Pittsburgh and 2% in Philadelphia changed their mode of transportation based on the information provided. (Fekpe, 2003)

**REAL-TIME TRANSIT INFORMATION – REHOBOOTH BEACH, DE.** Summertime parking and traffic problems in the beach town area around Rehoboth Beach, Delaware, are addressed with seasonal bus services including a park-and-ride Beach Bus. Electronic signs placed at the Rehoboth Park-n-Ride, the Rehoboth Boardwalk, and Dewey Beach’s Ruddertown complex, provide both scrolling text messages and AVL-based bus arrival time predictions (NextBus, 2002). In the season following installation, “ridership increased over 13 percent from the year before. No additional service hours or miles were operated…” (Hickox, 2002). This notable response pertains to a recreation and tourist oriented rider clientele, and the electronic sign placement may have had an advertising as well as informational effect. (TCRP, 2003)

**REAL-TIME TRANSIT & PARKING INFORMATION – ACADIA NATIONAL PARK, ME.** The Acadia National Park, in Maine, is visited by an increasing number of people each year, exceeding 2.5 million annually in 2002. In 2001-2002, a partnership between the U.S. Departments of Transportation and Interior, Acadia National Park, and the State of Maine, implemented several real-time traveler information systems to provide more timely and accurate information to visitors regarding the Acadia’s Island Explorer free shuttle bus service and on-site parking availability. Components included (1) real-time bus departure electronic message signs, (2) automated on-board “next-stop” announcements on each Island Explorer bus, and (3) real-time parking information made available by website, telephone, and parking status signs.

A visitor survey, conducted near the end of 2002, revealed the following shifts in transportation choices and preferences among park visitors:

- Real-time parking information impacted decisions visitors made about travel in the park. Of visitors using the parking information, 43% changed the time they visited a destination and 38% changed destinations based on the information.
- Visitors strongly believed in the benefits of the Island Explorer’s real-time bus departure signs and the on-board bus announcements. Over 80% found that these technologies made it easier to get around and 69-80% visitors believed they helped to save time.
- Visitors using the electronic bus departure signs and on-board announcements reported that the technologies helped them decide to use the Island Explorer bus (80% and 67%, respectively). 44% of the users of the real time parking information said it helped them decide to use the Island Explorer bus. (Battelle, 2003)
• National 511 Phone Number
During the 1990s, a variety of organizations established hundreds of travel information telephone numbers across the country to provide real-time and other transportation information. In 1999, the U.S. Department of Transportation petitioned the Federal Communications Commission for a three-digit dialing code to make it easier for consumers to access these travel information services – using the same, simple phone number nationwide. The FCC assigned the “511” number on July 21, 2000. In early 2004, 511 was available in over 20 states/regions, providing users access to advanced traveler information services.

DID YOU KNOW? By January 2004, the 511 system was available to almost 57 million Americans (19.4%), in over 20 states/regions. In January 2004, 1.8 million calls were placed to the 511 system, with an average length of 1 minute and 46 seconds (for a total of over 3.2 million minutes of call time in the month). (Resource511, 2004)

• Integrated Electronic Payment Systems
Electronic Payment Systems (EPS) allow travelers to pay for transportation services electronically. The advancement of EPS technologies is allowing more widespread – and more integrated – application of electronic payment options for transit, parking, roadway tolls, and other fee-based transportation services. Integrated EPS technologies – from the “smart card” fare payment systems with imbedded microprocessors in each card to the Radio Frequency Identification (RFID) systems at many toll plazas – are quickly reducing many of the barriers to seamless transportation across travel modes and between different transportation providers. EPS technology can allow for seamless payment, with a single fare payment media, across a variety of modes (bus, rail, ferry, etc.), and on a variety of transportation service providers within the same region. Transit agencies and other providers are also exploring adding retail purchase options to fare payment smart cards, allowing transit users convenient purchase of retail goods and services in and around transit stations and stops. In each case, technological advances are enabling more efficient and convenient travel choices.

DID YOU KNOW? Smart card electronic fare payment systems are now in use by transit agencies in over ten regions of the U.S., including Washington, DC; Atlanta, GA Los Angeles, CA; San Francisco, CA; Orlando, FL; Minneapolis, MN; and others. (APTA).

INTEGRATED ELECTRONIC FARE PAYMENT – WASHINGTON, DC. The Washington Metropolitan Transportation Authority’s (WMATA) SmarTrip program was the first public transportation system in the U.S. to adopt smart cards, launching a pilot program in 1999. In June, 2002, WMATA sold its 250,000th SmarTrip permanent rechargeable plastic smart card which holds up to $200.00 in fare value. One third of WMATA Metrorail riders use SmarTrip cards regularly. SmarTrip will be expanded to parking, bus transit, and other regional rail service over a total of 17 transit systems. (APTA, 2003)
Financial Measures
Transportation expenses are a major factor in the travel choices people make everyday. In fact, for the average American household, transportation costs represent 18 percent of total household expenditures (STPP, 2000). As such, a wide range of demand-side strategies are oriented around using financial incentives and targeted pricing systems to encourage efficient travel choices.

• Tax Incentives
  The Federal tax code allows employers to provide tax-free transit, vanpool, and parking benefits to their employees. The employer and employee save on taxes, since neither pays federal income or payroll taxes on these benefits. Called "qualified transportation fringe" benefits in the Internal Revenue Code, Section 132(f), these tax incentives are often referred to as "Commuter Choice tax benefits" or simply "commuter benefits." For tax year 2004, transit and vanpool expenses up to $100 per month ($1,200 per year) and qualified parking expenses up to $195 per month ($2,340 per year) are tax-free. The monthly tax-free limits are subject to annual adjustments, indexed to inflation (see www.commuterchoice.com for continually up-to-date information). Providing commuter tax benefits to employees can save payroll taxes for employers. Because the value of the benefit paid to employees is considered a tax-free transportation fringe benefit and not wage or salary compensation, the cost of the benefit is eligible as a business expense and payroll taxes do not apply. There are three primary ways employers can structure the benefit:

  Employer-Paid Transportation Benefits. Employers can pay for their employees to commute by transit or vanpool, up to a limit of $100/month (subject to annual change). With this arrangement, employees get up to $100 in a tax-free transportation benefit. Employers get a tax deduction for the expense and enjoy savings on payroll-related taxes. Employers have found that providing transportation benefits offers significant savings over offering the equivalent dollar value to employees in the form of a salary increase. Employers can also pay for the cost of parking for employees, up to a limit of $195/month (this limit is subject to annual change).

  Employee-Paid, Pre-Tax Transportation Benefits. Employers can allow employees to set aside up to $100/month of pre-tax income to pay for transit or vanpooling (subject to annual change). Employers save money overall since the amount set aside is not subject to payroll taxes. Employees save money, too, since the amount of an employee's salary set aside for transportation benefits is not subject to income or payroll taxes, up to the specified monthly limits.

  Shared-Cost Transportation Benefits. Employers can share the cost of transit or vanpool costs with employees—and everyone can receive valuable tax savings. With this approach, employers can provide a portion of the cost of taking transit or vanpooling as a tax-free benefit and allow the employee to set aside pre-tax income to pay for the remaining amount of the benefit (up to the specified limits).
**Questions & Answers**

Q. Are additional tax incentive programs available to employers at the state level?

A. Yes, several states have tax incentive programs to encourage employer participation in providing commuter benefits to their employees. For example, the Maryland Commuter Tax credit provides a 50 percent tax credit, up to $30 per employee per month, for provision of transit passes, vanpool benefits, and reimbursement for carpooling expenses. Other states offering tax incentives to employers include: Georgia, Minnesota, Delaware, Connecticut, Oregon, New Jersey. See the following U.S. EPA document for more information: www.bwc.gov/pdf/fedtax.pdf

**FAST FACTS:** Although 86 percent of American workers feel that commuter assistance benefits — such as discount transit passes, ride sharing boards, or parking benefits — are beneficial and useful, only 17 percent have access to such assistance through their employers. Eighty-six percent of employees who do not have commuter assistance typically drive alone to work, compared with only 71 percent who do have access to commuter assistance. Surveyed employees who have commuter assistance are almost eight times more likely to use public transportation such as the train, subway or bus than those employees who do not have assistance (15 percent versus 2 percent). (Xylo, 2001)

- **Parking Cash-Out**
  Employers can offer their employees the option to “cash out” of their existing parking space. For example, if Company A subsidizes parking for their employees at $60/month, a parking cash-out program would allow employees to choose from the following options: (1) keep the parking space worth $60/month, (2) give up the parking space and receive $60 extra each month in taxable salary, or (3) receive $60/month in tax-free transportation benefits to pay for transit or vanpooling. Cash-out programs often work best for employers that pay separately for parking and for organizations with parking shortages or demands to expand parking facilities.

**FAST FACTS:** A 1997 study of eight parking cash out programs in California found that total vehicle trips declined by 17% after a parking cash out option was introduced at various urban and suburban worksites, as shown in Figure 3 below. (Shoup, 1997)

**FIGURE 3: CASHING OUT IMPACTS ON COMMUTE MODE (SHOUP, 1997)**
• Parking Pricing
Parking pricing entails charging vehicles directly for use of a parking space, and is among the most powerful demand-side strategies. There is a cost (whether in land value, construction cost, maintenance cost, etc.) for all parking spaces. The question is whether these costs are subsidized by developers, property owners, property managers, or others – or whether, and how, these costs are charged directly, in full or in part, to those using the spaces. Well-crafted parking pricing strategies can impact the use of alternative travel modes, in particular where high-quality transit services are available. Variable parking pricing programs (see below for more detail on variable pricing), where parking prices are higher during more congested hours of the day or along more congested routes, assist in managing demand and encouraged the use of less-congested travel times and travel routes. Within particular parking lots, parking managers can discount certain parking spaces (preferably in priority locations, such as next to a building entrance) for use by those arriving in multi-occupant vehicles.

FAST FACTS: Over 95 percent of commuters park for free at work in the US, and almost all of them drive alone (91 percent of total commuters). For 2002, this yielded an estimated commuter parking subsidy for off-street parking paid by the employer and/or developer of $36 billion. (Shoup, 2003)

• Variable Pricing
Variable pricing changes the price structure of toll roads, bridges, parking lots, and other congested transportation facilities in order to provide incentives for using the facilities in uncongested times or by different modes. On variable priced toll roads, toll rates are structured such that higher prices are assessed based upon time of day concurrent with typical or even actual periods of congestion. Despite the nature of the program, tollway users will experience higher charges during the peak periods and lesser charges during off-peak or shoulder periods. The effect of variable pricing on toll facilities is to: 1) help divert some traffic from the peak period to the shoulders of the peak period, and, 2) provide a cost-based encouragement for the use of transportation options (such as transit and ridesharing). Shifts to either off-peak periods or other transportation options will likely reduce the overall congestion on the facility, and, reduce the need for additional capacity on the toll facilities.

VARIABLE-PRICED TOLLS – LEE COUNTY, FL. Lee County is using variable-priced tolls to mitigate congestion on two county bridges by spreading traffic away from the peak period “rush hour.” In the “shoulders of the peak period” (6:30 – 7:00 am, 9:00 – 11:00 am, 2:00 – 4:00 pm, and 6:30 – 7:00 pm), patrons received a 50% discount on the bridge toll if they utilize the bridge’s electronic toll collection system. According to a 1999 telephone survey, half of respondents indicated they always or sometimes considered the toll discounts prior to making a trip across the bridges. As a result of the program, use of the bridges increased in the off-peak times and decreased during the peak periods. Analysis indicated that the travelers who modified their travel plans were more likely to be retired or working part-time. The survey results indicated that commuters were less likely to modify their schedules as a result of variable pricing, and that the program appears to have a greater impact on shopping trips. (Burris, 2000)
FAST FACTS: Over forty-five projects in fifteen states have investigated and, in some cases, begun implementation of pricing programs. In Hudson County, NY, variable pricing on existing toll bridges increased transit usage and reduced peak-period traffic by 7 percent. On the New Jersey Turnpike, up to 15 percent of peak-period traffic was reduced by variable pricing. Variable tolls on the State Route 91 facility has increased three-or-more person carpools. (FHWA, 2004)

• Distance-Based Pricing
Distance-based pricing involves shifting automobile expenses that are often fixed monthly or annual costs, such as automobile insurance or vehicle registration, to expenses that vary according to how much the vehicle is driven. Distance-based pricing strategies are designed to directly tie more types of automobile expenses (i.e., in addition to fuel expenses) to the number of miles driven. Distance-based pricing programs may include (1) pay-as-you-drive automobile insurance, (2) mileage-based vehicle registration fees, and (3) mileage-based vehicle purchase taxes.

DID YOU KNOW? Progressive Insurance became the first insurance company in the United States to offer mileage-based vehicle insurance when it initiated service in Texas in 1999. Not only does Progressive charge per mile, but the company also uses a Global Positioning Satellite (GPS) system to charge motorists more when they drive under higher risk conditions. In 2004, GMAC Insurance and OnStar teamed up to offer mileage-based insurance discounts to OnStar subscribers in four states. Under the new program, vehicle owners with active OnStar accounts may be able to save from 5 to 40 percent on their car insurance, depending upon where they fall within seven mileage categories. (OnStar, 2004)

• Incentive Rewards Programs
Reward-based incentive programs use financial and recognition rewards to encourage travelers to try and to maintain efficient transportation choices. There are a wide variety of ways incentive reward programs are structured: (1) direct cash or gift certificate rewards offered to travelers for efficient travel choices, either on a regular basis or through periodic prize giveaways, (2) points-based systems for use of efficient travel choices, much like airline frequent flier programs, (3) extra time off of work, or similar workplace-based rewards, and (4) recognition of travelers or sponsoring organizations in newspaper ads, award ceremonies, etc. Reward-based incentive programs are sponsored by organizations at many different levels, from single-site employers to federal agencies. For example, the Best Workplaces for Commuters℠ program, established by the U.S. Environ-
M I T I G AT I N G T R A F F I C C O N G E S T I O N

The Environmental Protection Agency (EPA) and the U.S. Department of Transportation (DOT), publicly recognizes employers whose commuter benefits reach a National Standard of Excellence. EPA and DOT also recognize entities other than employers, such as business parks, downtown districts, or shopping malls, which provide and administer to each of the district’s employees a commuter benefits program that meets the National Standard of Excellence. For more information, visit: www.bwc.gov.

**Travel Time Incentives**

Increases in congestion levels around the country are creating longer and longer travel times. The average driver in the country’s 75 largest cities experienced about 26 hours of travel delay due to congested driving conditions in 2001. In addition to an overall increase in average travel times, travel time “reliability” has also decreased, with crashes, vehicle breakdowns, weather, special events, construction and maintenance accounting for about 50 percent of all delay on the roads in 2001 (TTI, 2003). As such, a variety of demand-side strategies are oriented around providing travel time incentives to encourage efficient travel choices. These demand-side travel time incentives address both overall travel time savings and improved travel time reliability.

- **High-Occupancy Vehicle (HOV) Lanes**

  HOV lanes are exclusive roadways or lanes designated for high-occupancy vehicles, such as buses, vanpools, and carpools. The facilities may operate as HOV lanes full time or only during the peak periods. HOV lanes typically require minimum vehicle occupancy of two or more persons. However, in some locations, occupancy requirements have been increased to prevent congestion on the HOV lane. Support facilities, such as park and ride lots and transit centers with direct access to the HOV lane, are important system elements to increase facility use. HOV lanes may also be used to provide bypass lanes on entrance ramps with ramp meter signals. Keys to the success of lanes include location (areas of high congestion do better); enforcement; interagency coordination; synergy with parking policy, trip reduction ordinances, and transit and ridesharing programs; public and policy-maker support; and education and marketing. A related concept, high-occupancy toll lanes, or HOT lanes, allow single-occupant vehicles to utilize HOV lanes for a fee. HOT lanes can expand the range of travel choices available to all users and even help articulate the perceived “value” of HOV lanes to transit, vanpool, or carpool travelers able to use the same lanes at free or reduced rates. Revenues generated through fees paid by single-occupant vehicles on HOT lanes can also bolster ongoing funding for transit and ridesharing services along a HOT/HOV route.

**FAST FACTS:** There are more than 2,500 lane-miles of HOV facilities in the U.S. and Canada. This is expected to double within the next 25 years. One of the first HOV lanes, the I-10 HOV lane in southern California, known as the “El Monte Busway”, was opened in 1973 as a dedicated busway and later opened to carpools of three or more people. In 2002, the single El Monte HOV lane carried more people than three regular general purpose lanes during peak periods, and, saved users an average of 20 minutes over the eleven mile distance. On average in southern California, HOV lane users saved more than half a minute per mile compared to the general purpose lanes. (CA DOT - District 7, 2003)
Mitigating Traffic Congestion

BUS SIGNAL PRIORITY SYSTEMS – INTERNATIONAL EXPERIENCE. “Transit signal priority (TSP) installations in England and France have shown a 6 to 42% reduction in transit travel time, with only 0.3 to 2.5% increases in auto travel time. In North America, Toronto, Edmonton, Charlotte, Portland, Chicago, and Los Angeles, among others, have installations in place. In Toronto, for example, average transit signal delay reductions of between 15 and 49% using TSP has justified expansion to over 300 signalized intersections (15% of total) along four bus and five streetcar routes, all in mixed traffic. Other TSP deployments include a 2-mile stretch in Cicero, IL on Cermak Road that is the site of an Illinois Department of Transportation demonstration using wire loops at 10 signalized intersections. Chicago Transit Authority and suburban PACE buses, using transponders and absolute TSP, realized an 8-minute trip time versus 12 minutes before TSP (a 33% reduction). In Los Angeles, two projects demonstrated application of TSP in conjunction with service restructuring (Metro Rapid) at approximately 100 signals along of each corridor (14-16 miles). Results indicated an average 8% decrease in overall bus running time, and a 35% reduction in bus delay at signalized intersections.” (ITS America, 2002)

- Transit / HOV Signal Priority Systems & Queue Jumps
  Queues at either arterial intersections and/or ramp meters (signals that manage access to freeways from arterials) can significantly lengthen travel times for all travelers. When compounded with the need to make stops, signal delays often result in unacceptably long travel times for potential bus riders, carpools, and vanpools. Many metropolitan areas have implemented signal priority systems and queue jumps as one means of addressing signal delay for multi-occupancy vehicles, providing a significant improvement to travel time and/or travel time reliability for transit users, vanpoolers, or carpoolers. These demand-side strategies provide a travel time incentive for the use of high-occupancy travel modes – or the use of underutilized travel routes/times.

  FAST FACTS: The Minnesota Department of Transportation conducted a study to evaluate the effectiveness of its extensive ramp metering system, including shutting the system down. The study showed that ramp metering decreased total travel time by 24% in heavy congestion and 46% in typical traffic. Without HOV bypass lanes, ramp metering imposes a delay on buses and carpools. With HOV bypass lanes, overall travel time delay can be reduced by up to 62% in heavy congestion due to 1) reduction of freeway traffic due to ramp metering, and 2) no travel time delay on the ramps. (MN DOT, 2002)

- Preferential Parking
  This strategy reserves priority parking spaces within a parking lot for those arriving by carpool or vanpool, or even those arriving during less-congested times of the day. “Preferred” parking could include (1) covered parking that protects people and cars from the weather, (2) an assigned parking space near the building entrance, (3) a level-one spot in a multistory parking garage, or (4) priority position on a parking space waiting list. Although designating preferred parking areas is most effective where parking demand meets or exceeds supply, many travelers with abundant parking still enjoy parking closer to the building or in a designated parking space.
FAST FACTS: The City of Aspen, Colorado, provides a variety of demand-side transportation strategies to preserve the physical environment and to control future traffic impacts on the community. In order to encourage carpooling, vehicles with more than three people entering the downtown area can stop at a kiosk and receive a Carpool Parking Permit that allows that vehicle to park in a designated area free of charge all day. In 2001, approximately 16,000 daily permits were issued. Coupled with the high-occupancy vehicle lanes, the distribution of these permits is one of the most successful incentives to rideshare.

Marketing & Education
A critical element of successful demand-side strategies is often a well-designed and executed marketing and education program. Even in communities where high-quality transportation mode, route and time choices are currently available, travelers who remain unaware that these choices exist, or unconvinced that these choices are viable and/or reliable, even modest shifts in travel behavior and transportation efficiency are unlikely. Transportation marketing programs, at their most basic level, are designed to do one of three things: (1) increase awareness of available transportation choices, (2) encourage travelers to try new, more efficient travel choices for the first time, or (3) increase or maintain the frequency that people utilize more efficient travel modes, routes or times. Educational programs are designed to make travelers more aware of available transportation choices, and more aware of the specific facts related to travel choices – such as travel costs for different travel modes, travel times at different departure times, etc. Several specific strategies are emerging at the forefront of demand-side marketing and education strategies:

- Social Marketing
  Social marketing campaigns are increasingly being used by organizations around the country to encourage voluntary, socially-beneficial behavior change. “Social marketing is the use of marketing principles and techniques to influence a target audience to voluntarily accept, reject, modify, or abandon a behavior for the benefit of individuals, groups, or society as a whole” (Kotler, 2002). Using techniques similar to marketing commercial goods and services, various organizations have used social marketing techniques to encourage environmentally-friendly landscaping techniques, increase the use of seat belts and child safety seats, promote safe bicycling and the use of bike helmets, and champion enhanced exercise and physical activity. Similar approaches are increasingly being used to encourage voluntary changes in travel behavior, from reducing the number of trips made by single-occupant automobile to encouraging travel at off-peak travel times.

FAST FACTS: In 1993, North Carolina launched the “Click It or Ticket” campaign to increase seat belt use throughout the state. A social marketing campaign touted the benefits of seat belt use in conjunction with communicating a $25 fine for violations (fine revenues went to local schools). Before the campaign, only 65% of North Carolinians used seat belts. By 2000, seat belt use had jumped to 84%, among the highest rates in the nation. Highway fatalities and injuries were cut by 14%, and statewide, auto insurance rates fell. The U.S. Department of Transportation called the campaign a “model for the nation,” and it has since been replicated by states across the country. (Kotler, 2002)
• Individualized Marketing
Individualized marketing – sometimes referred to as dialogue marketing – focuses marketing efforts and financial resources on a targeted group of individuals or households, working on a one-to-one level to provide tailored information about available transportation choices and small incentives to encourage individuals to try new options. In April 2004, the Federal Transit Administration (FTA) selected four communities for a pilot individualized transit marketing project: Bellingham, WA; Cleveland, OH; Sacramento, CA; Triangle Park, NC. “The FTA’s pilot project is based on personalized, individual marketing of potential commuters who might consider using public transit, but need more information. Transit agencies in the pilot communities first identify a neighborhood (approximately 600 households) with existing transit service and those residents are contacted in writing to determine if they are interested in learning more about travel options. Interested residents are then contacted by phone to determine if they would like information on transit, bicycling or walking. The outreach continues until residents have enough information to ensure their comfort level with trying different modes of transportation. In a few cases, bus operators make ‘home visits’ to personally discuss public transportation routes and options with residents.” (FTA, 2004)

FAST FACTS: A UITP (International Public Transportation Association) project conducted in Europe, as well as larger scale individualized marketing programs in Australia, resulted in significant increases in transit ridership. The pilot project in Europe resulted in a 10 percent reduction in car usage in the targeted area, while the large-scale individualized marketing efforts in Australia yielded up to 14 percent reductions. The first U.S. pilot project in Portland, Oregon, reduced car travel by 8 percent in the first area selected for the pilot, and resulted in a 27 percent increase in travel by carpool, vanpool, transit, bicycling and walking in that same area. (FTA, 2004; Australian TravelSmart, www.dpi.wa.gov.au/travelsmart/)

Targeted Strategies
Often complementing the more broad-based, general demand-side strategies, an array of demand-side strategies are targeted to specific traveler choices – such as choices regarding travel mode or trip departure time. These targeted strategies are described in detail in the section below, and are organized around the five primary categories of choices that affect overall transportation demand.

• Mode Strategies
• Route Strategies
• Departure-Time Strategies
• Trip-Reduction Strategies
• Location / Design Strategies

Mode Strategies
The following demand-side strategies specifically target the choices of travel mode, from driving alone to bicycling to using transit:

• Guaranteed Ride Home
Guaranteed Ride Home (GRH) programs, sometimes called emergency ride home programs, provide those who do not drive into work, or other supported destination, with
a free ride home in cases of emergencies, unplanned overtime, or other unexpected issues. Rides are often provided by taxi, but GRH can also be supported through rental cars, company fleet vehicles, or other alternatives. Often sponsored by local/regional governments, or by employers, GRH programs provide a back-up travel option to prevent travelers using alternative travel modes from being stranded at their destination.

**FAST FACTS:** In a 2003, survey the Artery Business Committee Transportation Management Association in Boston found that seven percent of commuters who used to drive alone switched to transit once they found out that there was a GRH service available. Metropolitan Washington's Council of Governments (MWCOG) GRH program is listed as a transportation control measure in the area's state implementation plan (SIP). MWCOG estimates that by 2005, its GRH program will eliminate 0.76 tons per day of NOX, at a cost of $8,800 per ton of NOX reduced. (Todreas, 2004)

• **Transit Pass Programs**
  Transit pass programs provide subsidized or free passes to travelers for the use on community transit and/or regional rail, bus, ferry or shuttle transit services. Free transit passes provide an incentive for “first time” users to try using transit and simplify the fare payment process.

**FAST FACTS:** When employees in downtown Ann Arbor, Michigan were provided a discounted or free transit pass (depending on the level of employer involvement), the estimated effect was a 9.2% increase in daily bus trips and a 3.5% daily decrease in the number of private vehicles coming into downtown between 2000 and 2001. (White, 2002)

• **Shared Vehicles**
  Shared vehicles provide a flexible option to travelers who rely primarily on non-motorized and public transit travel, yet at times require a vehicle for special trips, such as grocery shopping or trips to rural areas, or to get from the transit station to their final destination. Shared vehicle concepts include:

  • **Car Sharing:** Member based programs offer 24 hour access to a fleet of vehicles (cars, vans, trucks) within a city or neighborhood. Vehicles are reserved and used for just a few hours or up to a week. Most programs offer vehicles at an hourly and mileage based rate, with prices including gas, insurance, parking and maintenance. Several vehicles are generally located at convenient locations throughout the city
  • **Station Cars:** Similar to the car sharing concept; small, low emission vehicles are available at transit stations, helping people get from the train to their final destination, used daily for the commute or on an as needed basis.

**FAST FACTS:** According to researchers at the University of California at Berkeley tracking City CarShare, a San Francisco Bay area car-sharing organization, 30 percent of users have sold one or more of their privately owned vehicles and City CarShare is saving 13,000 miles of vehicle travel, 720 gallons of gasoline, and 20,000 pounds of carbon dioxide emissions in the Bay area. (City CarShare, 2004)
Departure-Time Strategies

The following demand-side strategies specifically target trip departure-time choices:

- **Worksite Flextime**
  Worksite flextime allows employees to set their own arrival and departure time to/from work – within established time boundaries agreed to by their employer. This strategy can influence travel in several ways. In congested areas, it may encourage employees to avoid the most congested travel times, reducing the demand on roadway and/or transit systems during peak-demand periods. Furthermore, flextime programs often provide employees with the schedule flexibility sometimes needed to coordinate carpools and vanpools.

  **FAST FACTS:** From a Federal Transit Administration report on the potential impacts of flextime programs on peak-period traffic demand: “At Bishop Ranch in California, flextime policies [were] successful in shifting employee arrival times to earlier periods. A survey of 14,800 employees between 1988 and 1990 showed the percent of employees starting work before 7:00 a.m. increased from eight to 17 percent, and the percent starting work after 9:00 a.m. increased from one to 9 percent. Departure peaking also has been reduced. The percentage of workers leaving before 4:00 p.m. increased from 12 to 17 percent. The employer flextime programs were instituted as part of a broad demand management program for the area, as well as a local trip reduction ordinance encouraging reduction of peak hour vehicle trips.” (FTA, 1992)

- **Coordinated Event or Shift Scheduling**
  Scheduling the coordination and staggering of traffic to reduce the number of vehicles arriving and leaving a site at one time. This can apply to event venues, specific worksites or office parks with severe traffic congestion.

  **FAST FACTS:** Near downtown Milwaukee, Summerfest, an annual, eleven-day outdoor music festival, attracts approximately 100,000 patrons per day and over 1 million annually. Since parking on-site is limited near the venue, alternative means of providing transportation and informing festival visitors with traffic, alternative route and parking information were essential. Local ridership data for Year 2000 showed that approximately 25% of the total attendance used bus transportation.

Route Strategies

Travelers making day-to-day decisions regarding available travel routes generally use a combination of information resources to determine the quickest, or most reliable, route option. Many commuters listen to television and radio reports of traffic conditions. Others explore real-time, web-based travel-speed maps. Some simply pursue alternate routes when their normal route is unusually congested. The role of demand-side route strategies is to get the most accurate, timely information on travel conditions to people before they end up on congested facilities – allowing them to select less-congested routes and avoid “adding to the problem” by using already congested routes. Demand-side route strategies can apply to roadway, transit and other travel route alternatives.
• **Real-Time Travel Route Information**

More and more areas around the country are launching real-time travel route information resources for area travelers. Using web-based maps, en route variable message signs, wireless updates to mobile devices, and other communications mediums – travelers are better able to make the most efficient route choice, and better able to make that choice before they end on a congested roadway or transit facility. Real-time, web-based traffic maps, like the Georgia Navigator system shown in Figure 4, often use a color-coded system to display travel speeds, warning indicators to show current incident locations, and hotlinks to connect users to live camera images of existing traffic conditions (where available). Organizations implementing comprehensive demand-side strategies are working with employers, property developers and managers, and others to integrate these real-time tools into corporate intranets, lobby kiosks, and others medium – in order to ensure that people can access this information conveniently.

**FIGURE 4: GEORGIA NAVIGATOR REAL-TIME TRAFFIC MAP. www.georgia-navigator.com**

**DID YOU KNOW?** The Utah Department of Transportation's CommuterLink, a real-time, web-based traveler information system that was operational for the 2002 Salt Lake Winter Olympics, is based on the Georgia Department of Transportation's Navigator system – which was used during the 1996 Summer Olympic Games.

• **In-Vehicle Navigation Systems**

In-vehicle navigation systems are currently available in a variety of automobiles currently on the market for sale, lease and rent. These systems generally provide drivers with route guidance, vehicle position, and regional points of interest information. Historically, in-vehicle systems have relied on static data about travel times for each road segment to calculate the shortest travel time from where the vehicle is located to a point the driver inputs as the destination. As the collection and dissemination of real-time travel information – and the availability and affordability of regional broadband wireless networks – both improve, in-vehicle navigation systems will be able to provide drivers of private automobiles and transit vehicles real-time route guidance. Such guidance will encourage travelers to take advantage of underutilized travel routes and avoid non-recurring congestion caused by incidents and other emergencies.

**FAST FACTS:** Telecommunications companies are launching region-wide, broadband wireless services in cities around the country. The expansion of region-wide broadband wireless will expand the capacity to deliver real-time traffic data and other information to vehicles moving throughout a region. Telecommunications companies initiated service in Washington, DC, and San Diego, CA, in 2003. Service will expand to other major metropolitan areas throughout 2004 and 2005. (Baig, 2004)
• **Web-Based Route-Planning Tools**
  A variety of companies provide web-based travel route planning tools for roadway trips, and an increasing number of transit agencies are offering similar services for transit riders. These tools allow users to enter trip start and end locations (along with desired departure times or en route services, in some instances), and process recommended travel routes and forecast travel times. As these tools evolve, multi-modal travel route planning and the capacity for using real-time travel information to suggest less-congested alternate routes or modes is likely to emerge.

**Trip Reduction Strategies**

The following demand-side strategies are designed to reduce the need for some trips altogether:

• **Employer Telework Programs & Policies**
  Employers establish telework programs and policies at the worksite in a wide variety of ways – from structured, formally-implemented telework programs and policies to more informal telework arrangements established between individual employees and their direct supervisors. In many areas, transportation organizations – from metropolitan planning organizations to transportation management associations – have well-established telework support programs to assist employers in setting up appropriate telework systems and policies.

**FAST FACTS:** In a 2001-2002 employee survey, AT&T found that “AT&T teleworkers again reported that they gain about an extra hour of productive time each day at home, adding up to at least an estimated $65M in business benefit each year... Teleworkers appear to get more accomplished not only because of time saved by not commuting - that is, increased productivity on a per teleworker or per workday basis - but also because of increased productivity per unit hour. The ability to focus and manage time is critical for knowledge workers, and little distractions in the office add up to big costs in productive time.” (Roitz, 2002)

• **Employer Compressed Work Week Programs & Policies**
  Employers in a variety of setting establish compressed work week programs, offering employees the option to work the same number of work hours in fewer days per week, or per pay period. Development of compressed work week programs and policies involves a variety of partners, including company management and human resources staff, employee labor unions, and regional transportation organizations.

**FAST FACTS:** A 1991 study of compressed work week programs in Ventura County, CA, reports that the program was associated with a decline in single-occupant vehicle trips to work, from 82 percent to 77 percent. (Freas, 1991)
Location / Design Strategies

The location of land uses in a community – from homes, to businesses, to retail establishments – directly impacts transportation demand. Over time, as cities evolve, changes in land use development patterns lead to changes in trip-making patterns. In some areas, urban growth has led to increases in trip lengths and growth in the average number of vehicle trips per day. In other areas, a variety of land use location and design strategies have led to reductions in trip lengths and vehicle trip generation – contributing to congestion mitigation advances (R.H. Pratt Consultant, 2003). Communities, businesses, and individuals make land use location and design decisions based on a wide range of economic, social, environmental, and other factors. Transportation accessibility is also a factor in many of these decisions, and a variety of location/design demand-side strategies are available. Several specific programs are described below. A more extensive discussion of the impacts of land use and site design strategies on travel patterns is available from the Transportation Research Board: Traveler Response to Transportation System Changes: Chapter 15 Land Use and Site Design (R.H. Pratt Consultant, 2003).

• Live Near Transit Mortgage Incentives
Live near transit programs offer mortgage incentives to encourage residential location near transit facilities. The programs recognize that household transportation expenses can be lower for residences well served by public transportation, and allow homebuyers to use these transportation savings as additional borrower income in qualifying for a home mortgage. For example, Fannie Mae sponsors the Smart Commute Initiative™ in pilot cities across the country. In several of the pilot cities, the Smart Commute Initiative involves partnerships with regional planning organizations, transit agencies, and private companies to provide complementary services supporting the use of public transportation (i.e., discounted transit passes, shared-car membership programs, etc.). Fannie Mae also supports the Location Efficient Mortgage® program in four pilot cities nationally.

WASHINGTON REGIONAL SMART COMMUTE INITIATIVE.
In Washington, DC, the Smart Commute Initiative offers mortgage incentives to households locating within one-quarter mile of a public bus stop or one-half mile of a public rail station. Through the program, participating lenders will add a portion of the potential transportation savings to borrowers’ qualifying income - an addition of $200 per month for one wage-earner households and $250 per month for two wage-earner households (a potential increase in home-buying power for a typical purchaser of a median-priced home of approximately $10,000). Participants also receive discounts on transit passes and lifetime membership in the Flexcar shared-car program. (www.mwcog.org/planning/smart_commute/index.html)

• Live Near Work Incentive Programs
Live near work programs provide incentives for employees to live near their place of employment. Examples include down payment assistance, location efficient mortgages and rent subsidies. By providing housing close to employment, this program can lower the costs of commuting, lessen the pressure on infrastructure, and generate more pedestrian traffic in business districts.
DID YOU KNOW? In 1997 Maryland’s General Assembly adopted a series of growth management programs, one of which was the Live Near Your Work Program. The City of Baltimore pioneered the program and continues to partner with area “Live Near Your Work Employers” to provide $2,000 cash grants to home buyers for down payment and/or settlement expenses. (www.livebaltimore.com/homebuy/lnyw.html)

• Proximate Commute
This program involves voluntary, coordinated relocation of eligible employees who work for multi-site employers to the work branch locations closest to their home, reducing commute distances. Rather than having employees commute to distant locations, their employers help them arrange job swaps and transfers to company sites closer to home. In the mid-1990s, the Washington State Department of Transportation worked with Key Bank on a proximate commute demonstration project. A total of 500 Key Bank employees – from 30 individual branches in three counties – were found to be eligible for the program. An initial review found that 83% of the employees lived closer to an average of 10 different branches than the branch where they were presently employed. 85 of the 500 employees enrolled in the program. The result was a 65% reduction in miles traveled. (Giery, 2003)

FAST FACTS: In 2002, Boeing undertook a pilot project to itemize the jobs and home addresses of 10,000 of its non-union workers to determine if some could transfer to a plant closer to home. Preliminary research showed that 53 percent, or 42,475, of its workers share a job description with a plant that is closer to their residence. Boeing found that if those employees could be moved, it would reduce commute-related travel by 168 million miles annually, equating to 8 million gallons of gas and 5,000 tons of emissions each year. (Seattle Post-Intelligencer, 2002)

• Transit-Oriented & Pedestrian-Oriented Design, Mixed-Use
A wide range of urban form and design strategies can enhance opportunities for the use of public transit, ridesharing, bicycling, and walking. Focusing a mix of land uses – such as employment, housing, restaurants, services (banking, day care, etc.), retail, and more – in well-designed, pedestrian-friendly developments and/or near transit connections can reduce the demand for vehicle travel and reduce trip distances. A 2002 study in California demonstrated that transit-oriented developments (TODs) can yield 20 to 40 percent higher ridership at an individual transit station for both work and non-work trips, and can increase overall regional transit ridership by up to 5 percent. (Parsons Brinckerhoff).

FAST FACTS: An assessment of the impact of different degrees of land use mix on travel patterns in 57 suburban activity centers found that centers with some on-site housing had 3 to 5% more transit, bike and walk commute trips. Additionally, for each additional 10% of commercial/retail floor space in the activity center, transit and ridesharing increased by 3%.
TRAVELER CHOICES
an outline of the range of traveler choices impacted by demand-side strategies

Traveler Choices
Strategies implemented as part of a demand-side program are designed to facilitate efficient traveler choices.

Individual travelers, families, and businesses all make important decisions that collectively impact traffic congestion. These decisions include day-to-day travel choices, such as travel mode, departure-time, and travel route. They also include decisions to eliminate some travel altogether – for example, by working from home a few days a month or by using internet-based technologies to preclude the need to physically travel to a store, library, or other destination. Finally, individuals and organizations make important decisions about the location of their residence or business – often factoring in transportation-related considerations such as commute to work travel times or ease of access to public transportation services.

This section provides additional detail on five primary traveler choices:

1. Mode Choices
2. Departure-Time Choices
3. Route Choices
4. Trip Reduction Choices
5. Origin / Destination Location Choices

Mode Choices… “What travel mode will I use for my trip?”
Demand-side strategies target improvements to the availability and viability of real transportation mode alternatives for a full range of travelers, from school-age children through seniors, and for a full range of trip types, from the trip to work to the trip to the corner store. By enhancing the availability of a range of travel mode choices, travelers can select the most appropriate or efficient option for each trip. In many situations, the flexibility and convenience of the single-occupant automobile is the best option. However, for many trips, other mode choices can prove less expensive, less stressful or more predictable.
The Range of Mode Choices:
• **Single-Occupant Vehicle (SOV)**
  A single individual driving an automobile or motorized cycle with no other passengers.

**FAST FACTS:** The country’s share of commuters driving alone increased by just over 3% from 1990 to 2000 (from 73.19% to 76.31%). From the 2000 U.S. Census, the District of Columbia (40%), New York (56%), Hawaii (67%), and Alaska (69%) remain the four jurisdictions with the lowest drive alone rates. Alabama (85%), Michigan (84%), and Ohio (84%) have the highest drive alone rates. (2000 U.S. Census)

• **Carpool**
  Two or more people sharing a ride in a private vehicle. Carpooling is the most common and flexible way for travelers to share a ride, and often occurs between family members, friends, or co-workers. More informal than a vanpool and more flexible than public transit, carpools generally have two or more passengers who live in the same neighborhood, or along the same route, using a private vehicle to travel to common or nearby destinations. Carpooling often appeals most to people traveling at least ten miles or whose trip takes over 20-30 minutes.

**FAST FACTS:** While the average fare paid by bus passengers in 2001 was $0.74 per unlinked trip, vanpool passengers paid an average of $2.06. As a result, transit operators in the Puget Sound region achieve an 85% farebox recovery of capital and operating costs for their vanpool programs. In 39 cities reporting data on more than one mode to the National Transit Database (NTD) in 2001, vanpools had the lowest cost-per-passenger and cost-per-revenue-mile expense to transportation agencies. (APTA, NTD)

• **Vanpool**
  A group of seven or more people sharing a ride in a prearranged vehicle. With one or two vanpool participants typically serving as regular drivers, vanpools provide non-stop, point-to-point service. The van’s ownership and operating costs are usually paid for by the van riders on a monthly basis. Vanpools typically serve trips of 15 miles or more. Many transportation agencies complement fixed-route bus and rail transit with vanpool services to provide attractive door-to-door travel options for otherwise difficult to serve trips (i.e., suburb-to-suburb trips, trips to low-density office markets, and trips to/from smaller towns or outlying communities).

---

**Case Study Examples**

**VANPOOLING - PUGET SOUND, WA.** Six large, medium and small transit agencies in the Puget Sound region include vanpool service as an integral part of their total service package. In January 2004, King County Metro operated 663 vanpool and 60 vanshare vans, Community Transit ran 210, Pierce Transit ran 228, Kitsap Transit ran 89, Intercity Transit ran 77, and Island Transit ran 43. In the Puget Sound area, vanpooling has achieved a 2% market share of the overall commuter market. Among commuters who travel 20+ miles each way, vanpooling has reached a 7% market share. King County Metro’s VanShare program provides service to bridge the gap between the commuter and a public transportation hub or terminal (rail station, Park & Ride lot and ferry dock). The agencies specifically look to vanpooling to meet demand in hard-to-serve suburban markets. For more information on vanpooling in the Puget Sound region, contact Syd Pawlowski at King County Metro, 206-684-1535, syd.pawlowski@metrokc.gov.
• **Public Transportation**
Rail, bus, shuttle or ferry transportation services provided to the general public, utilizing a paid driver and administered by public transportation agencies or private-sector companies. Services may operate along a fixed-route on a set schedule, or may utilize more flexible routing and scheduling options. Public transportation services provide critical, high-capacity access to dense-urban areas (allowing for intensified land use development without increased congestion), offer needed transportation services to those without access or unable to drive (including child and the elderly populations), and are increasingly vital to the success of special events (from major events like the Olympic Games, to recurring events like baseball games or concerts). In an effort to preserve high-value environments and enhance visitors experience, public transportation is now a key element of overall mobility and access planning at many of the nation’s parks, including Acadia and Zion National Parks.

**FAST FACTS:** Public transportation ridership has increased over 21 percent in the last six years (1998-2003), faster than highway or air travel. Every $1 invested in public transportation projects generates $6 in local economic activity, and supports approximately 47,500 jobs. Public transportation is a $32 billion industry that employs more than 350,000 people. (APTA, 2004)

• **Non-Motorized (Walk, Bike, Skate)**
Includes walking, bicycling, skating or any other mode of non-motorized travel. Often complements other modes of travel. For example, most public transportation trips begin or end with a walking trip, and many users bicycle to/from transit stops. A safe and convenient environment for pedestrians can dramatically increase the number of people walking to offices, stores, or schools during the day. Walking then enables sharing a ride or taking the bus as a realistic travel alternatives.

**DID YOU KNOW?** In 2000, the bicycle industry generated $5.89 billion in sales. Each year, nearly one billion trips are made by bicycle, and over 40 million American adults ride a bike at least once a month. Bicycling and walking represent 7% of all trips made nationally, yet accounts for 13% of all traffic-related fatalities in the country. (America Bikes, 2003). More than half of the American public (55%) says it would like to walk more throughout the day either for exercise or to get to specific places. When thinking about deciding where to live, having sidewalks and places to take walks for exercise or fun is important to nearly eight in ten Americans (79%), and “very” important to four in ten (44%). Having areas to walk in the neighborhood rates third on a list of seven items asked in the survey, behind feeling safe from crime and the quality of the public schools. (STPP, 2001)
Departure-Time Choices… “What time-of-day or day-of-week will I depart for my trip?”

Beyond day-to-day choices about travel mode, travelers also make regular decisions about the time of day, or even day of week, to depart on their trip. Travelers often adjust their travel schedules to avoid rush-hour traffic congestion, to work around childcare or school schedules, or to take advantage of reduced roadway, bridge or transit off-peak pricing discounts. Demand-side strategies use a variety of approaches to facilitate utilization of less-congested travel times, mitigating the length and duration of congested peak periods (“spreading the peak”). The enhanced use of real-time travel information increasingly allows travelers to avoid non-recurring traffic incidents by shifting trips to an earlier or later time.

The Range of Departure-Time Choices:

- **Time of Day**
  Shifting trip departure-times away from congested times of day, to avoid non-recurring traffic congestion resulting from a traffic incident, to avoid traffic congestion caused by weather, or for individual scheduling needs.

  FAST FACTS: The extra time needed for rush hour travel has tripled over two decades. According to the Texas Transportation Institute’s (TTI) 2003 Urban Mobility Report, the national average Travel Time Index for 2001 was 1.39 (meaning a rush hour trip took 39 percent longer than a non-rush hour trip). The national average in 1982 was only 1.13, a 26% increase in travel time for a rush hour trip versus a non-rush hour trip. This increasing “rush hour penalty” creates a growing incentive for travelers to take advantage of less congested travel times. (TTI, 2003)

- **Day of Week**
  Shifting trips to less-congested days of the week. In addition to more common “rush hour” times of the day in many urban areas, congested travel conditions in some communities are more frequently linked to certain days of the week. For example, travel to recreation or tourism destinations can be plagued with peak-direction congestion on Friday afternoons and Saturday mornings, followed by congestion in the reverse direction on Sunday afternoons. US 50 over the Chesapeake Bay Bridge, Highway 99 to the Whistler Blackcomb ski area, Route 6 to the Cape Cod National Seashore, and I-70 to Colorado’s many ski areas all exhibit this day-of-week congestion.

Q. Do demand-side operations programs require people to change their travel patterns?
A. Absolutely not. These programs simply aim to provide travelers with the broadest range of efficient travel choices, the best information on the choices available and how to use them, and balanced financial incentives for the most efficient alternatives.
Route Choices… “Which route will I use for the trip?”

Many travelers have several routes available to travel between Point A and Point B. Travelers wisely choose routes that get them where they need to go (including en route stops) based on experience over time that informs them of the most efficient route choices. Some travelers choose the fastest routes, while others choose routes with less-hectic or safer travel conditions. Other travelers alter travel routes from day-to-day as the result of changing travel needs (i.e., trip chaining) or as the result of non-recurring travel delays caused by traffic incidents, roadway construction, or even weather. The collective route choices made by travelers in a region affect the performance of the transportation network (“too many people using the same route at the same time”). Demand-side programs provide travelers with advanced, real-time transportation information in a variety of formats, facilitating traveler utilization of excess roadway capacity on less-congested travel routes, and limiting the magnitude and duration of both recurring and non-recurring travel delays. These strategies can also focus on shifting travel away from residential or other sensitive routes, and can shift demand away from routes with construction related delays.

The Range of Route Choices:

- **Alternative Roadway Routes**
  Shifting the roadway route utilized to travel between destinations, in order to avoid congested facilities and travel on routes with available capacity. Travelers may utilize a variety of traveler information tools – such as real-time traffic information available on websites or en route variable message signs – to determine the best available routes.

- **Alternative Mode Routes**
  Shifting the transit routes utilized in order to avoid system delays or other issues, or shifting the travel mode used (into transit, bike, walk, etc.) in response to delays on roadway systems.

**ROUTE CHOICES – CAPE COD NATIONAL SEASHORE.** Of the five million annual visitors to the Cape Cod National Seashore today, one-half arrive during a ten-week period in the months of June-August. The type and duration of tourist visits has changed over the past forty years. The two-week to a full month stay that was usual in the 1960s and 1970s has been replaced by shorter trips, usually a two to three day weekend. In order to address the long-range transportation needs of the area, planners developed the Long-Range 25-Year Plan for Alternative Transportation Systems – including transit enhancements and development of intelligent transportation systems to provide both pre-trip and en route travel information services. From the plan: “Pre-trip information can assist a driver map a route, gather information on current roadway conditions, and identify detours around planned construction. Transit users can identify transit routes, schedules, fares, and connections… En-Route Driver Information systems provide real-time information to travelers who have commenced a trip. Information on delays, accidents, weather conditions, and emergency situations can be communicated to the traveling public. Route guidance systems can identify alternative routes that are available to by-pass delays.” (Volpe, 2003)
Trip Reduction Choices... “What are my options to reduce the need for some trips?”

The demand for travel is based on the need of customers to move between two points for some purpose, whether to get to work or to the store. “Trip reduction” choices explore alternative ways to “connect” origins and destinations, using technology and other advancements to eliminate the original need for some trips altogether. As an example, “teleworking” connects people to their jobs through the information superhighway, rather than the local interstate highway.

The Range of Trip Reduction Choices:

• Telework

Simply defined, teleworking is working at home or another off-site location, full- or part-time. While employees may be hooked up to the main office via a sophisticated computer network, it’s possible to telework with as little as a pen, paper and phone. Jobs are more portable than they once were. Teleworking is increasingly used by employers to reduce the demand for office space and parking space. Additionally, teleworking is often used as a recruiting and retention tool. Across the country, part-time teleworking is on the rise, while trends suggest a gradual decline in the number of people working full-time from home. A 2003 survey by The Dieringer Research Group reported that 23.5 million Americans telework at least one day per month, a growth of 40 percent since 2001. The report found that 42 percent of these employee teleworkers work from home at least one day per week, and 22 percent of the employees work at home daily or nearly every day. (Dieringer, 2003)

FAST FACTS: 21% of working Americans teleworked in 2001. 58.8% of teleworkers say they work longer hours because they work at home. (ITAC, 2001)

• Compressed Work-Week Schedules

In a compressed work week, employees complete their required number of work hours in fewer-than-normal days per week (or per pay period). This arrangement allows employees to have one day off each week or one day off every other week, depending upon which type of compressed work week program preferred. The two most popular compressed work week schedules are the 4/40 and 9/80 programs, although other variations also exist. These options are described below:

• 4/40 Program. Employees work four 10-hour days each week, with the fifth day off. To ensure five-day coverage, some employers have half the company take Mondays off and half take Fridays off.
• 9/80 Program. Employees work 80 hours in nine days, with the 10th day off. This schedule usually translates to eight 9-hour days and one 8-hour day (this shorter day is often the Friday that the employee works). In a company with two major work groups, each group might take off alternating Fridays.
FAST FACTS: A 1995 study of 2,600 Southern California employees, conducted for the California Air Resources Board, found that “employees on compressed work week reduced their net number of trips by an average of 0.5 per week… The respondents using a 9/80 schedule drove an average of 13 fewer miles per week; those using a 4/40 schedule drove an average of 20 fewer miles per week.” (Holmes, 1995)

Origin / Destination Location Choices… “How do residential, business, shopping and other location choices impact my travel choices?”

While travel choices cover the range of alternatives about how and when to travel between an origin and destination (decisions that people make every day), individuals and businesses also make more fundamental choices about the actual location of these origins and destinations - and these “location choices” have a significant impact on the demand for transportation. People looking for a new home often consider the length and difficulty of their commute to work in their residential location choice. Companies often consider maximizing access to employee labor markets, or to central freight shipment locations, when making business location choices. Retail establishments often assess area consumer markets and ease of access to their retail location. Additionally, community land use design decisions can integrate a mix of land uses in one area, making it easier for people to access multiple destinations (work, shopping, day care, etc.) in a centralized area. All of these location choices can have a significant impact on the number of trips people make, the length of these trips, and the viability of making these trips by a variety of travel modes (driving, transit, walking, etc.).

The Range of Origin / Destination Location Choices:

- **Residential Location**
  Decisions about residential location, with consideration given to ease of access to adjacent transportation facilities (roadways, transit stations/stops, bike paths, etc.) or to travel distances to key destinations (work, shopping, schools, etc.).

- **Business Location**
  Decisions about business location, with consideration given to ease of access to adjacent transportation facilities, proximity of employee residential locations and commute distances, ease and manner of access to potential customer markets, etc.

FAST FACTS: Quantitative assessments of jobs/housing balance at the sub-regional level have shown that a good balance of jobs and housing can be associated with average commuter trip lengths lower by seven to almost 30 percent, compared to where jobs and housing are out of balance (R.H. Pratt Consultant, 2003).

Q. Do these travel choices, such as using transit or adjusting travel times, really work for everyone?

A. No, but even shifting 5-10% of travelers to a different mode or time can have a significant impact on peak period congestion in certain locations. Many travelers in urban areas note that congestion is less severe when area schools are not in session – a prime example of how small shifts in travel patterns can affect overall congestion levels and delay.
APPLICATIONS

the application settings for demand-side strategies

Demand-side strategies facilitating efficient traveler choices are tailored for a wide range of different program applications, each addressing different trip types of travel market segments.

1. Schools & Universities
2. Special Events
3. Recreation & Tourism Destinations
4. Transportation Corridor Planning & Construction Mitigation
5. Employer-Based Commute Programs
6. Airports
7. Incidents & Emergencies
8. Freight Transportation

Schools & Universities
Throughout the United States, driving children to school is as routine as the commute to work. While school bus systems exist for many school districts (particularly rural), they do not always fit student schedules (due to after school activities, etc.) or they are not even offered in some urban districts. Neighbors may form carpools for their children, however, without outside support or guidance, the reach of these carpools may be limited to groups of friends or neighbors that already know each other and that have children in the same school. “School Pool” programs are administered in many communities to share information with parents and assist in the connection of interested parties for sharing a ride. Not only do school pools reduce overall vehicle miles traveled, they also decrease congestion around the schools, which enhances safety and fosters an improved environment for children walking or bicycling to school. Often referred to “safe
routes to school,” these programs are underway across the country, in cities of all sizes. The California Safe Routes to School Clearinghouse offers a range of resources and contacts for these efforts: www.4saferoutes.org.

In university or college settings, the physical space for parking and transportation infrastructure is often limited. By making transportation opportunities abundant and flexible in nature, students, faculty, and staff are encouraged to try and eventually rely on alternatives to single occupancy vehicles. Other programs may integrate on-campus housing as part of an integrated transportation and land use strategy designed to reduce travel distances or eliminate the need for some trips altogether. Disincentives, such as an aggressive parking fee structure, often play an integral role in encouraging more efficient travel choices.

Special Events
Many communities recognize sizeable special events produce significant impacts to the transportation system. In order to curtail traffic disruptions and congestion related to events – whether they are summer festivals, sporting events or conventions – agency collaborations on traffic management plans are using available assets, including local transit and ITS infrastructure, to better manage demand. FHWA has developed a technical reference entitled Managing Travel for Planned Special Events. The reference is intended to serve as a stand-alone tool for transportation practitioners and includes successful case studies for a range of special event types.

King County, in Seattle, developed an internet-based resource for offering ridematching and other services for regional events. The website provides an updated list of upcoming special events, and facilitates ridesharing to the event locations. More information is available: www.rideshareonline.com/eventmatching/logonframepubevent.asp

Recreation & Tourism
Unique circumstances can lead to successful implementation of demand-side strategies at recreation and tourism destinations. Typical of the resort areas researched for this guide, maintaining environmental, natural, and aesthetic features of

CONTRA COSTA COUNTY, CA. The county-wide SchoolPool program has providing rideshare assistance and bus passes on local transit for five years.

UNIVERSITY OF WASHINGTON. The University created the “Universal Pass” which provides transportation options for a quarterly fee to faculty/staff.

SUMMERFEST, WI. The Wisconsin Department of Transportation demonstrated the effectiveness of “pre-planning” for large events, such as the Summerfest concert festival, attended by over one million people annually.

SEATTLE SEAHAWKS, WA. As a condition of project approval, the transportation management plan for Seahawks Stadium established goals to reduce personal vehicle trips. Based on 2002 results, mode split goals set forth in the plan have been surpassed.

ZION NATIONAL PARK, UT. In order to preserve the unique resources and recreational opportunities of Zion Canyon, the Park instituted a mandatory shuttle system during peak visitation. 75% of Zion’s annual visitors utilize the shuttle system.

ASPEN, CO. In this city, the revenue generated from the paid parking program is directly reinvested into demand-side programs and allocated for future transit investments.
the community are of necessary importance for the economic vitality of the area. As part of this guide, information has been collected on strategies to manage traffic that have been implemented in recreational and destination communities. Demand-side strategies typically focus on targeted travelers (i.e. employees, visitors, etc.) to reduce trips during congested travel times. Often demand-side programs are geared towards home-based work trips. However in an area where tourism and seasonal services occur, demand-side strategies might be particularly effective if targeted towards seasonal employees often priced out of living close to their employment center or visitors who are accustomed to paying for services and already expect a unique experience from visiting the area. The case studies highlighted in this guide describe a collection of programs undertaken by various sponsors (i.e. local jurisdictions, transit authority, non-profit organizations) as part of a collective effort for their community.

**Transportation Corridor Planning & Construction Mitigation**

Planning and preliminary engineering of major corridor investment projects presents significant opportunities for the coordinated integration of demand-side programs. In more and more projects around the country, these programs are being developed as an integrated component of each “build” alternative assessed in the corridor planning process. There are three prime opportunities for integration of demand-side programs into the corridor planning and construction process:

1. **Project Phasing.** In corridors where major capital investments are selected as part of the “preferred alternative,” the final implementation of these investments is often 5-10 years down the road. Demand-side programs often take much less time and money to implement, and can provide valuable transportation services in the early years of implementation. Systems management strategies can achieve near-term, incremental improvements to traffic flow. Demand-side measures can enhance available travel choices and establish key partnerships with corridor businesses.

2. **Construction Mitigation.** The (re)construction of major corridor infrastructure projects often takes many years to complete. During this time period, transportation capacity in the corridor is often degraded and access to businesses limited. Demand-side programs provide critical mitigation strategies to reduce the negative impacts of construction, including:
   - Providing traveler information regarding construction activities like ramp closures, and offering details and assistance on alternative travel modes, travel routes and travel times.
   - Working with corridor employers and other businesses to provide traveler information and to develop access alternatives, such as transit, vanpooling, flexible work hours or telework.
   - Working with transportation agencies to adjust existing transportation facilities and services, such as adding temporary HOV lanes or adding additional transit services.
3. Complementing Build Alternatives. Demand-side programs often play an important role as a complement to a build alternative, in two key ways:

A. Maximizing the utilization of build alternatives. Strategies implemented vary, based on the nature of the build alternative. For example:
   - For corridors adding HOV lanes, appropriate strategies might include partnerships with employers for promotion of transit and ridesharing, development of incentives, education and marketing of associated travel time and travel cost savings for HOV lane use, information on lane access times and locations, etc.
   - For corridors adding transit systems, appropriate strategies might include working with employers to improve connections to the transit stops/stations, development of transit pass programs, marketing and education of transit routes, stops and schedules, real-time transit schedule information, etc.

B. Providing enhanced travel choices for trip patterns not well served by the major investment. For example, construction of new general purpose lanes and a rail transit line along a north-south corridor may not provide significant benefits for east-west travel patterns in the area. Transportation management strategies can augment the major north-south investment with systems management strategies to improve traffic flow and demand-side programs to provide enhanced travel choices for east-west trips. These same programs also enhance access to major north-south investments.

Employer-Based Commute Programs
As a travel market, work-related trips tend to reflect the highest percentage of peak-period trips made within a region. Typically, commute trips occur regularly and are sometimes easier to arrange for a consistent alternative to driving alone than other trip types. For this reason, many demand-side strategies are implemented through employer-based and work site specific programs that encourage employees to switch from driving alone to carpooling, vanpooling, or using some other alternate means of travel. Often programs deployed at a work site level encourage employees to ad-
just work schedules or even reevaluate the need to travel (i.e. telecommute). Regional demand-side programs also focus on commute trip reduction strategies that complement local transportation programs and facilities such as light rail, regional bus service, and rideshare programs. As an incentive, employers are typically eligible for tax benefits by providing certain qualifying transportation benefits.

**Airports**

In recent years, increased attention has been given to transportation systems supporting airports both locally as well as internationally. Airports are vital to local economies and therefore should be given due diligence for continued and orderly expansion. Transportation management efforts, whether or not expansion is on the horizon, include internal circulation plans, overall master planning efforts, and regional transportation infrastructure investments. Planning efforts should take a critical look at airfield capacity, terminal and parking space and access issues. Besides encouraging travelers to use alternative means to travel to, from and within airport property, successful planning efforts have incorporated transportation options for airport employees. Since the terrorist events on September 11, 2001, transportation infrastructure as it relates to maintaining airport security has also been taken to a level of elevated importance and scrutiny.

**Incidents & Emergencies**

Strategies to improve traveler awareness of an unplanned event and to expedite the response to incidents on the roadway network are essential for maintaining freeway operations. Traffic incidents are a significant cause of freeway congestion. When an incident occurs, roadway capacity is typically reduced by blocking a lane or introducing a distraction in the traveling environment that causes motorists to reduce travel speed. Considerable documentation is already available on incident and emergency management programs throughout the country. FHWA has numerous publications, including the Benefits Brochures series, highlighting technology for incident and emergency response. AASHTO has published the Connecticut Department of Transportation (CONNDOT) Incident Management System (IMS) as one of their highlighted Success Stories. CONNDOTs IMS, like many throughout the country, monitors traffic operations at a traffic operations center, dispatches and coordinates interagency emergency response, adjusts traffic signal systems to manage flow, and supports highway service patrols. Transportation management plans are also critical to emergency preparedness planning efforts for natural disasters and other major, unexpected occurrences.
Freight Transportation
Considering that commercial vehicle traffic typically comprises a steady percentage of daily traffic on state highways and the interstate system, further research on non-commute demand-side strategies would benefit from a more detailed discussion of freight management and commercial transportation. As a function of their size, freight trucks have been attributed with adding to congestion, road surface degradation and traffic accident severity. Commercial vehicle travel reductions can provide benefit to both the highway system and local roads utilized for delivery. There are a number of programs around the country that have been implemented to streamline commercial vehicle operations. FHWA has also documented the benefits of commercial vehicle electronic screening in their Benefits Brochures series. Besides streamlining operations, perhaps the most effective way to manage commercial vehicle travel is to encourage off-peak travel or alternative routes. Improving scheduling and truck routing processes can contribute to a reduction in freight vehicle mileage.

DEMAND-SIDE FREIGHT STRATEGIES – LONG BEACH, CA. The Los Angeles region has 16 million residents, 9 million jobs, and one of the busiest freight ports in the world. In the Los Angeles area, the Long Beach port moves close to 13,000 20-foot long containers each day. To better manage this high level of goods movement, Intelligent Transportation Systems can be used as a tool to implement Transportation Demand Management concepts traditionally seen in personal commuting. TDM concepts in goods movement include better scheduling, better routing and reduction of bottlenecks at check points.

On December 10th, 2003, the Marine Terminal Operators (MTO) introduced a new truck identification technology that has potential to reduce air pollution and relieve truck congestion around the port. The two tracking devices currently being considered are radio frequency identification tags (RFID) and Real-Time Locating System tags (RTLS). Both systems are similar to electronic toll collection devices currently used in private automobiles across the country. At the MTO’s expense, these devices will be installed in over 30,000 trucks that use the Long Beach terminal.

The new technologies will help reduce congestion in several ways. First, it allows the MTO to identify and register trucks without the need for them to stop at port entrances. Electronic identification also will reduce the entrance gate personnel requirements for the MTO, making off-hour deliveries less expensive and more realistic. Increasing off-hour deliveries has the potential to shift delivery schedules to times of the day that experience less commuter congestion. Thirdly, the new technologies could locate lost truck drivers and facilitate route finding back to the terminal. Finally, electronic identification provides an excellent tool to gather data on truck contributions to local highway congestion.

The Vice Mayor and City Councilman of Long Beach, Frank Colonna is excited about the potential to reduce the impacts of truck congestion on neighboring communities. Mr. Colonna has said, “I like the initiative. It will provide a pathway to better manage truck traffic, minimize congestion, [and] reduce air pollution...” The MTO intends to have the system up and running by March 2004. For more information contact: Port of Long Beach, (562) 437-0041, info@pobl.com.
SUMMARY OF CASE STUDY EXPERIENCE
this section reviews the case studies collected and key lessons learned from the case study exploration

*Mitigating Traffic Congestion* provides over 25 in-depth case examples of demand-side programs implemented in a rich and varied range of locations, including the following (with corresponding page numbers):

**Schools & Universities**
- University of Washington - Seattle, WA ........................................................... 61
- Contra Costa County SchoolPool - CA ........................................................... 63

**Special Events**
- Summerfest and Concert Tour - WI ............................................................... 65
- Seahawks Stadium (Qwest Field) - Seattle, WA ............................................ 67
- PacBell (SBC) Park - San Francisco, CA ........................................................ 69

**Recreation & Tourism Destinations**
- Zion National Park - UT ............................................................................. 71
- City of Aspen - CO ................................................................................... 73
- Lake Tahoe Basin - CA ............................................................................... 75

**Transportation Corridor Planning and Construction Mitigation**
- I-15 Reconstruction - Salt Lake City, UT ..................................................... 77
- I-25 & I-225 Reconstruction - Denver, CO ...................................................... 79
- Springfield Interchange - VA .......................................................................... 81

**Employer-Based Commute Programs**
- Bal Harbour Village - FL ............................................................................... 83
- CALIBRE - Alexandria, VA .......................................................................... 85
- CH2M HILL - Denver, CO ........................................................................... 87
- Georgia Power Company - Atlanta, GA ....................................................... 89
- Hennepin County - MN ................................................................................ 91
- Johns Manville - Denver, CO ......................................................................... 93
- Nike - Beaverton, OR .................................................................................... 95
- Overlake Christian Church - Redmond, VA ................................................... 97
- Simmons College - Boston, MA .................................................................... 99
- Swedish Medical Center - Seattle, WA ........................................................... 101
- Texas Children's Hospital - Houston, TX ....................................................... 103

**Location / Design Strategies**
- Metropolitan Seattle Transit-Oriented Development and Flexcar - Seattle, WA. 105
- Orenco Station Mixed-Use Development - Hillsboro, OR .............................. 107

**Variable Pricing**
- Lee County Variable Bridge Tolls - Lee County, FL ........................................ 109

**Advanced Traveler Information**
- Commuter Link - Salt Lake City, UT ............................................................. 111

46
Demand-side programs have also been applied to major employment centers, new development sites, airports, freight movement, and to entire regions (via road pricing and travel reduction regulations).

This shows the diversity of applications for demand-side strategies, some focused on the traditional commuter market and others applied to school, recreation, and other types of travel. The common theme is the desire to reduce peak period travel by managing demand and removing cars from the most congested places (parking lots, roads, highways) and the most congested times. This is accomplished by facilitating efficient traveler choices of the mode of travel used, the time of departure, the route used, and by reducing the need for some trips altogether.

Another commonality is the use of demand-side strategies to address very specific problems, such as:

- Inadequate parking or road space for employees, visitors, fans, customers, etc.
- Harmful effects from automobile emissions.
- Employee tardiness or absence due to travel delays or lack of travel options.
- Recruitment and retention of skilled workers with minimal stress from commuting.

The more targeted the problem and travel market, the better chance that demand-side programs can provide an effective solution or be part of a package of solutions.

All of these problems impose a tangible cost on travelers, on business, on government, and on society as a whole. The benefit-to-cost ratio of many demand-side programs is quite high, as is discussed below.

**What Works Best? A Review of International Experience**

Several seminal research projects and guidance reports have been produced since the 1993 FHWA report “Implementing Effective TDM Measures” (COMSIS, 1993). This body of knowledge includes studies performed at the regional, state, national and international levels. Considerable research has been performed in U.S. regions that require employer trip reduction programs (e.g., WA and AZ); in states that embrace TDM (e.g., Florida); among research organizations (e.g., TRB and TCRP); and federal agencies (FHWA, FTA, EPA). Among the more important recent references is the TCRP Report 95, the “Traveler Response to Transportation System Changes,” which documents the impacts of various demand management strategies in chapters covering: HOV facilities, vanpools, pricing, parking management, and employer TDM (R.H. Pratt Consultant, 2003).

An example of this research comes from another TCRP project, B-4, “Cost Effectiveness of TDM Programs,” that evaluated some 50 employer-based demand management programs in the U.S., but provides insight into demand management effectiveness in both commute and non-commute applications. The study estimated that the average reduction in vehicle trips among all these “successful” programs was 15.3% (at a cost of about $0.75 per trip reduced). However, programs that focused on information/promotion alone exhibited no measurable decrease in trips. Programs that provided enhanced alternatives, such as vanpools or shuttle buses, realized a 8.5% reduction in trips. Programs that focused on financial incentives and disincentives realized a 16.4% reduction of trips and
programs that combined enhanced alternatives with incentives/disincentives for their use, realized a 24.5% reduction in vehicle trips. (COMSIS, 1994).

Evidence also suggests that the number of strategies implemented, or the size of the budget, does not positively correlate with higher effectiveness. Some of the simplest, albeit politically controversial, measures involve pricing of automobile travel and subsidies for high occupancy modes. So, one researcher concluded: “It’s more what you do to influence commute behavior (the strategies/incentive utilized), more than how you market the program or how much you spend” (ESTC, 1998).

Another important study, the Congressionally-mandated review of the Congestion Mitigation Air Quality (CMAQ) federal funding program performed by the Transportation Research Board, revealed that four of the five most cost-effective strategies (measured as the cost per pound of emissions reduced) funded by CMAQ were demand-side strategies, including: regional rideshare programs, charges and fees for drivers, vanpool programs, and “miscellaneous TDM” programs, (TRB 2002).

Many other recent research projects have documented the effectiveness of TDM strategies to reduce automobile travel for school trips, recreation and special event trips. This was accomplished by increasing auto occupancy (which is already higher than work travel) and providing quality shuttle service and traveler information.

The scope of demand-side strategies has evolved over the past 30 years in the U.S. However, these measures (referred to as Mobility Management in Europe and some other regions of the world) are a growing phenomenon in other countries and are even integrated into national policy in places like:

- **Sweden.** Where a region must consider demand management solutions before considered new road capacity.
- **The Netherlands.** Where travel reduction goals have been set and TDM is an integral part of the program to meet these goals.
- **United Kingdom.** Where all regions are required to have “green travel plan” capabilities and integrate TDM into land development approvals (AMOR, 2003).

Many other innovative applications of demand-side strategies have been tested, evaluated, and documented in Europe, Australia, Canada, etc. In Europe especially, demand-side strategies are being applied to non-commute travel markets (tourists, schools, special events) in a conscious effort to address the growth in automobile use that is affecting most countries of the world. The E.U.–funded project MOST (MObility STrategies for the next decades) provides comprehensive findings from over 30 pilot projects (AMOR 2003). A recent study by the Organization of Economic Cooperation and Development (OECD), “Road Travel Demand: Meeting the Challenge,” documents world-wide experience with demand management strategies (OECD, 2002). The resource section of this report provides references and links to related websites.
LESSONS LEARNED FROM THE CASE STUDIES

all the research on, and experience with, demand-side pro-
grams and strategies cannot possibly be summarized in
10 brief points. However, a few common findings and les-
sons can be offered here

1. **Demand-Side Strategies Are About Choices** – As the term implies, demand-side strategies intend to modulate the demand for travel in a way that is based on choices (mode, time, route, etc.), and incentives for using alternatives to driving alone and avoiding the most congested conditions. A good example of this is the I-15 FasTrak program in San Diego, which allows solo drivers to pay to use the HOV lanes and allows those sharing a ride to use the lanes for free, but does not force a fee on any driver or require anyone to use a particular facility (OECD, 2002).

2. **Time and Financial Incentives Are Most Effective** – Time savings for alternative mode users (such as HOV lanes), financial incentives (such as vanpool subsidies or tax incentives) and financial disincentives (such as parking or road pricing) are consistently cited as the most effective demand-side strategies. These intervening influences help to balance out the perceived convenience and speed of driving alone (ITE, forthcoming).

3. **Incentives and Disincentives Require Good Alternatives** – Time and financial incentives and disincentives are most effective when they support good travel alternatives, such as transit service, vanpool formation, carpool matching, bicycle facilities, etc. The TCRP B-4 study, cited earlier, provides tangible evidence of this symbiosis by showing that the most effective programs combined financial incentives (such as transit subsidies) with improved alternatives (such as more frequent and convenient bus service (COMSIS, 1994).

4. **Managing Demand Can Be a Cost-Effective Tool** – Many studies that have compared mobility and air quality strategies have concluded that demand management strategies are among the most cost-effective in that they can reduce a trip, mile of travel or ton of emissions for a relatively modest amount of money. Demand-side strategies may not be the primary solution to these problems, but if they are applied in the right situation, they can help address traffic and air pollution problems in modest, yet very affordable ways (TRB, 2002).

5. **Information Technology Enhances Demand-Side Programs** – While incentives and disincentives are perhaps the key to effectiveness, much of managing demand relies on good information about travel conditions and alternatives. Advances in information technology make managing demand more effective by providing real-time, accurate information on travel options, traffic conditions, alternative routes, and even dynamic matching of travelers into shared ride arrangements.
6. **The Implementing Organization Should Match the Scope of the Strategies** – The organizational home for demand-side programs should match the scope of the application. For example, strategies to reduce congestion around employment centers or in corridors might be managed by Transportation Management Associations, whereas regional traveler information and ridematching services might better be implemented by regional agencies with access to appropriate resources and information. Multiple organizations are often involved in a given urban area, calling for coordination and cooperation to maximize impacts.

7. **Packaging Demand-Side Strategies Can Create Synergies** – Research indicates that the greatest potential for demand management lies in strategic grouping of measures into “programs” of reinforcing actions. For example, limiting parking in a high-density commercial development served by convenient, reliable transit can do more to reduce vehicle trips than can solely limiting parking supply (ITE, forthcoming). One study concluded that “packaged, complementary solutions are usually more effective than a single measure” (OECD, 2002).

8. **Expectations Need to Be Realistic** – Demand-side programs are not a panacea for all social ills or a cure-all for traffic congestion problems. However, they can have a significant impact on travel. If the correct incentives and disincentives are used to facilitate shifts to alternative modes, demand-side strategies can reduce vehicle trips and VMT 10%-20%. Most decision-makers, however, are reluctant to adopt certain disincentives (such as parking pricing) to change travel behavior in a significant way. In the absence of these strategies, most demand management programs should only be expected to reduce travel by 0% - 5% (COMSIS, 1993). At the same time, it is important to recognize that the goals for demand-side programs often extend beyond reducing VMT to include mobility, accessibility, environmental, and other outcomes.

9. **Plans for Managing Demand Should Be Integrated into Overall Transportation Plans** – Demand-side strategies should be considered a set of measures to better manage existing infrastructure, but they still need to be well-planned. Demand management actions should be considered simultaneously with related transit, traffic engineering, and land use plans (ITE, forthcoming). Since many metropolitan planning organizations and regional councils now fund and oversee demand management efforts, it is important to integrate demand-side strategies into long-range plans, as well as shorter-term management and operations actions. It is also important to evaluate the impacts of actual demand-side measures, as implemented, to better inform future decision-making.

10. **Demand-Side Strategies Are Practical** – Demand-side strategies are compatible with sustainability, transportation-land use interaction, and other longer-term goals. Yet, it is most applicable to managing demand for finite travel markets, to solve real problems that provide tangible benefits to users and implementers. Travels are smart consumers and, when faced with tangible changes in out-of-pocket costs and travel time, will change their travel behavior in immediate and significant ways (ESTC, 2003).
This report offers a new, broader perspective on demand-side strategies. These programs can be a critical component of a comprehensive transportation improvement program to improve the efficiency of the current transportation system, and they can also be an integral part of longer-term transportation and land use plans in order to change the fundamental influences on demand for the single occupant vehicle traveling at peak periods on congested roads. Ultimately, demand-side programs can be a critical factor in “decoupling” the link between economic growth and transportation growth. Economic growth creates new demands for travel and not all of this new demand can be accommodated on current or future roads (OECD, 2002).

Demand-side programs, in their traditional form of commute trip reduction, were born from energy crises of the 1970s as a response to fuel shortages. In the new millennium, managing demand extends to all types of travel, be it parents walking a group of kids to school in a “walking bus,” visitors to a National Park leaving their cars off-site and using clean shuttles, new residents opting to live in “transit-oriented developments” to avoid the need for an extra car, or shippers coordinating deliveries to avoid congested roads and clogged city streets.

This is all demand management. Many of the tools used today by transportation planners, traffic engineers, and traffic operations managers are designed to modulate the demand for travel (by mode, route, location or time) rather than provide more capacity in the system to accommodate more trips. This new perspective on demand-side programs can still benefit from some of the findings from the 1993 FHWA report, “Implementing Effective TDM Measures.” That report discussed the “economics of TDM” by estimating that the average cost to society to accommodate a one-way daily solo commute trip was $6.75, whereas the cost to employers to reduce a commute trip was $1.33. Carpooling cost commuters $1.92 per trip, whereas driving alone cost $4.81. (COMSIS 1993) These economics are as compelling today and they were ten years ago. Perhaps as the “demand for TDM” grows and is applied to other travel markets, the economics are even more compelling.

In the future, the role of demand-side programs in solving specific problems and contributing to larger goals will be even greater as our inability to squeeze more cars into a limited road system compels us to look for ways to do things “smarter” and to focus on moving people, goods, and information rather than cars and other vehicles.

REFERENCES

Davis, Donald D., Ph.D. and Karen A. Polonko, Ph.D. *Telework America 2001 Summary.* Old Dominion University, October 2001.

University of Washington - Seattle, WA

Large University Grapples with Growth
The University of Washington’s (UW) Seattle campus of 643 acres is the heart of the University District, the City’s second largest employment and activity center outside of the central business district. In Fall 2002, student enrollment was over 39,000 and faculty and staff nearly reached 22,000. According to 2002 Campus Master Plan efforts currently underway, the Seattle campus is projected to grow by 1,000 students and 2,000 additional faculty and staff by 2012 triggering significant development and transportation demands.

The “Universal” Solution: U-PASS
The current Transportation Management Plan (TMP), U-PASS, demonstrates a strong, collaborative partnership between the University, the City of Seattle and transit providers, King County Metro (Metro), Snohomish County’s Community Transit (CT) and the regional transit authority Sound Transit. In the late 1970’s, University transportation goals were conceived and then formalized in 1983 as part of the City-University Agreement. Specific goals included maintaining 1983 traffic volumes traveling to or from campus during peak periods and limiting UW parking supply to 12,300 while making certain that additional spill-over parking would not occur within the surrounding neighborhoods.

As part of the 1989 General Physical Development Plan (GPDP) for the campus, it became clear that forecasted population growth and development would trigger a significant increase in vehicle trips and a loss of approximately 1,700 surface lot parking spaces to new construction. As part of the GPDP planning process, a task force was formed to develop, guide and oversee the implementation of a new TMP. The task force recognized the importance of transportation incentives as well as complementary disincentives (i.e. parking rate increases).

In 1990, the task force pitched the U-PASS as a “universal pass” providing card holders with a range of transportation options and incentives with one pass, the U-PASS. The U-PASS Program began as a three-year pilot program in 1991 with a budget of $17.4 million. In 2002, the U-PASS annual budget was approximately $11.3 million. Since its inception, the most significant cost of the U-PASS Program is related to transit service. Currently, user fees cover 50 percent of the Program costs while the remaining revenue is generated from parking fines, fees and other UW sources.

Removing the volume discount provided by a quarterly parking pass, the variable rate method favors infrequent users. In other words, the more you park, the higher the fee.
Today, U-PASS provides an array of transportation options for a quarterly fee to eligible students ($35 in 2003) as well as faculty and staff ($48.96 in 2003). Record sales in Fall 2002 indicated that nearly eight-six percent of the total student population participated. Transportation alternatives and programs included with a U-PASS include the following:

- Full fare coverage on Metro Transit, Sound Transit, CT and Sounder commuter train service,
- Free carpool and vanpool parking,
- Vanpool subsidies,
- Discounted "occasional" parking permits,
- Local merchant discounts,
- Ridematching services,
- Reimbursed rides home for faculty and staff, and
- Evening neighborhood shuttle service.

Considering all the transportation options U-PASS provides, it is most frequently used for transit service on Metro Transit, Sound Transit and CT. Transit agencies have preserved and stimulated ridership by increasing capacity and introducing new routes as user needs change. Today’s U-PASS is less than half the price of the traditional bus pass of 1990. Since 1991, 91 million vehicle trips to or from campus have been eliminated by U-PASS transit riders.

Managing traffic demand through pricing has been documented as a key component of U-PASS Program success. Besides quarterly and daily parking rate increases, UW has developed a number of flexible parking features to compliment other U-PASS program components and alternatives to single-occupancy vehicle (SOV) travel including the Pay Per Use Parking (PPUP) program. Basically, PPUP participants are tracked each time they use the West Campus Garage and are subject to a variable parking rate structure. Removing the volume discount provided by a quarterly parking pass, the variable rate method favors infrequent users. In other words, the more you park, the higher the fee.

**U-PASS Success Leads the Way**

Immediately after implementation, U-Pass was a success in reducing vehicle trips and parking lot occupancy on campus. The Program is continually monitored and evaluated through a series of surveys, traffic counts, parking utilization studies, and individual U-PASS component monitoring. As a result, comprehensive measures of effectiveness are available. As reported in the 2001-2002 U-PASS Annual Report produced by the UW Transportation Office, U-PASS has been attributed with the following:

- Prevented the need to build 3,600 new parking spaces saving considerable capital cost,
- Reported 86% U-PASS user satisfaction, a 13% increase over Year 1992, and
- Reduction of 33% in parking permit purchases since October 1990 indicating that users are finding another way to school or work.

In addition, 2002 traffic counts indicate that morning peak period traffic was 18 percent below the 1983 traffic levels, a goal set forth in the City-University Agreement.

As a result of the success of the U-PASS Program on UW’s Seattle campus, similar but fiscally-separate programs have been implemented at UW Bothell, UW Tacoma, and Harborview Medical Center. In addition, Metro has developed FLEXPASS for metropolitan Seattle employers and commuters using the U-PASS as a model. As a tribute to U-PASS success, the Program has been heavily awarded both locally and nationally.
Identifying the Problem – Outside of the Classroom

The SchoolPool program serves western, central, and eastern Contra Costa County, in the northern California Bay Area. Very few schools in Contra Costa County offer bus service for their students. As a result, traffic congestion within the communities surrounding the schools presents a significant mobility challenge. The average one-way trip length to or from school within Contra Costa County is about 4.3 miles. Similar to other parts of the country, crowded classrooms are forcing students to attend a school “across town” instead of in their own neighborhood.

Offering Options for School Trips

The SchoolPool program is administered by staff at the Contra Costa Commute Alternative Network (CC CAN) and has been in operation for 5 years. The goal of the SchoolPool program is to provide parents with information on neighboring students who are interested in carpooling to and from school, and to encourage the parents to establish a carpool. Carpooling is voluntary and no financial incentive is offered to the parents. Carpool ridematch lists are provided to parents with students attending the same school(s) to encourage carpooling. It is promoted among residents who have children in all public and private schools throughout the County (kindergarten through college).

For the 2002 school year (July 2002 – June 2003), carpool ridematch forms were sent directly to 150 participating schools and in turn were distributed in Fall registration packets to over 157,000 school children. Additional program outreach efforts included presentations to Parent Teacher Associations (PTAs) and school administration.

As ridematch applications are received, rideshare matches within the same district are found and sent within three days to the applicant. For the 2002 school year, approximately four ridematch lists were sent to each parent during the course of the first three months of the school year. Additional ridematch lists were sent throughout the year as new parents moved into the school area, or as parents’ commute patterns changed.

Parents who were unable to find a carpool partner were encouraged to have their children try transit instead of driving. To encourage participation, a $20 bus pass was provided for the student’s use. CC CAN Staff worked with County bus operators to develop bus schedule brochures for each school district. In turn the brochures were distributed with free tickets so that parents could see and experience which routes and schedules serviced their schools.
SchoolPool requires a full time employee for 6 months or a half-time employee on an annual basis. The most intense time is between April and October when registration forms are generated and distributed and most of the outreach occurs. The total program cost for SchoolPool during the 2002 school year (July 2002 to June 2003) was $95,000.

**Setting a Good Example**

For the 2002 school year, 710 individual ridematch requests were received from parents. Of these, 174 included siblings (essentially duplicate requests) who were also riding in the carpool, which resulted in a total of 536 unique ridematch requests. In general, parents must make two round trips to the school (one each morning, and one each afternoon) to pick up their children. These two round trips equate to four one-way trips. Allowing for 25% of the trips to be drop-offs on the way to work, it is estimated that three one-way trips are saved for each non-sibling, which in this case is a reduction of 1608 one-way trips per day.

A follow-up survey was conducted to determine the usage and satisfaction of program participants from SchoolPool 2001/2002. Of the participants who were contacted, 27% indicated that they have continued to carpool resulting in continued reduction of 816 one-way trips per day.

In addition to the carpool riders, another 1,932 students received bus passes in 2002. These passes were given to students whose parents indicated that they usually drive the student to school. Nearly 2,000 bus riders equates to a reduction of around 4,000 one-way trips per day.

Collectively, the three groups discussed above, new carpools, 2001 carpools still ridesharing, and bus riders have contributed to an annual one-way trip reduction of 1.13 million trips and a vehicle miles traveled (VMT) reduction of 3.96 million.

In addition, due to additional school bus cutbacks in the summer of 2003, the SchoolPool Program had over 3,000 bus riding participants. The construction of a new school without bus service (even public bus service) has resulted in additional rideshare requests topping the 2002 totals.
Recurring Event Traffic Management
Southeastern Wisconsin is host to various special events throughout the year ranging from sporting events to rock concerts, all attracting a large number of visitors from around the region. In particular this case study will focus on two events, both being music festivals/concerts. Summerfest is an annual music festival that takes place at the Henry W. Maier Lakefront Festival Grounds near downtown Milwaukee and within a close proximity of several major freeways. The second highlighted event is the Grateful Dead Tour that took place at the Alpine Valley Music Theatre in the rural Wisconsin city of East Troy in Walworth County.

Combining Resources and Integrating Technology
In 1995, a number of key components added to the local transportation system as part of an Intelligent Transportation System (ITS) early deployment package, MONITOR, set the stage for special events planning and traffic management in the future. Also in 1995, the Traffic Incident Management Enhancement Program (TIME) was conceived consisting of four inter-related components: 1) special events and construction, 2) emergency response, 3) corridor traffic management, and 4) public information. TIME has been the catalyst of multi-jurisdictional coordination and collaboration regarding regional transportation issues.

The importance of special event transportation planning was recognized through a review of incident management procedures and programs. Wisconsin DOT (WisDOT) and planning partners began to collaborate on traffic issues related to recurring events such as Summerfest (attracting 1 million people over the course of eleven days), the State Fair and professional sporting events. Planned special events have tangible elements of time, location and content that lend themselves to early coordination unlike unpredictable, unplanned incidents such as a major traffic accident.

Throughout the process, additional challenges have been recognized such as the compounding effect of numerous events, even if they are small in scope, occurring at the same time

Summerfest
Summerfest is an annual, eleven-day outdoor music festival that starts during the last week of June and lasts through the Fourth of July weekend. Summerfest attracts approximately 100,000 patrons per day and over 1 million annually. It’s been estimated that approximately 45% of all attendees are out of town travelers.
Since parking on-site is limited near the venue, alternative means of providing transportation and informing festival visitors with traffic, alternative route and parking information were essential. In order to manage the steady influx and departure of Summerfest attendees, several Wisconsin DOT field components and other regional resources were utilized. Managing traffic for Summerfest requires high level interagency coordination on the part of WisDOT, Milwaukee County Sheriff’s Department, City of Milwaukee Public Works and Police departments, MCTS, and Summerfest Staff. A scenario based Traffic Management Plan was in place to inform travelers of traffic conditions and detour information.

For Summerfest, several transit enhancements were deployed including expanded transit and shuttle bus service. Temporary access improvements including bus only access to closed freeway ramps as well as bus only lanes and one way traffic patterns increased transit effectiveness and reliability during the event. Other operational measures such as providing round trip fares and separate staging areas for expanded shuttle service expedited passenger loading.

**Grateful Dead Tour**

The Grateful Dead Tour in 1989 held at the Alpine Valley Music Theatre in East Troy, Wisconsin was attended by nearly six times as many people as expected (200,000 instead of 35,000). At the time, a coordinated Traffic Management Plan was not in place. Attendees arrived earlier and stayed later than the venue itself and damages to personal property, severe congestion on local roads, and inadequate emergency access were consequences of the 1989 Tour.

Thirteen years later, local law enforcement officials requested the assistance of the Wisconsin DOT to create a Traffic Management Plan that would reduce or possibly eliminate the congestion and problems experienced in 1989. On June 26, 2002, a Concert Management Plan was created after approximately 5 weeks of planning time consisting of four sub-plans, 1) Traffic Management, 2) emergency government, 3) weapons of mass destruction, and 4) emergency medical.

The plan implemented several traffic control measures to guide and control traffic including portable VMS, type 3 barricades and traffic cones, portable lighting units, ATV/bicycle/equestrian patrols, HAR, and a significant law enforcement presence. In addition, a nearby permanent WisDOT Rest Area was temporarily utilized as a remote command center for Walworth County Sheriff Department and a WisDOT remote TOC.

**Indicators of Successful Event Planning**

Special events planning in southeastern Wisconsin has lead to the development of a number of tools including the Severity Level Matrix. Developed in coordination with local law enforcement and event sponsors, the Excel-based Matrix indicates anticipated level of response based on event criteria such as predicted attendance and road closures.

WisDOT continues to work with local agencies and event planners on special event transportation planning. While mitigating traffic congestion for special events is often limited by transportation facilities or time of day, agencies continue to give due diligence to safe, efficient, and informed traffic management. Throughout the process, additional challenges have been recognized such as the compounding effect of numerous events, even if they are small in scope, occurring at the same time.

**Summerfest**

Quantitative effectiveness data for the Summerfest Traffic Management Plan is limited. However, MCTS ridership data for Year 2000 listed below provides an indication of success:

- Approximately 25% of the total attendance utilized bus transportation.
- The Downtown Shuttle provided 100,000 rides.
- 300,000 riders utilized the Freeway Flyer service from 13 park-and-ride lots.

**Grateful Dead Tour**

The two-day Grateful Dead reunion took place on August 3-4, 2002 without serious incident. Approximately 37,000 people attended the reunion, not the expected 100,000. Attendees and residents followed the traffic guidance. During the entire two-day event, 123 citations were issued for various charges and 15 arrests were made, which is a significant decrease compared to 1989. Public information campaigns, “If you don’t have a ticket, don’t come” and national media attention were successful in detouring impromptu concert goers without tickets from loitering the venue.

As a result, Walworth County adopted an ordinance (Ordinance No. 232-11/02 Sec. 10-28 a) stating that an event licensee is responsible for reimbursing the County for the cost of providing extraordinary governmental services required as a result of an event. Grateful Dead Tour promoters were required to pay the County $15,000 in additional fees.
A New Stadium for Seattle

In the late 1990s, as plans for a new football and soccer stadium began to take form, public agencies and the private sector acknowledged the importance of a balanced Transportation Management Program (TMP). The TMP needed to be consistent with the region’s approach on engaging stakeholder involvement and preserving the quality of life and the natural environment.

In 1998, Washington voters approved Referendum 48 allowing the use of public funds to build the stadium, an adjacent exhibition center and a parking structure. The referendum also created the Public Stadium Authority (PSA) to provide public representation as part owner. The new Seahawk Stadium is west of I-5 and north of Seattle Mariner’s Safeco Field. The site is where the former Kingdome stood within Seattle’s Pioneer Square neighborhood. In 2000, the Kingdome was imploded and construction began. Two years later, the facility was completed within the $430-million budget and ahead of schedule. Seahawk Stadium was designed to host professional football and soccer games with a seating capacity of 67,000. The adjacent exhibition center typically hosts non-sporting events with up to 15,000 attendees.

The TMP is explicit regarding roles and responsibilities for TMP planning and implementation by assigning responsibility in one of four ways: exclusive, lead/coordination, partner, or advocate.

TMP Sets the Stage

As transportation and parking mitigation for the Environmental Impact Statement (EIS) prepared for the project, the Transportation Management Program (TMP) was born. The Seattle Department of Construction and Land Use (DCLU) required that the conceptual TMP contained in the Final EIS be further developed and committed to as a condition of project approval. The TMP has built on the success of other local projects including the TMPs for prior Kingdome Stadium, the new Safeco Field, and the Seahawk’s temporary use of the University of Washington’s Husky Stadium during construction. The TMP was designed to minimize personal vehicle use to and from the site by supporting other transportation modes thereby minimizing negative transportation-related impacts to visitors as well as the immediate neighborhood. A number of goals were set as guiding principals for the TMP concerning area residents and businesses. Specific goals included minimizing the impact of event parking on adjacent neighborhoods as well as minimizing access delay and confusion for neighboring residents and businesses prior to, during, and following events. The TMP is flexible in nature with the ability to adapt to tenant changes, travel pattern variations, and transportation improvements as they occur in the vicinity.

The development of the TMP was a collaborative process engaging key stakeholders through a series of meetings including the re-establishment of the Parking and Access Review Committee (PARC), a group previously organized to address transportation and parking issues associated with construction of nearby Safeco Field.
Input on the TMP was obtained from all affected agencies including King County METRO, the Seattle Department of Transportation, the Seattle Police Department, the Washington State Department of Transportation, and the Port of Seattle. The TMP was subsequently approved by the stakeholder groups and forwarded to the DCLU for final approval, which was granted in early 2002 allowing enough time for implementation prior to the stadium opening in August 2002.

The TMP is organized into four strategic program groups, which include: 1) Traffic and Parking Demand Reduction, 2) Management of Resultant Vehicle and Pedestrian Demand, 3) Event Management and Public Information, and 4) Implementation and Monitoring. The TMP is explicit regarding roles and responsibilities for TMP planning and implementation by assigning responsibility in one of four ways: exclusive, lead/coordination, partner, or advocate.

Transportation options for Seahawk Stadium include, but are not limited to, regular Metro transit service, Metro Express Bus Service from Park and Ride lots, charter buses, Sounder train service, and Event Match ridematching service.

**Settling the Score**

In order to evaluate the effectiveness of the TMP, it was important to have measurable criteria. Recognizing that personal vehicle use and parking have a significant impact on area traffic circulation and congestion, an index was developed to measure the reduction in personal vehicles traveling to and from events. The index has been defined as the number of personal vehicles per 1,000 persons attending an event.

The index is directly affected by the use of transit and other alternative modes of travel and average vehicle occupancy for the personal vehicles that do travel to the event. Based on historical travel data for the Kingdome and applying performance assumptions for each program contained in the TMP, an estimated mode split was derived that was then used as the basis for performance goals for the new stadium in terms of cars per 1,000 attendees. The index-based approach has proven to be well-suited as an evaluation tool since it allows for varying degrees of attendance and time of day. The table below indicates performance goals (less than or equal to) for a single event occurring at any given time.

<table>

<td>277</td>
</tr>
<tr>
<td>Stadium Weeknight</td>
<td>370</td>
<td>349</td>
<td>328</td>
<td>307</td>
</tr>
</tbody>
</table>

Although scheduled events at Safeco Field, Seahawks Stadium and the exposition center were never to occur concurrently or even within four hours of one another, an additional set of goals were established for dual events. Prior to the City of Seattle's approval, a “Dual Event Agreement” was established eliminating the possibility of having two events with a combined attendance of over 58,000 occurring within 4 hours of each other without a special TMP.

An initial review of 2002 results indicate that mode split goals have been surpassed. The non-auto mode split was surveyed at between 25% and 30% which exceeded initial projections of 20%. Success can not be directly attributed to any single mode of travel, but is reflective of the range of options available including Park and Ride facilities, transit service, ferry and rail services as well as bicycling and walking.
A New Downtown Ballpark for the SF Giants

Pacific Bell Park, the San Francisco Giants 41,000-seat “downtown ballpark,” opened in March 2000. The ballpark is located alongside San Francisco Bay, approximately one mile (1.6 km) south of the center of downtown San Francisco. The ballpark is located in the South of Market Area (SOMA) of San Francisco, a former warehouse district that in recent years has become a popular location for new technology firms and high-density residential development. The ballpark site is relatively small and is bounded by water on two sides. Unlike most sports stadia, PacBell park and its parking lots were constructed almost entirely with private funds. As a result, very little funding (about $1.5 million) was available for off-site transportation improvements, such as improved roadway, transit or pedestrian facilities. However, the Giants promoted the downtown site, in part, because of its proximity to regional transit and existing commuter-oriented parking supply. Additionally, the ballpark planners also hoped that many downtown workers would walk or ride bicycles to PacBell park on weekdays. Traffic concerns included the fact that weekday afternoon ball games would be over within close proximity to the start of the evening rush hour.

TMP Required by City

Due in part to concerns of local residents and businesses about traffic congestion, particularly for weekday afternoon games, the City and County of San Francisco required a Transportation Management Plan (TMP) be developed and approved to assure efficient transportation operations and minimal impacts to the surrounding neighborhoods. A Ballpark Transportation Coordinating Committee (BTCC) was appointed to develop the TMP and garner buy-in from affected parties. One key objective of the TMP was to maximize the use of non-auto modes by baseball fans, particularly public transit.

The TMP included the promotion of existing and new transit services:

- Caltrain commuter rail service terminus adjacent to the ballpark.
- A new LRT line from Caltrain to BART Embarcadero station.
- Nearby BART regional rail under Market Street.
- New ferry service to the adjacent China Basin Ferry Terminal.
- Various SF Muni bus lines and regional bus service to the Transbay Terminal.

The Giants and regional transportation agencies educated fans on the potential traffic and parking problems and the range of convenient and affordable transit options.
PacBell has 5,000 dedicated parking spaces in lots located across Mission Creek. New residential area parking restrictions were imposed and several streets and lanes closed during games (including access routes to the parking lots and regional transit service).

Finally, a set of transit promotional activities and incentives were part of a comprehensive marketing campaign called “Your Ticket Home” and were funded by the Giants, the Metropolitan Transportation Commission, and several corporate sponsors. The campaign was designed to entice first time user to try transit and included the following components:

- A pocket-size pocket information guide for fans and all season ticket holders.
- A transit information hotline answered by the regional ridesharing organization.
- The opportunity to purchase transit tickets by mail (resulting in over $100,000 in advanced fares purchases).
- An incentive program that rewarded Giants fans points toward their fan appreciation program for purchasing transit tickets.
- Promotion of the Your Ticket Home campaign on Bay Area trains and buses serving the ballpark.
- The deployment of “Transit Ambassadors” to answer questions and guide new riders through transfers and fare collection particulars.

**Better than Expected Results**

The primary measures of success were the proportion of fans arriving by transit and the severity of traffic and parking congestion. During the first year in PacBell Park (renamed SBC Park in 2004), the ballpark and its TMP achieved a 50% non-auto mode split and the dedicated parking lots never reached capacity.

Part of the evaluation of the TMP’s effectiveness was a comparison of the first year operation of PacBell Park with 3Com (formerly Candlestick Park). Some key comparisons are provided below and bear witness to the success of the TMP:

<table>
<thead>
<tr>
<th></th>

<td>8,800</td>
<td>5,000</td>
</tr>
<tr>
<td>Parking Fee</td>
<td>$6</td>
<td>$15-20</td>
</tr>
<tr>
<td>Other Nearby Parking Spaces</td>
<td>10,000</td>
<td>2,000-3,000</td>
</tr>
<tr>
<td>Percent on Transit</td>
<td>3-4%</td>
<td>34-41%</td>
</tr>
<tr>
<td>Percent Walking</td>
<td>0%</td>
<td>5-8%</td>
</tr>
<tr>
<td>Percent in Autos</td>
<td>96%</td>
<td>48-58%</td>
</tr>
<tr>
<td>Average Auto Occupancy</td>
<td>2.5 fans per car</td>
<td>2.8 fans per car</td>
</tr>
</tbody>
</table>

Half of Giants fans arrived by non-auto modes and parking lots were never full to capacity due to the effectiveness of the TMP.

What do the Giants and City of San Francisco attribute the high transit usage and lack of parking and severe traffic problems? First, pre-opening public information not only educated fans as to the lack of parking and congested downtown streets, but one the range of affordable transit options. Pre-paid transit ticket opportunities and a high proportion of advance payment season ticket holders provided fans with ample time to plan their trip to the ballpark and reduce spur of the moment travel (more commonly made by car). A significant percentage of fans at weekday (32%) and weeknight (28%) games came to the ballpark directly from work.

The high level of transit use at PacBell can be attributed to the following factors: 1) availability of reliable, efficient, and affordable mass transit; 2) commitment to quality transit service by regional providers and the Giants made possible by predictable ridership; 3) high parking costs and limited availability; 4) close proximity to a large downtown population base; a well developed and executed transportation management plan; and 5) public expectations as to the severity of traffic and parking problems.
FAST FACTS ABOUT: Zion National Park - UT

Types of TDM: Mode Choice
Keywords: national park, shuttle system, sustainable practices, parking restriction, road closure, alternative fuel vehicles
Area Demographics: Utah’s first national park, annual visitation of 2.61 million in 2002.
Program: Mandatory summer shuttle system since 2000 serving Zion Canyon and Springdale. Parking is restricted on Scenic Drive.
Results: 75% of Zion’s annual visitors use the system. In 2000, the shuttle system reportedly reduced nearly 1,200 vehicle trips per day and almost 11,000 vehicle miles traveled per day.
Cost of Program: $12 million for the initial capital investment and approximately $2.5 million in annual operating costs.
Contact: Ron Terry, Zion National Park

Protecting Assets

Zion National Park, located in southwest Utah, was designated as the state’s first national park in 1919. The Park, associated with deep canyons, dramatic cliffs and the Virgin River, is nearly 230 square miles although most of the visitation is focused on Zion Canyon. The Park is accessible from the south, west and east with the southern access through the town of Springdale. The usual approach to the southern access is from the west via State Route 9.

In the early 1990s an escalated number of visitors to the Zion Canyon made it increasingly difficult for visitors to find parking along the Zion Canyon Scenic Drive. In 1999, the annual visitation was 2.4 million. Increased visitation resulted in traffic congestion, inadequate parking, destruction of natural resources and a diminished visitor experience in the 6-mile upper portion of the Zion Canyon. On an average day during the peak season up to 5,000 cars including tour buses were using the Scenic Drive. Only 400 parking spots were available along the scenic roadway and as a consequence visitors typically double and triple parked destroying vegetation.

Bold Idea for Zion

Several alternatives were considered by Park officials prior to implementing the existing shuttle program. Alternatives considered but rejected included increasing parking in the Canyon, closing the scenic drive once the parking filled, and providing a voluntary shuttle system. The selected alternative included the implementation of a mandatory shuttle system using propane-powered vehicles during the peak tourist season.

The shuttle system began operation on May 26, 2000 allowing only the Park’s shuttle busses to operate north of the Zion Canyon Visitor Center during the peak summer season. An exception has been given to allow employees and guests of the Upper Lodge to continue using the Scenic Road although they are encouraged to use the shuttle system once their vehicle is parked. Parks Transportation, Inc. currently operates 30 NPS-owned propane-powered shuttle buses. Approximately 20 of these buses operate exclusively within the park with attached trailers capable of holding a total of around 66 passengers each. The shuttles have operated daily from the beginning of April though the end of October since 2000. Personal vehicle access is only permitted from November to late March on the Scenic Drive except for Upper Lodge employees and guests.

The shuttle system operates in two loops. One route makes six stops within the town of Springdale and the other has eight stops along the Scenic Drive. The Visitor Center is the central transfer point for both the Zion Canyon route and the Springdale Loop. Although parking is permitted at the Visitor Center, it is typically full by late morning during the peak season. Parking at the Visitor Center is equivalent to the 400 spaces that used to be available to visitors on the Scenic Road prior to implementation. Some of the Scenic Road parking has been converted to bus stops, but most of the spaces remain providing general parking during the off-peak season when the road is again accessible to all.
Visitors are encouraged to park in Springdale and use the shuttle system to access the Park free of charge. Springdale has provided approximately 1000 parking spaces for Park visitors. Shuttles operate within the Canyon at 6 minute headways during the middle of the day and approximately every 10 to 15 minutes in the morning and evening. Between 6:30 - 7:30 AM and 9:00 – 11PM frequency is reduced to every 30 minutes. Each full shuttle bus, which has a capacity of 66 people has the potential to replace 25 cars.

The shuttle system is an integral component and was the catalyst of a large-scale improvement project including the construction of a new Visitor Center and a bus maintenance facility, as well as a 3-mile pedestrian path, the Pa’rus Trail. Additional streetscape and safety improvements near shuttle stops were also included in the project. The Visitor Center showcases award-winning energy efficient design and sustainable development practices. Like a number of other National Parks, Zion is also testing alternative fuel vehicles to assess environmental impacts. Zion has two electric trams each holding up to 36 passengers.

The total cost of the improvement project was $27.4 million, including $9.4 million for shuttle buses and trailers. The bus maintenance facility cost an additional $2.6 million. Annual operating costs of the shuttle system are estimated to be $2.5 million, or about one dollar per visitor. The street, landscaping, and sidewalk improvements surrounding the Springdale shuttle stops were financed by federal enhancement funds secured by the Utah Department of Transportation.

Benefits Started on Day One

The shuttle system has had a significant impact on traffic operations and the natural environment within the Canyon. The 2000 operational period lasted from the 26th of May until the 29th of October, during which more than 1.5 million passengers utilized the system. The effectiveness data below indicates the marked success of the system during its’ first year of operation.

*Source: 2001 Draft Report on Air Emissions Inventory for Zion National Park*

Current estimates indicated that about 75 percent of the 2.5 million annual visitors ride the Zion Canyon shuttle. In the programs second year, 2002, annual shuttle boardings (2.35 million) almost equaled park visitation (2.61 million).

The shuttle system has been attributed with eliminating much of the vehicle congestion, parking conflicts, and aesthetic and noise related issues associated with vehicle use in the Park. Research is underway to quantify the effect that propane-powered shuttle buses have had on reducing noise levels. Prior to implementing the system, a noise impact assessment concluded that a considerable portion of the Canyon noise was a result of commercial tour bus traffic which is now prohibited north of the Visitor Center.

The town of Springdale has directly benefited from their Partnership with the Park on the shuttle system. Today, over half of the system operates within Springdale thereby providing free transit service to the residents. Likewise, the Park has also benefited from collaborating with Springdale. Without the partnership, the Park would have had to invest in additional roadway and parking infrastructure to support the shuttle system. The partnership has been attributed with reducing Park roadway construction needs by 40% and parking development by 54%. Aside from providing a transportation alternative for Park visitors and staff as well as Springdale residents, the shuttle system has indirectly promoted the local economy. Springdale experienced a 5 percent increase in retail sails during the first year of shuttle operation.
Aspen at the Top
Aspen, Colorado is recognized as a premier recreational and resort destination in the western United States. Located approximately 220 miles west of Denver, Aspen is home to less than 15,000 permanent residents. Visitors push the seasonal population to 25,000 during the winter peak ski season. Aspen is home to the Aspen Skiing Company (ASC) which operates two luxury hotels and 15 restaurants. At the peak winter season, ASC employs 3400 people, and is the largest employer in the Valley.

Aspen is accessible via Colorado Highway 82 (CO 82), which is currently under construction. The CO 82 project is a 40-mile corridor improvement from Glenwood Springs, Colorado at I-70 to Aspen. A key project component includes the installation of high occupancy vehicle (HOV) lanes. When completed, the HOV facility will stretch 16 miles from Basalt to Aspen. The HOV lane has also served as a construction traffic impact mitigation tool, reducing the number of vehicle trips passing through the construction zones along CO 82. By using temporary signing and striping during construction, the Colorado Department of Transportation (CDOT) was able to start providing a time-saving advantage to HOVs.

Aspen has implemented transportation goals to preserve the physical environment and control future traffic impacts on the community. The 1993 Aspen Area Community Plan adopted a transportation goal to limit the traffic entering Aspen to 1993 volumes. Traffic volume counts are taken continuously at Castle Creek Bridge and are summarized monthly to ensure that the goal is being met. The goal has been met every year since. The City of Aspen has adopted several transportation goals besides limiting traffic volumes such as reducing parking occupancy rates downtown and offering viable alternatives to driving alone.

Program Description - Complementing Strategies
Aspen exemplifies the cohesion of a range of demand-side strategies, in most cases implemented by a number of different organizations (local transit agency, non-profit, local jurisdiction, etc.), successfully contributing to vehicle trip reduction. The section below highlights a few of the Aspen’s programs although success is difficult to attribute to only one or two strategies.

Area-wide Rideshare - The City of Aspen coordinates the local rideshare arrangements. The distribution of daily Carpool Parking Permits provides an indication of the success of their ridesharing program. To encourage carpooling, vehicles with more than 3 people entering the downtown area can stop at a kiosk and receive a Carpool Parking Permit that allows that vehicle to park in a designated area free of charge all day. Approximately 16,000 daily permits
are issued annually. Coupled with the high-occupancy vehicle lanes and transit signal priority, the distribution of these permits is one of the most successful incentives to rideshare.

**Transit Service** - The Roaring Fork Transportation Authority (RFTA) provides daily fixed route and demand response transit services. RFTA operates partially on a local sales tax. The local jurisdictions including Aspen and Glendale contribute proportionately to the transit service they receive. During the summer, RFTA operated the Maroon Bells shuttle service to the Maroon Bells National Recreation Area. Personal vehicle traffic is restricted between 9:00 AM and 5:00 PM daily allowing access only to shuttles and those with special needs. The combined June and July 2003 ridership was over 40,000 passengers.

**Park and Ride Lots** - Highway 82, the main north-south roadway has eight P&R lots available to commuters. The lots range in size between 10 and 150 spaces. The neighboring Town of Snowmass hosts an aggressive intercept parking program in which perimeter parking lots are available to leave vehicles and use transit. The alternative to intercept parking in Snowmass is to buy a parking permit to park in the core area.

**Employer-based Support Programs** - The Transportation Options Program (TOP) is comprised of 32 businesses and over 6000 employees. Participating employers provide an employee transportation coordinator (ETC), nick-named TOP Dogs, to attend meetings and disseminate information to employees. TOP has also negotiated the creation of the Zone Pass with Roaring Fork Transit Association (RFTA), which enables individualized transit options to encourage employers to purchase transit passes for their employees. Other TOP incentives include schedule display boards, email traffic alerts, and monthly newsletters. TOP is operated on funds from the paid parking program. All TOP services are free.

**Parking Incentive Programs** - The paid parking program, Pay and Display, has been implemented with the highest rates charged downtown. One Pay and Display ticket covers the entire block with a maximum of two hour parking. Aspen also has traditional parking meters. Money generated from Aspen parking programs is applied directly towards other transportation management programs.

**Marketing** - Find Another Way Day is an annual marketing campaign to encourage commuters to try another mode of travel. For the last 7 years, the City of Aspen has sponsored this event to encourage people to leave their car at home and use another means to get around town or commute to work. Find Another Way Day events include entertainment, food, prizes and free bicycle safety checks. In 2001, a Customer Appreciation event was also added to Find Another Way Day to enable citizen’s not living and working near the downtown core area to participate. In 2003, the event became Find Another Way Week with daily events happening throughout the Valley. In 2002, the City implemented “Carpool Patrol” in cooperation with local radio stations by interviewing and giving prizes to carpoolers who stopped at the kiosk.

**A Decade of Success**

The City of Aspen has designated one full-time individual to demand-side programs. The program is evaluated yearly and considers a documented goal and outcome plan. Aspen has found it fruitful to track quantifiable measures of effectiveness such as the number of transit passed sold, Carpool Parking Permits distributed and traffic volumes as well as performing annual reviews with their employer participants to ensure that their needs are being met. Each year, specific goals are outlined and later the outcome is documented.

The programs highlighted above have collectively but not exclusively contributed to achieving transportation goals. As of 2003, revenue generated from the paid parking program generated $600,000 for program support and $300,000 for future transit investment. This program is also attributed with reducing parking occupancy downtown by 10%. The City has also displayed flexibility with their programs to ensure that goals are met. For example, in 2003, parking rates were increased to cover higher transit costs as well as to preserve the parking occupancy rates downtown. In 2003, the City of Aspen became the first and only city in the nation to be awarded best workplace for commuter status by the US EPA. The City’s program also received the 2003 Outstanding Service Award from the Association for Commuter Transportation.
Area Characteristics

The Lake Tahoe Basin incorporates two states and five counties between the Sierra Nevada and Carson mountain ranges. Approximately two-thirds of the Basin is in California and one-third in Nevada. The area can be characterized as mountainous with limited areas of level terrain. Lake Tahoe itself is twenty-two miles long and 12-miles wide with 72-miles of shoreline.

The population of the Lake Tahoe Basin consists of residents and visitors. The Basin economy is significantly dependent on resort, recreational, and gaming industries. The resident population lives and works in the basin, and the influx of visitors arrive during the winter ski season (December through March), and the summer seasons (June through August). However, the month of August has the highest travel demand in terms of peak hour traffic volumes on the roadways. Currently (according to 2000 census data) about 56,000 people reside year-round in the Basin. Population growth through 2010 is expected to be modest in contrast to the rest of the four counties of which the Tahoe Basin is a part. The land use restrictions and the physical carrying capacity of the Basin will tend to maintain steady linear trends in population growth.

The roadway network within the Basin consists essentially of a “ring road” with a handful of regional access points. Most of the roadway network supporting the Basin can be classified as 2-lane highway and local collectors and arterials. Traffic entering the Basin has access from several points. The most direct access route to the City of South Lake Tahoe from points west and east is U.S. 50. State Route (S.R.) 89 and S.R. 267 provide access from Truckee and the I-80 corridor on the north. S.R. 89 through Tahoe City consistently maintains the highest traffic volumes entering the Basin both during the peak month and yearly. Except for U.S. 50 from the east, all the access routes are two-lane highways.

In response to the TRPA air quality threshold standards, the 1992 Regional Transportation Plan (RTP) established a VMT threshold standard to reduce vehicle miles of travel (VMT) by 10 percent of the 1981 base values. A number of demand-side programs have been implemented in an effort to obtain the VMT threshold.

Public and Private Transportation Investments

The Tahoe Basin is served by two publicly operated transit systems, tourist oriented trolley services, and a number of privately operated shuttle systems. Demand response service is offered by many agencies, and subsidized taxi services are also available. Basin agencies have realized investment in existing infrastructure
with comprehensive studies concluding with detailed recommendation for pedestrian and bicycle facilities as well as enhancements to the existing ITS initiatives. Highlighted below are a few of the innovative programs and TDM measures that the Basin has successfully implemented in recent years.

**Visitor-based Trolley Service** - In addition to the two established local transit agencies operating in the Basin, there are two successful summer trolley systems operated by the local Transportation Management Associations. The north shore service, Tahoe Trolley, is free at night but requires a minimal fare during the day. Service is available for approximately 60 days during the summer. In 2001, 18,000 riders used the service despite a 25% service cutback due to the limited availability of drivers. The south shore of Lake Tahoe supports a separate trolley system called Nifty 50. As a tourist-focused system, Nifty 50 operates approximately 80 days during the summer months from 10AM to 10PM. In 2001, 70,000 passengers used the service.

**Privately Operated Shuttle Service** - Several privately operated shuttle services also operate in the Basin. Casinos and hotels offer daily shuttle services while the major ski areas offer shuttle services either on a contract basis or privately during winter months. Services are available on both the north and south shore areas. As documented, the casino shuttles offer a significant service providing nearly 500,000 one-way passenger-trips per year. North shore ski areas to the south shore also provide service. Coordination of services between the public transit system on the south shore and the ski shuttles is afforded by use of common bus stops. The Tahoe Queen operating out of the Ski Run Marina also provides a waterborne ski shuttle service between the north and south shore areas.

**Heavenly Ski Resort Gondola** - In 2000, Heavenly Ski Resort installed a gondola providing direct access from the hotels, casinos and center of South Lake Tahoe to the resort. The gondola affords mountain views covering 2.4 miles for the 17-minute scenic ride. The new gondola recently won the Silver Eagle Award from the National Ski Areas Association, recognizing the improvement the gondola has made to the resort and community in reducing vehicle trips while minimizing visual impacts and environmental disturbances. Heavenly reports that 20% of their winter visitors access the ski resort via the gondola, which has helped reduce traffic congestion in South Lake Tahoe.

**Transportation Management Associations** - Over the last ten years, a number of measures have been implemented in the Basin through two community-based transportation management associations (TMAs).

The Truckee/North Tahoe TMA (TNT/TMA) has been a local leader in addressing transportation issues as well as disseminating information and providing transportation alternatives. One of their most successful programs is the Tahoe Trolley, which provides a summer season service (approximately 60 days) in and around north shore communities, resort areas, and to Emerald Bay providing a link to the south shore transit options. In addition, the TNT/TMA has taken the lead in coordinating expanded winter transit service for the north shore. Currently, one full-time and one part-time employee operate the TMA with an annual budget of about $160,000. 44% of the required revenue is generated from member contributors including local jurisdictions and area resorts.

Serving South Lake Tahoe, the South Shore TMA has focused primarily on appealing to the visitor market of the Basin. Formed in 1994, the TMA initiated the successful summer trolley program, Nifty 50 Trolley. The TMA is responsible for maintenance, drivers and securing funding as well as all other logistical matters related to the service. The South Shore TMA is actively involved with local planning efforts and is leading the effort to institute the coordinated transit system (CTS), which would combine both public and private transit services of the south shore. The South Shore TMA and NDOT are also working on securing funding to expand the existing seasonal shuttle service and to provide service to employees commuting between the Tahoe Basin and the Carson Valley.

**Measures of Effectiveness**

Programs highlighted above contribute positively to the overall transportation and visitor experience within the Tahoe Basin. Summarized below are indicators of program performance provided by project sponsors:

- **Seasonal Trolley Service Ridership (Summer of 2001):**
  - 18,000 passengers on Tahoe Trolley, north shore.
  - 70,000 passengers on Nifty 50, south shore.
- 500,000 one-way passenger trips per year provided by private casino shuttles.
- 20% visitor using the gondola to access Heavenly from South Lake Tahoe versus arriving by vehicle.
Area Characteristics

The Utah Department of Transportation (UDOT) completed the 17 mile reconstruction of I-15 in July 2001. The project was completed in four and a half years at a cost of about $1.52 billion. Instead of rehabilitating segments of the highway, UDOT decided to rebuild the entire corridor. To meet an aggressive schedule and, in particular, aiming to finish construction before the 2002 Olympic Games, UDOT completed the project using a design/build approach.

The original I-15 infrastructure, built in the 1960’s, was designed to support half the traffic capacity it served in 1997. This capacity-enhancing project included adding two general purpose lanes, two high occupancy vehicle (HOV) lanes and auxiliary lanes between interchanges. Project components also improved access to downtown Salt Lake City, provided railroad grade-separations, replaced deficient bridges and utilized single-point interchange design. The project mitigated conflicting merging traffic movements and significant traffic congestion.

Program Description

UDOT recognized that the project would have significant consequences to traffic circulation and operations during all project stages. The contractor was required to maintain two lanes of traffic in each direction during peak commute periods as well as preserve critical freeway-to-freeway movements and access to downtown at all times. When interchanges and cross streets were closed, no two adjacent interchanges were inaccessible at the same time. Incident Management programs were expanded and supplemented by contractor-required courtesy patrols. As part of the reconstruction, emergency pullout locations were constructed along the corridor since limited shoulders were provided for disabled vehicles.

UDOT used a combination of demand-side strategies to maintain traffic during reconstruction. The ITS system (CommuterLink) was installed in three major pieces: 1) the Traffic Operations Center (TOC) including the physical building and internal networking equipment, 2) the control software, and 3) field equipment including VMS signs, cameras, and signal controllers. The comprehensive system includes a 511 Traveler Information Line, coordinated signals, ramp meters as well as speed, volume, weather and pavement sensors. UDOT installed the bulk of the $70 million worth of ATMS equipment using a design-build procurement method. CommuterLink was funded mostly by state funds ($52 million) with local ($1 million) and federal ($17 million) contributions.

ATMS technology enabled jurisdictions to monitor construction impacts, respond to traffic accidents faster, and communicate with the motoring public. The UDOT TOC is directly linked to both the Salt Lake City and Salt Lake County Traffic Control Centers and the Utah Transit Authority (UTA) Radio Center to provide seamless communication between jurisdictions.
UDOT also undertook a marketing campaign recognizing that one of the best ways to minimize traffic conflicts and delays on the interstate during reconstruction was to reduce the number of vehicles on the road. Employers and employees were encouraged to participate in ridesharing opportunities provided by UTA and commuter transit services, the Telecommuting Directive, and the Corridor Business Program. Informational services included the use of the internet, highway advisory radio, media outlets, signing, seminars and open houses. The importance of ridesharing and trip reduction was reiterated and promoted by such programs as Skip-a-Trip.

Evaluation of the 2002 Winter Olympic Games

The ATMS was put to the test for the 2002 Winter Olympic Games which was the largest Winter Games held to date. In total, the Games utilized twelve venues across the region. With 1.5 million tickets purchased, the travel needs were unprecedented. After the conclusion of the Games, an assessment was made on program components.

A number of goals and programs were established specifically for the Games TDM Plan depending on the venue and transportation user group. The two primary user groups considered were spectators and residents. For example, a specific TDM Plan goal was established to reduce background traffic by at least 20%. The strategies implemented to achieve this goal included transit, carpools, shifting work hours and travel routes and times. A follow-up survey with residents concluded that approximately one-fifth of residents changed travel patterns during the Games. Most residents offered that the change was related to an adjustment in daily work hours as opposed to a change in mode or route. In addition, a reduction in day-time truck traffic reduction between 30 -45% indicated by limited date from UDOT’s Automated Traffic Recorder (ATR) system also contributed to reducing background traffic. The Olympic Spectator Transportation System (OSTS) was developed to address the transportation needs of the spectator population and included 19 park and ride lots served by shuttle buses, the TRAX light rail system with overflow parking lots and publicly - subsidized shuttle services to mountain venues.

Athlete and media transportation needs were also identified and addressed. A shuttle service was created exclusively for 11,000 members of the media, which operated on fixed routes 24 hours a day. The Athlete Transportation System served 3,300 athletes and officials housed in Olympic Village. The System included over 500 passenger vans, 50 cargo vans, 44 coach buses which operated 24 hours a day. Both media and athlete services were encouraged to use alternate routes.

Measures of Effectiveness

CommuterLink has already demonstrated its effectiveness. During its first years of operation, CommuterLink has been attributed with the following successes:

- Increased peak hour freeway speeds by 20%,
- Decreased freeway delay by 36%,
- Decreased traffic signal stops by 15%, and
- Decreased Intersection delay by 27%.

Considering the efficiency measures above, CommuterLink is projected to save Utah more than $100 million annually.

An evaluation of the ATMS and TDM Plan components specifically for the Winter Games provide the following results:

- 80,000 unique visitors visited the CommuterLink web site during the Games,
- 511 Traveler Information line daily usage peaked near 4000 calls. By comparison, 511 usage on a typical day in 2002 was around 300 calls.
- Over 2.5 million passenger-trips were recorded on public transit during the Games.
- Park and ride shuttle buses carried one-third of the transit passenger trips.
Area Characteristics

The I-25 corridor in metropolitan Denver is one of the most overburdened sections of roadway in Colorado. Over the past twenty years the region has experienced intense residential and employment growth leading to increased travel demand and congestion along the I-25 corridor.

In an effort to confront congestion along I-25, the Colorado Department of Transportation (CDOT) and the Regional Transportation District (RTD) initiated a multi-modal design-build project known as the Transportation Expansion Project, or T-REX. The design-build approach compliments T-REX project goals, which are:

- Minimize inconvenience to the public,
- To stay within the $1.67 billion project budget,
- To provide a quality product, and
- Complete the project on time (2008).

The project is ahead of schedule and is estimated for completion in 2006.

The T-REX project includes both light rail construction and highway capacity and safety improvements. T-REX, a design-build project, will add many new elements to the transportation system including 19 miles of double track light rail, 13 light rail stations (all but one with park & Ride lots), 34 additional fleet vehicles, and a new maintenance facility. The project will also provide additional lanes on both I-25 and I-225 within project limits as well as other safety improvements associated with save ingress and egress.

Program Description

T-REX owners recognized the potential impact that the large-scale project could have on the motoring public and took steps to minimize inconvenience associated with the reconstruction project. The TransOptions program was formulated in consultation with key community stakeholders as a construction mitigation program designed to assist employers and commuters in dealing with the challenges of traveling to, from and through the corridor during construction. CDOT and RTD dedicated $3 million to the TransOptions program, which included transit and vanpool subsidies, community outreach and education on construction and transportation options.

TransOptions has been recognized as a key element of construction mitigation by providing commuters and employers with incentives to use alternative modes to, from and through the corridor. TransOptions builds on the success of the TMAs and TMOs and established demand-side programs implemented by local jurisdictions including the Denver Regional Council of Government’s (DRCOG) RideArrangers.

Facilitative leadership has helped avoid roles and responsibilities pitfalls. For continued success, it will be important to communicate the role of agency partners to ensure focused but collaborative efforts through established and new partnerships.
Due to the fluid nature of a design-build project and the foresight of those involved, a number of recent project features have been deployed to manage travel demand during construction. In November 2002, T-REX opened a temporary bus/HOV lane on I-25 to promote the benefit of higher occupancy modes. In May of 2003, T-REX launched a real-time instant email alert system utilizing project ITS components as they became operational. In May of 2003, TransOptions was honored with a TDM Award presented by the Southeast Business Partnership for its continued commitment to and success with construction related transportation management to date.

**Measures of Effectiveness**

Recently, the T-REX TransOptions program has undergone an evaluation of its first two years (2001 and 2002) utilizing a variety of measures including documentation review, stakeholder interviews, e-mail surveys, and quantitative analyses of program data. The evaluation identifies strengths and weaknesses of the TransOptions program, as well as opportunities and threats for the future of the program.

By reducing daily vehicle miles traveled (VMT) along the T-REX corridor, the TransOptions program is contributing to T-REX's goal of minimizing inconvenience along the corridor. As part of recent analysis conducted by UrbanTrans Consultants, Inc., TransOptions contributed to VMT reduction was measured. Collectively, transit and vanpool subsidies provided by TransOptions have reduced daily VMT by 74,800. The following successes have been cited as contributors of VMT reduction based on analysis completed to date:

- 14 employers purchased Eco Pass which resulted in over 1,200 employee Eco Pass holders,
- 66 commuters purchased ValuPass,
- 318 commuters purchased subsidized transit pass products at 4 Sales Pass Outlets established with T-REX support,
- 80 commuters utilized Commuter Checks to purchase transit products,
- 179 Vanpool riders received T-REX TransOptions subsidies, and
- 9 Vanpools were formed.

A number of TransOptions strengths were documented as part of the evaluation and are seemingly applicable to all highway reconstruction projects. Collaborative, responsive leadership of the TransOptions staff is imperative for the continued interest of project team members including the TMA/TMOs, DRCOG, RTD and the TransOptions TDM Committee. Facilitative leadership has helped avoid roles and responsibilities pitfalls. For continued success, it will be important to communicate the role of agency partners to ensure focused but collaborative efforts through established and new partnerships. Program credibility continues to be strengthened by the presence of a public relations firm on the TransOptions team. Marketing and public relations outreach of the TransOptions program resulted in increased employer and employee awareness of transit, vanpool and carpool. Success is evident measured by the implementation of over 300 events, attended by more than 20,000 persons by the end of 2002. In addition, just as important as providing employers and commuters with subsidized transit and vanpool products, it was necessary to enable the TMA/TMOs and DRCOG the tools to effectively provide those products. TransOptions is flexible in nature, adjusting to user needs.
Area Characteristics

The Springfield Interchange Improvement Project, a major reconstruction project sponsored by the Virginia Department of Transportation (VDOT), is currently mid-way through construction. The multi-phased, $350 million project began in March of 1999 and is scheduled for completion in 2007. The pre-project interchange, where I-95, I-395 and I-495 met, was nearly a mile long linking the three major interstates and serving nearly 400,000 vehicles a day. The original interchange was constructed in the 1960’s and was not equipped to handle current or future transportation needs. Traffic forecasts projected volumes to double by 2020. Project improvements include building more than 50 bridges and flyovers, 30 ramps, and installing nearly 200 guide signs and 20 electronic message signs. Among a number of goals, VDOT undertook the Project to improve safety and access while increasing throughput capacity. A main project feature is to barrier-separate HOV lanes, through lanes and local lanes on I-95 to reduce weaving conflicts.

Program Description

VDOT has worked with federal and local agencies to create a comprehensive Congestion Management Plan ($28 million) including incident management, traffic operations, and demand management. The program allocation is $10 million over 8 years. Specific Plan goals were established to reduce 1,000 vehicles per peak hour and 2,500 vehicles per peak period.

Incident management components include the use of an on-site mobile command vehicle, equipment to respond to hazardous waste spills and traffic incidents of all degrees as well as increased patrols by the police and safety service units. Operational improvements include the installation of cameras to monitor traffic flow proximate to the interchange, a coordinated construction phasing plan, and information dissemination regarding alternate routes and emergency routes. In addition, signal timing adjustments and spot intersection improvements (installing or lengthening turn pockets) were also made. Infrastructure improvements also included capacity enhancements at intersections along parallel routes to accommodate diverted trips. Other specific TDM investments included a 10% increase in Park & Ride spaces, expanded commuter rail service, OmniRide bus enhancements, telework centers, fare discounts for both bus and rail service, and the promotion of vanpools, carpools, and private buspools of more than 30 passengers.
The region has numerous transportation management associations (TMA)s and ridesharing organizations available to users. Currently, bus service proximate to Springfield is free of charge thanks to a state-funded program conceived by the Northern Virginia Transportation Commission, Fairfax County, and the Washington Metropolitan Area Transit Authority (WMATA).

The Project maintains a project website, an information line and utilizes media for public outreach. Commuters or other travelers are encouraged to stay informed about project conditions. VDOT has enhanced information dissemination to the public by opening the nation’s first formalized retail Information Center (IC), which is located in the Springfield Mall to help disseminate project information. The storefront station is equipped with monitoring cameras and can provide rideshare assistance and transit information and passes. Additional project elements promoting TDM include High Occupancy Vehicle (HOV) lanes, including the two-lane reversible facility running north to south and roadway operational improvements.

**Measures of Effectiveness**

The use of transit, carpooling, and vanpooling in the I-405 corridor has been consistently high due in large part to the success of the HOV lanes and Metrorail line. The challenge of the Congestion Management Plan was to provide additional services that would encourage drivers to change their behaviors. An early survey of single occupant drivers determined the most effective improvements to entice people out of their cars. Demand-side strategies were formulated based on these improvements. With HOV lanes already in place, VDOT was able to offer a time-savings advantage. The public outreach component is proving to be a success. As of May 2003, over 230,000 motorists had visited the Information Center in the Springfield Mall.

The Springfield Interchange Improvement Project is currently in Phase 4 and 5 and continues to operate the Congestion Management Plan established for the Project. As of June 2002, the Congestion Management Plan had been through three evaluation processes and has not been substantially modified. Minor shifts in programmed funds have occurred, but the majority of demand-side strategies are performing at or above their anticipated goals. Even during reconstruction, the original number of through travel lanes is maintained during peak hours.
Vanpooling: A New Idea Presents Itself

Bal Harbour Village is a small, upscale resort town located in South Florida. With a population of 3,309, the Village has implemented strict growth management policies since its incorporation in 1946. Today, the Bal Harbour Village Manager seeks out ways to sustain Bal Harbour’s appeal to both Village employees and in turn to visitors. Despite good bus service, Bal Harbour Village employees are not avid bus riders. The presence of free parking for employees may be one explanation for low bus usage. Residential location may be a second explanation. Most of Bal Harbour Village’s employees commute from outside the town limits and prior to August 2001, a great majority of them drove alone.

In August 2001, the Village Manager received a flyer advertising the South Florida Commuter Services (SFCS) vanpool services. SFCS works with the South Florida Vanpool Program (SFVP) to provide vanpool services and programs. SFVP works directly with employers to design a vanpool program, present vanpooling options to employees and manage the program from the start-up through implementation. The Village Manager’s interest was peaked and he scheduled an employee vanpool presentation.

Immediate Vanpool Formation

The presentation concluded with high employee interest in starting a vanpool. Immediately, eight Bal Harbour employees signed up to form a vanpool. In addition to presenting the Vanpool program to employees, the Village Manager began researching subsidies and payment options for employees. In order to tap into employee motivation, the Village Manager leveraged a subsidy paid by Miami-Dade County with funds from the Village of Bal Harbour to establish the first vanpool. The employee and Village divided the remaining vanpool costs.

Employees that participated in the first vanpool began to report reduced commuting costs and influenced other employees to consider vanpooling. Not long after the first van formed, the Village Manager acquired enough employees to sponsor a second vanpool. In just 2 years, 12% of Bal Harbour Village’s employees are vanpooling. Due to the vanpool popularity, the Miami-Dade County subsidy and new transportation tax proceeds, the Village of Bal Harbour is able to pay 100% of the vanpool costs. Thus, as of Summer 2003, employees pay only the cost of gas to vanpool. All vanpoolers are eligible to participate in the County’s Guaranteed Ride Home program.

Results

The Village Manager’s interest in promoting alternative mode choices to employees has resulted in the formation of a strong vanpooling program. Today, Bal Harbour’s mode split reflects the high interest in vanpooling. 12% of employees vanpool, 2% telework and 48% drive alone. The remaining 38% are police officers that work irregular shifts.
FAST FACTS ABOUT: Calibre - Alexandria, VA

Types of TDM: Modal Shift, Location Shift
Keywords: Transit Subsidy, Parking Management, Shuttle, Relocation, Parking Cash Out, Telework, Lease Negotiation
Employer Demographics: Located in Alexandria, VA near Washington, DC in an area well served by subway, commuter train and bus
Program: $65 transit, bike or walk subsidy, $65 parking cash out, carpool subsidy, telecommute
Cost of Program: $99,000 - $30,000- transit subsidies, $5,500 Telecommute program administration, $64,000 TeleworkVA! subsidy
Staff: 2 (Benefits Coordinator and HR Director)
Results: 2% carpool, 12% transit, 5% telework
Contact: Michelle Voisinet Caylor, Benefits Coordinator mcaylor@calibresys.com

Company on the Move

CALIBRE is an employee-owned government information technology and management services firm headquartered in Alexandria, Virginia. CALIBRE’s transportation program is a reflection of company objectives to “Take Care of Our People”, “Manage Our Company” and “Be Good Citizens”. CALIBRE opened its Falls Church, Virginia office with 44 employees in 1989. Over the next seven years, the company added two offices in the Virginia area. By May of 2001, company management recognized the benefits of consolidating Metro Washington, DC area staff into one office and began searching for appropriately sized office space. To assist the company in selecting a highly accessible location, the company looked at where employees lived and estimated employee commute times. The company found that relocating corporate headquarters to the Alexandria/Springfield, Virginia area would equalize commute time.

In addition to equalizing commute time, the company wanted to relocate to an area better served by a variety of transit modes. The Metro Park area of Alexandria provides access to the Franconia-Springfield station, which serves both the DC Metrorail and Virginia Railway Express (VRE). The new facilities accommodated staff from the three Virginia offices and provided ample room for predicted growth.

Pulling the Pieces Together

Prior to relocating to the Alexandria/Springfield Area, a landlord-operated shuttle to and from the Pentagon, a major CALIBRE client, was the extent of the transportation benefits program. Today, CALIBRE’s transportation benefits program is flexible towards a variety of transportation modes. All CALIBRE employees in the National Capital Area are eligible to receive subsidized parking or participate in the Metrochek program. CALIBRE’s corporate headquarters employees may also receive parking cash out benefits. Metrochek, a transit program sponsored by WMATA, provides employees with vouchers from $65-$100 for approved transit costs. The
voucher can be applied to most forms of public transportation. The parking cash out program provides employees who opt out of their parking space and do not utilize transit, a subsidy of $65.00 a month. Cyclists and walkers can utilize the subsidy to defray the costs of commuting on bike or foot. CALIBRE employees who choose to carpool receive parking cash out of $32.50 a month. Additionally, employees outside the Metropolitan Washington Area may identify local transit programs for consideration in the Commuter Transit Benefits program.

In addition to transit, bike and walk subsidies and the parking cash out program, CALIBRE supports both flextime and telecommuting. As a high tech company, CALIBRE recognized that employees did not need to work from the office to be productive. In June of 2002, CALIBRE began a pilot program with TeleworkVA! a public and private partnership that promotes telecommuting. TeleworkVA! assisted CALIBRE by mapping out a telework policy plan highlighting how best to work with employees that telework. CALIBRE’s telework plan requires employees interested in telework to first gain support from their supervisor and then together, submit a telework application. Employees are required to set up a home office, send in a photo of the office, pass a safety check and attend telework training with their supervisor. The training focuses on communication expectations, offers suggestions on supervising from a distance, and provides tips on avoiding telecommuting pitfalls. To provide seamless phone access, CALIBRE upgraded their phone system to allow for a telework employee’s home phone to ring when their office number is dialed. The company reimburses employee expenses incurred from telecommuting and requires the employee to come into the office at least twice a week. Although supportive of the telework concept, the inter-connectedness and teamwork qualities of the CALIBRE culture necessitate the presence of employees at least twice a week.

Marketing the Program
Prior to hiring employees, CALIBRE invites the potential hire to an offer interview at which, a Vice President explains the CALIBRE culture and employee benefits, including telework, parking cash out and subsidized transit passes. Because of the offer interview, employees are aware of the transportation benefits before they accept the job. Once at CALIBRE, employees attend a new hire orientation where the transportation benefits program is reintroduced. In addition, information on the program is always available via the company’s intranet. This has proven to be an effective marketing and outreach strategy as more new employees take advantage of the program than existing employees.

The Benefits Coordinator at CALIBRE includes the transportation program and any upcoming regional events in the monthly employee newsletter. She works with the local rideshare agency to host transportation and telecommuting fairs at the office. The Benefits Coordinator has recognized that the motivation to try transit stems primarily from an employee’s experience and frustration with a long commute. Employees who first choose parking often decide commuting via Metro and commuter rail may be more time efficient and cost effective. Therefore, the program allows employees to switch from parking to subsidized transit at any time.

Results
CALIBRE evaluates the success of their program in a simple yet effective manner. As long as the number of transit users grows, the program is deemed successful. Upper management is concerned with stalling the parking demand issue as far into the future as possible. Continued growth in the transit pass and parking cash out programs assists CALIBRE in meeting this goal. If participation in the transportation benefits program decreases, management will re-evaluate the program’s effectiveness. At that time, a new program or a more aggressive parking management program may emerge.

After 2 years of program implementation, 2% of CALIBRE’s employee’s carpool, 12% utilize transit (bus, rail, subway) and 5% participate in the telework program. Although 81% of CALIBRE employees continue to drive alone, many of them utilize the nearby Metro to travel to and from work-related meetings and trips during the week.
Strategic Relocation

CH2M HILL is an employee owned, engineering, construction, and operations firm serving a variety of public and private clients throughout the world. CH2M HILL’s mission states, “We are a global project delivery company making technology work to help our clients build a better world.” Fulfilling this mission begins with CH2M HILL’s commitment to fostering healthy employees and leaving as light an environmental footprint as possible. An example of this commitment to the environment and employees is reflected in the firm’s transportation benefits program.

CH2M HILL has 165 offices throughout the world with both corporate headquarters and regional operations located in Denver, CO. Prior to 2002, CH2M HILL’s corporate and regional employees were scattered in four locations throughout Denver. CH2M HILL’s executive leadership team decided to relocate employees to one campus-style office park. Prior to choosing the location of the new corporate and regional Denver offices, the leadership team plotted where employees lived and made relocation decisions based upon accessibility. After careful consideration, CH2M HILL chose an area south of Denver, along the I-25 corridor. The Meridian International Business Center, located less than 20 miles south of Denver and 30 miles north of Colorado Springs, boasts easy access to multiple east-west and north-south highways. The campus is in a traditional suburban business park setting featuring ample parking and sparse bus service.

Roadway convenience and employee residential locations were not the only factors driving CH2M HILL to relocate to Meridian. In 2001, the Colorado Department of Transportation and the local Regional Transportation District (RTD) began to move forward with plans for a massive corridor-wide roadway expansion and light rail project. The corridor construction project, entitled Transportation Expansion or T-REX, included plans for a Denver light rail system with a station near CH2M HILL’s then-anticipated campus. The Leadership Team was keenly aware of the positive opportunities for increased mass transit use by the firm’s employees as a result of this new transportation infrastructure.

Corporate TDM: Telework and Flextime

At a corporate level CH2M HILL has established an aggressive Telework and Flextime program. CH2M HILL’s Telework Program Policy views telework as a “mutually beneficial work arrangement designed to attract and retain employees and reduce company costs.” Participation in the company’s telework program is based on job suitability, suitability of the employee’s skill sets, job performance and suitability of home work site. Employees must obtain supervisory approval to participate in the firm’s Telework Program. Once approved, employees are required to complete a two-hour telework training that covers IT and ergonomic aspects of teleworking. The teleworker is responsible for defining a safe and appropriate workplace using the tools provided by the company. CH2M HILL provides specific equipment and software tools and reimburses employees for appropriate office supplies and voice and data connectivity charges. While CH2M HILL is supportive of both full-time and part-time/occasional telework arrangements, only full-time teleworkers receive financial support. The company provides
in-house “hoteled offices” or carrels within the CH2M HILL office, which come equipped with phones, networking capabilities and office supplies. Employees who telework on a full-time basis can utilize these workstations if and when they are required to work from the office. CH2M HILL also recognizes the need to provide employees with work hour options.

**Regional Denver Office TDM: “Look Before You Leave”**

Because the culture within CH2M HILL leans toward decentralized decision-making, there is no corporate mandate to offer transportation benefits. There are offices, (such as the Seattle, Washington office), which are required by the state to provide transportation benefits. Despite the lack of such a mandate in Colorado, CH2M HILL’s Denver office initiated an innovative TDM program. As the company moved forward with office relocation plans, recruitment and retention were forefront in managers’ minds. Management recognized commute times would increase for a number of employees either by virtue of the office relocation or by the up-coming T-REX project. Either way, they did not want highly valued employees dissatisfied with working at CH2M HILL due to the impending traffic, congestion and construction. To complicate matters, transit service to the new campus was severely limited as was bike accessibility.

With support from management, an employee in the Denver office asked other co-workers to volunteer their time to assist CH2M HILL in addressing transportation related concerns. Soon the T-REX Tamers Transportation Team was formed with the intent of helping managers create new services and programs aimed at improving accessibility and mobility to, from and around office locations all of which were in the direct path of the T-REX project. Utilizing employee survey results, the T-REX Tamers were able to focus efforts down to the types of information and programs that employees would respond to the most. First, they chose a TDM program theme: “Look Before You Leave” which encourages employees to look at traffic conditions before leaving home and/or work. As employees began to “look before they left” they were presented with the information they needed to make intelligent transportation decisions, including the decision to not drive at that specific time.

The central feature of the program is a transportation Intranet featuring current traffic updates, planned closures, T-REX project information (closures, construction updates), links to Denver International Airport, subscription service to a traffic alert service provided by MyTrafficNews.com and driving directions using popular websites. Employees can also access links to Denver Metro’s transit provider (RTD), carpool and vanpool information and rideshare matching services, bike to work information and links to company telework and flextime policies. The Intranet also provides links to local businesses that provide pickup and delivery of dry cleaning, meal delivery and car maintenance services. Finally, the site offers information on learning and professional development opportunities. Employees faced with a congestion-filled commute can opt to stay and earn CH2M HILL professional development credits. A transportation fair was held to heighten awareness of the T-REX project and introduce the new tools and alternatives available to employees.

**Results**

CH2M HILL evaluates success through two main efforts. First, periodic surveys are provided to employees to learn more about travel modes and commuting concerns. Second, alternative mode users are encouraged to register with Teletrips, a web-based alternative mode data gathering resource. Employees who register with Teletrips receive a weekly e-mail survey requesting information about their commute and in return receive a aggregate report on the amount of pollution they reduced, number of drive-miles avoided and an estimate of time saved by teleworking, using the bus, carpooling or vanpooling. Additionally, CH2M HILL receives a company-wide profile, which generates air pollution credits through the e-Commute program. In 2002 alone, 81 Denver campus employees reported the following results: 115,130 miles saved, 3,689 hours saved, 61,325 lbs. of carbon dioxide saved and 3,497 lbs. of carbon monoxide not created.

CH2M HILL has been successful at getting 17% of its employees out of single occupant vehicles. A little more than 8% of employees take advantage of CH2M HILL’s Telework and Flextime programs; 5% carpool; 3% take transit and .5% bike commute. Given CH2M HILL’s remote location, lack of bus service and the on-going construction project, a 17% mode shift is a solid start. Furthermore, the light rail segment of the T-REX project includes a stop near the Meridian International Business Center. CH2M HILL provides solid stepping-stones to assist in further employee transit usage.
Georgia Power Company - Atlanta, GA

Summer Olympics + Increased Parking Demand + Poor Air Quality = New Commuter Benefits

Georgia Power, an investor owned utility that serves customers across the state, boasts office locations throughout the State of Georgia. 5,500 of the approximately 8,800 Georgia power employees are located in the greater Atlanta metro region. Executives at Georgia Power were concerned that there was not enough parking at the downtown Atlanta Georgia Power Headquarters location. As such, in 1994 they decided to provide the commuter benefits to downtown employees. The commute options program, titled SmartRide, included subsidies for Metropolitan Atlanta Rapid Transit Authority (MARTA) transit tokens. Initially, the SmartRide program was only available at the downtown Georgia Power facility but eventually expanded to other regional offices.

With the upcoming 1996 summer Centennial Olympic Games in Atlanta, employers throughout the greater Atlanta region were concerned with the impact the Games would have on traffic congestion and employee accessibility to the workplace. Additionally, in 1996 Georgia Power was consolidating two downtown offices into one building. Given these two pressures, executives at Georgia Power opted to increase the types of transportation programs offered. Unfortunately, in 1997 the consolidated downtown building experienced serious parking problems. Georgia Power also responded to pressure from the 1998 Voluntary Ozone Action Program, which encouraged state agencies and major corporations to reduce vehicle miles traveled by 20%. To reduce demand for employee parking and assist in reducing Atlanta’s worsening traffic congestion and air pollution, Georgia Power redesigned their SmartRide program.

Vanpool Becomes Mode of Choice

In 1998 Georgia Power extended their SmartRide program from a downtown focused transit subsidy program to an extensive regional commute options program. The program featured company sponsored vanpools, fleet vehicles, free MARTA passes, telework, flextime, alternative work locations, free and preferential parking for vanpools and first come first serve preferential parking for carpools. Of the commute options benefits offered, the company sponsored vanpool is the most popular among employees.

As of summer 2003, approximately Georgia Power supports over 50 vanpools involving over 500 employees. Fifty percent of vanpools travel to the downtown headquarters office and fifty percent travel to regional offices. The vanpool program is offered to all employees, including temporary contract employees. Currently, the longest vanpool trip documented is 160 miles round trip from Rome, Georgia to a North Atlanta metro regional office.

Fleet vehicles are available to employees who use alternative transportation to get to work. This is an important transportation strategy the company offers because employees do not feel “trapped” in the office once they carpool, vanpool or use transit.
**Additional Program Details**

Fleet vehicles are available to employees who use alternative transportation to get to work. This is an important transportation strategy the company offers because employees do not feel “trapped” in the office once they carpool, vanpool or use transit. Employees are allowed use of a fleet vehicle to run errands or go to meetings during the work day. Keeping with its desire to be good environmental citizens, the Georgia Power vehicles are either powered by electricity or ethanol.

To keep track of employee usage of transportation options, an internal alternative mode tracking system was developed for Georgia Power. Also called SmartRide, the software provides employees with a web-based reporting portal that offers a user friendly way to track carpool, vanpool and transit use. Separate internal timekeeping software is used to report when employees telework, work at an alternative location, or work an alternate schedule.

Georgia Power participates in the Guaranteed Ride Home (GRH) funded by Commute Connections, the regional rideshare agency. Employees who use alternative transportation have access to a free ride home in case of an emergency or unplanned overtimes. If there are any overages in the program, Georgia Power supplements the program.

In previous years, the program was highly marketed through e-mail, and messages on televisions monitors around the downtown campus. Employees received information from management and letters from the CEO that encouraged individual travel behavior changes. Additional program marketing and outreach was done in conjunction with the smog alerts season which initially lasted from May to October but eventually became a year round event. Given budget cuts, Georgia Power currently markets the transportation program through human resource orientations, word of mouth and occasional e-mail messaging. Georgia Power attempts to increase awareness of the transportation benefits program during smog alert season but to a much more limited extent.

**Measuring Success**

The main goal of the commuter options program is to get as many cars off the roads as possible. Georgia Power has been successful in accomplishing this goal as the company boasts over 1.2 million VMT reduced each month. Even with a downturn in staff, participation in the programs has been steady with 13% of employees carpooling or vanpooling, 15% working compressed or flex time schedules, 5% using transit while another 5% telework.

The success of this program is also measured by employee reaction. Employees recognize this as a good benefit and management sees it as a recruitment and retention tool. Georgia Power’s efforts have been recognized with a host of awards from local, regional and national organizations since 1997. As recipients of the 2001 Clean Air Campaign’s HOViE Award, Georgia Power’s program was acknowledged for encouraging the use of HOV lanes through carpooling, vanpooling and/or alternative fuel vehicles. The company has also been honored as a designated US EPA Best Workplace for Commuters, and was awarded the 1999 Outstanding in the Field Award from the Southeastern Association for Commuter Transportation.
Hennepin County - MN

**FAST FACTS ABOUT:** Hennepin County - MN

| Types of TDM: | Modal Shift, Location Shift |
| Keywords: | Transit subsidy, Pre-Tax benefits, Legislation |
| Employer Demographics: | Hennepin County, Minnesota, has 130 offices and facilities dispersed throughout the county with differing levels of transit service at each site. About 10,000 County employees are located in downtown Minneapolis and are well served by transit. |
| Results: | Estimated 60% drive alone, 15% carpool, 2% vanpool, 15% bus, 3% telework, 5% flextime |
| Cost: | $559,000 bus subsidy + $14,000 vanpool, parking and administration costs = $573,000 - $109,000 FICA Savings = Total Cost: $464,000. |
| Staff: | Minimal staff time and staff costs once program was set up. |
| Contact: | Mike Bastyr, Sr. Human Resources Representative, 612-348-4640 |

**Local and Federal Legislation and Policy Impacts**

Since 1960 the City of Minneapolis’s growth management policies concentrated office and retail use in a downtown core and limited parking to areas just outside the core. These policies have resulted in high bus service and ridership in the downtown core, where most of Hennepin County’s employees work.

Like many other US cities, Minneapolis is recently experiencing a resurgence in downtown growth and development. As Minneapolis’s downtown core continues to grow, city and county officials have become concerned about increasing congestion and decreasing air quality.

In 1999 Minneapolis expanded the smart growth policy in their City Comprehensive Plan to include more emphasis on transit. Per the plan, “Minneapolis will follow a policy of ‘Transit First’ in order to build a more balanced transportation system than the current one.”

In addition to the local “Transit First” policy, federal legislation passed in 1999 encouraged employers throughout the United States to reevaluate their transportation benefits programs. Internal Revenue Code Section 132 (f), allows employees to exclude certain transportation fringe benefits from gross income. In 1998, these pre-tax fringe benefits were limited to $65.00/month for transit or vanpool and $175.00/month for qualified parking. In 2000, the benefit limits were increased to $100/ month for transit or vanpool and $195.00/month for qualified parking.

The convergence of local policy and federal legislation provided the impetus for Hennepin County to reevaluate its 20-year old bus pass program.

**Pre-Tax and Creative Use of Savings**

Hennepin County’s pre-tax transit pass program, available to all 13,000 employees, immediately increased transit usage by 400-500 employees spread throughout the County’s dispersed offices.

Soon after Hennepin County’s introduction of the pre-tax transit program, MetroTransit, introduced a metro pass. Although employees voiced interest in the metro pass, the cost was too high for Hennepin County. Instead, in 2000, the County enhanced the transit pass program by providing a 40% discount on transit pass purchases. The combined subsidy and pre-tax status of the transit pass reduced costs for the employee. Transit purchases increased to over 1,900 by January 2003.
As an employer, the pre-tax bus and parking program saved the County money on FICA payments. The County decided to filter the FICA savings back to offset the subsidy program. Doing so defrays 30% of the cost to provide the subsidy. From June 2000 through January 2003, the subsidy, less the FICA savings, totaled $666,464.

**Results and Challenges**

Due to the high level of bus service in the downtown core, Hennepin County’s marketing and outreach is focused on encouraging bus ridership. The combination of subsidies and pre-tax incentives captured the attention of employees and increased bus ridership by almost 900 employees in one year. Success for Hennepin County is measured by increased participation in the transit subsidy program. Since the changes in the program, SOV rate has reduced to approximately 60% with an estimated 15% of employees carpooling, 2% vanpooling, 3% teleworking, 5% using flextime and 15% utilizing transit.

Despite the initial success of the transit subsidy/pre-tax incentive program, employees complained about the confusing pre-tax parking process. As the pre-tax parking benefits operate differently than the popular and familiar flexible spending accounts, employees became frustrated.

Hennepin County’s Benefits Unit kept an open-door policy and sought and responded to feedback on a regular basis. County newsletter articles and e-mail announcements were used to both inform and clarify the program to employees.

One employee responded to a newsletter article with an e-mail stating, “Pre-tax parking is confusing and stupid.” That quote was used as the title for an employee mailing that explained changes that made the program easier for employees to use. Feedback loops and consistent updates increase the appeal to employees, and therefore participation.

The local MetroTransit group recognized Hennepin County’s innovative funding model with a transportation benefits program award.
1987-1990s: The Early Years of the Transportation Program

In 1987 Johns Manville, a leading manufacturer and marketer of premium-quality building and specialty products, moved from a spacious location in the Foothills outside of Denver, Colorado to a transit-convenient location in downtown Denver. Despite the expense, management guaranteed employees free parking for the first five years at the new location. For employees that did not want to drive, the company paid all but the taxes on either a monthly transit pass or up to four coupon books of transit tickets. Employees opting for the monthly pass could choose between purchasing a subsidized Local, Regional and Express bus pass. The individual employee’s commute lengths determined the type of pass they preferred.

Johns Manville extended their parking subsidy after five years and continued to pay 100% of parking costs for employees until 1998. On October 1, 1998, Johns Manville capped the employer paid parking expense at $110 per month. Employees had the option of parking on the roof for no extra expense or parking under cover for an additional $15.00 per month. For those who chose covered parking, the additional $15.00 per month was deducted through payroll at $7.50 per pay period. Both rooftop and covered parking costs increased through the next four years. Effective March 1, 2002, rooftop parking increased to $131.30 and covered to $146.40. Current lease requirements include a 1% increase in parking costs per year, which Johns Manville passes down to employees. Currently, Johns Manville continues to subsidize all parking at $110.00 a month.

Pre-Tax Benefits and Light Rail

A provision amended by the Transportation Equity Act for the 21st Century increased the limits for public transit to $65 dollars per month (Federal, tax free) in January of 2000. The allowed pre-tax amount exceeded the cost to ride the bus and therefore, the employee was no longer taxed as part of the program. This legislation encouraged Johns Manville to reevaluate their transportation benefits program. Cost-effectiveness and bottom line good business sense became the main motivations for Johns Manville.

In 1994, Denver welcomed its first light rail line which included a stop in front of Johns Manville’s Denver office. The opening of the rail line attracted additional employees to transit. It became cost effective for Johns Manville to purchase the local annual employee bus pass, the Eco Pass, when over 30% of employees started riding light rail and transit.
passes for 30% of employees became far more expensive than purchasing the Eco Pass for all employees. Additionally, upper management recognized the financial benefits of providing an Eco Pass program for employees as annual parking costs were significantly reduced as the number of employees choosing light rail and transit increased.

In 2000, Johns Manville worked with the local transit district, RTD, to provide the Eco Pass to all employees. The company received a variety of incentives and “first-time-Eco Pass” subsidies that further convinced upper management to expand the transit program. Despite the short-term incentives, the company recognizes the need to provide choices to employees and is committed to providing the Eco Pass as long as the benefit is cost-effective when compared to parking. Johns Manville pays 100% of the Eco Pass cost.

Employee Choice

Due to the fact that Johns Manville subsidizes each parking space they require employees to choose between a parking space and the Eco Pass, employees cannot have both. Given the “either-or” policy, Johns Manville recognized the need to provide flexibility within the program. Therefore, employees are free to try one form of commuting for a short term in order to make the best decision between driving and utilizing transit. Additionally, all employees that chose an Eco Pass are eligible to participate in the Guaranteed Ride Home Program and can receive up to 12 free parking days a year. Finally, Johns Manville’s transportation program also provides $110/month in vanpool subsidies for interested employees. Given the close proximity to transit and rail, only two employees currently participate in a vanpool program.

Results

Since 2000, when the Eco Pass program started, Johns Manville’s transportation benefits program has resulted in the following mode split: 55% drive alone, 44% bus/rail, .5% vanpool, .5% walk.
Nike Bucks

The Nike Corporation has a history of supporting alternative mode usage through the creation of aggressive employee transportation benefits. In 1991, when upper management decided to relocate Nike’s World Headquarters (WHQ) to a suburb outside of Portland, Oregon, they recognized the opportunity to save money by building fewer parking spaces and promoting carpool, vanpool and the overall use of alternative modes. In 1992 when Nike moved its WHQ to Beaverton, Oregon they introduced the incentive based Nike Bucks program. Alternative mode users could choose between receiving $1.00 a day in a Nike Buck voucher or a $21.00 bus pass subsidy. The Nike Buck vouchers could be used at on-site cafeterias, shops and Nike stores. The Nike Bucks program was initially only available to employees housed at the new WHQ, but due to its popularity, the program was expanded to include Nike’s Portland area retail stores and Portland’s Niketown. Ensuring employees outside the WHQ were indeed utilizing alternative modes became more and more difficult. By 1996, management began to question the overall effectiveness of the program as it became more difficult to manage and monitor.

1996: Mandates, Economics and Reevaluating Programs

At the same time Nike management began to reevaluate the Nike Bucks program, the State of Oregon’s Department of Environmental Quality (DEQ) established a commute trip reduction mandate (titled the Employee Commute Options program or ECO) aimed at employers in the Portland area with more than 50 employees reporting to a single work site. Beginning in 1996, affected employers were required to provide incentives and programs for employee use of alternative commute options. Employers were now required to reduce single-occupancy vehicle commuting by 10 percent over three years. As 5,000 employees reported daily to Nike’s WHQ in Beaverton, Nike was affected by the new mandate. By the time the mandate became law, Nike had been working on reducing SOV commuting for three years. After consultation with the DEQ, Nike was given permission to utilize their 1992 levels of SOV usage for base line data purposes.

Layered upon the growing difficulty of monitoring the Nike Buck program and the new local mandate was the 1996 Asian economic downturn’s impact on Nike. The Asian economic downturn resulted in huge layoffs at Nike as well as a corporate-wide reevaluation of every Nike program. As such, management questioned whether or not the hard to track $250,000 a year Nike Buck price tag was the best way to encourage alternative mode usage.

A New Program

With upper management’s support, Nike’s Employee Transportation Coordinator (ETC) gathered employees from various departments to create a new, cost-effective and easy to manage transportation benefits program. With management’s support, they decided to retain an incentive based program but to alter the incentive to a...
large quarterly drawing with smaller monthly drawing. At first employees that participated in the Nike Bucks program were resistant to changes and the alternative mode usage decreased when the new prize-oriented program was implemented. The ETC marketed the program through a transportation fair, newsletters, flyers and posters and soon, interest in the prizes and utilizing alternative modes increased. The ETC and employee planning group named the new program TRAC.

In addition to the prize incentives, Nike also developed transit subsidies and carpool incentives. Since 1996, all WHQ employees have been eligible to receive a transit pass for the local bus and light rail system. Nike subsidizes the cost of an annual bus/rail pass by 72% and the WHQ are well served by both bus and light rail service. To encourage rail usage, Nike sponsors a shuttle to transport employees to and from the light rail station, which is located about 1/2 mile from the WHQ campus. All bus pass holders are eligible to participate in the Guaranteed Ride Home (GRH) program, which is administered by the local transit authority, TriMet. The ETC promotes carpooling through the use of an in-house rideshare matching list and the presence of preferential carpool parking. Nike also supports a flextime policy allowing employees to work with their supervisors to determine the best schedule most appropriate for them and their workload.

**Commuting by Bike and Building Amenities**

Nike’s ETC provides a variety of services for bike commuters, and interested bike commuters. Upon request, the ETC will work with employees to map out the safest bike route, provide regional and local bike resources and information to assist with their commutes, and promote bike specific events to all employees. Nike has two fitness centers for employee use and bike commuters can easily access the showers and locker room. Nike also provides bike racks scattered around the campus and bike cages in the fitness center area. Furthermore, employees are allowed to bring bikes into the building and store them in their offices. Bike commuters are eligible to participate in the monthly and quarterly drawings.

In addition to the two fitness centers, Nike’s WHQ features a variety of on-site amenities designed to limit SOV and vehicle usage during the workday. Nike employees can access quality childcare at one of the two on-campus childcare centers. Employees that need childcare for only a short time can utilize the Nike Tykes drop off program when regular care is unavailable. Nike’s WHQ campus also features two sundry stores, dry cleaning service, beauty salon, an ATM and on-site movie ticket sales.

**Goals and Evaluation**

Nike’s extensive transportation benefits program and the presence of a variety of on-site building amenities stems from the company’s commitment to environmental leadership and sustainable practices. Although Nike is affected by local commute mandates, their commitment to promoting alternative mode usage existed prior to the mandates. Today, Nike’s goals revolve around the ECO mandate, which includes reporting progress towards meeting the specific mandate goals every two years. Additionally, Nike tracks awareness of and participation in the TRAC program through a newly developed in-house technology. This new technology allows alternative mode users to report their commute mode on a weekly basis. The ETC can utilize information garnered from the employees for both evaluation and targeted marketing. Additionally, the employees are automatically entered into drawings each time they register their commute modes.

**Results**

Nike’s SOV rate in 1992 was 98%. Since moving the WHQ’s and implementing the Nike Buck and TRAC programs, Nike’s SOV rate has reduced to 78%. 10% of employees carpool, 2% bike, 5% use bus and rail and 5% use flextime. Employees provide the ETC with feedback and ideas for program improvement and the ETC is given flexibility from upper management to make appropriate changes when necessary. Nike’s ETC is actively involved with the local TMA and is on the MPOs TDM subcommittee. Nike’s transportation programs have resulted in numerous recognitions and awards including recognition as a “Best Workplace for Commuters” by the EPA.

Community Driven

The Overlake Christian Church broke ground in 1968 with a handful of members and even fewer employees. By the mid-1990’s, its growth resulted in the need for a new, larger church. Church leaders selected a 27-acre site in Redmond, Washington and oversaw the construction of the 250,000 sq. ft. campus located minutes from Microsoft. The Overlake Christian Church (OCC) development included the construction of a parking lot necessary to accommodate the 2,000 plus vehicles for attendees and employees. In November 1996, OCC opened the doors to its new campus for 3,500 plus attendees and 109 employees.

OCC was driven to provide commute benefits to employees by the desire to set an example to other employers and the opportunity to be a role model in the community.

With assistance from the Greater Redmond Transportation Management Association (GRTMA), the OCC chose to voluntarily comply with Washington State’s Commute Trip Reduction (CTR) law. The CTR law requires that all employers with more than 100 employees traveling to work during peak morning times provide commute alternative programs. These programs must reduce the number of single-occupancy-vehicles (SOV) on the roadway during the busy morning commute. Though over 100 employees worked at OCC, not all traveled to and from work during the peak morning commute times. Nonetheless, OCC was driven to provide commute benefits to employees by the desire to set an example to other employers and the opportunity to be a role model in the community.

Carpool and Take Time Off

OCC is located in an area of Redmond that receives minimal transit service. This, combined with the availability of ample free parking, led OCC to develop a carpool-oriented transportation program. Upper management supported the program by providing opportunities for creativity and innovation. They also set aside funds and assigned transportation benefits program management responsibilities to a staff member. As such, the Human Resource Director and the Employee Transportation Coordinator (ETC) developed an incentive based program.

In 2001, OCC unveiled its unique and award-winning transportation benefits program. Utilizing the GRTMAs rideshare matching software, OCC provides internal rideshare matching services to connect employees with one another. Employees that choose to carpool on a regular basis can earn up to 16 hours of paid time off.
a year for carpooling. Time is earned on a quarterly basis and is based on the number of days per week an employee commutes using an alternative commute mode. As a further benefit, carpoolers receive the best parking spaces at OCC.

Recognizing carpooling isn’t for everyone, the program also provides a $20.00 a month transit and ferry pass incentive. OCC has set up a telework program, supports flextime and alternative work schedules and provides bike racks, showers and covered bike parking for cyclists.

Marketing, Partners and Results
The ETC utilized a thorough marketing campaign to educate employees about the new program. Presentations to new and existing employees throughout the year, as well as a transportation benefits program piece on the OCC Intranet ensure all employees are informed of the program. The transportation program is also shared at OCC’s regular chapel meetings and all-staff lunches and via email notification.

OCC partners with the GRTMA to leverage marketing and outreach materials produced by them for employers throughout the Redmond area. GRTMA also sponsors multiple regional events throughout the year, including Bike to Work day and other alternative commuting campaigns. The ETC works diligently to ensure OCC’s employees are aware of and involved in the various local, regional and state campaigns, events and activities.

Despite the presence of free and ample parking and the low level of bus service, Overlake Christian Church has created a successful model transportation benefits program. From 2001-2003, Overlake Christian Church’s program has reduced SOV travel by employees from 84% to 52%. 31% of employees participate in the program, 26% carpool, 12% utilize flextime, 8% telework, 1% use transit and 1% bike to work.

Overlake Christian Church has won numerous awards including the Diamond Award from Commuter Challenge (the local employer commute assistance program), the City of Redmond’s Commute Trip Reduction Program Award and recently the Washington State Governor’s Commute Smart Award.
Student Meetings at the Parking Garage

Simmons College is a small, nationally recognized, private university located in the Longwood/Fenway neighborhood of Boston. Surrounded by a variety of universities, cultural institutions and medical facilities, Simmons College is well served by the Massachusetts Bay Transportation Authority's (MBTA) transit and subway service, otherwise known as “the T”. Though parking is limited in the area, Simmons College attempted to stand by a “low-cost-parking-for-all-faculty-and-staff” policy.

Most of Simmons’ 740 faculty and staff prefer to drive to work, park in the Simmons owned lot and come and go at their leisure. In an effort to maintain popular parking benefits, Simmons College provided faculty and staff a parking spot on request. A year of parking cost employees a mere $200, far below the cost of utilizing transit or the nearby subway. As parking demand grew, the College recognized the need to change their parking policy. Yet, limiting parking or raising rates were not options under consideration.

In 1998, as parking demand increased, the parking situation became critical. Staff and faculty often waited in the parking garage entrance for a half hour before getting a space. Faculty began scheduling student meetings in the garage while they waited. Others used cell phones and laptops to remotely work from their vehicles. Frustration escalated and college leadership began to fear losing employees. As the situation worsened, the Director of Auxiliary Services researched similar problems and uncovered possible solutions. The research pointed to the economic reality that given a fixed supply of parking, demand could be influenced by changing price. By raising the cost of parking while simultaneously increasing the attractiveness of transit, travel behavior could be changed and the parking crises could be quelled. Yet, upper management remained opposed to increasing parking costs.

Incentives and Disincentives

In 1998 leadership at the college changed and support for a parking management program grew. The Director of Auxiliary Services met with the new Executive Management staff and demonstrated that the parking crisis could not be solved without raising rates and supporting alternative modes. The College began to slowly increase the cost to park and also introduced a 25% transit subsidy, or T-Pass. Unfortunately, these techniques did not change travel behavior. The transit subsidy appealed to existing transit users and the parking increase was not enough to discourage parking. Over the next five years the College continued to both increase parking costs and transit subsidies. Eventually they got to a price point where transit was more appealing. Today, faculty and staff are eligible for a 60% T-subsidy (up to $65.00 a month) and parking has increased from $200 a year to $1200 a year.
Program Goals:
Two main goals drive the Simmons College transportation benefits program. First, Simmons leadership is committed to reducing vehicle miles traveled. Few parking structures exist in the Longwood/Fenway neighborhood and the large medical center presence results in the need for ample patient and visitor parking. Furthermore, the City of Boston’s strict parking development requirements inhibit future growth in parking. Therefore, Simmons College and other nearby institutions have made a community commitment to each do their part in reducing vehicle miles traveled and manage parking well.

Second, Simmons College strives to be a good employer by providing a wide array of employee benefits. The transportation benefits program compliments other employee benefits and promotes the College’s commitment to employees. All new employees are introduced to the employee transportation benefits and the transportation coordinator sends out newsletters and bulletins reminding employees of their transportation options. Employees can opt for the T-subsidy at anytime.

Program Details:
Faculty and staff of Simmons College must choose between paying for a parking space or receiving the T-Pass. Simmons College provides a 60% Subsidy for all MBTA transit passes, with a limit of $65.00 a month. This provides plenty of support for most of MBTA’s pass programs and only those with commutes from New Hampshire accrue out of pocket costs. If faculty and staff opt to drive to work, they can pay $1200/year for a parking space in the faculty/staff parking garage.

All T-pass holders, carpoolers and cyclists are eligible to participate in one of two Guaranteed Ride Home programs. As part of the transportation benefits program, Simmons created their own Guaranteed Ride Home (GRH) program. The Simmons program is open to any employee in need of an emergency ride home. Additionally, due to a partnership with the local transportation organization, MASCO Commuter Works, a second GRH program is included in the benefits program. Though rarely utilized, the MASCO Commute Works GRH provides an added resource to commuters. In addition to the GRH programs, Simmons College provides 15 free-park day vouchers for T-Pass holders. Many faculty and staff take advantage of educational benefits and/or teach night classes. The vouchers allow employees to drive on those days, park and get home safely.

Additionally, as a member of the local TMA, MASCO Commute Works, Simmons College faculty, staff and students can utilize Commute Works’ shuttle system. The shuttle system features six shuttles serving the Longwood/Fenway area, Cambridge, Chestnut Hill, University of Massachusetts and other destinations. Simmons College pays 60% of the shuttle pass for staff and faculty. Two shuttles transport commuters to and from the Ruggles and JFK T-stops. These shuttles are fully supported by MASCO Commute Works and are free to all riders.

The hiring of a professional parking management company rounds out Simmons College transportation program. During the first week of classes, on graduation day and on other days throughout the school year, Simmons College experiences peak period parking issues. The parking management company manages parking during these peak periods by providing valet parking and other parking services. Additionally, the company limited parking in the parking garage to faculty and staff. The surface parking lots became student parking lots. Frequent in and out student trips are easier to manage on a surface lot. The parking management company works closely with Simmons College and neighboring institutions to minimize parking problems.

Results
Simmons College utilizes two tools to evaluate the success of their program. As the transportation coordinator works with the parking management company to track the parking demand. The ability to manage the lot and keep up with demand is a key indicator of success. To date, they have had far fewer parking problems and the demand has reduced by 20% over the last five years. The transportation coordinator also includes a few parking and transportation related question in the annual employee satisfaction survey. Negative comments regarding the T-Pass program rarely appear on the surveys, implying the program is working. The coordinator is open to feedback and constructive criticism about the T-Pass program. The transportation benefits program has significantly reduced drive-alone parkers at Simmons College. Today, 41% of faculty and staff park on campus, 27% use transit and the remainder carpool, walk or ride their bike to work. Although no one currently uses vanpool, the transportation coordinator is open to supporting any non-single occupancy vehicle mode usage with the 60% subsidy (up to $65.00 a month).
Benefits Before and After State Mandate

Swedish Medical Center, in Seattle, WA, is comprised of three separate campuses spread throughout the greater Seattle area. Swedish’s 7,000 employees and 2,000 physicians are accustomed to the irregular work shifts and on-call realities of hospital work. Despite the challenges inherent in scheduling and transportation, Swedish has supported transportation benefits since the 1980’s. Carpools with three or more Swedish staff received free parking at the Swedish campus and those with two or more received a 50% parking subsidy. Employees were also eligible for a 25% transit pass subsidy. In 1986, Swedish Hospital’s growth resulted in the need for a new building. At the time, the City of Seattle began to require all new construction and development plans whose fulfillment would result in adverse effects on traffic and mobility to include a transportation management program (TMP). The TMP included traffic and mobility mitigation plans as well as reporting requirements and schedules. In 1986, Swedish chose to focus their TMP and therefore, transportation benefits, on carpool and transit benefits. Swedish continued to provide free parking for vanpools, subsidized carpool parking and they extended the transit subsidy to 50%.

In 1991, Washington State passed the Commute Trip Reduction (CTR) law. The CTR law requires employers with more than 100 employees traveling to work during peak morning times to provide commute alternative programs. These programs must reduce the number of single-occupancy-vehicles (SOV) on the roadway during morning commute times. Thus, since 1991, Swedish has been required to develop programs that encourage employees to utilize alternative, non-SOV modes of transportation for their commutes.

Motivation and Program Details

In addition to adherence to the CTR law, Swedish views their transportation benefits program as a recruitment and retention tool. Hospitals all over the country are experiencing nursing shortages and Swedish strives to be an employer of choice. Given these motivations, Swedish worked with the local rideshare and transit organization, to develop and implement a variety of incentives and disincentives to driving alone. Through the leadership of Swedish’s Employer Transportation Coordinator (ETC), Swedish expanded the initial program to one that provides extensive transit, ferry and rail subsidies, preferential parking and vanpool subsidies.
Swedish tailors its transportation benefits for each of the three campuses and for night and day shift employees. All day and evening shift employees at each campus are eligible to receive a fully subsidized area transit and rail pass, called a Flexpass, or a Washington State Ferry pass. The Flexpass can be used on each of three adjoining county transit systems, the regional transit system, regional commuter rail and the soon-to-be-built monorail.

All employees with a Flexpass are eligible to participate in a county-sponsored vanpool program. Each of the three adjoining counties, King, Pierce and Snohomish, operates an extensive vanpool program. Swedish provides a $63.00 a month vanpool subsidy for all employees. Given that most vanpools do not exceed a cost of $63.00 a month, the vanpool subsidy is often 100% for employees. All alternative mode users who receive their Flexpass are eligible for the Guaranteed Ride Home (GRH) program that includes 16 free taxi-rides home a year. Additionally, all Swedish employees that work a 12-hour shift are eligible to participate in a unique taxi service Swedish provides. Every weekday between 6:00-7:00pm, employees with a Flexpass can take a taxi to specific park-&-ride. The taxi service is an extra bonus designed to assist employees achieve a quick and easy commute home after a long, over-time shift.

Parking

Bus service and parking availability is different at each of the three campuses. The First Hill campus features fewer parking spaces and higher levels of transit service than either the Ballard or Providence location. Thus, the First Hill campus has limited all day shift SOV parking to upper management since July 1990. SOV parking costs $70/month; carpool parking is $12.50 per person per month and vanpools park free. Both carpools and vanpools receive access to the best parking spaces at the First Hill campus. Given the need for flexibility and the on-call realities of hospital work, carpool and vanpool passengers receive four free SOV parking days a month. Night shift employees at First Hill receive free parking but are not eligible for a Flexpass. Instead, night shift employees are eligible to receive a WA State Ferry pass and/or a dollar value Puget Pass that covers their specific commute. The Puget Pass can be used on all local and regional transit but is not valid for use on the ferries.

Neither the Providence nor Ballard campuses receive high levels of bus service. Additionally, parking is more plentiful at each campus. Therefore, Swedish charges SOV’s $60 a month and carpools $12.50 per person per month to park at the Providence Campus. Parking at the Ballard campus, the smallest of the three campuses, is $30 a month for SOV parking and free for carpoolers.

Role Modeling and Marketing

When the ETC was asked to take on full-time transportation benefits and CTR reporting responsibilities, she responded by relinquishing her SOV commute. Since then, she has tried most of the commute alternatives Swedish provides and is able to use her own experience and understanding of the process of commuting via vanpool, carpool and/or transit to encourage employees to at least give it a try. To market the program, the ETC sends out a fact sheet with bus route information, parking requirements and costs, and Flexpass, carpool and vanpool benefits to each employee when they are hired. This fact sheet is delivered to the employee’s home along with two free transit passes to encourage transit usage on their first day of work. Additionally, the ETC utilizes the intranet, employee newsletters and new employee orientations to market the various program elements. Swedish’s intranet includes information about local merchant discounts for Flexpass holders, all transit, rail and ferry schedules and services, adverse weather notices, links to the regional Rideshare organization and parking pricing information.

Results

Swedish Medical Center strives to be a best workplace, recruit and retain high quality nurses, doctors and hospital staff and abide by the local and state mandates. Their efforts have resulted in the following modal splits:

Recruitment and Retention

Located just southwest of Houston, Texas in the Texas Medical Center, Texas Children’s Hospital (TCH) is the largest pediatric hospital in the United States. A full-care pediatric hospital, the hospital’s medical staff consists of more than 1,580 primary-care physicians, pediatric subspecialists, pediatric surgical subspecialists and dentists. In addition, Texas Children’s boasts a nursing and support staff of more than 6,000. TCH’s mission “to create a community of healthy children” is leveraged by the CEO’s commitment to assist employees balance work and home life.

Given the nursing shortage and limited supply of high quality doctors, recruiting and retaining top notch employees became difficult for TCH. Therefore, in an effort to increase TCH’s recruitment and retention, the CEO convened a focus group in 2001. Vice Presidents and Directors of various departments participated in a brainstorming session and discussed ideas on how TCH can continue to function as a “world class” facility and attract and keep top notch employees.

Brainstormed ideas included providing free uniforms to staff, offering $2,500 per year tuition subsidy, and instituting free parking, bus passes and carpool allowances. All of the ideas were implemented at the cost of $5.7 million for the first year. Highlighted among the benefits was the flexible employee transportation benefits program.

Flexibility is Key

Recognizing the changing needs and schedules of hospital employees, TCH’s upper management is committed to providing flexible employee transportation benefits. Among the many benefits Texas Children’s offers are transit subsidies, rideshare matching, vanpool subsidies, parking management programs, pre-tax benefits, bike/walk incentives, a telework program, flexible work schedules, a Guaranteed Ride Home program, and shuttle service. Most of the programs are flexible from month to month and all employees are eligible to participate. Due to the CEO’s emphasis on home and work life, he wanted to make sure the program maintained an “ease of use” with the program. Employees feel like they own the program because they can pick and chose which options are best for them at different times. For example, in the summer months, more employees use alternative transportation modes. These employees are eligible to receive transportation benefits strictly for the summer months.

Incentives for Options

Management believed the presence of a subsidy would increase participation in the transportation benefits program.

Previous to the 2001 brainstorming session, the hospital subsidized transit subsidies at less than 15%. After the brainstorming session, both the number of transportation options supported by TCH and the amount of subsidies provided increased. Management believed the presence of a subsidy would increase participation in the transportation benefits program. The table below summarizes TCH’s program options and corresponding subsidies. Subsidy ranges shown are based on employee commute distance and cover 100% of vanpool and METRO transit costs.
### Commute Option

<td>Carpool Allowance</td>
<td>$20/ month</td>
</tr>
</tbody>
</table>

### “Free Rides”

While not heavily marketed, when the commute options program is advertised the messages are simple, “Free Rides” or “Manage your home and work life”. Information about the program is given to new hires during orientation along with free one-day passes from METRO. Enrollment forms and information about the programs can be found on TCH’s intranet. Additional commuter option information is published in the company newsletters and are placed on bulletin boards in general employee areas. TCH also works with Commute Solutions, the regional commute alternatives program, to help get the word out to employees. Commute Solutions offers brochures, training and a telework program to TCH employees.

TCH has been challenged by the “it’s too good to be true” employee mentality. Often, employees do not believe that these programs are free. They are looking for a catch or think this is a one time only subsidy. Once TCH management is able to clearly explain the transportation benefits program, employees are hooked.

### Make the Employees Happy

The program at TCH does not have set quantifiable goals to measure success. Success of this program is based on employee reaction. Management does not “worry” about the program unless there are negative reactions to it, which has not occurred to date. TCH management strives to ensure employees are provided with as many available commuter options and that the program remains flexible and open ended. Surveys about the TCH benefits package are performed regularly. The results of the survey are compiled and given to the Vice President of the institution on a monthly basis.

Currently, survey results show 20% of TCH employees participate in the commute options program. Of that population, approximately 10% carpool or vanpool, and 10% ride transit.

In addition to changing employee travel behavior, the employee benefits program has contributed to improving TCH’s recruitment and retention numbers. Before program implementation, the population at TCH was 3,700. After implementation, with the addition of 1.2 million square feet to the facility, an additional 1,800 persons were hired. TCH’s management praises the transportation benefits program and the other employee benefits (free uniforms, tuition) as an important recruitment and retention tool.
Area Characteristics
The City of Seattle, King County, Sound Transit, University of Washington, surrounding jurisdictions and private developers have committed to trip reduction by introducing a number of complementary programs and projects throughout the region. This case study will focus specifically on public-private partnerships that foster a complementary relationship between land use, transit, parking availability, and transportation demand. The success of transit oriented development (TOD) projects and Flexcar, the County’s car sharing program, is due in large part to the willingness of program sponsors and participants to try something different. In addition to the programs highlighted below, three other case studies within this report are from the Seattle metropolitan region, the University of U-PASS Program, the Swedish Medical Center, and Seattle Seahawks Stadium.

Program Description
King County Transit Oriented Development (TOD) Program
Developed in 1998, TOD efforts began by assessing established park-and-ride sites for development potential. Following a series of analysis efforts, a number of TOD projects have been completed, are under construction or are currently under study. Each success has led to a continued investment in infill development, affordable development and design practices that maximize the viability of alternate modes of travel besides single occupancy vehicles. Since 1999, the Program has received an annual $1 million appropriation for staffing, consulting fees, and project development. Summarized below are three completed TOD projects developed at park-and-ride lots throughout metropolitan Seattle.

The Village at Overlake Station, Redmond, WA - As the first suburban “pilot” program, the Overlake project includes 308 apartments, a daycare facility and a shared parking structure open to park-and-ride users with spaces reserved for Flexcar. As a condition, the developer was required to provide one bus pass per apartment.

Northgate North, Seattle, WA - Northgate North opened in October 2000 as a four story retail project requiring a new access road which resulted in a loss of a portion of the park-and-ride lot. As a condition, the developer was required to provide replacement parking in its parking structure. In March 2002, the County purchased additional adjacent land to provide an additional 500 parking stalls. Negotiations continue regarding the ultimate outcome of the site which is only partially developed.
Renton Transit Center, Renton, WA – The Renton site is home to 90 apartments and a new parking structure with 150 new park-and-ride stalls. The apartments have all been rented and staff research indicates one third of the tenants travel by transit.

As the TOD programs continue to grow, a number of lessons learned have emerged. Although it might be challenging to agree on terms of shared parking arrangements, it introduces a substantial benefit to the viability of the site as both a TOD and park-and-ride facility. It has also been beneficial to evaluate existing park-and-ride demand and suggest consolidations where appropriate.

Flexcar
In 1998, King County Metro, the County’s transit provider, initiated efforts to make the case for car sharing as a viable alternative to personal vehicle ownership. A number of successive events occurred leading up to the actual implementation of the program including the development of Business and Marketing Plan, the Request for Proposals to secure a vendor, and the explicit identification of roles and responsibilities among jurisdictional participants. From the onset, a number of distinguishing features were recognized as contributors to the program’s success including the expectation of rapid growth, utilizing a multi-market approach, and the presence of political support.

In January 2000, Flexcar was implemented in Capitol Hill, Seattle’s highest density neighborhood with four vehicles. According to 1990 Census data, Capitol Hill was home to 16,250 residents of which 37% did not own a personal vehicle. Within the first year, Flexcar grew to over 900 members with 19 vehicles with presence in five neighborhoods. Today, Flexcar operates more than 100 vehicles in over twenty neighborhoods. As a company, Flexcar continues to expand with operations in six metropolitan areas throughout the U.S. (Seattle, Portland, Washington D.C., Los Angeles, San Diego, and Denver). In a report summarizing the first six months of Flexcar based on 146 responses to a new member survey it was determined that the majority of the members work in a managerial or professional occupation and 79% were college graduates. 55% of members indicated that they lived in a rental property.

Like other car sharing programs, Flexcar participants pay an annual fee and select a rate plan that suits their needs. Rate plans are offered hourly or monthly and fees are incurred based on time and distance driven. In return, user costs such as vehicle maintenance, gasoline, and insurance are paid for through the rate plans. Vehicles are parked within a reasonable distance from residential and employment centers. Reservations are made by phone or on-line.

Measures of Effectiveness
As an indicator of TOD and Flexcar success, both programs have received awards and recognition as innovative strategies with a positive impact on regional travel. It’s also evident that the two programs complement each other as car sharing has been included in development plans, including some King County TOD projects.

By requiring developers to provide bus passes and making transit and light rail highly accessible to tenants, the TOD program has been able to obtain a variance in the parking requirements for new multi-family construction. Instead of requiring 2.5 parking stalls per apartment, the ratio has been dropped to 1 stall per apartment as is the case at Overlake. Since tenants are required to register their car for the site, the actual stall usage per apartment ratio was able to be measured. On average, .6 of a stall is being utilized per apartment. It’s also been inferred that a third of the tenants use transit, which is three times greater than a typical suburban multi-family apartment complex.

Currently, Flexcar program effectiveness is being analyzed by the University of Washington.
FAST FACTS ABOUT: Orenco Station - Hillsboro, OR

**Types of TDM:** Mode Choice, Location Choice  
**Keywords:** light rail, transit-oriented design, housing, zoning, community design  
**Area Demographics:** Master-planned community at Orenco Station proximate to Tri-Met Westside MAX light rail within metropolitan Portland, Oregon.  
**Program:** Transit-oriented development featuring a varied housing selection and pedestrian-friendly amenities. Free transit passes are offered to all new tenants for one year.  
**Results:** 53% increase in transit usage after Westside light rail opened. Reduced need to travel outside of immediate community for discretionary trips.  
**Contact:** www.orencostation.com

**Area Characteristics**

The developers of Orenco Station call it America’s most awarded new community. As the winner of the National Association of Homebuilders Master Planned Community of the Year (1999), there are many good reasons why. The 206-acre, transit-oriented development has many planning and design features that make it one of the most livable new communities in the U.S. Located on the Westside Light Rail line outside of Portland, Oregon, Orenco Station is a pedestrian-friendly, mixed-use development with all the fundamental features of a successful neo-traditional community including a menu of housing choices, a town center with a main street corridor, ample park and recreation amenities and a variety of transportation options including light rail.

Although the Orenco Station site was originally zoned for industrial use and later for subdivision housing, the site was ultimately designated as a “town center” in the Portland Metro Area 2040 Plan. The Plan specifies legally binding requirements for all Westside station areas, and mandates features such as minimum densities and residential density targets at varying distances from light-rail stops, mixed-use development in station areas, pedestrian oriented buildings, prohibitions on auto-oriented land uses, and reduced parking. A special zoning ordinance was customized for Orenco Station establishing design guidelines to allow for and ensure an urban mix of housing types and land uses not typically found in the suburbs.

**Demand Management by Community Design**

One of the benefits of being a transit-oriented development is the provision of transportation alternatives. The community was designed to be a “complete community”, meaning residents could work, shop, recreate and live within it, thereby reducing the need for travel outside of it. Orenco residents are located within a quarter mile radius of groceries, restaurants, and professional services.

The other defining transportation feature is the development of pedestrian pathways, and open space that all culminate at the Orenco Station stop of the Tri-Met Westside MAX light-rail line. This region-wide light rail system is one of the key features of the Portland region’s livability. Orenco residents may walk to the station and have access via light rail to downtown Portland, the Portland International Airport, Hillsboro’s high technology industrial center and other parts of the metropolitan region. The development team consciously biased towards pedestrians to encourage walking to transit and local commercial development and to encourage a more community-oriented life style.

The community was designed to be a “complete community,” meaning residents could work, shop, recreate and live within it, thereby reducing the need to travel outside of it.
generous adjacent pedestrian facilities. In addition, a new grocery store and retail kitchen store will be opening in the fall of 2003. Housing units are also located above the retail spaces.

Several design features were employed in the residential areas to reinforce the pedestrian- and community-orientation of Orenco Station. Residential streets within Orenco generally allow for parking on one side with widths held to 25 feet. To further reduce the impact of automobiles, Orenco’s site design provides alley-accessed parking, thereby eliminating front garages, curb cuts, and driveways.

The community was designed to provide a variety of housing options, all of which are made for compact development: single-family homes, townhouses, accessory units, loft units, and apartments. The single family detached units are relatively small, ranging from 1,400 to 1,700 square feet; but all units have a dedicated home-office space and features to reduce the amount of commuting in the community. Unlike more traditional subdivisions, the three- and four-unit townhouse structures are integrated with single-family detached housing. The loft units have many of the architectural features of single family homes. Apartments and lower price condominiums are also available in the development to offer more affordable options. All residential unit sales have been strong since the beginning.

At Orenco, all new tenants are provided free transit passes for one year with other tenant marketing materials. Intel and other large employers adjacent to Orenco provide transit passes through an arrangement with Tri-Met.

A special zoning ordinance was customized for Orenco Station establishing design guidelines to allow for and ensure an urban mix of housing types and land uses not typically found in the suburbs.

Measures of Effectiveness

The planning and design of Orenco have been noticed by community residents and is reflected in their attitudes and behaviors. A Pilot TOD Pass Program was implemented in September 1998 to test the effectiveness of transit pass incentives. Under the program, new tenants were provided free transit passes with other tenant marketing materials. Some key findings include:

- Whereas only 30% of respondents reported using transit prior to the Westside MAX opening, 83% reported that they used transit in May 1999 (after the opening).
- From September 1998 to May 1999, transit use for commuting purposes increased 22%.

Although the Pilot program has expired, all new residents continue to receive free 1-year passes.

According to a recent Lewis and Clark College study, transportation practices were also affected by the design and planning of the Orenco community. The study suggests:

- 70% of those surveyed shop in the Town Center at least once a week.
- 85% of respondents stated that the close proximity of neighborhood businesses and amenities has reduced the need to drive elsewhere to purchase necessities or for entertainment.
FAST FACTS ABOUT: Lee County Variable Bridge Tolls

Types of TDM: Value Pricing, Off-peak Travel Time Shift
Keywords: Value pricing, variable pricing, electronic tolling, flexible work arrangements, off-peak travel time shift, discounts, incentives
Area Demographics: Lee County, Florida (Cape Coral and Fort Myers); 400,000 residents
Program: 50 cent discounts on tolls for use of off-peak travel times on two principal bridges accompanied action to raise overall bridge tolls to $1 (from 75 cents)
Cost of Program: $9.7 million grant awarded by Federal Highway Administration for technology installation, demonstration, implementation, and evaluation; additional $7.0 million set aside as "emergency revenue reserve"
Implementer: Lee County Public Works
Results: 5% shift from peak to off-peak travel
Contact: Chris Swenson, CRSPE, Inc., crs@crspe.com

Providing Choice in Tolling

Lee County, Florida, is a pioneer in using variable tolls as a way to manage congestion, provide traveler choice, and spread traffic away from the peak period. The principle behind this objective is that commuters will make rational choices if those decisions are based on balanced cost incentives. The Leeway project provides another measure of choice – price choice – to the mix of Transportation Demand Management (TDM) strategies.

Background

Lee County is located in southwest Florida. Approximately half a million people live in the metropolitan area comprised of Ft. Myers and Cape Coral, with an additional 1.7 million tourists visiting per year. The Caloosahatchee River separates these two cities, and the County provides only three bridge crossings. Two of these crossings, the Cape Coral Bridge and the Midpoint Bridge, are the most relevant to commuter traffic, and were the focus of the Variable Pricing Program.

A toll of $1.00 was levied on both bridges in 1997. In order to convince the public to accept the higher $1.00 toll, over a previous $0.75 toll, Lee County Commissioners endorsed an innovative concept of varying the level of the toll based upon the time of day. In the “shoulders of the peak period” (6:30 – 7:00 am, 9:00 – 11:00 am, 2:00 – 4:00 pm, and 6:30 – 7:00 pm), patrons received a 50 percent discount on the toll if they utilize the bridge’s electronic toll collection (ETC) system. Due to a popular “frequent user” program, this discount varies in value from either $0.25 to $0.50 each trip.

The objectives of the variable pricing program were to provide travelers with:
• an incentive to shift from peak periods
• an opportunity to lower out-of-pocket costs
• a reason to use ETC (which provides for better traffic management at toll plazas)

Challenges

There are a variety of challenges involved with the variable pricing program. The two principal concerns were:
• marketing the benefits of variable pricing in an area with relatively low levels of congestion, and,
• ensuring sufficient funds are generated to repay bonds and cover operating/maintenance costs
Lee County does not experience significant levels of congestion. In fact, most of the main arterials and highways operate at free-flow even in the peak hour. The challenge to Lee County officials was how to market the new off-peak travel discounts, when shifting travel was not likely to significantly short the likely travel time. Lee County responded to this challenge by marketing the convenience of electronic tolling and the cost savings provided by using off-peak periods. A variety of media was used to market the service, with multiple points of presence throughout the County. Media coverage of the concept also was high, since there is appeal in the innovation of variable pricing. Within a year, the project had over 40 articles in print media and 150 news stories in televised media.

In addition to convincing travelers to use the program, Lee County also needed to convince employers to offer employees flexible scheduling and variable work hours. Without the ability to shift the commuter’s travel time, the off-peak discount program would not be successful. In order to accomplish this, the County conducted outreach to medium and large size businesses in Ft. Myers (the principal employment node).

The issue of ensuring sufficient funds was critical to implementing the program. In 1996, Lee County applied for, and received, a grant from the Federal Highway Administration’s Value Pricing Pilot Program. The $20 Million grant provided a $7 Million set-aside to compensate for lost tolls under the variable pricing program. The set-aside was necessary to alleviate concerns about the potential loss of revenue.

**Results**

The variable pricing program has been successful in meeting the program’s objectives. Approximately 7 percent of all eligible participants indicate the variable pricing program causes them to alter their tripmaking behavior. According to a telephone survey of eligible drivers in late 1999, half of respondents indicated they always or sometimes considered the discounts prior to making a trip across the bridges. Finally, the variable pricing program is well known in Lee County, with over 90 percent of travelers familiar with the program. Altogether, these show that travelers are aware of and consider the option provided to them from the variable pricing program.

In three years of the implemented project, as reported by Mark Burris at the Center for Urban Transportation Research (“Lee County Variable Pricing Project: Evaluation Report”, January 2001), use of the bridges increased in the off-peak times and decreased during the peak periods. Traffic data near the bridges indicate that variable pricing had caused no measurable change in vehicle speeds, queue lengths at toll plazas, average vehicle occupancy, transit ridership, or accidents.

Over time, more and more travelers have utilized the electronic toll collection technologies, reducing the average cost per transaction. Lowered transaction costs on the bridges have partially offset the loss of revenue from the toll discount, as has the natural increase in daily traffic. It should be noted that the program continues to this day (September 2003), well after the expiration of the Federally funded toll revenue guarantee.

Evidence for this case study has been provided by numerous evaluation reports conducted by Mark Burris (Center for Urban Transportation Research) and Chris Swenson (CRSPE, Inc.).
Background Information

The CommuterLink system design was based on Navigator, the Georgia Department of Transportation’s Intelligent Transportation System, which was used for the 1996 Summer Olympics in Atlanta. With a deadline to have the system operational by the 2002 Salt Lake City Winter Olympics, UDOT staff felt it was better to go with an older model that had been tested than to trouble shoot newer technology and deliver less than adequate service to travelers during the Olympics. UDOT employees customized Georgia’s software to address their needs and added the feature that automatically disseminates alerts via email.

Advanced Traveler Information System Issues

**Timing**- Traffic reports on commercial radio stations are provided at specified intervals of time. Most often, traffic reports are not broadcast more frequently than every 10 minutes during peak rush hour. If an incident is reported one minute after the last traffic report is given on that station, it will be 9 minutes before commuters hear about it in the next report. That interval of time is often when commuters initiate their trip and make their decisions on which routes to take. Thousands of commuters may have made different travel choices had they heard the information. Instead they are choosing a route that will take them to and contribute to worsening delays at the incident. Receiving the traffic report as soon as the incident is reported gives commuters more opportunity to avoid it and lessen impacts of it.

**Simplicity**- Radio stations often have to cater to their regional audience, and therefore provide traffic reports on all of the roads in the region. This is often rushed and confusing to listen to. If for some reason you were distracted when they said something about your route, it will be ten minutes before you can hear it again.

Solutions

UDOT recognized that in order to effectively manage traffic it is as important to allow travelers to manage their own demand. This can be done by providing travelers with information when and where they need it. UDOT in partnership with numerous other organizations developed CommuterLink as a centralized system to manage travel in the region.

Description of CommuterLink Website

In addition to traffic monitoring and incident detection, CommuterLink also provides a user friendly format to relay the information detected and monitored to the traveling public. This is done through the CommuterLink Website. The CommuterLink Website (CLW) is operated by UDOT, on computer servers located at the TOC. CLW provides a map of the freeway system and the major surface streets, where most of the surveillance equipment is installed. CLW offers three primary types of information to the traveler:

1. Traffic conditions (speeds, incidents)
2. Roadway closures and construction
3. Weather (including pavement conditions)
Traffic information is presented in a number of ways. To display congestion conditions, the speed on each freeway segment (about one-half mile long) is shown as color-coded band (red = 0-30 mph, yellow = 31-50 mph, and green = 51 mph and above). Incidents are denoted with a red triangle; if the user clicks on that symbol, further information about that incident is displayed on a small portion of the screen, in the lower left corner. Visitors to CLW can also view video footage of real-time traffic conditions by clicking on the cameras located on the map.

Roadway construction and closures are displayed as a color-coded triangle, near the location involved. Yellow triangles denote current construction and/or closures; blue triangles identify future construction or closures.

Weather conditions are displayed as a cloud near the roadway where road conditions are provided.

Alert System
The CLW also enables individual users to subscribe to an “Alert” system, which automatically sends an email message in the event of an incident that falls within user-specified parameters (time of day, day of week, severity of incident). CommuterLink provides information only about the routes with a traffic impact level that concerns the subscriber at a time when it concerns them. The criteria for which an individual can subscribe can be seen at right.

When an “Alert Subscriber” presses the “Create Profile” button they are added to the CommuterLink database. Every half hour subscribers who checked that “Notification Timeframe” box are activated. Within that half hour, CommuterLink captures information about travel speed on regional roadways every 20 seconds. If travel speed on any of those roadways indicates an incident, CommuterLink sends an email is sent to the subscriber. A sample message would be, “Crash I-15 at 1500N SPGVL on right shld.”

A variation on receiving this information is an email account allows users to receive this information on their cell phone or pager using text messaging. This provides them with the information they need, when they need it, wherever they may be.

By receiving emails at work before they leave to get in their car, commuters can make a decision to delay their departure until incident is cleared or plan an alternative route to avoid the incident. In either case the traveler is not adding to the problem created by the incident and able to use their time more productively. Similarly, by having the information sent to their pager or cell phone, commuters can receive information about an incident before they leave the office or while they are on the road. If they receive it early enough they can receive the same benefits listed above.

Quick Facts*

- CommuterLink initiated email subscriptions in late 2000.
- In March 2004, CommuterLink had 6,652 commuters subscribing for traffic incident information to be sent to their email account.
- CommuterLink had 121,117 visitor sessions during March of 2004. Averaging 3,907 sessions per day.
- 83% of the sessions occur during the week with Monday and Wednesday being the busiest days
- CommuterLink receives its most visitor sessions between 7:00 am and 6:00 pm. Peak usage is between at 4:00 pm and 5:00 pm for commuters to plan their trip home.

*Detailed usage statistics for the CommuterLink Website are maintained by the website host (UDOT), using the “Webtrends” tracking software package. All usage data reported in this section are based upon the information reported by that system.

Completed in collaboration with the Michigan Department of Transportation, Michigan Economic Development Corporation and Michigan State Housing Development Authority.

This report was produced with the generous support of the Rockefeller Foundation.

The Rockefeller Foundation fosters innovative solutions to many of the world’s most pressing challenges, affirming its mission, since 1913, to “promote the well-being” of humanity. Today, the Foundation works to ensure that more people can tap into the benefits of globalization while strengthening resilience to its risks. Foundation initiatives include efforts to mobilize an agricultural revolution in Sub-Saharan Africa, bolster economic security for American workers, inform equitable, sustainable transportation policies in the United States, ensure access to affordable and high-quality health systems in developing countries, accelerate the impact investing industry’s evolution, and develop strategies and services that help vulnerable communities cope with the impacts of climate change. For more information, please visit www.rockefellerfoundation.org.
PURPOSE

The purpose of this document is to provide an overview of the state of the practice for transportation demand management (TDM). This document will be incorporated into project reports identifying framework strategies for TDM for the communities of Grand Rapids, Washtenaw County, and the greater Detroit region.

These communities have chosen to investigate TDM strategies under the Michigan Sustainable Communities Smart Growth America Support Project. Strategies will build from existing conditions to pursue (or set) national best practices for transportation demand management for the region while serving as a statewide and national model for other communities.

This document will be used in the first stage of the planning process as an assessment tool for helping to determine a strategic focus for each community. Community representatives and the consultants will use this document as a framework for assessing where each community’s transportation system is strong and what elements hold the greatest potential for improvement.

TRANSPORTATION DEMAND MANAGEMENT OVERVIEW

Despite common perception, few places have a consistent traffic problem – they have a rush hour problem. The nearly universal hours of the traditional workday means that legions of workers, students, and visitors hit the streets at the same time – generally between 7:30am and 9:30am in the morning and 4:30pm and 6:30pm in the evening. This means that streets and highways are congested and challenged to operate efficiently during these select hours of the day, but generally have abundant capacity during all other days and times.

Transportation Demand Management (TDM) seeks to do two things – 1) promote more efficient modes of travel to move more people in the same amount of roadway space (Figure 1) and 2) spread the travel demand across more hours of the day to take advantage of space and capacity when it’s available (Figure 2).
TDM is a general term for strategies that increase overall system efficiency, most often by encouraging a shift from single-occupant vehicle (SOV) trips to non-SOV modes, or shifting trips out of peak periods. TDM seeks to reduce auto trips – and hopefully vehicle miles traveled – by increasing travel options, by providing incentives and information to encourage and help individuals modify their travel behavior, or by reducing the physical need to travel through transportation-efficient land uses. The cumulative impact of a comprehensive set of TDM strategies can have a significant benefit on system efficiency, accommodation of new growth, and success of a metropolitan area. TDM programs are usually implemented by public agencies, employers, or via public private partnerships.

**LEADING PRACTICES**

TDM is a common term today. Most places associate it with measures such as transit benefits, carpool matching, and telecommuting. All are very important measures, though still often only lightly used, but the leaders in transportation demand management go much farther in adopting comprehensive and ambitious strategies. Leading practices include:

- Integrated TDM programs across multiple employers and institutions closely coordinated with the municipality and transit authorities;
- Strong regional leadership and coordination of transportation demand management strategies, often including mode split targets with regular measurement and reporting of performance and progress;
- Pricing and incentives to influence mode choice and travel demand;
- Adoption of public policies that imbed transportation demand management (and predictability) into the land development process; and
- Broad and effective public outreach and promotion programs that not only improve the public’s awareness of alternative modes, but actively assist them in their day to day travel planning and choices.

**Integrated Transportation Demand Management**

Standard transportation demand management practice is often employer-based, and these programs can be highly effective. More effective, however, is the integration and coordination of TDM strategies across multiple employers in an area. Coordination avoids the “tragedy of the commons” where one employer bears the burden of reducing employee auto trips while a competitor’s employees get a “free ride” even while the net effect on the system diminished. The...
integration of TDM measures such as employee shuttles not only has cost efficiencies for all participants, but makes a more efficient system overall for employees, roadway networks, transit providers, and the general public as a whole.

Often this integration and coordination occurs through a voluntary member-based and controlled Transportation Management Association (TMA). TMAs work in close collaboration with local authorities, but are frequently privately funded and operated. Model TMAs allow the participation of large and small employers alike to enable even small employers to provide comparable travel services to their employees. Pooling resources dramatically improves the economic efficiency of all

**Mayo Management in Rochester, MN**

The Mayo Clinic in Rochester, Minnesota is the largest integrated medical center in the world and a flagship presence in the city. In 2010, the city of Rochester adopted a comprehensive mobility plan that included aggressive mode split goals for 2030. Recognizing the value they had in the city, and the value the city goals held for them, the Mayo Clinic has partnered with the city to establish a transportation management association to implement a host of programs including expanded TDM offerings at the clinic and an extensive commuter bus system from outlying areas. The city and institution continue to collaborate on a bicycle master plan and bike share feasibility study.

and the trip reduction effectiveness of TDM measures.

**Leadership and Performance Measurement**

Highly successful TDM programs often have at their root a strong champion and leader. Some regions have dynamic political leaders who eloquently make the case for collective action in managing travel demand. In other places, a major institution leads by example, encouraging other area employers or generators to join in the effort.

Equally important to leadership, is defining a measurable goal and regularly evaluating progress toward it. We achieve what we measure, goes the old adage. Today’s leading regions set mode split targets, define strategies and policies to achieve them, establish appropriate measures for performance, and standardize data collection and reporting schedules and responsibilities.

**Santa Monica’s “No Net New Trips”**

For decades, Santa Monica politics had been dominated by growth opponents who used traffic fear as their primary tool for stopping development. The city’s award-winning 2011 Land Use and Circulation Element update, however, commits to no net increase in vehicle trips, by locating new growth with transit, establishing new neighborhood retail centers, imposing a multimodal transportation impact fee, and enacting robust Transportation Demand Management requirements. To implement the plan, the city is writing new (and updating existing) ordinances, and investing in multimodal transportation options. Santa Monica’s General Plan is the first plan in the State of California to significantly exceed statewide Greenhouse Gas reduction targets.
Pricing and Incentives

According to the Encyclopedia Britannica, “So long as they are not artificially controlled, prices provide an economic mechanism by which goods and services are distributed among the large number of people desiring them.” Similarly, incentives or benefits are a means by which to compensate travelers for the inconvenience inherent in certain modes of travel. In transportation demand management, these two mechanisms most often materialize in parking rates, road tolls, and transit programs.

![Figure 3, Effects of Parking Cash-Out on Parking Demand](image)

Parking Pricing and Management

Parking management has a direct and profound impact on automobile travel demand. If parking is free, convenient, and abundant there is little incentive to travel via any other mode. But parking is never free. Parking has a substantial cost to employers and property owners in its construction, maintenance, operation, and opportunity cost (land that could be put to other revenue or value-producing use but which instead is held as surface parking). These costs are often hidden to employees and travelers or dramatically subsidized as a “loss leader” or “the cost of doing business”, but are still paid by all in higher rents and passed on to all customers. Making parking costs transparent to travelers helps better inform their commute decisions and balance the costs and benefits of alternative modes.

Leading practices include market-rate or cost-recovery parking pricing, unbundling parking from tenant leases or purchases, separate value accounting for employee benefits, and other practices.
Alternate Mode Incentives

Driving is fast, comfortable, convenient, and typically relatively cheap even when true parking costs are included. Alternative modes do often have penalties to the traveler in terms of time, comfort, and cost. However, encouraging the use of non-auto modes has broad benefits to regional economies and stakeholder employers and institutions in the form of greater transportation system reliability, resiliency, and capacity for additional growth.

Typically most effective are direct incentives or benefits such as employee transit or bicycle benefits or parking cash out programs.

FlexPasses in Seattle

King County Metro offers an annual universal transit pass program called FlexPass, available only for purchase by employers. Participating employers must purchase a FlexPass for all regular, full-time employees. The pass provides unlimited transit rides on King County Metro buses, Sound Transit regional express buses, and Sounder commuter rail, as well as a portion of vanpool costs and the guaranteed ride home program.

Development Practices and Processes

Every place changes and develops over time. While it is important for today’s employers and institutions to adopt demand management strategies, some of the most dramatic and effective programs have been those that anticipated the potential cumulative impact of growth thirty years out and established expectations and requirements for development in the present, even prior to a clear evidence of need. Establishing clear, consistent, and predictable policies provides a good framework to ensure equitable review and approval of diverse developments, whether they occur next year or next decade, and reduce the ultimate cost and consequences of traffic for a more sustainable future.

The best examples have adopted comprehensive public policies and established development review processes that require transportation demand management for all major developments that include bold strategies like maximum parking allowances and proffered bicycle infrastructure elsewhere in the network.

Four decades of TDM in Arlington County, VA

In 1972, Wilson Boulevard in Arlington County, VA was not much to look at. Cars were king. Parking ramp billboards marketed the area as “Parkington”. But with premium transit coming to the corridor, county leaders envisioned a different future where vibrant high density growth concentrated at the transit stations while the traditional neighborhoods were protected and thrived off it just beyond. Development codes were adopted requiring projects to mitigate their traffic impacts, promote alternative modes, and invest in establishing a multimodal system for the area. Today, more than thirty years later, the corridor produces 33% of the county’s tax base on just 8% of its land while Wilson Boulevard – that critical car corridor – has seen just 5% more in traffic volumes.
Information for Trip Planning and Decision-Making

One of the largest obstacles to efficient travel management is the lack of information. Many commuters simply do not know the range of travel options available to them, their cost, how to use them, or when they are available. Uncertainty is a tremendous deterrent.

Getting information out broadly is a major challenge and can require substantial cost, but it can also bring about the largest return on investment. Advertisements and promotional campaigns, such as carpool days, commute challenge weeks, or rideshare months can encourage commuters to try different modes once or twice, which is sometimes all it takes to change behavior.

Technology has been an enormous boon in encouraging and enabling management of travel demand. Travelers now have available to them an array of trip time and cost calculators – many of which include environmental or social cost calculations in them as well. These convenient tools allow travelers to determine the right mode of travel for them on that particular day according to their particular needs. Leading practices integrate information across a variety of modes and systems including taxi, transit, bicycle, and driving. Emerging tools include dynamic ridesharing and other social media connections. This is a resource sure to continue to expand in breadth and effectiveness.

Figure 4  Chicago’s Trip Planning App

Travel options in your hand

Smart phones and open source data has revolutionized travel. There is an app for nearly everything. One challenge, however, is that every system seems to have its own site forcing a traveler to consult multiple sources in order to plan their trip most efficiently.

In November 2012, the Regional Transportation Authority of Chicago released “goroo” a full website and app that combines the information of multiple transit providers in addition to weather and traffic information for walkers, bicyclists and auto commuters to make better decisions about the comfort and efficiency of their trip and options for connecting to, or substituting, transit services, a leisurely stroll or, soon, a transfer on one of the city’s shared bikes.

Beyond real time schedule information, the mobile site includes walking and bicycling information, updates on delays or detours, and information on major area attractions.

Source: RTA – www.goroo.com
TOOLS AND TECHNIQUES

In addition to these broad approaches, there are also a wide range of specific and effective tools utilized in successful TDM programs. Tools fall into three major categories:

- Expanded transportation options, which can include improvements to cycling and walking options as well as transit and ridesharing strategies;
- Incentives to use alternative modes, which includes commuter benefits for transit use and flexible scheduling; and
- Parking management, which includes a host of parking incentives and disincentives.

Expanded Transportation Options

Enhanced Bicycle and Pedestrian Facilities

Although responsibility and authority for developing broad bicycle and pedestrian networks generally falls to the municipality, individual employers or institutions can make a significant difference by providing bicycle and pedestrian connections and accommodations on their own campus or site. Simply making it safe and possible (and preferably attractive) to get from the general transportation network to and into the facility can dramatically improve use of non-motorized commute modes. Accommodations include pedestrian-oriented entrances, good sidewalks and lighting, attractive landscaping or art, seating, bicycle accommodation in parking ramps, secure bicycle storage, and employee shower and changing facilities. Many large employers, campuses, business districts, and municipalities are establishing bike-share programs to further enhance and enable this mode of travel.

Pass Programs

Some employers directly cover employee transportation costs (up to a certain level) providing compensation in addition to wages. Employer subsidies for transit, bicycling, and vanpools up to the federally allowed monthly limit are considered qualified transportation benefits under federal tax law and may be excluded from an employee’s wages.1 Consequently, neither the employer nor the employee is taxed on the benefit. Direct employer subsidies are generally greatly valued by employees and significantly impact their travel decisions.

---

1 For further details about qualified transportation benefits, see the current IRS Publication 15-B.
Vanpools

Vanpools serve longer-distance commutes along corridors with very limited or no existing transit service. They consist of a group of five to 15 commuters who rideshare to and from work in vans leased from an outside operator who owns and maintains the vehicles and provides insurance and other support. In some cases, vans can be provided by an employer or can be owned by an individual. One of the vanpool participants serves as the primary driver and another as a backup driver. (Volunteer drivers usually ride free in exchange for their additional driving and coordination responsibilities.) The cost for participants depends on the size of the van, the length of the commute trip, the number of participants, and the availability of employer or government subsidies. Average costs are approximately $100 per month per person.

Carpool

Although carpools are typically formed voluntarily, institutions, employers, developers and property owners can encourage and accommodate them through the establishment and reservation of preferred parking spaces and free or reduced parking costs for designated and registered carpools.
Rideshare and Ride Matching

One of the greatest impediments to carpool and vanpool formation can be finding suitable partners with similar work schedules, origins, and destinations. Facilitated rideshare matching can overcome this obstacle by enabling commuters who are interested in ridesharing to enter their travel preferences into a database and receive a list of potential rideshare partners. The success of these programs is largely determined by the number of participants and, in turn, the number of potential matches that can be made. Rideshare programs may be administered through individual employers, but are often most effective when coordinated through a transportation management association or other larger scale program.

Car-Sharing

Shared vehicle programs are gaining wider and wider application across the country. Shared vehicles can be provided through a separate (typically private) car-sharing company or by the employer or property owner who owns, maintains, and manages the vehicle. Car-sharing enables employees to commute via a non-auto mode but still access an automobile for necessary daytime trips such as meetings or personal errands or appointments.

Shuttles

Some employers provide, or contract with transit providers to operate, direct shuttles to and from employment sites and transit or parking facilities. Employer shuttles pick up employees at a parking lot, regional bus stop, or commuter rail station, and drive them to their workplace. Some employers also operate daytime shuttles, allowing employees to leave their jobsite for lunch or running errands, making it unnecessary for them to drive. Shuttles can be operated by a local transit system, an employer, a municipality, a nonprofit, or a partnership of a combination of these entities.

Incentives and Supportive Policies

Travel Subsidies or Benefits

Direct subsidies may include the provision of free or subsidized transit passes, vanpool vehicles or fares, and/or shuttle services to reduce the rider’s cost of these high-capacity modes and create cost-competitive alternatives that make SOV commutes seem more expensive by comparison.

Federal code allows pre-tax benefit for employees. Employers can further promote the allowance by establishing systems to allow employees to withdraw money from their paychecks before taxes are deducted for use toward the purchase of transit passes.

Guaranteed Ride Home

This employer- or association-provided benefit allows for a set amount of free taxi rides or use of car-share vehicles for unplanned trips home that cannot be accommodated by the employee’s normal commute mode (e.g., working late past last scheduled bus, carpool passenger with sick child at school). Statistics on such programs indicate that although they tend to have relatively low employee utilization rates, they have very high satisfaction rates from participants providing a high benefit for a low cost to employers.

Flexible Scheduling
This strategy allows employees to reduce their number of weekly commute trips and shift work trips to nonpeak hour times of day. Examples include:

- Telecommuting – Allowing employees to work from home or a non-office location one or more days a week;
- Compressed Workweek – Enabling employees to compress regularly scheduled hours into fewer work days per week; and
- Flexible Schedule – Allowing employees to offset work hours from the typical 9-5 standard and shift commute travel to offpeak hours.

**Employer Assisted Housing and/or Live Near Your Work Programs**

Walking is the most affordable, reliable, and efficient mode of transportation, however it is many ways the most limited as well. Most people cannot reasonably walk farther than a mile from home to workplace, but for those who can and do they generally report lower levels of stress, higher levels of work and life satisfaction, and greater productivity in both.

Employers across the county, and particularly those in highly competitive markets or industries, are beginning to implement employee housing assistance programs. Such programs typically take the form of down-payment or first time homeowner assistance, but increasingly there are examples of developments using live near your work as a component of a larger traffic mitigation program.

The leading talent in today’s increasingly mobile workforce is often times choosing where they want to live before they are choosing where they want to work and then looking at employment opportunities nearby or tele-working options worldwide. Savvy employers see the benefits of investing in attractive, livable communities adjacent to their worksites as a means of attracting, and retaining the top talent for the next generation of innovation.

Not all Live Near Work programs involve housing subsidies. Some are as simple as real estate marketing of the nearby community. Staff that can walk to work can save upwards of $10,000 on average in annual transportation costs – the equivalent of a sizable wage bonus to employees at no cost to employers.

**Parking Management**

Parking management is a general term for strategies that encourage more efficient use of existing parking facilities, reduce parking demand, and shift travel to non-SOV modes. The supply of free or inexpensive parking at the final destination is a key decision factor cited for choosing to drive a personal auto rather than taking a bus, bike, walk, or carpool. Parking demand that exceeds supply

---

**John Hopkins neighbors in Baltimore**

Since 1997, John Hopkins University has helped more than 300 employees purchase homes in the neighborhoods surrounding their campus. Through a partnership with Baltimore City and the State of Maryland, and partially funded by the Rouse Company Foundation, the program provides up to $17,000 in down payment and settlement costs for first-time home buyers. The program has resulted in much improved safety and livability in the target neighborhoods, strong relationships with the city and civic leadership, and improved overall retention for the institution.
results in the common phenomenon of “circling”—cars going round and round the local area searching for limited parking, leading to more congestion and delay. Therefore, parking management is integral to any transportation demand management program.

- Variable Market Rate On-Street Pricing – Setting parking rates that fluctuate with demand helps optimize parking availability, free spaces for short-term users, and reduce search traffic. As a general rule, on-street spaces should be priced according to demand while off-street spaces should be priced to recover construction, operating, and maintenance costs.

- Unbundling Parking Costs – Requiring that parking spaces be leased or sold separately (“unbundled”) from the rent or sale price gives a financial incentive inducing individuals to drive less or own fewer cars, or encouraging companies to increase transit commute rates among their employees.

- Parking Tax – Parking taxes can be assessed and designed to target specific types of parking behavior, such as taxing peak-hour, commuter, or early-bird parking.

- Parking Cash-Out – An employer based strategy that allows the employer to charge employees for parking while giving employees a bonus or pay increase to offset the cost of parking. Employees may use this increase to pay for parking or may choose an alternative mode and “pocket” the difference.

- Shared Parking/ Park Once is a strategy that seeks to shift parking demand into shared, public facilities rather than a proliferation of dedicated, accessory lots — reducing the volume of parking and local vehicle trips as well as the number of curb cuts on local sidewalks.

- Electronic Parking Guidance Systems direct motorists from the main access roads of a defined geographic area to parking facilities with available spaces. The number of spaces currently available in a specific car park or as a total number for a defined area is shown on variable information signs, and may also be presented via phone, the Internet, or in-vehicle navigation systems.

- Parking maximums impose limits on the number of parking spaces that the municipality will allow to be provided at new developments through off-street parking requirements, and can help encourage transit use and other alternatives to single-occupant automobile use.

- Park-and-ride lots can intercept traffic outside of highly congested areas and transfer them to transit or carpools for the final leg of the journey.

- Parking enforcement and education can help manage the on-street supply and free spaces for short-term parkers.

- Parking permit reform: allowing employees to purchase individual days of parking on a pro-rated basis comparable to monthly rates.

- Priority program such as providing a few free days of parking each month for employees who usually commute using a non-SOV mode; and/or offering lower parking rates to carpools and vanpools.
ORGANIZATIONAL STRUCTURES

As a region makes decisions about types of strategies to implement to manage transportation demand, a structure for carrying out the strategies is equally important to discuss. In some regions, a public or private entity takes the lead and manages implementation; in many, a public-private partnership is set up to access the advantages of each.

Transportation Management Organizations\Associations

TDM measures can be implemented on an employer-by-employer scale, but regional impacts are most easily achieved when multiple entities work together. Transportation Management Organizations or Associations (TMO\TMA) have been proliferating around the country for the past decade and are especially adept at implementing TDM due to their broad-reaching memberships and flexible funding.

TMO/TMAs are typically nonprofit organizations and, as such, are eligible for government funds inaccessible to private organizations. By pooling resources, individual stakeholders can leverage resources further, do more marketing and advertising and reach a wider range of individuals.
Challenges can arise in coordination with government agencies and addressing unmet needs of area residents or individuals not represented on the TMO/TMA.

**Private Entity**

A private employer along a corridor or in an area can lead TDM efforts, often with some of the advantages of a TMO. Private entities have maximum flexibility in implementing different strategies and often demand a high return on their investments, sometimes leading to a more successful program. As strategies take shape over the long term, however, private entities may not maintain interest or obligation to continue participating, especially if the return on the investment is not high enough. Also, the needs of all affected individuals may not be served by one private entity as the leader for TDM. Finally, private entities are typically not eligible for local, state, or federal funding that can sometimes offset costs.

**Public Agency**

Public agencies can also take the lead in implementing TDM measures. In many regions, these include regional or metropolitan transit districts or authorities, local planning or transportation departments, or metropolitan planning organizations. Public agencies by nature have a broader mission to address regional unmet needs, typically have greater access to federal and state funding, and can best coordinate with other governmental programs or organizations, such as transit systems. Despite these advantages, public agencies may not be able to access as much private funding and often have more constraints than a private entity might in implementing different measures.

**FUNDING AND PARTNERSHIPS**

Funding transportation demand management initiatives can be enhanced through partnerships and especially by the creation of a TMO. While businesses themselves can offer employee transportation benefits and in some cases take advantage of federal tax incentives, TMOs have much greater flexibility with raising funding and accessing additional funding streams. These can include:

- District assessment/tax - Assessments levied through a TMO or other type of business improvement district can help fund TDM programs and are often the largest source of income for these entities.

---

**Lloyd TMA – Portland, OR**

Participating Lloyd Transportation Management Association businesses pay no dues. Instead the association is funded through three sources:

- A Business Improvement District that is a "fee/assessment" on property owners. The BID then provides membership to all businesses located in buildings paying the assessment. The BID generates 40% of the TMA’s budget.
- Parking meter revenue which supplements the BID and is targeted toward programs that serve business and employee needs. This accounts for roughly one-third of the budget.
- Commissions on the sales of transit passes. The TMA receives 3% on all transit passes sold to businesses through the TMA and/or its Transportation Store. In 2005, the TMA sold over $1.2 million in transit passes, and therefore received about $36,000 in commissions (comprising the balance of the TMA budget).
Parking revenue - Parking revenue can be used on an individual employer level but also on a larger scale, especially if the organization is allowed to collect revenue from parking meters.

Direct employer contributions - Direct contributions to services is the most common type of funding, especially for smaller-scale or early-phase efforts. Contributions can be assessed based on a formula or collected as part of dues for a TMO.

Local government contributions - For special projects, local governments sometimes supply grants or potentially state or federal funding for certain types of initiatives, such as directly-operated transit. Typically, governmental contributions are not allocated on an ongoing basis.

EDUCATION AND OUTREACH

Social marketing and incentive programs are proving increasingly popular and effective at promoting non-SOV travel. Social marketing seeks to influence individuals’ behavior to achieve a broad social good (in the case of TDM, reducing drive alone trips). Awareness and educational programs, workshops, and community outreach efforts may take the form of promotional campaigns similar to product advertising.

Incentive programs build on this marketing effort to frame non-motorized, transit, and high-occupancy travel as a social norm, by offering prizes or cash rewards to residents who use non-SOV modes. In Seattle, Metro’s bi-annual Wheel Options campaign gives commuters a chance to register and win a sweeping variety of prizes for getting to work any way other than driving alone. The county’s In Motion programs extend this opportunity to residents in general.

Figure 6  Seattle Metro TDM Advertisement

Employers can easily provide information about commute options in employee lunch and break rooms as well as via intranet sites, periodic emails, and employee newsletters. Employers and TDM entities can also hold events to promote use of alternatives to driving alone (e.g., transportation fairs, bike to work day, contests, etc.).

Another strategy is to have an employee transportation coordinator. This is an individual whose responsibilities are to find transportation options and develop transportation programs for employees. Few employers offer an on-site coordinator, a practice which is common typically at
only the very largest of employers. This service is also commonly provided through a TMA or government entity or agency.

**PERFORMANCE MEASUREMENT**

No matter what type of strategy an area decides to implement, keeping tracking of its effect on the region is critical to maintaining participant momentum and supporting funding. For some measures, such as transit service, tracking the number of passengers supplies an acceptable metric to measure success. However, the primary goal of TDM measures is to reduce single-occupant vehicle travel in an area. Therefore, measuring the trip reduction impact is a more telling method for gauging success. The below table displays the estimated effects of each type of strategy and combination of strategies.

**LEARNING FROM THE LEADERS**

By far, the best transportation plan is a good land use plan where employment, amenities and education are easily accessible and attractively designed and located. While most communities still struggle with the seamless union of land use and transportation planning, design and development, transportation management strategies can help communities and stakeholders more efficiently use the systems and resources they have and ensure they have space and services for continued growth.

Which tools or approaches work in a particular locale depends on transportation resources, community cultures, and stakeholder commitment.
**Smart Growth America** is the only national organization dedicated to researching, advocating for and leading coalitions to bring smart growth practices to more communities nationwide. From providing more sidewalks to ensuring more homes are built near public transportation or that productive farms remain a part of our communities, smart growth helps make sure people across the nation can live in great neighborhoods.

About this guide

TRANSPORTATION DEMAND MANAGEMENT (TDM) is one of the approaches that Canadian municipalities and regional transportation authorities are using to create cleaner, more efficient and reliable transportation systems.

Over the last decade, a growing number of communities have been integrating TDM into their transportation plans and operations. This guide represents a summary of the lessons they have learned, and offers advice to help other municipalities plan and implement their own TDM programs. It references real-world examples, as well as other documents that offer additional guidance in more specialized areas of TDM. It draws on collective experience to provide an overview of the entire process behind TDM program planning and delivery.

This guide is meant to be accessible to readers who are less familiar with TDM, including those in mid-sized or small communities. It addresses the practical concerns of its intended readers including decision makers (e.g. elected officials and senior managers) who provide staff with strategic direction and authorize resources, managers in municipal staff groups with direct or indirect responsibility for TDM, and practitioners involved in planning and delivering TDM measures.

The figure below illustrates the guide’s structure, and will help readers navigate the main sections.

CHAPTER 1 – UNDERSTANDING TDM discusses the role of TDM, its relationship to other municipal activities, and challenges and keys to success.

CHAPTER 2 – PLANNING TDM PROGRAMS outlines a four-step process to planning new or expanded TDM programs.

CHAPTER 3 – DELIVERING TDM PROGRAMS discusses three keys to the effective delivery of TDM programs including internal capacity building, collaboration with partners, and communication with key audiences.

APPENDIX A – TDM MEASURES offers a descriptive inventory of common TDM approaches and tools that are broadly relevant to Chapters 1, 2 and 3.
Acknowledgments

The authors are grateful to staff of the Environmental Initiatives Group, Environmental Affairs of Transport Canada for their guidance. They are also indebted to two groups of individual advisors who gave freely of their time and wisdom in reviewing draft versions of this guide:

ACT Canada’s Board of Directors
- Ralph Bond, BA Group (Toronto, ON)
- Wayne Chan, Region of Peel (Brampton, ON)
- John Cicutti, Region of Waterloo (Waterloo, ON)
- Frankie Kirby, TransLink (Burnaby, BC)
- Lorenzo Mele, Town of Markham (Markham, ON)
- Ron Schaefer, City of Calgary (Calgary, AB)

Other advisors
- Allison Cook, City of London (London, ON)
- Don Cook, City of Saskatoon (Saskatoon, SK)
- Claude d’Anjou, Mobiligo (Montréal, QC)
- Jerry Dombowsky, City of Kelowna (Kelowna, BC)
- Ryan Lanyon, Metrolinx (Toronto, ON)
- Roxane MacInnis, MRC (Ottawa, ON)
- JoAnn Woodhall, TransLink (Burnaby, BC)

Members of the consulting team for this guide were Geoff Noxon of Noxon Associates Limited and Sharon Lewinson of ACT Canada, both in Ottawa, ON. Any errors or omissions in this guide remain the sole responsibility of Noxon Associates Limited.

Glossary of key terms

**ACTIVE AND SAFE ROUTES TO SCHOOL (ASRTS) PROGRAM.** Comprehensive, community-based initiatives that encourage walking and cycling to school through education, training, promotion, safety improvements, and incentives. Also known as Safe Routes to School.

**ACTIVE TRANSPORTATION (ACTIVE COMMUTING).** Human-powered travel, primarily walking and cycling but also in-line skating, skateboarding, wheelchairing and other methods.

**BIKE SHARING.** Programs that offer free or low-cost bike rentals, intended for short periods of use and a large number of daily users per bicycle. Public bike sharing initiatives are open to all users, while private bike sharing initiatives are restricted to employees or clients of a particular business or institution.

**CARSHPARING.** Services that offer short-term pay-per-use car rentals, typically open to the public and sometimes also to businesses as a complement or replacement to corporate fleet ownership.

**COMMUTER SURVEY.** An electronic, paper-based or face-to-face tool for gathering information about employee commuting habits and attitudes in a workplace.

**CYCLING SKILLS COURSES.** Training for individuals about safe bicycle operation, addressing subjects such as riding in traffic, darkness and inclement weather, and roadside bike repair. The Canadian Cycling Association’s CAN-BIKE program includes courses for children, learner adults, women, rural cyclists and urban commuters.

**EMERGENCY RIDE HOME.** A service offered by an employer or third party that helps non-driving commuters get home quickly and conveniently in case of family emergency, unexpected overtime or other unforeseen event. Transportation is typically by free or reimbursable taxi or car rental. Also known as guaranteed ride home (GRH).

**EMPLOYER TRANSIT PASS PROGRAM.** The sale of transit passes to commuters at their workplace, with the employer either acting as a reseller, or forwarding payroll deductions to the transit operator. Payroll-deduction transit pass programs typically demand a minimum one-year subscription.
**End-of-Trip Facilities.** Bicycle parking, shower and change facilities in workplaces for use by cycling or walking commuters.

**Individualized Marketing.** Initiatives that use targeted, customized communication and incentives to motivate sustainable transportation choices by individuals who self-identify as being interested in adopting new behaviours. Individualized marketing is most commonly applied at a household level, but can also be used in workplaces.

**Market Segmentation.** Division of a larger market into groups that possess common characteristics, as the basis for marketing activities that differ among groups.

**Open Street Events.** Special events that involve temporary closure one or more streets to motor vehicles, enabling use of the street space for walking, cycling, entertainment and other activities.

**Public Transit Pass Program.** Sale of discounted transit passes to the general public by subscription, typically for a minimum term of one year.

**Ridematching.** A service to help commuters find partners for carpooling, typically through automated Internet-based services.

**Telework (Telecommuting, Mobile Working).** An arrangement allowing workers to reduce their commuting by performing some or all of their work away from their normal workplace.

**Transit-Oriented Development.** Form of development offering a land use density, mix and design that makes transit use attractive and efficient; typically involves mixed-use, pedestrian-friendly developments around rapid transit stations and corridors.

**Transportation Demand Management (TDM).** The use of policies, programs, services and products to influence whether, why, when, where and how people travel. TDM measures help shape the economic and social factors behind personal travel decisions.

**Transportation Demand Management (TDM) Program.** A collection of TDM initiatives delivered through or in partnership with municipal government operations, typically with dedicated staff and financial resources. TDM programs are usually considered to be ongoing, long-term endeavours rather than short projects.

**Transportation Fair.** A special event at workplaces or educational institutions to build awareness of sustainable travel options by offering a range of information and services.

**Transportation Management Association (TMA).** An organization that promotes and supports workplace travel plans among employers; may offer services such as commuter surveys, analysis, consultation, special events and carpool ridematching.

**Trip Planning.** Internet-based, phone-based or face-to-face help for individuals to plan optimal routes for trips, usually by transit but sometimes by cycling or walking.

**Universal Transit Pass (U-pass) Program.** Common initiative at post-secondary institutions, whereby all students or members of a sub-group (e.g. full-time undergraduates) pay a fee that gives them unlimited access to transit for the entire semester, school year or calendar year. U-Pass fees are typically much lower than the cost of buying regular passes or tickets, because the cost of transit fares is redistributed from a smaller group to a larger one.

**Walking School Bus.** An arrangement whereby a group of children walks to school with one or more adults, typically involving set meeting points, schedules and rotating volunteer schedules.

**Workplace Travel Plan.** A package of coordinated initiatives to encourage efficient and sustainable commuting among employees.

**Vanpooling.** Shared use by multiple commuters of a van that is typically owned by a third party such as a non-profit organization, for-profit business or employer.
Chapter 1: Understanding TDM

This chapter introduces TDM and its benefits for Canadian communities, and helps readers to:

- understand how TDM supports sustainable transportation
- see how TDM is integrated with other municipal services
- explain and build support for TDM
- be aware of common challenges and keys to TDM success

After reading Chapter 1 readers will be better equipped to tackle Chapter 2, and start the process of planning a new or expanded TDM program.

1.1 The basics of TDM

1.1.1 Communities and sustainable transportation systems

The challenges posed by transportation systems to Canadian communities are growing. Increasingly, congestion is a fact of life but road expansion is no longer considered a solution. The environmental impacts of motorized travel are unacceptable. The costs of conventional mobility are unsupportable given today’s fiscal constraints. Residents are demanding travel options that are convenient, reliable, healthy and safe. In response, virtually all new transportation plans emphasize the need for more sustainable transportation options—in other words, greater use of walking, cycling, transit, carpooling and telework.

By reshaping their transportation systems, Canadian communities are pursuing three key dimensions of sustainability:

- **QUALITY OF LIFE.** Sustainable transportation systems reduce travel delays that affect families and increase costs to business. They increase physical activity levels and reduce the health impacts of air pollution. They improve safety by shifting travel from cars to transit, reducing travellers’ risk of being involved in a collision. They increase opportunities for all people to participate in educational, recreational and social activities without the need to use a car.

- **ENVIRONMENTAL HEALTH.** Sustainable transportation systems have lower emissions of greenhouse gases and smog-causing air pollutants, and help reduce intrusion into natural areas by urban development.

- **ECONOMIC GROWTH.** Sustainable transportation systems have lower long-term costs, including the costs of transportation infrastructure (e.g. new and wider roads), transportation operations (e.g. vehicle fuel, repair, insurance) and their health impacts (e.g. hospital care for collision victims and asthma patients). Car travel is expensive both for citizens and governments. Shifting travel demand from cars to more sustainable modes frees up public and private resources to invest in other priorities.
1.1.2 Definition of TDM

In any community, the transportation and land use system includes three major elements that represent the physical, economic and social factors behind travel behaviour (see figure, below):

- **transportation demand**—the needs and desires of individual people
- **transportation supply**—the infrastructure and services that move people
- **land use**—the places people travel to and from

![Major elements of a community's transportation and land use system](image)

Sustainable transportation measures work by addressing one or more of these three key elements. Policies, programs, services or products that address transportation demand are grouped under the term **TRANSPORTATION DEMAND MANAGEMENT** or **TDM**. By influencing whether, why, when, where and how people travel, TDM measures can cause the following changes in travel behaviour:

- **modal shift**—more people choosing to walk, cycle, take transit, carpool, vanpool or telework
- **trip reductions**—more people choosing to telework, shop online or conduct personal business by telephone
- **driving reductions**—more drivers making fewer trips by car and to closer destinations
- **time and route shifting**—more drivers changing the time or route of their driving trip to avoid traffic congestion

1.1.3 Rationale for TDM

TDM offers communities the same benefits as other sustainable transportation measures that change transportation supply or land use. It can reduce air emissions, congestion, delay, automobile user costs, and public costs incurred for health care, emergency response, and road and parking infrastructure. It can also improve access to opportunity, public health, road safety, employee morale and productivity, and environmental health.

Three key attributes of TDM make it a valuable addition to a community’s sustainable transportation “toolbox”:

- **FLEXIBILITY.** TDM measures are readily customized for specific user groups (e.g. seniors, youth, cyclists, transit riders), travel purposes (e.g. shopping, commuting), travel destinations (e.g. a single hospital, business park or neighbourhood), or timeframes (e.g. weekdays, sporting events, an entire smog season). By comparison, transportation supply and land use measures are much less customizable by user group, purpose, place or time.

- **SPEED.** TDM measures can be planned and delivered in days, weeks or months. Transportation supply and land use measures can take years, or even decades.

- **AFFORDABILITY.** TDM measures can be scoped and scaled to match available resources. While the most effective approaches to TDM are not inexpensive, municipalities can tailor a TDM program to make effective and creative use of existing staff and budgets. Even relatively costly TDM measures tend to be far less expensive than most transportation infrastructure projects.
TDM measures do not replace transportation supply measures (such as new transit lines and bicycle lanes) or land use measures (such as urban design standards and mixed-use developments). However, they complement these other measures in a very powerful and cost-effective manner. In fact, TDM is an excellent way to maximize the efficient operation of existing land use and transportation systems.

Assessing the benefits of TDM measures

By focusing on social and economic factors and avoiding expensive physical changes, TDM measures can have very high benefit-cost ratios. One study for the UK Department for Transport estimated that the congestion-reduction effects of TDM measures could have a ten-to-one ratio of benefits to costs—and this excluded powerful but controversial measures like road pricing. [S. Cairns et al., Smarter Choices: Changing the Way We Travel, 2004]

A compilation of this and other evidence on the effectiveness of TDM measures is available in The Case for TDM in Canada: Transportation Demand Management Initiatives and Their Benefits, available at www.actcanada.com. That guide is a recommended tool to help practitioners understand their key audiences and build support for TDM initiatives.

1.1.4 Types of TDM measures

TDM measures can take different forms (see the figure below, as well as the more detailed list in Appendix A), and are generally divided into two categories. Education, promotion and outreach measures raise awareness, improve understanding, and build positive attitudes about sustainable transportation choices—for example, special events or cycling skills training. Incentive and disincentive measures make specific travel choices more or less attractive through convenience improvements, cost changes or rewards—for example, ridematching services or transit pass discounts.

TDM measures can also be delivered in different locations. Workplace initiatives can involve carpool ridematching services, subsidized transit passes, telework promotion or flexible work hour programs. School initiatives can involve walking school buses or ridematching services. Post-secondary initiatives can involve universal transit passes, active transportation promotion, ridematching services and parking management. Residential initiatives are aimed at households, usually within a specific neighbourhood, and can involve individualized marketing or carsharing. Community-wide initiatives are not targeted at a particular market, and include public carpool ridematching, high-level messaging campaigns and special events.
1.2 TDM in the municipal context

1.2.1 Integrating TDM with other municipal activities

TDM can provide support to many activities that municipalities may be involved in.

**Public Transit.** Marketing activities by transit systems are a form of TDM. Transit systems also conduct special events to encourage individuals to try transit, and offer fare incentives such as discounts to encourage individuals to buy transit passes or travel outside rush hours.

**Active Transportation.** Cycling and walking maps, special events like Bike to Work Week, cycling skills courses, better bike parking, promotion of public bike sharing systems, and celebrations of new trails or bike lanes are all TDM initiatives.

**Carpool Lanes and Carpool Lots.** These supply-side measures depend on effective promotion and the facilitation of carpool formation through ridematching services, a staple of TDM programs.

**Land Use Intensification.** Urban boundaries that contain growth and zoning by-laws that encourage infill development both concentrate transportation activity in existing developed areas. TDM programs can ease the transition to intensification by encouraging residents and employees of infill projects to travel sustainably. In areas with limited parking capacity, TDM programs can also make vacant land more attractive to developers.

**Transit-oriented Development (TOD).** Many municipalities are working to intensify mixed-use, pedestrian-friendly developments around transit stations and corridors. The power of good design to maximize transit use can be amplified by effective education, promotion and incentives—particularly when new residents and employees are relocating from more car-dependent locations.

**Air Quality Improvement and greenhouse gas emission reductions.** Motorized travel generates a substantial portion of total greenhouse gas emissions and other air pollutants in most communities. Virtually all municipal air quality and greenhouse gas emissions reduction strategies aim to reduce driving, and TDM measures can help accelerate shifts to more sustainable travel.

**Economic competitiveness.** Municipalities compete to attract investment that creates and retain jobs, and to attract new residents. Telework and other TDM programs that improve commuting options can make workplaces more attractive and increase their reach into the labour market. They can also make the image of a community’s lifestyle more attractive to young families and the “creative class” of knowledge workers.

**Active Living Promotion.** Municipal health departments and district health units promote the health benefits of improved fitness through active living. TDM programs that encourage active transportation, such as for daily trips to work or school, are good complements to active living programs.

**Child and Youth Development.** The healthy development of young people is a primary concern of our education, public health and social service systems. TDM measures such as cycling skills education courses or Active and Safe Routes to School programs can increase physical activity among children and youth while also building their confidence and independence.
1.2.2 Challenges facing TDM

Most major Canadian municipalities have created TDM policies and programs, but few have successfully implemented broad and effective TDM measures. Several recurring challenges have contributed to this situation.

**TDM needs stronger backing by elected officials.** TDM is a broad subject that tends not to offer simple solutions. Its wide scope and subtle variations make it challenging for decision makers to champion. It can also be difficult to “see” TDM initiatives and measure their short-term impacts, which adds to the challenge of building political and public support.

**TDM does not fit the usual structure of municipalities.** TDM planning and delivery functions lack a natural home in municipal administrations—rather, they tend to bridge diverse areas including transportation engineering, development planning and approvals, transit service, health promotion, social services, economic development, and communications. TDM requires the commitment and assistance of engineers, planners, economists, behavioural psychologists, social workers, communicators and elected officials.

**TDM staff may be asked to bear additional responsibilities.** TDM programs can become “catch-alls” for activities that do not fit neatly within traditional traffic and transit programs. For example, TDM staff are commonly asked to take responsibility for cycling network planning, sidewalk replacement projects and other sustainable transportation initiatives. This is not necessarily a bad thing, but the day-to-day demands of these projects can easily divert time and attention from TDM.

**Infrastructure and land use issues are seen as more important.** In municipal organizations with limited resources, land use and transportation infrastructure concerns can control the agenda and marginalize TDM initiatives. However, it is important that municipalities work on land use, transportation supply and transportation demand at the same time—TDM is an inexpensive way to boost the effectiveness and speed of development and transport infrastructure strategies.

1.2.3 Keys to success

The TDM experiences of Canadian municipalities have revealed several basic approaches that can maximize the effectiveness and return on investment of TDM initiatives.

**Develop and follow a plan.** A TDM program is a long-term commitment that can involve many stakeholders and a wide range of measures. A TDM plan can help a municipality attract support, provide direction and coordinate action over time. This issue is the subject of Chapter 2.

**Remain alert to other opportunities.** While a TDM plan is very helpful, it is important to watch for opportunities (both internal and external) that the plan does not foresee. A sense of adaptability and a willingness to consider new ideas will ensure that open doors are not passed without consideration.

**Build partnerships.** TDM thrives on strong partnerships and cannot be undertaken successfully by a single group. Municipal governments have limited ability to make TDM initiatives work without help from institutional, private sector and other community partners that offer resources, extend the reach of TDM measures, and enhance the credibility of messages originating within government. For municipal staff groups, learning the art and value of successful partnerships can be vital. This issue is discussed further in Chapter 3.

**Provide adequate resources.** TDM is not about plans and policies—rather, it is about working with individuals and community organizations. These activities require time, energy and money. A municipality without a dedicated TDM practitioner on staff is likely to accomplish little, and many more staff may be warranted. Likewise, budget is required to develop and deliver the tools, resources and
incentives that can influence behaviour. This issue is discussed further in Chapter 3.

**Communicate clearly.** Communication may serve diverse purposes and take many forms, but it is an essential part of most TDM measures, and is also fundamental to the success of an overall TDM program. It cannot be an afterthought. This issue is discussed further in Chapter 3.

**Lead by example.** TDM measures invite institutions, businesses and individuals to behave differently—so to build goodwill, municipalities must put their own house in order first. This is especially true when working with other levels of government and private-sector employers. Developing a travel plan for its own workplaces allows a municipality to learn about TDM, and to develop and test new tools and resources before offering them to other workplaces.

**Embrace innovation.** “Doing things differently” requires both an appetite for innovation, and a willingness to treat failure as a learning experience. Strong leadership can help foster innovation. Small-scale demonstrations or pilot projects can encourage municipal decision makers and the general public to be more accepting of setbacks when they occur.

---

**Helpful resources**

The Federation of Canadian Municipalities offers a brochure, entitled *Improve Travel Options with Transportation Demand Management (TDM)*, and a customizable PowerPoint presentation to build understanding of TDM among key audiences in a range of communities. These resources were designed to address the questions and concerns of elected officials and other municipal decision makers. Both are available for free as downloads from www.gmf.fcm.ca.
Chapter 2: Planning TDM programs

TDM programs can target numerous audiences with multiple activities over several years, and are more likely to succeed when they are based on a thoughtful and realistic plan. This chapter outlines a four-step process to help a municipality plan a new or expanded TDM program with measures (see Appendix A) that support the community’s transportation goals:

- **Step one: Gather information**—Develop knowledge to enable good decisions by conducting a scan of current activities, talking with stakeholders, and researching key markets.
- **Step two: Set direction**—Articulate the community’s TDM vision, goals and objectives, and identify its most important opportunities and challenges.
- **Step three: Assess options**—Consider how different TDM measures could help the community achieve its goals by using a range of criteria to evaluate them.
- **Step four: Identify actions**—Build a plan of action that explains what TDM measures will be implemented and how the TDM program will strengthen over time.

These steps are summarized in the flowchart below, and the key questions to be asked at each step are summarized in Section 2.5.

By following the ideas in Chapter 2, a municipality can develop a plan for a TDM program that is appropriate for the community’s context, objectives and challenges. Delivering that TDM program successfully is the subject of Chapter 3.
2.1 Step one: Gather information

TDM plans are like business plans—they should be based on a solid understanding of key markets and competing interests.

The first step in building a TDM plan is to gather information that will enable a solid understanding of the existing situation, and lay the groundwork for identifying the TDM plan’s major directions and recommended actions (as discussed in later sections of this chapter).

It is important to know what TDM-related initiatives each branch of the municipal government has tried before, is doing now, or is planning for the future. Integrating this knowledge into the TDM plan will help identify opportunities, dodge pitfalls and generally avoid “reinventing the wheel.”

2.1.1 Scan of municipal activities

Compile a list of municipal challenges, plans, policies, programs, projects and partnerships that are relevant to possible TDM actions. Areas to investigate include public transit, active transportation, parking, development planning and approvals, public health, environmental management (water and energy conservation, air quality, climate change), parks and recreation, communications, economic development and tourism. Note that some of these areas may be the responsibility of external organizations like regional governments, district health units or arm’s-length commissions, and are addressed in the next section.

2.1.2 Scan of stakeholder interests

It is also helpful to scan the challenges, interests and activities of external TDM stakeholders and potential partners to identify their related objectives and past, present or future actions. This scan may involve the review of strategic plans, status reports, media releases and other documents. It may also involve discussions with representatives of relevant organizations.

Stakeholders to include. The broad range of possible stakeholders includes chambers of commerce and economic development organizations, school boards, university and college administrations and student associations, large employers (e.g. hospitals), major developers and property managers, adjacent municipalities and senior levels of government, social service agencies (e.g. for seniors, youth, immigrants, persons with low incomes or disabilities), festival organizers and local non-profit organizations active in environment or transportation.

This list of stakeholders may be lengthened if any of the activities identified in the previous section are the responsibility of external organizations, rather than the municipality. It may also be shortened to suit the time and resources available for the scan.

Issues to address. Key questions to ask when gathering information include:

- What challenges faced by stakeholders’ organizations, employees or customers could be overcome by improving travel options or shifting travel demand? These may be known,
high-profile challenges that contributed to the need for a TDM plan in the first place, or they could be more subtle issues that are only revealed through conversation.

- What TDM-related initiatives (i.e. facilities or services) have stakeholders undertaken in the past? Are they planning any in the future?
- What possible TDM services or activities might interest stakeholders as partners, clients or participants?

**How to gather information.** Stakeholders can be consulted by email or a written questionnaire, but talking to them by telephone or in person may spur them to be more forthcoming. In some cases, a workshop with multiple stakeholders can spark a creative, collegial atmosphere that leads to new possibilities being identified. Another step that could identify potential partners and other stakeholders in the municipal TDM planning process is to issue a public call for submissions through website notices, articles or advertisements in community newspapers, and announcements at committee or council meetings. To keep them on topic and maximize the value of their input, consider asking respondents to address a small number of focus questions, like those suggested above, and to limit the length of their submissions.

**2.1.3 Market research**

The strategies commercial marketers use to sell us soap and soft drinks are based on a thorough understanding of the overall market and key segments within it. Marketers want to know what products consumers prefer and why, and what advantages of a different product might entice them to change their behaviour.

A similar approach is taken by social marketers, including TDM practitioners, who try to influence individual behaviours for social benefit rather than corporate profit. Their thought process, known as market segmentation, identifies and analyzes groups of people with common characteristics. It is summarized in the following figure.

**Benefits.** TDM planners and practitioners can use market research to build their understanding of how people travel, why they do so, and what measures might get them to travel differently. Market research can identify groups that are most likely to adopt new behaviours, as well as those that are most likely to resist.

Another benefit of market research is that it can create a baseline for evaluation. The success of a TDM initiative can be determined by comparing, for example, the future number of bicycle commuters to a baseline measurement conducted before the initiative was conducted.

**Information sources.** While the principle of using market segmentation to support TDM planning is strong, many municipalities collect very little helpful information. Knowledge about individual travel circumstances, preferences and decisions is rare. One possible source of market research relevant to TDM is a customer survey undertaken by the local transit system to identify ridership growth opportunities and challenges. Another source could be a public opinion survey conducted as part of an active transportation planning process. Several other good Canadian examples of TDM market research are summarized in the following box.

While market research does cost money to undertake, it can add great value to future investments in TDM programs and services. They key to effective market research is to not waste resources on questions that provide little direction. The activity scan and stakeholder consultation activities described above can help
identify important questions about key travel market segments. One way to maximize the return on market research is to focus on known problem areas: if congestion in a single corridor is driving interest in TDM, surveys could help identify who is driving through that area, why, and what might motivate them to take a different route or change travel modes.

Helpful resources

Transport Canada offers two publications that can help with the information-gathering step of a TDM plan. Both are available at www.tc.gc.ca/urban.

- Changing Transportation Behaviours: A Social Marketing Planning Guide provides detailed advice on gathering information to support TDM initiatives.
- Compendium of Canadian Survey Research on Consumer Attitudes and Behavioural Influences Affecting Sustainable Transportation Options lists findings about key travel-related attitudes, perceptions and misperceptions of various parts of the Canadian population.

Examples of TDM market research in Canada

The City of Ottawa’s Commuter Travel Behaviour and Attitude Survey in 2002 used a telephone survey of 1,000 adults to gather information on current commuter travel behaviours and the underlying reasons, the potential for shifting travel demand from cars to walking, cycling and transit; and residents’ awareness of and participation in certain programs.

The Smart Commute program of Metrolinx has conducted three commuter attitude surveys, the latest in 2008, to better understand the travel choices of commuters in the Greater Toronto and Hamilton Area, the reasons for those choices, and commuters’ awareness of Smart Commute. It has also conducted a comprehensive School Travel Household Survey to help develop effective school-based TDM programs.

The Central Okanagan Region’s market research for its TDM-focused Social Marketing Strategy in 2004 included six focus groups and a random telephone survey of 823 Kelowna area residents.

The Vélo Québec Association conducted an opinion survey in 2005 (L’état du vélo au Québec) to measure cycling activity among adults, their interest in cycling more, motivators to do so, barriers that kept them from doing so, and support for various government policies and actions to improve cycling.

Major metropolitan areas (e.g. Montreal, Ottawa, Toronto, Calgary, Edmonton, Vancouver) conduct periodic origin-destination studies of their entire populations. These random-sample surveys attempt to capture all local travel by residents (but excluding children, in most cases), and provide valuable material for social marketers who can link current choices to individual age and sex, family size and structure, work and home location, and so on. However, origin-destination studies do not capture other valuable information concerning values, attitudes and preferences that have a major impact travel behaviours.
2.2 Step two: Set direction

The second step in building an effective TDM plan is to use the information gathered in the first step to create a strategic framework that sets the plan’s major directions. This framework, which includes a TDM vision, goals and objectives (see Section 2.2.1), articulates what the municipality hopes to achieve through the use of TDM. It provides a basis for identifying strategic opportunities and challenges (see Section 2.2.2) and is also useful in evaluating possible TDM initiatives, as discussed in Section 2.3.

**VISION STATEMENT.** A vision describes an optimal future. The benefit of a compelling TDM vision lies in its ability to clearly communicate to stakeholders why TDM is important by clearly describing what it can accomplish in a tangible way.

One approach to building a TDM vision is to describe how the community will look when TDM initiatives have had their fullest effect—in other words, what travel outcomes (i.e. changes to attitudes and behaviours) might be realized, and what effects those changes might have on the lives of residents. One example of this kind of TDM vision is shown in the accompanying box.

Another approach to building a TDM vision is to structure it around important community values such as quality of life, environmental health and economic growth—core values that a municipality may already have identified in a general community vision, official plan or transportation master plan. Linking TDM directly to the community’s loftiest desires and intentions is a powerful way to express why TDM is important. One example of a TDM vision that is structured in this way is given in the upper box on the following page.

**GOALS.** While a TDM vision can explain the importance of TDM at a high level, more specific goals and objectives are required as the basis for evaluating and planning actual TDM initiatives. Goals highlight the priorities of a TDM program by identifying the outcomes that warrant the greatest attention, and the activities that warrant the greatest resources. Goals can be expressed in many ways—they may focus on community outcomes, specific major program delivery components, the application of specific TDM activities or tools, or the delivery of activities through or to key stakeholders. The lower box on the following page shows examples of each of these.

2.2.1 Vision, goals and objectives

The work discussed in Section 2.1 results in a good understanding of the context for a TDM program in the community, including municipal activities, stakeholder interests and market conditions. The next task is to articulate what a TDM program can do for the community, why it is important, and who will benefit from it.
**A TDM vision based on travel outcomes**

In the future, Calgary residents will rely less on driving cars and more on walking, cycling, transit, carpooling, and telework. Those who drive will choose destinations, routes, and times that reduce their travel impacts. Trips to reach employment, education, and personal services will be shorter and more convenient. Traffic congestion and air pollution will be reduced, individuals will be safer and more physically active, and businesses will be more accessible to employees and customers. Transportation infrastructure requirements will be reduced on a per capita basis.

The City of Calgary’s TDM initiatives will contribute to this future state by improving awareness and understanding of the travel options available to the public, providing incentives to make sustainable options more attractive, and using partnerships to build stakeholder interest and commitment.

Through leadership The City will demonstrate its commitment and build strong connections among its related services, and through outreach it will actively engage individuals and other organizations in efforts to help residents make more sustainable travel choices.

— City of Calgary’s TDM Master Plan (2008)

---

**Possible approaches to identifying and structuring TDM program goals**

<table>
<thead>
<tr>
<th>Focus on community outcomes such as:</th>
<th>Focus on the application of specific TDM activities or tools such as:</th>
</tr>
</thead>
<tbody>
<tr>
<td>better public health</td>
<td>guidelines for new developments</td>
</tr>
<tr>
<td>reduced congestion and delay</td>
<td>promoting transit</td>
</tr>
<tr>
<td>improved equity</td>
<td>promoting active transportation</td>
</tr>
<tr>
<td>reduced emissions</td>
<td>promoting carpooling</td>
</tr>
<tr>
<td>enhanced safety</td>
<td>managing parking</td>
</tr>
</tbody>
</table>

**Focus on major program delivery components such as:**

- outreach
- marketing
- performance measurement
- innovation (research and development)
- cost-effectiveness

**Focus on activities delivered to or through key stakeholders such as:**

- employers and property managers
- developers
- schools and post-secondary institutions
- families
- youth
- seniors
- special events and festivals
**Objectives.** Individual goals are usually broken into objectives that are either qualitative (i.e. descriptive) or quantitative (i.e. measurable). Quantitative objectives include targets as the basis for future performance measurement, evaluation and reporting. Setting effective targets requires a “baseline measurement” (as discussed in Section 2.1.3) that describes existing conditions. Directional targets represent either a simple increase or decrease from the baseline (e.g. more people buying transit passes, fewer single-occupant vehicles parking in municipal lots). Specific targets represent a more precise change from the baseline (e.g. number of employers to engage, number of residents to be involved in special events).

**An example TDM goal and component objectives**

**Goal:** To use marketing strategies that build public support for sustainable travel options, improve public awareness of their benefits, and encourage their use

**Objectives:**
- Create a TDM program identity and use it to link and strengthen TDM messages
- Develop a social media campaign that engages individuals and enables personal communication (target: attract 300 “friends” to the program’s Facebook page in one year)
- Support events that build public awareness and encourage people to try sustainable travel options (target: double the number of special event participants over three years)

**2.2.2 Opportunities and challenges**

After setting major directions for the TDM program, it is advisable to assess the factors that both support and oppose success. Having a good sense of the opportunities and challenges facing TDM initiatives is key to developing a plan that is strategic in nature.

Opportunities and challenges should be considered and identified for several dimensions of the TDM program. For each dimension, ask the following questions:

- **What are the ideal conditions?** Identify factors or conditions that would maximize success.
- **What opportunities exist?** Identify real factors or conditions that meet or approach any of the ideal conditions.
- **What challenges exist?** Identify real factors or conditions that obstruct or oppose any of the ideal conditions.
- **What future directions are needed?** Identify the most attractive opportunities and threatening challenges that will shape future actions.

**Assessing program viability.** The first dimension to ask these four questions about is the basic viability of the TDM program as a municipal endeavour. One aspect of viability is authority and accountability, for which the ideal conditions include:

- a clear mandate for staff to implement TDM initiatives within the organization and out in the community
- a supportive TDM policy framework
- endorsement and encouragement of TDM initiatives by senior management and elected officials
- a clear TDM “figurehead” (either an individual or staff group) who is associated with the program’s objectives, communications and activities
- performance targets, and measurement and reporting protocols
The other aspect of TDM program viability is \textit{internal and external resources}, for which the ideal conditions include:

- sufficient staff and budget to enable strategic actions
- a prioritized, affordable and feasible action plan
- committed internal partners who act as champions, share an interest in key outcomes, and actively participate in coordination and implementation
- external partners who could act as champions, share an interest in key outcomes, and actively participate in (or deliver) TDM initiatives
- an intention to recognize and reward the successes of internal and external partners

\textbf{Assessing goals and objectives.} After using the four previous questions to assess overall program viability, they can also be used to assess individual TDM goals and objectives. Consider and document the ideal conditions, opportunities, challenges and future directions for each goal and its component objectives. Especially when conducted by a group like a TDM steering committee (see Section 3.2.1) this exercise can greatly enhance a municipality’s collective understanding of how individual measures could contribute to a longer-term vision for TDM.

\section*{2.3 Step three: Assess options}

After the direction-setting work discussed in Section 2.2, the next step is to identify the most appropriate TDM measures to include in the municipal program. This section discusses criteria that can help evaluate different TDM measures (including those in Appendix A).

\textbf{Impact.} Understanding the potential impact of a measure in key areas is always important. A commonly assessed impact is the expected degree of change in individual travel behaviours—for example, how many people might be motivated by a particular project to switch from driving alone to walking, cycling, transit or carpooling. This is a very challenging question to answer, as human responses to change are always somewhat unpredictable.

Some modelling tools do exist that could help predict the impacts of TDM measures on travel behaviour (see the box on the following page). However, local knowledge and experience are probably the most reliable tools for estimating behavioural change. Questionnaires that ask people about the likelihood of changing behaviour in response to a given measure can give a rough picture, but are notoriously unreliable. How people say they would react hypothetically is often very different from how they do react when faced with reality.
Models that can help predict travel behaviour impacts of TDM measures

Transportation models (e.g. EMME) are maintained by larger municipalities and can reflect the impacts of changes in travel time, out-of-pocket costs, transit service quality and car ownership. However, they do not address active transportation well and cannot consider less tangible factors such as the relative comfort and security of travel options.

Economic models use elasticities to assess the different choices that may result from price changes.

Choice models that simulate consumers’ rational trade-offs are very flexible but must be customized using market-specific data (e.g. stated preference surveys).

Integrated land use and transportation models can consider the effects of land use mix and density, but are complex and costly.

Program models to evaluate specific TDM measures, such as TRIMMS (Trip Reduction Impacts for Mobility Management Strategies), a sketch-planning tool calibrated using American data.

Other tools to estimate TDM outcomes

Transport Canada’s Urban Transportation Emissions Calculator (UTEC) is an online tool to estimate emissions from personal, commercial and public transit vehicles (see www.tc.gc.ca/utec). Key information from UTEC for different Canadian regions has been summarized in Section 3.2.5 of Workplace Travel Plans: Guidance for Canadian Employers, (see www.tc.gc.ca/urban).

The Canadian Automobile Association’s Driving Costs brochure (www.caa.ca/drivingcosts) can help estimate the costs of car ownership and operation. Other travel costs related to parking, tolls and transit fares depend on local conditions. The costs of delay due to congestion are difficult to estimate, as are the social costs of transportation activities (e.g. construction, maintenance, pollution, noise) arising from an average trip.

Helpful resource

For those seeking a compilation of measured TDM impacts in a variety of areas, ACT Canada’s report The Case for TDM in Canada: Transportation Demand Management Initiatives and Their Benefits is a reliable source (available at www.actcanada.com).

Cost. Nominally similar TDM measures can have widely varying costs. For example, promotions using social media like Facebook and Twitter will cost less than those using television and radio ads; similarly, incentives can range from inexpensive giveaways to substantial discounts or rewards. This flexibility to plan measures to fit an available budget is one of the advantages of TDM over conventional infrastructure. However, when evaluating the costs of individual initiatives or the achievement of certain objectives, it is necessary to consider what will be done by whom, and how. Cost estimates can be more illuminating when direct costs (those borne by the municipality) are accompanied by leveraged costs (those borne by partners). Two projects with similar direct costs but different leveraging potential are likely to be viewed differently; greater leverage likely means greater impact.
**Feasibility.** There are many dimensions to the feasibility of a possible TDM measure. Whether it is likely to be easier or more challenging depends on the requirement for staff time and budget, and the difficulty of acquiring or developing needed tools and resources. It is quite possible for some measures to have short-term windows of heightened feasibility, due to financial or political opportunities, that will pass if not acted on. For TDM measures that involve partnerships, it is important to assess the engagement of key partners and stakeholders, and the difficulty of coordinating heightened levels of involvement. Finally, legal or regulatory barriers may impact on the feasibility of certain measures.

**Immediacy.** This criterion reflects the time it will take to implement a measure and reap the benefits. Some measures can be undertaken quickly but take years to show results; others may take years to implement but show rapid results. It is important to be realistic and avoid underestimating the time needed to implement measures and see results. TDM programs can involve many concurrent measures that compete for staff time, and the competition for attention and effort of partners can also be fierce (especially when the project is outside partners’ core interests, as with school or workplace travel plans). There are many stories of TDM projects being delayed for months or even years because of turnover in a single staff position. Results also tend to be slow because masses of people rarely change behaviours suddenly; rather, individuals tend to change travel behaviour when other life changes occur (e.g. a new job or family member, improvement or decline in health or financial circumstances, and so on).

**Value.** Value is the balance of costs against benefits. A TDM initiative that achieves moderate gains at a moderate cost will offer less value than another offering greater gains at a lower cost. Applying a value scale to compare different TDM measures is one way to highlight key differences among them, and can also help to make the business case for measures that end up being recommended.

**Risk.** Risk considers confidence in a measure’s impact and cost estimates, as well as its feasibility and immediacy of results. Comparing options on the basis of risk can highlight those that are quick wins (immediate, feasible, high confidence) as opposed to long shots (slower, less feasible, lower confidence). Particularly when starting a new TDM program, lower-risk measures are a more attractive starting point. Early success is a good way to build momentum and validate TDM approaches; it also might not be advisable to begin a new program with measures that face technical obstacles, require years to work, and are subject to substantial cost overruns.

**Role.** Within a TDM program, some measures act as important precursors or foundation elements that enable and strengthen others. For example, it may be hard to persuade employers to develop workplace travel plans before the municipality has a “value proposition”—i.e. a group of services and programs (e.g. a carpool ridematching service or discounted transit pass program) that it can offer as an incentive for employers to become engaged.

**Strategic Importance.** A final criterion to assess possible TDM measures is the extent to which each measure will contribute to the TDM plan’s goals and objectives. Even a simple approach to gauging a measure’s impact on each objective (e.g. a low, moderate or high rating) can help identify the relative importance of each option within the strategic framework. Knowing that a particular measure is strategically important may compensate for low ratings in other areas. For example, a highly strategic measure may be considered a priority despite weak value or risk ratings; likewise, a low-risk, high-value measure may be delayed if its impacts are in an area of low importance.
2.4 Step four: Identify actions

The final step in developing a TDM plan is the identification of actions to be undertaken. Ideally, this is more than a list of tasks or measures drawn from those in Appendix A—it should be the story of how those tasks will accomplish the TDM program’s goals and objectives.

**Audiences.** The action plan component of a TDM plan has several audiences. These include decision makers, who want to know the rationale for each action as well as its expected outcomes and costs. Managers also want to know what resources are needed to deliver the program, who needs to be involved, what risks to watch for, and how to evaluate performance. TDM staff want to know what they are expected to deliver, how and by when. Finally, stakeholders and partners—both inside and outside the municipal organization—need to know their roles and responsibilities, and the importance of the part they will play.

**Contents.** A well-rounded action plan will include the following information:

- action descriptions, including major TDM program elements, their component tasks and key deliverables
- high priority tasks such as key foundation elements or quick wins
- roles and responsibilities for each task, and a roll-up for each key stakeholder including TDM staff, internal partners and external partners
- expected timelines for individual tasks, and a roll-up for each calendar year (or other time periods as needed, e.g. by quarter or fiscal year)
- costs and funding sources for the entire program, key elements and individual tasks, and a roll-up by quarter or year
- desired outcomes for key program elements and individual tasks, and a roll-up by market segment or other theme as appropriate
- performance measurement indicators and targets, and monitoring and evaluation activities for the overall program and for key elements and tasks
- a communications strategy that addresses key messages and channels, public engagement approaches including outreach and social media, and program reporting
- a continuous improvement process, including timelines for revisiting and updating the TDM plan as needed

Despite this long list of desirable elements, it is not always possible or necessary to develop a detailed multi-year action plan right away; it may simply be beyond the short-term capacity of involved staff. Instead, a municipality’s first action plan may well be more strategic. For example, it could identify goals and objectives, key market segments, and an approach to identifying a detailed stand-alone action plan for each priority area. This approach could lead to
the subsequent development of one action plan for workplace partnerships, another for school outreach, and a third for internal municipal programs. One advantage of this approach (other than its respect for capacity constraints) is that key stakeholders (e.g., elected officials) will be able to endorse a “big picture” document without having to absorb a large amount of detail or needing to approve actions they are not yet fully comfortable with. A preliminary action plan can also specify general frameworks for resource needs and expected outcomes, leaving future action plans to flesh out the details.

**Helpful resource**

Performance measurement for TDM is key to demonstrating success and building buy-in, but it can be very challenging. Transport Canada’s *Canadian Guidelines for the Measurement of Transportation Demand Management Initiatives—User’s Guide* can help (see www.tc.gc.ca/urban). The guidelines are applicable to a range of TDM initiatives and offer a step-by-step framework for practitioners to choose impact measurement techniques that suit their application and local context.

Chapter 3: Delivering TDM programs

After working through Chapter 2 and completing a plan for the municipality’s TDM program, the process of implementation begins. The wide range of possible TDM measures (see Appendix A) means that this guide cannot address the delivery of specific initiatives—a subject better addressed by more specialized guides. However, Chapter 3 does discuss three keys to enabling the successful delivery of TDM programs that might involve any number of measures:

- **Building capacity**—Provide strong leadership, develop supportive policies, and ensure adequate levels of staffing and funding.
- **Working collaboratively**—Coordinate the actions of internal stakeholders, build external partnerships, and take advantage of opportunities for alternative service delivery.
- **Engaging audiences**—Use messaging, branding, Internet communications, special events, recognition, reporting and media relations to build dialogue with TDM stakeholders and customers.

This chapter will help build a stronger foundation for the municipality’s TDM program, and enable effective delivery of the TDM plan developed in Chapter 2.

### 3.1 Building capacity

The capacity of a TDM program to achieve success can be elevated through strong leadership (Section 3.1.1), supporting policy (Section 3.1.2), and adequate staffing (Section 3.1.3) and funding (Section 3.1.4).

#### 3.1.1 Executive leadership

**Benefits.** Leadership among elected officials and senior managers is critical to the success of a municipal TDM program. Ideally, a *TDM champion* will emerge who can be a role model for staff and the public, an ally in public debate, a spokesperson to the public and media, a sponsor for new initiatives, and a mentor for additional champions over time.

**Fostering leadership.** As discussed in Section 1.2.2, TDM suffers from limited attractiveness as a political issue—and for this reason, a high-level TDM champion may not emerge naturally. It may be more practical to seek champions on an issue-by-issue basis, by positioning TDM’s varied benefits in a way that reflects the specific interests of potential leaders: for example, a municipal councillor who cares about improving child safety around schools or making neighbourhood businesses more prosperous; a medical officer of health who sees walking and cycling as a public health measure; or the director of a social planning council who wants new immigrants to be more comfortable using public transit to reach employment and education.
On an issue-by-issue basis, these supporters can be critical to building support for individual TDM initiatives. Over time, the TDM program will build its own political capital and attract champions who see TDM as a flexible approach to meeting a wide range of community goals.

3.1.2 Policy support

Policies remind decision makers about what to do (or not do) in certain circumstances. A strong framework of supporting policies can help ensure that future decisions are consistent with a TDM plan, and support its delivery.

An effective TDM policy framework can involve plans in many other areas (land use, transportation, municipal facilities, environmental management, public health) that touch on issues related to TDM. These connections remind decision makers that TDM is not a straightforward transportation service like snow clearance or vehicle licensing—rather, it is an interdepartmental approach to meeting community goals by influencing the daily travel decisions of residents.

TDM-supportive policies are crucial to the effective delivery of many TDM measures. For example, it can be difficult to promote bicycle commuting if workplaces do not offer bicycle parking, showers and change rooms. However, those features add to the costs of commercial development and, unless zoning by-laws require them, they are likely to be resisted by many developers.

Many municipal policy documents should be reviewed to maximize policy support for TDM, including: land use plans (from official plans to neighbourhood plans), zoning by-laws, transportation plans (including transit, active transportation and parking plans), and public health, recreation and environmental management plans.

It is helpful that municipal policies can “trickle down” from one plan or statement to another. For example, official plan policies will guide the creation of a transportation master plan, and transportation plan policies will guide the creation of a TDM plan. Policies can also “trickle up” from one plan or statement to another—and this is a real opportunity for TDM practitioners to broaden the effect of their work. For example, TDM plans could identify deficiencies in transportation plans or land use plans that need to be fixed when those plans are updated in the future.

3.1.3 Staffing

**Need for TDM staff.** At their most effective, TDM programs create a cultural shift within governments and across communities. This kind of change requires many eyes to spot opportunities, many minds to build partnerships, and many hands to deliver initiatives. Developing TDM tools, processes and relationships is labour-intensive work, and tackling serious transportation challenges through TDM demands serious resources.

Having sufficient TDM staff within a municipal government and its partner organizations is essential to success. However, TDM is a discipline that lacks resource-based benchmarks or standards for municipalities, and it tends to struggle to compete with the staffing needs of more established municipal services.

**Role of a TDM coordinator.** It is increasingly common for municipalities to hire a single “TDM coordinator” to plan and deliver TDM initiatives. This person may be located in one of many municipal departments—usually in planning or engineering, but possibly in transit, health, social services, or elsewhere. He or she typically works closely with colleagues in all of these areas, playing a central coordinating and facilitating role with planning, monitoring and reporting responsibilities.

Over time, individual TDM coordinators can build momentum and achieve some success, but they cannot single-handedly influence the travel decisions of tens or hundreds of thousands of other people. It is simply not realistic to expect one or two practitioners to make significant
progress in overcoming the transportation challenges facing a typical medium or large municipality. A shortage of staff cannot be counterbalanced with budgets for contractors and consultants, because of the time and energy required to responsibly manage those expenditures.

**Number of Staff.** So, while it is relatively easy to say that one or two TDM practitioners are needed to enable any kind of effective delivery, it is more difficult to identify an optimal number. In fact, no Canadian community has reached an optimal level of TDM service delivery—and most communities with approved TDM policies and plans are far short of the staffing levels they would need to deliver them (even the Greater Toronto and Hamilton Area, where governments and their partners employ at least 30 full-time TDM practitioners in 2010, could make effective use of many more).

Any community of at least 20,000 people that wishes to develop a TDM program could benefit from having at least one full-time TDM staff person. Based on Canadian experience, it is suggested that a minimum of one full-time TDM practitioner for every 100,000 to 200,000 residents would enable a meaningful impact on larger communities. These practitioners may be distributed among government agencies, or employed by NGOs that deliver services on behalf of a municipality.

As noted above, the optimal staffing level for TDM programs will depend on the nature and desired outcomes of the services being delivered. An analogous issue is illness prevention—i.e. how many people should be working to prevent illness in a community? Clearly, there is no straightforward answer—it will depend on the illnesses being targeted, the nature of the audiences, and the measures being delivered. For TDM programs, a prudent approach is to start small but continually build human resources over time, as they are needed to deliver promising initiatives.

**Skills to Look for When Hiring.** TDM is a demanding discipline. Practitioners do not require transportation experience, but they do need an interest in transportation issues and a willingness to learn more about them. The following attributes would be very helpful to any person playing a TDM coordination role:

- *municipal experience*—how decisions are made, how to navigate a bureaucracy
- *business experience*—what interests the private sector, how decisions are made
- *marketing and customer service experience*—understanding consumer behaviour, focusing on client needs
- *volunteer experience*—what motivates volunteers, how to build and leverage capacity
- *communication skills*—speaking with energy, writing clearly and accessibly
- *quantitative skills*—understanding and expressing travel data, creating spreadsheets and charts
- *people skills*—listening, enthusiasm for building relationships, desire to help others
- *pragmatism*—ability to recognize and pursue what works, good judgment in weighing practice versus theory
- *drive and determination*—love of challenge, willingness to take risks, ability to learn from failure
- *passion*—for cities, for people, for change

It is worth noting that these skills are not linked with any one academic curriculum or professional certification. Job applicants are best judged on individual merit and experience.

**Improving Skills.** Because TDM practitioners are unlikely to have all the skills listed above, ongoing professional development opportunities are vital. Training in areas including leadership skills, project management, media relations and public speaking is particularly valuable.
Practitioners also need to keep track of how TDM is working and evolving in other Canadian communities and internationally. Conferences, webinars and workshops allow them to meet and learn directly from their peers, and to build relationships that enable ongoing communication and advice.

Helpful networking resources

ACT Canada is the country’s only national organization devoted to sustainable mobility (see illustration below), and has focused on TDM for almost a decade. It holds annual conferences featuring international speakers and the results of Canadian experiences. See www.actcanada.com for more information.

The TRANSP-TDM listserv is operated by the Center for Urban Transportation Research at the University of South Florida. It is an active forum for information exchange and maintains an extensive archive with years of postings. See www.cutr.usf.edu/tdm for more information.

3.1.4 Funding

FUNDING AMOUNTS. Having adequate TDM staff and supportive internal partners will help a municipality to achieve some success, even with limited financial resources. Creative practitioners and their partners have been known to fund TDM measures by drawing on municipal budgets for public transit, active transportation, traffic management, health, recreation and environmental management. However, it is likely that transparency and accountability will eventually require the availability of TDM operating funds.

As with staffing, TDM funding can grow over time as plans are implemented and services expand. However, Canadian experience indicates that a rough annual budget of $0.50 or more per capita (excluding staff salaries) would allow delivery of basic TDM functions. Again, this amount will not enable substantial success against real challenges—but it does represent a starting point.

FUNDING SOURCES. While a few regional transportation authorities are funded by fuel taxes or vehicle registration fees, most of Canada’s municipalities rely on property taxes to fund public services such as TDM programs. Several other sources of TDM funding may be available, depending on local circumstances:

- **Fee-for-service arrangements** for some TDM programs, such as assistance to employers, can generate revenues that offset some costs. Experience has shown that only larger metropolitan areas are likely to offer market conditions that support such arrangements.
- **Partners** including school boards, business associations, festival groups and event sponsors may contribute financially to TDM initiatives that benefit them.
- **Development charges**, which are levied to pay for growth-related capital projects (e.g. new roads, libraries and community centres). Depending on legislative and regulatory frameworks, development charges can raise revenues for TDM programs that are expected to reduce the capital cost impacts of new development. As an example, the Town of Markham, Ontario funds its entire TDM program through the community-wide development charges assessed on new homes and commercial developments.
- **Parking fees** from off-street municipal lots and on-street spaces are often returned to general municipal revenues, but a portion of them
could be redirected to TDM programs. As an example, in Ontario the City of Mississauga’s parking program funds both a municipal TDM staff position and the Smart Commute Mississauga organization. This idea of using parking fees paid by drivers to improve transportation options for everyone can be politically palatable (it helped win public support for the congestion charging scheme in London, England) and also provides a degree of funding security.

- **Transit fare revenues** support transit operations, including conventional marketing activities. A portion of fare revenues could be used to support TDM programs that contribute to the achievement of transit ridership objectives.

- **Philanthropic foundations** may be willing to support TDM projects that are focused on improving a community’s social, public health or environmental outcomes.

- **Provincial and/or federal government programs** may offer support for projects related to sustainable transportation, health or the environment, but the specifics of such programs vary by jurisdiction.

- **The Green Municipal Fund** of the Federation of Canadian Municipalities offers support for a variety of projects, including grants for up to 50% of the cost of sustainable transportation feasibility studies and field tests (maximum $350,000). See www.gmf.fcm.ca for more information.

### 3.2 Working collaboratively

As mentioned in Section 1.2.3, working with others is a key to TDM success—it can maximize resources, increase reach to key audiences, and propagate social and organizational change. For this reason, most municipal TDM staff act as the “hub” in a wheel with many spokes—they wield influence, rather than control. It is worth noting that this culture of collaboration may be more natural to outreach-focused community planning, social service and public health departments than it is to more technical engineering groups.

#### 3.2.1 Internal coordination

**Steering Committee.** Coordination of TDM initiatives within a municipality is essential because of the many linkages among services. Formation of a steering or advisory committee can help stakeholders to stay informed of plans and actions, and to maximize synergies while minimizing conflicts.

Such a committee may include representatives of engineering, planning, health, recreation, environment, communications, social and economic development services. Local transit and parking operations are particularly critical members. Regular meetings can help cement personal relationships and encourage informal discussion in a way that email and phone conversations cannot. By emphasizing the cooperative nature of TDM programs, the committee can also become a forum for sharing staff and financial resources.

**Stakeholder Education.** More broadly speaking, internal education is advisable to build awareness of the TDM program, its methods and objectives among municipal staff, managers and elected officials. It can prevent the inadvertent introduction of new obstacles to TDM measures. Municipal staff in diverse departments, and particularly those responsible for planning and engineering, should understand sustainable transportation and TDM sufficiently to know how they can contribute to the solution, rather than be part of the problem. One path to improving their knowledge is through participation in webinars or other educational opportunities provided by outside organizations.
Municipal staff who have a close relationship to TDM services can benefit from extra learning or training opportunities. For example, development approvals staff require a clear understanding of the features that make new development TDM-supportive, and of the importance of working with developers to integrate those features. Tools that can help development approvals officers fulfill their role include checklists, guidelines and constructive critiques of previously approved developments that highlight both positive and negative features.

### 3.2.2 External partnerships

As discussed in Section 1.2.3, municipalities need institutions, businesses and community organizations to be actively involved in their TDM programs. In each case, these relationships are based on common interests and shared objectives. Many of the TDM measures identified in Appendix A exhibit the need for partnerships (ranging from informal collaboration to formal agreements) with workplaces, schools, post-secondary institutions and community groups.

**Benefits.** The benefits of partnerships include:

- **gaining support**—by demonstrating the broad interest and involvement that can convince decision makers of a TDM program’s value
- **leveraging resources**—by motivating external partners to invest in areas that interest them (e.g. investment by an employer in its own workplace, by a school board in its schools, or by an environmental group in TDM programs that raise awareness of climate change)
- **extending reach**—by opening up service delivery channels to access new markets, such as through a partner’s website, newsletters, meetings or events
- **enhancing credibility**—by ensuring that TDM messages come from independent sources, as well as from government
- **reducing risk**—by reducing the overall risks to the program of any one partner withdrawing its resources or participation

### 3.2.3 Alternative service delivery

Contracting with private or non-profit organizations to deliver specific TDM services can be a realistic option for municipalities. Transit authorities, where they are separate from the municipality, are another alternative.

**Service types.** External providers can deliver a number of services such as special event promotion and management (e.g. Bike to Work Weeks), school outreach (e.g. Active and Safe Routes to School programs, youth engagement and skills training), employer outreach (e.g. commuter surveys and other travel planning assistance, employee engagement, transportation fairs and other workplace events), and cycling skills courses available to the general public, workplaces or other targeted audiences.

**Benefits.** External service providers can offer several potential benefits:

- They can offer pre-existing relationships with key stakeholders (for example, a chamber of commerce might effectively deliver TDM services to employers). When dealing with those stakeholders, they do not bring with them the weight of municipal government (which could be either positive or negative depending on the stakeholder, service provider and government in question).
- They can have lower operating costs for accommodations, salaries and benefits. They can also leverage revenues from third parties that may be unavailable to municipal...
governments (e.g. from private-sector sponsors or senior government programs).

- They have less challenging approval processes for communications and purchasing. They also have less burdensome staff hiring processes, and greater flexibility in hiring term or part-time workers.
- They can operate without the disruption of labour stoppages, councillor inquiries, and (with longer-term contracts) election years and annual budget uncertainties.

**Key Issues.** Following good contracting procedure, TDM service agreements must be based on a clearly defined scope, deliverables, timelines, quality expectations and performance measurement criteria. It is also important to define communication protocols early in the process: Should messages to clients and the general public be seen as coming from the service provider and/or the municipality? Should branded programs carry the identity of the service provider and/or the local government? Who should handle media inquiries?

It is important to emphasize that TDM programs cannot be completely outsourced—municipalities must preserve critical policy, leadership and program development functions. Outsourcing arrangements also need to avoid creating a dependency on any single service provider, which can lead to future terms and conditions that are less than competitive.

**Transportation Management Associations (TMAs).** TMAs are one way to offer TDM services to employers. They can take different forms:

- The Greater Toronto and Hamilton Area has a network of eleven local Smart Commute organizations in 2010—some are independent non-profit organizations, some are programs delivered by local chambers of commerce or boards of trade (which can leverage established employer relationships), and others are municipal government services. All rely primarily on government funding to stay in operation (see www.smartcommute.ca for more information).
- In Quebec, several *Centres de gestion des déplacements* (CGDs, the French equivalent of TMAs) exist in the province’s largest cities. All are non-profit organizations, and rely significantly on government subsidies received by their clients (for more information see www.acgdq.com).
- In Vancouver, groups of employers in shared geographic areas work together under the banner of a TMA, with help from TransLink but without any formal organizational basis.

TMAs have the potential to be dynamic, efficient organizations. Like Quebec’s CGDs, they can generate revenue by providing valued services to workplaces—however, they are very unlikely to be financially independent. In Quebec, CGD revenues from employer fees are largely subsidized by the provincial government; in Toronto, the rates of cost-recovery by TMAs are less than 20%. TMAs can also be susceptible to poor performance if they lack the motivation of close government ties or funding conditions tied to outcomes. In short, the viability of independent TMAs in Canada is far from proven.

A more practical and controllable approach to alternative service delivery for employer-facing programs might be a straightforward service contract with a local non-profit organization. Another option would be to retain a for-profit business to deliver services in the manner of a TMA using a pay-for-performance contract. This model is being applied by Smart Commute Brampton-Caledon in Ontario, which has hired consultants to deliver services, but is otherwise untested in Canada. It is more common in the United States.
3.3 Engaging audiences

3.3.1 Messaging

**BENEFITS.** TDM programs are a chance for municipalities to talk with residents about options for getting around, and how to take advantage of them. The messages they deliver can support behaviour change by shifting the competitive position of different travel choices, and by “detaching” the desire for personal mobility from the assumption of car use. The culture of many communities holds that driving is the natural travel choice for most people, and that transit, carpooling, cycling and walking are most appropriate for low-income or athletic individuals. To change this culture, those communities must work to make the public image of sustainable travel choices more mainstream and attractive, with greater perceived benefits for users (e.g. fitness, cost savings, time savings) and the general public (e.g. congestion reduction, pollution reduction, lower public expenditures).

**KEY ISSUES.** It is important to not oversell sustainable travel choices by claiming benefits that are unlikely to be realized. Equally, it is important to not promote choices that people feel are remote or unavailable—for instance, promoting cycling in a neighbourhood where on-road safety is an acknowledged issue, or where promised cycling facility improvements are yet to be built.

It is also advisable to avoid positioning car use as “undesirable.” Many people reasonably feel that driving is their only choice to meet day-to-day obligations. TDM messages that criticize their travel decisions may only create hostility. Instead, messages about how people can drive efficiently, when they must drive, are both inclusive and constructive.

3.3.2 Identity and branding

**BENEFITS.** A memorable identity can help a TDM program build a long-term relationship with residents. At their best, program identities become brands—and successful brands enjoy customer confidence and loyalty, as shown by commercial examples like Apple Computer or Walmart. However, strong brands are based on consistent, positive customer experiences—that is, they require long-term commitment and they are earned rather than manufactured.

TDM program identities can help consumers and program partners to “connect the dots” by linking different products and services together (e.g. carpool programs, cycling skills courses, telework training, discounted transit pass programs). They position sustainable travel options as a mutually supportive suite of choices that offer more flexibility and convenience as a group than they do individually.

**KEY ISSUES.** One issue to tackle when developing a TDM program identity is to determine how it relates to other sustainable transportation services and programs that may have their own identities, such as public transit and carpool ridematching services. Overlapping or conflicting identities can confuse individuals who are looking for information or assistance. Another issue to consider is how a TDM identity relates to the identity of its parent organization. Government agencies typically have protocols that limit the scope and use of program identities; only in occasional cases (such as Metrolinx’s Smart Commute and the Central Okanagan’s i-Go!) will a TDM program identity likely gain its own meaning independent of its parent organization(s).
Local or regional TDM program identities in Canada

In Vancouver, TransLink’s TravelSmart program began as an individualized marketing pilot project and has now become the organization’s umbrella identity for promoting multimodal travel options (see www.travelsmart.ca for more information).

The City of Ottawa’s TravelWise program identity has been in use for a decade, and the name and logo have been shared with the Region of Waterloo (see www.ottawa.ca/travelwise and www.region.waterloo.on.ca/travelwise for more information).

The i-Go! program is supported by the City of Kelowna, West Kelowna and Westbank First Nation (see www.i-go.ca for more information).

In the Greater Toronto and Hamilton Area, the Smart Commute program identity developed by Metrolinx encompasses eleven local Smart Commute organizations that deliver TDM services (see www.smartcommute.ca for more information).

In the Montréal metropolitan area, the Agence métropolitaine de transport (AMT) has created the allégo program identity as an umbrella for its TDM services (see www.allego.amt.qc.ca for more information).

3.3.3 Internet use

**BENEFITS.** It is essential for TDM programs to have a strong Internet presence. The Web, email and social media greatly reduce the cost of program communications, increase convenience for users, and create new marketing channels for reach key audiences.

**KEY ISSUES: WEBSITES.** TDM programs commonly offer a central Web site as a clearinghouse for information on individual travel choices and TDM program initiatives. This site is usually located within a local or regional government’s Web site, unless an independent program identity has been established. An accessible and effective Web site can substantially reduce the amount of time that TDM staff members must spend answering questions or mailing out flyers and application forms. Web-based information technology also allows a Web site to act as an automated hub for sending out newsletters and other communications to interested individuals.

TDM program Web sites can evolve into portals that offer features such as multimodal travel planners, live traffic cameras, weather and collision reports, road construction notices, efficient driving tips, and links to air, rail and intercity bus carriers. Even though broadening a Web site’s scope in this way can dilute the core TDM message, there is definite public benefit in centralizing travel information. There is also a valuable opportunity to greatly increase the number of people who are exposed to the TDM program’s messages and services when they visit the site for other reasons such as traffic reports.

**KEY ISSUES: SOCIAL MEDIA.** One of the keys to effective marketing is to place products where people happen to be looking. Today, that means social media—the most important of which are Facebook, Twitter and YouTube (although the pace of change is dramatic).
**3.3.4 Special events**

**BENEFITS.** Special events serve many purposes within a TDM program. First, they validate and build awareness of sustainable travel choices by promoting them through media coverage, political endorsements and celebrity involvement. By encouraging visible displays of sustainable travel (e.g., a temporary increase in cyclist volumes) they shift social norms and build public acceptance of those options. They encourage people to try a new way of getting around, even for just one day, and provide positive reinforcement for people who already make regular use of sustainable travel options. Finally, they attract sponsors and partners who may then become more involved in other aspects of a TDM program.

**KEY ISSUES.** TDM practitioners can easily underestimate the resources required to successfully organize, promote and deliver a special event. Engaging individuals, business, community organizations and media is a time- and energy-consuming activity. When in doubt, a good strategy is to launch a new event by setting manageable objectives for participation, possibly by limiting the initial scope. Delivering a small but successful event is a good way to build momentum for subsequent years.

**TDM-related special events across Canada**

Many municipalities and non-governmental organizations conduct or sponsor special events that are consistent with TDM objectives, including:

- Bike (and Bike to Work) Day, Week or Month
- Commuter Challenge events
- International Car Free Day and In Town Without My Car Day
- International Walk to School Day or Month
- RideShare Week

Variations on these events are too numerous to list, and change frequently. Readers are encouraged to search the Internet for more information.
3.3.5 Advertising

**Benefits.** The publicity gained through advertising can play several important roles in a TDM program. First, it can build understanding of key issues and help influence attitudes, such as through an active transportation messaging campaign using bus boards, shelter ads or community newspapers. It can raise awareness of opportunities to participate in TDM initiatives, such as using local business publications to reach employers. It can also raise awareness about special events, such as promotion of Bike to Work Week through radio spots, or of employer recognition awards through print ads in business tabloids. Finally, it can provide clear and timely public information, such as notices of new services, application deadlines, or public review periods for reports.

**Key Issues.** For community-oriented information, weekly or monthly community papers can offer greater effectiveness and value than daily newspapers, particularly in larger markets. Electronic media can also be useful in reaching large numbers of people with a focused message. Although television ads are expensive, radio spots can be more economical or even virtually cost-free if they are positioned as public service announcements.

3.3.6 Recognition

**Benefits.** Positive reinforcement is helpful in encouraging and reinforcing any form of behaviour change. Public recognition of stakeholder efforts and successes is a valuable component of any TDM program.

**Key Issues: Awards.** The TDM-related awards used in Canadian communities include employer awards that recognize workplaces (and the people within them) that have made substantial travel planning efforts, and cycling-friendly business awards that recognize workplaces or merchants that have improved and promoted bicycle commuting and/or made cycling more attractive for customers. They also include individual awards for citizens who have played significant leadership roles in TDM programs or the pursuit of sustainable transportation, and special event awards that recognize organizations achieving high rates of participation among employee or student populations.

**Key Issues: Other Forms of Recognition.** Of course, recognition need not take the form of awards. It can also include public identification (e.g., through newspaper ads or a municipal Web site) of workplace or school partners, advisory committee members, special event participants or others who have supported TDM initiatives. Holding an event dedicated to recognition gives elected officials and other champions an opportunity to enhance their visibility on the issue, and for TDM stakeholders to meet each other and celebrate their successes together.

**Examples of TDM program awards**

The Smart Commute program of Metrolinx gives out several Employer of the Year awards, and a Champion Award for outstanding contributions by other individuals or organizations.

The City of Ottawa’s Bruce Timmermans Cycling Awards recognize annual contributions by individuals and organizations. They also offer cycling-friendly designations to business, organizations and other destinations that offer facilities and services to make cycling more attractive.
3.3.7 Reporting on program results

**Benefits.** Regular publication of reports on the status of the TDM program and individual initiatives, including measured results and individual stories or testimonials, serves a number of purposes. Reporting is part of program accountability and building the case for continued investment; it offers a chance to recognize contributors; it is an opportunity to validate TDM concepts and build understanding of their potential among the general public; and it can leverage media coverage to provide broad program exposure.

**Key issues.** As discussed in Section 2.4, a TDM program’s performance measurement activities will provide much of the key material for program reports. This information is vital, as it can help justify the continuation or expansion of program resources. However, many Canadian TDM programs have struggled with program reporting due to difficulties with performance measurement, often springing from a lack of technical knowledge and inadequate staff and funds to undertake needed surveys and observations. Remaining aware of this pitfall and seeking ways around it will increase the odds that a TDM program report will contain tangible evidence of success.

3.3.8 Media relations

**Benefits.** Media attention for TDM programs and initiatives can be much more than free publicity. It can validate the existence of a TDM program, and strengthen social norms around sustainable transportation choices. Positive “buzz” is also noted by elected officials and community partners, who may see an opportunity to lend their support and share the limelight.

**Key issues: challenges.** Fostering positive media relations around TDM programs can be a challenge. While media are generally supportive of the notions of outcomes like congestion or pollution reduction, reporters and editors can find more news value in critiques of government initiatives as inadequate or wasteful. The longer-term nature of TDM initiatives distinguishes them from more conventional transportation projects and their “ribbon cutting” opportunities. Their real news value lies not in a top-down narrative, but in the stories of individuals, businesses and institutions that benefit from them.

**Key issues: suggested approaches.** Promotional measures around special events or new services can identify “good news” stories for media use. Actions by residents, businesses and schools (not governments) offer human interest and encourage stories about outcomes rather than process. An added benefit of such stories is that they support the goal of shifting social norms by publicizing people who have changed their travel behaviour and benefited by it.

Because many TDM activities focus on the participation of local individuals, schools and businesses, community newspapers can make strong allies. It can help to have program partners make their own media contacts; this reduces municipal influence over the resulting story, but can make the story itself more attractive.

Generally, a successful media relations program must be based on more than a defensive approach of identifying sensitive issues and preparing question responses. It must proactively educate key editors and reporters about the scope of the challenge and the response, and provide media-friendly story opportunities. It is wise to respond quickly to media requests, and to have people ready to discuss their stories. On the whole, it is far better to engender a collegial relationship rather than to have an adversarial one develop by chance.
### 3.4 Summary

#### Delivering TDM programs

<table>

Appendix A: **TDM measures**

This Appendix provides a concise scan of measures that could be delivered through a community TDM program. These are presented in three sections:

- **modal measures** that make sustainable travel options more competitive to driving alone, by improving their profile and making them more accessible, comfortable, convenient, affordable or safe
- **outreach measures** that allow municipal governments to reach out and engage organizations and individuals, both to create delivery channels for municipal measures and to motivate independent action by partners
- **leadership measures** that municipalities can undertake within their own operations to further TDM objectives directly, and to act as role models for other organizations

Consistent with the discussion in Section 1 of this guide, most of these measures in this Appendix address the social and economic factors behind the travel choices that individuals make. However, some measures that target physical factors are included because they have strong links to the delivery of other TDM measures. For example, physical improvements to bicycle parking are included because they are often delivered as part of workplace or school travel plans, or within municipal leadership initiatives. Otherwise, this Appendix does not address major transportation infrastructure or land use measures such as public transit services or facilities, bicycle lanes or trails, high-occupancy vehicle lanes on freeways or arterial roads, or transit-oriented development.

### A.1 Modal measures: Improving travel options

#### A.1.1 Active transportation

**Promote a culture of active transportation**
- Messaging campaigns to advance active transportation’s competitive position
- Special events to promote walking and/or cycling at a community-wide or neighbourhood scale
- Awards to recognize corporate, community or individual contributions to active transportation

**Increase trial of active transportation options**
- Special events to promote walking and/or cycling at a community-wide or neighbourhood scale
- “Open street” events (e.g. ciclovias) to encourage fun, family-oriented trial of active transportation
- Promotion of bike sharing services (e.g. BIXI service in Montréal, QC)
**Improve Cyclist Convenience, Confidence and Safety**
- Maps that illustrate active transportation facilities and recommended routes
- Trip planning (online or in-person) to help individuals plan appropriate routes
- Wayfinding signage to help active transportation users find their way to major destinations
- Cycling skills courses for adults, youth and children, provided at various levels of detail and in various locations

**Integrate Walking, Cycling and Transit**
- Minor enhancements to walking routes that link key destinations to transit stops and stations
- Bike parking at transit stops and stations
- Bike racks on buses
- Bike-friendly policies and storage areas on rail transit vehicles

**Helpful resource**
Transport Canada’s *Bike Sharing Guide* helps planners and decision makers determine if public bicycle sharing is viable in their community and, if so, how to design, implement, and operate a successful system. Material in the guide is drawn primarily from European experiences and has been assessed for relevance to the Canadian context. See www.tc.gc.ca/urban for more information.

**Make bicycling parking more visible, secure and convenient**
- Relocated, expanded, signed and better lit bike racks in public locations and at major destinations
- Guidelines and assistance for workplaces and other destinations in purchasing and locating bike racks
- Provision of discounted bike racks to institutions and workplaces, or free bike racks to be returned or paid for after a trial period

**Encourage better shower and change facilities at destinations**
- Work with employers, property managers and institutions to improve employee shower and change facilities

**Helpful resource**
Transport Canada’s *Bicycle End-of-Trip Facilities: A Guide for Canadian Municipalities and Employers* can help municipal agencies and employers create attractive bicycle parking and related facilities to encourage bicycle use. The guide provides guidance on how to determine where, how much, and what type of bicycle parking and related facilities to provide, and how to design them. See www.tc.gc.ca/urban for more information.
A.1.2 Public transit

**Promote a transit culture**
- Messaging campaigns to advance transit’s competitive position
- Inclusion of transit directions in notices for public events (e.g., open houses, festivals)

**Make transit easier to use**
- Trip planning (online or in-person) to help individuals plan appropriate transit itineraries
- Provision of transit information kiosks at key destinations
- Real-time transit service information displays at key destinations, online and via wireless devices
- Online “how-to” video tutorials for new transit users
- Outreach communications and presentations (e.g., immigration centres, social service locations, seniors centres, secondary schools, workplaces)

**Make transit fare payment more convenient and affordable**
- Employer transit pass programs via discounted payroll deduction or reselling through workplaces
- Universal transit pass (U-pass) programs at post-secondary institutions
- Public transit pass programs (e.g., discounted annual subscription passes)
- Electronic fare cards, possibly integrated with other transit systems, parking meters, libraries, recreation centres and other government services

**Encourage trial**
- Promote transit use to reach special events (e.g., festivals, concerts, sporting events) by offering free or discounted transit fares (e.g., event ticket acts as game-day transit pass)

A.1.3 Ridesharing

**Enable ridematching**
- Online ridematching services for the public, with special features for employees of participating workplaces

**Make passenger pick-up and drop-off more convenient**
- Public carpool lots on community periphery, and/or arrangements with property owners (e.g., shopping malls) to permit on-site carpool parking

**Promote trial**
- Special events to promote carpooling

**Provide incentives**
- Preferential carpool parking spaces at municipal facilities and public events
- Discounted parking fees for carpools at public events

**Vanpooling**
- Promotion of public vanpooling services where they exist
- Promotion of corporate vanpooling as an initiative that major workplaces can offer
- Assistance with corporate vanpooling feasibility studies and plans in workplaces

A.1.4 Carsharing

**Support carshare operations**
- Lease of parking stalls to carshare services in public parking lots or on-street, where practical
- Favourable treatment of proposals to reduce on-site parking in new developments where carshare vehicles are provided

**Cross-promote with municipal services**
- Discounted transit passes for individual members of carshare organizations
- Discounted bike sharing memberships for individual members of carshare organizations
A.1.5 Telework

**BUILD AWARENESS AND UNDERSTANDING**
- Telework promotion and education aimed at governmental, institutional and corporate workplaces
- Assistance with corporate telework feasibility studies and plans in workplaces
- Special events to promote telework

A.1.6 Parking

**INCREASE THE COST OF PARKING**
- Monthly parking prices in areas with quality transit service no lower than the cost of a transit pass
- Daily, weekly and monthly rates in municipal parking lots that are in line with private parking operators
- Elimination of weekly or monthly discounts in municipal parking lots

A.1.7 Automobile use

**BUILD EDUCATION AND AWARENESS**
- Special events to promote alternatives to driving
- Online emission and driving cost calculators to build awareness of the benefits of not driving
- Workshops on fuel-efficient driving at neighbourhood destinations (e.g. libraries, community centres) and in workplaces

**INCREASE THE COSTS OF AUTOMOBILE USE**
- Vehicle registration levies, parking levies, road use charges—which generally face substantial legislative, political, public acceptance, social equity and technical challenges

---

**Helpful resource**

Transport Canada’s *Improving Travel Options in Small and Rural Communities* guide can help practitioners—engineers, planners, health professionals, economic development officials and others—to improve travel options for residents of small and rural communities. This includes a range of actions that make personal transportation activities more sustainable—encouraging drivers to operate their cars more efficiently, or to leave their cars at home and walk, cycle, take transit or carpool instead. See www.tc.gc.ca/urban for more information.
A.2 Outreach measures: Reaching key audiences

A.2.1 Individuals and households

**BUILD AWARENESS AND UNDERSTANDING**
- Messaging campaigns to advance the competitive position of sustainable travel options
- Development of a strong central TDM program brand
- TDM program Web site with multimodal travel information
- Social media campaigns to attract and retain key audiences
- Cross-promotion of TDM measures and other programs delivered by the municipality or its partners in the fields of emissions reduction, energy conservation, waste reduction, water conservation and public health

**PROVIDE CUSTOMIZED ADVICE AND INCENTIVES**
- Individualized marketing programs (also called residential travel plans) that offer customized information and advice on sustainable travel choices to interested individuals and families
- Transportation fairs offering multimodal information and services at major workplaces
- Cycling skills courses at workplaces
- Provision of discounted or “try-then-buy” bike racks to institutions and workplaces
- Special events to promote sustainable commuting and challenges among workplaces

A.2.2 Workplaces

**BUILD PARTNERSHIPS**
- Networking with business associations, property managers and corporate executives
- TMA formation to reach out to employers and employees in target areas
- Professional development opportunities (e.g. workplace travel planning workshops) for TDM contacts in local workplaces

**PROVIDE VALUED SERVICES**
- Employer transit pass programs
- Ridematching programs with special features for employees of participating workplaces
- Emergency ride home (ERH) subscription program, or assistance and advice in establishing workplace ERH programs
- Assistance with development of workplace travel plans and commuter surveys to assess baseline activities and attitudes, and to measure travel plan impacts

**PROVIDE WORKPLACE TRAVEL PLAN ADVICE AND ASSISTANCE**
- Workplace scans to assess opportunities and challenges related to sustainable commuting
- Assistance with development of travel plans
- Assistance with commuter surveys to assess baseline activities and attitudes, and to measure travel plan impacts

Helpful resource

Transport Canada’s *Workplace Travel Plans: Guidance for Canadian Employers* is written for employers interested in helping their employees find more efficient and sustainable ways of commuting to work. It helps employers to define their own goals and objectives, then to develop a tailored travel plan that will give them a positive return on their investment.
A.2.3  **Post-secondary institutions**

**BUILD PARTNERSHIPS**
- Networking with administrators
- Professional development opportunities (e.g. travel planning workshops) for TDM contacts in post-secondary institutions

**PROVIDE VALUED SERVICES**
- Universal transit pass (U-pass) programs for students
- Employer transit pass programs for staff and faculty
- Ridematching programs
- Emergency ride home (ERH) subscription program, or assistance and advice in establishing workplace ERH programs
- Transportation fairs offering multimodal information and services
- Cycling skills courses
- Assistance and advice with bike parking improvements
- Special events to promote sustainable travel options

**PROVIDE TRAVEL PLANNING ADVICE AND ASSISTANCE**
- Campus scans to assess opportunities and challenges related to sustainable commuting
- Assistance with development of travel plans
- Assistance with commuter surveys to assess baseline activities and attitudes, and to measure travel plan impacts

---

**Helpful resource**

The Canadian Urban Transit Association’s *U-Pass Toolkit: The Complete Guide to Universal Transit Pass Programs at Canadian Colleges and Universities* is a comprehensive guide to implementing universal transit pass programs. It is available from CUTA upon request. See www.cutaactu.ca for more information.

---

A.2.4  **Schools**

**BUILD PARTNERSHIPS**
- Communications and meetings with school board administrators, school principals and staff
- Professional development opportunities (e.g. school travel planning workshops) for TDM contacts in schools

**PROVIDE VALUED SERVICES**
- Traffic safety audits and improvements in the vicinity of schools
- Crossing guard programs
- Cycling skills courses for school staff and students
- Bike parking improvements
- Special events to promote sustainable commuting by school staff and students
- Curriculum resources
Provide travel planning advice and assistance

- School scans to assess opportunities and challenges related to sustainable travel
- Assistance with development of travel plans
- Assistance with travel surveys to assess baseline activities and attitudes, and to measure school travel plan impacts

A.2.5 Other audiences

Neighbourhood business groups
- Promotion of “shop locally” campaigns

Festivals
- Advice and assistance with integrating sustainable transportation principles and practices into festival planning and implementation (e.g. user information, valet bike parking, transit cross-promotions)

Tourists and visitors
- Provision of local transit, cycling and walking information at hotels and major destinations, and through tour operators

A.3 Leadership measures: Showing the way

A.3.1 Municipal travel plan

Improve and promote sustainable travel options for employees
- Develop and implement a workplace travel plan for municipal facilities, addressing both employee commuting and local business travel

Improve and promote sustainable options for client and visitor travel to or from municipal facilities
- Public bike parking improvements, preferential carpool parking, and sustainable transportation information provision at municipal facilities

- Inclusion of information on sustainable travel to municipal facilities in public meeting notices, event invitations and bulletins

A.3.2 Zoning and development approvals

Require or encourage TDM-supportive features in new developments
- Zoning by-law changes to require bike parking, showers and change rooms
- Guidelines and checklists for inclusion of TDM-supportive features in new developments

Helpful resource

Green Communities Canada’s Active and Safe Routes to School program has developed a comprehensive set of School Travel Planning Tools that can help with the development and implementation of school travel plans. See www.saferoutestoschool.ca for more information.
- Training for development approvals staff on dealing with developers from initial consultation to final approval

**REQUIRE TRAVEL PLANS FOR NEW DEVELOPMENTS**
- Policy requiring development and implementation of a travel plan for new commercial and residential developments of a minimum size, parking capacity or traffic volume generation

**ENCOURAGE INNOVATIVE DEVELOPMENT FEATURES**
- Encourage the inclusion of proposals to include carshare memberships, public bike memberships and/or annual transit passes with the purchase of a new home or condominium

**REDUCE PARKING SUPPLY REQUIREMENTS**
- Zoning by-law changes to eliminate or reduce requirements for minimum parking capacity
- Zoning by-law changes to introduce or reduce limits for maximum parking capacity
- Cash-in-lieu-of-parking option for new developments to fund public parking facilities and services rather than build private on-site parking
- Favourable treatment of proposals to reduce on-site parking in new developments where carshare vehicles are provided

**Helpful resources**
ACT Canada’s publication *TDM Supportive Guidelines for Development Approvals* addresses the use of development applications, site plan reviews and contact with developers, landowners and facility managers to enforce and implement TDM principles. See www.actcanada.com for more information and to download the free guidelines.

The Institute of Transportation Engineers publication *Promoting Sustainable Transportation Through Site Design: An ITE Recommended Practice* describes comprehensive site development practices to promote the use of sustainable travel to non-residential or mixed-use developments. See www.ite.org for more information on the document and how to purchase it.
Incorporating TDM Into the Land Development Process

The opinions, findings, and conclusions expressed in this publication are those of the authors and not necessarily those of the U.S. Department of Transportation or the State of Florida Department of Transportation.
Unfamiliarity with the plans, processes and procedures of the local government land development process, transportation demand management (TDM) professionals can be frustrated in their efforts to improve mobility and reduce traffic congestion. This report provides detailed information to transportation professionals regarding how to incorporate TDM strategies into the land development process. The report documents efforts to secure TDM strategies as part of development approvals, summarizes the long range planning groundwork that frames the land development process, provides several case study examples from Florida and nationwide and also identifies several institutional barriers to the use of TDM as part of the land development process. A major finding is that transportation professionals interested in using TDM in land development must get involved long before development proposals are submitted. This requires participation in review and updates of the MPO long range transportation plan and transportation improvement program as well as local government comprehensive plans. Further, it involves appraising how well the local government land development regulations implement the intent of the comprehensive plan and reviewing traffic analysis methodology and underlying assumptions. These ground laying activities will begin the integration of TDM principles and strategies into the land use and transportation planning processes resulting in physical infrastructure, regulatory tools and operations management to support TDM as part of the solution as land development proceeds.

EXECUTIVE SUMMARY

Problem statement

Transportation planning and system development in Florida, including the use of transportation demand management strategies, begins with both federal and state law. These laws, combined with escalating right-of-way and construction costs and shrinking revenue sources, have influenced transportation decision makers to place more attention on maximizing the use of the existing transportation system through the approach of transportation demand management (TDM). However, numerous barriers and obstacles exist for the incorporation of TDM into the land development process. Consistent prioritization of funding for private automobile and truck transportation service over the years reinforces existing travel behavior and public expectations at the local level. Historically, urban transportation planning carried out by both state and municipal governments nationwide has accommodated the demand for travel and safeguarded this accommodation from land development. TDM is concerned with managing (reducing in many cases) the demand for travel by seeking to create conditions that meet travelers’ needs and at the same time alter their behavior to reduce adverse impacts and to generate greater efficiencies. The land development process is where these two philosophies to transportation system development and management (managing vs. accommodating) come into conflict and can potentially be resolved.

Study purpose and objectives

While TDM usually has been applied as an effort to convince employees to use alternative transportation, there are diverse settings and contexts for using TDM, both on-site and off-site, and providing for physical facilities as well as management and operations. In addition to alternative mode use, TDM strategies influence travel behavior by time of day or day of the week, trip frequency, trip length, regulation, route and cost. For example, single-occupant vehicle commuters can still participate in TDM by relocating to a work site branch office closer to home (proximate commuting), telecommuting one or more days of the week or staggering work hours.

One of the challenges in the use of impact fees, impact fee offsets, concurrency assessments and trip reduction ordinances is determining a reasonable and effective dollar amount required that covers the costs of needed facilities and can be demonstrated to represent the impact from the development. In the case of a concurrency management system, if trip credits are awarded in exchange for the conduct of a TDM program, the challenge is to refine a method for calibrating the credit amounts of developments of different sizes so that it encourages an effective TDM program and provides a worthwhile financial savings to the developers.

The goal and objectives of this study were based on the premise that a systemwide integrated approach to achieving transportation goals should be used and that transportation demand management is a critical component in conjunction with land use planning, transportation system construction and transportation systems management for the development of a cost-effective and functional intermodal and multimodal transportation system. The report provides information for municipal planners, traffic engineers, land development proposal reviewers and TDM professionals working for commuter assistance programs, transportation management associations and in other capacities. This study was sponsored by the Florida Department of Transportation and funded through the National Center for Transit Research.

The geographic focus of this study was the state of Florida; however, the findings and recommendations will have application to municipalities nationwide. The purpose of this study was to determine ways that TDM could be more effectively incorporated into the land development
Incorporating TDM into the Land Development Process

process, so that the necessary foundation for later TDM program implementation is laid. This goal was achieved through the study objectives of:

✓ Reviewing the federal and state legal framework;
✓ Exploring the many means of influencing travel behavior, with examples of TDM strategies, how these may fit into the land development process and what parties may be potential implementing partners;
✓ Identifying challenges preventing the inclusion of TDM in the land development process;
✓ Summarizing current practice at the local level;
✓ Providing case study examples both nationwide and from Florida; and
✓ Providing recommendations for incorporating TDM into the land development process.

Report appendices include excerpts from development agreements, analysis of site impact methodology, example of long range transportation plan TDM policies, and traffic impact fee reduction incentives.

Findings and Conclusions

A total of 38 recommendations are provided in this report, which fall under six general categories, including:

- Immediate actions for specific proposals
- Involvement in the MPO planning process
- Involvement in State government processes
- Seeking refinement in methodologies
- Developing professional relationships

A few of the findings and recommendations are highlighted below.

The mission of the Florida Department of Transportation is to advance transportation for statewide purposes, which is in some ways fundamentally different from the transportation interests of local urban areas. The state roadway system primarily serves through movements for regional mobility purposes while municipal roadways of varying functional classifications attempt to juggle access provision while meeting level of service standards. The presence of state roads, built to specifications for moving through traffic, affects the pattern of local land development in that there is an attraction to build near available capacity. Resulting dispersed land development is difficult to serve with transportation alternatives.

Vital to the administration of the land development process is maintaining the confidence of land developers that each one is treated fairly and in the same manner as all other developers. This places a responsibility on any such method to determine the magnitude and quality of future impacts of development, to attribute the impacts accurately to the responsible party, and to identify mitigating measures that will both directly address those impacts as well as serve the development of the contributing party. The rational decision making process and range of answers generated for the development of the transportation system is linked to the kinds of data collected, the degree of detail and scope of the collected data and the analysis techniques used. The analysis techniques used incorporate assumptions about desired outcomes as well as drive particular analysis outcomes.

One finding from the literature review that has strong relevance to the application of TDM in the land development process is the analysis conducted by Donald Shoup of UCLA regarding the use of
Incorporating TDM into the Land Development Process

The Institute of Transportation Engineers (ITE) trip generation and parking rates. Shoup found that local governments tend to overly rely upon the accuracy of these rates despite cautions provided by ITE for their appropriate application. In Florida, local governments primarily use ITE rates for determining concurrency, the extent and type of needed transportation improvements as part of land development and in the application of transportation impact fees. However, the ITE trip rates primarily represent land development patterns that provide no other choice besides private automobile driving and therefore demonstrate little use of alternative transportation. The lack of use of transportation alternatives is misinterpreted as a lack of need for transportation alternatives. Reinforcing this outcome is also the misapplication of ITE parking generation rates that are likewise generated from locations that offer no transit service and which result in overestimates of needed parking. Use of ITE traffic and parking generation rates should be supplemented with traffic counts when possible. Additional analysis should be conducted with the intent to estimate the nature and magnitude of transportation demand under conditions where transit service reaches a level of quality described in long range planning documents and after a program of parking management, where transit oriented development phasing has reached completion, and where there is a high quality pedestrian environment and TDM programs in place.

TDM professionals should get involved in the land development process as early as the rezoning application stage. TDM professionals should request a copy of the application. A first question for TDM professionals to consider, in an evaluation of a project, is whether a rezoning request preserves the intent of the Comprehensive Plan, especially with respect to urban infill, revitalization, and urban redevelopment within a TCEA. TDM professionals should check to see if its location lies within a TCEA or some other district requiring special considerations. TDM professionals have an opportunity to use the TCEAs or other special district designation as a means to promote TDM strategies for consideration as congestion mitigation and mobility enhancement.

As a committee member and regular participant in metropolitan planning organization (MPO) activities, the TDM professional has the opportunity to influence MPO guiding policies which directly impact the content of the Long Range Transportation Plan as well as the Transportation Improvement Program (TIP) and subsequent project funding. The commuter assistance program (CAP) executive director should not only educate the MPO Board and committee members regarding the benefits of TDM strategies, but also offer specific ways for including them in the various MPO products. This report has included a number of useful policies for use in long range transportation plans. The CAP representative also should assist in developing alternative revenue sources and seek earmarks for TDM strategies.

The focus of TDM program budgeting often has been based upon short term time frames. For example, CAPs may be evaluated based upon annual work plans supported by annual budgets; therefore, some of the most important work with far reaching and lasting impact (TDM strategies corresponding to land development) takes a back seat if performance results must be demonstrated within the year. The CAP representative should work with MPO staff to consider more realistic time frames not only for implementation of TDM strategies but also for tracking and measuring program results. Match these with work programs and budgets that coordinate with those time frames.

Of all features in the site plan and building plan, the availability and amount of parking is the cornerstone of shifting a balance toward the use of other modes, as well as other means to reduce the need to travel. Limiting the availability of parking has a strong impact on the use of the transportation system but efforts can backfire if satisfactory alternative transportation is not concurrently in place. TDM professionals should advocate for a more complete multimodal system. As the level and quality of multimodal transportation service increases, parking limitations can gradually be established. TDM professionals should stimulate discussion through arranging forums...
Incorporating TDM into the Land Development Process

among bankers, developers and local governments about the marketability of development with reduced parking. TDM professionals should suggest a plan for staging the gradual reduction of parking availability in coordination with redevelopment, which includes triggers or thresholds that precipitate the institution of parking reductions.

In the future, renewed consideration and research should be focused upon refining the Development of Regional Impact (DRI) traffic impact methodology and the 9J-2.045 F.A.C. Transportation Uniform Standard Rules to recognize that transportation demand calls for a wider offering of mobility services and authorize their use. Such methodology and authorized mobility measures would recognize that the demand for transportation alternatives will not be obvious or easily measurable while the basic system providing for alternative mobility service is not fully in place.

TDM professionals should encourage planners and engineers to weigh the limitations of using various TDM performance measures against the particular goals to be achieved. Examples include reducing single occupant vehicles (SOV), average vehicle occupancy (AVO), and average vehicle ridership (AVR), understanding that their use will limit the actions taken. Reducing SOV limits TDM strategies to mode shifting and does not recognize that SOV drivers can also participate in TDM. AVO does not incorporate the effects of bicycling, walking or telecommuting. AVR is a measure associated with work sites, limiting TDM application to commute travel. AVR also does not incorporate the effects of bicycling, walking and telecommuting. These are all useful measures but they should be applied only with the understanding of what they do not consider and should perhaps be used with other measures such as a vehicle employee ratio (VER), also known as vehicle trips reduced (VTR), which is the number of vehicles per 100 employees. Other measures might include reducing vehicle trips (VT) or reducing vehicle miles traveled (VMT).

Available transportation planning methods fall short of enabling an evaluation of a trade-off among modes. Research should continue to focus on this missing piece, starting with the Strategic Intermodal System geodatabase. TDM professionals should become more active in the discussion about the application of multimodal LOS standards as part of the transportation approval process. Ideally, TDM professionals should generate support for the future development and application of a method to make tradeoffs across modes. Preserving roadway level of service standards for private motor vehicles as specified in the local Comprehensive Plan appears to drive the process thereafter. In the long range transportation planning process, TDM professionals should suggest exploring the use of alternative standards for combined people-moving capacity across modes along corridors carrying heavy directional traffic.

Benefits

These study results provide practical insight and specific recommendations, not only to TDM professionals, but also to municipal traffic engineers and planners and land development proposal reviewers. The recommendations include immediate actions and longer range activities in several arenas. They also identify a broader range of stakeholders. Implementation of these recommendations will accelerate a transition toward a more integrated transportation system that provides better, more cost-effective service and mobility choices.
INTRODUCTION

While the use of transportation demand management (TDM) offers the possibility of relief from today’s congested roadways, a key to the successful use of these strategies is incorporating them into the land development process. Local governments are responsible for the regulation of land development activities, from developing generalized long range plans that guide future growth to negotiating development orders that will shape travel characteristics at the site-specific level. While federal and state governments encourage alternative transportation, local governments still face a number of barriers to strengthening transportation options through the land development process. The challenge is to incorporate TDM into all stages of the land development process thus making it integral to the process rather than an afterthought. This study examines how TDM is incorporated into long range transportation plans, local government comprehensive plans, land development regulations, and site development. It also discusses the various challenges of incorporating transportation demand management into the land development process and identifies opportunities for TDM professionals to champion TDM strategies throughout the process.

![Figure 1: TDM is a Key Strategy for Achieving Transportation Goals]
A common past approach to achieve transportation goals was to emphasize one particular strategy alone, such as either expanding the physical capacity of the system or applying TDM strategies, with the expectation that each should function as a stand-alone strategy. As illustrated in Figure 1 above, this report is based on the premise that a systemwide integrated approach to achieving transportation goals should be used. This is achieved by expanding the physical capacity of the transportation system combined with land use controls, TDM and transportation systems management. What this means for TDM is to incorporate TDM strategies into the land development process from the very beginning long range transportation and land use planning stages, through land use regulatory regimes, and continuing through site development negotiations and property management stages.

TDM encourages better management of existing transportation infrastructure, services and resources. Examples of TDM tactics include public transit services, ridesharing, compressed work week, telecommuting, limiting parking, and provision of bike and locker facilities by employers. Interest regarding methods of including TDM strategies in land development processes is growing among planning professionals. The purpose of this report is to identify where the integration of TDM strategies occurs within various stages of the land development process and how TDM professionals can influence this process. The report provides information for municipal planners, traffic engineers, land development proposal reviewers and TDM professionals working for commuter assistance programs, transportation management associations and in other capacities.

According to the Victoria Transport Policy Institute (VTPI), “Transportation Demand Management or TDM (also called Mobility Management) refers to various strategies that change travel behavior (how, when, and where people travel) in order to increase transport system efficiency and achieve specific objectives such as reduced traffic congestion, road and parking cost savings, increased safety, improved mobility for non-drivers, energy conservation and pollution emission reductions.” There are many different TDM strategies with a variety of impacts. Some improve the transportation options available to consumers, while others provide an incentive to change travel mode, time or destination. Some reduce the need for physical travel through mobility substitutes or more efficient land use (1).

While TDM usually has been applied as an effort to convince employees to use alternative transportation, it is much more than that. As illustrated in Figure 2 below, there are diverse settings and contexts for using TDM, both on-site and off-site, and providing for physical facilities as well as management and operations. In addition to employees, TDM can be applied to residents, visitors, patients and many other groups defined by specific travel patterns and needs. In addition to alternative mode use, TDM strategies influence travel behavior by time of day or day of the week, trip frequency, trip length, regulation, route and cost. For example, single-occupant vehicle commuters can still participate in TDM by relocating to a work site branch office closer to home (proximate commuting), telecommuting one or more days of the week or staggering work hours.

**Methodology**

The project involved the following research approach:

- Review the literature and current policies in Florida and other states, if applicable, as they relate to MPO long range transportation plans, local comprehensive plans, and various land development regulations, including trip reduction ordinances.
Incorporating TDM into the Land Development Process

- Investigation of 16 selected Florida municipalities. Identification and documentation of specific case studies illustrating the process of development review between local governments and land developers.

- Summarization of general findings and conclusions regarding the incorporation of TDM in the land development process.

### On-Site and Off-Site Activities

**On-site (public or private land development)**
- Employment sites
- Residential communities
- Large scale developments within a campus or with some unifying organizing characteristics
  - Airports
  - Schools and universities
  - Hospital complexes
  - Industrial parks
  - Tourist attractions
  - Location-specific special events (convention center, hotels, etc.)
- Freight transportation

**Off-site transportation facilities (publicly owned)**
- Special events, such as a parade along a transportation facility
- Transportation corridor planning and maintenance of traffic
- Incident/emergency management

**Figure 2: TDM Tactics Apply to a Range of Land Development Types**

This report begins with a review of the federal and state legal foundation that provides requirements and limitations as well as opportunities for land development and the use of TDM to support it. Secondly, a discussion is presented about the many means of influencing travel behavior, with examples of TDM strategies, how these may fit into the land development process and what parties may be potential implementing partners. Thirdly, barriers and challenges to the inclusion of TDM in the land development process have been identified. The report next summarizes current practice at the local level for incorporating TDM into the land development process, providing case study examples both nationwide and from Florida of long range planning by the metropolitan planning organizations, local government comprehensive plans, land development regulations and the site development approval process. Recommendations for incorporating TDM into the land development process are provided. Appendices include excerpts from the Sarasota County Development Agreement, a discussion of Florida Developments of Regional Impact and the methodology used for assessing site impacts, an example of Long Range Transportation Plan TDM policies from Pinellas County and the City of Sarasota, traffic impact fee reduction incentives from Clark County, Washington and the comprehensive transportation review methodology from the City of Rockville, Maryland.
LEGAL FOUNDATION

Transportation planning and system development in the state, including the use of transportation demand management strategies, begins with both federal and state law. These laws, combined with escalating right-of-way and construction costs and shrinking revenue sources, have influenced transportation decision-makers to place more attention on maximizing the use of the existing transportation system through the approach of transportation demand management (TDM).

Federal Law – Metropolitan Planning Organizations (MPOs)

A long range transportation planning process is undertaken by metropolitan planning organizations (MPOs) across the nation (in urbanized areas where the population is greater than 50,000). The metropolitan planning process is a continuing, cooperative and comprehensive process involving local government officials and other transportation stakeholders. The MPO planning process has been guided by the Transportation Equity Act for the 21st Century (TEA-21) and its predecessor, the Intermodal Surface Transportation Act (ISTEA) that “…shifted the focus of transportation planning away from narrowly addressing traffic congestion through new highway construction to holistically resolving identified transportation needs through enhanced multimodal transportation alternatives and improved long range transportation decision-making” (2). Now the MPO planning process is given new direction through the federal Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU). In August 2005, SAFETEA-LU was signed into law by the President, which authorizes federal surface transportation programs for highways, highway safety and transit for the five-year period, 2005-2009. The full implications of the new law on TDM as it relates to land development are not fully known as passage of the new law coincided with the end of this research study period.

TEA-21 established that the MPO transportation planning process must address seven emphasis areas, among them to “increase the accessibility and mobility options available to people and for freight…”(3). It also established the legal framework for MPO organizational structures and responsibilities. Although the MPO planning process primarily addresses transportation, land use is ultimately affected. According to the Federal Highway Administration, “Not only does the transportation system provide for the mobility of people and goods, it also influences patterns of growth and economic activity through accessibility to land” (4). The Unified Planning Work Program (UPWP), the Long Range Transportation Plan (LRTP), and the Transportation Improvement Program (TIP) are the key documents produced by the MPO planning process.

Florida Law

Local Government Comprehensive Plan. In Florida, the Local Government Comprehensive Planning and Land Development Regulation Act, Chap. 163.3161 F.S, both authorizes and requires local governments to control future land development to ensure stable and orderly growth that includes an intermodal transportation system. This is accomplished through local government comprehensive plans (LGCP) that, among other things, “facilitate the adequate and efficient provision of transportation…”(5). The Act also provides that no public or private development can be permitted except in conformity with the LGCP. At the same time, all ordinances and programs adopted under the authority of the Act must be developed and applied with sensitivity to private property rights.

Municipalities having populations greater than 50,000 and counties having populations greater than 75,000, or local governments within the boundaries of a metropolitan planning organization, must include a transportation element within their LGCP that specifically includes mass transit, ports,
Incorporating TDM into the Land Development Process

aviation, recreational traffic, and parking (6). The intent of the transportation element is to ensure a comprehensive, multimodal transportation system.

LGCPs must also include a five-year, financially-feasible, capital improvements element (CIE). The CIE must include principles guiding the expansion or increase in public facilities, principles to correct existing deficiencies in public facilities, an estimate of public facility costs, and provisions for “standards to ensure the availability of public facilities and the adequacy of those facilities,” a concept commonly known as concurrency or adequate public facilities (7). Chapter 163.3180 F.S. states that public facilities, including transportation facilities, must be available to provide adequate service concurrent with the impacts from new development. This state law is implemented through local government concurrency management plans as guided by Florida Administrative Code 9J-5. Concurrency management planning directly affects local capital improvement programming as well as the land development process.

In 1999, the Florida Legislature amended Chapter 163 authorizing local governments to establish multimodal transportation districts (MMTD) (8). The purpose of the legislation was to provide a planning tool that Florida communities could use to systematically reinforce design elements that support walking, bicycling and transit use. It also enabled Florida communities to advance transportation concurrency through development of a high quality multimodal environment, rather than the typical approach involving road widening for automobile capacity. A multimodal transportation district is an area where primary priority is placed on “assuring a safe, comfortable, and attractive pedestrian environment, with convenient interconnection to transit” (9).

**Land Development Regulation.** While the local government comprehensive plan sets the policy framework guiding new development, land development regulations (LDR) adopted by a local government implement the comprehensive plan by specifying minimum standards for development. Chapter 163 F.S. requires each local government to unify its set of land development regulations into one Land Development Code. State law explicitly encourages local governments to use such land development regulations as subdivision regulations, incentive zoning, planned unit development, and impact fees. It is within the land development code that local governments can specify criteria for inclusion of TDM strategies in land development.

**Development Agreements.** A development agreement is a formal, consensual, binding contract between a local government, the land developer/owner, and if appropriate, other parties (i.e. the Florida Department of Transportation or adjacent land owners). In *Bargaining for Development*, David Callies *et al.* state, “The landowner generally wishes to guarantee that the local government’s land use regulations, conditions, and exactions remain fixed during the life of a prospective land development on the subject parcel. The local government, on the other hand, seeks as many concessions and land development conditions as possible beyond what it could reasonably require through subdivision exactions, impact fees, and other conditions under the normal exercise of its regulatory authority or police power” (10). In short, the agreement ties land development rights to the provision of public facilities.

Chapter 163.3220-163.3245 authorizes local governments, by ordinance, to enter into development agreements with “any person having a legal or equitable interest in real property located within its jurisdiction” (163.3223 F.S.) and sets the parameters. Among other things, development agreements must include a legal description of the land, its owners, a timeframe for the agreement not to exceed 10 years, permitted uses, and information regarding the roles and responsibilities of the parties in terms of the provision of public facilities, confirmation of consistency with the local government’s comprehensive plan and LDRs. Land development regulations in place at the time the development
agreement is executed govern the development throughout the timeframe established in the agreement.

The flexibility of the development agreement makes it a useful tool for local governments by allowing them to address a variety of issues. For example, Sarasota County adopted a Development Agreement Ordinance (Ord. No. 2004-086 now Article VIII. Sec. 94-261 through Sec. 94-268 of the Sarasota County Code.) in late 2004 with the stated intent, “to promote and facilitate orderly and planned growth and development by providing a degree of certainty in the development approval process” (11). The Ordinance includes sections on findings, regulations, applicability, effect on other ordinances and regulations, local laws and policies governing development agreements, forms, enforcement, legislative act, severability, codification, filing and an effective date. During the adoption hearing, county staff promoted the benefits of the ordinance by indicating that it would allow the County to enter into public-private partnerships and encourage developers to participate in public improvement projects in which they might not otherwise participate (12). Appendix A contains the Sarasota County Development Agreement Ordinance. Development agreements are used principally for developments of regional impact.

**Developments of Regional Impact.** Developments of regional impact (DRI) are designated as such by their size and have greater impact on land development patterns than the transportation system. Most local governments in Florida use development agreements exclusively for Developments of Regional Impact (DRIs). Pursuant to Chapter 380 F.S., developments meeting specific criteria that have the potential to impact more than one county must undergo the DRI review process, including the documentation of impacts on the regional transportation system, as part of an Application for Development Approval (ADA), which must be approved by the State Department of Community Affairs. All impacted local government jurisdictions and any agencies with jurisdiction, such as the Florida Department of Transportation, participate in the DRI review process which is overseen by a regional planning council.

Under the current DRI review process, level of transportation service is measured in terms of roadway capacity leading to developer-funded improvements to maintain automobile/truck level of service (LOS). The estimated traffic impact is the basis for determining the developer’s fair share cost in contributing to roadway improvements that are necessary to maintaining automobile/truck LOS.

The DRI transportation impact analysis focuses primarily on the impacts of the private automobile, with little attention devoted to a large array of potential considerations. Any multimodal strategies are addressed in one question on the DRI application, “What provisions, including but not limited to sidewalks, bicycle paths, internal shuttles, ridesharing, and public transit, will be made for the movement of people by means other than private automobile? Refer to internal design, site planning, parking provisions, location, etc.” Rule 9J-2.045(6)5 F.A.C. authorizes provision of “…programs that provide alternatives to single occupancy vehicle travel…” as long as such programs “…assure that public transportation facilities shall be constructed and made available when needed to accommodate the impacts of the proposed development…”. This guidance does not define or specify TDM but rather public transportation capital improvements. Earlier language that was removed during an amendment process allowed explicitly for buses and vehicles for vanpools. Appendix B contains a detailed discussion of the relationship between DRIs, FDOT Site Impact Methodology, and bus transit. Other factors intrinsic to the traffic impact methodology such as guidelines for acquiring and applying mode split (trade-off between private auto trips and transit trips) further impede the inclusion of multimodal strategies. Because the traffic impact analysis is focused on private automobiles/trucks, developer contributions to pay for traffic mitigation go to roadway...
Incorporating TDM into the Land Development Process

improvements. Transportation improvements, as provided by developers, also must meet certain tests as provided by state law, summarized below (13):

- The transportation need that must be mitigated must be attributable to the proposed development paying for the mitigation.
- The amount of the contribution must correspond to the amount needed to mitigate the impacts from the development.
- The funds must go toward improvements to serve that development.
- Developers of DRIs cannot be required to contribute funds for mitigation unless the host local government has an ordinance in place requiring non-DRIs to mitigate their impacts.
- Developers of DRIs cannot be charged twice to mitigate for the same impacts, as in the case that a local host government charges impact fees.

These requirements pose special difficulties for developers to provide TDM improvements as mitigation for roadway impacts of a DRI. For example, if a high quality bus service, commensurate with highway level of service, is not in place, then it is not possible to reasonably estimate the need for transit service by a new development unless there is a way to measure latent demand for transit service. As a result, a very low number of bus trips is estimated. Consequently, a small amount of money or capital facilities is estimated to pay for bus mode share. Funds must be demonstrated to benefit the development. If there is an impact fee ordinance in place, then funds cannot go toward operations. This leaves capital facilities only, such as buses, bus shelters, and vans.

To encourage the desired results of engaging land developers to select TDM options as part of the DRI process, local governments should make full use of the planning and regulatory processes available to them to guide development toward locations where it is effective to provide identified TDM services. These include:

- the long range transportation planning process and the transportation improvement plan of the MPO,
- the local government comprehensive planning process, especially alternative concurrency provisions provided in 9J-2.045(6)2, F.A.C., pursuant to supporting Transportation Concurrency Exception Areas (TCEA) and Transportation Concurrency Management Areas (TCMA), where such mobility measures are specifically adopted in a local government comprehensive plan that has been deemed in compliance per F.S. 163.3180(5) and (7).
- urban development boundaries, and
- zoning and other tools within the land development code.

The Florida Department of Community Affairs (DCA) Interagency Implementation Team for transportation has plans to update F.A.C. 9J-2 to reflect changes from the recently passed Senate Bill 360. It is not known at the time of this report if F.A.C. 9J-2.045(6)2 and 5 will be revised.

Additionally, local governments could provide disincentives for a development that is located outside the existing or planned service area of transit, while offering incentives that make it more desirable to build in areas within the existing and planned bus service area.

The passage of Senate Bill 360 (“The Pay as You Grow Plan for Florida’s Future”) may herald some changes and opportunities for incorporating TDM into the land development process. These include the following:

- Local governments will have an opportunity to improve their development review processes.
• Local governments may adopt a 10-year long-term (15-year if approved by DCA) concurrency management system. The longer time frame is more conducive to demonstrating TDM impacts.
• Funding for infrastructure and technical assistance will be provided.
• Local governments must consult with FDOT and cooperatively develop a plan to mitigate impacts on the Strategic Intermodal System in TCEAs and TCMAs.
• New standards are required for TCEAs on mobility, design, urban infill, etc. TCEAs will be required to demonstrate multimodal strategies, connectivity, and urban design standards through the land development code. Existing TCEAs must be upgraded to the new standards.
• Regulatory incentives will be provided for having designated urban service boundaries and Urban Infill and Redevelopment Areas.
• The development of model TCEA strategies and evaluation criteria will be applied to three pilot communities.

However, one of the options given to developers is to pay for a project that is in the 5-year capital improvements element. This emphasis on capital improvements makes it more difficult to consider programmatic TDM strategies.

In the future, renewed consideration and research should be focused upon refining the DRI traffic impact methodology and the 9J-2.045 F.A.C. Transportation Uniform Standard Rules to recognize that transportation demand calls for a wider offering of mobility services and authorize their use. Such methodology and authorized mobility measures should recognize that this demand for transportation alternatives will not be obvious or easily measurable while the basic system providing for alternative mobility service is not fully in place.
RELATING TDM TO THE LAND DEVELOPMENT PROCESS

As part of this study, it is helpful to identify the relationship between TDM and the land development process including the range of specific actions that can be considered and their timing in the process. Figure 3 below illustrates how TDM tactics can apply to all stages of the land development process. There are TDM tactics that represent physical facilities as well as operations and management tactics. In addition, TDM can apply to facilities, operations and management that are on-site and off-site.

Chronology of the Land Development Process

**Long range**: Prior to land development or during negotiations for development agreements.
**Time horizon**: generally up to 20 years.
**Approach**: planning and financing, proactive articulation of the desired form of land development.
**Tools**: Long Range Transportation Plan, Metropolitan Planning Organization Transportation Improvement Plan, Local Government Comprehensive Plan, and development agreements

**Mid range**: Prior to land development or during negotiations for development agreements.
**Time horizon**: generally up to 5 years.
**Approach**: regulatory, reactive articulation of the minimum development criteria required or “gatekeeping” to prevent poorly conceived development from happening.
**Tools**: Land Development Regulations (Unified Land Development Codes in Florida municipalities), Capital Improvements Element, Level of Service standards

**Short range**: Finalization of plans and construction.
**Time horizon**: Immediate and ongoing.
**Approach**: measurement and negotiation.
**Tools**: traffic impact methodologies, site development review process, incentives, impact fees.

**After land development**: Ongoing management and operations.
**Time horizon**: indefinitely over useful life of development
**Approach**: contractual agreements
**Tools**: property leases and provisions of development agreements regarding subsequent development phasing

Examples of Corresponding TDM Tactics

**Onsite Physical Facilities**: includes infrastructure and amenities

- **Long range**: Location decisions for major land use types, marketplace development of ecosystem assets, urban growth boundaries, transit oriented development planning
- **Mid range**: Limit parking supply, site design standards
- **Short range**: Bike lockers, showers

- **After land development**: Parking supply adjustments, physical improvements and maintenance to existing facilities

**Offsite Physical Facilities**: includes infrastructure and amenities

- **Long range**: Capital facilities financing and planning for alternative modes
- **Mid range**: High occupancy vehicle lanes
- **Short range**: Connective sidewalks, transit shelters

- **After land development**: Parking supply adjustments, physical improvements and maintenance to existing facilities

**Onsite Operations and Management**: Includes incentives, disincentives and market-based tactics

- **Long range**: Long range TDM plan
- **Mid range**: Trip reduction ordinance
- **Short range**: Agreement to unbundled parking in property lease

- **After land development**: Tax benefit programs, parking cash out, school pools, guaranteed ride home, telecommuting technical assistance

**Offsite Operations and Management**: Includes incentives, disincentives and market-based tactics

- **Long range**: Establishment of transportation management association, planning and financing for transit operations
- **Mid range**: Pricing and management of public parking
- **Short range**: Agreement to subsidize operation of a public transit route as a condition of development approval

- **After land development**: Advanced traveler information system, variable pricing, operating excellent public transportation service

Figure 3: TDM Tactics Can Apply to All Stages of the Land Development Process
Table 1 below illustrates TDM in a different way, according to its comprehensive applicability. TDM strategies are organized by their means of influencing travel behavior. First are those that have greater potential to affect travelers’ longer term decisions about work and residential location including trip length, mode, and route. For example, in the first row, trip length may be affected by realtors who often play a role in influencing travelers’ residential choices. Likewise, economic development organizations, both public and private, play a role in influencing business and employment locations. Regulation is listed next, which affects both longer term travel decision making as well as day-by-day decisions. Finally, cost, frequency, and time of day/day of week primarily influence traveler’s day-to-day decisions.

As apparent in Table 1, implementation of many TDM strategies through the land development process does not necessarily rest on the shoulders of just one entity, but requires a coordinated effort. Table 1 also shows how, by all means of influencing travel behavior through TDM strategies, land developers and TDM professionals can play a role.

### Incorporating TDM into the Land Development Process

**Regulation.**

Mandate specific traffic management actions or outcomes by local ordinance.

- State growth management provisions
- Concurrency
- Trip reduction ordinances
- Zoning ordinances
- Subdivision ordinances
- Parking ordinances
- High occupancy vehicle lanes
- Parking pricing
- Transit subsidies
- Parking cash-out
- High occupancy toll lanes
- Commuter tax benefits

- Carried out primarily by **land developers, property managers**, employers, neighborhood associations

**Cost.**

Establish incentives and disincentives.

- Highway patrol
- State land planning agency
- State DOT
- Municipal land development regulator
- Municipal public works department
- Municipal parking department
- Highway patrol
- **Property manager**
- Municipal parking department
- State DOT
- Employers
- Commuter assistance programs
- Transportation management associations

**Frequency.**

Reduce number of trips over given time period.

- Providing on-site amenities
- Compressed work week
- Telework

- Providing physical facilities, such as employee cafeteria, fitness center, bank
- Providing technical support to employers

- **Land developer**
- **Property manager**
- Employer
- Commuter assistance program
- Transportation management association

**Time of day/day of week.**

Move trips to less congested periods or avoid vehicle trip completely.

- Compressed work week
- Staggered work hours
- Telework
- Flex time

- Unbundling parking from employment site leases
- Providing technical support to employers

- **Property manager**
- Commuter assistance program
- Transportation management association
- Employer
CHALLENGES AND OPPORTUNITIES FOR THE INCLUSION OF TDM IN THE LAND DEVELOPMENT PROCESS

While carefully selected and properly executed TDM strategies can improve overall mobility, there exist various challenges of incorporating transportation demand management (TDM) into the land development process.

1. Data Availability, Analysis Methods and Transportation Concurrency

FDOT maintains a traffic and roadway database called Traffic and Roadway Information Systems (TRIS). It contains information about traffic count statistics and roadway features for the purpose of state transportation planning and development for the State Highway System (SHS). The SHS includes roads under the jurisdiction of the State of Florida and maintained by FDOT, including roads with Interstate, U.S. and S.R. numbers. Florida is in the process of changing the way it plans the transportation system of the state. The change is from thinking of each mode separately toward an approach that manages the seamless movement of people and goods in a multimodal system. This is referred to as the Strategic Intermodal System (SIS), created in 2003. Part of this process is the development of a unified geodatabase that collects data for other modes to the same depth as has been the case for highway travel (14). This planning activity recognizes that while the older database is adequate for determining which projects within each mode are the most important, more in-depth data are needed to determine if limited funding should go toward improving a port or instead building a new interchange on an interstate or some other intermodal trade-off. In order to make these kinds of intermodal trade-off decisions, an understanding of how the facility is used, and how it interrelates with other transportation modes is necessary. This newer planning strategy will reap advantageous benefits for the state and municipalities and it is a giant leap in the right direction toward intermodalism. It also is important to remember that the FDOT’s charge as a state agency is to advance transportation for statewide purposes, which is in some ways fundamentally different from the transportation interests of local urban areas.

As this relates to the site development for a new shopping center or office building in a municipality, the transportation impacts of that new development may adversely affect the through-moving capability of a state highway. From the standpoint of serving the new development, which hopes to attract tenants, employees and customers, the more important transportation objective is providing easy access to and from the development from local and regional trip origins. The transportation improvement options for these two objectives may differ. TDM seeks to provide mobility options. To this end, intermodalism is not only important to providing options, but multimodalism is also important, in the sense that someone can choose to successfully travel entirely by walking, bicycling, riding transit or avoiding travel altogether by telecommunications. Research by Liu et al. (15) demonstrates that intermodal transfers are time consuming and are avoided by travelers whenever possible; therefore, the success and functionality of multimodal options requires developing them as complete systems that connect intermodally.

Developing complete and parallel multimodal systems that interconnect is expensive and may be criticized as redundant. However, continued dependence on one mode, highway travel by private vehicle, is also expensive and has been demonstrated that it will not continue to meet growing demand. Putting “all the eggs in one basket” exacerbates vulnerabilities to incidents, natural disasters and national security threats.

FDOT has one of the most extensive and well organized transportation data collection systems and toolbox of analysis methods of all transportation agencies in the state. The smaller the local municipality, the greater the reliance upon technical assistance from FDOT and the more likely that FDOT analysis methods and data are used for local transportation planning purposes.
Incorporating TDM into the Land Development Process

In most instances, transportation concurrency as it is written in F.S. 163.3180 more specifically addresses roadway private motor vehicle traffic. While professionally accepted methods of measuring multimodal quality/level of service have been adopted by FDOT for separate transportation modes (auto/truck, transit, bicycle, pedestrian) these methods are not meant to be used for considering trade-offs among modes (16). Instead, a level of service is computed for each mode rather than the development of a composite overall transportation level of service measure. In other words, available methodologies fall short of enabling an evaluation of a trade-off among modes in a seamless transportation system. As a result, there is currently no tool to evaluate the trade-off between allotting financial and land resources to improve bicycle LOS through the creation of bicycle lanes, which means less money and right-of-way to improve roadway LOS for motorized vehicles. Likewise, signal timing to favor pedestrians at intersection crossings increases delay and degrades LOS for motor vehicles. However, through TDM strategies, local governments are being asked to change the balance of their trade-offs toward alternative modes. Vital to the administration of the land development process is maintaining the confidence of land developers that each one is treated fairly and in the same manner as all other developers. This places a responsibility on any such method to determine the magnitude and quality of future impacts of development, to attribute the impacts accurately to the responsible party, and to identify mitigating measures that will both directly address those impacts as well as serve the development of the contributing party.

The rational decision making process and range of answers generated for the development of the transportation system is linked to the kinds of data collected, the degree of detail and scope of the collected data and the analysis techniques used. The analysis techniques used incorporate assumptions about desired outcomes as well as drive particular analysis outcomes. A summary below of the FDOT Site Impact Analysis methodology used in the traffic analysis of DRI impacts is an example of this. A detailed look at the DRI process and Site Impact Analysis methodology is provided in Appendix B, excerpted from Hendricks (17).

2. Continuing Land Development Fuels Need for Alternative Emergency Response

An extreme manifestation of accommodating private motor vehicle demand is hurricane evacuation. FDOT justifiably prioritizes safety first. The primary response to this need has been preserving the functioning of the FIHS to serve high speed high volume traffic, especially as emergency evacuation routes. Highways that are designated as regional evacuation routes must also maintain a high level of service. The need to maintain a high level of capacity that will be used only in emergencies creates conditions of plentiful capacity during all other times of the year. This fuels land development growth where capacity exists, which in turn creates the need to build more capacity to maintain a high level of service to be used in times of evacuation. A certain leveling of the playing field must occur with respect to transportation quality of service across modes before people will consider other modes of travel for daily purposes. That requires some degree of greater traffic congestion combined with satisfactory service offered by other modes. With the lion’s share of transportation resources going toward maintaining private motor vehicle level of service, the balance needed is always out of reach.

A prescient report prepared by Wolshon et al. (2001) of the LSU Hurricane Center prior to the events of Hurricane Katrina included a nationwide survey of hurricane transportation evacuation planning policies. It cited generally limited planning at the state level for the evacuation of low-mobility groups (18). Potential low-mobility evacuees include low-income persons without cars, the elderly, the homebound infirm, school and hospital populations and tourists. To address this issue, the Florida Commission for the Transportation Disadvantaged (TD) has been operating for the past 25 years and oversees 49 Community Transportation Coordinators (CTC) in all 67 counties.
Incorporating TDM into the Land Development Process

Considering the four hurricanes that struck Florida in the summer of 2004, the performance of the CTCs was outstanding, especially under conditions of closed bridges, flooded roads, electrical outages, limited fuel and destroyed communications and computer systems. This Commission is recognized as one of the best in the nation in providing and coordinating transportation for elderly, disabled and low-income citizens. However, what would an urban area do if it faced the need to evacuate a large number of low-income persons without cars? The Florida CTCs last year concentrated on the most vulnerable people—the elderly, frail and those having special medical needs. But if a large population of low-income people without cars needed to evacuate, this may overwhelm the CTCs. Local emergency plans include the deployment of municipal buses and school buses to evacuate people but does this constitute sufficient capacity? Neighboring bus systems stand ready to help evacuate. But again, is this enough and would not that burden the municipality lending its bus service?

Florida has a large low-mobility population. The demographics of Florida communities in particular show not only high numbers of tourists, even in the “slow” summer season, but also senior citizens and low-income persons. The American Community Survey (19) reported that nationwide, the number of persons with disabilities that prevent them from going outside their home was over 10.7 million persons. This is approximately 4 percent of the total population nationally. A survey conducted between October 1994 and January 1995 indicated that approximately 26 million Americans (1 in 10) described their disability as severe. A person who has a severe disability is one who is completely unable to perform a daily living activity or socially defined task or who needs personal assistance (20). Figures for those who cannot “go outside home” classification of disability at the state level were unavailable; however, there were Census 2000 estimates of the total number of persons with disabilities statewide. These included over 1.9 million or 21.9 percent of the Florida population age 21-64 and over 1.0 million or 39.5 percent of the Florida population age 65 and over. Over 17 percent of Florida’s population is age 65 and over. Approximately 12.7 percent of Florida’s population is low-income (21). If Florida’s low-income population reflects that nationwide, then approximately 25 percent of low-income households in Florida do not own cars. Recent estimates for the Tampa Bay region show approximately 14,000 households in Hillsborough County and 22,000 households in Pinellas County within a Category 5 hurricane evacuation zone that do not own vehicles (22).

Transportation infrastructure in the U.S. has been developed to serve motor vehicle traffic and more recent attention upon maximizing the use of existing infrastructure in times of evacuation has focused upon highway contraflow strategies. An untested Florida DOT plan exists for the conversion of Interstate 4 in Florida between Ybor City and Orlando into a one-way eastbound evacuation route. However, in September 2005, when 200 miles of Interstate 45 north of Houston were turned into northbound only lanes, gridlock resulted for Hurricane Rita evacuees. The LSU study points out that while buses are the most common mode of transportation to evacuate low-mobility groups, many heavily populated cities do not have an adequate supply of buses to move all low-mobility evacuees that need assistance. If the priority justification behind the allocation of resources to maintain high capacity roadway service is hurricane evacuation, then the same justification should apply to maintaining bolstered public transit fleets circulating on routes with greater frequency. The resulting increase in transit quality of service due to larger in-service fleets (and the resources to operate them) would contribute toward providing satisfactory modal alternatives on a daily basis. The effects of such improved service availability would trickle down to land development location decisions and site design. But Hurricanes Katrina and Rita demonstrated that the emergency evacuation solution is somewhere beyond better transit service and more buses. It depends upon better land development that supports and is supported by the transportation system. This system must be capable of fully using strategies to manage transportation demand during times of crisis and after the crisis has passed when populations are dislocated and transportation systems are damaged. So while resources are
poured into a regional roadway system to handle motor vehicle demand during times of hurricane evacuation, the more comprehensive solution offered by land development that enables transportation demand to be managed is overlooked.

3. Transportation System Financing

The regional and statewide transportation emphasis on highway system service for freight and private automobile travel reinforces a predominantly highway oriented system at the local level, as state highways traverse urban areas. This sets the development of other modal options at a disadvantage, as highway travel receives the bulk of state transportation funding and scarce resources require allocation trade-offs. The State Transportation Trust Fund is replenished by state motor fuel tax revenues, vehicle licensing fees, auto registration fees and rental car surcharges. This reflects the principle that the road system should be paid for by its users. The downside to such revenue sources is no institutional incentive to decrease auto ownership and decrease traffic as more traffic is associated with increased revenues and enhanced economic activity.

Consistent prioritization of state highway funding over the years reinforces existing travel behavior and public expectations at the local level. Section 206.46, F.S. requires that a minimum of 15 percent of revenues distributed by the State Transportation Trust Fund is devoted to local public transit systems and capital rail projects. For all practical purposes, the State Highway System for private automobile and freight traffic is the backbone of regional and intrastate travel in Florida. While FDOT has a Public Transit Office, the state does not have a statewide passenger transit system, which is commonly provided in many European nations. Instead, the Transit Office administers grants, monitors compliance with transit regulations and provides technical assistance to locally operated transit agencies. The provision of high quality transit service is potentially the most far reaching of TDM strategies to meet local travel needs efficiently. Ensuring high quality transit success depends on a pedestrian friendly environment, most often seen in the form of transit oriented development. However, once the decision is made to fund and build an additional highway, there is the added permanent commitment to maintain and resurface it on a regular schedule. Additional highway investment for private motor vehicle travel begets the need for more highway investment. In Florida, there are over 40,000 lane miles and 6,200 highway bridges on the State Highway System, all requiring regular inspection, repair and maintenance (23). The Public Transit Office’s mission is to maximize the passenger carrying capacity of these surface transportation facilities. The goal is to promote use of transit for local trips so that state highways are free to serve regional travel purposes. However, regional and local travel modes are intertwined and reinforcing. A local transit system works better within the context of a strong regional transit system and vice versa. Transit 2020, the transit element of the Florida Transportation Plan, cites three key issues that impede achievement of transit goals.

- The level of transit service for most Floridians is inadequate and will worsen given current trends.
- Current transit funding levels are inadequate to fund existing as well as expanded capital, maintenance and operating programs; several funding sources lack stability and flexibility.
- Existing policies and institutional arrangements and practices sometimes hinder or fail to promote the achievement of transit objectives.

4. Market-based Land Use Decisions

The State specifically wants to attract high-wage jobs and private sector investment to achieve statewide economic development goals. A company’s location or expansion can be adversely affected by transportation-related problems. The Economic Development Transportation Fund,
commonly referred to as the "Road Fund," is an incentive tool designed to alleviate transportation problems that adversely impact a specific company's location or expansion decision. These grants are worth up to $2 million and are awarded by the State of Florida to the local government for transportation facility improvements as part of the land development process. Funding pays for such eligible improvements as design and engineering, signalization, construction costs of access roads or road widening, and other work. However, the potential opportunity is recognizing that private enterprises have varying transportation needs. For example, some industries have time-sensitive freight transport requirements for expressway access at high operational level of service. These include products whose transport time should be minimized, such as refrigerated pharmaceuticals and blood products. Not all private enterprises require this kind of transportation service and access but could thrive in a transit-oriented development. For example, a medical research and manufacturing operation employing 170 people, most of them high wage, is located in downtown Seattle. Through offering employer transit subsidies coupled with a parking management program, the firm reduced the number of vehicles per 100 employees driving to the site by 10 percent between 1999 and 2001. Later, the company moved even closer into the core of the downtown because a favorable loan arrangement and better suited physical facilities saved the company money. Incidentally, the move positioned the company even closer to a transit hub, making it easier for employees to use transit. This example demonstrates that some companies are better suited to downtown locations, even some manufacturing operations, like this high technology example. (24).

Use of public transit is typically not associated with high-wage workers primarily because public transit has not been developed to provide premium service. As higher income households in both the United States and in Florida make more trips than low and middle income households (25), it is even more imperative that success in attracting high wage jobs is also combined with strategies to most efficiently use the transportation system. Application of TDM principles could demonstrate that better business placement would match its particular transportation needs to the transportation service type while preserving highway access for additional enterprises that truly need it.

5. Balancing Competing Interests with Scarce Resources

A quote in John Mason’s white paper for FHWA entitled “Understanding the Communications and Information Needs of Elected Officials for Transportation Planning and Operations” states it best: Government leaders must balance available funding with the desires of their constituents. In addition, they must address not only transportation, but a myriad of additional community concerns, making it difficult for them to have an in-depth knowledge of any subject. Systematic inclusion of TDM in the land development process will involve an understanding of the trade-offs between private automobile use and increased mobility through transportation demand management. It means that transportation investments are made now, incurring some present hardship, which result in benefits that are enjoyed later. An additional challenge is that changes brought on by TDM happen gradually; in the midst of explosive population growth, the positive effects of a shift in planning approaches from accommodating traffic to managing traffic can at first be obscure.

“Local elected officials must manage public expectations about transportation. We walk a fine line between almost unlimited public demand for unfettered mobility on the one hand, and very limited public support for increased tax revenue with which to finance these improvements on the other” (Gerry Connelly, Chairman, Board of Supervisors, Fairfax County, VA) (26).
6. Roadway Functional Classification

Roadway functional classification affects land development decision-making. The functional classification of a roadway sets expectations as to how the road will perform and guides decision making and priority setting with respect to how it will be improved and maintained. FDOT’s functional classification of roadways describes how they are designed to serve a specific function for moving traffic. Local governments may have their own functional classification system but have found it advantageous to be consistent with the State and Federal functional classification systems. The definitions below demarcate the trade-off between unimpeded movement of through traffic and accessibility to destinations. For brevity, the list below omits freeways, expressways, the distinction between major and minor collectors, and the distinction between these classifications as rural and urban.

a. **Principal Arterial** - A highway which serves moderate to high volumes of traffic moving over long distances. These include interstates, freeways and expressways. They are characterized by high volumes, high capacity and continuous alignment. These facilities usually connect major population centers. Although they provide access to abutting property, such access is usually controlled through frontage roads and limitations on the number of driveway cuts. Major intersections are channelized, signalized, and spaced at intervals of at least 1/4 mile. Minor intersecting streets usually function under stop sign control.

b. **Minor Arterial** - Similar in function to a principal arterial but operating under lower traffic volumes and over shorter distances. Minor arterials generally have less restrictive access controls and more widely spaced intersections in rural areas.

c. **Collector** - Thoroughfares that provide for traffic movement between arterials and local streets. Collectors usually carry moderate traffic for moderate distances. Traffic volumes can vary depending on the density of the surrounding area. Vehicular speeds are moderate.

d. **Local Street** - A street intended only to provide access to residences, businesses, or other abutting properties.

Local decision makers have priorities that are partly based on the necessity to comply with state requirements as well as to secure funding. While some small proportion of state roads are functionally classified as local, most state roads are built for regional mobility purposes, which is different from the main purpose of most municipal roads. State roads run through and are connected to the local road systems of urban areas. As a result, the functioning of a local road affects the level of service of a state road. Conversely, the presence of state roads, built to specifications for moving through traffic, affects the pattern of local land development in that there is an attraction to build near available capacity. The functional classification of state roadways tends to favor serving through movements for regional mobility purposes while municipal roadways of varying functional classifications attempt to juggle access provision while complying with level of service standards to meet concurrency. This is a difficult balancing act with ramifications for land development. For example, In 1997, the City of Tampa evaluated the feasibility of a “neighborhood collector” classification to protect residential neighborhoods from the adverse impacts of through traffic. The downside to completely protecting neighborhoods from through traffic is that it reinforces the hierarchical system of roadways that requires major arterials to be multilane. In a hierarchical street system, arterials become the only routes available for areawide travel. This spurs the separation of land uses, which further impedes transit-oriented development.
State roads, mainly arterials, are built for regional mobility purposes both running through and connecting to the local road systems that provide for local traffic movement and access to land uses. One of the main complaints regarding these arterials is the negative impact they have on the non-automobile community. Congested arterials impede the rapid movement of buses and are often unfriendly to bicyclists and pedestrians. Planners experience resistance from developers regarding the implementation of TDM strategies. Developers have specific “formulas” for creating developments based on marketing knowledge received from their buyers. They believe, not without merit, that because their buyers are not seeking specific TDM strategies, such investments are not desired by the public and, therefore, not justified. Notably, recent interest by planners in New Urbanism and traditional neighborhood development is fostering a change in development “formulas” throughout the state. This trend shows a growing understanding on the part of the general public that lifestyle alternatives are possible. The surge of New Urbanism has brought increased interest in taming these arterials, resulting in a collaboration between the Congress of New Urbanism (CNU) and the Institute of Transportation Engineers (ITE). At the time of this writing, the CNU and ITE are working on, “…the creation of an industry-approved design guide that gives transportation engineers and thoroughfare designers design criteria that incorporate techniques and principles of new urbanism and smart growth for context-sensitive major thoroughfares for urban settings” (27).

7. Programming and Evaluation Time Frames Do Not Correspond

The focus of TDM program budgeting often has been based upon short term time frames. For example, commuter assistance programs (CAP) may be evaluated based upon annual work plans supported by annual budgets; therefore, some of the most important work with far reaching and lasting impact (TDM strategies corresponding to land development) takes a back seat if performance results must be demonstrated within the year. TDM programs often require longer time frames for implementation and for demonstrating changes in travel behavior. Because the land development process often takes longer than a year and straddles work plans of multiple years, it does not fit the evaluation time frame.

8. Lack of Knowledge and Lack of Resources

Most local government staff members are unlikely to have the full knowledge and understanding of the TDM strategies available to them. It is likely that, without specific examples of how TDM strategies can be included in the land development process from long range plans through development agreements, TDM strategies will be either weak or non-existent. Also, many TDM strategies are not capital intensive and therefore may require more effort to devise programs that establish who is responsible for implementation and how to gauge results. TDM professionals are not included among those who regularly review land development proposals or traffic analyses. Public transit and TDM agencies rarely have the staff resources to stay on top of the myriad development proposals under review at any one time, leaving it up to the local host government to advocate on their behalf. Even in the case of developments of regional impact, in which transit agencies are usually involved, it is often the case that the review process occurs over an extended period of time during which the development concept may change repeatedly in response to market conditions. Changing conditions may necessitate follow-up reviews for which transit agencies may not have the staff resources.

9. TDM is Considered a Mitigative Measure Only

TDM has traditionally been viewed and applied as a mitigative response to an already congested roadway system that primarily serves private motor vehicles. This practice of waiting until there is a congestion problem before implementing TDM strategies places increased pressure for results that
Incorporating TDM into the Land Development Process

take years to achieve. If applied systematically throughout the land development process, TDM would be regarded not so much a mitigative measure as it would a means to enhance mobility. Systematic incorporation of TDM in the land development process would incorporate travel demand management, in all its definitional aspects, right from the very beginning of the long range land use/transportation planning process through to the day-to-day travel options people consider.

10. Relationship Between Local Government and Developer

The developer often is uninformed regarding the integration of TDM into land development projects. While there are many TDM-related services and facilities that could be made possible through land developer participation, the host local government balances conditions and requests against enticements to maintain a positive business relationship with the developer. Certain considerations by the host local government can make a difference in whether the business of land development remains worthwhile and profitable. These include the following:

- Certainty of the process;
- Fair treatment in relation to business competitors as well as in relation to the negotiated responsibilities of the developer and the host local government;
- Flexibility in solution seeking; and
- Respect for time constraints of the land development process.

11. Monitoring Development Agreements

Despite a local government’s focus on creating development agreements, challenges remain in monitoring them. Most often, monitoring occurs at points in time when developers must apply for site plan or building permit approvals or submit annual reports. Occasionally, complaints from the general public trigger a review of the development agreement and the developer’s compliance with that agreement. Often, staffing constraints make it difficult for local governments to be vigilant regarding implementation of programmatic transportation improvements and services. As a result, TDM strategies that require non-physical improvements in a development agreement may have little compliance. This challenge is evident in the case studies compiled for this report.
CURRENT PRACTICE OF INCORPORATING TDM INTO THE LAND DEVELOPMENT PROCESS

For the purposes of this report, the land development process in Florida includes long range planning, land development regulations (addressing zoning, subdivision, parking, etc.), other ordinances (such as concurrency and trip reduction), as well as various permitting processes. Managing transportation demand involves each stage of the development process. Often, the land development process is weighted toward accommodating the demand for private motor vehicles at the expense of managing transportation demand. Challenges of incorporating TDM strategies into the land development process exist in each stage of the process and affect the outcome. This discussion of the land development process from long range planning through site development identifies how TDM is currently being incorporated into each stage as well as some of the factors that may work against transportation demand management.

Long Range Planning

Local governments are responsible for land development policy setting through development of generalized long range plans guiding future growth, as well as regulating development at the site-specific level. Long range planning includes both transportation planning as carried out by metropolitan planning organizations and comprehensive land use planning as carried out by local governments. Although local government comprehensive plans provide guidance for the entire jurisdiction, local governments are increasingly developing sub-area, small area, sector, or selected area plans to respond to individual land use, transportation, and economic needs as well as to resident desires in specific areas.

MPO Long Range Transportation Plan (LRTP) In a 2002 review, Kramer and Mierzejewski found that “almost all MPOs incorporated the concepts of intermodalism and multi-modalism into their long range transportation plans” (28). For the first time, the majority of Florida MPOs considered alternative modes of transportation in addition to the automobile, including bike paths, sidewalks, multi-use trails, rail lines, bus rapid transit, express bus routes, and HOV lanes. Although most MPOs allotted some funding for alternative modes of transportation, the majority of funding went to auto-related improvements.

A few MPOs, including the Tallahassee/Leon County MPO (now the Capital Region Transportation Planning Agency, CRTPA), the Broward County MPO, and the Gainesville MTPO, established unique approaches to promoting multi-modal transportation systems in their 2020 LRTPs. The CRTPA “…conducted a two-tiered walkability/bikability analysis to target bicycle and pedestrian enhancements to areas that have a high potential for bicycle and pedestrian activity.” The Broward County MPO Board included a significant number of transit-related improvements through complex alternatives testing which included both highway and transit alternatives. Finally, the Gainesville MTPO adopted a variety of multimodal projects including road connectivity projects, lane reductions to enhance pedestrian and bicycle facilities, as well as express bus service.

Most Florida MPOs are currently preparing updates to their long range transportation plans; to date, seven of them have completed the process and adopted the updated plans. Although many of the LRTP updates are not complete as of this writing, most MPOs have adopted their guiding goals, objectives, and policies (GOPs). A review of these GOPs reveal greater policy emphasis on managing transportation demand, including the following generalized objectives.

MPOs seek to change user behavior to accomplish reductions in SOV (single-occupant vehicle) dependency through increased vehicle occupancy, reduced peak period travel, and increased
availability and use of alternative modes of travel (29). The concept of changing user behavior to maximize the capacity and efficiency of the transportation system appears as a policy in MPO LRTPs. While recognition of managing transportation demand in plan updates is a positive sign, the key concept that is missed by the general objective above is that TDM comprises many other ways to manage demand besides modal options. While the emphasis in the objective is upon reducing single-occupant vehicle travel as the means to decrease traffic congestion, examples of other strategies, including congestion pricing and compressed work week, do not necessarily reduce SOV use but can decrease congestion. This illustrates the need for planners and policy makers to better understand that TDM includes influencing travel behavior by mode, time of day, trip frequency, trip length, route, cost and regulation, and that the selection of one or more objectives to accomplish the goal may or may not include SOV reduction. This recognition is especially important in Florida urban areas where parking is plentiful and small effort is being made to limit parking.

A handful of policy statements attempt to make more specific recommendations, including reducing peak period travel using TDM strategies and providing a telecommunication network that would enhance people's ability to avoid trips entirely. Examples of goals, objectives, and other policy statements expressing these planning concerns include:

- **Okaloosa-Walton TPO:** Reduce energy consumption by promoting actions to increase the occupancy in vehicles (e.g. ridesharing, mass transit, HOV lanes).
- **Collier County MPO:** Encourage employers to use incentives for transit use, such as bus passes, van pooling, and coordination of ridesharing activities.
- **Lee County MPO:** Reduce peak period travel through the use of Transportation Demand Management measures (e.g. carpooling, vanpooling, telecommuting, flexible work hours, etc.).
- **Pinellas County MPO:** Encourage the development of a telecommunication infrastructure to provide universal service access to all citizens for expanding educational opportunities via distance learning, obtaining medical information via telemedicine, increasing commerce via the purchase of goods by online shopping, and creating job opportunities via telework. These elements will foster economic development by helping citizens and businesses move intellectual property, data and information electronically. This policy is intended to reduce or even eliminate the need to travel for these purposes.

Another observation is the frequent use of “soft” verbs—actions that sound good but for which progress is difficult to measure. These actions include “coordinate with”, “promote”, “encourage”, “consider” and “continue to support”. Another common phrase is “implementing where feasible” which suggests the intent to use TDM but provides a way to justify avoiding TDM based upon professional judgment. Related to this are ambiguities in the use of wording that expressly requires an action versus that which implies it is optional (i.e., “shall” versus “will”, where standard rules for these words often do not reflect actual usage). Policy language must be clear about what is mandatory. Word selection in policies also should clearly describe the intended application of TDM. For example, the difference between the use of “transportation alternatives” and “transportation choices” may be interpreted differently by some. Critical to the initial acceptance of TDM, particularly as citizens are being asked to change their travel behavior, is the concept that TDM provides everyone with choices and the selection of one mode or action does not have to be used every time. TDM enables travelers to have the option to choose transit one day and drive to work...
alone another day when needed. TDM is intended to maximize travel flexibility while encouraging the selection of the best and most efficient travel choice for each trip.

Under the sponsorship of Bay Area Commuter Services, the regional commuter assistance program in the Tampa Bay area, long range TDM planning for municipalities was advanced through the preparation of Long Range TDM Plans for Hillsborough and Pinellas Counties by the USF Center for Urban Transportation Research. These were developed with the active participation of advisory committees comprised of their respective MPOs, city and county staff, transit agencies, FDOT and other key stakeholders. Baseline performance was measured for 2000 and peer communities were selected in regard to demographic, transit, vanpool program and congestion index characteristics. Forecasts for 2025 were developed using the Environmental Protection Agency’s (EPA) COMMUTER Model. The model estimated the impact of TDM strategies based upon several scenarios developed by the advisory committees. The plans demonstrated that success of TDM depends upon the packaging of various actions that complement and reinforce each other to achieve a desired objective. The plans also contain estimated costs of implementation and demonstrate that the impact of TDM strategies corresponds to the degree of financial support and commitment assigned to their implementation (30a and b).

The Pinellas County MPO example cited above regarding encouraging the development of telecommunications infrastructure points to a different challenge entirely. While many transportation entities at the federal, state and local levels provide programs to promote telework, they do not control telecommunications infrastructure. While the FDOT has pursued the development of a fiber optic network, it has been for Intelligent Transportation Systems (ITS) applications for optimizing highway traffic flow rather than reducing the need to travel through electronic access. Telecommunications within the transportation arena is an underdeveloped area well worth pursuing (31).

MPOs seek to make modal alternatives more viable through increased availability, improved service, and additional funding (29). Increased multi-modalism is one of the key priorities of the Intermodal Surface Transportation Efficiency Act of 1991 (ISTEA) and remains a corner-stone of transportation policy at both the federal and state levels. Individual MPO priority statements touch on a variety of issues and subjects, each of which can be categorized generally under a desire by MPOs to create a multi-modal transportation system. Again, the majority of objectives and policies address alternative modes of transportation including bike paths, sidewalks, multi-use trails, rail lines, bus rapid transit, express bus routes, and HOV lanes. Many MPOs express a clear desire to make alternative modes of transportation competitive with the single occupant vehicle through improved travel time, accessibility, and aesthetics. Examples of goals, objectives and other policy statements expressing these planning concerns include:

- **Ocala/Marion County TPO:** Provide increased fixed route transit services by expansion of the existing transportation system into areas of high population, employment, or services, and/or by decreasing existing bus route times thereby providing more frequent service.

- **Florida-Alabama TPO:** Encourage developers in the local government site plan review process to include provisions for alternate forms of transportation such as a compact car, motorcycle, golf cart, designated car pool, and bus as well as for bicycle racks, High Occupancy Vehicle (HOV) lanes, and designated park and ride lots.
• *Gainesville MTPO:* Improve the viability of alternatives to the single-occupant automobile (bicycle, walking, public transit, carpooling, and telecommuting) as options for all users of the transportation system through accessibility, convenience and comfort.

MPOs seek to improve the connectivity of the transportation network through the provision of alternate routes (29). Some MPOs address the need to improve connections between roadways of various functional classes (arterials, collectors, local roads, etc.) to encourage an appropriate distribution of vehicle traffic across the entire roadway system and relieve congestion on the higher order roadways. A few MPOs expand upon that concept to include improved connectivity between all components of the transportation system including sidewalks, bikeways and transit ways. Examples of goals, objectives and other policy statements expressing these planning concerns include:

• *Capital Region TPA:* Improve connectivity of the collector roadway network to relieve congestion on arterial and freeway facilities.

• *Florida-Alabama TPO:* Provide design guidelines for developers to ensure multimodal connectivity in or between new developments.

• *Volusia County MPO:* Support in-fill development and the concentration of new commercial and office space in activity centers that can be interconnected by transit, bikeways and sidewalks.

MPOs seek to promote livable communities through the design of a transportation system that is both sustainable and sensitive to community visions and values (29). MPOs also indicate support of community livability through the transportation planning process, stressing the need to provide a transportation system that enhances multi-modal access to key community facilities such as schools, work places, shopping districts, recreational venues, cultural facilities and medical services. A policy example addressing livable communities is below:

• *METROPLAN ORLANDO:* Provide a pedestrian system that connects to an inter-modal transportation system in order to support neighborhood and community livability and vitality.

MPOs seek to encourage local governments to adopt urban design strategies and corresponding land development regulations that support the integration of land use and transportation (29). While MPOs encourage local governments to develop and implement urban design strategies that integrate transportation and land use, local governments are directly in control of the land development process. Some specific design concepts recommended by MPOs include designs that encourage internal trip capture, control of access along major facilities, mixed use development, transit-oriented development, walkable communities and more intense non-residential development in transit corridors while discouraging the development of strip commercial land use and improvements that support peripheral growth and urban area sprawl.

Additionally, MPOs encourage local governments to include requirements in their land development regulations to ensure that new development is integrated into the multimodal transportation system. Suggestions include regulations that require developers to integrate design elements in their site plans that would facilitate transit use (transit stops and connections, etc.), encourage walking, biking and other modal transportation modes (bicycle racks, lighted sidewalks, benches, van pool parking
spaces, etc.), and provide for multi-modal connections to adjacent land uses. Examples of goals, objectives and other policy statements expressing these planning concerns include:

- **Ocala/Marion County TPO**: New subdivisions and developments shall be required to provide multi-modal interconnections to adjacent properties to permit travel to neighboring land uses without having to use the public roadway system.

- **Collier County MPO**: The MPO will work with local governments to develop ordinances that require all new and redevelopment projects to consider alternative modes and “smart growth” design techniques.

- **Volusia County MPO**: Support in-fill development, redevelopment and the concentration of new commercial and office space in activity centers that can be inter-connected by transit, bikeways, and sidewalks.

- **Capital Region TPA**: Coordinate with local governments and other agencies, to discourage development of strip commercial land use, encourage the control of access along major facilities, encourage mixed-use development, and encourage transit-oriented development with more intense non-residential development in existing and planned transit corridors.

- **Miami-Dade MPO**: Discourage improvements that support peripheral growth and urban area sprawl.

In crafting TDM-specific objectives and policies, each MPO must remain aware of its role in establishing guiding policies for the transportation system while still being specific about what is to be accomplished and how it is to be accomplished. The following discussion includes examples from a few MPOs that specifically use the terms “transportation demand management” or “TDM” in their respective LRTPs. Note that the Collier MPO “encourages” TDM, while Pinellas County MPO establishes a more active role for itself in working with local governments regarding transportation demand management. Finally, the Hillsborough County MPO sets aside specific funding for TDM programs. Each level of inclusion serves a useful role for the population it serves.

In the first example, the adopted GOPs for the Collier MPO 2030 Long Range Transportation Plan Update specifically included TDM in the following objective and accompanying policies:

**OBJECTIVE 1.14 Encourage utilization of Transportation Demand Management (TDM).**

**POLICY 1.14.1** The MPO will encourage local jurisdictions to develop multimodal plans, services, and programs that decrease reliance on the single occupant vehicle as the dominant means of travel.

**POLICY 1.14.2** The MPO 2030 LRTP will identify methods citizens can use to commute to work and decrease overall traffic demand on the transportation system. These methods may include transit ridership, telecommuting, flexible work schedules, carpooling, vanpooling, walking, and bicycling.

It is important for TDM professionals to point out to transportation planners and policy makers that while TDM has traditionally been applied to commuter travel, commute trips only constitute 20 percent of all travel. TDM can be applied to a variety of trip purposes and land development settings. FHWA comprehensively identifies the range of application settings for implementing TDM (32).
Incorporating TDM into the Land Development Process

These are not just employment sites targeting commute trips. As illustrated in Figure 2 in the introduction of this report, these application settings include schools, special events, recreation and tourism, corridor planning and construction mitigation, freight transport, airports and incidents and emergencies.

The Collier MPO Policy 1.14.1 limits the role of the MPO to providing encouragement to local governments to make their own efforts. Although in Policy 1.14.2, the MPO takes an active role to “identify methods citizens can use,” the policy provides no further guidance regarding how to share those methods with citizens. On the other hand, the Pinellas County 2025 Long Range Transportation Plan Update provides more specific actions for the MPO. One of the objectives in the Pinellas County Plan is devoted to transportation demand management stating, “Reduce traffic congestion and positively impact air quality by decreasing the use of the single occupant vehicles (SOV) at peak hours” (33). This objective is supported by fourteen policies (Appendix C) outlining the MPO’s intent to perform various support roles in the implementation of TDM measures throughout the County. Below are just a few of the policies from this Plan:

1.7.1. Policy: The MPO shall work with local governments, transportation demand management (TDM) agencies and FDOT to develop vehicle trip (VT) reduction and vehicle miles of travel (VMT) reduction goals.

1.7.2. Policy: The MPO shall assist and support the efforts of Bay Area Commuter Services (BACS) to implement and achieve the goals of its Long Range Transportation Demand Management Plan and to carry out recommended actions derived from related studies.

1.7.3. Policy: The MPO shall assist and encourage the efforts of local TDM agencies by providing technical and funding support for promotion of alternatives to SOV travel, including carpool, vanpool, transit, walking, bicycling, telecommuting and variable work schedules.

1.7.4. Policy: The MPO shall continue to participate in events and other activities sponsored by local transportation-related agencies that support and facilitate the use of alternatives to driving alone by commuters and other travelers (e.g., Commuter Choices Week, B-BOPP, Tampa Bay Commuter, etc.).

In these and the remainder of the policies devoted to TDM, the Pinellas County MPO stresses action in terms of “work with, assist, encourage, participate, and provide technical and funding support.” Policy 1.7.1 states that vehicle trip (VT) and vehicle miles of travel (VMT) reduction goals will be the result of collaboration between the MPO, local governments, TDM agencies and the FDOT. Further, Policy 1.7.3 specifies that the MPO will provide technical and funding support to local TDM agencies.

As evidenced in the Collier and Pinellas County MPO plans, most TDM-related policies affirm the MPOs intent to influence or encourage local governments and other agencies to implement the measures because, in reality, each MPO guides transportation funding not land development or program implementation. MPOs also have the capacity to provide technical support for transportation planning where local agencies lack the necessary expertise. The goals, objectives and policies adopted by each MPO serve as a valuable tool for local governments to build on as they develop their comprehensive plans.
Each MPO adopts GOPs to serve as guidance in developing alternatives and, ultimately, expenditures for the adopted plan. The MPO solidifies its intent for the transportation system through its funding or investment choices. Whereas TDM is often mentioned within the goals, objectives, and policies of each MPO, there is seldom any funding attached to TDM programs. An example of an MPO that has included specific TDM funding in their plan is the Hillsborough County MPO. The Adopted 2025 Long Range Transportation Plan was guided by a number of Goals, Principles, and Objectives or GPOs (rather than goals, objectives, and policies), several of which either specifically include transportation demand management or refer to it. Below are the various objectives referring to TDM along with the accompanying goals and principles:

**Goal I: Vitality of the Tampa Bay Region**

**Principle 1.1 Relieve Traffic Congestion and Minimize Travel Time**
- Foster strategies that reduce the growth in peak hour vehicle travel (i.e., carpooling, telecommuting, bicycling, etc.).

**Principle 1.4 Encourage Private-Sector Transportation Investments**
- Encourage private-sector participation in providing the design, right-of-way, and construction of transportation improvements.
- Consider, where feasible, incentives for private sector participation in the development of transit stations, intermodal terminals, toll roads, and transportation demand management programs.

**Goal II: Promote Accessibility & Mobility Options Available to People or Freight, and Enhance the Integration and Connectivity of the Transportation System**

**Principle 2.2 Decrease Reliance on Single-Occupancy Vehicles.**
- Increase the percentage of persons using alternative modes, especially during peak hours.

**Goal IV: Preserve Existing Facilities and Promote Efficient System Management and Operations**

**Principle 4.4 Emphasize the Use of Existing Transportation Systems to Avoid Unnecessary Capacity Improvements.**
- Promote policies that maximize the use of the existing transportation system and explore opportunities for connectivity before building new facilities (i.e., re-striping for bicycle lanes, new technologies, access management, and transportation demand management).
- Encourage local governments and private entities to implement transportation demand management techniques in order to reduce demand and provide commuter benefits.

Although the GOPs refer to transportation demand management, the Plan text uses the term travel demand management rather than transportation demand management and describes it as follows:

*Travel Demand Management (TDM) comprises an array of strategies to address peak-hour congestion through reducing demand for road-space. In general, TDM strategies encourage*
travelers, especially commuters, to make their trip via some method other than driving alone (bus, carpool, vanpool, bike, walk); or not to make the trip at all (telecommute); or to shift their travel time to off-peak hours (compressed work week and flex-time programs).

The Plan lists the agencies within Hillsborough County (the MPO’s jurisdiction) that implement TDM programs. Each agency works with “…employers to encourage their voluntary adoption and support of TDM programs, such as carpool incentives and telecommuting.” The Plan suggests a program that “would make employer TDM programs available to at least 50,000 workers in Hillsborough County.” In order to accomplish this goal, it is envisioned that the various TDM agencies would approach those businesses employing a minimum of 500, 250, and 50 employees, respectively. Of the trip reduction facilities and incentives discussed for this program, one includes a, “…government-funded match for employer subsidies of employees’ transit fares.” An example of this incentive could involve the purchase of a transit pass by an employee for 50 percent of the normal fare. The remaining 50 percent would be split by the employer and the MPO match program.

Not only does the Hillsborough County MPO include TDM in its Goals, Principles, and Objectives, as well as a discussion in the text of the document, it establishes funding for the program beginning in 2010. Using revenue from the Transportation Management Area funds (also known as federal urban allocation funds and available to MPOs with an urbanized area population over 200,000), the funding total for the TDM program’s first five years is $12,966,712 of the $126,781,006 available; for the fifteen-year period from 2010 to 2025 it reaches a total of $35,411,232 of the $310,568,927 available. Details of the funding allocated in the MPO’s LRTP are presented in Table 2 of this report.

The Hillsborough County MPO has chosen to support transportation demand management through appropriate funding, and to establish a program goal of making TDM programs available to 50,000 employees throughout the County. Other Goals, Principles, and Objectives in the Plan address increasing transit service and availability as well as site plan, subdivision design, and land development patterns that encourage livable communities and discourage single-occupancy vehicle travel. While this type of language is contained in each MPO’s long range transportation plan, subsequent funding of programs that support the language is key to reaching specific TDM goals.

Detailed alternatives analysis, as performed by Broward County, emphasizes the trade-off between modes and enables transportation decision-makers to reach informed decisions regarding the transportation system. More up-front work is required in order to perform this type of alternatives analysis, but can result in decisions leading to a functional multimodal transportation system later. Although many MPOs include transportation demand management provisions in their GOPs, most alternatives analysis still focuses on serving private motor vehicles. While limiting, this emphasis is not necessarily incompatible with TDM if strategies of influencing travel behavior by time of day, day of week, trip frequency, route and cost are used.

Local Government Comprehensive Plans (LGCP) Both authorized and required by the Local Government Comprehensive Planning and Land Development Regulation Act, Chapter 163.3161, F.S., local governments in Florida prepare comprehensive plans to address land use, transportation, housing and environmental resources, along with other required plan elements. Local government comprehensive plans (LGCP) establish the policy direction of a jurisdiction’s land development regulations. Local governments across the state have prepared and implemented long range comprehensive plans with varying degrees of success in managing growth. Limited success in managing growth is evident through several factors, including increases in traffic congestion and decreases in accessibility and mobility.

As with the MPO long range transportation plans, most goals, objectives, and policies of local government comprehensive plans, incorporate a variety of multimodal alternatives, site plan and subdivision design guidelines, and land development patterns that encourage livable communities while discouraging single-occupancy vehicle travel. Although it is important that the LGCP strongly and clearly provide the policy foundation for incorporating TDM strategies into the land development process, most LGCPs in Florida only encourage the practice.

Due in part to traffic concerns over recent years, people across the nation have had an increased interest in sustainable communities concepts such as establishing urban growth boundaries, directing land development inward, revitalizing downtowns and creating livable communities. This interest is often reflected in the use the local government comprehensive planning process and corresponding land development code to implement these concepts. Local government comprehensive plan examples discussed here are from the City of Orlando, the City of Jacksonville, and Broward County.

City of Orlando. The City of Orlando relies on METROPLAN ORLANDO (Orlando’s Metropolitan Planning Organization) and LYNX (the Central Florida Regional Transportation Authority) to organize and implement TDM programs in the city. Objective 4.2 and Policies 4.2.1 through 4.2.6 of the Orlando Growth Management Plan below address TDM by encouraging METROPLAN Orlando and LYNX to take various actions regarding transportation demand management, obliging the City only to participate.

Objective 4.2 The City shall annually coordinate with METROPLAN ORLANDO and the Central Florida Regional Transportation Authority (dba LYNX) to undertake efforts to promote Transportation Demand Management programs focusing on the region’s major activity centers.

Policy 4.2.1 The City shall support and will participate in activities of Metroplan Orlando and the Central Florida Regional Transportation Authority (dba LYNX) to promote Transportation Demand Management programs in the region.

Policy 4.2.2 The City shall encourage METROPLAN ORLANDO and the Central Florida Regional Transportation Authority (dba LYNX) to undertake efforts to increase regional awareness on the importance of Transportation Demand Management programs in addressing traffic congestion, environmental protection, and energy conservation.
Incorporating TDM into the Land Development Process

Policy 4.2.3 The City shall encourage METROPLAN ORLANDO and the Central Florida Regional Transportation Authority (dba LYNX) to develop incentives for employers to implement Transportation Demand Management (TDM) programs. The TDM programs may include, but not be limited to, ridesharing, flexible work hours, telecommuting, preferential parking, bicycle parking, and transit subsidies.

Policy 4.2.4 The City shall encourage METROPLAN ORLANDO and the Central Florida Regional Transportation Authority (dba LYNX) to develop thresholds at which various Transportation Demand Management measures could be required by local governments.

Policy 4.2.5 The City shall encourage METROPLAN ORLANDO and the Central Florida Regional Transportation Authority (dba LYNX) to conduct transportation surveys to assess changes in alternative transportation modes use.

Policy 4.2.6 All projects that are located outside metropolitan activity centers, and that will include a concentration of more than 500 employees, shall coordinate with METROPLAN ORLANDO and the Central Florida Regional Transportation Authority.

City of Jacksonville. In an effort to increase bicycle and pedestrian travel, the City of Jacksonville’s 2010 Comprehensive Plan directs the City to support the development of pedestrian accommodations and bikeways throughout planning and land development and to “actively encourage” citizens to use those facilities. The Plan also establishes a Transportation Management Area (TMA) in the area of State Road 9A at J. Turner Butler Boulevard and Baymeadows Road (Objective 1.3). Policy 1.3.11 specifically requires a TDM plan:

Any non-residential development proposed within the TMA which will employ more than one hundred (100) persons shall submit to the City, prior to the issuance of final development agreements or permits, a plan for the use of Transportation Demand Management (TDM) strategies and incentives. Such strategies may include participation in the Jacksonville Transportation Authority’s (JTA) Suburban Mobility Management Program, participation in a Transportation Management Organization (TMO) and other strategies recommended in the MPO’s Congestion/Mobility Management Plan for the Jacksonville Urbanized Area and the MPO’s Commuter Assistance Program. Any such development shall implement its TDM plan, as submitted to the City. All non-residential development within the TMA shall participate in the MPO’s Commuter Assistance Program.

According to the City’s current planning staff, there is no actual process to implement this provision. When the City does ask developers to include transit or TDM in transportation for their development, many reasons are offered as to why such measures simply “won’t work.” The City does coordinate with the First Coast MPO who administers the Metropolitan Commuter Assistance Program (MCAP) through funding from the Florida Department of Transportation.

Broward County. Most proactive in its inclusion of TDM strategies is the Broward County Comprehensive Plan (BCCP). Its policies are measurable. When this is the case, plan policies can be evaluated regarding whether or not they have been met. The BCCP contains the following policy:

Broward County shall provide for an energy efficient roadway network through implementation of, but not limited to, the following programs, activities, or actions:
- Through participation in the MPO, increase the vehicle occupancy rate from 1.37 to 1.43 persons per vehicle through transportation demand management (TDM) strategies, such as ridesharing programs, preferred parking, and high occupancy vehicle lanes.
Incorporating TDM into the Land Development Process

- Through participation in the MPO, work to reduce the per capita vehicle miles traveled (VMT) below the year 2002 projected daily per capita VMT of 19.42 by implementing TDM strategies.
- Through its membership on the MPO, maintain and, where feasible, expand the number of ride-sharing lots in Broward County.

In its 2004 Evaluation and Appraisal Report, Broward County noted that it “has increased the vehicle occupancy rate per vehicle through transportation demand management (TDM) strategies, such as ride-sharing programs, preferred parking, and high occupancy vehicle lanes.” Broward County has begun both carpool and vanpool programs and provided funding for transit shuttles in support of these policies. The number of park and ride lots has increased from 5 lots to 23 lots. The actions taken by Broward County illustrate that stating clear, measurable goals within its Plan policies along with appropriate funding leads to successful implementation. Performance measurement enables an effective TDM program to continue to win funding and support.

It is important to select program measures with care. Performance measures will dictate what actions are taken and may de-emphasize some actions that would otherwise be highly effective in achieving the goal. For example, Broward County’s goal is to provide for an energy efficient roadway network and measures this using a vehicle occupancy rate. This performance measure places program emphasis upon ridesharing and transit use but loses the effects of bicycling, walking and telework. An example as illustrated by Burch (1994) is the widespread use of average vehicle ridership (AVR), which is a measure of the number of persons per vehicle used to commute to a work site. The preferred goal is to reduce vehicle trips rather than increasing passengers per vehicle. Therefore, vehicle trips are the variable that should be represented as the numerator in a ratio of vehicles to persons. As a vehicle employee ratio (VER), this encompasses all modes of transportation, including the contribution of bicycling and walking. (34)

While some local government comprehensive plans attempt to include provisions for multimodal transportation and transportation demand management, often other provisions of the plans maintain the status quo by protecting the roadway system from encroachment. For example, the City of Tampa Transportation Element of its Comprehensive Plan includes Objective 2.1 to implement programs to protect existing and future rights of way from building encroachment. The City requires, through its development review process, that development follow special street setback requirements as established in Chapter 27-99 Zoning, of the Code of Ordinance.

Small Area Plans (SAP) Although local government comprehensive plans provide guidance for entire jurisdictions, local governments are increasingly developing sub-area, small area, sector, or selected area plans to respond to individual land use, transportation, and economic needs as well as resident desires in specific areas. They are generally developed with oversight of an advisory group that represents area stakeholders, and may focus on a particular neighborhood, commercial district, or high growth area. A multimodal transportation district is one type of small area plan. Each of these plans also may address TDM for the specific area. The following examples illustrate how transportation demand management can be addressed in a small area plan.

City of Orlando. The overall vision for Southeast Orlando, a future mixed-use community that at buildout could have as many as 50,000 residents, is outlined in the Southeast Orlando Sector Plan (35). The transportation section of this document describes a plan designed around transit use, bicycle use and pedestrians, with “cars . . . kept in perspective.” This will be accomplished via land use patterns, densities and street layout. The Growth Management Policy Framework makes one specific reference to TDM:
In order to develop public transit systems and services that encourage public transit ridership, increase personal mobility, conserve energy resources, preserve air quality, and foster economic growth within the Southeast Orlando Sector Plan area, projects that will include a concentration of more than 500 employees shall coordinate with METROPLAN ORLANDO and the Central Florida Regional Transportation Authority to implement Transportation Demand Management programs.

Northeast Polk County’s Ronald Reagan Parkway Selected Area Plan includes a specific TDM strategy in its vision for the area:

Live-Work Residential. It is anticipated that the percentage of commuter residents in this area will increase. The proliferation of long-term residents is vital to the sustainability and stability of the area, specifically the economy and property values. Therefore, it is imperative that greater accommodation be made for residents who choose to conduct business at their residence to reduce their amount of commuting as well as bring more commerce to Polk County. It is envisioned that residential developments will designate more areas and design more residences to enable this land use activity. In addition, greater latitude should be given to isolated properties along collector roads to develop live-work units through minimized or expedited permitting (36).

Multimodal Transportation District

A multimodal transportation district is one type of small area plan that can be a useful tool for incorporating TDM strategies in the long range planning process. In 1999, the Florida legislature amended Chapter 163, Florida Statutes authorizing local governments to establish multimodal transportation districts. The purpose of the legislation was to provide a planning tool that Florida communities could use to systematically reinforce across a defined area, those community design elements that support walking, bicycling and transit use. It also enabled Florida communities to advance transportation concurrency—a policy requirement that transportation facilities be available concurrent with the impacts of development—through development of a high quality multimodal environment, rather than the typical approach involving road widening for automobile capacity.

A multimodal transportation district is an area where primary priority is placed on “assuring a safe, comfortable, and attractive pedestrian environment, with convenient interconnection to transit” (Chapter 163.3180(15)(a)F.S.). Communities must incorporate community design features that reduce vehicular usage while supporting an integrated multimodal transportation system. Common elements include the presence of mixed-use activity centers, connectivity of streets and land uses, transit-friendly design features, and accessibility to alternative modes of transportation.

Multimodal transportation districts (MMTDs) are to be carried out through local comprehensive plans, land development regulations, and capital improvements programs. The National Center for Transit Research (NCTR) at the Center for Urban Transportation Research (CUTR) prepared a report entitled, Model Regulations and Plan Amendments for Multimodal Transportation Districts that contains model land development regulations and comprehensive plan amendments that local governments in Florida can use and adapt to promote multimodal transportation systems and development patterns. The report begins with an overview of the purpose and statutory requirements for multimodal transportation districts in Florida, and continues with model comprehensive plan amendments and land development regulations to assist local governments in implementing MMTDs.
MMTD designation is accomplished by amending a local government comprehensive plan and accompanying future land use map, as provided in Chapter 163.3184, F.S. A proposed multimodal transportation district must be reviewed and approved by both the Department of Community Affairs (DCA) and the Florida Department of Transportation (FDOT). Local governments must demonstrate that an area qualifies as an MMTD based upon the following existing or planned future design elements defined in Chapter 163.3180(15)(b), F.S.:

- A complementary mix and range of land uses;
- An interconnected network of streets to encourage walking and bicycling, with traffic calming where desirable;
- Appropriate densities and intensities of use within walking distance of transit stops;
- Daily activities within walking distance of residences, allowing independence to persons who do not drive;
- Public uses, streets, and squares that are safe, comfortable, and attractive for the pedestrian, with adjoining buildings open to the street and with parking not interfering with pedestrian, transit, automobile, and truck travel modes.

Local governments may be interested in establishing a MMTD because transportation concurrency is not primarily based upon motor vehicle level of service but by demonstrating an adequate level of mobility based upon professionally accepted multimodal LOS methodologies. Within a MMTD, local governments may also choose to reduce impact fees or local access fees imposed on land development based upon the reduction of vehicle trips or vehicle miles traveled expected based upon the development pattern planned for the district.
Land Development Regulations

Many local governments are doing just that. Florida law requires each local government to develop land development regulations that facilitate their individual long range comprehensive plans. Land development regulations include a wide range of regulations including adequate public facilities or concurrency ordinances, impact fee ordinances, zoning and subdivision regulations and other requirements for the development of land within the governing jurisdiction.

Impact Fee Ordinances. An impact fee ordinance provides another opportunity in the land development process to encourage developers to incorporate transportation demand management strategies. Impact fees have been defined as “a monetary charge imposed by local government on new development to recoup or offset a proportionate share of public capital costs required to accommodate such development with necessary public facilities” (38). Florida state law explicitly encourages local governments to enact land development regulations, including impact fees, to manage growth. Impact fee programs may be either demand driven (most prevalent), facility driven (less prevalent), or a combination of the two approaches (least prevalent) (39). Demand-driven approaches translate new auto trips into cost-per-trip based on the cost to improve a mile of roadway. Facility-based approaches arrive at a fee by taking the road improvement budget in the capital improvements program and dividing it by the trip generation rate for a proposed land use.

Most jurisdictions provide some form of credit, also known as an “offset,” for developer-initiated improvements or in-kind contributions. The Model Impact Fee Authorization Statute defines offsets as “the amount by which impact fees should be reduced to fairly reflect the value of land dedications or other physical improvements provided by a developer pursuant to any local requirements. Such offsets shall apply only to external or off-site improvements or dedications” (40). These offsets, known as impact fee waivers, reductions or exemptions, provide for a full or partial exemption from impact fees to accomplish specific planning objectives. A certain percentage discount is sometimes offered as part of the impact fee formula or in the impact fee ordinance, reducing the amount of the assessment by a given percentage. Because many TDM strategies are programmatic and on-site in nature, impact fees and the use of offsets have had limited application. However, several municipalities have applied them toward physical improvements to encourage alternative transportation and traditional neighborhood development as described in the examples below.

Orlando, Florida. The City of Orlando adopted an impact fee formula in the late 1990s that includes a schedule based on vehicle miles of travel (VMT) indicators (for various development units) (41). Rates vary according to geographic location and nature of development (e.g. lower or higher trip intensity patterns). For example, downtown and traditional city rates are comparatively lower than those in the “other city” area, because of the intensive land use mix and higher use of alternative modes in those areas.

The VMT indicator is used to adjust impact fee rates for compact developments that have lesser impacts on the road network. If the VMT indicator calculated for a specific traffic zone or zones is lower than the previously determined regional VMT indicator, the impact fees are adjusted accordingly. Under this approach, residential developments in the downtown area could receive as much as a 38% discount in road impact fees when compared to the previous formula.
Following the adoption of the new impact fee schedule, the City of Orlando Transportation Planning Bureau engaged in a special study to determine the transportation benefits of the traditional neighborhood development (TND) for walking and bicycling. The purpose of the study was to determine whether and by how much to reduce the transportation impact fee for the Southeast Sector Plan, which also incorporated TND requirements and called for higher accessibility as measured by a connectivity index (42). The study involved a survey of bicycle-friendly cities including Portland, Seattle, Vancouver, Davis, and Boulder to identify their bicycle/pedestrian mode split by trip purpose. The survey results showed an average 30% bicycle/pedestrian trip share for work, schools, shopping and recreational activities in these cities.

The report recommended a revision in the Trip Generation Factor (TGF) (which addresses mode split where vehicle lane miles of travel decrease and alternative mode trips increase) in the traffic impact fee (TIF) formula from 1 to 0.7 for TND development—a 30% reduction. The report acknowledged that “due to insufficient evidence supporting whether connectivity will translate into increased mode splits across all land uses, the reduction is proposed to apply only to those uses most closely associated with opportunities for non-automotive trips.” This included the land uses in the Southeast Sector Plan that comply with TND and network connectivity criteria.

Under the Southeast Sector Plan requirements, any applicant that adds links to the bicycle/pedestrian network from the development to the surrounding network, such that the connectivity index is 1.4 or greater, receives a 30% reduction in impact fees. These connections can be in the form of bicycle/pedestrian paths, sidewalks and streets. Staff notes that larger developments are those that typically benefit from the reduction, although some smaller, stand-alone sites could benefit depending upon their contributions.

Estimating trip generation for proposed new development is a challenge in the design and application of impact fees or any other fee or regulation that relies upon trip generation. Actual trip generation can vary widely for similar land uses; however, due to lack of resources to conduct their own studies, local governments commonly rely upon the use of trip generation estimates from the Institute of Transportation Engineers. Shoup points out this precarious use of ITE trip rates for transportation planning and design purposes despite cautions provided by ITE for their appropriate application. For example, ITE describes the trip rates for land uses as estimated from observations generated at selected developments, primarily from suburban localities with little or no transit service, nearby pedestrian amenities, or travel demand management programs. There is strong evidence to suggest that most selected sites offer free parking. Half the rates are based on five or fewer studies per land use. At most sites, vehicle trips are observed during the course of one day only. Shoup also points out that many factors influence the number of vehicle trips generated at a site, and we should not expect floor area, acreage or any other single variable to accurately predict the number of vehicle trips at any site or land use. Transportation planning decisions have contributed to the design for a car-oriented system because of the systematic misapplication of ITE trip rates by local governments over the years. The ITE trip rates represent land development patterns that provide no other choice besides private automobile driving and therefore demonstrate no use of alternative transportation. The lack of use of transportation alternatives is misinterpreted as a lack of need for transportation alternatives. Reinforcing this outcome is also the misapplication of ITE parking generation rates that are likewise generated from locations that offer no transit service and which result in overestimates of needed parking (43).

Due to the above observations, it is evident that impact fees can be used to encourage the use of transportation demand management strategies, but planners must be aware of how the methodology for determining the fee may inadvertently reinforce an outcome that reflects the status quo rather than helping to shape a more balanced supply of physical transportation facilities and their use.
**City of Loveland, Colorado.** The City of Loveland Colorado enacted a credit for mixed-use development in November 2001. The program offers a 25% reduction in the road impact fee to encourage mixed-use development. The ordinance provides rationale and eligibility criteria for the reduction. However, city staff has not had much experience with administering the credit for the mixed-use development. To date, the credit has been provided at two locations—both relatively large developments (approximately 70 acres). Staff indicated that the mixed use credit program may be disbanded. One reason is that Loveland is currently a small town that is developing in a low-density suburban fashion and many developments are not designed in a pedestrian-oriented fashion. Another constraint is that the credit works for large developments, but is not applicable to small single-use developments under separate ownership that together achieve comparable results, such as where a multi-family development is built next to a commercial development with adequate connectivity. According to staff, this has raised fairness concerns.

**Palo Alto, California.** One example of the use of transportation impact fee credits to entice developers to incorporate TDM strategies in their developments is in Palo Alto, California. In an effort to reduce new vehicle trips, the City of Palo Alto is implementing a strategy to provide effective alternatives to automobile travel. The transportation impact fee (TIF) expenditure plan includes citywide transportation demand management, expanded shuttle service, bicycle facilities, and computerized traffic management (44). Using an improvements-driven approach, the recommended transportation impact fee is “based on charging new development for 7.6% of the cost of the expenditure plan (which) represents the proportion of 2025 vehicle trips that is expected to be generated by development subject to the TIF.”

The impact fees are based on p.m. peak hour trip generation (ITE or Santa Clara County Valley Transportation Authority (VTA) sources). Credits are not given for transportation improvements required before the imposition of the fee (such as for intersections). Trip reduction credits are allowed for mixed-use development, locations close to transit, and effective TDM programs. The following table indicates the maximum potential trip reductions generally allowed for by VTA.

1For mixed-use projects, the percentage is off of the smaller trip-generator with the same number of trips reduced for the smaller generator applied to the larger generator.
2Major bus stop defined as a stop at which six or more buses per hour from the same or different routes stop during the peak period.
3If the shuttle trip reduction is being combined with the ‘Employment near LRT or Caltrain Station’ reduction, the maximum shuttle trip reduction that can be taken is 1.5%.

Clark County, Washington. Another effort to incorporate TDM in the land development process through impact fees is found in Clark County, Washington. Clark County adopted an ordinance that provided an impact fee reduction as an incentive to making specific improvements in order to achieve desired densities within transit supportive and mixed use development. However, discussions with Clark County staff reveal that this approach was never implemented (no developers attempted to use the provisions) and was later repealed due to problems with other areas of the ordinance. Initial actions eligible for credit included a 1% credit for “designation of ten percent of all non-residential parking as carpool/vanpool parking facilities if located in a manner maximizing accessibility subject to ADA requirements,” a 3% credit for “installation of parking spaces which will become paid parking (by resident or employee),” and a 1% credit for “installation of preferential carpool/vanpool parking facilities.” The complete tables of incentives are provided in Appendix E.

A new credits table within a proposed mixed used zone is currently under review in support of a provision in the recently adopted comprehensive plan, zoning map and development regulations (see Table 4). The amount of credit available is simply to create a developer incentive rather than being the result of specific analysis. The Clark County model provides several specific actions, such as the installation of bus-stops or bike lockers, and the corresponding impact fee credits that could be incorporated into local impact fee ordinances.

**Atlanta, Georgia.** The City of Atlanta provides for a 50% reduction in transportation impact fees for projects within 1000 ft. walking distance of a MARTA rail station or bus stop (measured by walking path or sidewalk). This amount is a partial exemption rather than a credit and was designed as an incentive rather than based on analysis. Full exemptions are provided for “Empowerment Zones” and “Linkage Communities”—federal designations for economic development of low-income areas—as well as for projects that provide affordable housing (50% to 100% credit depending on whether it’s ADA accessible). In addition, the City may designate a development that creates numerous jobs as an economic development project and provide a waiver for this as well, if it meets certain criteria regarding the number of employees hired from within the neighborhood or City.

These exemptions are subject to a requirement that the City make up the difference in lost transportation impact fees through the capital improvement program somewhere in the City (Note: they do not divide the City into zones for transportation impact fee administration; it is citywide). The exception to this requirement is the 50% credit for MARTA area development. Because the 50% credit for MARTA area development is an incentive for transit-oriented development (considered economic development) around transit areas, the City does not reimburse this credit through the CIP. The rationale, as explained by staff, is that the added development will increase property tax revenues for the City, offsetting the loss of impact fee revenues.

Concurrency Ordinances. Also known as adequate public facilities ordinances, these regulations require that public facilities be available to meet the needs of new development at the same time the development is occupied. Florida defines its own concurrency requirements in F.S. 163. 3180.

**Rockville, Maryland.** The City of Rockville, Maryland is moving away from mitigation measures related primarily to providing additional roadway capacity through physical improvements and is encouraging mitigation for alternative modes (e.g. ridesharing programs, shuttles to transit stations, installation of pedestrian and bicycle facilities, etc.). Rockville applicants for developments may be obligated to contribute toward the improvement of offsite transportation and safety facilities to help address identified safety hazards for all modes. As stated in the *City Transportation Plan*,

> Providing safe, direct pedestrian routes between residential areas and activity centers can help reduce the number of day-to-day vehicle trips. These connections can be created or improved by installing sidewalks, adding paths to link cul-de-sacs and dead end streets, installing pedestrian signals and crosswalks, or by constructing pedestrian bridges over busy roadways. Treatments, such as lighting, landscaped buffer areas and other streetscape improvements, can heighten safety and make pedestrian facilities more attractive for users.
Incorporating TDM into the Land Development Process

The City enacted a Comprehensive Transportation Review Methodology (CTR) in September 2004 to evaluate the impacts of new development on the transportation system and to determine mitigation for alternative modes and assign corresponding “trip” credits. Because they are deemed to have a measurable traffic impact under the methodology, developments that generate 30 or more total peak hour site trips must conduct an off-site analysis for all transportation modes.

The off-site analysis includes an assessment of major intersections that are impacted by the development as well as non-auto facilities, including sidewalks, bikeways, and transit systems that lead to the development. The goal of the off-site analysis is to “ensure that the site can be accessed safely and efficiently through various modes and that adequate transportation facilities are in place to support the subject development without detriment to the overall transportation system.” Upon completion of the required multimodal analysis, applicants must summarize all issues and impacts related to site access and circulation, automobile traffic, non-auto facilities and intersection safety as well as planned mitigating actions.

Applicants are encouraged to mitigate transportation impacts by providing non-auto improvements and modifications to the transportation system for which they receive trip credits. Applicants may receive a maximum 15% trip credit for implementation of a TDM program and participation in the City’s TDM Program.

The CTR Methodology was developed as a precursor to adoption of a new adequate public facilities ordinance, which is expected in 2005. Staff indicated that the program is so new, there has not been experience with it for comment. The trip credit amounts were developed based on a review of what other communities were doing (e.g. Orlando, Portland, Montgomery County), as well as based on observations and experiences with multimodal development and mode split in the past. Staff plan to initiate a project this year to monitor outcomes through surveys and other methods, so they can determine how well the program is working and the appropriateness of the trip credits.

Although the program offers credits for participating in the City’s TDM program, staff note that “it’s tough to create a standard credit value for TDM because the developments are all so different and in different areas of the City.” Therefore, the credits are highly subjective and determined on a case by case basis based on the feasibility of potential trip reduction in the given context. See Appendix F for a full discussion of Rockville’s CTR Methodology.

Transit Oriented Concurrency. In 2005, the county commission of Broward County, Florida, amended the county’s land development code to provide for a transit-oriented concurrency system. These changes led to the creation of transit-oriented concurrency districts, defined as “compact geographical area[s] with an existing network of roads where multiple, viable alternative travel paths or modes are available for common trips.” This contrasts with the county’s standard concurrency districts, where roadway improvements are to remain the focal point of transportation enhancement efforts (45).

Because these definitions are open to interpretation, the county commission included specific locations for both types of concurrency districts within the text of the amendments.

The transit-oriented concurrency system begins with Transportation Concurrency Satisfaction Certificates (TCSC), which are required for issuance of a building permit from any local government within the county (with exceptions for types of development that will not generate any additional transportation impacts). For most areas of the county, including standard concurrency districts, the process of earning a TCSC is straightforward enough—usually a simple determination of adequacy, as defined by the land development code (45).
Incorporating TDM into the Land Development Process

Within transit-oriented concurrency districts, however, Broward County has outlined specific circumstances under which a TCSC will be issued. They include (but are not limited to):

- Projects located on land platted between March 1979 and the effective date of the ordinance, provided the planned development is consistent with current zoning approvals;
- Projects located on property where the county has made a vested rights finding with regard to transportation concurrency, provided the planned development is consistent with current zoning approvals;
- Projects taking place as the result of an approved DRI or FQD development order issued prior to the adoption of the *Broward County Comprehensive Plan* in 1989;
- Projects that will not increase the number of dwelling units, the type of unit, or will not cause an increase in the number of peak trips generated; and
- Developments that will promote public transportation.

However, if a proposed development within a transit-oriented concurrency district does not meet any of these criteria for obtaining a TCSC, the developer can simply pay to the county a Transit Concurrency Assessment (45).

Property owners wishing to develop land within transit-oriented concurrency districts can earn credits for transit-oriented development: “A property owner may apply for credit against the County’s Transit Concurrency Assessment by demonstrating that a proposed development satisfies all the criteria for a specific level of credit.” Credit level definitions and the degree of credit earned for each level are described in exhibits within the text of *Broward County Resolution 2005-291*, included as an attachment to this document. The amount of credit potentially available to the developer increases with each level, as do the layers of approval required (46).

Level 1 credit applications can be determined during the Development Management Division’s building permit review, and require no additional application forms. Level 2 credit also requires a review of a current approved site plan, and levels 3 and 4 require not only a site plan review but an agreement between the county, municipality and developer. This agreement is intended to “ensure the implementation of all required criteria, to provide for enforcement mechanisms . . . to specify the degree of credit granted, and to specify the property which would benefit by the grant of the credit” (46).

Additionally, under certain circumstances, a developer may opt not to pay some or all of the Transit Concurrency Assessment, and may instead implement or participate in the implementation of an alternative transit improvement. This alternative improvement must be intended to enhance transit ridership, and cannot focus predominantly on the occupants or users of the applicant’s property. The alternative improvement must be determined to be beneficial to the regional transportation system within the relevant district (45). This approach would appear to resolve some of the site impact analysis methodology issues arising from Developments of Regional Impact, described in Appendix B.

**Trip Reduction Ordinances.** Trip reduction ordinances (TRO) are regulations enacted by local governments usually for the purpose of reducing the number of trips generated during the peak periods of traffic congestion. They are most commonly used in areas with severe air quality problems in an effort to reduce emissions. TROs usually target work sites employing over 100 employees and require the following:
• work sites must conduct a yearly survey of trip making by employees during the a.m. peak period,
• employers must provide some combination of trip reduction incentives,
• employers must demonstrate a good faith effort to reduce trip making to the work site, and
• employees must reduce trip making by some percent over a designated period of time.

TROs often are considered by business groups to be draconian in nature; however, there are ways to formulate them for effectiveness and acceptance by those expected to implement them. There are over forty municipalities in the United States that have TROs. They are more often used on the West Coast in such places as Los Angeles and Irvine, California, the Puget Sound region of Washington State, and Tucson and Phoenix, Arizona, but can also be found in Alexandria, Virginia and Cambridge, Massachusetts.

TROs are the regulatory mechanism most adapted for use in the final stage of land development, in which property managers/owners and property tenants are required to carry out a specific plan developed for each work site as approved by the host local government. TROs are most often tied to a property manager and tenants because the relevant TDM measures are usually programmatic in nature rather than physical. A typical work site trip reduction program includes an employee transportation coordinator who is an employee assigned to promote the use of commute alternatives, administer trip making surveys, provide alternative transportation information, and serve as liaison between the work site and the host local government. Typical services offered by a participating work site include preferred parking for carpools and vanpools, free emergency guaranteed rides home, telework options, flex time or compressed work week schedules and subsidized bus passes.

The Parking and Transportation Demand Ordinance of Cambridge, Massachusetts is included as a case study in this report. Unlike other TROs, it is an example of the use of physical parking availability as a means to control traffic demand. In this way, the implementation stage is during the physical redevelopment of a site. Cambridge is also an example of a municipality that is essentially built out, but where redevelopment pressure is strong. As such, this example may be useful to Florida municipalities, such as Pinellas County, that are largely urbanized.

To date, the City of Boca Raton is the only Florida municipality that has passed a TRO, in response to conditions placed upon a citywide DRI. Detailed guidance was provided to the City by CUTR for the development of the ordinance. The conceptual framework for the development of an effective TRO centered upon 9 principles (47):

1. Take a long-term outlook
2. Foster public-private partnerships
3. Build in flexibility and choices
4. Allow voluntary participation
5. Seek continual improvement
6. Establish tiered levels of participation
7. Select performance measures carefully
8. Make it easy to administer
9. Coordinate with existing programs and services

To gauge effectiveness, it is important to implement a process for documenting baseline trip making conditions before the implementation of the TRO, and survey the results of program efforts after implementation.
Land Developer Engagement Through TMA Participation

In cases where the land development process has been engaged to incorporate TDM strategies, a commonly employed condition that is sometimes required in trip reduction ordinances has been funding the start-up of a transportation management association (TMA) or requiring land developers or property managers to purchase memberships in an existing TMA. In some cases, this strategy has been misapplied where public-private interest in a TMA is weak; however, approximately 140 TMAs are currently in existence nationwide and many have land developer participation. TMAs have shown potential as a TDM strategy to organize business and community efforts toward common localized transportation goals. Based upon data collected by the 2003 Transportation Management Association Survey, TMAs nationally have provided a wealth of services to TMA members, to non-members and to the general public (48). Such services have included:

- Employee Transportation Coordinator training
- Rideshare matching
- Telecommuting program assistance
- Subsidized transit passes
- Direct rideshare incentives
- Shuttle/Local transit provision
- Direct shuttle service operation
- Guaranteed Ride Home
- Vanpool subsidy program
- Regional/Local advocacy
- Site design assistance
- Multilingual translated information
- Active living program
- Promotional events
- Trip reduction plan preparation
- Parking service provision
- Parking pricing and/or management
- Promotional materials/newsletters
- Tax benefit program assistance
- Carshare program
- Bicycle program
- Cycling Safety workshops
- Walking program
- Pedestrian amenity review
- Visitor services
- Relocation assistance
- Electric vehicle promotion
- Construction/traffic advisories
- Government reporting/compliance
- Alternative fuel infrastructure development
Incorporating TDM into the Land Development Process

Individual Site Plan Evaluation

A review of sixteen municipalities in Florida indicates varying degrees of integration of TDM into long range comprehensive planning, municipal land development regulations, and in the development agreement process itself. For example, in Jacksonville, Florida, the commuter assistance program does not currently work directly with City staff in reviewing development proposals for potential use of TDM strategies. Some limited involvement in the process does occur through the MPO staff and the MPO Transportation Coordinating Committee (TCC) where the Metropolitan Commuter Assistance Program (MCAP) is a voting member. In the past, the commuter assistance program was part of Jacksonville’s Transportation Division, and, therefore, was more directly involved. Now organizationally apart from it, efforts are underway to reestablish a coordinative process between the commuter assistance program and the Transportation Division.

Below is a summary of the major steps of the land development process. The City of Tampa, located in Hillsborough County, is used as a specific example throughout the discussion. All municipalities create their own processes; therefore, the details may be different from one locality to another, but most municipalities share the many issues raised and follow this general process. Suggestions for how TDM professionals can get involved in the process are interspersed in the process description.

Where Municipal Plans, Policies, and Regulations Coincide with an Individual Development Proposal

To understand the process of an individual land development proposal and opportunities presented by it, it is necessary to step back and briefly review the policy and regulatory context. The City of Tampa’s major concerns for its transportation system include achieving and maintaining LOS standards, rights-of-way preservation, and access control on state-maintained roadways. These emphasis areas are explicitly stated as well as run as major themes throughout the policy language of the City’s Comprehensive Plan and the Land Development Code. It is suggested that as TDM professionals consider how to engage in the land development process, a first step is to become thoroughly familiar with their local government’s Comprehensive Plan and the land development regulations that are required to implement the Comprehensive Plan. The familiarization process results in an understanding of the major themes, concerns and goals for land development in the municipality and how transportation planning is intended to advance those goals.

This familiarization process will also demonstrate that while the Comprehensive Plan is the overriding document, it is frequently written in a style that leaves the Plan intent dependent on the interpretation of staff that administer the land development regulations. It is also possible and likely that, in a review of such Plan policies and the regulations that advance them, areas of inconsistency may be found. It may be found that regulations do not implement policies well or that no implementation mechanisms exist for advancing Plan policies. As with any kind of law, there is usually something lost in the translation between the spirit and intent of a policy and the regulations.

To be enforceable, adherence to regulations must be measurable and are often written in “black and white” terms, such as quantitative standards, numerical thresholds and minimums, or as specific actions that must be taken. With that understanding, municipal land development codes are required to be reviewed by the zoning administrator on a periodic basis, and comprehensive plans undergo a continual process of evaluation and revision. TDM professionals should seek ways to get involved in these review processes because the plans, policies, and regulations are the litmus test against which every development proposal is reviewed. For example, because roadway LOS standards are the gatekeepers of transportation approvals for development, TDM professionals should become more active in the discussion about the application of multimodal LOS standards as part of the transportation approval process. Ideally, TDM professionals should generate support for the future
Incorporating TDM into the Land Development Process

development and application of a method to make tradeoffs across modes. Ultimately, this would change the definition of transportation LOS standards in the comprehensive plan to enable land development to proceed at the appropriate densities and qualities that support high quality transit service.

A concurrency management system is the set of procedures and processes that a local government uses to assure that development orders and permits are not issued unless the necessary facilities and services are available concurrent with the impacts of development. For the purpose of issuing development orders or permits, the City Land Development Coordination Division allows no less than a peak hour roadway Level of Service Standard D, as set forth in Chapter 17.5 of the City of Tampa Code, except for those road segments classified as backlogged, constrained or within a Transportation Concurrency Exception Area (TCEA). For any development proposal, TDM professionals should check to see if its location lies within a TCEA or some other district requiring special considerations.

Level of service of a roadway segment is initially measured by its volume to capacity (v/c) ratio. If a road segment volume exceeds the adopted v/c ratio, further study is done based upon specific roadway characteristics in addition to travel speed. If further studies indicate that the adopted standard is not being met, then regulatory actions are required before the issuance of development orders and permits. The interpretation and application of transportation concurrency requirements of land development are the foundation for what is considered and approved thereafter. The outcome of the analysis relies heavily upon the initial methodology and underlying assumptions agreed upon by the developer’s consultant and the local government as well as the professional judgment of the consultant. The transportation analysis happens early in the process, as discussed further below.

The entirety of Tampa is within a designated Transportation Concurrency Exception Area (TCEA), except for the northeast portion of the city known as New Tampa. As such, these portions of the City contain not more than 10 percent vacant developable land. TCEAs are designated locations where roadway LOS standards are not being achieved, and where, due to redevelopment, urban infill or revitalization goals, the area is exempted from roadway LOS standards. Within Tampa’s TCEA, alternative forms of mobility may have to be made available by the land developer’s proposal. For example, Policy 2.7.2 of the City of Tampa Transportation Element specifies various activities that may be used to decrease automobile travel on or encourage the efficient use of the Florida Intrastate Highway System and other identified roadways within the TCEA. The one specified activity that relates to land development is the potential requirement that transit, bicycle, and pedestrian design considerations are included in the design of all redevelopment and new development. TDM professionals have an opportunity to use the intent of TCEAs as a means to promote TDM strategies for consideration as congestion mitigation and mobility enhancement. This is because local governments with TCEAs must adopt, as part of their comprehensive plans, guidelines and policies that specify programs to address transportation needs in such areas. These may include timing and staging plans, parking control and pricing strategies, the availability of public transportation, other transportation demand management programs, transportation system management programs, and the use of creative financing tools for the provision of transportation services and facilities.

For example, in 1998, the City of Tampa completed a Congestion Management System, which gives higher priority to corridors serving the TCEA and recommends improvements for congested corridors within the TCEA as priorities to be included in the MPO’s Transportation Improvement Program. Concerning the use of City funds, the City will likewise prioritize congested corridors in the TCEA. The Congestion Management System establishes measures and standards to assess mobility patterns and the performance of roadways and transit. It identifies congested corridors and areas, identifies short and long range transportation strategies, and establishes a monitoring process to assess the

National Center for Transit Research / Center for Urban Transportation Research / University of South Florida
Incorporating TDM into the Land Development Process

effectiveness of congestion management strategies. While the Congestion Management System emphasizes physical improvements to the roadway system, these can go hand in hand with demand-side strategies offered by TDM.

Reliance Upon External Agencies

The City of Tampa’s Comprehensive Plan is the responsibility of the City to implement; however, many policies in the Transportation and Land Use Elements call for actions by various external agencies. In order to work successfully in the land development process, TDM professionals should establish working relationships with key technical people within the following agencies:

- FDOT oversees the Florida Intrastate Highway System (FIHS) and assesses the use of high occupancy vehicle (HOV) lanes on the Intrastate System;
- MPO responsibilities include the Long Range Transportation Plan, the Transportation Improvement Plan and the Congestion Management System. Policy guidance directs the MPO to consider the needs of projects identified to support infill development when it prioritizes highway system needs and improvements in developing the Long Range Transportation Plan.
- The Hillsborough County City-County Planning Commission administers the Future Land Use Map and Designations and the Plan Amendment Review Process.
- HARTline develops the Transit Development Plan (TDP). The 2004-2013 TDP lists bus rapid transit (BRT) projects and “transit emphasis corridors.”

Transit emphasis corridors are identified bus routes targeted for physical improvements. Improvements may include traffic signal priority systems, slip lanes, “super stops” with passenger amenities, and intelligent transportation systems applications. Using Tampa’s Transit Development Plan (TDP) as an example, four transit emphasis corridors have been identified. The goal is to locate "super-stops" where the corridors intersect and to have high frequency at the stops. If this proves successful, BRT may be used along other corridors. Two “super express corridors” were also identified, in which improvements are planned to increase the speed of the service and make it more attractive to passengers. Funding has been earmarked for these improvements. Where special emphasis is placed upon enhanced transit service development, TDM professionals should advocate for special incentives to attract land development projects along these corridors. Incentives should particularly reward land developer efforts that arrange transit-oriented development at major transit node locations and bus stops.

Rezoning: Where a Land Development Proposal Usually Begins

Zoning is a police power of the local government to regulate the subdividing of land and to specify allowable uses, lot size, building height, dimensions and placement, population density, parking, and other standards to protect public safety, welfare, and property value. In Tampa, the zoning ordinance is consistent with and implements the objectives of the City’s Long Range Comprehensive Plan, as required by State law. Often, property owners and land developers seek rezoning. This can be accomplished if it is found that a rezoning results in land usage that remains consistent with the Comprehensive Plan. The City Council can initiate a rezoning for reasons of broad scale future land use planning. More often, rezoning occurs one parcel at a time. Land development often begins with a petition from the property owner/land developer for a rezoning, either of an individual parcel or of some larger area.
A pre-application conference with the city traffic engineer must be held prior to the submittal of the rezoning petition in order to determine what traffic information is required in the application. The land developer must explain in the rezoning application why the change is necessary to promote public safety and welfare and how it conforms to the objectives of the Tampa Comprehensive Plan. A transportation analysis, prepared by a professional traffic engineer or approved by the city traffic engineer, must be submitted with all rezoning applications. The analysis must include the total trips generated by the rezoning and the distribution of the trips onto adjacent streets. Institute of Traffic Engineers (ITE) trip generation rates or other approved source must be used as the basis for trip generation calculations.

As also discussed in the above section on impact fee ordinances, ITE trip generation and parking generation rates must be used with caution. Most local governments nationwide use ITE Trip generation and parking generation rates. Shoup demonstrates how improperly used ITE rates may lead to an overestimation of the need for private motor vehicle level of service and a conclusion that transportation alternatives are neither needed nor desired. For example, ITE describes the trip rates for land uses as estimated from observations generated at selected developments, primarily from suburban localities with little or no transit service, nearby pedestrian amenities, or travel demand management programs. There is strong evidence to suggest that most selected sites offer free parking. Half the rates are based on five or fewer studies per land use. At most sites, vehicle trips are observed during the course of one day only. Shoup also points out that many factors influence the number of vehicle trips generated at a site, and that floor area, acreage or any other single variable does not accurately predict the number of vehicle trips at any site or land use. It is recommended that TDM professionals should raise questions about the application of the ITE trip rates and suggest that the rates be supplemented with traffic counts. Based upon the magnitude of the proposed development, TDM professionals can suggest to the local government to consider requiring supplemental traffic counts if similar developments can confidently be found for comparison purposes. Additional analysis should be conducted with the intent to estimate the nature and magnitude of transportation demand under conditions where transit service approaches a level of quality described in long range transportation planning documents and after a program of parking management. Based upon the area vision for the development site, other conditions may include where transit oriented development phasing has reached completion, where a high quality pedestrian environment has been achieved and where TDM programs have been established.

The Tampa City Code requires that no zoning change be permitted if it reduces roadway level of service standards as specified in the Comprehensive Plan. However, the Comprehensive Plan also specifies that, as early as the rezoning process, the City can require a developer to provide on-site transit amenities “where appropriate” and “adequate.” While it is not practical for TDM professionals to attend all meetings relating to a rezoning, it is recommended that TDM professionals should meet in advance with the municipal traffic engineer to review the methodology used to determine what information is needed for a rezoning application and provide general suggestions to the traffic engineer regarding how the assessment of a rezoning application can be made to incorporate TDM considerations.

The zoning administrator must distribute copies of the application to the appropriate agencies and one copy of the application to the City Clerk for presentation to the City Council to set the public hearing. Any department or agency has the right to enter written or oral testimony into the record at the public hearing. Written testimony is submitted to the zoning administrator for consolidation into a single document. At this stage, TDM professionals should request a copy of the application and provide written and oral testimony suggesting how the proposal could incorporate TDM strategies to enhance transportation level of service and reduce congestion.
A rezoning application is essentially a reactive process in which an application is submitted describing what the developer wants to do. Reviewing parties then approve it contingent upon changes or conditions, or disapprove it based upon whether the application meets minimum requirements. To save the developer and all other stakeholders time, preferred development types and characteristics should be explicitly communicated via a neighborhood plan or at least during the pre-application conference. This includes a discussion of building height, square footage and dimensions, parking configuration, occupancy classification, and minimum building setbacks. Ideally, TDM professionals should be involved in the development of prior neighborhood, area, or district plans and have garnered interest and support to apply TDM principles, such as transit oriented development, into future land development. These are items commonly reserved for later review in the building plan approval process; however, waiting that long to discuss them, the developer already has a detailed plan for what he wants to do. Disapproving detailed plans and asking for another concept at this point only wastes time, costs money, and frustrates land development efforts.

Subdivision Review

The City of Tampa’s subdivision ordinance (Ch. 23) is distinct from the zoning code (Ch. 27) but these are both part of the City’s Land Development Code. Both processes are followed concurrently in the development process. While zoning concerns the compatibility of land uses and defines densities, building types, surface paving and other development attributes, the subdivision process addresses the manner in which land is divided to provide mechanisms for bonding and construction of public improvements, ensure safe and convenient access and traffic control, and to provide authority requiring timely installation by the developer of adequate and necessary physical improvements. Figure 4 shows the development review process for planned developments, which are specially defined in the zoning code, and which are eligible for increased densities given that they provide certain amenities or design features. Planned developments are generally large projects with lengthy build-out schedules that are designed to contain mixed uses. They must be designed in such a way that residential and non-residential uses are compatible. The special zoning classification for planned developments provides flexibility.
Fig. 4. City of Tampa’s Development Review Process for Planned Developments

Subdivision review occurs in stages. The first stage is the preliminary plat review. This review occurs usually in conjunction with the detailed site plan review in the same meeting. A plat is essentially a map that is a complete and exact representation of the subdivision of land. The purpose of the preliminary plat review is to ensure consistency with zoning and subdivision standards and the Comprehensive Plan. The preliminary plat for a phased development must show all construction phases and the proposed development schedule. Each development phase must be capable of operating independently and in conjunction with successive phases, with respect to vehicular...
Incorporating TDM into the Land Development Process

circulation and access and other transportation facilities. The preliminary plat includes physical boundaries, existing site conditions, subdivision design, development schedule and a transportation analysis and concurrency review using ITE trip generation rates.

The Subdivision coordinator arranges for the preliminary plat review and the detailed site plan review to be discussed in the same meeting. The detailed site plan review includes lot layout, location of local streets, location of projected utility lines and improvements and location of drainage.

After preliminary plat approval, construction drawings are submitted that detail the installation of improvements to serve the subdivision. A temporary certificate of concurrency is issued at this stage. If public improvements are needed as a result of the development, the developer and the City enter into a subdivision agreement in which the developer agrees to post performance security prior to final plat approval for any public improvements not yet installed and accepted. The subdivision agreement also provides that the developer install all improvements in accordance with approved construction drawings. When the City approves the subdivision final plat, it accepts any dedicated improvements for maintenance by the City and a final certificate of concurrency is issued.

**Process Timing.** Not only do development review steps proceed in a particular order, but the timing of the review and revisions are important to the developer because lateness of plan revisions may subject the proposed development to any changes in the Code since initial approvals were granted. For example, after the rezoning, there is a conceptual site plan review. The zoning administrator provides recommendations to City Council. After a “reasonable period of time” following receipt of staff recommendations, City Council approves or disapproves the conceptual site plan. The applicant has three months to revise and resubmit the plan, after which the plan is subject to Code changes.

The detailed site plan review and the preliminary plat review can be conducted at the same meeting after City Council approves the conceptual site plan review. The applicant has 45 days to respond to comments on the detailed site plan and three months to respond to preliminary plat comments. After these deadlines, the plans are subject to Code changes. If the detailed site plan is disapproved, the applicant has 45 days to respond to comments, after which the applicant must pay a resubmittal fee. After the detailed site plan is approved, the building plan can be submitted for review. If it is disapproved, the applicant has another 45 days to revise and resubmit the building plan, after which the applicant must pay a resubmittal fee. After plan approval, the issuance of construction permits must happen within six months.

Upon approval of the preliminary plat, the applicant has six months to submit construction drawings after which time the preliminary plat approval expires. After construction drawings are approved, the applicant has six months to begin construction of required improvements. If the deadline passes, plans are subject to Code changes. After submittal of final plat review, the applicant has three months to revise and resubmit the plat, after which the plat is subject to Code changes.

**Site Plan Approval Process**

In Tampa, there are two review and permitting processes, one for projects that involve developing one’s personal residence (one- and two-family dwellings) and another process for commercial projects, which include housing developments for profit. The Commercial Development Services office in the Business and Housing Development Department processes applications. The process consists of three phases: 1) review and approval of a site plan, 2) review and approval of a building plan, and 3) interagency coordination prior to issuance of construction permits. The City has a Construction Services Center, which functions as a one-stop shop where applications are submitted and where all communication is funneled. The purpose of the Construction Services Center is to
streamline the application review and permitting process for the convenience of the customer, the land developer.

The Tampa Development Review Committee (DRC) reviews applications for land development. They provide technical assistance to land developers and City agencies. These applications include land rezoning applications, applications for approval of special use permits (described below), and planned developments. Planned developments become their own designated zoning classification. Members of the DRC include representatives of City agencies and others, such as the Department of Public Works, Department of Sanitary Sewers, Water Department, Legal Department, Sanitation Department, Police and Fire Departments, Department of Parks, Recreation and Cultural Services, State Department of Transportation, County School Board, County Health Department, designated land planning agency, Tampa Electric Company, the gas company, the Federal Housing Administration, HARTline, the Architectural Review Commission and the Barrio Latino Commission. The zoning administrator establishes meeting dates and these meetings are open to the public. A local TDM representative should request an appointment to serve on the Development Review Committee.

**Special Use Permits**

Special use permits are not rezonings but are applied for and granted for cases of land development that are unusual or complex in nature and the special use permitting process is intended to increase the efficiency in processing such applications. S-1 special use permits are for those that have impacts of a temporary nature or impacts that affect adjacent properties. These applications are decided by the zoning administrator. S-2 special use permits are those that may have potential impacts of areawide or citywide consequence and that may constitute a substantial deviation from the zoning code. In these cases, the zoning administrator ensures the land developer’s application is complete, does an analysis, and files a recommendation to the City Council. A public hearing is required and the City Council decides on the application. After a special use permit is approved, any minor changes to the plans can be approved by the zoning administrator as long as the proposed changes are in harmony with the action of the City Council. If there is a substantial deviation requested, then it must be treated as a new application and the City Council must approve it. The special use must not set a precedent for encouraging more intensive uses. The Code provides specifications for many individual special uses.

**Internal and External Review**

Site plan review and approval can be done before or concurrently with the building plan approval process. Site plan review involves several City departments. These include those listed below. Transportation and land development coordination are just two of several reviews. This extended list illustrates the complexity of the land development process.

**City Departments**

- Land Development Coordination Division
  - Zoning Office
  - Subdivision Review Office
- Fire Marshal
- Historic Preservation Office
- Tree and landscaping
- Sanitation
- Wastewater Department
• Stormwater Management Division
• Transportation Division
• Water Department
• Parks Department
• Other departments depending on the nature of the development project

The developer must also receive review and approval from outside agencies, including:

• Hillsborough County Environmental Protection Commission (EPC) and the Florida Department of Environmental Protection (FDEP)
  o If the proposed project involves wetlands, SWFWMD, FDEP and EPC must issue approvals.

• Southwest Florida Water Management District (SWFWMD)
  o If the proposed project increases the amount of impervious surface or requires on-site stormwater management, SWFWMD must approve the project.

• Florida Department of Transportation (FDOT)
  o If the proposed project is located along a State road, FDOT will review the application regarding traffic impact, driveway connection location and design, and drainage connection to the State Stormwater Management Facility.

If the construction is new, the developer applies for a unique address assignment from the Right-of-Way and Mapping Division, by submitting an application form. If the proposed development is in a designated Historic Special Review District, an additional application must be submitted to the Architectural Review Commission. If the proposed development is in another Special Review District, additional requirements apply, such as other design guidelines. Special Review Districts include:

• Central business district
• Channel district
• Commercial overlay districts
• Mixed use overlay districts

The Zoning Office determines if the proposed development is a Development of Regional Impact (DRI), based upon project location, size and scope. A DRI project must submit additional information to the Land Development Coordination Division. The Subdivision Review Office also reviews the project. A permit technician assigns a tracking control number to the application which the developer uses to follow his application through the review process and to post inquiries. The application is submitted with a plan review fee. The site plan application includes a Site Data Table of required information. This includes the amount of parking required for the site, with a breakout of parking calculations if it is a mixed use facility. In addition, the amount of parking included on the site plan must be stated with the number of compact parking spaces provided, if used. Of all features in the site plan and building plan, the availability and amount of parking is the cornerstone of shifting a balance toward the use of other modes, as well as other means to reduce the need to travel.

City of Tampa Parking
The City of Tampa sets forth the minimum required number of off-street parking spaces in its code of regulations, Article XVIII, Section 27-242. For redevelopment and development projects in the
Incorporating TDM into the Land Development Process

zoning categories of YC-1 and YC-3, an in-lieu parking fee ordinance exists that has traditionally waivered all parking requirements for these areas.

The challenge of parking is that satisfactory alternative transportation options must be in place as parking availability is decreased. Parking availability must be decreased and made more expensive in order to encourage the shift toward other modes once they are offered. Lastly, risk averse bankers are hesitant to offer financing to developers who propose site plans with reduced parking. TDM professionals should stimulate discussion through arranging forums among bankers, developers and local governments about this issue. TDM professionals should suggest a plan for staging the gradual reduction of parking availability in coordination with redevelopment. Valk recommends that such a plan would call for strategies working in tandem, including managing existing parking, expanding parking supply, reducing parking demand, protecting residential parking, creating a financing program and monitoring results to make changes as needed. Existing parking can be managed through enforcement of time limits and parking pricing. Parking supply should be expanded only after setting specific parking demand and access thresholds that when met, trigger parking construction. Parking demand can be reduced through offering a combination of incentives and services to use transportation alternatives as well as the adoption of regulatory measures. Residential parking can be protected through the use of residential parking permit programs, where needed. A financing program can use existing revenue to fund capital improvements, construction and operations. Additional revenue from increased parking fees and fines can support parking demand reduction efforts. The parking plan should include a schedule by which all elements of the program are implemented. The plan should contain specific parking demand and access thresholds to establish when more aggressive actions should be taken. Actual conditions should be recorded and used as the basis for refining actions taken (49).

**Building Plan Approval Process**

A site plan submittal package may be submitted before or concurrently with the submittal of a building plan application. The site plan and building plan must be approved before construction permits can be issued. City of Tampa offices that review the building plan application include the offices for architecture, plumbing, electrical, mechanical, and the Fire Marshal. It is the building plan application that includes a Building Data Table that includes, among many other things, the proposal for:

- Building square footage and dimensions
- Building height and number of floors
- Occupancy classification
- Minimum building setbacks and dimensions

The building plan application and approval process is probably too late for suggestions and negotiations regarding aspects of the building. Ideally, building design considerations should include
a transit orientation and include sufficient densities to support transit service. Residential development should incorporate wiring to support telework and other telecommunications applications. These considerations should be discussed at the earliest stages of the land development planning process, such as during a rezoning application, as discussed above.

The building plan application is submitted with a review fee. After the site plan and the building plan are reviewed and approved, the developer must pay additional fees prior to receiving construction permits or prior to a final certificate of occupancy. These fees include:

- Hillsborough County School District
- Sewer
- Water
- Fire line impact fee
- Transportation impact fee

Transportation Impact Fee

Tampa’s Transportation Impact Fee Ordinance includes a straightforward schedule of set fees based upon the type of land use and its size in terms of units, as identified in the Institute of Transportation Engineers’ Trip Generation, An Information Report. Units include number of dwelling units, square footage, beds, parking spaces or number of students. Revenues are used to provide roadway improvements and related infrastructure necessitated by new development. In the spirit of promoting redevelopment, the City of Tampa has a waiver in place that exempts parts of the Ybor City Historic District from paying transportation impact fees, in addition to exemptions for the East Tampa and West Tampa districts. For example, an office under 100,000 square feet in size located in the Central Business District must pay $6,056 per 1000 square feet. After the initial review of the site plan submittal package and the building plan application, the Permit Technician contacts the land developer with any questions or requested changes. The developer resubmits revised drawings, with an original for comparison purposes. If the developer already has three re-submittals for the same comment, the developer has to pay a re-submittal fee. If the developer does not respond in 45 days to plan examiner questions, the City will consider the project abandoned and will dispose of the application. For larger projects, phased permitting of construction allows for separate permits for foundations, building shell, and interior finish to help expedite construction scheduling. The submission requirements for these phases are identical to the site review and building plan review phases.

In many municipalities, an agreement can be reached in which the developer can receive an impact fee credit if there is indication that by implementing TDM the result will include reduced traffic. The challenge to this process is that the “default” transportation option is the already well-developed roadway system and the measure of transportation demand is not in units of person trips but in units of private auto trips. The burden of proof for trip reduction through TDM is on the developer. If the municipality has not already invested in a functioning TDM system, then there is no “TDM infrastructure” into which an individual site development can connect. The recent development of Broward County’s transit oriented concurrency system is one example of how an impact fee system can be altered to finance a transportation system with more options. TDM professionals should keep abreast of ongoing evaluation and refinements to this approach and consider how the concept might be applicable in their own municipalities.
Development Phasing

Policy 2.3.3 provides a means to achieve cost affordable level of service by using development phasing to assure consistency with the associated level of service standard required. Because land development is frequently built in phases, TDM professionals must be prepared for involvement in the development process as an ongoing effort that may require years for an individual development to reach completion.

A Land Development Case Study: Tampa General Hospital

The above discussion provides a general overview of the land development process using the City of Tampa as an example. A Tampa land development case study is provided below to illustrate how the process unfolds in reality. Several observations emerge: the first two are procedural and other observations are idiosyncratic to the particular proposal, but may be a common scenario in other cases. All observations give TDM professionals information about how to be proactive in generating serious consideration to the use of TDM strategies as options for mitigating congestion and enhancing mobility.

Tampa General Hospital (TGH) is the region’s only Level One trauma center and is located in the core of downtown Tampa on the north side of Davis Island. TGH is located within a TCEA. Davis Island extends to the south and is an affluent residential neighborhood. Access to the island is limited to a pair of bridges at the island’s northernmost point, which is the same location as the hospital entrance. As a result, hospital-related traffic and island resident traffic affect each other.

To keep up with the needs of the region, TGH is in the process of expanding their facility by 280,000 square feet. In addition, TGH has requested permission from the city to rezone hospital property and lease 0.4 acre of a waterfront city park (Marjorie Park) for a 1,400 space parking garage, add an additional office building on the hospital campus and add a floor to an expansion already under construction. Both the earlier approved expansion and the new rezoning request combined would almost double the total size of the hospital to 2.2 million square feet. The rezoning request was necessary because the proposed expansion included building parking partly on hospital property that was previously zoned residential. In order to build the parking facility that traversed both hospital and City property, the zoning for the hospital land in question had to be changed to Planned Development, with a land use plan category of Public/Semi-Public.

The City Council initially attached nine conditions to TGH’s rezoning application. One condition stated that prior to the issuance of a building permit, the hospital would have to prepare a parking management plan that would include a carpooling incentive program. The parking management plan was in response to the Davis Island citizens’ concerns about traffic. This carpooling program would have permitted employees who carpool to park in the hospital’s garage for free, while solo drivers must pay for their parking. Presently, the existing parking garage is owned and operated by the City of Tampa, not TGH. An hourly parking charge or an advance parking voucher can be purchased by visitors in a pack of three for $3.50 per day. Employees currently park off-site. Nationally, there are difficulties recruiting and retaining nurses and other hospital staff. Transportation services such as transit subsidies, parking cash-out, guaranteed emergency ride home and company vanpools, have been offered by employers nationwide to recruit and retain employees. TDM strategies such as offering employee transportation services are not listed in the TGH menu of employee benefits.

The other rezoning conditions involved physical improvements to the transportation infrastructure in the immediate vicinity, or to new signage. All nine conditions were agreed upon by the hospital and the City’s Transportation Department. However, ultimately the nine conditions attached to the rezoning application were eliminated by a final rezoning decision, which was intended specifically to provide for a parking facility that could more effectively meet the hospital’s parking needs.
There were a number of factors involved in the outcome of this development review. It was highly visible to the public; the Council’s final vote was held at the Tampa Convention Center to handle the more than 500 people who turned out for the meeting. Almost 75 percent of the crowd was hospital supporters and employees. The local media had a hand in casting the issues, which were presented as pitting the desires of one affluent neighborhood, which already had more than their minimum required amount of city park land, against the medical care needs of the region. In the words of the St. Petersburg Times, “Council members ultimately agreed with [TGH] that the hospital’s mission in providing health care to west central Florida and educating University of South Florida medical students outweighed the importance of saving a small, underused portion of the park.” (50).

Other concerns voiced by Davis Island residents included how a parking garage on a waterfront park would obscure the view. While these concerns were of importance to the Davis Island residents, they were trivial to the rest of the City and would not play well with the City Council. Instead of discussing how the hospital could expand, serve the needs of the region and USF, while at the same time mitigate impacts, it became a choice between hospital expansion or waterfront park preservation. In exchange for the loss of the 0.4 acre of Marjorie Park, the hospital agreed to build a 0.7 acre waterfront public walkway and give $1 million for recreational improvements on Davis Island.

Overall issues of traffic congestion became invisible toward the end of the process. Typically, issues relating to parking management or other traffic mitigation plans are worked out prior to a City Council vote, but a parking garage became the main focus of the Council’s vote. In this case, the Davis Island Civic Association initially commissioned its own transportation analysis. The hospital’s consultants also conducted a traffic impact analysis. The Hospital examined several parking options. It is not known what the traffic analyses determined. After the final vote to approve the parking garage, one Council member commented that traffic snarls may increase with the hospital expansion, but, he continued, “that’s part of living in a growing City.” Shrugging off traffic congestion as part of urban life is unusual in a state where municipalities are obliged to maintain LOS standards. Even though the hospital is located within a TCEA, which gives it some flexibility from strict adherence to standards, there still must be some plan for improving mobility. Traffic impacts do not appear to have been a major discussion point in the public hearings. The public discussion overlooked how traffic snarls can affect the functioning of the hospital. TDM strategies could have been a condition to improve level of service on the bridges connecting Davis Island to downtown Tampa, achieving positive effects for the hospital and at the same time reducing traffic impacts to Davis Island residents. In addition, TDM might have provided opportunities to reduce the impact of the garage on the waterfront park (51).

Case Study Observations and Conclusions. Many, if not most, major projects within medium to large municipalities require a rezoning; conditions are often attached. In Florida, a rezoning cannot be allowed unless there is demonstration that the rezoning continues to preserve the intent of the Comprehensive Plan. A rezoning also cannot be allowed if it results in a violation of level of service standards. Rezonings occur well before the site plan review stage. A first question for TDM professionals to consider in evaluating a project is whether a rezoning request preserves the intent of the Comprehensive Plan, especially with respect to urban infill, revitalization, and urban redevelopment within a TCEA. It is recognized that transit usage, pedestrian trips, and the reduction of motor vehicle trips can be accomplished with transit oriented development (TOD). TOD requires compact, high density, mixed use development, which may require a rezoning or may show a high level of traffic generation. Neighborhood groups may express opposition to TOD. While TCEAs, by definition, do not have to adhere to LOS standards, they must demonstrate some plan for alternative mobility. Therein lies an opportunity for TDM strategies.
Typically, issues relating to parking management or other traffic mitigation plans are worked out in the initial stages, often during the rezoning, and much prior to a City Council vote. The Council may have no questions or concerns about traffic, and the subject may never come up.

During debates over rezonings, the issue of traffic congestion might take a back seat to other issues. If traffic turns out to be key, it is often couched in terms of an “either/or” choice: “Either we allow the development to be built as proposed with abundant parking and increased roadway capacity or it cannot be done at all.” TDM professionals have an important opportunity at these junctures to point out that the development can go on and there are other options to handling the transportation needs generated by the development.

It is essential for TDM professionals to seek out the news media covering the event, to frame the transportation issues from a standpoint of mobility management and see to it that this message does not get obscured. Just as important as a good working relationship with the Zoning Administrator and the Chief of Transportation in a municipality, TDM representatives should also develop a professional rapport with journalists. Typically, particular news reporters are assigned to consistently cover transportation, growth, and development in a specific area. The best outcome is that the news media refer to TDM professionals as sources of reliable and accurate information. Journalists know everyone has a bias. Ideally, journalists will come to know TDM advocates as professionals whose bias is the desire to identify all the possible transportation options, keep the public informed and involved in the process and seek out balanced solutions.

TDM professionals should attend high visibility public hearings and sign up to speak. TDM professionals should carefully prepare and rehearse their 3 minutes allotted time to speak. Understanding that the sound byte most often reported in the news is something sensationalist:

“Don’t strangle [TGH’s] growth because of parking and expansion problems. Let it flower and let Tampa be known for its educational and medical reputation, not lap dancing.”
Les Valitutti, public hearing attendee (52)

TDM professionals should attempt to make their point succinctly, addressing emotional hot buttons with solutions backed up by reliable evidence.

Residential neighborhood input influences whether TDM provisions are included in rezoning requests on nearby land. Neighborhood input should focus on the traffic generation potential of the proposed land use and the cost/benefit to citywide concerns, and not just on the neighborhood impact of the type of proposed new use. TDM professionals should seek common ground with neighborhood groups and help them phrase their concerns as relevant to addressing citywide concerns.

It is common for proposals for new developments, redevelopments and expansions to be revised one or more times after agreements have been reached. TDM professionals should remain in the communication loop even after decisions and approvals have been issued, and expect proposed changes that will require new analyses and renegotiations. If TDM professionals want to get involved in the land development process, they must be prepared for a process that seems without end.

Even after a physical development is completed, promises, both verbal and written, about program implementation and what will or will not be permitted to take place in the future, are often forgotten or not enforced. If development pressure is there, no promise is secure. Agreements to engage in
TDM are often not followed over time. Institutional memory and the capacity to monitor developer agreements are as tenuous as the rate of planning staff turnover. As a result, municipal agency procedures must be in place to enable a new staff member to take up where a former staff member left off, to continue tracking agreement implementation and documenting reasons for changes. Once tracking is achieved, instances will be found where provisions of agreements are not being implemented as originally drawn up. TDM professionals rarely hold positions in which they can enforce agreement provisions; however, they can bring forgotten provisions to the attention of those who do. Monitoring and enforcement is time consuming and expensive for municipalities. Nevertheless, TDM professionals can create a valuable partnership role for themselves as development monitors. Enforcement divisions of local government can choose to do nothing in response to violations, but it is important for TDM professionals working in a monitoring capacity to continue to track and document what is happening, because the working relationship between a local municipality and land developers is based on a foundation of professional trust and integrity of the development process. If it comes to light that more than a few developer agreements are not followed, then municipal leaders will eventually be forced to review and strengthen the process.

More often, agreements are renegotiated after the physical land development is complete. Here again, TDM professionals should be at the discussion table. Better yet, after an initial agreement is made, TDM professionals should help make the initial agreement stick by serving as technical support to assist the developer and property owner/manager with implementation. Furthermore, TDM professionals should serve as publicists to bring positive recognition of developers and property managers with good track records of implementation to the attention of municipal decision makers.
RECOMMENDATIONS FOR INCORPORATING TDM INTO THE LAND DEVELOPMENT PROCESS

There are many opportunities to participate and provide valuable input for incorporating TDM into the land development process, from long range planning through land development and monitoring of completed developments. These recommendations provide basic guidance to that end. These recommendations are provided to municipal transportation planners, traffic engineers and land development proposal reviewers. Ideally, these professionals are in the best positions to use these recommendations to incorporate TDM into land development. However, because these professionals may be less familiar with TDM, it will be up to TDM professionals who work for commuter assistance programs, transportation management associations, or other allied organizations, to engage in most of these activities.

Recommendations for participation in the land development process are offered with the understanding that, for most organizations involved in TDM, implementation of the recommendations may constitute either a significant increase in workload or a significant shift in focus from existing activities. Adding to this condition, the land development application process is on a tight timetable. In order for TDM professionals to be useful participants, TDM involvement must be orchestrated so as not to slow the process down but to prove helpful in the transportation analysis aspects of the process as well as providing recommendations and ideas for alternative congestion reduction and mobility enhancement strategies.

Although individual TDM organizations may not be able to implement every one of the recommendations due to staffing constraints or other reasons, the best result will be realized by implementing as many as possible. If TDM professionals do not have the resources to review key development proposals and engage in the actions described below, TDM professionals should arrange to meet with local planners to provide training in TDM applications in advance of the review of specific proposals. This could include offering planners check lists of strategies or other prepared materials that outline key considerations.

To prepare to provide technical support to local planners, TDM professionals should seek professional training, such as the Florida Commuter Choice Program Certificate offered by the USF Center for Urban Transportation Research, or some other similar professional development opportunities. Alternatively, if local planners, traffic engineers and land development proposal reviewers have professional training opportunities, they can directly avail themselves of training in the application of TDM. However, it is anticipated that local governments will rely, at least initially, upon the assistance of commuter assistance programs and transportation management organizations to fill this need.

1. Immediate Actions for Specific Proposals

Consider staffing needs. A TDM agency that wants to get involved in the local government land development review process must commit a realistic amount of staff time and effort to participate because the process for each development application can take anywhere from several months to several years. In a large urban area this could easily occupy two full time positions. In a smaller but fast-growing county, this may also require two full-time staff positions with backgrounds in planning, land development, transportation, and public administration. Staff should not have to be at every meeting but there are key early meetings, when transportation analysis methodology is discussed and when various transportation alternatives are being identified.
Choose proposals strategically. Based upon staffing and time constraints, TDM professionals will not be able to pursue all development proposals. A strategy should be devised for selecting which development projects should receive more attention. This can possibly be done by:

- Identifying which development proposals have the best chance at adopting TDM strategies, or
- Identifying which development proposals have the most potential for congestion reduction results where it is straightforward to measure the difference.

For example, TDM professionals may choose to focus their attention on land development applications where comprehensive plan policies provide direction for emphasis upon certain locations. These may be:

- Constrained corridors within the TCEA (where there can be no more road widening)
- Other roadway facilities violating the LOS standard within the TCEA (where there is a choice of roadway capacity improvements and/or transit)
- Transit emphasis corridors
- “Super express” service corridors
- Other areas within the TCEA that present development opportunities and through which some influence can be brought to bear upon the process due to membership contacts of a transportation management association or other allied organization

Through Comprehensive Plan Policy for the City of Tampa, for example, the roadways that receive the highest priority are those within the TCEA which are operating below the adopted LOS standard (Policy 2.7.5). This Policy calls for capacity improvements for both roadways and transit services within the TCEA. Every 5 years, the City Transportation Division must evaluate the effectiveness of the TCEA looking at several performance measures. It is important for TDM professionals to participate in the evaluation of the TCEA to identify other possible causes to the rise or fall of the five performance measures listed below. According to Policy 2.8.1, these include:

1. The amount of transportation impact fees set aside for transit or parallel roadway capacity.
2. Evaluate programs which promote pedestrian and non-automobile travel in the TCEA including improvements to the pedestrian and bicycle infrastructure.

With respect to urban infill, urban redevelopment and downtown revitalization areas:

3. The level of development or redevelopment activity
4. Improvements to mass transit infrastructure
5. Increase in mass transit ridership

The opportunity of a TCEA is that roadway concurrency requirements are suspended, providing an opportunity for alternative approaches. The TCEA concept was developed to enable urban infill, urban redevelopment and downtown revitalization. The performance evaluation, as outlined in the Policy above looks to see if development has increased and if overall mobility has increased. It is also recommended that TDM professionals prioritize the TCEAs in their urban areas for applying TDM strategies. While the status of development activity cannot solely be attributed to transportation conditions, a demonstration of mobility enhancement through TDM could encourage a review of the roadway LOS treadmill that many urban areas in Florida run upon without progress.

Get involved at the rezoning application stage. Vitally important to incorporating TDM effectively into land development proposals is involvement as early as the rezoning application stage.
TDM professionals should request a copy of the application. A first question for TDM professionals to consider, in an evaluation of a project, is whether a rezoning request preserves the intent of the Comprehensive Plan, especially with respect to urban infill, revitalization, and urban redevelopment within a TCEA. TDM professionals should check to see if its location lies within a TCEA or some other district requiring special considerations. TDM professionals have an opportunity to use the TCEAs or other special district designation as a means to promote TDM strategies for consideration as congestion mitigation and mobility enhancement.

Challenge “either/or” thinking. TDM professionals should listen for discussion among other transportation professionals that begins to phrase the issues in “either/or” language that limits consideration of options (“Either more road capacity/parking is built or the project cannot proceed.”). TDM professionals have an important opportunity at these junctures to point out that the development can go on and there are more options to handling the transportation needs generated by the development, as offered by TDM.

Participate early in development review. The site plan approval stage comes after a rezoning approval. It is recommended that a local TDM representative request an appointment to serve on the Development Review Committee that reviews the site plan applications. At the very least, establish a process by which local government staff communicates the existence, location, and status of development proposals. This possibly could be achieved through coordination with a “construction services center” or some other “one-stop” office set up to streamline the process. While some information is public record and there are scheduled public hearings advertised in newspapers, this point in the process is frequently too late to have an influence. Getting in early in the process of development review might be as simple as being copied on emails with attachments. Approval of this inclusion likely must come from top management offices and communicated by them to the appropriate Services Center staff and technicians.

Develop a check list. Develop a check list for transportation planners and land development proposal reviewers that describes non-capital intensive TDM strategies that can be implemented.

Transform parochial interests. TDM professionals should seek common ground with neighborhood groups and help them phrase issues such that their neighborhood concern has citywide transportation implications. For example, TDM professionals should guide neighborhood input to focus on the traffic generation potential of a proposed land use and the costs/benefits to the city, and not just on the neighborhood impact of the type of proposed new use.

Provide testimony. TDM professionals should provide written and oral testimony suggesting how the proposal could incorporate TDM strategies to enhance transportation level of service and reduce congestion.

Monitor developments over time. Because land development is frequently built in phases, TDM professionals should remain in the communication loop even after decisions and approvals have been issued, and expect proposed changes that will require new analyses and renegotiations. It is not uncommon for phased development to make revisions to development plans as market indicators suggest more profitable building scenarios. TDM professionals should help make TDM strategies successful by serving as technical support to assist the developer and property owner/manager with implementation. Staff turnover erases institutional memory of development proposal history. Municipal agency procedures must be in place to enable a new staff member to take up where a former staff member left off, to continue tracking agreement implementation and documenting reasons for changes. TDM professionals can bring forgotten provisions to the attention of those who can. TDM professionals can create a valuable partnership role for themselves as development
Incorporating TDM into the Land Development Process

monitors. Preparing “standard operating procedures” for development review and monitoring can ease the task of tracking a project as well as enable the project to be handed off to another staff member if necessary.

2. Involvement in the MPO Planning Process

Participate in MPO committees and other activities. Metropolitan planning organizations (MPOs) offer a number of opportunities for TDM professionals to be involved in the MPO transportation planning process. In addition to workshops, hearings, and other public involvement activities aimed at the general public, the MPO does the bulk of its work through established committees, with ultimate voting authority in the MPO Board. Occasionally, a transit authority may be included as either a voting or non-voting member on the MPO Board. At this level, a high-ranking representative should represent the transit authority. More often, a transit authority or TDM agency may have voting or non-voting membership on a Technical Advisory Committee. Even at this level, a representative with a leadership position, such as the executive director of the commuter assistance program, should be the one to attend meetings. Other committee involvement possibilities include the Citizen’s Advisory Committee or other standing committees established by the MPO.

Attendance and participation at all committee or board meetings is essential to establishing both personal and professional credibility with other members of the committee and the MPO staff. Committee members are involved in every aspect of the MPO transportation planning process.

Influence MPO product content and advocate for funding of transit and TDM-related activities. As a committee member and regular participant in MPO activities, the TDM professional has the opportunity to influence MPO guiding policies which directly impact the content of the Long Range Transportation Plan as well as the Transportation Improvement Program (TIP) and subsequent project funding. The commuter assistance program (CAP) executive director should not only educate the MPO Board and committee members regarding the benefits of TDM strategies, but also offer specific ways for including them in the various MPO products. This report has included a number of useful policies for use in long range transportation plans. The CAP representative also should assist in developing alternative revenue sources and seek earmarks for TDM strategies. It is very important for this individual to understand and educate others regarding the trade-offs between accommodating travel demand and managing travel demand. The CAP representative should encourage planners to reconsider assumptions made in the analysis of transportation alternatives and be cognizant of the level of accuracy that analysis methods offer.

The CAP representative should work with MPO staff to consider more realistic time frames not only for implementation of TDM strategies but also for tracking and measuring program results. Match these with work programs and budgets that coordinate with those time frames.

Improve relations by involving MPO Board, staff, and committee members in transit or TDM agency activities. Raise the awareness of the MPO Board, staff, and committee members regarding various transit and TDM agency activities by inviting them to attend them or otherwise involving them in various transit or TDM agency activities.

3. Involvement in Local Government Processes

Study local planning documents. It is recommended that TDM professionals become thoroughly familiar with their locality’s Comprehensive Plan, especially the Future Land Use Element and the Transportation Element. Some local governments have Congestion Management System Plans
developed to address areas with low LOS. While the plans emphasize physical improvements to the roadway system, these can go hand in hand with demand-side strategies offered by TDM.

**Articulate the trade-offs.** In accommodating travel demand versus managing travel demand, this is an issue of making a different set of trade-offs at the policy level. The realm of TDM support at the level of long range planning includes such actions as “providing incentives”, “continuing to support”, “continuing to work with”, “encouraging”, and “coordinating”. There is a great reliance upon city administrators to interpret what TDM actions conform to and advance the policies of the local government comprehensive plan. The policies, for example, may require developers to provide facilities and on-site amenities, “where appropriate”… “as needed” and “where feasible”, which all rely on professional judgment. TDM professionals should listen to the ongoing discussions with regard to long range transportation planning because the stage is set here for land development. TDM professionals should prompt a revisiting of the difficult questions to encourage a more explicit articulation of what is being traded. Elected officials and decision makers must have the knowledge and understanding about the trade-offs in order to demonstrate leadership and the political will to make unpopular decisions that may upset the status quo of how benefits from the transportation structure are shared. Questions include:

1. How much right-of-way do we really need?
2. What level of service standard is acceptable?
3. For any course of action, what are the alternatives that we are foregoing?
4. What are the underlying assumptions?
5. Which groups are being served/not served? Which groups are most vocal and which are underrepresented? For example, is it the majority versus the low mobility groups? Is it the neighborhood versus the surrounding town?

**Participate in planning document review.** The “buck stops” where your municipality’s land development code (LDC) of regulations places requirements, prohibitions, and quantitative standards. However, the LDC must be consistent with and implement the Comprehensive Plan. For example, review the applicability of sources that the municipality originally used as a basis for development and parking standards. If there are inconsistencies or opportunities to strengthen the means by which the LDC implements the comprehensive plan, then TDM professionals have the opportunity and responsibility to point these out in the comprehensive planning update process. Seek ways to get involved in the review processes for the comprehensive plan and the land development regulations because the plans, policies and regulations are the litmus test against which every development proposal is reviewed.

**Adopt measurable objectives.** It is recommended that TDM professionals encourage long range planners to replace vague language in plan policies, such as “continue to support”, with clear unambiguous language about what is expected, based on measurable objectives. For example, “Reduce vehicle trips entering the business district during the a.m. peak period by 3 percent by the year 2010.”

**Advocate for transit oriented development incentives.** Consider policies that encourage land development proximity and connectivity, such as transit oriented development. In locations where special emphasis is placed upon enhanced transit service development, TDM professionals should advocate for special incentives to attract land development projects along these corridors. Incentives should particularly reward land developer efforts to arrange transit-oriented development at major transit node locations and bus stops.
Stage gradual parking reductions. Limiting the availability of parking has a strong impact on the use of the transportation system but efforts can backfire if satisfactory alternative transportation is not concurrently in place. TDM professionals should advocate for a more complete multimodal system. As the level and quality of multimodal transportation service increases, parking limitations can gradually be established. TDM professionals should stimulate discussion through arranging forums among bankers, developers and local governments about the marketability of development with reduced parking. TDM professionals should suggest a plan for staging the gradual reduction of parking availability in coordination with redevelopment, which includes triggers or thresholds that precipitate the institution of parking reductions.

Review staff functions. Consider whether difficulties in coordinating land development planning, transportation planning and traffic engineering are in part due to the manner in which staffing tasks are compartmentalized within departmental functions.

Stay current on innovations in the field. Local governments often have found it helpful to borrow good ideas from other municipalities. This is a sound practice as long as borrowed ideas are tailored to the unique conditions of the locality. TDM professionals should keep abreast of ongoing evaluation and refinements to Broward County’s transit oriented concurrency approach and consider how the concept might be applicable in their own municipalities.

Recognize TDM credentials. In the long run, an important way to elevate the usage of TDM is through incorporating a balanced approach to transportation engineering and planning at the college undergraduate and graduate levels. Local TDM professionals can suggest hiring criteria for key local land development administrative positions. Such criteria could include strong preference for candidates who have studied TDM, determinants of travel behavior, multiple methodologies for assessing traffic impact, and other indicators of a broadened transportation education.

4. Involvement in State Government Processes

Update the Development of Regional Impact (DRI) analysis process. In the DRI process, there is an emphasis on the use of capital improvements to resolve capacity deficiencies. Operations and management programs generally have not been used to address regional impacts. It is difficult to develop an intermodal and multimodal local transportation system if the regional and interstate transportation systems rely primarily on one mode. This is because the local system is so closely intertwined with the regional and interstate systems. State planners should revisit the long term possibilities for multimodal regional and interstate transportation systems. Florida DOT site impact analysis procedures used to evaluate DRI impacts are used with the intent to preserve level of service (LOS) on the State Highway System (SHS) and the Florida Intrastate Highway System (FIHS). Analysis tools for determining LOS focus on highway capacity for automobiles and trucks. Trip generation is characterized as motor vehicle movements. Transit share is based on existing transit usage in areas where transit service often is underdeveloped. The DRI Application for Development Approval (ADA) questions should be reviewed and updated to place greater emphasis on transportation alternatives, transit oriented development and pedestrian-friendly development design. The site impact methodology should be updated to reflect an anticipated future multimodal system, otherwise site impact analysis will tend to mirror and reinforce the existing conditions of a private motor vehicle oriented system. Broward County’s transit-oriented concurrency approach may offer concepts that could be borrowed by the DRI review process to widen the possible options for addressing regional transportation impacts with alternative modes.

Consider the impact of emergency evacuation on statewide transportation planning. It is recommended that TDM professionals suggest a reconsideration of statewide strategies for
Incorporating TDM into the Land Development Process

emergency evacuation and include TDM in evacuation strategies. Maintaining regional highway capacity for emergency evacuation attracts and disperses new land development where capacity exists, which limits mobility choices and thwarts application of many TDM strategies. It is recommended that while FIHS capacity is maintained for evacuation events, the bus fleets of urban areas should also be maintained to satisfactorily serve low-mobility populations during evacuation events. This increase in bus service capacity then can be made available daily, encouraging a trickle-down effect upon land development location decisions and site design.

Funding allocations are influenced by the source of revenues. This is because it makes sense to tie the funding of services to those who use them, when possible. It is recommended that state and local policy makers reconsider sources of transportation revenue and TDM professionals should be participants in the dialogue. Alternatives could include raising motor vehicle fees, especially registration fees for new motor vehicles and parking pricing. The increased revenue should be earmarked to complete the road system for alternative users, including pedestrians, bicyclists, and high occupancy vehicle lanes and bus rapid transit. There should also be consideration of other transportation revenue sources to remove dependence for revenue generation from private automobile ownership and usage, such as fuel taxes.

5. Seek refinement of methodology for determining transportation impact of land development.

This review recognizes that the demand for transportation calls for a wider choice of mobility services (such as transit service, vanpools, guaranteed ride home), which would result in a transportation impact from land development that is characterized differently from a mere calculation of the number of additional vehicles generated by the development. This transportation demand for varied services will be suppressed if the basic system for providing such alternative transportation services is not yet in place. Once such a system is in place, transportation impact would have to be measured differently, such as the number of additional bus boardings, the number of pedestrian crossings at key intersections, and the numbers of additional vanpools and guaranteed ride home registrants. Differently measured impacts would call for an expanded menu of service improvements that could be contributed by the developer as part of the development agreements and development orders.

Select performance measures carefully. TDM professionals should encourage planners and engineers to weigh the limitations of using various TDM performance measures against the particular goals to be achieved. Examples include reducing single occupant vehicles (SOV), average vehicle occupancy (AVO), and average vehicle ridership (AVR), understanding that their use will limit the actions taken. Reducing SOV limits TDM strategies to mode shifting and does not recognize that SOV drivers can also participate in TDM. AVO does not incorporate the effects of bicycling, walking or telecommuting. AVR is a measure associated with work sites, limiting TDM application to commute travel. AVR also does not incorporate the effects of bicycling, walking and telecommuting. These are all useful measures but they should be applied only with the understanding of what they do not consider and should perhaps be used with other measures such as a vehicle employee ratio (VER), also known as vehicle trips reduced (VTR), which is the number of vehicles per 100 employees. Other measures might include reducing vehicle trips (VT) or reducing vehicle miles traveled (VMT).

Incorporate TDM as conditions for rezoning approvals. TDM professionals should meet with the municipal traffic engineer to review the methodology used to determine what information is needed for a rezoning application and provide general suggestions to the traffic engineer regarding how the assessment of a rezoning application can be made to incorporate TDM considerations.
Reconsider trip and parking estimates. TDM professionals should meet with the municipal traffic engineer to discuss the use and limitations of the ITE trip generation and parking generation rates. Local government transportation planners should evaluate the extent to which their customary use could mislead to faulty conclusions regarding the magnitude and characteristics of travel demand. Ideally, to estimate for a land development proposal, trip and parking rates will be computed from counts from other local developments that closely match the proposal in terms of its physical features and function, development environment, and areawide development goals for the future.

Encourage the development of LOS evaluation that enables trade-offs among modes. Available transportation planning methods fall short of enabling an evaluation of a trade-off among modes. Research should continue to focus on this missing piece, starting with the SIS geodatabase. TDM professionals should become more active in the discussion about the application of multimodal LOS standards as part of the transportation approval process. Ideally, TDM professionals should generate support for the future development and application of a method to make tradeoffs across modes. Preserving roadway level of service standards for private motor vehicles as specified in the local Comprehensive Plan appears to drive the process thereafter. In the long range transportation planning process, TDM professionals should suggest exploring the use of alternative standards for combined people-moving capacity across modes along corridors carrying heavy directional traffic. In the case of Tampa, one way to do this is to implement Policy 4.2.3, which calls for the City to assist HARTline to increase the modal split for mass transit by providing the highest levels of transit service on transit emphasis corridors. This Policy specifically calls for providing dedicated travel lanes for exclusive transit or high occupancy vehicle use. Especially for constrained corridors in which additional lanes cannot be built, such strategies require making a trade-off for more transit usage and less private motor vehicle level of service.

6. Develop professional relationships.

Identify key people in the local development process. TDM professionals should establish working relationships with key technical people, including those representing the Florida Department of Transportation, the planning commission, the transit agency, and the MPO. Establish a working rapport with the zoning administrator and the municipal traffic engineer. Invite such key municipal development staff to participate in a meeting of your organization, to give them first hand knowledge about what services your agency provides, your mission and goals, and express a desire to participate in the land development process. Make the case how you can be helpful to the process. Demonstrate a knowledge of the complexities of land development, issues and trade-offs, and your flexibility of thinking and desire to help solve transportation problems through strategies tailored to help properly conceived land development succeed.

Involvement at the neighborhood level sets the stage for TDM implementation. TDM professionals should be active in the development of neighborhood, area, or district plans and work to establish community support for using TDM principles in future land development, such as transit oriented development. Such support would ease acceptance of alternative building square footage, building height and number of floors, occupancy classification, minimum building setbacks and dimensions that support transit and pedestrian use. These features are proposed in writing at the building plan approval stage but are conceptualized early.

Balance specificity with flexibility. Alternative transportation facilities and amenities must maintain the character of the surrounding neighborhood and be complementary to stable residential areas. Neighborhood groups may express opposition to TOD. This requires the exercise of interpretation and sensitivity to residents who do not want to see change in their neighborhoods.
Incorporating TDM into the Land Development Process

Where there is ordinance language that is more specific and less open to interpretation, such as numerical standards, this type of regulation has more enforcement power but a less flexible impact. In the development of regulation language that advances the application of TDM, the goal is to make ordinance language as specific as possible without losing the flexibility and leeway needed to be responsive to neighborhood concerns in individual cases of development.

Seek networking opportunities. TDM professionals should consider serving on citizen review boards as part of community service activities. This can provide valuable networking and partnership building opportunities. Participate on local boards and committees to develop an understanding of different aspects of the community as well as to provide information regarding the benefits of TDM to other participants. Most TDM professionals are becoming aware of the opportunities provided by participating in technical advisory committees of the MPO. In addition, there are appointed citizen review boards that are established to secure resident participation, promote good government and to promote the effective and efficient delivery of public services. While these review boards are for citizen residents of the municipality and not professional representatives of organizations like a commuter assistance program, clearly the persons who participate on these boards have related professional backgrounds. TDM professionals who have an interest in community service as well as individual members of the CAPs or TMAs could serve on these boards to provide a TDM perspective in the decision making process. These boards include variance review boards, architectural review commissions, neighborhood planning task forces, enterprise zone development agencies, and the municipal planning commission.

Establish partnering roles. TDM partnering agencies should make a decision whether/when participation in the development approval process for a particular application should be a coordinated team approach or whether one partnering agency should attempt to be the sole voice and conduit for involvement and recommendations. This decision could be decided in advance as a general coordinating policy or it could be decided on the basis of each individual application.

Agree upon an effective division of labor. Based upon staffing and time constraints, TDM professionals will not be able to pursue all development proposals. Consequently, they should form a strategy in advance for participating in the land development process that coordinates the agreed upon efforts of the regional commuter assistance program (CAP), the local transportation management associations, the local transit agency, the bicycle/pedestrian coordinator, the FDOT District public transit office and other key TDM agencies. For example, staff of the regional CAP might provide assistance to the TMAs in the form of information regarding rezoning applications and site plan applications submitted in the TMA service areas. The CAP might also serve on the MPO Technical Advisory Committee and provide updates to local TMAs regarding long range transportation planning initiatives.

Demonstrate a coordinated effort. It is important that in this coordination effort, there be communicated to the municipal offices overseeing the land development process, a unified voice among allied organizations with regard to TDM. It can only help to demonstrate a coordinated approach. The worst that can happen is for disagreement among allied organizations to become apparent, which will communicate disorder and a strong sense that including TDM in the discussion will complicate and slow the process down rather than be of assistance. It may help for TDM agencies to decide in advance what their respective roles will be through identifying what strengths each partner agency has and how best each agency can contribute. Deciding roles in advance may reduce or eliminate friction relating to “turf”.

Be mindful of how one TDM strategy can impact others advocated by partners. In the development of combinations of TDM strategies, sometimes one strategy can offset the impact of
another. For example, a dedicated bus lane may experience a lowered level of service if it is turned into a high occupancy vehicle lane shared by carpools and vanpools. In this case, coordination with and support of the local transit agency includes carefully weighing the impact of combined TDM strategies and open discussion about what will create the best overall outcome.

**Reach out to economic development interests.** TDM professionals should aim to apply TDM to residential and business location decision making because this sets the stage for using TDM strategies more effectively on a day-to-day level. Develop working relationships with realtor associations, economic development arms of local government and chambers of commerce.

**Educate the media about the use of TDM as mobility management.** It is essential for TDM professionals to seek out the news media covering the events relating to a development proposal, to frame the transportation issues from a standpoint of mobility management and see to it that this message does not get obscured. TDM representatives should develop a professional rapport with journalists. TDM representatives should attend high visibility public hearings and sign up to speak. TDM professionals should carefully prepare and rehearse their 3 minutes allotted time to speak, to succinctly address “hot button” concerns with factual evidence. While oral testimony at the public hearing stage is likely too late to influence transportation professionals, it can have an impact on how the issue is reported in the news media. This affects receptivity by the public and by elected officials who must vote on development matters.

**Publicly praise land development that supports community transportation goals.** TDM professionals should continue to serve as publicists to bring positive recognition to developers and property managers for good track records of implementation.
CASE STUDIES
Two case examples were documented for this report as briefly described below:

- **Commute Trip Reduction Program.** Durham County, North Carolina. This ordinance requires major employers to provide employees with information on alternative transportation modes, to participate in a survey and reporting effort, and to prepare a plan to reduce commute-related traffic generated by their employees.

- **Parking and Transportation Demand Management Ordinance.** Cambridge, Massachusetts. This ordinance is one of the measures the City uses to minimize the number of single-occupancy vehicles operated within the City. Parking is strictly limited, and a variety of TDM measures are supported through negotiations with developers.

**Commute Trip Reduction Program**

**Durham County, North Carolina**

**Sources:** Interviews with Audra Foree, TDM Planner, Triangle Transportation Agency, Durham, NC and Charseem Anderson, Transportation Planner, City of Durham, NC; Durham County Code, Article V: Commute Trip Reduction Program.

Located in the Research Triangle of North Carolina, Durham County has an area of 290 square miles and is home to 236,781 people (2003 estimate). The American Community Survey estimates that, in the larger Raleigh-Durham-Chapel Hill metropolitan statistical area (of which Durham County is a part), 81% of working adults used single-occupancy vehicles as their primary means of transportation to work.

Durham County instituted a trip-reduction ordinance in 2000 for the main purpose of heading off imminent non-attainment status in local air quality. The ordinance takes an employer-based, rather than a development-based, approach to transportation demand management (TDM). Indeed, there is no land-use component to the ordinance at all.

The ordinance requires “major employers” (defined as organizations employing at least 100 people) to provide employees with information on alternative transportation modes, to participate in a survey and reporting effort, and to prepare a plan to reduce commute-related traffic generated by their employees. Technically, this plan must be approved by the county. The ordinance provides a mechanism for the county to object to any employer’s traffic reduction plan, however, no plan has been rejected to date.

Durham County is intentionally taking a less confrontational and more conciliatory approach to TDM than are other municipalities. “Employers have lots of leeway regarding compliance,” says Audra Foree, the TDM planner for Triangle Transit Authority (TTA), the lead transportation agency in Durham County. “The ordinance basically gives them suggestions; they can install bike racks, set aside designated parking spaces for carpoolers, or something else. The method they use to achieve traffic reduction is up to them.”

Suggestions for employer’s traffic reduction plans found in the ordinance include the following TDM strategies:

1. Commuter matching services to facilitate employee ridesharing for work trips;
2. Provision of vans for vanpooling;
3. Subsidized carpooling or vanpooling which may include payment for fuel, insurance, or parking;
4. Use of company vehicles for carpooling;
5. Provision of preferential parking for carpool or vanpool users;
6. Reduction of on-site employee parking or re-designation of existing parking to pooling employee parking;
7. Subsidized bus fares;
8. Construction of special loading and unloading facilities for transit, carpool, and vanpool users;
9. Cooperation with the City or County of Durham in construction of sidewalks or bicycle routes for the work site;
10. Provision of bicycle racks, lockers, and showers;
11. Providing to employees information on alternate modes and other travel reduction measures;
12. Establishing a work-at-home program, including telecommuting;
13. Establishing a program of adjustable work hours which may include compressed work weeks and flexible starting and stopping hours;
14. Parking incentives and disincentives;
15. Implementing other measures designed to reduce commute trips, such as provision of day-care facilities, restaurant, or emergency ride home services.

The ordinance does not set community-wide goals for traffic reduction, but does not hold employers to achieve any kind of citywide goal or standard, leaving them to their own devices to comply with the ordinance. As a result, the Triangle Transit Authority (TTA) acts as a consulting organization working with employers to identify the most successful (and cost-effective) methods of implementing TDM. According to Foree, the most important factor in creating an effective program is the person appointed by the employer to liaison with TTA. “An employer must designate an Employee Transportation Coordinator (ETC) at the worksite, and that person is the City’s contact point within the company for the development of the program,” she states. “We work with the ETC to implement the annual employee survey. The ETC is also in charge of keeping alternative transportation mode information at the worksite—things like bus schedules, brochures, etc.”

Charseem Anderson, a transportation planner for the City of Durham, is in charge of administering the City’s trip reduction plan with its goal “to reduce vehicle miles traveled for employees, and to encourage them to get out of the SOV (single-occupancy vehicle) mindset.” The City’s plan encourages employees to participate in the program through incentives that are associated with each alternate transportation mode. For example, employees with valid City Employee IDs ride the transit system for free and are eligible to use the guaranteed emergency ride home. City employees are also allowed to adjust their arrival and departure times in accordance with the bus schedule.

One benefit of the flexible nature of the Durham County TRO is that it helps mitigate the resistance that is common to similar ordinances in other parts of the country. While development-based requirements can often breed contentious fights over TDM requirements (due at least in part to the amount of money involved in even a slight delay in construction), in Durham, the most significant variable is the attitude of the employee transportation coordinator (ETC). “It really depends on the person who’s given the responsibility,” says Foree. “If they’re amenable to the idea of serving in that capacity, the process tends to work better. It helps if they are already of the mindset that [traffic reduction] is something that people should be doing.” Prior to Durham County’s adoption of the trip reduction ordinance, some corporations were already implementing traffic reduction plans, for example, GlaxoSmithKline. Some corporations are much less interested in coordinating trip reduction through the TTA, especially if the designated ETC is not interested in serving in that role.
“We’ve been achieving our [traffic reduction] goals within the city, but one of the biggest hurdles we face is getting the supervisors to let their employees participate,” says Anderson. For example, although many employees would like to participate in the compressed work week and telecommuting options, they are not appropriate for everyone. Oftentimes, some managers are skeptical of “the idea that their employees can still be productive if they are not under direct and constant supervision.”

Judging the success of any TDM initiative requires measurement and evaluation of the specific techniques implemented. Like most municipalities, Durham County takes a low-cost, low-tech approach to questions of verification and measurement. “We require major employers to conduct annual surveys among employees and to prepare an annual report to TTA,” says Foree. The TTA then examines those documents “to determine if the plans are compliant with the ordinance.” TTA uses an evaluation form for this purpose. Information provided on the form includes: the date on which the plan was first received; whether the employer has submitted all necessary fees; whether the employer has designated an ETC, and the identity of that person; a description of how TDM information is distributed to employees; descriptions of both current and planned trip reduction measures, to include specific goals for the following year; and the response rate of the survey. The City also tracks employee compliance through an annual survey. Typical topics covered include: basic travel habits; the type of vehicle used for travel (especially model, make, and fuel type); miles traveled; and the specific reasons the individual made the choices he or she did.

There are, however, some measurement-related pitfalls to consider. In particular, establishing a baseline can be tricky, due mainly to difficulty in obtaining baseline data. “Between years 2000 and 2002, we attempted to gather baseline info through a ‘suggested’ survey,” says Foree. Only some of the companies distributed the survey. In addition, reporting methods were not standard and were, therefore, difficult to measure, resulting in a very weak baseline. According to Foree, “In 2003, we developed and used a standard [required] survey and report, and we are now gathering the first measurements based on this standard survey. We expect to have all the results sometime in the spring of 2005.”

The ordinance does include a $1,000 one-time penalty for noncompliance. Despite the seemingly small size of the fine for most companies that would be categorized as major employers, only one fine has been assessed since the program began in 2000, indicating compliance with the ordinance.

Some employers might be put off by the possibility of high costs for program implementation, but the flexibility of Durham County’s ordinance can help mitigate those fears. In fact, the City of Durham hasn’t yet incurred any specified costs, although that may be in large part due to the unique situation of City government. For example, the City subsidizes its own transit system on which employees ride for free. Further, Anderson says, “the emergency ride home service is set up in such a way that, if they need to pay a cab fare, employees are reimbursed directly by an individual department’s travel budget, instead of by the Transportation Department’s funds.”

As a result of the flexibility and leeway inherent in Durham County’s ordinance, there is very little actual negotiation involved in the implementation of the trip reduction ordinance. The main advantage of this ordinance is ease of employer participation. Because compliance with the ordinance is determined by the number of full-time employees, it is easy for employers to determine whether or not they are subject to the ordinance. In addition, the requirements they must meet (as set forth in the ordinance) are not difficult. Thus, participation by employers is relatively simple to achieve. The disadvantage of this approach is that individual employers are not responsible for specific traffic reduction goals. Employers will almost always elect to implement the least rather than the most cost
Incorporating TDM into the Land Development Process

effective TDM strategies. As long as Durham County is able to meet its overall traffic reduction goals, this trip reduction ordinance can be deemed successful.

**Parking and Transportation Demand Ordinance**

**Cambridge, Massachusetts**

**Sources:** Interviews with Susanne Rasmussen (Director of the Environmental and Transportation Planning Division, Community Development Department, Cambridge, MA), Catherine Preston (PTDM Planning Officer, Cambridge, MA), and Jim Gascoigne (Executive Director, Charles River TMA); Cambridge City Code, Chapter 10.18

**Resources:** The following documents are available at [www.cambridgema.gov](http://www.cambridgema.gov):
- Parking and Transportation Demand Management (PTDM) Ordinance
- Interdepartmental Parking Facility Registration Form
- PTDM Employee Transportation Coordinator Designation Form
- PTDM Plan Property Transfer Form
- PTDM Small Project Plan
- Zoning Ordinance

This case study involves Cambridge, Massachusetts, a city of over 100,000 residents covering an area of 6.5 square miles. Located just across the Charles River from Boston, Cambridge is home to Harvard University, the Massachusetts Institute of Technology, and a strong high-tech business sector. The Parking and Transportation Demand Management Ordinance discussed here is but one part of the City’s TDM program, designed “to improve mobility and access, reduce congestion and air pollution, and increase safety. These programs work to reduce the level of drive-alone travel by promoting walking, bicycling, carpooling, vanpooling, public transportation, and other sustainable modes. The City works cooperatively with citizens, businesses, and institutions in Cambridge and the Boston area to implement TDM measures” (53).

Another codified example of Cambridge’s TDM program is Article 19 of the Zoning Ordinance which addresses special permits required for “large projects” whose definition varies, depending on the specific type of development being proposed (54). Applicants for a large project special permit are required to conduct a traffic study, which should “identify parking and transportation demand management measures and other mitigation measures proposed to ameliorate any adverse traffic impacts identified in the study.” Traffic mitigation measures are outlined in Article 18 of the Zoning Ordinance. Additional citywide transportation demand management efforts include support of the EZRide Shuttle, GoGreen Month, Bike Week, and a pilot project for Enhanced Bus Stop Signage.

**Background**

*The Parking and Transportation Demand Management (PTDM) Ordinance* (Chapter 10.18) was passed in November 1998 to provide some “teeth” to a stagnant *Vehicle Trip Reduction Ordinance* (VTRO) and address concerns about increased traffic within the community itself. The VTRO, passed in 1992, was a response to concerns about air quality, and, more specifically, about transportation’s contribution to declines in air quality and the resulting parking freeze imposed by the Massachusetts Department of Environmental in the early 1970s. A broader goal of the VTRO was regulating improvements to air quality and reductions in vehicle trips via a new approach to transportation. It is interesting to note that the parking freeze was actually requested by the Cambridge City Council as a tool to guard against the growth of new parking spaces that would meet increased demand from the neighboring city of Boston. The freeze applies only to the construction of
new, fee-based parking facilities, either surface or structures, and does not apply to on-street parking or accessory parking.

Another significant factor for passing the *PTDM Ordinance* was a general fear of traffic that might be brought about by the rapid growth of the biotech and dot-com industries within the city during the late 1990s; however, the very biotech firms seen by many Cambridge residents as being a major source of their city’s traffic problems were, in reality, some of the city’s earliest practitioners of TDM, developing in-house programs for their employees. Traffic fears were enhanced with the end of Cambridge’s rent control program in 1996, when the resulting change in the city’s demographics led many Cambridge residents to perceive the presence of a higher number of cars per household than in previous years.

**Parking and Transportation Demand Management Ordinance (PTDM)**

The *Parking and Transportation Demand Management Ordinance*, Chapter 10.18 of Cambridge’s *City Code*, states its purpose: “to regulate and control atmospheric pollution from motor vehicles by formalizing parking and transportation demand management planning, programs, and coordination which have been ongoing for a number of years. This Chapter will reduce vehicle trips and traffic congestion within the city, thereby promoting public health, safety, and welfare and protecting the environment.” The ordinance requires parking and transportation demand management plans for commercial parking facilities and other types of non-residential parking facilities, provided they meet certain size requirements. Elements of this ordinance include:

- Establishment of purpose, definitions, and designation of a PTDM Planning Officer;
- Registration of all parking spaces;
- Parking and Transportation Demand Management plans;
- Reduction in minimum parking requirements and maximum distance standards;
- Requirements applicable to small projects; and
- Enforcement, evaluation, and expiration.

Basically, the process involves registration of all parking spaces prior to the construction that creates the spaces. Building, expansion or operation of a parking facility requires a *Parking and Transportation Demand Management Plan* approved by the Planning Officer. The *PTDM Plan* may include requests for “fewer parking spaces that [sic] the minimum set forth by the Zoning Ordinance” or “utilizing off-site parking spaces that are further from the project site than the maximum distance requirements set forth in the *Zoning Ordinance.*” Small projects (using 19 or fewer parking spaces) are required to implement a minimum of three PTDM measures. Enforcement of the ordinance includes a per parking space, per day monetary fine for violations. The ordinance, as originally written, had a three-year sunset clause; after re-approval in 2001, it contains a five-year sunset clause, set to expire in 2006.

The city's Traffic, Parking and Transportation department maintains an inventory of all off-street parking spaces located within the city. Anytime a developer or property owner attempts to increase the number of non-residential spaces beyond the number listed in the inventory for a particular piece of property, the PTDM ordinance is triggered. This is typically a result of other building activities, and therefore is flagged during the application process for special permits, building permits, open-air parking lot licenses, garage and gasoline storage licenses, or curb cuts, for example.

The annual cost of administering and enforcing PTDM in the City of Cambridge amounts to staffing one full-time professional planner. The city is able to achieve some economies of scale, because their
Incorporating TDM into the Land Development Process

Traffic and Parking Department (which maintains the inventory and is responsible for enforcement) is able to use existing staff to carry out inspections and enforcement actions.

Negotiations between the City and the Developer

Any developer or property owner who plans on increasing off-street non-residential parking must obtain an approved PTDM plan before a building permit, special permit, certificate of occupancy, license, or variance can be issued. This means that negotiations between the developer/property owner and the City do not include whether a TDM plan is required, but what specific form the plan will take.

The starting point for these negotiations is usually the identification of comparable plans that have already been implemented and have shown a reasonable amount of success. The ideal candidate for comparison would be a similar type of business, located in an area with a similar level of transit service, and one that has at least some monitoring to show successful achievement of the mode-split commitments. Once a starting point has been selected, the developer/property owner examines the plan and determines possible modifications to better fit their specific situation. Generally, plans that have elements supporting all modes of transportation and are sufficient to meet their mode-split targets stand the best chance of being approved. Developers typically do not propose radically different plans from those suggested by the PTDM manager. In general, negotiations revolve around the degree of support for various elements of the plan—how much subsidization of transit passes will be required, whether or not there is a need for a privately-run shuttle, or how many HOV spaces will be required, etc.

The draft process itself usually takes from 40 to 60 days. The process typically consists of the following elements:

- The developer/property owner writes and submits a draft plan;
- The PTDM Manager comments on the draft;
- The developer/property owner and the PTDM manager conduct a face-to-face meeting; and
- The developer/property owner writes and submits a final plan.

In some rare cases, there may be additional drafts and comments. If the process continues for more than the 60 days designated by the PTDM Ordinance, the parties have to agree to an extension of the deadline. Extensions are usually required because the developer has a large team that needs to be consulted on the plan. On the other hand, extensions required because of difficulty reaching an agreement between the developer/property owner and the City are relatively rare; to date, there has been only one plan rejected. Any plans not acted upon by the PTDM manager within 60 days of submittal are automatically approved.

Cambridge’s experience with TDM negotiations suggests that developer resistance can vary significantly: “Sometimes, developers have been amenable to everything we suggest during permitting, and the ones we get resistance from are their eventual tenants,” says Catherine Preston, Cambridge’s PTDM manager. “Small property owners tend to be more resistant than larger property owners. At this point, we also encounter developers who have been through the process before on other projects and are somewhat accepting of it, but, based on their experience, have specific tweaks they look for.” According to Preston, it is the tenants/employers occupying the buildings who tend to be most sensitive about PTDM. For this group, the strongest resistance comes from anything that affects the supply or cost of parking for their employees. Preston cites fairness and transparency within the negotiation process as a key element of success. It is critical not to give any developer or
property owner the impression that they are being “singled out” or treated differently from others in comparable situations.

Sometimes, developers and property owners argue that there is a mistake in the inventory. In these instances, the developers and property owners may present to the City any available documentation that demonstrates the spaces in question existed prior to November 1998. However, the Traffic and Parking department makes the final determination of whether or not an increase has occurred. If one has, the project is referred to the PTDM manager, who then begins the negotiation process. There are some instances in which developers or property owners increase the number of spaces without City approval through re-striping of an existing lot or conversion of residential spaces to non-residential use. Typically, the City discovers these instances through word of mouth, whether from an annoyed neighbor, a city worker involved in a different project in the area, or a customer of the business. In these instances, Cambridge’s inspectors then visit the site and verify the number of spaces in operation, as well as their purpose.

**Monitoring and verification**

All PTDM plans for projects of 20 or more parking spaces are required to submit annual monitoring reports to the City. These include annual mode-split surveys, and biannual driveway and parking utilization counts. Surveys must have a response rate of 60% to be considered reliable, and the City has the ability to audit the surveys and counts, should that prove necessary. Any discrepancies between the survey and the counts raise a “red flag” with the Parking and Transportation Department, which then works with the property owner to determine the cause of the discrepancy.

Cambridge does not measure the progress of PTDM by traffic counts on city streets, thereby leaving project monitoring reports as the primary source of data regarding the success of the program. There are two main reasons for this:

- PTDM only impacts new, non-residential development in the City (it is not retroactive to existing parking and does not affect new residential parking), and
- The City has very limited ability to influence regional traffic passing through Cambridge (i.e., trips without an origin or destination within the city); in fact, growth in traffic passing through Cambridge has been more significant than growth in traffic generated by projects within the city itself.

In determining the level of success, Cambridge’s planning professionals look at how much traffic a new project has generated, and then attempt to estimate how much more traffic would have been generated without the PTDM ordinance: “We look at the 1990 census and determine the number of trips that would be generated with a project in that tract,” says Susanne Rasmussen, Director of Cambridge’s Environmental and Transportation Planning Division. “We then require limiting traffic increases to a maximum of that number, minus ten percent.”

**Transportation Management Association role**

Cambridge’s TDM efforts benefit from the presence of the Charles River Transportation Management Association (CRTMA), which assists regulated businesses in complying with their PTDM agreements. Boasting 20 members, CRTMA helps implement programs like shuttles, Emergency Ride Home, transportation fairs, information distribution and marketing, and car and vanpool ride-matching. This centralized implementation approach permits member businesses to achieve results in a cost-effective manner.

CRTMA Executive Director, Jim Gascoigne, describes how that process generally works:
“We meet with each member to determine their interests and needs. We work with the members to develop a specific program, where necessary, or to implement existing programs. Programs that we implement for members are the standard tools of TDM. CRTMA provides an economy of scale; in many businesses, for a fraction of the cost and aggravation of implementing the programs in-house, CRTMA can perform the function.

Our biggest success in this regard is the EZride shuttle service. The five vehicles that comprise EZRide replace ten corporate shuttles, most of which were required by PTDM agreements. The result is a publicly accessible, privately funded service that offers greater frequency, greater comfort, and more destinations (including buses, three of Boston’s subway lines, and the North Side Commuter Rail), all at a price significantly less than the cost of running an individual corporate shuttle. This service likely would not have been possible without shuttle requirements in PTDM agreements.

The PTDM got businesses into the shuttle business as a way to improve their mode-splits. CRTMA got the businesses to work together by saving them money.”

CRTMA’s involvement in Cambridge’s TDM plans actually began at a very early stage. CRTMA staffers pitched the concept of TDM to area businesses within the Chamber of Commerce, explaining why it made good business sense and, ultimately, ended up with their support.

Incorporating TDM into the Land Development Process

Appendices
APPENDIX A: SARASOTA COUNTY DEVELOPMENT AGREEMENT

The following is an excerpt from the Sarasota County Development Agreement, Section 94-261 of the Sarasota County Code. (Source: www.municode.com).

ARTICLE VIII. DEVELOPMENT AGREEMENTS

Sec. 94-261. Findings.
The Board of County Commissioners hereby makes the following findings:

(a) Pursuant to Article VIII, Section I(g) of the Constitution of the State of Florida, the Sarasota County Home Rule Charter, F.S. § 125.01, and the Local Government Comprehensive Planning and Land Development Regulation Act, (The "Act"), Chapter 163, Part II, Florida Statutes, as amended, Sarasota County is authorized and required to adopt a comprehensive plan.

(b) The Board of County Commissioners of Sarasota County adopted "Apoxsee, the Sarasota County Comprehensive Plan," in accordance with the provisions of the Act, including the adoption of acceptable levels of service for public facilities including transportation, potable water, sanitary sewer, parks, drainage and solid waste.

(c) The Board of County Commissioners of Sarasota County adopted Ordinance No. 89-103, as amended, the Sarasota County Concurrency Management System Regulations and codified as Chapter 94, Article VII, in order to insure that public facilities and services needed to support development will be available concurrent with the impact of such development.

(d) Pursuant to the Florida Local Government Development Agreement Act, F.S. §§ 163.3220--163.3243 (The "Development Agreement Act"), local governments are authorized to adopt by ordinance, procedures and requirements whereby a local government may consider and enter into a development agreement with any person having a legal or equitable interest in real property located within the local government's jurisdiction.

(e) The lack of certainty in the approval of development can result in a waste of economic and land resources; discourage sound capital improvement planning and financing; escalate the cost of housing and development; and discourage commitment to comprehensive planning.

(f) Development agreements entered into pursuant to the Local Government Development Agreement Act, strengthen the public planning process, encourage sound capital improvement, planning and financing; assist in assuring that there are adequate capital facilities to support development; encourage private participation in comprehensive planning; and reduce the economic cost of a development by providing assurances to a developer that, upon receipt of a development permit, the developer may proceed in accordance with existing laws and policies, subject to the conditions of a development agreement.

(g) The provisions of this ordinance, in their interpretation and application, are declared to be the minimum requirements necessary to accomplish the stated intent, purposes, and objectives of this ordinance. Nothing in this ordinance shall be interpreted as characterizing a development agreement as anything other than a discretionary, bilateral contract between the County and the owner with consideration given by both parties to the contract.

(h) The Board of County Commissioners of Sarasota County, has determined that it is in the best interest of achieving and maintaining the quality of life in Sarasota County to provide appropriate procedures and requirements for the adoption of development agreements through the provisions of Development Agreement Regulations.

(i) The Board of County Commissioners, sitting as the Sarasota County Land Development Regulation Commission has reviewed the proposed ordinance and has found that it is consistent with the Sarasota County Comprehensive Plan.

(Ord. No. 2004-086, § 1, 10-12-2004)
Sec. 94-262. Adoption of the Sarasota County Development Agreement Regulations.
The Board of County Commissioners of Sarasota County hereby adopts the Sarasota County Development Agreement Regulations, attached to Ordinance No. 2004-086 as Exhibit "A" and made a part hereof by reference.
(Ord. No. 2004-086, § 2, 10-12-2004)

Editor's note: The Development Agreement Regulations are printed following this article.

Sec. 94-263. Applicability.
The Sarasota County Development Agreement Regulations shall be applicable throughout the unincorporated Sarasota County, Florida, and as otherwise provided by law.
(Ord. No. 2004-086, § 3, 10-12-2004)

Sec. 94-264. Effect on Other Ordinances and Regulations.
Nothing in this Ordinance shall be construed or applied to excuse or replace development approvals required under existing land development regulations, contained within Ordinance No. 97-051, the County's Land Development Regulations codified as Chapter 74 of the Sarasota County Code, nor to release any developer from its proportionate share of the cost of public facilities improvements otherwise required.
(Ord. No. 2004-086, § 4, 10-12-2004)

Sec. 94-265. Local Laws and Policies Governing Development Agreements.
Sarasota County's laws and policies set down in the development agreement as governing the development of the land at the time of the execution of the development agreement shall govern the development of the land for the duration of the development agreement, except that Sarasota County may apply subsequently adopted laws and policies to a development that is subject to a development agreement if the Board of County Commissioners holds a public hearing pursuant to the requirements of this article and determines any one of the following:
(a) The laws and policies are not in conflict with the laws and policies governing the development agreement and do not prevent development of the land uses, intensities or densities in the development agreement;
(b) The laws and policies are essential to the public health, safety, or welfare, and expressly state that they shall apply to a development that is subject to a development agreement;
(c) The laws and policies are specifically anticipated and provided for in the development.
(d) Sarasota County demonstrates that substantial changes have occurred in pertinent conditions existing at the time of approval of the development agreement; or
(e) It is demonstrated that the development agreement is based on substantially inaccurate information supplied by the developer.
(Ord. No. 2004-086, § 5, 10-12-2004)

Sec. 94-266. Forms.
Adoption of standard development agreement forms by resolution and certification of attorney.
(a) The Board of County Commissioners is hereby authorized to adopt by resolution standard forms for development agreements and security referenced in this ordinance.
(b) Development agreements submitted to the County for review shall be in the approved standard form and shall be accompanied by a certification from an attorney that the agreement is in the standard form, or that any changes, additions or deletions from the standard form are shaded or redlined in the proposed draft agreement. Additions shall be underlined; deletions shall be cross-hatched or struck-through.
(Ord. No. 2004-086, § 6, 10-12-2004)
Sec. 94-267. Enforcement.
(a) In accordance with F.S. § 163.3243, as the same may be amended from time to time, any party to a development agreement, any aggrieved or adversely affected person as defined in F.S. § 163.3215(2) which will suffer an adverse effect to an interest protected or furthered by the Comprehensive Plan, or the state land planning agency may file an action for injunctive relief in the Circuit Court of Sarasota County to enforce the terms of a development agreement or to challenge compliance of the agreement with the provisions of the Development Agreement Act.
(b) In addition, any person who violates this article shall be subject to the enforcement provisions set out in Article VIII, Chapter 2, of the Sarasota County Code, as amended from time to time, and the penalties set forth therein.
(c) Nothing herein shall constitute an exclusive remedy, and the County reserves the right to pursue any and all legal and equitable remedies in order to abate a violation of this article.
(Ord. No. 2004-086, § 7, 10-12-2004)

Sec. 94-268. Legislative Act.
A development agreement is determined to be a legislative act of Sarasota County in the furtherance of its powers to plan and regulate by agreement and, as such, shall be superior to the rights of existing mortgagees, lien holders or other persons with a legal or equitable interest in the land subject to the development agreement, and the obligations and responsibilities arising thereunder on the property owner shall be superior to the rights of such mortgagees or lien holders and shall not be subject to foreclosure under the terms of mortgages or liens entered into or recorded prior to the execution and recordation of the development agreement.
(Ord. No. 2004-086, § 8, 10-12-2004)

EXHIBIT A. SARASOTA COUNTY DEVELOPMENT AGREEMENT REGULATIONS

A. Intent and authority.
The purpose of these regulations is to provide procedures and requirements whereby Sarasota County may consider and enter into a development agreement with any person having a legal or equitable interest in real property within the unincorporated Sarasota County, under the authority of The Florida Local Government Development Agreement Act, F.S. §§ 163.3220–163.3243.

The issuance of development agreements is intended to promote and facilitate orderly and planned growth and development by providing a degree of certainty in the development approval process. The certainty accorded developments under these regulations will: encourage greater participation in the comprehensive planning process; assure there are adequate public facilities for the development; and reduce the economic cost of development.

B. Definitions.
Apoxsee, the Sarasota County Comprehensive Plan, or Apoxsee means the document adopted by the Board of County Commissioners of Sarasota County and filed with the Clerk of said Board pursuant to Ordinance No. 89-18, as the same may be amended from time to time.

Applicant means any person or his duly authorized representative who submits a request for a development agreement for the purpose of obtaining approval thereof.

Board means the Board of County Commissioners of Sarasota County, Florida.

Comprehensive Plan means the document "Apoxsee, the Sarasota County Comprehensive Plan," ("Apoxsee"), adopted by the Board of County Commissioners of Sarasota County and filed with the
Incorporating TDM into the Land Development Process

Clerk of said Board pursuant to Ordinance No. 89-18, as the same may be amended from time to time.

Day means a working day, unless specifically referenced otherwise and shall exclude Saturdays, Sundays and legal holidays.

Density means the number of residential dwelling units permitted per gross acre of land as determined by the Sarasota County Zoning Regulations.

Developer means any person, including a governmental agency, undertaking any development.

Development, includes all other development customarily associated with a development permit unless otherwise specified. When appropriate to the context, "development" refers to the act of developing or to the result of development. Reference to any specific operation is not intended to mean that the operation or activity, when part of other operations or activities, is not development. Reference to particular operations is not intended to limit the generality of this subsection.

Development Agreement means an agreement entered into between Sarasota County and a person associated with the development of land pursuant to the terms of this Ordinance No. 2004-086.

Development Agreement Act shall mean F.S. §§ 163.3220--163.3243, as amended from time to time.

Development Order means any action granting, denying, or granting with conditions, an application for a development permit.

Development Permit means any preliminary subdivision plan, subdivision or other plat approval, site and development plan approval, rezoning, certification, special exception, variance, environmental permit or any other official action of Sarasota County or any other state or local government, commission, board, agency, department or official having the effect of permitting development of land located within the geographic area subject to the provisions of the Sarasota County Land Development Regulations.

Intensity means the degree to which an area is developed based on density, use, mass, size, impact, and traffic generations.

Land means the earth, water, and air above, below, or on the surface, and includes any improvements or structures customarily regarded as land.

Land Development Codes, Sarasota County means the code adopted by Resolution No. 89-384, pursuant to F.S. 163.3202, containing land development regulations that are consistent with and implement "Apoxse, Sarasota County Comprehensive Plan".

Land Development Regulations (LDR), Sarasota County means the regulation of the development of land within the unincorporated area of Sarasota County, Florida as provided for in Sarasota County Ordinance No. 81-12, as amended and codified as Chapter 74 of the Sarasota County Code.

Laws for the purposes of these regulations means all ordinances, resolutions, comprehensive plans, land development regulations, and rules adopted by the Board of County Commissioners of Sarasota County affecting the development of land.
Incorporating TDM into the Land Development Process

**Level of Service (LOS)** means an indicator to the extent or degree of service provided by, or proposed to be provided by, a facility, based on and related to the operational characteristics of the facility.

**Local Planning Agency** means the Sarasota County Planning Commission.

**Person** means any individual, corporation, business or land trust, estate, trust, partnership, association, two or more persons having a joint or common interest, state agency, or any legal entity.

**Public Facilities** means major capital improvements, including but not limited to, transportation, sanitary sewer, solid waste, drainage, potable water, educational, parks and recreational, and health systems and facilities.

**State Land Planning Agency** means the Department of Community Affairs.

**Third Party** means a government, agency or other unit of local government which does not have regulatory authority over the use of land but provides services for which Sarasota County has adopted Level of Service standards.

C. **General requirements.**

1. **Requirements of a Development Agreement.** A development agreement shall include but not be limited to the following:
   
   (a) A legal description of the land subject to the agreement and the names of its legal and equitable owners;
   
   (b) The duration of the agreement;
   
   (c) The development uses permitted on the land, including residential densities and building intensities, structure heights, maximum square footage of commercial buildings;
   
   (d) A description of public facilities that will service the development, including who shall provide such facilities; the date any new facilities, if needed, will be constructed; a schedule to assure public facilities are available concurrent with the impacts of the development; and if necessary, any third party or other agreement assuring the provision of said public facilities;
   
   (e) A description of any reservation or dedication of land for public purposes;
   
   (f) A description of all local development permits approved or needed to be approved for the development of the land;
   
   (g) A master conceptual development plan or an agreement to amend the development agreement within one year of the execution of said development agreement to include a conceptual development plan for the land subject to the development agreement containing the following unless the Board approves a modification to these requirements:
      
      (1) The general layout of the proposed development by land use and identifying the acreage and density and/or intensity of each portion of the proposed development;
      
      (2) Access points to the surrounding road system, internal and major road rights-of-way and road widths, any proposed pedestrian and bicycle facilities, and other easements;
      
      (3) Common open space and native habitat preservation and mitigation areas, recreational areas and any public purpose lands;
      
      (4) General stormwater retention areas; and
      
      (5) The location of any on-site potable water supply (e.g., wells) or wastewater treatment facilities.
   
   (h) A finding that the development permitted or proposed is consistent or will be consistent with the comprehensive plan and all applicable land development regulations;
   
   (i) A description of any conditions, terms restrictions, or other requirements determined to be necessary by Sarasota County for the public health, safety and welfare of its citizens;
(j) A statement indicating the failure of the agreement to address a particular permit, condition, term, or restriction shall not relieve the developer of the necessity of complying with the appropriate law governing said permitting requirements, conditions, terms or restrictions; and

(k) A description of the requirements for the filing of an annual report and a statement indicating who shall file an annual report and the required submission dates.

A development agreement may provide that the entire development or any phase thereof be commenced or completed within a specific period of time.

2. Duration of a Development Agreements and Relationship to the Comprehensive Plan. The duration of a development agreement shall not exceed ten (10) years. It may be extended by mutual consent of the Board, the developer, and any third party to the agreement, subject to a public hearing in accordance with the public hearing requirements contained in subsection C.6. of these regulations. No development agreement shall be effective or be implemented by Sarasota County unless the Sarasota County Comprehensive Plan and Plan Amendments implementing or related to the development agreement are found in compliance by the state land planning agency in accordance with F.S. 163.3184, 163.3187, or 163.3189.

3. Processing of Development Agreements With Other Applications for Development Approval. Where an application for a development agreement is filed in conjunction with other applications for development approval, the review periods for processing development agreement applications may be altered to accommodate the concurrent processing of the other applications.

4. Periodic Review of a Development Agreement. Within 12 months of the effective date of a development agreement, Sarasota County shall review the land subject to the development agreement to determine if there has been demonstrated good faith compliance with the terms of the development agreement. In addition to these requirements, any person with a legal or equitable interest in land for which a development agreement was entered into with Sarasota County, or their authorized representative shall submit an annual report to the Planning and Development Services Business Center on the date specified in the development agreement, pursuant to Section G of these Regulations.

5. Amendment or Cancellation of a Development Agreement. A development agreement may be canceled by the County or amended, subject to the procedural and public hearing requirements contained in these regulations, and under one or more of the following conditions:
   (a) Where there is mutual consent of the parties to the agreement, or by their successors in interest.
   (b) Where state or federal laws have been enacted which preclude one or more parties of the agreement from complying with the terms of the agreement.
   (c) Where the Board has found, in the annual review of land subject to a development agreement, there is substantial noncompliance with the terms of the development agreement.
   (d) Where, pursuant to Section 5.B. of Ordinance No. 2004-086 [section 94-265(b)], Sarasota County, may apply subsequently adopted local laws and policies to a development agreement.

6. Public Hearing. After the Planning and Development Services Business Center has made a recommendation on the application and the proposed development agreement, the application and proposed development agreement shall be considered at two public hearings.

If the proposed development agreement is being considered in conjunction with an application for a development permit which requires review by the Planning Commission, the first public hearing shall be held before the Planning Commission, who shall review the application, proposed development agreement, recommendation by the Planning and Development Services
Business Center and public testimony and recommend its approval, approval with conditions or denial. The second public hearing shall be before the Board, who after review and consideration of the application, the proposed development agreement, the recommendations of the Planning and Development Services Business Center and the Planning Commission, and public testimony, shall approve, approve with conditions, or disapprove the development agreement. The second public hearing shall be a minimum of seven calendar days after the Planning Commission public hearing. The day, time, and place of the second public hearing shall be announced at the first public hearing.

In all other instances, both public hearings shall be held by the Board. The second public hearing shall be held a minimum of seven calendar days after the first public hearing. The day, time, and place of the second public hearing shall be announced at the first public hearing. At the conclusion of the second public hearing, the Board shall, after review and consideration of the application, the proposed development agreement, the recommendations of the Planning and Development Services Business Center and the Planning Commission, if applicable, and public testimony, approve, approve with conditions, or disapprove the development agreement.

The notice of public hearing shall state the intent of the Board to consider a development agreement and shall specify the location of the land subject to the development agreement, the development uses proposed on the property, the proposed residential densities, and the proposed building intensities and height and shall specify a place where a copy of the proposed development agreement can be obtained.

Notice of intent to consider a development agreement shall be advertised approximately 7 days before each public hearing in a newspaper of general circulation and readership in the county where the local government is located. Notice of time and place of the first public hearing shall be sent at least 7 days in advance of the hearing by mail, to the owner of the subject property or his designated agent or attorney, if any.

7. **Recording of a Development Agreement.**
   
   (a) Within fourteen (14) calendar days after the Board has entered into a development agreement or the amendment to or cancellation of a development agreement, said agreement shall be recorded in the County public land records by the Clerk of the Circuit Court of Sarasota County. A copy of the recorded development agreement, or amendment or cancellation of a development agreement, shall be submitted to the state land planning agency within fourteen (14) calendar days after the agreement is recorded.
   
   (b) A development agreement shall not be effective until it is properly recorded in the public records of the County and until 30 calendar days after having been received by the State Land Planning Agency pursuant to this section.

D. **Binding nature of the development agreement.**

The burdens of the development agreement shall be binding upon, and the benefits of the agreement shall inure to, all successors in interest to the parties of the agreement.

E. **Enforcement.**

Any party, any aggrieved or adversely affected person as defined in F.S. § 3.3215(2), or the state land planning agency may file an action for injunctive relief in the circuit court to enforce the terms of a development agreement or to challenge compliance of the agreement with the provisions of the Development Agreement Act.

The County shall withhold approval of developments or permits if provisions of the agreement are not met or fulfilled.
F. Development agreement procedures.

1. Preapplication Conference. Preapplication conferences are required prior to the initiation of an application for a development agreement. Applicants shall submit a written request for a preapplication conference with the Executive Director of the Planning and Development Services Business Center. The pre application conference shall be held with the Executive Director of the Planning and Development Services Business Center or the Executive Director's designee. The purpose of the pre application conference is to assist in bringing the application as nearly as possible into conformity with these regulations or other regulations applying generally to the property involved and/or to define specifically other information essential to the review of the petition. In addition, the following information shall be discussed:

   (a) Other applications for development approval to be filed in conjunction with the application for a development agreement. If appropriate, staff shall clarify the necessary requirements for the processing of the concurrent applications and any necessary revisions or exclusions to the review time limits;
   
   (b) The appropriate composition of the review/negotiation team necessary to process the development agreement application;
   
   (c) Other jurisdictional agencies that need to become a party to the development agreement;
   
   (d) Any known Level of Service (LOS) or land use compatibility issues which need to be addressed; and
   
   (e) Whether complexities inherent in the proposed development agreement warrant alterations to the required review times listed in Section F of these Regulations.

2. Filing an Application to enter into a Development Agreement with Sarasota County. Applications for a development agreement shall be filed with the Planning and Development Services Business Center.

   (a) There shall be no deadline for filing an application for a development agreement.
   
   (b) The filing fee shall be due upon submittal of the application for a development agreement.
   
   (c) The submittal must contain all information required by the development agreement application form and these regulations.
   
   (d) Fifteen (15) copies of the information required by the development agreement application form shall be submitted to the Planning and Development Services Business Center unless otherwise directed in writing by the Executive Director of the Planning and Development Services Business Center or the Executive Director's designee. However, when a property lies within 1/4 mile of the boundaries of the cities of Sarasota, North Port or Venice or the counties of Manatee, DeSoto or Charlotte, one (1) additional set of the required information shall be submitted.

3. Third Party Participation in a Development Agreement. If the participation of third parties is necessary or in the best interest of Sarasota County, the approval of a development agreement may be conditioned upon the participation of specified third parties in the processing of the development agreement application.

4. Sufficiency Review.

   (a) Upon receipt of an application for a development agreement, or if appropriate, upon authorization by the Board of County Commissioners for third party participation in the processing of a development agreement, the Executive Director of the Planning and Development Services Business Center will forward copies of the completed application to the designated review/negotiation team for a determination as to whether the information submitted is sufficient to assess the application for a development agreement. Each agency on the review/negotiation team shall complete its sufficiency review and forward its comments to the Planning and Development Services Business Center within fifteen (15)
days. All review/negotiation agencies must comment in writing on the sufficiency of the development agreement application.

(b) Upon receiving all review/negotiation agency comments, the Planning and Development Services Business Center shall notify the applicant, in writing, whether any additional information is needed.

(c) Should the applicant be notified of the need for additional information, the applicant may: supply the additional information requested; appeal in writing to the Planning and Development Services Business Center requesting a reconsideration of the need for additional information; or notify the Planning and Development Services Business Center in writing of the intent not to submit additional information.

(d) Should the Planning and Development Services Business Center receive a request for reconsideration of the need for additional information, Planning and Development Services Business Center shall, within ten (10) days, respond in writing to the applicant. The response shall state whether the Planning and Development Services Business Center is maintaining, withdrawing, or revising the request for additional information.

(e) The sufficiency review shall be complete upon the determination by the Planning and Development Services Business Center that all information needed to review the application has been submitted or upon the receipt from the applicant that no additional information will be forthcoming.

(f) Each member of the review/negotiation team shall be notified of the conclusion of the sufficiency review by the Planning and Development Services Business Center and sent copies of any additional information submitted by the applicant.

5. **Formal Review and Negotiation of a Development Agreement.** Unless otherwise altered, the following review time frames shall apply:

(a) Upon the conclusion of the sufficiency review, each agency on the review/negotiation team shall have ten (10) days to review the complete application and all supportive documentation. Each agency in the review/negotiation team shall then submit to the Planning and Development Services Business Center, their comments and recommendations regarding the disposition of the development agreement application.

(b) Upon receipt of all agency review reports, the Planning and Development Services Business Center shall have ten (10) days to compile a preliminary report. A copy of the preliminary report shall be sent to the applicant and all members of the review/negotiation team.

(c) The Planning and Development Services Business Center shall meet with the applicant and the review/negotiation team for the purpose of discussing the findings and recommendations contained within the preliminary report and to establish the basis for negotiating a mutually acceptable development agreement.

During the negotiations, or at any time prior to the issuance of a final report by the Planning and Development Services Business Center, the applicant may revise the submitted application for a development agreement. However, each additional submittal may initiate a new review period unless this requirement is waived by the Executive Director of the Planning and Development Services Business Center or the Executive Director's designee.

(d) At any time prior to or during the negotiation process, the applicant may be required by the review/negotiation team to prepare and submit a draft development agreement. The review/negotiation team may require inclusion of specific provisions necessary to protect the public interest which may be set forth in a standardized form provided by the County.

If the applicant submits a proposed development agreement, said proposal shall be considered part of the overall application for a development agreement. Therefore and unless otherwise notified, fifteen (15) copies of the proposed development agreement shall be
Incorporating TDM into the Land Development Process

submitted to the Planning and Development Services Business Center for distribution and review by the review/negotiation team. Each member of the review/negotiation team shall then submit to the Planning and Development Services Business Center comments and recommendations on the proposed development agreement.

(e) The applicant may, at any time prior to or during the negotiation process, elect not to negotiate further and have the application and any draft of a development agreement presented to the Planning Commission, if applicable, and to the Board.

(f) Upon completion of a negotiated development agreement or the review of the applicant's proposed development agreement and the election by the applicant pursuant to (c) above, the Planning and Development Services Business Center shall issue a final report on the application for a development agreement and set a date and time for the required public hearings. No amendments to the application shall be accepted from the applicant beyond this point in time.

6. Public Hearings. The Planning and Development Services Business Center report and recommendations regarding the proposed development agreement shall be presented to the Planning Commission, if applicable, and to the Board for consideration during a noticed public hearing(s). The applicant shall have the right, prior to the close of the public hearings, to respond to contentions advanced as part of any testimony or other evidence presented during the public hearing.

After the close of the public hearing, the Board, in the exercise of its legislative discretion, may approve the development agreement as proposed, approve the development agreement with amendments, or deny the development agreement.

In the event the petitioner has the proceedings before the Planning Commission or the Board taken down by a certified court reporter, pursuant to F.S. 286.0105, the County may require the filing of the transcript of such proceedings, and the decision of the Board shall be rendered within (30) calendar days of the filing of the transcript.

G. Annual review procedures.

1. Filing an Annual Monitoring Report. As required in a legally executed development agreement, any person with a legal or equitable interest in land for which said development agreement was entered into with Sarasota County, or their authorized representative shall submit ten (10) copies of an annual monitoring report to the Planning and Development Services Business Center for review. This report shall be submitted by the date specified in the adopted development agreement and each year thereof, until such times as the terms and conditions of the development agreement are satisfied. This report shall contain:

   (a) Any changes in the plan of development, or in the representations contained in the development agreement, or in the phasing for the reporting year and for the next year;
   (b) A summary comparison of development activity proposed and actually developed;
   (c) The identification of undeveloped tracts of land, other than individual single family lots, that have been sold to a separate entity or developer;
   (d) An assessment of the level of compliance with the conditions contained in the development agreement by the developer, the local government and if applicable, third party(s);
   (e) Any indication of change in local jurisdiction by reason of annexation for any portion of the development in the reporting year or the following year;
   (f) A list of local, state or federal permits which have been obtained or which are pending by agency, type of permit, permit number, and purpose of permit; and
   (g) The identification of any changes in local, state or federal legislation substantially affecting compliance with the development agreement.
Failure to submit an annual report or the deliberate misrepresentation or the use of gross inaccuracies in the report may be grounds for the initiation of proceedings to amend or cancel the development agreement.

2. Annual Development Agreement Review.
   (a) Within five (5) days of receipt of the annual monitoring report, the Planning and Development Services Business Center shall send a copy of the submitted report to each of the review agencies for their review, analysis, and comments.
   (b) Reviewing agencies, upon receipt of the submitted report, will have fifteen (15) days to evaluate the report and issue comments to Planning and Development Services Business Center. All review agencies must respond with a written report or comments. The review shall address the following:
      (1) The completeness and accuracy of the information contained within the submitted document;
      (2) The degree of compliance with the terms of the development agreement; and
      (3) The identification of any substantial changes warranting an amendment or cancellation of the development agreements.
   (c) Upon receipt of all review agency comments, the Planning and Development Services Business Center shall, within ten (10) days, issue a formal report on the findings of the annual review and issue a determination of compliance with the terms of the development agreement. This report shall be sent to the owner or authorized agent and shall be available for public inspection at the Planning and Development Services Business Center.
   (d) The owner(s) or authorized representative of the land which submitted the monitoring report may request, in writing, a meeting with the Planning and Development Services Business Center to discuss the contents of the report.

3. Determination of Noncompliance. In the event that it is determined that there has been a failure to comply with the terms of the development agreement, the Planning and Development Services Business Center may find the use of the land is not in compliance with the development agreement. Should the Planning and Development Services Business Center issue a finding of noncompliance, the Planning and Development Services Business Center shall submit as an agenda item at a regularly scheduled meeting of the Board of County Commissioners a request to initiate proceedings to amend or cancel the development agreement.

H. Procedures to amend or cancel development agreements.
   An application to amend or cancel an adopted development agreement may be initiated by the Planning and Development Services Business Center, the owner of real property for which a development agreement has been adopted or any third party to a development agreement. An amendment or cancellation of a development agreement may be initiated under the following conditions: following a proposed change by the owner; the adoption of state or federal laws preventing the carrying out of the development agreement; following the completion of an annual review; or a proposal to apply subsequently adopted local laws and policies to a development agreement pursuant to Section 5.B. of Ordinance No. 2004-086 [section 94-265(b)].

Applications to amend or cancel a development agreement shall conform to the general and procedural requirements for the processing of a development agreement. In addition, the following regulations shall apply:
1. Filing an Application to Amend or Cancel a Development Agreement with Sarasota County. Applications to amend a development agreement must contain all information required by the Development agreement application form relating to the requested amendment. Applications to
cancel the development agreement must include sufficient justification warranting the cancellation of such agreement.

2. Formal Staff Review. Where the proposal is for a cancellation of an adopted development agreement, the allotted twenty (20) day staff review period may be reduced.

I. **Schedule of fees.**
The Board shall by resolution establish a schedule of fees for the filing, processing and reviewing of, or an amendment to or cancellation of a development agreement, or the annual review of a development agreement and related documents submitted to the County pursuant to the Development Agreement Act and these regulations. The fee as established shall be collected and administered in the manner prescribed by Sarasota County Ordinance No. 85-91 as amended, and Resolution No. 90-212, as the same as may be amended from time to time.

(Ord. No. 2004-086, 10-12-2004)
APPENDIX B: DEVELOPMENTS OF REGIONAL IMPACT AND THE FDOT SITE IMPACT ANALYSIS METHODOLOGY

Excerpted from “Land Developer Participation in Providing for Bus Transit Facilities/Operations”. Funded by the National Center for Transit Research. Sponsored by the Florida Department of Transportation. Prepared by the Center for Urban Transportation Research, University of South Florida.

It is important to examine developments of regional impact (DRI) in this report because DRIs usually represent the largest developments and as such, have the greater potential impact on land development patterns and the opportunity to influence the development of the transportation system. The development of regional impact review process is concerned with identifying multi-jurisdictional impacts of development and establishing mitigative conditions under which building activity may be permitted to proceed. The structured DRI review process facilitates capital improvements planning.

A Florida Development of Regional Impact (DRI) is any development that, because of its character, magnitude, or location would have a substantial effect upon the health, safety, or welfare of citizens of more than one county [Chapter 380.06, F.S.]. There are different types of DRIs, including the following.

- Areawide DRIs, in which there are two or more development projects represented by separate property owners
- Downtown DRIs
- DRI Master Plan, in which construction is in phases over an extended period of time

DRIs are established by Chapter 380, F.S., which authorizes the Florida Department of Community Affairs to develop land and water management policies to guide local decisions relating to growth and development. DRIs are implemented by rules in the Florida Administrative Code, Chapter 9J-2.

The DRI designation of a land development proposal initiates a review process, in which the regional planning council, the state and other agencies have an opportunity to provide recommendations to the local government in the drafting of conditions attached to a local government development order for assuring that regional impacts have been properly addressed [A local government development order is any order granting, denying, or granting with conditions, an application for a development permit, whereas a development permit includes any building permit, zoning permit, plat approval, or rezoning, certification, variance, or other action having the effect of permitting development activity to proceed, as defined in Chapter 380, F.S.]. The regional impact review includes the documentation of impacts upon transportation as part of an Application for Development Approval (ADA), which must be approved by the Department of Community Affairs.

Transit service is addressed in the ADA question, “What provisions, including but not limited to sidewalks, bicycle paths, internal shuttles, ridesharing, and public transit, will be made for the movement of people by means other than private automobile? Refer to internal design, site planning, parking provisions, location, etc."

The end result of the DRI process is a resolution passed by the host municipality, rendering a development order (DO) in response to an Application for Development Approval submitted for a project that has been determined to be a development of regional impact. The DO must be consistent with Chapter 380, F.S., Rule 9J-2 F.A.C., the local government comprehensive plan, the strategic regional policy plan, and the state comprehensive plan.
Fourteen types of projects may be DRIs if they exceed specific size thresholds. These development types include airports, hospitals, and hotels, as well as industrial, office, retail, residential, and multi-use developments. Thresholds for determining DRI status include building square footage, acreage, and parking requirements.

If a project is determined to have a transportation impact, then a separate traffic methodology meeting must be held. This allows the regional planning council, the Florida Department of Transportation, the Florida Department of Community Affairs (DCA), the local government, and the applicant to decide on a mutually acceptable methodology for identifying a project’s transportation impacts, thus saving time and simplifying the process.

Rule 9J-2.045(7)(a)1-5, Florida Administrative Code, lists the following measures that can be used to mitigate transportation impacts and which reasonably assure that public transportation facilities will be constructed and made available when needed to accommodate the impacts of the proposed development, consistent with Chapters 163 and 380, F.S.:

- scheduling of facility improvements
- alternative concurrency provisions
- proportionate share payments for roadway improvements based upon peak hour roadway trips generated.
- level of service monitoring with binding commitments for needed improvements
- a combination of the above mitigation measures, OR the provision for capital facilities for mass transit [e.g. buses for fixed route service, vehicles for vanpool or ride share programs]

Through the DRI process, RPCs in Florida have recommended to local governments a number of conditions as part of a DRI development order, that the developer:

- consult with the transit agency to determine the transit related needs to serve the project and coordinate with any plans to extend transit to the project;
- be financially responsible for any implementation of on-site amenities;
- establish a transportation systems management plan that includes use of bus transit as a means to reduce project-related p.m. peak hour automobile trips;
- coordinate with the city to promote transportation demand management strategies; and,
- when transit is already available to the site, build bus turnout bays and reasonably sized bus shelters along public roadways to serve the development, as required by the local government, or provide the transit agency with the funds to do it.

For approving a development order that requires developer exaction, the local government must comply with Paragraphs 380.06(15)(d), (e), and Subsection 380.06(16), Florida Statutes, which are similar to requirements for impact fees.

The Florida Statutes state that DRI developments must pay their proportionate share only if non-DRIs are required to pay also. The law further states that developers cannot be charged twice for the same impact. The key for a land developer to fund transit is to demonstrate that impacts would be mitigated by doing so. The existing DRI process instructs the developer to use professionally accepted methods for assessing level of service (LOS). The tools of analysis available for determining level of service are mode specific. Most commonly in use is the Highway Capacity Manual method for determining roadway level of service. Recommended development order conditions regarding bus transit generally assume that the local government or local transit provider will run a bus route past the development site, if they are not already doing so.
FDOT Procedures for Site Impact Analysis

Proposed developments that do not meet the size thresholds constituting a DRI do not require site impact review by FDOT.

The FDOT procedure for site impact analysis is a process that is specifically geared toward determining a new development’s roadway traffic impacts upon the State Highway System and the Florida Interstate Highway System. Most FDOT activities relating to site impact assessment originate from amendments to the future land use map (FLUM) of the comprehensive plan and amendments to the comprehensive plan due to a proposed development of regional impact (DRI).

The estimated traffic impact is the basis for determining the developer’s fair share cost in contributing to roadway improvements that are necessary to maintaining roadway level of service. Considerations about transit usually only arise in relation to the ability of alternative modes to serve some of the new trips generated by the development, lessening the impact to roadway level of service.

According to FDOT’s Standard Site Impact Procedures, there is a process composed of several steps, conducted in this order:

1. Methodology Development
2. Existing Conditions Analysis
3. Background Traffic
4. Trip Generation
5. Trip Distribution
6. Mode Split
7. Assignment
8. Future Conditions Analysis
9. Mitigation Analysis, if necessary
10. Site Access, Circulation and Parking
11. Review and Permitting

It is the applicant who proposes a methodology for reviewers’ concurrence for determining site impact. The study area, also called the area of influence, is typically estimated using professional judgment and then refined during the study process. The DCA rule for DRIs requires that the study area include all facilities where traffic generated by the proposed development is equivalent to 5 percent of the maximum service volume at the LOS standard for the facility.

The methodology for determining the developer’s fair share for funding of mitigation improvements is identified in the Methodology Development (Step 1) phase of the impact analysis. The fair share is determined in relationship to the number of trips generated by the development and the capacities on an affected roadway segment.

Step 2, the Existing Conditions Analysis, includes a review of existing transit service and transit ridership.

Step 4, Trip Generation, is a separate step conducted before the estimation of person trips. Trip generation characterizes person trips as motor vehicle movements and it is considered to be the most critical stage in the site impact analysis. The amount of travel that uses modes other than automobiles is estimated using regional and local guidelines based upon existing transit usage. As a result, 3 to 5 percent is considered a maximum realistic share of travel for modes other than automobiles.
Step 6, mode split, is the analysis portion that estimates the amount of travel in person trips that will use the various modes available to the site.

References to transit appear again in Step 9, the mitigation analysis, in which the measures proposed must clearly demonstrate that they contribute to reducing traffic congestion along facilities where LOS has been made unacceptable upon the addition of the new development. The mitigation analysis includes a plan that details system improvements necessary with the phasing of the project and identifies the responsible party for implementing the improvements. Improvements typically include some combination of physical or operational changes to the roadway facilities, transportation demand management strategies, and fair share contributions by the developer.

Under Mitigation Analysis, various examples of mitigation measures are listed, including construction of new facilities and addition of general-use lanes. Where the construction of new facilities are considered, enhancements for the use of transit, such as geometric and operational improvements to accommodate bus travel are encouraged. Other encouraged mitigation measures include enhancements for the use of transit, such as the construction of park and ride lots, the construction of bus shelters and turn-out bays. The measures also include high occupancy vehicle (HOV) treatments such as the construction of HOV access ramps and the implementation of HOV priority lanes. Public transit operational improvements are other available mitigation measures. These improvements include new or modified service routes and employer subsidized transit. This measure can be used if it can be demonstrated that the necessary agreements are in place with the local transit agency and that the strategy can be demonstrated to cause a mode split shift toward transit. Transportation demand management techniques, such as providing transit subsidies, are recognized as having potential to reduce site traffic. A monitoring plan is usually put in place to measure effectiveness.

The mitigation analysis demonstrates that the proposed improvements will result in an acceptable operating condition along the roadway. The calculation of the proportionate share contribution is based upon a formula, as provided in the Florida Administrative Code. The final fee and mitigation fee considered is typically negotiated among the applicant, local governments, regional planning councils and FDOT if state highway improvements are involved.

A Summary of Stipulated Conditions Relating to Bus Transit

All RPCs in Florida were contacted with the request to provide best examples of RPC recommendations for the provision of bus service. The list below is a synthesis of conditions that RPCs in Florida have recommended to local governments as part of a DRI development order. These include recommendations that the developer do the following.

- Consult with the transit agency to determine the transit related needs to serve the project and coordinate with any plans to extend transit to the project.
- Be financially responsible for any implementation of on-site amenities.
- Establish a transportation systems management plan that includes use of bus transit as a means to reduce project-related p.m. peak hour automobile trips.
- Coordinate with the city to promote transportation demand management strategies.
- When transit is already available to the site, build bus turnout bays and reasonably-sized bus shelters along public roadways to serve the development, as required by the local government, or provide the transit agency with the funds to do so.
- Subsidize a bus route to a new mall and provide bus drop-off at the front entrance.
- Provide a parcel within the development for a transit stop that can accommodate multiple buses at one time.
• In public gathering places, provide a place where transit information can be prominently displayed.
• Encourage tenants and owners within the employment centers to provide preferential parking for vanpools/carpools.
• Disseminate information to tenants and residents about local ridesharing programs.
• Some period of time after the issuance of the development order, propose transit-related actions, facilities, and sites to the municipality and transit agency.
• Consider paying the cost for an additional bus route to the DRI or increased frequency on existing routes during later phases of construction.
• Maximize access by interconnecting parcels within the development and providing road linkages to the local street system.
• Provide park and ride spaces proximate to a multi-bus transit stop, either in conjunction with commercial development or by purchase of property.
• Designate a part-time ride share coordinator to distribute transit information.
• Include transit-oriented design (TOD) features into the project design, as specified by a transit agency design manual, such as covered pedestrian walkways linking buildings to transit stops.
• Establish a transportation management association to implement trip reduction programs within the DRI.
• Provide sidewalk access between transit stops and nearby residential and commercial development.

The Development of Regional Impact (DRI) review process focuses upon identifying impacts to the existing roadway system. DRIs are often located on large tracts of undeveloped land to which transit service has not yet extended. Developers will seek less costly undeveloped land, on the suburban fringe, where there is usually little or no transit service but is attractive because of market accessibility by the existing road system. As the suburb-to-suburb home-to-work travel pattern expands with increasing suburbanization, some transit agencies are withdrawing poorly used bus service extensions from new developments to downtowns in favor of focusing on service enhancements to existing well-used bus routes serving neighborhoods closer to the urban core.

Under the current DRI review process, level of transportation service is measured in terms of roadway capacity. Alternative transportation, such as ridesharing and transit, are identified as part of Transportation Systems Management (TSM) strategies for the purpose of mitigating development impacts on roadways rather than as a mode of transportation with its own level of service (LOS) standards. This necessarily leads to a determination of improvements, to be accomplished by the developer, which are intended to restore roadway LOS rather than improving use of transit as a mobility solution to the new development.

For example, the DRI Application for Development Approval (ADA) emphasizes and provides detailed instructions on quantifying the impacts to roadways as part of Question 21—Transportation. At the end of Question 21, after parts A through H addressing quantifying roadway impacts have been addressed, there is the general question:

What provisions, including but not limited to sidewalks, bicycle paths, internal shuttles, ridesharing and public transit, will be made for the movement of people by means other than private automobile? Refer to internal design, site planning, parking provisions, location, etc.
Alternative modes are a procedural afterthought and it is implied that not much attention is expected by the developer to seriously consider other modes of transportation. All other modes, each having very different characteristics, are combined into one “other than automobile...” category for purposes of review. The Application for Development Approval provides further instructions:

The applicant must clearly document any estimate of mode split to transit or non-motorized transportation. The proposed usage should also be supported through an agreement with the transit agency and an acceptable internal roadway design... Change in mode split must be supported by the developer based on data collected on projects of similar intensity and use.

The burden of proof is placed upon the underdeveloped alternative mode, to demonstrate a shift in mode split. The new project is not likely to be permitted to set a precedent, if projects of similar intensity and use that demonstrate a higher transit mode share cannot be found.

Despite the limitations of the current Application for Development Approval, the DRI process has the potential to be an opportunity to guide DRIs in a positive direction toward State Comprehensive Plan goals for a truly balanced transportation system.

Developers must submit annual reports regarding the phased development of DRIs, which must identify modifications that are consistent with the plans and policies of the local host municipality, the Florida Department of Transportation, and the metropolitan planning organization. This places the responsibility upon these state and local agencies to have plans and policies that set the tone for improving transit. One way to accomplish this is for the provisions of Florida Administrative Code 9J-2.045 and the instructions for determining impacts as part of the ADA to be updated to include new methods for measuring multi-modal level of service. The F.A.C. guidance and ADA instructions should be updated as these methods are refined in the future by the Florida Department of Transportation.

Other hurdles in elevating the use of public transit improvements to address the transportation impacts of DRIs are:

- providing public bus transit improvements that can be demonstrated to specifically benefit the particular DRI contributing funds, and
- demonstrating that those particular transit improvements cause a mode shift to transit.

Transportation improvements, as provided by developers, must meet certain tests as provided by state law. These tests are similar to those provided for impact fees, regardless of whether a local government has adopted an impact fee ordinance or not. These tests are that [Chapters 380.06(15)(d) and (e) and 380.06(16), F.S.]:

- The transportation need that must be mitigated must be attributable to the proposed development paying for the mitigation.
- The amount of the contribution must correspond to the amount needed to mitigate the impacts from the development.
- The funds must go toward improvements to serve that development.
- Developers of DRIs cannot be required to contribute funds for mitigation unless the host local government has an ordinance in place requiring non-DRIs to mitigate their impacts.
- Developers of DRIs cannot be charged twice to mitigate for the same impacts, as in the case that a local host government charges impact fees.
These requirements pose special difficulties for developers to provide transit improvements as mitigation for the transportation impacts of a DRI. For example, if a high quality bus service, commensurate with highway level of service, is not in place, then it is not possible to reasonably estimate the need for transit service by a new development unless there is a way to measure latent demand for transit service. As a result, a very low number of bus trips is estimated. Consequently, a small amount of money or capital facilities is estimated to pay for bus mode share. Funds must be demonstrated to benefit the development. If there is an impact fee ordinance in place, then funds cannot go toward bus operations. This leaves capital facilities—bus shelters are the likely choice.

The *Transit Capacity and Quality of Service Manual* already assigns bus shelters as an amenity and not a necessary element of bus service availability. Bus shelters do not accomplish much if bus service is not available.

If funds can go toward operations, it is possible to quantify a cost of bus service to cover bus operations to serve those generated trips only; however, this still would not help if bus service does not yet extend out to the DRI. If effective bus transit service does not already exist in the area, then it is not possible to pay some incremental bus transit cost, commensurate with the number of new trips generated by a development, such that the new development benefits from the fees paid.

It is recommended that there to be some means to enable local governments to charge development for bus transit improvements that do not necessarily serve that development, but can be applied to bus routes that may be extended to serve the development in the future.

Whether the development is a DRI or not, the contribution should be consistent with the intent to provide transportation facilities concurrent with the impact of development and to maintain a transportation LOS, commensurate with the mobility demand generated by the development.

To reinforce the desired results of engaging land developers to pay for bus transit improvements as part of the DRI process, local governments should make full use of the planning and regulatory processes available to them to guide development toward locations where it is efficient to provide transit service.

These include:

- the long range transportation planning process and the transportation improvement plan of the MPO,
- the local government comprehensive planning process,
- urban development boundaries, and
- zoning and other tools within the land development code.

Additionally, local governments could provide disincentives for a development that is located outside the existing or planned service area of transit, while offering incentives that make it more desirable to build in areas within the existing and planned bus service area.
APPENDIX C: PINELLAS COUNTY LRTP TDM POLICIES

From the Pinellas County 2025 Long Range Transportation Plan Update. Metropolitan Planning Organization, Pinellas County, FL, October 2004.

Transportation Demand Management

1.7. Objective: Reduce traffic congestion and positively impact air quality by decreasing the use of the single occupant vehicle (SOV) at peak hours.

1.7.1. Policy: The MPO shall work with local governments, transportation demand management (TDM) agencies and FDOT to develop vehicle trip (VT) reduction and vehicle miles of travel (VMT) reduction goals.

1.7.2. Policy: The MPO shall assist and support the efforts of Bay Area Commuter Services (BACS) to implement and achieve the goals of its Long Range Transportation Demand Management Plan and to carry out recommended actions derived from related studies.

1.7.3. Policy: The MPO shall assist and encourage the efforts of local TDM agencies by providing technical and funding support for promotion of alternatives to SOV travel, including carpool, vanpool, transit, walking, bicycling, telecommuting and variable work schedules.

1.7.4. Policy: The MPO shall continue to participate in events and other activities sponsored by local transportation-related agencies that support and facilitate the use of alternatives to driving alone by commuters and other travelers (e.g., Commuter Choices Week, B-BOPP, Tampa Bay Commuter, etc.).

1.7.5. Policy: The MPO shall work with transportation agencies and local governments to encourage non-work trips to be made at times other than peak to assist in the reduction of traffic congestion during those periods.

1.7.6. Policy: The MPO shall work with transportation agencies and local governments to encourage those using non-work trips to use public transportation and/or other forms of ridesharing (i.e., carpool and vanpool) whenever possible.

1.7.7. Policy: The MPO shall encourage and participate in public-private partnerships and develop incentives to encourage employer, developer and other organizations’ participation in meeting the mobility needs of County residents, visitors and businesses.

1.7.8. Policy: The MPO shall work with transportation-related agencies and local governments to encourage, promote and support employer participation in qualified transportation fringe benefit allowed under the federal IRS Code to provide tax-deductible public transportation benefits to their employees.

1.7.9. Policy: The MPO shall work with local governments, TDM agencies, employers and developers to encourage and implement effective parking management strategies, including preferential parking for carpools and vanpools, shared use parking and variable parking pricing.

1.7.10. Policy: The MPO shall provide policy direction and implementation support to city and county traffic departments, TDM agencies, FDOT and state/local emergency and police departments to maintain the flow of people and goods during major reconstruction of highway facilities.
1.7.11. Policy: The MPO shall continue to work with the Pinellas County School Board, private schools and Bay Area Commuter Services to expand the school based carpool program and to encourage the use of non-motorized modes to reduce traffic congestion in and around schools and improve safety of our children.

1.7.12. Policy: The MPO shall encourage the development of a telecommunication infrastructure to provide universal service access to all citizens for expanding educational opportunities via distance learning, obtaining medical information via telemedicine, increasing commerce via the purchase of goods by online shopping, and creating job opportunities via telework. These elements will foster economic development by helping citizens and businesses move intellectual property, data and information electronically. This policy is intended to reduce or even eliminate the need to travel for these purposes.

1.7.13. Policy: The MPO shall encourage opportunities for advancement in telecommunications and other technologies and their impacts on travel behavior to identify other means for meeting some of the transportation needs of County residents and businesses.

1.7.14. Policy: The MPO shall encourage the business community to adopt telecommunication solutions such as web conferencing and telecommuting in order to substitute for some of their needs to travel by private vehicle and/or complement the transportation needs.
APPENDIX D: CITY OF SARASOTA TDM POLICIES

From the Sarasota City Plan Transportation Chapter. City of Sarasota, Florida. November 1998. Only the objectives and policies directly referring to transportation demand management have been reproduced below.

Objective 1 - Level-of-Service for Safe, Convenient and Efficient Transportation System
To continue to provide a safe, convenient and efficient transportation system with a level-of-service that sustains the City’s natural, aesthetic, social and economic resources.

1.4 Effect of Projected Deficiencies on Future Land Use: The City shall ensure that development which increases traffic on roads which are backlogged, constrained or projected to be at deficient levels of service by 2010 be required to provide:
   - either conventional mitigation measures; and/or
   - a Transportation Demand Management or Transportation Systems Management plan for approval by the City Engineer.

1.5 LOS Study for Below Standard Thoroughfares: The City, in cooperation with the Metropolitan Planning Organization’s Congestion Management Task Force, will study and recommend specific roadway improvements, TSM and TDM measures, to alleviate congestion on thoroughfares whose LOS is, or is projected to be, below adopted standard.

1.23 Use of Transportation Systems Management (TSM) and Transportation Demand Management (TDM) to Remedy LOS Deficiencies: The City will pursue TSM and TDM measures, as appropriate, to remedy existing and projected Level-of-Service (LOS) deficiencies.

Objective 2 - Alternative Modes of Transportation
The City shall continue to provide for alternative modes of transportation, in coordination with other units of local government and the private sector, including handicapped-accessible mass transit to all existing and proposed major trip generators.

2.2 Transportation Demand Management Mitigation (TDM) Credits: The City will consider developing, in the Land Development Regulations, a mitigation bonus schedule for transit-oriented development, mixed use development, home-occupation-related development, and other commitments included in requests for development that reduce single-occupant motor vehicle trips.

2.6 Alternatives To Fixed-Route Services: The City, in conjunction with the Metropolitan Planning Organization, will examine Transportation Demand Management alternatives to supplement or complement certain Sarasota County Area Transit services. These include vanpooling for long-distance commuters, demand-responsive para-transit services to bus route outer termini, station cars, and privatization of services.

Objective 5 - A Transportation System to Enhance and Preserve City Neighborhoods
The City will continue to develop a transportation system which helps preserve and enhance the City’s neighborhoods.

5.3 Transportation Demand Management Bonuses: The City should consider reducing parking requirements in the Land Development Regulations for development that:
Incorporating TDM into the Land Development Process

- commits to a trip reduction program through a Transportation Demand Management program approved by the City; and/or
- demonstrate that time-shared parking with other nearby land uses reduces the number of spaces required at any one time.

**Objective 8 - Transportation Concurrency Exception Area (TCEA)**
The City shall manage transportation concurrency within the City’s Community Redevelopment Area (CRA), as defined in Illustration T-12A, through the use of a Transportation Concurrency Exception Area (TCEA). The purpose of the TCEA is to encourage the development of compact, dense and mixed uses in the CRA by replacing standard concurrency requirements with TCEA regulations.

The transportation and mobility needs within the TCEA shall be met through the following Action Strategies as an alternative to the statutory concurrency requirements.

8.1 **Interim Standards:** The City will apply the following interim transitional standards to development within the TCEA until the Sarasota City Plan is amended to provide permanent standards for concurrency requirements within the TCEA. The cumulative impact of any new development shall not:

- exceed 15% of the AADT on the effective date of the plan for roads which are operating at LOS “E” or “F”;
- degrade LOS below “E” for roads operating at LOS “D.”

LOS shall be calculated for the directional, peak hour LOS on any roadway impacted by the project seeking concurrency. An “impacted roadway” is defined as any roadway where traffic volume from the proposed development exceeds 4 ½ % of that roadway’s maximum service capacity at LOS “D”. The calculations shall use the software and formulas derived from the latest edition of the Highway Capacity Manual, published by the Transportation Research Board:

- Transportation facilities needed to serve new development shall be in place or under actual construction no more than 5 years after issuance of a certificate of occupancy when the cost of such transportation facilities exceeds $400,000.00.
- Transportation facilities needed to serve new development shall be in place or under actual construction no more than 3 years after issuance of a certificate of occupancy when the cost of such transportation facilities is $400,000.00 or less.
- In lieu of traditional mitigation, (i.e. roadway improvements), developers may be allowed to mitigate up to 30% of new trips by using proven TDM programs with verifiable results. “Verifiable results” shall mean that it is possible to quantify the number of new trips which are eliminated by the use of TDM measures. The City shall have the discretion to determine the appropriate percentage of new trips to be mitigated in this manner up to the 30% maximum.
- Developers may be required to participate in a Transportation Management Organization (TMO) as a condition precedent to the issuance of a development permit; and,
- Developers shall prepare and submit traffic circulation plans including ingress and egress from and to adjacent roadways for automobiles, trucks and delivery vehicles, pedestrian, mass transit, and bicycles.
- Traffic circulation plans shall be reviewed and approved by the City Engineer.
- Development agreements which commit the developer to make specified transportation improvements may be required as a condition precedent to the issuance of a development permit. Development agreements may also require the developer to participate in TSM and TDM programs.

116  National Center for Transit Research / Center for Urban Transportation Research / University of South Florida
Incorporating TDM into the Land Development Process

- Non-de minimis developments will still be required to perform traffic studies to estimate their compliance with the LOS standards. If these studies estimate that a development traffic impact does not meet the new LOS standards, the City shall require enforceable development agreements which commit the developer to make certain improvements to meet those standards.

During this interim period, developments which cannot meet the above standards shall not be approved.

8.6 **Transportation Demand Management (TDM) Developer Requirements:** The City shall study the feasibility of amending the LDRs to require any development locating within the TCEA to implement and maintain a trip reduction program and/or to pay into a TDM trust fund if the impact of such development on any segment of roadway within the TCEA would exceed 4.5% of that roadway’s two-way service volume at LOS “D.”

8.7 **Transportation Management Organization:** In cooperation with the Sarasota Downtown Association and residents within the TCEA, the City shall pursue establishing a Transportation Management Organization (TMO) to make recommendations to the City Commission concerning Transportation Systems Management and Transportation Demand Management strategies. Such recommendations may include both implementation of new strategies and modification of existing strategies.
APPENDIX E: TRAFFIC IMPACT FEE REDUCTION INCENTIVES, CLARK COUNTY, WASHINGTON

(These incentives were never implemented and later repealed.)

APPENDIX F: COMPREHENSIVE TRANSPORTATION REVIEW METHODOLOGY, CITY OF ROCKVILLE, MARYLAND

- Comprehensive Transportation Review Methodology. City of Rockville, Maryland. This methodology is designed to evaluate the impacts of new development on the transportation system, to determine mitigation for alternative modes and to assign corresponding “trip” credits.

City of Rockville, Maryland

Contact: Katherine Kelly
Transportation Planner - Department of Public Works
240-314-8527
kkelly@rockvillemd.gov, www.rockvillemd.gov

The City of Rockville, Maryland is located in the Washington DC metropolitan area and is characterized by lower density suburban style development. Given the regional context, the City experiences a significant amount of through traffic on its major thoroughfares. The Transportation Plan describes the City as follows:

“The suburban nature of many areas in Rockville makes people dependent on the automobile. Residential neighborhoods are separated from commercial areas. Cul-de-sacs and dead end streets divide uses that are physically proximate. Some neighborhoods have no sidewalk or walkway system. There is competition between the automobile and pedestrians at intersections. All of these factors force many residents to disregard walking as a viable means of transportation.”

As a result, Rockville is moving away from mitigation measures related primarily to providing additional roadway capacity through physical improvements and is encouraging mitigation for alternative modes (e.g. ridesharing programs, shuttles to transit stations, installation of pedestrian and bicycle facilities, etc.). Rockville Applicants for developments may be obligated to contribute toward the improvement of offsite transportation and safety facilities to help address identified safety hazards for all modes. As stated in the City Transportation Plan,

“Providing safe, direct pedestrian routes between residential areas and activity centers can help reduce the number of day-to-day vehicle trips. These connections can be created or improved by installing sidewalks, adding paths to link cul-de-sacs and dead end streets, installing pedestrian signals and crosswalks, or by constructing pedestrian bridges over busy roadways. Treatments, such as lighting, landscaped buffer areas and other streetscape improvements, can heighten safety and make pedestrian facilities more attractive for users.”

The City enacted a Comprehensive Transportation Review (CTR) Methodology in September 2004 to evaluate the impacts of new development on the transportation system, to determine mitigation for alternative modes and to assign corresponding “trip” credits. Because they are deemed to have a measurable traffic impact under the methodology, developments that generate 30 or more total peak hour site trips must conduct an off-site analysis for all transportation modes (see Table F1). Smaller developments evaluate only on-site multimodal access and circulation needs.
The off-site analysis includes an assessment of major intersections that are impacted by the development as well as non-auto facilities that lead to the development. The goal of the off-site analysis is: “to ensure that the site can be accessed safely and efficiently through various modes and that adequate transportation facilities are in place to support the subject development without detriment to the overall transportation system.”

Below is a summary of components of the CTR:

- **Component A—Introduction and Existing Conditions:** Project description.
- **Component B—Site Access & Circulation:** Analysis of internal circulation, entrance configurations, vehicular access and other relevant access and on-site features; the Proposed Site Access and Circulation Transportation Statement; and the Proposed Conditions Site Plan.
- **Component C—Automobile Traffic Analysis (Off-Site):** Analysis of auto traffic using the technical guidelines for traffic analysis in the traffic study area.
- **Component D—Non-Auto Off-Site Analysis:** Analysis of access to the development from activity centers via alternative modes of transportation using the guidelines for creating an inventory of pedestrian, bicycle, and transit facilities in the non-auto study area and for analyzing intersection safety ratings for these modes of transportation.
- **Component E—Summary, Mitigation, and Credits:** Summary of the report findings and impacts; recommended mitigation plans.

</tbody>
</table>

* Peak hour site trips are calculated using the trip generation rates referenced in Section IIIC5.
* Note: Not all types of development applications are subject to CTR standards. Refer to Table 1 to determine types of development applications that must comply with CTR standards.

Non-Auto On-Site Analysis
The non-auto on-site analysis must address availability of sidewalks and bicycle facilities on the site frontage and in some cases through the site. Bicycle facilities are those identified in the Bicycle Master Plan. Transit facilities are based on projected daily ridership (existing ridership data plus additional ridership projected from the new development).

Non-Auto Off-Site Analysis
The non-auto off-site analysis must address access to the development from activity centers via alternative modes of transportation. Activity centers are defined as “areas with destinations such as schools, shopping, recreational facilities, and other points of attraction.” Under the guidelines, developers must conduct an inventory of pedestrian, bicycle, and transit facilities in the non-auto study area along routes to activity centers within a certain radii of the site, and evaluate intersection safety ratings for these modes of transportation.

Activity center routes to evaluate are determined in coordination with City staff based on “land uses surrounding the access route, volume of activity, and priority of the City to attract persons to the activity center(s).” The extent of the non-auto study area is based on trip generation and a radii based on City analysis of walk sheds to non-auto facilities and national studies of how far individuals will travel to use non-auto facilities (Table F2). The City also designated transit oriented areas (TOAs) where “viable non-auto options exist within 7/10ths of a mile accessible walking distance” from
Incorporating TDM into the Land Development Process

Existing and programmed transit stations and major access routes to transit facilities. TOAs provide for lower LOS thresholds than non-TOAs given the viability of multi-modal options.

### Table F2: Non-Auto Study Areas

<table>
<thead>
<tr>
<th>New Minimum Activity Center Routes Evaluated</th>
<th>30-350</th>
<th>351-500</th>
<th>500+</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accessibility to Activity Centers</td>
<td>.25 mile radius</td>
<td>.35 mile radius</td>
<td>.35 mile radius</td>
</tr>
<tr>
<td>TOA Designation</td>
<td>TOA</td>
<td>Non-TOA</td>
<td>TOA</td>
</tr>
</tbody>
</table>

Note: The radii of a study area can be expanded up to .5 mile for developments in TOAs when considering installation of transit facilities. For example, if installation of bus facilities is planned within a TOA, the radii of the study area can be as large as .5 mile for all developments regardless of peak hour site trips generated.

Selected sidewalks and bicycle facilities within the non-auto study area must be evaluated for connectivity from the site to activity centers. The City of Rockville’s *Synthesis of Pedestrian Policies Manual* is used to guide improvements to pedestrian facilities. Determinations of deficiency for bicycle facilities are based on bicycle level of service (BLOS) standards established by the City based on the “levels of comfort” that riders feel on designated facilities. BLOS is calculated based on volume of directional traffic, speed limit, lane width, pavement surface, percentage of heavy vehicles, and other roadway and sidewalk characteristics and conditions.

The City’s goal for the bikeway network is to maintain a Bicycle LOS (BLOS) of “C.” This is accomplished primarily by providing facilities that connect and are accessible. Routes are determined by staff, based on the City’s Bicycle Master Plan [see City of Rockville Bikeway Master Plan Update as adopted April 2004 at http://www.rockvillemd.gov/masterplan/bikeway/index.html]. All bicycle facilities in the City’s Bikeway Master Plan that lie within the non-auto study area, including shared roadways, signed-shared roadways, bike lanes, shared-use paths, or widened sidewalks, must be identified in the inventory.

The transit inventory along activity center routes must include the location of bus routes, frequency of service, hours of operation, existing daily ridership levels, and bus stops and amenities (concrete pad, bench, bus shelter and connectivity to the sidewalk network) at existing and programmed bus stops. The transit inventory must also include lighting features (overhead streetlights) at transit stops and nearby parking areas, as well as availability (posting) of schedules or real-time transit information.

Another interesting feature of the methodology is the requirement for each applicant to conduct an intersection safety analysis for all modes. The intersections to be rated for safety are determined in the scoping meeting, when the non-auto study area is being identified. Each intersection is evaluated and given a rating that ranges from poor to excellent, based on a table of safety rating indicators. Applicants must also determine if intersection crossing times are adequate based on City standards. For example, if the flashing walk time is less than the length of the lanes divided by four (4), then crossing time is deemed inadequate.

**Summary of Development Application Issues and Impacts**

Upon completion of the required multimodal analysis, applicants must summarize all issues and impacts related to site access and circulation, automobile traffic, non-auto facilities and intersection safety. All impacts must be noted in a chart listing impacts on the left and intended mitigating actions on the right.
Mitigation
Trip credits for mitigation are applied against new peak hour site trips before any other trip credits or reductions (apart from pass-by reduction) are applied for the development application. No additional credit will be applied if modal split is used in traffic analyses. Mitigation plans must be approved by the Traffic & Transportation Division and may consist of:

- Implementation of, or monetary contribution towards, proximate physical roadway modifications that increase auto capacity sufficiently to bring LOS to acceptable levels;
- Implementation of, or monetary contribution towards, physical non-auto improvements that appropriately address project-specific impacts through an alternative means, and
- Participation in the City’s TDM Program or alternative TDM program.

Table F3 summarizes types of mitigation an applicant can consider and maximum credits.

<table>
<thead>
<tr>
<th>Mitigation</th>
<th>Maximum Credits Allowed</th>
</tr>
</thead>
<tbody>
<tr>
<td>Off-site mitigations to roadway network that a developer offers to implement. Goal is to lessen the impact from trips generated by the development.</td>
<td>Variable credit, depending on improvement</td>
</tr>
<tr>
<td>Off-site mitigations to non-auto facilities that a developer offers to implement. Implementation of a Transportation Demand Management program.</td>
<td>15% of trips 10% of trips</td>
</tr>
</tbody>
</table>

* Note: On-site mitigations (per minimum standards) for access, circulation, pedestrian, bicycle and transit facilities are required and therefore are not eligible for mitigation credits.

The maximum total amount of trip reductions and credits per development application are outlined in Table F4. These are 30% of new peak hour site trips generated in a TOA and 20% of new peak hour site trips generated in a non-TOA, after pass-by trip reduction is applied and before any other trip reduction or credit is applied. Trips are credited against the total trip generation for the site and not at specific intersections and credits differ within and outside of the TOA. However, mitigation will be targeted toward intersections that are impacted by the new development. Drive-through facilities are not eligible for modal split reductions, mixed use reductions, or trip credits but may be eligible for other trip reductions.

<table>
<thead>
<tr>
<th>Type of Trip Reduction or Credit</th>

<td>15% TOA  10% Non-TOA</td>
</tr>
<tr>
<td>Combined trip reductions and credits ceiling</td>
<td>30% TOA  20% Non-TOA</td>
</tr>
</tbody>
</table>

Applicants are encouraged to mitigate transportation impacts by providing non-auto improvements and modifications to the transportation system. Applicants may receive trip credits only for non-auto improvements approved by the Traffic & Transportation Division that are beyond minimum requirements or that are not already required on site. Trip credits are applied as mitigation according to the rates outlined in Table F5 and may include a combination of facilities, given that certain facilities and programs are more effective in reducing trips than others. Mitigation involving transit facilities must be done in coordination with the Department of Public Works and the regional transit agency, taking into account the effects such facilities may have on operational costs and transit planning.

¹ “Per facility” refers to the number of credits granted per installation of one facility of the indicated type. Credits are applied above and beyond minimum N/A requirements for adequate public facilities or what is otherwise required on-site.

² When a sidewalk or bike facilities installed is not an exact multiple of 130’ long, remaining fractions will be prorated.

³ Facilities must link to existing or programmed portions of the bicycle network in the Bicycle Master Plan. Total width, length and location will be determined by the Traffic & Transportation Division at time of development approval, based on development type and size.

⁴ Bicycle lanes that require street lane widening will be credited the same amount as shared bicycle/pedestrian paths.

⁵ This facility must decrease the distance pedestrians must travel to cross a street.

⁶ Other than those required in the non-auto study area. Concrete pads must be installed before a bench or shelter is installed. Locations based on ridership numbers and by determination of the Traffic & Transportation Division.

⁷ Bus pull-offs are not desirable along roads classified as arterial due to speed and volume of traffic. Installation of pull-offs will be determined by the Traffic & Transportation Division in coordination with Montgomery County Department of Public Works & Transportation.

⁸ Subsidization of a bus stop, portion of a bus route, or extension of service where service is scheduled to be eliminated by Montgomery County Department of Public Works & Transportation due to low ridership or other factors.

⁹ A facility that is a dedicated space for transit information with a public waiting area. Commercial lobbies do not qualify. Must include no less than 1 seat for a transit resource person and no less than 5 seats in the public waiting area. Must be within .7 mile (3696 feet) of at least two bus stops and/or Metro stations.

¹⁰ A facility with transit information and a resource person but no public waiting area.

¹¹ A facility that includes maps and schedules (when possible) of transit services.

The City also has a transportation demand management (TDM) program and TDM policy, which aim to reduce single-occupancy auto (SOV) trips and implement demand management throughout the City. In a TOA, a maximum of 15% trip credit may be applied for a developer’s implementation of a TDM program (see CTR Appendix L for qualifying activities) and participation in the City’s TDM program. Development in non-TOAs may be eligible for a maximum of 10% TDM trip credit. TDM trip credit is summarized in Table F6.
The City received a Transportation Community Services Program grant (TCSP) from the Federal Highway Administration to assess accessibility to the Town Center. The planning effort will evaluate the accessibility of the Town Center from all portions of Rockville, for existing conditions, the next five years, and through the Master Plan buildout of the area. The analysis will identify strengths and weaknesses in pedestrian, bicycle, transit, automobile, and truck access to the Town Center. Upon completion of the baseline analysis, the project will prioritize implementation of improvements using a Geographic Information Systems (GIS) model and a series of public participation and coordination activities. The findings will be fed into the master planning process.

The methodology was developed as a precursor to adoption of a new adequate public facilities ordinance, which is expected in 2005. Staff indicated that the program is so new, there has not been experience with it. The trip credit amounts were developed based on a review of what other communities are doing (e.g. Orlando, Portland, Montgomery County), as well as based on observations and experiences with multimodal development and mode split in the past. Staff plan to initiate a project this year to monitor outcomes through surveys and other methods so they can determine how well the program is working and the appropriateness of the trip credits.

Although the program offers credits for participating in the City’s TDM program, staff note that “it’s tough to create a standard credit value for TDM because the developments are all so different and in different areas of the City.” Therefore, the credits are highly subjective and determined on a case by case basis based on the feasibility of the potential trip reduction in the given context.

Issues faced in program development include the need for proactive coordination with the County and adjacent jurisdictions. One issue that arose was how best to achieve a continuous multimodal network where an abutting jurisdiction does not have similar requirements. The challenge of developing a coherent multimodal network on a site-by-site basis was another issue that arose. Staff indicated that there is some benefit to both a facility based as well as a policy based approach. The facility based approach is straightforward in that credits can be readily provided for developments that contribute toward development of the facility. The policy based approach, which is administered site-by-site, can then address the more micro issues of site network layout and continuity with adjacent sites.
Integrating Demand Management Into the Transportation Planning Process

**Introduction**

Travel demand management (TDM) has been included in many transportation plans over the past three decades to address key policy objectives, including energy conservation, environmental protection, and congestion reduction. For the purpose of this article, TDM is synonymous and used interchangeably with the terms “transportation demand management” or simply “demand management,” and is defined as a set of strategies aimed at maximizing traveler choices.

Many recent transportation plans appropriately place TDM very high in policy level discussions. TDM is seen as a vital part of an approach to plan, design, and operate “smarter,” “more efficient” transportation systems in a region. For example, the Washington State DOT’s plan for fighting congestion, “Moving Washington,” includes managing demand as one of three equal pillars of their approach, along with strategic road capacity expansion and operational efficiency improvements.¹

In addition to policy objectives, TDM strategies are usually listed within the set of projects that are found toward the end of most transportation plans. However, in many transportation plans, these projects often concentrate on traditional commuter ridesharing concepts, such as the funding of ridesharing programs, vanpool subsidies, or telecommuting assistance, which primarily strive to reduce long-term trips to address air quality goals.

Often, TDM is lost between high-level policy statements at the beginning of the planning process and specific projects that conclude most plans. TDM is not viewed as a vital day-to-day operational philosophy on how to manage and operate transportation systems to address a wide variety of issues such as mobility, accessibility, land use, and livability.

Although these traditional TDM strategies are still vital and serve large sections of the population, new approaches to manage travel demand have emerged in recent years with the advent of technology (and, more important, connectivity) in the transportation arena. Personal technology and communication advances show promise in making personal travel decisions more dynamic and fluid. In parallel, transportation systems management is progressing toward a more “active” management of the system, recognizing the day-to-day need to influence traveler decisions early in the trip-making process.

Together, these developments create new opportunities for demand management. Currently, our day-to-day efforts to manage and operate the transportation system are all about managing demand, since we usually cannot increase capacity or influence land use in the short term. One example is advanced real-time traveler information, provided via variable message signs or on-board devices. This is fundamentally a demand management strategy to help travelers learn of bottlenecks, slowdowns, and incidents in order to avoid them by traveling a different route or at a different time. Acknowledging that most of what we do to operate our transportation system today is managing demand goes a long way toward understanding the need to better integrate TDM into the transportation planning process. Likewise, TDM is sometimes overlooked as a solution strategy because of skepticism over actual impacts, and difficulties with measuring results.

**New Conceptualization of Travel Demand Management**

To address this gap in current transportation planning practices and the growing role of demand management, FHWA has developed a desk reference titled *Integrating Demand Management into the Transportation Planning Process*. This ar-
Managing demand is about providing travelers, regardless of whether they drive alone, with travel choices, such as work location, route, time of travel and mode. In the broadest sense, demand management is defined as providing travelers with effective choices to improve travel reliability.2

Figure 1 illustrates this view of contemporary TDM strategies by using a trip-chain graphic. At the heart of the conceptual framework is the need to understand the difference between TDM and traffic management. The figure shows the need to integrate TDM and traffic management into a larger framework of travel choices and congestion reduction techniques. These choices begin with consideration of overall travel demand and work their way through traffic demand and network demand. The set of strategies shown on the right side of the figure are not exhaustive and are meant to show the type of strategies that focus on traffic management and/or TDM. However, the key to the conceptual framework is to show differences between types of demands and how offering choices can influence these demands.

FHWA Guidance—An Overview

The intended users of this desk reference are transportation planning professionals who are seeking information on the role of TDM in meeting the specific needs of the planning process. The desk reference is fundamentally organized around two aspects of transportation planning: policy objectives and scope of the planning effort. The reference discusses how TDM relates to seven key policy objectives that are often included in transportation plans, such as congestion and air quality. It then

discusses how TDM might be integrated into four levels of transportation planning from the state down to the local level. The reference also includes information on tools available for evaluating TDM measures and on the known effectiveness of these measures. Figure 2 (from the desk reference) provides a cross-walk of the major sections in the document.

The desk reference presents a definition of TDM that is broader than traditional commuter ridesharing to encompass many travel choices, including mode, location, route, and time of day. As such, this concept of TDM includes many strategies that are not always thought of as TDM, such as road pricing, traveler information, and measures aimed at improving the operational efficiency of existing facilities. In essence, the desk reference presents TDM as an operational philosophy that seeks to balance demand reduction strategies with smart capacity enhancements as part of a more holistic approach to urban transportation.

Figure 2 provides a matrix that shows, in very general terms, how TDM “fits” into the seven policy objectives and four planning levels. In some cases, the fit is better, such as with land use, which is most effectively dealt with at the local level where local police powers allow for zoning and development approval. Other issues, such as air quality, are better handled at a higher level, such as the metropolitan or state levels. Overall, this figure is provided to show, at a glance, the range of policy objectives and planning levels described in the Desk Reference.

Travel Demand Management and Policy Objectives

The reference elaborates on the role of TDM in addressing seven key policy objectives: mobility/accessibility, congestion, air quality, economic development, land use/transportation integration, goods movement, and livability (expanding transportation choices to enhance community quality of life). By including objectives related to economic vitality, the environment, and livability, these policy
areas also encompass the basic components of sustainable transportation. The reference discusses the general relationship to TDM, offers specific TDM strategies to address each objective, provides case examples, and gives advice on how to integrate TDM into the planning process. For example, the guidance provides advice on how to integrate TDM into efforts to address mobility. An agency can take the following steps to advance TDM for regional mobility and accessibility:

- Incorporate the strategies and related objectives of TDM into the general planning factors in the transportation planning process;
- Ensure that the congestion management process incorporates those TDM strategies that enhance regional mobility and accessibility so that they work in concert with other strategies to maximize the efficiency potential for the transportation system;
- Incorporate the TDM strategies for regional mobility and accessibility as potential solutions in major investment studies to help address the factors influencing project solutions while efficiently and effectively meeting the needs of the community; and
- Ensure that TDM strategies are part of the public involvement dialogue to gain the broad support of the community.

**Travel Demand Management at Four Planning Levels**

Although it is critical to understand the role of TDM at a policy level, understanding how TDM fits into the agency’s planning processes is the primary focus of the desk reference, as it directly drives funding, implementation, and desirable outcomes for regions. Consistent with emerging guidance in planning for operations, the reference identifies guidance at four planning levels:

- Statewide planning—System planning, policy direction, statewide TDM programs. This primarily falls under the purview of the state DOT.
- Metropolitan planning—Long-range regional transportation plans, congestion management process activities undertaken by metropolitan-level planning organizations.
- Corridor planning—Major investment studies, congestion management process as part of specific corridors.
- Local planning—Land use planning activities conducted by city planning organizations, including TDM planning by developers for new developments.

In each case, the guidance is based both on experience to date (with examples and illustrations) and on how TDM integration might be improved to make it more effective in addressing key policy needs during the planning process. The specific types of transportation plans to which TDM has or can be integrated are enumerated for each level. Key takeaways are provided for each level to provide sound planning tips. For example, metropolitan planning organizations can advance TDM initiatives as a comprehensive part of addressing urban mobility challenges by:

- Coordinating local, regional, and state planning for TDM activities;
- Incorporating TDM goals and objectives in long-range plans;
- Seeking a role for TDM as an integral strategy in congestion management plans;
- Embracing TDM as a short-term operations and long-term sustainability strategy;
- Building awareness and motivation among member jurisdictions that have not pursued TDM;
- Encouraging communities that support TDM to take specific action;
- Challenging communities that have taken TDM action to ratchet up their efforts by providing model ordinances, regulations, and local planning guidelines;
- Setting aside funding for TDM initiatives;
- Better coordinating in-house planning efforts with in-house TDM operations (where applicable); and
- Developing TDM-specific performance measures to evaluate project-specific and systemwide performance.

Another key feature of the desk reference is a focus on appropriate performance measures to link TDM to specific plan goals at each planning level. Linking performance measures to planning objectives is consistent with other FHWA guidance on planning for operations using an objectives-driven, performance-based planning process.

For example, at the corridor level, it can be challenging to measure performance of TDM in a corridor setting. Unfortunately, many performance measures used for highway operations and congestion are not the same measures used to gauge TDM program performance. This can create a dilemma as planners and operators of the highway system seek to understand the impact of TDM on a particular highway. Indicators linked to congestion in a given corridor include:

- Travel time reliability;
- Delay (including vehicle hours of travel); and
- Level of Service.

Performance indicators more appropriate to TDM include:

- Vehicle trip reduction;
- Vehicle-miles traveled (VMT) reduction;
- Person-miles traveled (VMT) reduction;
- Person throughput (high-occupancy vehicle use);
- Mode shift; and
- Transit service reliability.

The measure that comes closest to linking the two disciplines is person throughput. Knowing vehicle occupancy, including transit, can help planners understand the efficiency of the facility in moving travelers, not vehicles. Some TDM measures, such as VMT reduction, can be converted to congestion measures such as delay by using some simplifying assumptions about volume and speed relationships.

**Travel Demand Management Effectiveness**

The guidance also provides an overview of the tools and techniques available to evaluate TDM during the planning process. This includes the ability to forecast the estimated impacts of various TDM strategies as well as the need to establish performance-based planning objectives. Finally, it discusses the ability to perform benefit/cost analysis on TDM, and gives an overview of the known effectiveness.
of various TDM strategies in terms of fulfilling key performance objectives (e.g., VMT reduction, mode shift, congestion relief, emissions reduction). Acknowledging that our understanding of TDM effectiveness is still evolving, the centerpiece of this chapter is a matrix conveying the relative effectiveness of various TDM strategies to address the previously mentioned seven policy objectives.

The desk reference includes examples, case studies, and best practices to support the information in each section. It also includes extensive references to other resources that deal with specific aspects of planning and TDM.

Use Of The Guidance
The desk reference, as well as other recent guidance on TDM, traffic management, and the transportation planning process, will encourage transportation planners to take a more measured and thoughtful approach to integrating TDM into the planning process. This will expand choices and elevate demand management to address transportation and related issues. The desk reference will allow for a better understanding of where, how, and when to include TDM in the planning process and provide more concise descriptions of its benefits.

Acknowledgments
The authors wish to acknowledge the contribution of several others who worked on the development of the FHWA Desk Reference: Beverly Kuhn and Casey Dusza of the Texas Transportation Institute, and Don Vary and David Friedenfeld of Wilbur Smith and Associates. In addition, we would like to thank all the federal reviewers and the participants in the review workshops in Chicago, Richmond, Salt Lake, Dallas, and Orlando.

INTRODUCTION

The Michigan Sense of Place Council, representing numerous state agencies under the direction of Governor Snyder, has partnered with Smart Growth America to provide technical advisory services to six communities of Michigan pursuing livable communities initiatives. Assistance was offered in two primary areas – community mobility management and strategic transportation demand management (TDM). The effort in the SEMCOG region focuses particularly upon TDM as a mitigation strategy during major capital construction.

TDM is a suite of strategies that reduces congestion by spreading out peak travel to different times of day and different modes other than driving alone. TDM programs can be administered at many levels – from a regional agency, municipality or individual employers – and works by providing a variety of competitive travel choices and incentives to change behavior.

The SEMCOG project has progressed in four stages:

1) assessment of existing TDM programs, local resources, and major project status and phasing,
2) discussion of alternative approaches and strategies,
3) development of strategic implementation plan,
4) proposed performance measurement and tracking framework.

This memo outlines that fourth and final component. It identifies a number of recommended measures meaningful to the transportation demand management strategy as well as a recommended process for data collection.
PERFORMANCE MEASUREMENT PROCESS

For TDM strategies to have long term value, information on the impact and performance of the package of strategies is necessary. This not only provides valuable information in making adjustments to management strategies, but also provides the business case for continued application in future projects and regionally.

Performance Measurement Framework

Identifying the right performance measures is often the most difficult stage of the performance measurement process. Numerous performance measures would be important to document the success of TDM programs, however only a handful of measures can be realistically and effectively collected on an ongoing basis. The performance measurement framework outlined in Figure 1 below provides an overview of criteria used to develop the performance measures:

Figure 1  Performance Measurement Framework

<table>
<thead>
<tr>
<th>Performance Measurement Criteria</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Consistent</td>
<td>Comparable data should be collected year after year. This means data needs to be collected and reported the same way each time on the same geography.</td>
</tr>
<tr>
<td>Readily available</td>
<td>Data should be drawn from existing data sets wherever possible.</td>
</tr>
<tr>
<td>Useful</td>
<td>Data collected should meaningfully inform how the suggested TDM strategies are performing and what adjustments are prudent to make.</td>
</tr>
<tr>
<td>Timely</td>
<td>Data should be collected on a regular basis – for example, quarterly during construction and annually thereafter – and reported within 6 weeks of data collection.</td>
</tr>
<tr>
<td>Reported</td>
<td>Data and findings must be recorded and transmitted to project owners and partners to inform additional actions.</td>
</tr>
</tbody>
</table>
Performance Measurement Matrix

TDM strategies focused on in the implementation plan are designed to mitigate the impacts of specific construction projects. Although it will be important to track the impact of these strategies during the construction projects, there is also an opportunity to measure the lasting effects of the proposed TDM strategies. Therefore, two types of performance measures are included in the matrix below:

- **Construction Measures** track the impact of the strategy during a specific construction project
- **Ongoing Measures** track the impact of the strategy over time at a regional level

Figure 2 below provides a matrix of identified construction and ongoing performance measures, the data source and data source contact, frequency of data collection, the baseline condition, and a target to assess the performance of each measure against the baseline. Where relevant, examples of other communities utilizing these or similar metrics are provided as reference. The measures outlined in Figure 2 require data that is readily available today. Figure 3 provides a matrix of performance measures that can be tracked if strategies outlined in Phase III are implemented.

USER GUIDE

This section presents a practical “User Guide” to collect base information and follow up data to assess the impact of the TDM programs and strategies in the region. This Guide provides a brief description of the performance measure (both during construction and on an ongoing basis), the baseline condition in order to assess progress, the data associated with each measure, the required resources to collect that data, and the appropriate time frame to collect the data.

<td>Date Scored</td>
</tr>
</tbody>
</table>

How to Collect:

Bike counts along parallel routes during construction should be required to be tracked. Contact Tony Kratofil, Metro Region Engineer at MDOT, to identify the specific project manager for the construction project. The project manager will administer the bike counts on designated routes on a monthly basis.

Bicycle data can be quickly and relatively affordably collected via automated count technologies. Several non-motorized count technologies are available. Many can either be mobile devices (moved between construction locations) or permanent installations (for ongoing counts).

For a summary of automated bicycle and pedestrian count technologies and equipment providers please see the National Bicycle and Pedestrian Documentation Project Automatic Count Technology Memo (June 2009) available at bikepeddocumentation.org/index.php/download_file/-/view/22
**TDM Strategies: Business Support**

<table>

**How to Collect:**

Although MDOT does not currently have high occupancy vehicle (HOV) lanes, MDOT could install them as part of construction projects. MDOT would need to install sensors in the HOV lanes to track the number of cars traveling in the HOV lane. Data from the sensors would be available on a daily basis. Contact Tony Kratofil, Metro Region Engineer at MDOT, to identify the specific project manager for the construction project. The project manager will administer the HOV sensors on designated routes and track HOV use on a monthly basis during construction.
### TDM Strategies: Increase usage and availability of Park-and-Ride; Park-and-Pools

<table>

</tr>
<tr>
<td><strong>Frequency:</strong> Monthly</td>
</tr>
<tr>
<td><strong>Construction Score</strong></td>
</tr>
<tr>
<td><strong>Date Scored</strong></td>
</tr>
</tbody>
</table>

**How to Collect:**
Vanpool ridership numbers are available upon request. New riders are tracked as they submit paperwork to ride. Each van submits a daily ridership form that is reported to the National Transit Database which is submitted monthly online. A monthly report can be easily produced upon request. This monthly report will also need to be acquired at the beginning of the construction project to document the baseline condition along the corridor.
## TDM Strategies: Congestion Management

<table>
<thead>
<tr>
<th>TDM Measure(s): Travel time</th>

| **Frequency:** Monthly | **Frequency:** Annually |
| **Construction Score** | **Ongoing Score** |
| **Date Scored** | **Date Scored** |

**How to Collect:**
SEMCOG tracks travel time on an annual basis. SEMCOG’s travel time index is defined on this website:

http://www.semcog.org/uploadedFiles/Programs_and_Projects/Transportation/Congestion/CngDefThreshold.pdf

Baseline conditions for freeways are documented here:
http://www.semcog.org/uploadedFiles/Programs_and_Projects/Transportation/Congestion/PerformanceFwy.pdf

Baseline conditions for arterials are documented here:
http://www.semcog.org/uploadedFiles/Programs_and_Projects/Transportation/Congestion/PerformanceArterial.pdf

The Travel Time Index is typically tracked on an annual basis. During construction, the annual count would be used as a baseline and the construction project manager would monitor travel time on a monthly basis.
<table>

</tbody>
</table>

**How to Collect:**

For the construction measure, the number of people who sign up to receive updates on the marketing website will be a good measure of people’s awareness of the construction project. On an ongoing basis once the regional marketing campaign is established, a biannual travel and awareness survey should be administered to gauge people’s awareness of the regional campaign. Metro Portland conducts a similar survey. A copy of the survey can be found in Appendix A of this summary report:

Bicycle Transportation Alliance. 2009 – 2012 Annual Reports.

The “affected construction area” is determined as half the distance between the construction route and the prescribed detour route.

Email from Jay Gardiner, SMART, October 18, 2013.

The “affected construction area” is determined as half the distance between the construction route and the prescribed detour route.

To confirm the target, SEMCOG should determine the number of website hits that MiDrive and MiCommute currently receive. Diane Cross at MDOT (CrossD2@michigan.gov) and Robert Morosi at MDOT (MorosiR@michigan.gov) are the contacts for this information.

TriMet. The Open Trip Planner. Metro 2009-2011 Regional Travel Options Grant. August 31, 2011.

The “affected construction area” is determined as half the distance between the construction route and the prescribed detour route.

The “affected construction area” is determined as half the distance between the construction route and the prescribed detour route.

1. Residential Projects - TDM Measures. Knowledge of TDM Requirements
   and Their Implementation ...................................................... 8
ABSTRACT

Over the last decade, local jurisdictions and transportation agencies have increasingly used transportation demand management (TDM) programs to manage traffic impacts of new office/industrial and retail developments. More recently, however, King County and the cities of Kirkland, Redmond, and Seattle, Washington, have introduced TDM programs for residential developments or "origin" sites. The objectives of the evaluation discussed in this paper were (1) to document the implementation of home-end TDM strategies and (2) to evaluate their effectiveness in mitigating the number of vehicle trips generated by residential development.

Since few projects had been built and occupied by the time the evaluation concluded, quantitative evaluation was limited, and the success or failure of residential TDM programs could not be determined. However, it was possible to gain an understanding of the nature and reasons for the implementation problems encountered through qualitative means. These included interviews with jurisdictional staff, developers and managers and a focus group among residents. The analysis pointed out problems related to (1) the decision process leading to the imposition of mitigation requirements, (2) the institutional memory of requirements, (3) monitoring, (4) enforcement of compliance, and 5) the adequacy of mitigation measures. The paper concludes with recommendations to mitigate these implementation problems.
CHAPTER 1.0
INTRODUCTION

Over the last decade, local jurisdictions and transportation agencies have increasingly used transportation demand management (TDM) strategies as a means of managing the traffic impacts of new office/industrial and retail developments. TDM programs are developed for a specific development project to mitigate the transportation impacts associated with it by discouraging single-occupant vehicle (SOV) trips and encouraging travel by high-occupancy vehicle (HOV). They serve the site-specific needs of tenants and are designed to reduce SOV trips and parking demand at a development site. (King County Draft Administrative Guidelines for Application of TSM under SEPA, April 18, 1990)

In the past, these efforts to discourage SOV commutes and encourage HOV modes of transportation have almost exclusively been focused on "destination sites" — office buildings, industrial/office parks, and office/retail developments. Since 1987, however, King County and the cities of Kirkland, Redmond, and Seattle, Washington, (Figure 1) have introduced the concept to residential developments, or "origin" sites, in an attempt to mitigate the transportation impacts of these developments through promotion of HOV use among residents.

Before the onset of this study, no data on residential projects using TDM strategies had been collected, nor had an evaluation been conducted of the TDM programs and the various mitigation measures attempted. An objective assessment of these programs seemed appropriate. Thus, the original objectives of this project were to (1) document the implementation of "home-end" TDM programs and (2) evaluate their effectiveness in managing the transportation impacts of residential developments on freeways and adjacent arterials. These objectives were meant to identify the effect of home-end TDM programs on HOV use by residents and to identify specific effective actions.
Figure 1. Seattle, Washington Vicinity Map
The researchers intended to combine a number of different methodologies, including surveys of project residents, surveys of ridematch and vanpool applicants, interviews with project developers and managers, and comparisons of vehicle counts between TDM program sites and control sites.

However, in the early stages of the project it became clear that the scope envisioned was not appropriate for the available data. Only a limited number of developments with TDM requirements had been built and occupied by the time the study began, despite the fact that jurisdictions started to require TDM measures at residential developments in 1987. An even smaller number had actually implemented any TDM measures. Surveying residents of projects with TDM programs or conducting formal interviews with developers or managers following a prepared outline also proved very difficult.

Thus, this paper does not determine the success or failure of TDM programs on residential developments, although the researchers gathered as much information relating to the original goals of the study as possible, i.e. the documentation of home-end TDM programs and their evaluation. Rather, the scope of the project was extended to gain an understanding of the nature of the problems encountered in implementing these programs and to develop approaches to minimize these problems. Where possible, new approaches to addressing these problems that have been used in other parts of the country were studied, although none of them has been formally evaluated to date. Conversations with both developers and staff of the involved jurisdictions, as well as a review of available literature, showed that a range of factors not directly related to TDM measures nevertheless affects their effectiveness. These include site design and zoning and land use policies. The paper concludes with recommendations to mitigate TDM implementation problems at residential developments and deal with other problems.
CHAPTER 2.0

PROJECTS IN KING COUNTY, KIRKLAND, REDMOND, AND SEATTLE WITH TRAFFIC MITIGATION MEASURES

2.1 Location and status of TDM projects

The researchers established a list of developments with TDM requirements from files maintained by the Municipality of Metropolitan Seattle (Metro), the region's transit operator. As part of the State Environmental Policy Act (SEPA) process, each jurisdiction informs Metro about major projects with a potentially high impact on transportation. Because, with the exception of the city of Seattle, jurisdictions have generally required developers to negotiate any TDM measures with Metro, its files were relatively comprehensive. An attempt to verify Metro's files was unsuccessful because none of the jurisdictions kept readily accessible files on residential projects with TDM requirements.

In all, 57 residential projects with TDM requirements were identified and analyzed for this paper. Of these, 47 were located in unincorporated King County, three in the city of Kirkland, two in the city of Redmond, and five in the city of Seattle. Thus, almost all projects, as was the focus of the study, were in a suburban environment. According to the research conducted at the outset of this study, none of the other jurisdictions in the region had started to require TDM measures from residential developments. Ten of the projects, all located in unincorporated King County, were single family lot developments; therefore, a comparative analysis of TDM programs implemented for single-family projects versus multi-family projects could not be carried out because of the small sample size of single-family projects. For twelve projects, the information obtained was too limited or outdated, and the developers/managers for these projects could not be contacted. Nine of these projects were within the jurisdiction of King County, and three within the city of Seattle. Two projects, both in unincorporated King County, had been withdrawn and would not be built, and 25 were either still in the approval process, not started, or partially built. Only 18 had been built and occupied by May 1990 (Figure 2).
2.2 Types of home-end TDM requirements

Twelve different measures encouraging mode shift have been imposed on residential developments in the Puget Sound region. They can be grouped into four types, including

- the provision of physical structures that encourage mode shift,
- the distribution of transit and rideshare information,
- the collection of information on commute behavior, and
- transit subsidies.

No more than eight measures were required from any single development. Twenty projects had unspecified TDM program requirements, except for sidewalk improvement requirements.

(For a list of requirements on specific projects, see Table 1.)

2.2.1 Structural requirements

Structural requirements relate to the physical aspects of the development. They include a fully connected set of sidewalks on the project and along the street adjacent to the project, bus pads and shelters, and secure bike storage. While sidewalks by themselves do not guarantee a shift in mode choice, convenient and aesthetically pleasing pedestrian access to transit and car- and vanpools can encourage the use of these modes of transportation. They were required in 14 (25 percent) cases, all of them located in King County. For five (9 percent, n=57) of these projects this was the only requirement.

Easy and fast access to transit is a major factor in mode choice; thus the provision of a bus pad and/or shelter on project property can strongly influence the decision to use the bus. In King County four (7 percent) of the developments were required to provide bus pads and/or bus shelters.

LEGEND

Project: Units = Number of units; Type = type of development (sf = single family, mf = multiple family); Built = Indicates that project has been built

Amenities: Wal = sidewalk, Pad = pad, Shel = bus shelter, Bik = bicycle storage

Transit/RideShare (Distribution of Information): Info = information distribution; CIC = commuter information center; TC = transportation coordinator; Pro = promotion

Data: (Collection of Information on Commuter Behavior) Sur = survey residents; Rep = report

Subsidies: Bus = bus pass; Shu = shuttle

Developer: Cont = Contacted by investigators; Kno = developer knows about requirements; Imp = developer has implemented requirements
While the bicycle is still considered by many to be a means of exercise rather than a means of transportation, an increasing number of Americans commute by bike. The provision of secure bike storage at the residential end makes the use of the bike easier and thus can make this mode of transportation more attractive. Six (11 percent) of the projects were required to provide bike storage facilities. Four were located in King County, and one each in Kirkland and Redmond.

2.2.2 Distribution of transit and rideshare information

The distribution of information about transit and ridesharing options is the most frequent requirement imposed on residential developments. In addition, some developments were obligated to install a commuter information center (CIC), to provide a transportation coordinator (TC), and/or to promote transit and ridesharing options on a regular basis.

The distribution of information on transit and ridesharing options was required in 23 (41 percent) cases, 19 in King County, three in Kirkland, and one in Redmond. This requirement was usually fulfilled with a Metro information package to be received by every new resident of a project, although no procedure was specified.

A commuter information center (CIC) was requested in seven (13 percent) cases, six in King County, and one in Kirkland. CICs were to be established in the clubhouses, the central point of multi-family developments, at a prominent location. They provided current information on transit schedules and ridesharing options and reminded residents of the existence of these services.

To assist residents in finding car- and vanpools, to provide personalized transit information, and to give out bus passes, 17 (30 percent) projects were required to provide a transportation coordinator. Sixteen cases were in King County, one in Kirkland. How much time this person was required to spend on transportation issues was not specified.

Periodic promotion of transit and ridesharing options was required in four (7 percent) cases in King County. No time frame or procedure was specified.
2.23 Collection of information on the commute behavior of residents

To improve existing transit and rideshare services, updated information on the commute behavior and needs of residents is essential. Seven (13 percent) projects were asked to survey their residents or tenants upon request, five (9 percent) to write a report on a regular basis. All projects were located in King County.

2.24 Transit subsidy or provision

To facilitate transit use, some developments were required to provide free monthly bus passes to new or first-time residents. One project was required to provide peak-hour shuttle services to the closest park and ride lot.

The provision of free one-month bus passes, or in one case in King County a 50 percent subsidy, was required in 24 (43 percent) cases. All four developments in the city of Seattle were required to give free bus passes to first-time or new residents over a period of three months. Fifteen developments in King County, as well as all projects in Kirkland (three) and Redmond (two), were required to provide free one-month passes.

One project was to provide peak-hour shuttle services to the nearest park and ride lot. Originally, two projects, both large multi-family projects, had this requirement, but it was implemented only at the one in Kirkland. Unincorporated King County did not follow through on the enforcement of implementation for the second one.
CHAPTER 3.0

KNOWLEDGE OF AND COMPLIANCE WITH TDM REQUIREMENTS

3.1 Knowledge of the requirements

The developers or managers of 12 (27 percent) of the 45 projects for which contact could be made acknowledged awareness of at least one TDM requirement. Out of 21 projects where more than one requirement was imposed, developers of eight of them were aware of the requirements. However, two companies owned six of the projects. In all, only six companies in the area paid serious attention to the requirements. The two companies with more than one project with TDM requirements were among the biggest developers in the region and had a political and economic stake in successful relations with the jurisdiction. They were willing to comply with requirements they considered minor to preclude negative public opinion and higher mitigation costs. All four developers contacted who had both a sidewalk requirement and a generic "TDM program" requirement knew only about the sidewalk. Three projects reviewed had the single obligation to provide a free bus pass to first-time residents. Managers or developers of these projects were aware of the requirement. It is possible that in some cases developers claimed no knowledge of TDM requirements to cover their unwillingness to comply with them. In cases where the researchers suspected this, they could not establish whether the requirements were just considered minor and thus ignored until the developer was questioned about their implementation, or whether the TDM concept itself was not considered worthwhile. None of the 20 developers of projects with unspecified TDM program requirements was aware of any requirements.

3.2 Compliance with the requirements

While the existence of TDM requirements on projects could be determined with Metro lists, no sources other than the developers themselves were available to establish compliance for all but two of the projects. Thus, compliance had to be determined by interviews with developers.
compliance for all but two of the projects. Thus, compliance had to be determined by interviews with developers.

Of the 12 projects for which developers acknowledged the requirement(s), only nine (75 percent) had been built and occupied by May 1990. Of these nine, the requirements of eight (89 percent) had been implemented at least in part. As stated above, four of them had only a single requirement, three to provide monthly bus passes, one to provide sidewalks. Four other developments, each with a different set of requirements, belonged to the two previously mentioned major development companies. At the time this study was conducted, two of them were just starting to implement the measures because the developments had been occupied only recently. One developer acknowledged the requirements in an interview and stated that they were minor both in terms of costs and personnel, even though five different measures were required. However, he had not implemented them.
CHAPTER 4.0

PERCEPTIONS OF THE REQUIREMENTS

4.1 Perceptions of Developers and Managers

A list of questions for developers and managers (see Appendix A for interview guides) was prepared and used to guide informal interviews with developers and managers. No attempt was made to obtain statistically reliable data from this population. Thus, the information presented below is qualitative rather than quantitative and cannot be considered representative of all residential projects. It ranges from general data about the projects and their target clientele to more specific information on TDM program requirements.

New multi-family developments in the region for which this information had been gained were geared toward the middle or upper-middle class income range. None of the projects contained low income housing. Background checks on prospective tenants of a sample of these developments, conducted at most new projects, showed average incomes between $36,000 and $43,000 per apartment. The turnover rates ranged between 5 and 10 percent per month, or around 75 percent per year, and were considered normal by the management. With the exception of the few projects within the city of Seattle where the parking ratios were around 1.2 per apartment, the parking ratios on the suburban projects ranged from 1.6 to 2 spaces per apartment.

In general, the representatives of the development community were not very interested in the TDM requirements on their projects. They did not consider them important and, for the most part, seemed either not to be aware of them or to ignore them. In many cases, the developers had no concept of the requirements and their rationale were not particularly cooperative. The only exceptions were two of the major companies in the area, and developments in the city of Seattle, where all contacted developers complied with their requirements. Transportation issues such as access to transit or proximity of park and ride...
lots were not decision criteria in siting projects. Those who were aware of the requirements for their projects tended to be skeptical about the actual success of these programs.

None of the developers considered the requirements to provide information, a commuter information center, a bus pass, or a transportation coordinator a problem. While no developer had kept track of the actual costs for these requirements, both financial and personnel costs were considered minor or negligible in comparison to the overall costs of the project. This was true both for projects where these TDM measures were implemented, with estimated costs in most cases below $1000, as well as for projects whose developers were asked to estimate the potential costs of the above requirements for their projects. (A one-zone pass cost $26, and the distribution of information and passes was easily incorporated into the work of the project manager.) The only exception was the shuttle at the Park at Forbes Creek, where the ridership did not justify the expense. According to the developer, operating costs were about $3,000 per month, and the resale value of the project would have decreased by $400,000 if this expense had continued.

However, much more concern was expressed about the high costs of physical requirements such as sidewalks and bus pads, which can run up to several tens of thousands of dollars. In one case, the requirement for a sidewalk along the project was at first overlooked by the developer but later enforced by the county. The company refrained from going to court only because of plans for a second project in the neighborhood of the first one. None of the developers who acknowledged the existence of requirements had any problems understanding or implementing them.

With one exception, all representatives of developers who actually contacted Metro to negotiate and/or implement its requirements were pleased with the support Metro staff had given them. Metro response was considered timely and adequate.
4.2 Perceptions of residents and tenants

The material presented below was obtained through previously unpublished surveys conducted by Metro of residents of Ballinger Commons (Metro, 1989a) and The Park at Forbes Creek (Metro, 1989b), two projects with TDM requirements, a focus group meeting, and comments from managers and developers. The limited number of cases did not warrant distinguishing the projects by external factors such as the level of transit service available or density around the projects.

Interviews with managers of multi-family developments revealed that the interest of residents in transit and car- and vanpool options was small. If residents asked for transit information at all, which they rarely did, questions about directions and distance to the closest park and ride lot prevailed. To the knowledge of the developers and managers, there were no tenants who did not own a car and were thus dependent on transit. As the manager of one of the projects put it: "People who move here expect to use their cars."

The experience with the shuttle service at The Park at Forbes Creek confirmed this attitude. Here, the developer was required to provide free peak-hour shuttle services to the closest park and ride lot. While The Park had close to 500 units and an occupancy rate of 95 percent, only five residents rode the shuttle on a regular basis. The shuttle service was discontinued after nine months.

According to the manager, only 5 percent of Park residents took advantage of the substitute offer, a free one-month, two-zone bus pass. For five other projects with a bus pass requirement, a similar response rate was reported. While no figures on the actual number of requested bus passes could be obtained, the managers of these projects estimated that between 5 and 10 percent of the residents had asked for the passes. In most cases, the tenant was informed about the offer personally or through an information package upon moving in. The only exception to this was Remington, a single-family project, where about 40 percent of the residents had requested a bus pass (Hendriksen, 1990). In that case, however, the offer was made at the project's well attended first Home Owners Association meeting, after the
transportation management requirements had been introduced. Residents just checked their name on a list. At Ballinger Commons, the one project where this information was available, survey results indicated that the bus passes were used an average of nineteen times during that month.

One other requirement on large multi-family projects was the provision of a commuter information center (CIC). According to the Ballinger Commons survey, despite the fact that 65 percent of the respondents knew about the existence of the CIC, only 11 percent had ever looked at it (n=190). At The Park, 55 percent (n=76) of the respondents had considered it very likely or somewhat likely that they would commute by bus, carpool, or vanpool if a CIC were available. However, despite the fact that The Park provided a CIC and had gone to great effort to inform residents about the shuttle and other transit and ridesharing options, only 23 percent of the respondents actually had used one of these modes of transportation. The manager had even used the closed-circuit TV system of the project for promotion without, according to him, any success.

Participants of the focus group meeting at the single-family development stated that they would be more likely to take notice of transit or rideshare options if the information were provided in a regular newsletter, e.g., the monthly publication from the Home Owners Association. They suggested that the transportation coordinator on the project be responsible for listing project residents who were interested in carpooling or vanpooling in the newsletter, include information from the ridesharing agency in the area, as well as transit information and updates.

Residents were asked about the likelihood that they would change their mode of transportation if someone at the residence would help them plan their commute. At The Park, where the shuttle service was provided, 38 percent of the respondents answered that they were very likely or somewhat likely to change their commute behavior. At Ballinger Commons, 24 percent considered it very or somewhat likely. Interestingly, both projects had
a TC requirement, and at both sites a representative of the management served in that position at the time the survey was conducted.

Several projects were required to provide secure bicycle storage facilities. When asked whether they would change their commute if bicycle facilities (bike paths, storage for bikes, free loaner bikes to ride to a nearby park and ride lot) were provided, 38 percent of the respondents at The Park considered it very likely or somewhat likely. At Ballinger Commons, 7 percent considered it very likely or somewhat likely.

For reasons stated above, very little can be said about the effectiveness of different TDM measures on residential projects. It seems clear, however, that most residents are not interested in using HOV modes of transportation at projects without low-income housing. It is also not apparent to what extent people's stated willingness to change behavior will match their actual behavior over time. However, the survey results from The Park indicate that actual behavior changes may be much smaller than the stated willingness to make those changes.
CHAPTER 5.0

IMPLEMENTATION PROBLEMS WITH EXISTING RESIDENTIAL TDM PROGRAMS

Since the original intent of the research could not be carried out because of the small number of developments with TDM programs, the researchers tried to identify reasons for this failure. In the process of research for this project, a number of problem areas were uncovered related to

- the decision process that leads to TDM program requirements for residential projects,
- institutional memory about the requirements,
- monitoring,
- enforcement of compliance, and
- adequacy of the measures.

The following is a description of these problems.

5.1 Decision process leading to the imposition of requirements

All projects listed in this study were assigned requirements under a case-by-case negotiation process as part of the State Environmental Policy Act (SEPA) review. Interviews with staff showed that as of May 1990 none of the jurisdictions had established administrative guidelines or an ordinance imposing TDM requirements on residential developments, although efforts were under way to establish ordinances in all four jurisdictions. No performance goals had been established by any of the jurisdictions, neither for the overall effect of TDM strategies on residential projects nor for specific projects or classes of projects. King County, Kirkland, and Redmond usually required the developers of projects to contact Metro to negotiate the set of TDM measures appropriate for that project and/or to fulfill the requirements. However, procedures varied among jurisdictions.
Kirkland used a "rule of thumb" to decide on requirements for particular projects and had not established a coherent set of criteria or a consistent process. In Redmond, a project generally had TDM requirements if it contained more than 100 units. If it was close to a bus line, it was required to provide a bus pad and shelter as well as pedestrian access to that shelter. Further requirements were the distribution of information on transit and ridesharing options and a free one-month bus pass over a varying period of time. However, the process was not well established and staff were not operating on a decisive set of criteria.

Unincorporated King County had tried to establish a process for assigning requirements to residential developments. In general, when a project was large enough to be required to conduct a traffic impact study under SEPA, a special review process to include transportation demand management was triggered. The county then tried to ensure that Metro received a copy of the study. In turn, Metro was supposed to put together a set of requirements to recommend to the county. Because of a lack of an established procedure, this process collapsed. From then on, Metro was usually notified as part of the regular SEPA procedure for the project. Metro would work out a set of requirements in negotiation with the developer and send it to King County's Building and Land Development division to be included in further permit review and approval.

In the city of Seattle, residential projects with 20 or more parking spaces had TDM requirements. The Department of Engineering looked at the permit application for each project and could require further information. If deemed necessary, it might ask the Department of Construction and Land Use to request a traffic impact study. After review of all available information, the Department of Engineering would, in close cooperation with Metro, propose requirements such as bus passes or CICs, but the Department of Construction and Land Use (DCLU) was responsible for imposing the requirements. DCLU was not required to follow the Department of Engineering's suggestions. This process was followed for all types of projects within the jurisdiction of the city of Seattle under SEPA, including non-residential land uses.
These processes allowed for a great amount of flexibility and thus enabled the planning staffs in each jurisdiction to set requirements for a project according to the unique situation of a site. This flexibility can be advantageous when new TDM measures are tested; however, it can also create a set of problems, as described below.

During the initial review, insufficiently trained staff may be unable to recognize the significance of a project because of inexperience with TDM programs on that type of project. They may use their discretion and decide that the project does not need mitigation, while it actually has unrecognized or underestimated impacts that justify TDM requirements. While such requirements can still be imposed at a later stage, that is not likely to happen.

If there is no established process, implementation of TDM program measures is open to irregularities and unintended equity problems. As can be seen in Figure 3, there was no relation between the size of the project and the type or number of requirements imposed on that project, despite the fact that Metro, a single agency, established the requirements for the majority of developments in suburban areas. There were no clear thresholds for any given mitigation measure. (Figure 3)

A further problem lay in the need to use SEPA procedures. First of all, only projects considered for SEPA review were considered for TDM requirements. Second, if a project had a large enough impact to justify transportation mitigation measures, they could be implemented in two ways: (1) if the project was considered insignificant under SEPA for all other issues, it had to receive a determination of insignificance that included the mitigation for transportation impacts; or (2) if a project was expected to have a significant impact under SEPA, an Environmental Impact Study would be required and transportation mitigation measures would result from that process. When this paper was written, no process had been established to ensure that mitigation would occur.
An additional problem was posed by the fact that the use of SEPA tended to curtail regional mitigation. While one project by itself may not have a significant traffic impact, it can create problems if it is combined with other projects nearby. SW Campus Drive in Federal Way is a case in point. Campus Drive was a major development area in which several of the projects analyzed in this paper were located. In at least three cases, TDM measures were required for developments with more than one building phase, but only one of the phases had TDM requirements. One single-family development had five divisions totaling over 300 houses, but only one of its divisions, with about 60 houses, had TDM requirements. On at least one project, of about the same size as its neighbors, no requirements were imposed. SEPA theoretically requires consideration of cumulative impacts, but administratively, it is very difficult to impose mitigation measures based on cumulative impacts. This difficulty was apparent in cases in which no procedure had been established, such as in the residential projects analyzed here.
In the Puget Sound region, the decision process using the case-by-case approach has proved to be too flexible. To ensure predictability and continuity, an ordinance must be developed that structures the requirements for residential developments and/or sets clear performance goals for the TDM program on the residential project. However, the development of an ordinance requires a certain amount of commitment by the jurisdictions to TDM requirements on residential projects. They need to decide what they want to achieve with the policy, relate it to their overall transportation goals, and determine how much staff and money they are willing to commit to the effort.

5.2 Institutional memory of the requirements

According to officials, none of the jurisdictions that had residential developments with TDM requirements had a compliance tracking system when this paper was written. Thus, information on requirements for developments could and did get lost. Even for the city of Seattle, which had a process to determine the significance of applications, information proved to be incomplete. A representative of the county conceded that under the present system, information on transportation mitigation requirements could get lost when the application went through the subsequent stages. Thus, Metro could have projects on file that were supposed to implement TDM measures, but the county might not have received notice of any requirements on the same project.

As described above, only a small percentage of the developers contacted claimed awareness of the requirements on their projects. While some lack of knowledge can be explained by the lack of a jurisdictional tracking system and active enforcement, there were other reasons for this phenomenon. At the developer's office, the person who guided a project through the permit application process was not necessarily the person who would be responsible for it when the time came to implement the requirements. This could be true even within the same company. Interviews with developers showed, in at least three cases, that the agent responsible for a project changed during the course of this investigation. Even
though the first respondent had been aware of the requirements imposed on the project or was in the process of negotiating them, the next person did not know about them. In another case, the respondent said that he had just taken over the project, had found reference to the mitigation requirements only by chance, and was starting to negotiate them.

Further complicating the transfer of information is the fact that, commonly, development companies hand a project over to a management company once it is occupied. While the agent in the developer's office may be aware of the requirements, on-site management may not be informed. In at least one case the researchers observed that information on requirements was lost in the transferral process. One developer mentioned that a 1986 change in tax law complicated the process of information transmission. The law made it more profitable for developers to sell their projects shortly after they were finished and occupied and thus increased the percentage of projects that were sold shortly after completion.

Institutional memory is an important factor in ensuring compliance with TDM requirements. The analysis of existing projects and requirements showed that both the staff at the jurisdictions and the developers, managers, and owners of residential projects often did not know about the requirements of the project, or in the case of the developer or manager, claimed not to know about them.

To ensure that the information does not get lost both at the jurisdiction's and the developer's offices, the TDM ordinance should have clearly defined objectives and requirements. It is important to tie the requirements explicitly to the land, independent of ownership or control of the project.

5.3 Monitoring compliance

A monitoring mechanism is needed to ensure compliance with the mitigation measures and to determine whether the developer has made a "good faith" effort to implement the mitigation measures within a reasonable time frame and at an acceptable level
of quality. Furthermore, monitoring is particularly important for a new set of rules and requirements (such as transportation mitigation measures for residential developments) to enable the jurisdictions, Metro, and developers to examine the usefulness of the measures or sets of measures and to modify them accordingly.

When this paper was written, monitoring for compliance with mitigation measures in the Puget Sound region was very limited. This lack of attention could explain in part why so few developers responded that they knew about the measures. None of the jurisdictions had established a process of monitoring compliance, nor was any of them monitoring projects with TDM requirements on an informal basis. However, there were a few exceptions.

In the case of The Park at Forbes Creek, the developer had completed the negotiation process with Metro and had complied with all requirements, including the shuttle. The project had been monitored by Metro. Without Metro's interest in the shuttle and its ridership problems, and without the developer's desire to make the project work, Metro would not normally have monitored it so closely. According to the developer, one staff member of the city of Kirkland, where the project was located, made "a few informal phone calls." None of the other four projects with requirements belonging to that company had been closely monitored.

Apart from that, monitoring occurred only when mitigation measures required physical structures such as sidewalks or bus pads and shelters, or, as in the city of Seattle, CICs. In one case in the city of Seattle, compliance with a CIC requirement was monitored when the Certificate of Occupancy was issued, but there was no follow up.

None of the jurisdictions in the Puget Sound area effectively monitored the projects, except when physical structure such as sidewalks were required. Thus, neither the effectiveness of the existing mitigation measures nor compliance with the TDM requirements could be established.
5.4 Enforcement of compliance

Enforcement of mitigation measures should not be necessary if the developer makes an earnest effort to comply with them and make them work. However, jurisdictions need to establish a legal basis for enforcement so that violations can be pursued.

Since none of the jurisdictions had effectively monitored compliance with TDM requirements on residential developments or established any performance goals, it is not surprising that none of the jurisdictions in the Puget Sound area had established penalties for noncompliance when this analysis was conducted. Again, the only exceptions seemed physical structures such as sidewalks and the shuttle at The Park at Forbes Creek. The shuttle at The Park was the only requirement for which performance goals been established on any of the projects.

However, to set performance goals for the traffic mitigation measures on a residential development, the jurisdiction must first decide what it wants to achieve with its residential TDM programs; that is, it must establish its role in achieving its overall transportation goals. It then must determine how close to achieving these goals it can come, given its financial, personnel, and political situation, and adjust them accordingly. Only if a realistic and feasible balance between the goals of the mitigation measures and the administrative capacity is achieved can transportation mitigation requirements be monitored and enforced effectively and the credibility of the program be ensured.

5.5 Adequacy of TDM requirements

Even if the developer makes a good faith effort to implement the requirements imposed on the project, they will not necessarily result in a significant or recognizable change in commuting habits. The experience with the free shuttle service at The Park at Forbes Creek, where the developer made every effort to make it work, is a case in point. Obviously, it was not the appropriate measure, given the location of The Park and the demographic composition of its residents. Other examples include projects located on Campus Drive South West in Federal Way. Campus Drive South West is a new development
area with about 3,000 new apartments and houses. When the research for this paper was conducted, it did not have walking access to a bus line, only driving access to a park and ride lot three miles away. However, three of the projects with TDM requirements had a bus pass requirement.

Other factors, such as the proximity and convenience of transit service; the destination and length of commute trips; transportation and parking management at the work site; size, design, and lay-out factors at both the residential site and work site; as well as land use and zoning decisions, are important determinants that can potentially overwhelm all incentives resulting from the mitigation measures. These factors are addressed below.
CHAPTER 6.0
DIFFERENT APPROACHES FOR TDM PROGRAMS
AND THEIR IMPLICATIONS

In recent years, a small number of communities in other parts of the country has established traffic mitigation ordinances that include measures for residential developments. While none of them has been formally evaluated yet, their consideration may assist in solving the problems identified for the home-end TDM programs in the Puget Sound region.

6.1 Decision process leading to the imposition of the requirements

The problems arising from a case-by-case approach, as described above, indicate that, despite its flexibility, it is not the appropriate method. The decision between predictability and equity, combined with better administrative feasibility on the one hand and effective requirements tailored to the individual project on the other, should be made clear and carefully considered on a political level. Below, two very different existing approaches are described.

The first approach is the development of an ordinance with minimum size thresholds for increasing sets of requirements for residential projects.

North Brunswick, New Jersey's, traffic management ordinance is a good example of such an ordinance. For developments of 20 or more units, the developer must conduct a commuter survey to determine, among other factors, work place location and work schedule characteristics. For developments with 50 to 200 units, a 15-car vanpool park and pool lot is required. A 200 to 350 unit project must provide 30 park and pool spaces. A development with 350 or more units must construct park and ride facilities at the ratio of one parking space per ten units. (Kish, 1990; KPMG Peat Marwick, 1989)

Montgomery County, Maryland, on the other hand, allows the developer to choose among a set of options. The developer can decide either to finance the expansion of roads or
to reduce commute trips on an already existing project to mitigate the impact of the new development. In the latter case, the county authorizes the developer to devise the program, but the plan has to be approved by the county. (Hekimian, 1990; KPMG Peat Marwick, 1989) This approach allows development of a set of TDM measures tailored to the individual project and the transportation problems and options of its surroundings.

While this investigation was conducted, unincorporated King County and Seattle were in the process of drafting ordinances that included transportation mitigation measures on residential developments. Unincorporated King County, Kirkland, and Redmond were involved in drafting a TDM ordinance for the Eastside Transportation Program (ETP), which is trying to coordinate transportation planning for a larger area in eastern Puget Sound. The ETP includes parts of King County on the eastern shore of Lake Washington, as well as Kirkland, Redmond, Bellevue, Bothell, and Issaquah (see Figure 1 for map). In its residential section, the proposed ordinance required every developer of one or more units to disseminate public transportation information to new tenants or home buyers, in addition to free ride coupons. Furthermore, it required a financial contribution to park and ride lots or HOV facilities. Developments with 10 or more units were required to present a site plan facilitating public transportation needs and access to transit and ridesharing facilities. Each residential development over 50 units was required to conduct a biannual survey of its residents and to comply with all other requirements. By increasing the responsibilities of the developer with increasing project scale, it was a fair and equitable approach, since it applied to virtually every developer and not only to those above a certain size. (ETP, 1990)

Thus, all jurisdictions involved had recognized the need for clearly defined, consistent and predictable TDM requirements and were working towards that end when this paper was written.

6.2 Institutional memory of the requirements

As discussed above, one of the major problems with the existing approach is related to the lack of the jurisdictions' and developers' knowledge about the TDM requirements. If no process ensures that both know about the requirements imposed on the project, it is very easy for the developer (or later, the manager) to lose track of or ignore the requirements. Since measures are usually implemented only after the project has been occupied, when the original developer may already have sold the project or handed it over to a management company, they should be tied to the land. In addition, an effective monitoring process should ensure tracking.

One way to make sure that both the administrative staff of the jurisdiction and the developer are aware of the requirements is to establish an ordinance with a clear set of requirements dependent on the size of the development. Once in place, the requirements will become common knowledge, and developers with more than one project cannot claim ignorance.

Alexandria, Virginia, goes one step further by requiring (partial) compliance with the requirements before giving out a transportation management special use permit. The ordinance specifies that the permit runs with the land and is mandatory and binding not only to the applicant or owner, but to all their successors, heirs, or other occupants of the project. *(KPMG Peat Marwick, 1989)*

6.3 Monitoring compliance

While effective monitoring is an essential part of any program requiring transportation mitigation measures, it must not exceed the staff or financial capacity of the responsible administration. Thus, the requirements should be easy to monitor, or, if possible, be to some extent self-monitoring.

Montgomery County, Maryland, uses a combination of a self-monitoring and developer-paid audit process before county staff conduct their own review. The developer is required to submit a monthly report on the success of the mitigation program. To ensure that
the information provided by these reports is correct, the developer pays a fee, which the county uses to pay an independent auditor. The auditor monitors the project at regular intervals and provides the county with an assessment. Instead of monitoring the implementation of the program on site, which would involve considerable effort, Montgomery County staff simply review both documents. (Hekimian, 1989, 1990)

Alexandria, Virginia, requires the presentation of a transportation demand management strategy before a special use permit is issued. Furthermore, it requires that an annual per unit fee of $60 be paid into a citywide fund. The TC on the project uses this money for transit subsidies. If the money is not spent, it can be reprogrammed if the city approves the new use. Otherwise, the city can use the money to promote transit. Thus, city staff are involved in the monitoring process only if necessary. It is in the developer's interest to run the program to get a full return on his investment. (Grossman, 1990; KPMG Peat Marwick, 1989)

6.4 Enforcement of compliance

Apart from a feasible monitoring process, a functional enforcement process is necessary. As stated earlier, insufficient monitoring of the implementation of transportation mitigation requirements makes enforcement of the provisions of the agreement difficult or impossible. In addition, penalties for noncompliance, such as withdrawing use and occupancy permits, levying fines, or injunctions through court, while existent on paper, may be difficult to impose because of time and expense. However, even if the jurisdiction has trouble enforcing compliance with requirements on existing projects, a functioning monitoring process is useful if it establishes the permit process for future developments. Once the developer knows that future projects may run into trouble, compliance with requirements on existing projects should become normal procedure. The case of the project with the sidewalk requirement, mentioned above, illustrates that effect.
Failure to make a good faith effort to comply with requirements on residential developments can result in fines in Concord and Contra Costa, California; and North Brunswick, New Jersey. (KPMG Peat Marwick, 1989) However, when this paper was written, none of these jurisdictions had fined a developer. In Alexandria, Virginia, failure to comply with requirements may result in revocation of the transportation management special use permit, although this also had not yet happened. (Grossman, 1990)

Montgomery County, Maryland, has a unique method of enforcing requirements on developments. Developers are required to reach their performance goals before they receive a building or occupancy permit. The permit can be withheld until the performance goal has been reached. After occupancy, a performance bond is used to maintain the performance of the program if the developers' own efforts prove inadequate. (Hekimian, 1989,1990)

6.5 Adequacy of the requirements

Transportation mitigation measures are useful only if they are appropriate for the project. To ensure this, experience from similar projects should be considered. Montgomery County, Maryland, involves the developer in drafting requirements and is thus able to tailor the requirements to each project. While the developer is allowed to choose the mitigation measures to reduce traffic impacts, the jurisdiction sets strict traffic reduction goals.

Information on commute behavior and attitudes is essential to make mitigation measures as efficient as possible. Residents should be surveyed at regular intervals. North Brunswick, New Jersey, requires that each new tenant or condominium owner fill out a work place/commuter survey. This is used for carpool and vanpool coordination and to determine where a shuttle service might be feasible. (Kish, 1990)

One option for dealing with the conflict engendered by the necessity to develop a clear, equitable, and functional set of TDM measures for each development would be to require all developers to pay an annual fee based on development size into a transportation fund. This fee could apply not only to "hardware" such as park and ride lots, but also to the
"software," i.e., the actual program. This method would be an extension of the approach Alexandria has taken. Developers could decide either to spend the money through approved transportation demand management strategies of their own or to let a regional transit authority integrate their projects into a bigger program.
CHAPTER 7.0
OTHER FACTORS INFLUENCING
THE EFFECTIVENESS OF TDM PROGRAMS

Apart from the processes of establishing, monitoring, and implementing transportation mitigation requirements on residential developments, several other factors influence the success of these measures. While each factor by itself may not determine the success or failure of a TDM program, they are important components influencing the decision process of commuters and should thus not be ignored. They range from the proximity and convenience of transit service to the length and destination of the commute, transportation demand management at the work site, site design at both the residential project and the work site, and zoning and land use policies.

7.1 Proximity and convenience of transit service

With the exception of the three new developments within the city of Seattle, all projects evaluated in this study were located in suburban areas. Generally, in suburban areas transit service is less frequent, and the closest bus stop or park and ride lot are often not accessible by foot. According to members of the focus group meeting at Remington, good access to a park and ride lot is an important factor in mode choice. Furthermore, the access to the park and ride lot is often the most congested part of the commute and thus takes an inappropriate amount of time. The longer the access distance or travel time to transit, car- or vanpool in relation to the total commute, the less people will be likely to use alternative modes of transportation.

In addition, suburban work sites may not be linked to the public transportation system. Thus, the tenants of residential developments with a good TDM program may not be able to use public transportation to commute even if they are willing to do so simply because their work sites are not transit accessible. A study conducted in 1989 by the Center for Urban
Transportation Research (CUTR) of the University of Florida showed in its national sample that 22 percent of the people with access to public transit at their residence did not have transit access at their work sites. For work sites in the suburbs, which are the destination of many commuters originating in the suburbs, this percentage is probably even higher.

### 7.2 Destination and length of commute trips

In previous decades the majority of professional jobs have been located in urban centers. However, in the 1980s, jobs shifted towards suburban areas. In 1980, 57 percent of all office space in the U.S. was located in urban centers and 43 percent in suburbia. In 1986, the reverse was true; 60 percent of all office jobs were in the suburbs, and 40 percent in the cities. (Pisarski, 1987; Office Network, 1987) Between 1960 and 1980, suburb to suburb commutes in metropolitan areas with a population larger than 250,000 increased from 30 percent to almost 42 percent. (Fulton, 1986) The national survey conducted by CUTR indicated that one effect of the "suburbanization of the work place" is that people tend to live closer to their jobs. (CUTR, 1989)

While precise local figures were not available, a similar trend was clearly recognizable in the Puget Sound region. The surveys conducted at The Park at Forbes Creek and at Ballinger Commons, both multi-family rental projects, showed that the majority of respondents worked in a suburban environment, often fairly near where they lived. The survey conducted at The Park showed that only 15 percent of the respondents worked within the central business district of the city of Seattle. (Metro, 1989b) At Ballinger Commons, 23 percent of all respondents worked in downtown Seattle. (Metro, 1989a) According to one manager of another multi-family rental project, most of her tenants worked nearby as well. The recent study conducted by CUTR found that average national commute distances (with the exception of city to city trips) and times between suburbs are shorter than those for any other commute. (CUTR, 1989)
In the **Puget Sound** area, an increasing number of multi-family rental projects receive building permits in suburban areas. The remark of the manager that most of her tenants worked nearby indicates that people who rent rather than buy are more likely to live closer to their work site — if they can afford it — than people who own or buy houses. A regional telephone survey conducted by Metro in north King County showed that mean commute time by different types of dwellings were not significantly different. However, the cumulative percentages showed that **27.4** percent of the people who lived in multi-family developments in North King County and drove to work alone had car commute times of ten minutes or less, while this was true for only **20.9** percent of the respondents who lived in single family homes and drove to work alone, a 6.5 percent difference. (Gilmore Research Group, 1989) This finding implies that a portion of suburban renters live at a distance from their work site because they can not afford to live nearby.

### 7.3 Transportation demand and parking management at the work site

The success of efforts to manage transportation demand at the residential end is also affected by the existence of TDM programs and parking management strategies at the work-end. If the majority of the work sites of tenants or residents of new residential developments already have substantial programs, implementation of a program at the home-end may have little effect. On the other hand, certain changes at the work site, such as the removal of free parking, can have a positive impact on TDM programs both at the commercial and residential ends. According to several studies published recently, parking management is one of the most, if not the most, important decision factor in mode choice. (see e. g. Cervero, 1988; CUTR, 1989; Kenyon, 1984; Surber et al., 1984)

### 7.4 Site, design and layout factors
#### 7.4.1 Residential site

Recently, an increasing number of transportation scholars have pointed out the importance of factors such as size, layout, and design of a project to the level of transit use.
Only above a certain number of riders and a certain density is public transit feasible. A cul-de-sac arrangement, favored for both multi- and single-family developments, discourages not only through-traffic but also transit access by forcing buses to retrace their routes. While most residential developments have a system of sidewalks, they are often self-contained to discourage trespassing. At the same time, however, that arrangement makes it more difficult for residents to gain access to facilities outside the development and creates prohibitively long walking distances. The emphasis on automobile access has led to a layout that gives preference to car use (especially convenient parking and car access), rather than to a truly pedestrian-friendly environment.

7.4.2 Work site

In addition to factors related to the residential project, factors related to the work site influence the commute decisions of residents. Robert Cewero found that most suburban office projects were insensitive to the needs of pedestrians, cyclists, and transit users. Site layouts segregating buildings and land parcels in many instances create environments hostile to pedestrians. Similar to the layout of residential developments, wide setbacks and separate access roads on commercial developments discourage the entry of transit vehicles on these developments. Cewero concluded: "Where foot travel and transit travel are relegated to a second-class status, not surprisingly, solo-commuting predominates." (Cewero, 1988, p. V)

Thus, a good TDM program on the residential side can be rendered worthless if the appropriate measures are not taken at the work site as well.

7.5 Land use and zoning policies

Cervero found that the low density, single-use, and non-integrated character of many suburban office or commercial centers leads to a dependency on the car. In campus-like office parks, the trademark of many high-tech companies in the Puget Sound area as well as elsewhere in the country, employees need their car to run midday errands, go out for lunch, or travel to the bank. He asserted that on-site or near-site retail services such as shops and
restaurants, as well as banks and day-care facilities, are important to lure suburban workers out of their cars. To support this, mixed-use environments were found to have the highest percentage of car- and vanpool arrangements and transit ridership. (Cervero, 1988) While his study was based on suburban economic centers only and did not include the impacts of traffic mitigation measures on the residential end, it is evident that the success of home-end TDM programs is strongly influenced by the situation at the work-end.

Furthermore, authors such as Cervero, Bhatt and Higgins, and others have pointed out the importance of density requirements for residential developments and the necessity to move toward mixed-use zoning policies that allow higher density residential, commercial, and office development to take place near one another as well as near a transit system. A new design concept for suburbia, the "pedestrian pocket", recognizes this need and places all elements within a quarter-mile walking distance to each other. (Kelbaugh, ed., 1989)
CHAPTER 8.0
RECOMMENDATIONS AND CONCLUSION

8.1 Recommendations

This section provides four approaches to designing TDM ordinances for residential developments that mitigate the implementation problems presented above. Both a study on existing TDM ordinances, including requirements from residential developments in other parts of the country (KPMG Peat Marwick, 1989), as well as information from personal communication with staff from these jurisdictions, are included here. However, the following recommendations do not guarantee the success of TDM measures at the home-end; rather, they are designed to give them a chance of success — if the issues concerning zoning, land use policies and other factors are also considered.

The first step for each jurisdiction considering TDM requirements on residential developments should be to decide what it wants to achieve with that policy. It needs to ensure that the policy is consistent with the overall transportation goals for the jurisdiction and the region, and with the land use and zoning laws. Once it has decided to implement TDM measures on residential developments, it must make the commitment to follow through. In addition, the jurisdiction needs to ensure that the costs of the TDM strategies for the developer are scaled to their potential impact. The local jurisdiction should be able to afford the administrative costs to monitor compliance with the requirements and to enforce them. The next step is to balance all of the above against the political climate in which the jurisdiction operates and to decide on a policy. The research for this report has illustrated the results when jurisdictions have not considered these steps carefully enough. Four different approaches to a TDM ordinance for residential developments appear possible after consideration of these issues.

1. The first approach is to develop an ordinance requiring minimum size thresholds for increasing sets of requirements. The bigger the project is, the larger is the number of
requirements and the higher the costs. The developer is not required to meet any performance goals apart from the implementation of the measures themselves. This approach is appropriate for jurisdictions where transportation problems are heavy enough to warrant action, but not heavy enough to demand more stringent requirements. It is also most appropriate for small projects and is used for commercial developments by many jurisdictions in the country. It ensures predictability and continuity and is fairly easy to monitor. Since the requirements are clearly stated for each size of development, the information on them cannot get lost. However, this approach cannot ensure that the requirements are adequate for that particular project, and enforcement may prove difficult if the requirement is not appropriate.

2. To avoid inadequate TDM measures for a residential development, the jurisdiction may, in a **second approach**, decide to put the choice of the TDM program measures into the hands of the developer. While a basic set of measures should be carried out for each project, the developer must then choose further measures from a list of additional requirements in order to tailor the TDM program as closely to the development as possible. This second approach is particularly appropriate for larger developments. The jurisdiction reviews the TDM program, approves it if it is considered appropriate for the project, and issues a transportation special use permit. The permit is tied to the land; therefore, the information on the requirements cannot get lost. It can be revoked if the jurisdiction finds that the development's TDM requirements are not carried out adequately.

3. The **third approach** is a variation to the second approach. Its implementation is dependent on the severity of transportation problems in the area and the political feasibility of even stronger requirements. The jurisdiction sets performance goals and leaves the choice of TDM measures up to the developer. In this case, the jurisdiction monitors the performance of the TDM program to determine whether the developer reaches its goals. The jurisdiction revokes the transportation special use permit if the developer does not make a good faith effort to reach these goals.

42
4. A **fourth approach**, even more stringent than the above, is to require the developer to mitigate the projected traffic impact of the development before it has been built. The developer must do this by devising and implementing a TDM program on an already existing project. The developer does not receive a building permit before the performance goal for the TDM measures has been reached. This approach requires a high degree of commitment from the jurisdiction and is politically feasible only if the transportation system in the jurisdiction or region cannot be eroded any further. To simplify the monitoring process for the jurisdiction, each TDM program's process has to be reported to the jurisdiction on a regular basis. To ensure the **correctness** of these reports, a process that requires the developer to pay for an independent audit mechanism, in addition to the self-monitoring processes, used in Montgomery County, Maryland, is an appropriate solution.

To ensure compliance under all approaches, the jurisdiction may decide to require the developer, manager, or owner to pay an annual fee for each unit into a fund or performance bond. The developer can then use the fund to comply with the requirements, e.g., buy bus passes. Should the jurisdiction determine that compliance is inadequate, it can use the funds to finance TDM programs. If the developer is found to have made a good faith effort, he or she may be allowed to incorporate the remaining funds into the next year's program. The policy may also allow the developers to organize themselves into Transportation Management Associations in coordination with commercial areas in order to pool resources and efforts.

**8.2 Conclusion**

The quantitative evaluation of TDM requirements on residential projects in suburban Puget Sound proved difficult, since only a small number of projects had implemented these measures. However, the analysis of available quantitative and qualitative information pointed out implementation problems related to:
• the decision process leading to the imposition of mitigation requirements,
• institutional memory of requirements,
• monitoring of compliance,
• enforcement of compliance, and
• adequacy of mitigation requirements.

The research presented above shows the dilemma many jurisdictions face. The case-by-case approach to transportation demand management on residential projects used by unincorporated King County, Kirkland, and Redmond leaves both the staff of the jurisdictions, as well as the developer, with too many uncertainties about their respective responsibilities and creates equity problems. It does not send a strong enough signal of commitment on the part of the jurisdictions and allows developers to ignore or overlook their responsibilities. On the other hand, the evaluation of existing projects with implemented TDM measures has proved the importance of tailoring requirements to a particular development, as well as its surroundings.

Transportation demand management at residential projects, like any other policy, needs clearly defined and measurable goals and commitment by the local jurisdiction. It has to be integrated in a wider framework of local and regional transportation planning, to be balanced with the land use and zoning policies of the jurisdiction and the region, and to account for the financial and personnel capacity of the jurisdiction. A stringent and well considered TDM ordinance for residential developments is worthless if it cannot be monitored and enforced, if it is not linked to land use and zoning policies, or if the political climate does not allow for the level of commitment on the part of the jurisdiction necessary to make the envisioned residential TDM policy feasible. Thus, it is necessary to decide between the need for clear thresholds, a well structured ordinance, and the particular requirements of the project, while keeping the tradeoffs among them in mind. The success of development, imposition, monitoring, and enforcement of TDM measures on residential developments is not only dependent on the quality of the implementation of these strategies but also on other
factors such land use and zoning policies. However, jurisdictions have a number of options for implementing TDM ordinances for residential projects to mitigate implementation problems.

APPENDIX A

INTERVIEW GUIDES
1. INTERVIEW GUIDE FOR DEVELOPERS ON HOME-END DEMAND MANAGEMENT STRATEGIES

1. Information on the project

1.1. Rent range/price per unit.

1.2. Is this project targeted towards a specific clientele? (e.g.)
   - Singles/married couples, with kids?
   - Age group
   - Socio-economic group/income range
   - Other

1.3. Occupancy rate

1.4. Turnover

1.5. Parking ratio
   1.5.1. How many stalls per GSF? At the legal ratio? Is that enough?

   1.5.2. Are there any tenants without cars? How many?

1.6. Nature of sidewalks
   1.6.1. Is there a complete system throughout the entire development? (Do people have to use parking lots or roadways in some parts?)

   1.6.2. Is continuous walking access to transit provided? If the project has a wall or a fence around it, are there breaks to ensure easy access to transit facilities outside?
1.7. Transportation Coordinator

1.7.1. Is there a transportation coordinator on the project? (name, phone #)

1.7.2. How much time does he spend on his task? What is his salary?

1.8. Does the project have a communal area or an on-site office where information can be provided and shared? Is it used?

1.9. Is there a tenant organization on the project?

2. TDM program requirements on the project

2.1. Which of the required measures were you able to implement to date?

2.2. How long did it take you to implement them?

2.3. Did you have any implementation problems? If yes, what were they for each requirement?

2.4. Costs

2.4.1. What are the construction costs for the entire development?

2.4.2. Which portion of these costs were required to fulfill TDM program requirements? (actual or estimated $)

2.5. Are you in the process of implementing any of the remaining required measures at this time? (If so, which ones?)

2.6. Why were you not able to implement them to date? Were there any particular problems?
2.7. **Do** you expect to be able to implement them? When?

2.8. **Are** there any required measures for this project you will not be able to implement? Why is it not possible?

2.9. Is the jurisdiction enforcing the requirements or do you have leeway?

2.10 **Has** that influenced compliance with the requirements?

2.11. Did you know whom to contact at Metm to establish a CIC, provide bus passes, etc.?

2.12. Were there any problems with the contact at Metm or with Metm **procedures**?

3. **Experience with the TDM program on the project**

3.1 How did the **tenants/buyers** of the project react to the **offer(s)**?

3.2. Did you receive any comments from their side? Which?

3.3. **Do** they use the offered shuttle, bus pass, etc.?

3.4. What is your estimate of the percentage, real **#s** of tenants taking advantage of the **offer(s)**? (Are there any **records**?)

3.5. Which **one(s) was/were** most appreciated?

3.6. Which, in your opinion, works best? What led you to that conclusion?
4. Overall experience with TDM program requirements

4.1. Comparison with other TDM program projects

4.1.1. Do you have any other TDM program projects? (Record them)

4.1.2. Did you perceive any differences between the projects in terms of

- Offer acceptance by tenants
- Difficulty of implementation (reasons?)
- Costs of implementation, or
- Multi- versus single family projects?

4.2. Do you have any suggestions for changes in the wording of the requirements? Where are they unclear or not specific enough?

4.3. Threshold for TDM program requirements

4.3.1. In your opinion, where should the threshold for requiring a home-end TDM program be? Why? (Size, cost of development, which portion of the project's costs should be spent on TDM program measures?)

4.3.2. What is, in your opinion, the appropriate development size for requirement of each of the following requirements:

- Transit information
- Carpool information
- Bike shed
- Free bus pass (one-time)
- Project assisted access to carpool facilities and rideshare information
- Shuttle to nearest park and ride lot
- Carpool coordination on the project
- Bus pad

4.4. Did you offer any of the measures on your own in other developments without being subject to them through a TDM program? If yes, what was your rationale?

4.5. Have you advertised with these services for any of your developments? Did you use it as a marketing tool?
4.6. Did you get any reaction from your prospective clientele?

4.7 Is there any indication that some clients favor projects which provide these services?

4.8. Is proximity to transit service a factor in your site selection process?
2. INTERVIEW GUIDE FOR TRANSPORTATION COORDINATORS ON HOME-END TRANSPORTATION DEMAND MANAGEMENT STRATEGIES

1. Information on the project

1.1. Rent range/price per unit.

1.2. Is this project targeted towards a specific clientele? (e.g.):

- Singles/married couples, with kids?
- Age group
- Socio-economic group/income range
- Other

1.3. Occupancy rate

1.4. Turnover

1.5. Parking ratio

1.5.1. How many stalls per GSF? At the legal ratio? Is that enough?

1.5.2. Are there any tenants without cars? How many?

1.6. Does the project have a communal area or an on-site office where information can be provided and shared? Is it used?

1.7. Is there a tenant organization on the project?
2. The work of the transportation coordinator

2.1. How much time do you spend with transportation issues like giving out bus-passes or providing info? (How much does it cost your employer?)

2.2. Do your tenants use the offered bus-passes, the CIC, other sources of transit-info that you provide?

2.3. What is your estimate of the percentage, real #s of tenants taking advantage of the offer(s)? (Ask if records exist.)

2.4. Did you receive any comments from their side? Which?

2.5. Which one(s) was/were most appreciated? What led you to that conclusion?

2.6. Which, in your opinion, work best? What led you to that conclusion?

2.7. Is there one that is not implemented right now that you think might work?

2.8. How many tenants take the bus every morning who are not eligible for the bus-pass any more? (Ask if there is a convenient bus-connection — whether it makes sense at all to ask that question!)

2.9. Are there any carpools originating from this development that you are aware of? Where do they go?

2.10 What do you think could persuade more of your tenants to take the bus, carpool?
2.11. How is your contact with Metro? Is it **cooperative** or do you have any problems?

2.12. Is there anything in your relationship with Metro that you think should change?

2.13. What do you think about the idea to have a contractor run a shuttle, assist carpool matching **etc.** that would serve this project and others in the neighborhood?
3. Home-End Transportation Demand Management Programs
Residential Focus Group Questions

I. General questions

How do you feel about the traffic situation?
- In the region,
- during your commute,
- in your neighborhood?

(What, in your perception, is the biggest problem?)

How do you think it would be solved?)

Do your employers provide incentives to carpool, take the bus, etc.? Do you have free parking at your work place?

What are your experiences with it? Does it work, not work -why not?

(If there are no provisions, would you like to have them introduced?)

II. Own commute behavior

What made you decide to move here?

Do you carpool, ride the bus — sometimes, on a regular basis — now?

What motivated you to start that?

What would be the problems you would run into if you were to carpool, take the bus now?

What would influence your decision to start doing that now?

Did you get a/like the package with information on transportation options when you moved here?

Was the information adequate?

How helpful was the transportation coordinator in that respect? What other info/help would you like him/her to provide?

Some of you have been offered a free bus pass when you moved in. Did you use it? Why not?

Would you find it more useful to get two free ride passes as part of your info package from Metro?

Would you feel differently if you had the chance to catch a shuttle to the next PARK AND RIDE lot right here on the development? Why not?
III. Changes in Policy Affecting Mode Change

Rent for parking lot at the at the residential end:

With the growth of the region housing has become very expensive. One of the reasons for that development is the increase in the price of land. Here on the project, much of the space is taken up by parking lots. At the moment, the parking to apartment ratio in most residential developments is about two to one. If developers were able to reduce that ratio, they would be able to reduce costs. In many European cities, and even in some areas of the city of Seattle, people pay the rent for their parking spot separately from the rent for their apartment. How would you feel about being charged separately for parking? Let's say if you have two cars, you would pay the same amount as you pay now. If you have only one car, you would pay less, and if you use three parking spots because you maybe have an RV, you would pay more. This would be more equitable, because the people with less cars would not subsidize the people with more cars. It would reduce the costs of housing for people with a relatively lower income who tend to have fewer cars. What do you think about this idea?

Do you think this could work? Why not?

Would you feel differently if you had the chance to catch a shuttle to the next park and ride lot right here on the development? Why not?

Fees for parking at the work place:

A few weeks ago the legislature passed a new gas tax. It included a provision that enables municipalities to tax commercial parking lots. On the long run, and this is really a long shot, this could end free parking at your work place. How would you react to that? Under which circumstances would you be in favor of such a measure?
In general, what do you think has to change to make other means of transportation like carpooling, the bus, or rail more attractive? What would you advise policy makers to do?

**IV. Design and zoning changes**

Some planners are thinking about changes in the design of developments like this one to make it friendlier for pedestrians. How would you feel about that idea?

Some are even thinking about changes in the zoning requirements, i.e. a shift to mixed use to make it easier for people to leave their cars on the parking lot. One of the names the media has used for that approach is the "compact village". Examples here in the area would be Ballard, Fremont, Wallingford, and maybe Aurora. Would you like to live in a neighborhood where you can do part of your shopping by foot or to walk or bike to work?

What are the things you would be concerned about before you would move into such an area?

The preparation of this report was financed in part by the U.S. Department of Transportation, Federal Highway Administration and Federal Transit Administration. The opinions, findings, and conclusions expressed in this report are not necessarily those of the U.S. Department of Transportation, Federal Highway Administration and Federal Transit Administration.
Chapter 1: Introduction

1.1. Defining TDM

Transportation demand management (TDM) is a term used to describe a wide range of strategies that makes the most efficient use of the transportation system by increasing person-carrying capacity. TDM strategies can include promoting alternative modes like transit and increasing vehicle occupancy through ridesharing programs. In addition, TDM strategies can facilitate shifting trips from peak-hour congested corridors to off-peak periods or eliminating trips altogether through strategies like telework.

The Metropolitan Council of the Twin Cities region has provided a series of these TDM strategies through their regional TDM program over the last several decades. With help of promotion and marketing at the local level through transportation management organizations (TMOs), the regional TDM program has been a successful venture in promoting and implementing many TDM strategies. Today, the Twin Cities enjoys a mature regional TDM program with four healthy TMOs that work together to assist commuters in ways such as joining vanpools and carpools, biking to work, taking part in the annual Commuter Challenge, paying less for carpool parking permits, finding out about discounted transit pass products through Metro Transit, and working with travelers on construction congestion mitigation. A complete inventory of the TDM products and services offered throughout the Twin Cities region is presented in Chapter 2: Inventory.

1.2. Study Purpose

The purpose of the Transportation Demand Management Evaluation and Implementation Study (TDM Study) is to outline a clear process for selecting, funding, and implementing transportation demand management (TDM) strategies and also structuring and evaluating the Twin Cities TDM program. Through involvement with local TDM partners and researching best practices from TDM programs nationwide, the primary focus of the goals and recommendations in the TDM Study are:

- Improving the structure of the TDM program and the ensuring TDM funding is prioritized for activities and projects that will have the greatest impact
- Developing a clear and transparent funding allocation process for TDM Congestion Mitigation Air Quality (CMAQ) funds
- Conducting regular and consistent evaluation of the impact of TDM strategies implemented by all TDM providers in the region
- Focusing Metro Transit’s TDM outreach efforts outside of local transportation management organization (TMO) service areas

These elements were the primary needs identified by the local TDM partners that were engaged during the planning process through a formal Advisory Committee (the members of this Advisory Committee are detailed in Section 1.3). There are supporting policies and strategies for the TDM Study within the 2030 Transportation Policy Plan. These policies are described in Section 1.4.

1.3. Stakeholder Outreach and Plan Composition

The development of TDM Study was achieved through a collaborative process with state, regional, and local organizations that implement TDM. The stakeholders identified for this regional planning process included:
• Metropolitan Transportation Services (MTS), including Van-GO!
• Metro Transit
• 494 Commuter Services
• Anoka County TMO
• St. Paul Smart Trips
• Downtown Minneapolis TMO
• Mn/DOT Metro Division and Office of Transit
• Transportation Advisory Board and subcommittees

These organizations were formally engaged through an Advisory Committee during the entire TDM Study planning process. The Committee helped develop the goals, strategies, and recommendations of the TDM Study through multiple avenues for input.

At the first kickoff Advisory Committee meeting for the plan, members were engaged in a group meeting as well as one-on-one stakeholder interviews to provide knowledge and data about their local organizations and agencies. These interviews also included perspectives and thoughts for the goals and recommendations sections of the plan.

A second Advisory Committee meeting was held in December 2009 to conduct a planning assessment of the strengths, weaknesses, and future opportunities and threats to the TDM program. This information was critical during the evaluation phase of the TDM Study and helped inform the TDM program structure recommendations. The results of this analysis are summarized in Chapter 3.

The Advisory Committee was also involved in the delineation of the goals and strategies established for the TDM Study during third and fourth committee meetings in the winter and spring of 2010. The final eight goals for the TDM Study are listed in Section 1.5 of this chapter. Chapter 4: Recommendations contains a list of detailed strategies to implement each of these eight goals.

1.4. 2030 Transportation Policy Plan Policies and Strategies

The TDM Study is supported by the region’s 2030 Transportation Policy Plan (2030 TPP). Specifically, Chapter 2 of the 2030 TPP advances a transportation system investment policy centered on managing congestion by increasing the person throughput carrying capacity of the system. An important component of this policy and other policies in the 2030 TPP is a strong program of TDM initiatives that help to avoid and lessen congestion.

To further refine the purpose of the TDM Study, the following Policy/Strategies in Chapter 5 of the 2030 TPP were developed for TDM programs. Directly quoted from that chapter, the region’s policies for TDM are:

- Increase the use of alternative transportation modes such as walking, bicycling, public transit, carpooling, vanpooling, and flexible work arrangements, such as telecommuting, to reduce vehicle miles traveled.
- Mitigate congestion during the peak periods, special events, and construction.
- Reduce air pollution and energy consumption related to transportation.
- Make more efficient use of transportation infrastructure and services.
- Reduce the necessity of car ownership when other travel choices exist.
- Promote transportation-efficient land development.
- Provide “reverse commuting” assistance for urban commuters to employment locations not served by transit.
These policies from the 2030 TPP formed the basis for the goals and strategies of the TDM program, which are described in Section 1.5 below.

1.5. Transportation Demand Management Program Goals

TDM Study Goal 1: Traveler Focus. Develop a regional TDM program with a wide variety of strategies that are easily understood and utilized by travelers.

TDM Study Goal 2: Program Structure. Structure the regional TDM program and the provision of funds to local TDM partners that ensures resources are maximized toward activities and projects of greatest benefit.

TDM Study Goal 3: Target Markets. Target the geographic areas of the region where TDM strategies will be most successful and would make more efficient use of existing transportation infrastructure and services. National research indicated that centers of high employment and high employment density are the most successful target markets for TDM activities.

TDM Study Goal 4: Strategy Recommendations. The region will invest in TDM strategies with a proven track record of success. These strategies may include those that exist in the region today as well as piloted new strategies from national best practices.

TDM Study Goal 5: CMAQ TDM Funding Process. Allocate future funding for TDM based on monitored performance and sound estimates of impact.

TDM Study Goal 6: Performance Measurement. Develop consistent measurement methods for evaluation of the CMAQ-funded TDM program.

TDM Study Goal 7: New Funding. Develop additional sources of funding for the TDM program.

TDM Study Goal 8: VMT Reduction Goals. The region will track the vehicle miles reduced (VMTR) due to TDM efforts from all CMAQ funded activities. Using a consistent methodology year-to-year, the VMTR will be compiled annually and compared to performance in past years.
Chapter 2: Inventory

This chapter summarizes the key transportation demand management (TDM) programs implemented in the Twin Cities region. This inventory is not an exhaustive list, but highlights the programs that are funded through the Congestion Mitigation Air Quality (CMAQ) program, which is administered through the Metropolitan Council and Metro Transit.

The second component of this chapter contains several succinct summaries about the characteristics of the Twin Cities TDM programs. These include the roles and relationships of the many organizations involved in TDM and a summary of funding sources. These summaries help organize the region’s TDM program information so that it can be compared to other national best practices and evaluated consistently in the next chapter.

2.1. Metropolitan Council

The Transportation Division of the Metropolitan Council contains two “subdivisions” that perform important roles in the delivery of TDM services. These subdivisions are Metro Transit and Metropolitan Transportation Services (MTS). The TDM-related functions of these two groups are described in more detail below.

2.1.1 Metro Transit

Metro Transit is the direct transit operating subdivision of the Metropolitan Council. The TDM-related services Metro Transit provides include oversight of CMAQ-funded TDM programs as well as implementing regional TDM programs and tools.

On the funding side, Metro Transit administers the application process for all FTA grants including the TDM-related CMAQ grants to local organizations. When the grants are awarded, Metro Transit is also responsible for the oversight and administration of the funded TDM programs. At the conclusion of the CMAQ TDM grant cycle, Metro Transit summarizes the impact of the programs and reports their results to the Metropolitan Council and FTA.

On the TDM implementation side, the programs and tools implemented by Metro Transit include promoting transit and increasing transit pass sales, operating the regional ridesharing program, managing several incentive programs, assisting organizations build telework programs, and administering the regional Guaranteed Ride Home program.

The role of Metro Transit throughout the region depends heavily upon the presence of local transportation management organizations. In areas of the region where TMOs are active, Metro Transit offers assistance and support, particularly by providing incentive programs and tools such as the regional ridesharing database. In the areas of the region where no TMOs operate, Metro Transit is the lead organization promoting, marketing, and implementing TDM services. This area is quite large and Metro Transit must carefully plan their limited outreach and TDM resources for this area (Figure 1).
Figure 1: Metro Transit TDM Employer Service Area

Current efforts

Metro Transit provides several TDM programs and tools for commuters, TMOs, and other TDM groups. The major programs include rideshare planning and matching, a carpool and vanpool parking discount program, guaranteed ride home, transit pass programs, and telework assistance. These programs are described in more detail below:

- **Ridesharing.** The Metropolitan Council is required to administer a ridesharing program according to Minnesota State Statute 473.375, Subdivision 11. As a subdivision of the Metropolitan Council, Metro Transit is the responsible entity for implementing the regional ridesharing program. Much of the rideshare matching is performed through the online Rideshare Planner, which offers different ways of signing up for a variety of ridesharing opportunities. Commuters can create an account that will allow them to access a variety of Rideshare Planner tools. The “Trip Matching” tool will match Rideshare users with other commuters who will travel the same route for one-time trips. The “Carpool Matching” tool will match users who live near each other and are traveling the same direction and during the same time to share the ride to school or work. The “Vanpool Matching” tool will assist in finding people who live near one another to share a ride to school or work. Users of these tools may also track their trips and their savings in miles and CO₂ emissions by using the Commute Calendar, although there are no financial incentives to do so. Metro Transit is currently in the process of updating their ridesharing tools, including their website and database structure for maintaining and monitoring rideshare matches. A new tool is expected in late 2010.
• **Parking Perks for Poolers.** Registered Metro Transit carpools and vanpools are eligible to use free parking or receive a reduced rate for parking along specific streets or in specific parking lots and garages located in the cities of Minneapolis and St. Paul. Some parking facilities require approval from Metro Transit or Metropolitan Transportation Services (vanpool), as there are limited spaces. Once the requests have been approved by the agency, carpool or vanpool drivers receive one parking pass to identify that they have a valid permit and are allowed to park in the specific spaces or parking lots at a free or discounted rate. These designated parking spaces and lots also have signs indicating they are only intended for carpools and vanpools.

• **Guaranteed Ride Home.** Guaranteed Ride Home (GRH) is a form of commuter insurance as commuters are ensured a free emergency ride. This program is eligible for people who commute to work or school by bus, train, carpool, vanpool, bicycle, or by walking a minimum of three days a week. This program is available to people living or working in the Twin Cities metropolitan area and for those who have registered through the Regional Guaranteed Ride Home Registration. Registered participants receive two coupons worth $25 each every six months and registered participants will be eligible to use the coupons for a $25 cab fare, or for an emergency bus or train fare.

• **Bike2Benefits.** This incentive program encourages commuters to try bicycling one time per week for an eight-week period. If a participant completes the eight-week challenge, they are eligible for a grand prize. Trips are tracked in the Metro Transit web site and registration is conducted online.

• **Commuter Challenge.** The Commuter Challenge is an annual event held from April through June each year, sponsored by Metro Transit and the four transportation management organizations. The program challenges individuals to pledge to try one or more alternatives to driving alone during the three month period. Registration in the event automatically enters participants for grand prize drawings. The primary goal is to convert commuters who drive to work in single occupant vehicles into using another transportation alternative.

• **Commuter Choice Awards.** This event is held annually and its purpose is to recognize organizations in the region that do an outstanding job promoting transportation alternatives and implementing TDM programs. Employers nominate several dozen companies each year for a handful of top awards (e.g., Exceptional Company Involvement, Corporate Leadership, Outstanding Promotion).

• **Specialized Transit Pass Products.** Metro Transit provides commuters the opportunity to save money by offering a variety of specialized transit pass products. These products are designed to fit the specific needs of certain groups and benefit a variety of users.
  
  o The Metropass is available to companies with ten or more employees and a minimum of five transit users. This product offers employees unlimited rides and is a permanent pass available to employees as long as the company is in the program.

  o The GoToCollege pass is an unlimited ride pass program available to the students of the 76 colleges and universities of the Twin Cities region. Depending on location and available transit service, the pass cost is between $140 – $170 per semester.
The TransitWorks! pass product is available through stored value cash cards between $10-$40 or a 31 day unlimited monthly pass. Employers can choose to subsidize these passes and offer them to employees at a discounted rate.

- **Regional TDM Database.** In addition to the commuter programs described above, Metro Transit also manages data for many of the region’s TDM programs. They work with the four TMOs to update this database from local marketing and outreach efforts. The RidePro database includes data on programs such as:
  - Guaranteed Ride Home
  - Carpool and vanpool parking space registration and payment of the monthly incentives for participants in this program
  - Employer outreach contacts
  - Vanpool registration, including Van-GO! and private vanpools
  - National Transit Database reporting
  - Bike2Benefits incentive program
  - Vanpool reporting web site

**Funding**

The primary funding source for Metro Transit’s TDM programs is the CMAQ program. The Metropolitan Council has historically applied for and received CMAQ funding from the federal government and, typically, Metro Transit uses about half of the TDM funding for its own program. The remaining half is allocated to local TDM service providers. In 2008, Metro Transit received 58 percent ($1.595 million) of the region’s CMAQ TDM funds. The 20 percent local match required for these CMAQ funds is provided by the State of Minnesota, Metropolitan Council, local governments, and operating funds of Metro Transit.

**Evaluation**

Metro Transit maintains records of registration of carpools and vanpools in their database as well as the participation in their programs, particularly events like the Commuter Challenge. Results for 2008 are summarized below:

- **Regional Database.** 16,900 carpool matches were attempted, and out of these attempts, 13,900 matches were made. Also, 2,200 carpools were added in 2008 and 2,000 were deleted or purged. No data on actual carpool formation or how frequently matches actually carpool is maintained; however, Metro Transit assumes 5 percent of matches in the database actually start sharing a ride.
  - Assuming the 5 percent rate, the estimated vehicle miles of travel savings is 24,846,000 miles. This result is calculated using standard trip distance information for the region as well as assumptions on the frequency of travel in a carpool (assumed 3 times per week).

- **Commuter Challenge.** 15,000 commuters pledged to try transit, bike, walk, or rideshare over the three-month period of the challenge in 2008. When surveyed, nearly 93% of the people who drove alone before their Commuter Challenge pledge now use alternatives to driving alone more frequently.

- **Bike2Benefits.** In 2009, the program had 2,900 members with an estimated 375,500 bike and bike-transit miles logged.
2.1.2 Metropolitan Transportation Services

Metropolitan Transportation Services (MTS) is the second “subdivision” of the Transportation Division that is engaged in TDM programs and services. From a policy standpoint, MTS provides the formal link between the local TDM programs and the Metropolitan Council and Transportation Advisory Board. MTS also oversees the TDM-related components of regional transportation planning and funding through the biennial regional allocation of federal Surface Transportation Program funds.

In addition to its policy and Metropolitan Planning Organization (MPO) functions, MTS operates several transportation services related to TDM. The primary transportation service is the Van-GO! vanpooling program, which is described in more detail below. In addition to vanpooling, MTS also operates two contracted services: Metro Mobility, a paratransit service offered only to ADA certified riders and Dial-A-Ride service, a county-based shared-ride service reserved in advance.

2.1.2.1 Vanpooling

The MTS Van-GO! vanpooling program has been in operation since 2000 as a region-wide transit option for long-distance commutes. The intention of the program is to serve trips that are impossible or unrealistic to serve with regular fixed-route transit service within the region’s regular route service area, as well as areas outside of the transit-taxing district where regular route bus and rail services do not exist. The vans are administered and funded through the Council and day-to-day operations and maintenance are handled through a contract with a third party vendor, currently VPSI, Inc. Van-GO! is a regional service that primarily depends on local TDM providers, such as the transportation management organizations, to promote and market vanpool services. In addition to the Van-GO! vans, there are 20 private vanpools operating in the region that are provided Guaranteed Ride Home and the Driver Rewards program (described below). Including Van-GO! and private vanpools, the program contains over 80 vans and, since inception, has consistently grown the number of vans in operation.

Current efforts

As of November 2009, there were 85 vans in operation in the Twin Cities region. Many of the vans originate outside of the seven county region and terminate at employment centers within the region. Some vans also reverse commute from inside the seven county region to employment locations outside of the Metropolitan Council area. Many of the privately owned vans originate in Wisconsin and are destined to Anderson Window Corporation just inside the eastern boundary of Washington County. The characteristics of the current vanpool program are as follows:

- 59 Metropolitan Council Van-GO! Vans, divided by the following:
  - 27 vans originate from within the seven county region
  - 21 vans originate from areas outside the seven county region (collar counties)
  - 11 vans originate from Wisconsin
- 20 privately owned vans, 17 from Wisconsin (independent from Van-GO!)
- 6 City or Company sponsored vans (independent from Van-GO!)

Drivers and passengers have several incentives to operate a van on behalf of Van-GO! These incentives include:

- Full leased van provided by Van-GO! with a $1 million insurance policy for personal liability
- Full maintenance coverage
- Roadside hazard assistance program
- Access to fuel card program tied to van lease billing cycles
- The driver rides free and can use the vans for some personal trips up to 200 miles per month.
- Reduced passenger fare cost through the 55 percent lease subsidy provided by the Metropolitan Council (roughly $86 per person per month)
- Guaranteed Ride Home
- Driver Rewards, which offers $100 cash incentive to the driver for their first six months of continuous service and $100 per year thereafter. Backup drivers receive $50 after the first six months and $50 per year thereafter.

The minimum requirements to start and operate a Van-GO! van include:

- Registration with MTS in the regional rideshare database
- Driver and passengers must live or work in the seven county region
- Vans must carry at least 5 passengers an average of 3 days per week
- The routes of the vans must not duplicate any regular bus or rail service
- The driver must be over 25 years old, have a clean driving record, good credit rating, and complete VPSI driver safety training.

Van-GO! Funding

The Council subsidizes 55 percent of the individual Van-GO! van lease cost through a mixture of Congestion Mitigation Air Quality (CMAQ) and other federal funds, local taxes, and passenger fares. For the 2008 program year, Table 1 describes the funding sources and their amounts.

**Table 1: 2008 Van-GO! Funding Sources**

<table>

</tr>
</tbody>
</table>

Evaluation

Participation in the Van-GO! is carefully tracked by the Metropolitan Council. For the 59 vans subsidized by the Van-GO! program, the annual vehicle miles of reduction is just over 9 million miles. Table 2 below displays the 2008 results of the Van-GO! program as maintained through
the Metro Transit ridesharing database. Note this table does not summarize the participation by privately owned vanpools.

<td>$3.50 per passenger</td>
</tr>
</tbody>
</table>

Since its inception in 2000, the Van-GO! program has consistently added drivers, passengers, and vans to the program. With the exception of the steep increases in gas price in 2008 and its associated drop in vanpooling after prices settled in 2009, the growth in vanpooling has been consistently strong throughout the life of this program (Figure 2).

![Figure 2: Historical Van-GO! vanpool ridership](image)

### 2.2. Transportation Management Organizations

Four unique transportation management organizations (TMO) serve specific activity centers and areas in the Twin Cities region. These organizations are typically governed by a Board of Directors composed of local agencies, business leaders, and community stakeholders. They have traditionally focused on large employers and the commute trips associated with their employees; however, several of the TMOs are looking to apply TDM strategies to new traveler markets and non-work commute trips. The Metropolitan Council has a long history of supporting the work of TMOs through CMAQ funding and planning policy. In addition to implementing their own local TDM programs and strategies, they serve a critical role in promoting and marketing the regional transportation services provided by MTS and Metro Transit.
2.2.1 St. Paul Smart Trips Transportation Management Organization

The St. Paul Smart Trips TMO serves the City of St. Paul, including downtown business district employees as well as the employees and residents of adjacent city neighborhoods. The boundaries of their service area are synonymous with the municipal boundary of the City of St. Paul, yet their programs likely reach many employees who live outside the City in the broader Metropolitan Council region (Figure 3).

Figure 3: St. Paul Smart Trips Service Area

The TMO has recently made a strategic decision to target the residential neighborhoods of St. Paul with new and specialized TDM programs. The 2008 Summit-U residential Individualized Marketing pilot program was created from this strategic decision and specifically targeted the Summit-University neighborhood just west of downtown St. Paul. In 2009, the TMO built upon the success of the Summit-U program by implementing another individualized marketing program in Union Park neighborhood.
Current efforts

The current programs of the TMO are focused primarily on two traveler markets: the employee and the urban residential traveler of St. Paul. The TMO programs consist of:

- **Individual employee commuter services.** These services include customized travel plans and enrollment in commuter challenges. In addition, staff educates employees about pretax benefits, MetroPass, downtown parking for carpoolers, and other transportation incentives.

- **Employer services.** These services include new employee orientations and commuter surveys.

- **Residential individualized marketing at the household level** that includes pre and post surveying, communication pieces, individual trip planning assistance, and various “try-it” incentives.

- **Promotional efforts at employers,** including transportation fairs, relocation assistance, and enrollment into regional promotions like the Commuter Choice Awards program and the Commuter Challenge.

- **A web site serving as a primary portal** to describe available TDM programs and spread awareness about transit, ridesharing, telework, bike/walk, and parking programs.

- **Advocacy efforts** including working with the Central Corridor LRT planning project and coordination with land use development concepts. In this process, the TMO represented the pedestrian and bicycle travelers, looking specifically at how they can access future station sites.

Funding

The TMO is funded primarily by the federal CMAQ program. They use several local funding sources to comprise the 20 percent match required by CMAQ. The 2009 funding amounts, sources, and total funding for the organization is detailed in Table 3.

<table>

</tr>
</tbody>
</table>

Evaluation

The TMO currently monitors the effectiveness of their residential individualized marketing programs and have complete data for the Summit-U program implemented in 2008. Measurement methods included a pre- and post-neighborhood-wide phone survey, participant surveys, bicycle/pedestrian counts, and discussion with partners. Importantly, the TMO also selected a
control group to monitor more carefully if changes in mode share and vehicle trips were due to the individualized marketing program or other confounding externalities. Program highlights for the Summit-U neighborhood include:

- Bicycling and walking trips increased 33 percent in comparison to the control group.
- Using regional transportation averages on trip length, these bicycling and walking trips account for the equivalent of 153 vehicle miles per day during the program period.
- There was no statistically significant change in ridesharing or transit use.
- Drive-alone trips decreased by 21 percent. However, the control group also experienced a decrease in drive-alone trips by 24 percent.
- 8.6 percent, or 612 households, either ordered materials or participated in events.

2.2.2 Downtown Minneapolis Transportation Management Organization

The Downtown Minneapolis TMO (DMTMO) serves the downtown Minneapolis central business district with its workforce of approximately 135,000 employees. The borders of their service area include I-94 to the south and west, the Mississippi River to the north, and I-35W to the east (Figure 3).

The DMTMO has four goals: Commuter Connection, outreach, education, and advocacy. The DMTMO’s programs primarily focus on downtown employees and providing transportation information, products, and travel planning assistance. Their primary marketing strategy is the operation of their combined store and office, the Commuter Connection, which sells transit passes and bicycle accessories, registers interested candidates for ridesharing, sells carpooling parking permits, and provides various other services and information details on all modes of
transportation. Located in a skyway in central downtown, this store is constantly busy with employees and other travelers in the downtown area.

**Current efforts**

The following is an overview of DMTMO’s primary products and services as they relate to each of its goals:

- **Commuter Connection.** Commuter Connection is a one-stop shop for transportation information and services, is located on the skyway in central downtown. Among its information and services are:
  - Selling Metro Transit transit passes and regional bicycle maps,
  - Registering and renewing carpools
  - Individualized trip planning
  - Maintaining wait lists for carpool parking at public and private parking facilities
  - Taking MetroPass pictures
  - Providing skyway maps with walking distances
  - Providing hands on learning for using the bus bike rack
  - Distributing information on behalf of other agencies such as Van-GO!, Guaranteed Ride Home applications, MnPASS, City of Minneapolis downtown bike trails and policies, MnDOT’s bike rules of the road, and discounted carpool parking maps and brochures.

- **Outreach.** Outreach efforts serve primarily two markets: the employers and building managers/owners. The services and programs themselves are designed to reflect the particular needs and characteristics of each market.
  - Employer services include consulting and implementation assistance on pre-tax transportation benefits, discount transit programs, Van-GO!, discounted carpool parking and ridematching services, guaranteed ride home, and special focuses such as eWorkPlace. DMTMO provides an online new employee commuting resource kit specifically designed for the downtown workforce. The DMTMO provides commuting information at employer benefits and health fairs as well as conducting commuter fairs.
  - Building managers/owners services include consulting on programs and services that inform and facilitate use by tenants and tenants’ employees of commuting options, provide data that helps to market the advantage(s) of particular properties and conducts research for those interested in applying for LEED alternative commuting credits. On behalf of the City of Minneapolis the DMTMO assists new developments meet their TDM commitments and reporting obligations. The DMTMO participates in the Building Owners and Managers Association (BOMA) annual vendor fair.
Both outreach markets participate in regional campaigns such as Commuter Challenge and the Commuter Choice Awards. Both markets use the DMTMO services for relocating employers moving into downtown. The DMTMO sponsors commuter fairs at buildings and large employers that includes commuting information, a portable bus bike rack display, and invites several transportation related organizations of interest to the downtown community.

- **Education.** The DMTMO undertakes several education efforts including their website (www.mplstmo.org), emailed newsletters and announcements, brown bag lunches for employees on such topics as bicycle commuting, lunch & learns for employers that focus on single topics such as pre-tax transportation benefits, and Transportation Summits for employers that cover several timely topics.

- **Advocacy** goal is primarily met by providing an opportunity for dialogue between the sixteen member Executive Committee members and public sector representatives on transportation issues.

Periodically, there are unique opportunities for TDM programs and strategies in the downtown area. For example, the DMTMO played a key role in assisting employers and employees prepare for two major bus strikes over the past 15 years, commuting after the collapse of the I-35W bridge, and the expected gridlock during afternoon peak period during the 2008 Republican National Convention (RNC). During these times, the DMTMO conducted major campaigns to assist employers and their employees with commuting choices and trip planning. The marketing included creating informational packets for employers to distribute, mailings/emails, holding special meetings and speaking at other organizations’ meetings.

**Funding**

The DMTMO is funded primarily through federal CMAQ funds. The DMTMO earns the 20 percent local match from contracts they hold with Metro Transit for transit pass sales and carpool registrations at the Commuter Connection store. In addition, they make a small amount of profit on bicycle map sales. They have a reserve account they use for funding shortfalls. For the short term, they are also receiving assistance from the MnDOT eWorkplace.

**Evaluation**

The DMTMO monitors its program components in detail as services are performed. They track pass sales, carpool registrations, and outreach events and attendance. They also track company participation from their service area in regional events like Commuter Challenge. In the past, the DMTMO has met or exceeded the performance goals assigned by the Metropolitan Council, the DMTMO Executive Committee, and others.

In 2008 specifically, the DMTMO has estimated its efforts in transit pass sales, carpool registrations, and Van-GO! promotion has resulted in an annual savings of 28.85 million vehicle miles of travel, 2.27 million vehicle trips, and approximately 6,500 tons of CO₂ emission savings. Table 4 details these estimates by mode.

* Assumes an average 25.28 mile commute distance and 240 days per year

2.2.3 Anoka County Transportation Management Organization

The Anoka County TMO is unique for a TMO given it provides service to all of Anoka County and is within a department of the County, rather than a stand-alone non-profit organization. This is in contrast to the other TMOs that provide service to a smaller sub-area, corridor, or activity center. The Anoka County TMO serves commuters traveling on four major transportation corridors (I-35E, I-35W, TH10, TH65) located in Anoka County. Given its large service area, the TMO serves various traveler markets in different areas of the County, including residents and households as well as nearly 2,000 local employers (Figure 4).

Figure 4: Anoka County TMO Service Area
Anoka County has a large residential of 315,000. The County is a net exporter of workers to other communities and this influences the services and facilities provided for alternative transportation, particularly Park-n-Rides, regional express bus services, the new Northstar Commuter Rail service (began operations in November 2009), and ridesharing. The TMO helps promote and increase utilization of these and other services, as well as increasing utilization of County services like the Anoka County Traveler fixed-route and dial-a-ride bus transit service and other local commuter bus services including Ramsey Star Express and the Forest Lake bus service.

**Current efforts**

The TMO provides education, promotion, and information related to the following transportation choices available in the County:

- Ridematching services
- Transit service, particularly the Northstar Commuter Rail, Ramsey Star Express, Anoka County Traveler, Forest Lake Commuter Bus, and Metro Transit Park-n-ride lots and service
- Traffic mitigation services to businesses and residents along road construction corridors or projects
- Bicycling and walking, including producing an “Anoka County Bike Trail Map & Commuting Guide” distributed to 25,000 residents annually
- Telework

Working with several partners, the TMO promotes these transportation choices through many events, communication tools, and programs, including:

- The Anoka County TMO web site (www.anokacountytmo.com)
- Engaging employers through transportation fairs, newsletters, Lunch & Learn sessions and other networking meetings, enrollment in the Commuter Challenge, and conducting trainings and program development services. In addition, the TMO is developing a network of commercial and residential property managers to work with more in promoting transportation options.
- Working with local government agencies to coordinate promotion of TDM programs and services, particularly in highly congested corridors or construction corridors
- Participating in community events, like the Anoka County Fair, and developing advertising and marketing materials to increase awareness of the TMO as well as regional incentive programs (like the Commuter Challenge)
- Installing outdoor bike racks at no cost to employers. Also, the TMO provides information displays (kiosks) on transportation services available.
- Administering inter-office surveys to identify candidates for transit, carpooling, bicycling, and other transportation options. The TMO also uses employee home zip code mapping to find where employees live and, for those that live in the same zip code, explore the possibility of carpooling or vanpooling together into work.
All of these services are all provided free to Anoka County residents and to people that work for employers in the County.

**Funding**

The TMO receives funding from the federal CMAQ program and the County supports the TMO through providing a 30 percent local match. Currently, there are no other funding sources for the TMO.

**Evaluation**

In 2008, the Anoka County TMO provided road construction project information to more than 50,000 households, reducing construction-related traffic congestion in an area with over 170 businesses and 15,000 residents. Six editions of the “Commuter News” newsletter were distributed to 1,950 employers. Bike racks were provided to 24 employers actively promoting transportation choices.

The TMO promoted the Anoka County Traveler’s transit service, resulting in 257,440 non-SOV trips and the Ramsey Star Express commuter service, resulting in 67,340 non-SOV trips. An estimated 3.3 million vehicle miles were eliminated. The TMO actively worked with the County’s multi-modal planning manager to preserve funding for the Forest Lake commuter bus service and to secure $8 million in funding for expansion of transit service along TH65.

### 2.2.4 494 Commuter Services

The 494 Corridor TMO exists primarily to increase awareness and use of transportation options to major employment centers along the Interstate 494 corridor southwest of the Twin Cities. The TMO service area includes the I-494 corridor through Bloomington, Eden Prairie, Edina, Minnetonka, and Richfield (Figure 5). The traffic concerns along this corridor are significant enough that it threatens future growth and development in these cities; in response, the cities support the work of 494 Commuter Services and their efforts to manage demand.

**Figure 5: 494 Commuter Services Service Area**
494 Commuter Services is very successful in their employer outreach efforts, registering new carpoolers and vanpoolers, and increasing the number of new bus riders and bicyclists in the corridor. They hold hundreds of fairs and events every year and also work with employers one-on-one to increase the transportation benefits they provide to employees. 494 Commuter Services is also piloting a new employer-based individualized marketing approach to TDM and they see a bright future in using emerging communication techniques to speak to the increasingly mobile and sophisticated commuter.

Current efforts

494 Commuter Services provides a wide variety of services mainly focused on building relationships with commuters, registering them for regional services, and promoting the benefits of alternative transportation. Specific efforts include:

- Outreach activities through commuter fairs, bicycle clinics, and seminars on pre-tax transportation benefits.
- Personalized trip planning, brokering transit passes, and helping travelers find carpool matches
- Implementation of employer-based Individualized marketing programs with full evaluation of personalized trip planning assistance and its impact on travel behavior
- Assisting companies with TDM plan development and initiating telework programs
- Promoting and enrolling participants in regional events like the Commuter Challenge
- Installing outdoor bike parking and assisting companies develop preferential parking programs

Through these efforts, the organization focuses on promoting carpooling, vanpooling, bicycling, telework, and transit. Given the dispersed nature of the land uses and relatively low density over their service area, the biggest modal market for 494 Commuter Services is ridesharing followed by transit, then bicycling and telework.

Funding

494 Commuter Services is funded by the federal Congestion Mitigation Air Quality (CMAQ) program. The required 20 percent local match is composed of a mix of funds from the five cities within the organization’s service area.

Evaluation

494 Commuter Services tracks the benefit of their programs in several ways. They track the number of customized ridematches, customized transit itineraries, and customized bike route recommendations performed and the mode shift associated with these activities. They as also summarize this activity into a total number of vehicle miles saved. In their 2008 Annual Report, the following achievements were documented:

- Held 259 commuter fairs and 31 seminars on pre-tax transportation benefits
- Conducted 14 bike to work clinics and installed 9 bike racks for employers
- Promoted Commuter Challenge to 148 employers
Assisted six companies with TDM plans, and another six with telework implementation consulting.

494 Commuter Services estimates these efforts resulted in a savings of 24.9 million vehicle miles of travel in 2008. Further results for 2008 show:

- 2,653 new carpoolers
- 1,215 new bus riders
- 916 new bicycle commuters
- 3,365 individual pledges for the Commuter Challenge
- 4,000+ custom ridematches

### 2.3. Other TDM Services

#### 2.3.1 Hour Car & ZipCar

HourCar is a program of the non-profit organization, Neighborhood Energy Connection, which provides a car-sharing program. This program serves Minneapolis and St. Paul. All of the cars are located in proximity to bus routes and stops, and the cars are equipped to hold bikes. For people to become a member of HourCar, they must pay an initial $50.00 membership fee. Members are able to reserve cars by phone or online. HourCar vehicles cost $6.00-$8.00 an hour and an additional $0.25 per mile.

ZipCar car sharing is available through the Parking and Transportation Services of the University of Minnesota at both the Minneapolis and St Paul campuses. Students, faculty, and staff can join Zipcar for $35/year. Depending on the car model, drivers then pay an hourly rate for actual use of vehicle, typically around $8 per hour. Drivers register and reserve cars online. Currently, there are 10 vehicles available between the two campuses.

#### 2.3.2 NiceRide

NiceRide is a bike-sharing program that will launch in May 2010, and will be available for anyone to join. The bikes will be located in downtown Minneapolis, the University of Minnesota, and the Uptown neighborhood of Minneapolis. It is a convenient program, as users will be able to purchase cards at any of the many kiosks located in these neighborhoods. Once the users have purchased their cards, they are able to use the shared bikes at their leisure. Users simply insert their card at the bike stop, and then they are free to take the bike. The user is also free to return the bike to any rack, permitted that the racks have available spaces to lock up the bike.

### 2.4. Suburban Transit Agencies

There are several suburban transit agencies that provide service in the Metropolitan Council region in areas outside of the Metro Transit service boundary. These agencies and their operations typically provide TDM programs and services such as Guaranteed Ride Home, bike lockers, bike racks on buses, and special pass programs. The suburban transit agencies include:

- Maple Grove Transit
- Minnesota Valley Transit Authority
- Plymouth Metrolink
2.5. MnDOT

2.5.1 eWorkplace

eWorkPlace is a state-sponsored program for Twin Cities metropolitan area employers. This program allows employees to work from home or a remote location. The program encourages employees to connect with work via technology and allows for flexible scheduling. In addition to the benefit of flexible scheduling, the eWorkPlace program provides other tools to benefit employees such as the eWorkPlace Commute Tool, which tracks their many savings from teleworking. eWorkPlace also provides online tools such as a Managers Guide, telework policies, solutions to telework issues and barriers, case studies, and previous reports and white papers to provide education and assistance for employers and employees participating in the eWorkPlace program.

Employees who have enrolled for eWorkPlace may also submit questions and concerns online, in the ‘Ask the Expert’ feature. eWorkPlace also provides on-site training, e-learning, IT advice, and troubleshooting. These features are act as an incentive, as it may be more comforting for employees to take part in an alternative work program.

2.5.2 ArriveMN Web Site

In 2007 the ArriveMN web site (www.arrivemn.com) was developed by MnDOT as a one-stop information portal for all transportation services in the state. One area of particular emphasis was the Twin Cities region. Today, the site contains information on all modes of travel in the region, including bike, boat, bus, light rail, and heavy rail. Overall, this resource is underutilized and could be a communication tool developed and promoted by local organizations in the future.

2.5.3 Managed Lanes Operation and Planning

Two managed lane corridors exist in the region on I-35W and I-394. In coordination with MTS, MnDOT is conducting planning to expand the construction of managed lanes throughout the region. The Metropolitan Highway System Investment Study (MHSIS) will identify the types of managed lane projects that could utilize TDM services moving forward. Currently, the contract language used for the operation of the I-35W managed lanes implies that additional revenues must be spent on the improvement of bus transit services. There may be opportunities to amend this language in the future to support funding for TDM strategies along managed lane corridors.

2.6. Roles and Relationships of TDM Providers

There are several organizations and agencies that compose the TDM program structure of the Twin Cities region. In most cases, programs are administrated by the Metropolitan Council, funded by federal programs, and implemented by several local and regional organizations. Figure 6 details the roles and relationships of these groups and how they work together to provide TDM services.
Figure 6: Roles and relationships of TDM Providers
2.7. Funding Summary

The funding for TDM program implementation through the Metropolitan Council is primarily CMAQ and its required 20 percent local match. Most of the TMOs receive their local match from city or county governments and major employers. St. Paul Smart Trips is unique in that it has one grant-based source of funding through the McKnight Foundation. Also, the Van-GO! program receives revenue from subscriptions and other federal and state sources.

Table 5 below displays the 2008 annual funding for TDM programs with ties to CMAQ and the Metropolitan Council in the region.

Chapter 3: Evaluation

This chapter consists of three evaluation components. First, several best practices from other regions in the United States are presented to detail how they structure their incentive strategies, how they evaluate their TDM programs, and how these processes are different from what is performed in the Twin Cities region today. Second, the results of a strengths, weaknesses, opportunities, and threats (SWOT) analysis conducted in December 2009 with the Advisory Committee is presented to identify the issues with the TDM program structure today and how future opportunities can help mitigate these issues. Third, a TDM market analysis was conducted to identify areas for future TDM programs in employment population centers not directly served by TMOs today.

Note this chapter provides the background and data needed to inform the recommendations made in the next chapter, Chapter 4: Recommendations. Formal recommendations for the Twin Cities TDM program are not proposed in this chapter.

3.1. National Best Practices and Twin Cities TDM Programs

The best practices summarized in this section offer several comparable TDM programs to the Twin Cities. The best practices are composed of two components: a review of the incentive strategies offered in other regions, and secondly a review of their performance and how these regions track the effectiveness of their overall TDM programs.

At the conclusion of each section, the information is summarized and compared to the Twin Cities TDM program. These summaries help point out the differences between Twin Cities program and other programs, where opportunities for new strategies or structures may lie, and identify areas for improvement that will be refined into recommendations in Chapter 4: Recommendations.

3.1.1 Best Practice Incentive Strategies Review

This section provides an overview of several incentive strategies that are underway in five different cities in the United States. The locations chosen for review include:

- Atlanta region, GA
- San Bernardino region, CA
- Las Vegas region, NV
- State of Virginia
- San Francisco Bay Area, CA

3.1.1.1 Incentive Program Structures

There are primarily three types of incentive strategies provided by other regional TDM programs. These strategies include tax incentives, commuter incentives, and employer incentives. They are incentive strategies that primarily focus on the journey to work, which is also the primary focus of the Twin Cities TDM programs and most TDM programs nationwide.
Tax Incentives

The first group that is simplest to implement is the tax incentives provided through IRS Ruling 132 (f) which allows employees to purchase up to $230 per month of transit, vanpooling expenses and parking expenses with pre-tax dollars, and up to $20 per month for bicycling. The employer also benefits with reductions in corporate taxes, FICA, and FUTA. This program is available nationally to all employees and employers and the two major undertakings are educational, which means educating employers on the use of 132 (f) and identifying voucher and vendor programs.

Although this incentive strategy is generally easy to implement, most employers do not make the effort to offer the pre-tax strategy to employees. One city, the City of San Francisco, has an ordinance that tries to increase implementation and awareness of this benefit by requiring the pretax incentive be implemented at worksite where parking is paid for by the employer.

Commuter Incentives

Commuter incentives are composed of several variations in incentive strategies. One is providing incentives to SOV (single occupant vehicle) drivers to switch to a rideshare mode. The incentive is either paid through cash or gift certificates and is typically available for three months and is validated either through paper work signed by an employer or through web-based systems. A second type of incentive usually includes ridesharing membership in a club that offers periodic discounts or drawings for certificates or cash. A third type is mode specific such as offering a vanpool incentive, or offering an incentive for larger carpools.

Employer Incentives

These incentive programs are rare but include coordinator incentives (cash or gifts based on percent of registrants/population of worksite), or incentives to employers to implement telework or compressed workweek programs by offering access to consultants. Some states even provide cash for the acquisition of equipment, such as the State of Virginia’s Telework!va program.

3.1.1.2 Five Best Practice Incentive Strategies

Clean Air Campaign: Commuter Rewards

*Atlanta, Georgia*

The Clean Air Campaign offers many incentives through their Commuter Rewards program, which is tracked online with their CommuteTrak application, which allows commuters to log their daily commutes. There are three levels of rewards: cash for commuters, commuter prizes, and carpool rewards.

- **Cash for commuters** allows commuters to gain $2 per day, up to $100 over a three-month period.

- **Commuter prizes** allow on-going rideshare participants to earn $25 in randomized drawings. The rewards are paid through a gift credit card.

- **Carpool rewards** allow carpools of three or more to earn $40 gas cards each month for a year and carpools of four or more to earn $60 gas cards for a year.

These strategies are promoted through radio spots, the Clean Air Campaign web site and through local TMAs. Evaluation data shows that on average, commuters rideshare 4.39 days and 3-6
months later rideshare 3.08 days. Since last year, these incentives are available to all residents of the Atlanta region.

Rideshare and Rideshare Plus

San Bernardino Association of Governments and Riverside County Transportation Commission, California

Through the San Bernardino Rideshare program, new rideshare participants are provided with $2 per day in the first three months of ridesharing, with a cap of up to $50 per month. Compared to the Atlanta incentive strategy, the incentive is paid in form of gift certificates. On-going rideshares (Rideshare Plus) that participate in Club Ride get discounts for hundreds of merchants in the region. Both San Bernardino and Riverside counties have the same program and offer reciprocity as long as you live in either county. Validation is paper based; however, a web based system is under development. This incentive strategy started in 1991, and has been copied in many other regions.

Club Ride

Regional Transportation Commission of Southern Nevada

Club Ride Rewards is a TDM program with incentives that encourages commuters to use commute alternatives when traveling to and from work, such as carpooling, vanpooling, taking transit, walking, and bicycling. Commuters are eligible to win $5, $25, and $50 gift cards, in addition to selected merchandise. A unique aspect of this program is that it is employer based and targeted to the service workers in downtown Las Vegas. The employer initiates interest by signing up and then making incentives available to the employees. To verify participation and track trips in order to be eligible for the gift cards, card-activated computer terminals are deployed to the worksites for employee use. Each participating employee has a unique card to swipe through the computer terminal to verify their trip. Alternatively, employees can log their trips online, call, or send a text. This approach enables participants who do not own a personal computer to be fully engaged in the Club Ride program at their worksite.

Another incentive offered by the Regional Transportation Commission to employers is the EZ Rider Transit Pass Program. This pass program allows employers to purchase discounted transit passes pretax (EZ Rider Passes) for employees as an added transportation benefit. These passes can be purchased in bulk at a discounted rate of five to 15 percent. Employers must be a Club Ride partner to get the discounted rate and added tax savings.

The employer based discount structure for EZ Rider passes is as follows:

<table>
<thead>
<tr>
<th>Purchase</th>
<th>Discount</th>
</tr>
</thead>
<tbody>
<tr>
<td>up to 200 passes</td>
<td>5% discount</td>
</tr>
<tr>
<td>201 – 500 passes</td>
<td>10% discount</td>
</tr>
<tr>
<td>501 + passes</td>
<td>15% discount</td>
</tr>
</tbody>
</table>

To qualify for these incentives, the employers must purchase a set number of passes over the course of the year. However, how often the passes are delivered and when the employer pays is flexible.

Telework!va
Northern Virginia

Telework!va is a program that provides an incentive of up to $35,000 to employers of 20 or more for costs incurred in the implementation of teleworking in Northern Virginia, and up to $50,000 for employers with 200 or more employees in the I-495 construction corridor. This is a reimbursement-based strategy based on a variable percentage of lease costs and consultant/technical assistance expenses. Eligible expenses may also include laptops, computer peripherals such as printers, broadband access, connectivity infrastructure, VOIP technology, telework center fees, and consultant services. Employers must commit that their employees will telework 6 or more days per month or 1.5 days per week. This program has been available since 2001 and has assisted 101 employers.

Rideshare Rewards

511 Rideshare, San Francisco Bay Area, Northern California

The Rideshare Rewards campaign targets its incentives and messaging on time savings, consumer benefits, and the cost of gasoline. Radio spots are conducted to announce this once a year campaign during key listening periods and times of day when commuters are caught in congestion. The campaign primarily encourages people to try carpooling. Rideshare Rewards pays new carpoolers up to $100 in gas or grocery gift cards.

New carpoolers register at 511.org. Over the subsequent 90-day period, Rideshare Reward participants submit online commute logs, earn $2 per day, and can earn up to $100 total in Rideshare Rewards. Commuters receive assistance finding a carpool match through the 511 RideMatch Service at 511.org.

The Spin the Wheel is an additional motivational tool offered to ongoing carpoolers to keep them interested in submitting a commute diary. Each week of commute information submitted qualifies a web site user for one spin on a prize wheel. The online prize wheel is filled with gas cards, coffee cards, grocery cards and 511 logo products.

The Rideshare Rewards program has been running since 2006 and the program is being merged with a new ridematching system in development.

3.1.1.3 Best Practice Incentive Review Summary

Compared to the incentives offered with the Twin Cities regional TDM programs, the regional incentive strategies described above offer several differences. First, several of the regional programs offer a high level of direct financial incentives (cash or gift certificates) to new and/or ongoing participants. This type of incentive structure requires a large commitment in financial resources, but it also sustains the performance of the overall TDM program. Financial incentives work particularly well within ridesharing programs focused on increasing use of carpooling. In addition, several of these incentives strategies, including the incentives provided with 511 Rideshare Rewards in Northern California and the Rideshare Rewards program in Atlanta are ongoing. This helps with participant retention.

A second highlight is the orientation of some of the incentive strategies directly to employers versus employees. As opposed to the employees themselves, employers are seen as the target audience for the Nevada Club Ride program and the Telework!va program. Both of these programs are fairly robust in the programs and financial incentives they offer employees and have proven successful in their communities.
3.1.2 Best Practices in Program Evaluation

Best practices in program evaluation display the methods and procedures used by other regional
governments to assess the impact of TDM programs. These best practices clearly focus on
employee and participant surveys as the underlying data collection mechanism to derive
performance metrics. However, the practices vary considerably by each region and produce very
different results, responding to the interests and needs of those communities. The best practices in
program evaluation were chosen from a limited number of regions that are consistently
monitoring the impact of TDM programs. These regions were selected based on their program’s
sophistication more than their size or population in comparison to the Twin Cities region. The
five regions selected include:

- Phoenix and Maricopa County region, AZ
- Washington DC metropolitan region
- Atlanta region, GA
- Miami/Ft. Lauderdale region
- San Francisco Bay Area, CA

In general, the goals for program performance of most TDM programs are predetermined by
transportation conformity and air quality policies that are tied to State Implementation Plans
(SIP). The policies of a SIP are reflected in the regional Transportation Implementation Program
(TIP) and funding is delegated accordingly. As an example, in the case of Valley Metro’s goals in
Phoenix, the primary policies are established by the SIP, and then further defined by the
Maricopa Association of Governments and the regional TIP.

There are some instances when additional large development results in further TDM
implementation to adhere to compliance with the SIP. In the Washington, DC metro area, the
building of the Red Skins Stadium and resulting emissions exceeded limits in the SIP. Thus, the
TERMs analysis described later in this section was modified to indicate how TDM strategies and
the MWCOG Commuter Connections program would reduce the impact of transportation-related
emissions increases from building the stadium.

3.1.2.1 Valley Metro, Phoenix, AZ

The purpose of the annual Valley Metro telephone survey is to assess participation in and
reactions to the Trip Reduction, Regional Rideshare, and Clean Air Campaign programs for
Valley Metro. The study is conducted in partnership with Valley Metro, Maricopa Association of
Governments (MAG), and Maricopa County. Up until 2007, Valley Metro based the evaluation of
the TDM program on the results of a telephone survey of residents age 16 and older in Maricopa
County.¹

The survey tracks changes in alternate mode usage among commuters, perceptions of air quality,
and air pollution control. Whenever appropriate, the analysis examines the trends that have
occurred from year to year. Important differences between significant population sub-groups are
also discussed.

On average about 500 – 600 telephone interviews are conducted each survey year. The survey
takes about 12 minutes to complete. The total weighted sample has a margin of error of ±4.2% to

¹ Since 2008, residents age 18 and older have been surveyed. Since the surveyed population for 2008 and 2009 does not directly
match up with census categories, the survey results can not be used to project regional impacts on VMT for those years. For the
purposes of this summary, we have referred to the 2007 data results.
5.8% margin of error. Households are selected by means of random digit dialing. The results of the surveys are expanded to project regional impact.

The following are some of the highlights of the latest survey and show what kind of data a full telephone survey can recover:

- Overall in 2007, the percent of employed people using traditional alternate modes to commute to work did not change in comparison to the past two years (24% vs. 23% and 24%), but remains lower than the 35% recorded in 2004.

- Total alternate mode usage, which includes telecommuting and compressed schedules, increased significantly to the highest level in three years (43% up from 39%). The increase was due, for the most part, to an increase in employed residents who “always” use an alternate mode for their commute (12% up from 9%).

- The percent of employees who drive alone one or more days a week decreased to the lowest level reported since 2000 (85%).

- In 2007, both the percent of carpoolers/vanpoolers (17% to 18%) as well as the frequency of carpooling increased (2.9 days to 3.0 days). Although there was a slight increase in the percentage of people reporting to drive alone five days a week (63% to 66%), the percentage of employees reporting to carpool five days a week more than doubled (14% to 32%).

- The alternate modes that have made the most significant changes since 1993 are riding the bus (up 127%), walking (up 411%), and telecommuting (up 1,007%). The number of employed residents who operate a home-based business since 1993 is up by 219%.

- Using regional average trip distance data, approximately 8.6 million vehicle miles (approximately 18% of the total possible vehicle miles) were avoided daily in 2007 because employees used an alternate mode of transportation, worked at home, or had a compressed work schedule. This is equivalent to 2.3 billion annualized VMT in 2007.

3.1.2.2 Commuter Connections Program, Washington, DC

The Commuter Connections Program of the Metropolitan Washington Council of Government (COG), in concert with program partners, is responsible for implementing five Transportation Emission Reduction Measures (TERMs) in support of the metropolitan Washington region’s efforts to meet the conformity requirements of federal transportation and clean air mandates. The TERMS include:

- Maryland and Virginia Telework
- Guaranteed Ride Home
- Employer Outreach
- Mass Marketing
- InfoExpress Kiosks

In addition, there are six key program measures based on TDM program outcomes. These measures include:

- Vehicle trips reduced
- Vehicle miles of travel (VMT) reduced
- Emissions reduced: Volatile Organic Compounds (VOC), Oxides of Nitrogen (NOx), and Particulate Matter (PM2.5)
• Energy reduction (fuel saving)
• Consumer saving (commuting cost saving)
• Cost effectiveness, in terms of cost per benefit obtained (e.g., cost per trip reduced)

The evaluation process uses several calculation factors derived from surveys of Commuter Connections’ program applicants and/or the public-at-large. These factors include:

• Placement rate: percent of commuters who shift to alternative modes
• Vehicle trip reduction (VTR) factor: Average daily trips reduced for each commuter placed
• Average commute trip distance
• Proportion of ridesharers and transit users that drive alone to the location where they meet their carpool, vanpool, bus, or train.

Much of the data needed to perform this robust evaluation process is achieved through the following methods:

• **Ongoing Monitoring:** This includes the regional Association for Commuter Transportation (ACT) Employer Contact database, Maryland and Virginia Telework participants, Bike to Work Day participant records, Commuter Connections applicant database records, and the Commuter Operations Center activity tracking

• **Existing/Ongoing Surveys:** Commuter Connections applicant Placement Rate survey, Guaranteed Ride Home survey, State of the Commute survey, Employee Commute surveys (voluntarily administered by employers), Telework assisted employer follow-up surveys, Bike-to-Work Day participant survey

• **Analysis Tools:** EPA COMMUTER Model (v 2.0) and the CUTR Worksite Trip Reduction Model

The data retrieved from these data collection methods are applied to a basic methodology listed below to calculate program impacts for each TERM:

1. Estimate commuter population “base” for the TERM (e.g., all commuters, GRH applicants, ride-share matching applicants, kiosk users, Employer Outreach employees, etc.)
2. Calculate placement rate: Percentage of commuters in the population base who made a travel change as a result of the TERM
3. Estimate the number of new alternative mode placements: Multiply placement rate by the population base for the evaluation period
4. Calculate the vehicle trip reduction (VTR) factor for new placements: Average daily vehicle trips reduced per placement
5. Estimate vehicle trips reduced: Multiply number of placements by the VTR factor
6. Estimate vehicle miles traveled (VMT) reduced: Multiply number of vehicle trips reduced by average commute distance
7. Adjust vehicle trips and VMT for access mode: Discount vehicle trips reduced and VMT reduced to account for commuters who drive alone to meet rideshare modes and transit at park-and-rides and other parking facilities.

8. Estimate NOx, VOC and PM2.5 emissions reduced: Multiply adjusted vehicle trips and VMT reduced by emissions factors consistent with the regional planning process.

9. Estimate the energy and commuter cost savings: Multiply VMT reduced by fuel efficiency and vehicle operating cost factors.

10. Estimate cost effectiveness: Divide program or TERM costs by the program impact measures.

Figure 7 displays the results of the TERMs for the 2008 fiscal year.
Figure 7: 2008 TERM Results (*MWCOG 2008 data*).

</table>

1) Participation refers to number of commuters participating, except for the Employer Outreach TERM. For this TERM, participation equals the number of employers participating.

2) Impact represents portion of regional telecommuting attributable to TERM-related activities. Total telecommuting credited for conformity is higher than reported for the TERM.

3) Impacts for Employer Outreach - all employers participating includes impacts for Employer Outreach – new/expanded employer services since July 2005 and for Employer Outreach for Bicycling.

4) InfoExpress Kiosks TERM is part of the Integrated Rideshare TERM.
3.1.2.3 Atlanta Regional TDM Program, Atlanta, GA

Several measurement efforts are undertaken by Georgia Department of Transportation to document the impact of TDM in the Atlanta region. Surveys are conducted in the non-attainment area, including a State of the Commute telephone survey of about 4,000 randomly selected commuters, a random survey of 385 employer representatives, panel analysis of recipients of Commuter Rewards or Cash for Commuters, surveys of vanpool riders, and other programmatic surveys as needed. Not all surveys are conducted every year.

Commuter Placement Rates and Placements

To calculate the commuter placement rates, the percentage of active participants shifting to alternative modes or increasing their mode use during the evaluation period are used. Examples for 2002, which is year when a methodology framework was developed, are provided below:

- New carpool placement rate 11.2%
- New vanpool placement rate 3.4%
- New transit/non-motorized mode placement rate 7.9%
- Retained carpool placement rate 7.5%
- Retained vanpool placement rate 1.4%
- Retained transit/non-motorized mode placement rate 8.4%

The number of active participants, when multiplied by placements rates, provides an estimate of the total commuters placed in alternative modes.

Vehicle Trips and VMT Reduced

Vehicle trip reduction (VTR) measures the number of vehicle trips (VT) no longer made as a result of commuters shifting to alternative modes.

The VTR factors include:

- New carpool VTR factor: 0.34 daily one-way VT reduced per placement
- New vanpool VTR factor: 0.84 daily one-way VT reduced per placement
- New transit/non-motorized VTR factor: 0.54 daily one-way VT reduced per placement
- Retained carpool VTR factor: 0.82 daily one-way VT reduced per placement
- Retained vanpool VTR factor: 1.41 daily one-way VT reduced per placement
- Retained transit/non-motorized VTR factor: 1.08 daily one-way VT reduced per placement

These factors, when multiplied by the number of placements in their respective categories and discounted to reflect the short duration of temporary placements, equal a total daily vehicle trips reduced. Multiplying the number of vehicle trips reduced by the average commute distance for
the respondents who made a commute change results in a total daily vehicle miles traveled (VMT) reduction.

Using this methodology and results of the 2007 State of the Commute commuter survey, the results of the Atlanta program are summarized below:

- 84 percent drive alone, 6 percent carpool, less than one percent vanpool, four percent telework or work alternative work hours, one percent is on a compressed workweek schedule, four percent take transit and less than one percent bike or walk.
- The average one-way travel distance is 19.7 miles, with an average of 35.9 minutes of commuting time.
- The most frequently used commuter alternative among those who use other modes is telework (40%).
- The average size of carpoools is 2.48, and the average vanpool size is 7.75.
- 30 percent of those surveyed had never heard of transportation support service such as Clean Air Campaign or a TMO.
- In 2008, 69 percent of those enrolled in the Cash for Commuters program continue to carpool 3-6 months after the program ended.

3.1.2.4 South Florida Commuter Services (SFCS), Miami/Ft. Lauderdale, FL

SFCS tracks the number of employees that participate in employer TDM programs, as well as the benefits that each employer provides. Participants are contacted 30-60 days after they initially sign-up for SFCS services to determine use of services. Surveys are also sent out twice a year to gather feedback from participants. This data is used to create a trip reduction analysis for the Florida DOT. They also track calls to their information line, website hits, and the number of returned rideshare applications. SFCS evaluates its PR events by tracking the number of guests at events as well as feedback received from guests at these events.

Using these data and other sources, the following are some of the performance measurements used in evaluation:

- Share of commuters aware of brand
- Profiles of TDM elements for each employer
- Number of employers with telework and compressed work week programs
- Number of employees teleworking or working a compressed work week
- Number of calls received
- Mode shift from drive alone
- Mode shift from alternative modes
- Number of vanpool trips and actual vans
- Customer turnover
• Percent of non-SOV going back to SOV

Evaluation in 2004 of the SFCS programs show:

• Placement as measured by rideshare arrangement formed is 14 percent for all users, 19 percent for online users, and 12 percent for non-online users.

• Overall customer satisfaction had a rating of 7.1 to 6.8 (out of 10, with 10 being highest) for years 1999 to 2004.

• 57,660,000 miles of vehicle travel were eliminated in 2004 at the cost of $1.09 per trip and $0.04 for each mile reduced.

• The 2004 annual budget of SCFS was $2,425,000.

• There are over 13,000 people registered in the Guaranteed Ride Home database and only 749 rides were provided in 2004.

• Of the 23,000 registered commuters in the rideshare database, approximately 69 percent use an alternative mode of commuting once per week. This compares to just 19 percent of the general public.

• There are 89 vans in operation, accounting for 774 vanpoolers.

### 3.1.2.5 511 Regional Rideshare Program, San Francisco Bay Area, CA

The following summarizes annual calculations and metrics that are used by the 511 Regional Rideshare Program to track program performance. In the mid-1990s, the California Air Resources Board developed this methodology and quickly all California area Rideshare agencies began implementing it to calculate program impacts. Data for this summary came from participant surveys completed in fall 2008 and spring 2009, as well as the 511 Rideshare Ridematch database.

Each month, 511 Rideshare estimates the number of individuals (referred to as “Clients Placed”) who shifted to carpooling or vanpooling as a result of 511 Rideshare activities. This calculation is based on three 511 Rideshare activities: New or Updated Matchlist Requests, Placement Calls (also called Follow-up Customer Contact Calls), and New Vanpool Formation. Factors derived from surveys are applied to the volume of each of these activities to determine the final “Clients Placed.”

The vehicle trip and VMT reduction impacts are calculated once the Clients Placed participation is known. These impacts are calculated through a series of factors and regional averages. These factors are summarized in Table 6 and include:

• Prior SOV Use Factor. This is a percentage factor used to determine the number of trips eliminated per day specifically from the 511 Rideshare program. Some participants would have already been carpooling or using transportation alternatives before the program; therefore, a range of 55 – 60 percent is used to discount the impact of the program on vehicle trips and VMT. The resulting trips eliminated per day is the final Clients Placed numbers that are then used in the subsequent Days per Year and Miles per Trip calculations.
• Days Per Year. This factor assumes annual participation of 99 days per year for carpool registrants and 240 for vanpool registrants.

• Miles Per Trip. This factor assumes 32.8 mi per trip for carpools and 54 mi per trip for vanpools.

3.1.2.6 Best Practices in Program Evaluation Summary

Review of the five best practices in TDM program evaluation show that other regions in the United States use varying scales of regional surveying to comprehensively assess the impact of their programs. Surveying methods differ, but all approaches are fairly robust and require a thorough understanding of what is desired as output data for performance measurement.

Regions use the survey results in a variety of methods to estimate the impact of their TDM program, typically at least in terms of vehicle trips reduced or vehicle miles reduced. The key component to develop these performance metrics is to clarify a participation rate by new participants or ongoing participants in TDM programs. These participation rates are the foundation for other results, such as VMT savings, which typically use the participation rate and a
regional average commute trip distance that is already calculated for regional transportation demand modeling purposes.

Expanding more on participation rate, some regions clearly try to understand the subtleties of participation. That is, how many are new participants, how many are ongoing participants, and how many are participants that have reverted back to SOV use. These nuances help explain the true impact of the TDM program and help decision makers understand the long-term impact of TDM programs.

Table 7 presents a summary of the best practices in program evaluation. More detailed budget information is available in Section 3.1.3.

* Data obtained from the Texas Transportation Institute 2009 Mobility Study. Total Annual VMT is compiled from the daily VMT reported by region in the 2009 Mobility Study.

** 2006 – 2008 American Community Survey data for Metropolitan Statistical Areas representing these regions.

*** Results of region-wide 2008 TDM program survey including telework, which had a strong impact in this survey.

**** 511 Rideshare regional program results only. The VMT reduced number does not reflect local and transit partner programs.

Table 7 shows that there is a significant amount of variation between regions in terms of VMT reduced and the impact of VMTR as a percentage of total VMT. The principal reason for these differences is differing data collection standards and program effectiveness reporting requirements for each region. Also, some regional TDM programs may account for all programs, including telework and bicycle use, while others may only account for ridesharing programs.
3.1.3 Best Practices in TDM Program Funding

National research has shown that while TDM program funding is still heavily reliant upon CMAQ, a diversity of other funding sources are slowly being developed at the state, regional, and local level. Research conducted by the Center for Transportation and the Environment of nine regional programs found nearly 60% of all funding stems from the CMAQ program. Other federal funding accounted for 7 percent, state funding was 16 percent, and local funding 18 percent. The regions studied included Atlanta, Massachusetts (statewide MassRIDES program), Chicago, Houston-Galveston area, Miami-Dade, Phoenix, Riverside, CA, the San Francisco Bay Area, and the Washington DC metropolitan region. It is important to note that the regions listed above are all in nonattainment status for air quality designation while the Twin Cities is a maintenance area. The nonattainment status requires CMAQ be used for alternative transportation modes like transit and TDM. Since the Twin Cities region is in maintenance status, CMAQ funds in this region are more flexible and this may affect the ability of TDM partners to seek out funding resources.

Figure 8 displays the results of this research.

**Figure 8: Average Funding Sources across nine regions (CTE, 2006)**

The five regions researched for best practices in program evaluation were also studied for their funding sources. These funding sources and related annual budgets are detailed in Table 8.

3.1.3.1 Denver Regional Council of Governments TDM Pool Allocation Process

The Denver Regional Council of Governments (DRCOG) administers a regional CMAQ TDM funding application process with local TDM partners biannually. DRCOG staff administers the application, evaluation, and selection process for these funds. Like the Twin Cities, the DRCOG region has several transportation management organizations and other local organizations that use CMAQ TDM funding to implement local outreach programs and promote regional services.

DRCOG works with local organizations each funding cycle to establish an application process that ultimately awards the CMAQ funds on a competitive basis, but also a very transparent basis. There are a series of Workgroup meetings with local TDM partners to define funding eligibility requirements, review standards for VMT and trip reduction calculations from proposed projects, and ultimately the group reviews applications together and collectively select the winning applications through a point-based scoring system. The application consists of several sections, including:

- Application and project information.
- Funding request, with local match sources detailed including volunteer hours, in-kind services, and donations.
- Detailed work tasks with estimated start and end dates.
- Benefit calculations including single occupant vehicle trips reduced, VMT reduced, and cost effectiveness (total project cost divided by VMT).
- Other considerations, such as innovation and project readiness.

Information and resources are published to the DRCOG web site during the application process and final applications are submitted electronically. For the 2010 – 2012 funding cycle, the evaluation criteria and the maximum points that can be awarded for each criteria are provided in Table 9.

3.1.4 Best Practices in TDM Program Structures

There are different structures for regional TDM programs nationwide. The structure depends heavily upon local government engagement, regional policy, and the presence of local organizations such as transportation management organizations and special districts. In general, two types of structures exist:

- **Heavy regional involvement.** Examples include the Maricopa County Trip Reduction Program and the Portland, Oregon regional Employee Commute Options program administered by the Oregon Department of Environmental Quality.

- **Strong local implementation.** These examples are similar to the Twin Cities TDM program design, where local transportation management organizations and other groups provide local outreach and marketing of regional services as well as their own programs. A comparable region is the Atlanta, Georgia region.

The design of each of these program structures and examples from other regions is described below.

3.1.4.1 Maricopa County Trip Reduction Program

Maricopa County (Phoenix region) is a long-standing national example of mandatory regional TDM requirements through their Trip Reduction Program (TRP). The TRP has been in existence since the passage of the 1988 Air Quality Bill through the Arizona Legislature, which contained many new rules and regulations oriented to improving the region’s air quality. The TRP represented one of the most significant transportation-related regulations passed through the bill to improve Phoenix area air quality. Also, the Phoenix region does not contain transportation management organizations or other local organizations solely oriented to providing TDM programs. However, there are varieties of business improvement districts in operation that provide transportation-related services, such as shuttles in downtown Phoenix.

The TRP is administered through the Maricopa County Air Quality Department. It requires employers with 50 or more employees to develop travel reduction plans for their worksites. The County provides employers with TDM resources and incentives to help achieve the goals established in the plans, such as promoting alternative modes and providing regional incentive programs. Valley Metro, the region’s transit provider, implements the regional TDM program and accompanying incentives.

The regional goal of the TRP is to reduce single occupant vehicle trips and/or miles traveled to the work site by 10 percent a year for a total of five years, and then 5 percent for three additional years, or until a 60 percent rate of SOV travel is reached.

The TRP monitors the effectiveness of the program through providing surveys to participating employers, who in turn implement the surveys and provide the responses to TRP staff. The most recent regional results show employee participants in the TRP save an estimated 12,299 tons of air pollutants each year through the program.

3.1.4.2 Portland, Oregon Employee Commute Options Program

The Oregon Department of Environmental Quality (DEQ) implements the Employee Commute Options (ECO) Program for the Portland, Oregon region. The primary purpose of the program is to reduce air pollution from single occupant vehicle traffic in the region. It is a component of several transportation-related emission mitigation measures the region is implementing to comply with federal air quality standards.
Under the DEQ ECO program, employers with more than 100 employees must develop a travel reduction plan that demonstrates how they will provide their employees with commute alternatives and incentives designed to reduce the number of cars driven to work. The ECO program expects employers to provide the majority of these incentives and strategies such as transit pass subsidies are common tools. Employers are also required to survey their employees and provide the survey responses to the DEQ. In 2008, 780 participating employers reduced over 3 million commute trips through the ECO program.

The ECO program is successful in part because of strong local support and implementation of TDM programs. The Portland region is known for its strong local transportation management associations, who help support the mission of the ECO program. Also, in 2006 the Oregon Department of Transportation, Metro, TriMet, the City of Vancouver, and other public and private partners launched the Drive Less/Save More Campaign (www.drivelesssavemore.com). The City of Portland has also launched several successful TDM programs, including recent residential individualized marketing programs.

3.1.4.3 Atlanta Clean Air Campaign and Transportation Management Associations

As described in Sections 3.1.1.2 and 3.1.2.3, the regional Clean Air Campaign in Atlanta provides a variety of incentives for transportation alternatives and these incentives are monitored for their effectiveness. The Clean Air Campaign itself is a non-profit organization that is a combination of state, regional, and local government partners as well as major employer partners (like the Home Depot). The Clean Air Campaign acts as a “one stop shop” for information on transportation alternatives and TDM services. Travelers visit www.cleanaircampaign.org for information about all transportation options in the region.

Supporting the regional Clean Air Campaign are local Atlanta TMAs and the regional rideshare agency, RideSmart. These TMAs help employers provide cost-effective commute options for their employees such as transit discounts, carpool and vanpool incentives, and other programs that help Atlanta commuters change from driving alone to another mode. The Atlanta region has eight TMAs:

- Buckhead Area TMA
- Downtown TMA
- Clifton Corridor TMA
- CobbRides (recently rebranded LocalZoom)
- Commute Club: A Program of the Cumberland CID
- Midtown Transportation Solutions
- Perimeter Transportation Coalition
- ASAP+: Atlantic Station Access + mobility Program

These groups are funded through a mix of sources, including federal CMAQ grants as well as assessments from local improvement districts and local government support. A significant part of their efforts are channeled towards local outreach and marketing services to promote the regional programs that the Clean Air Campaign provides.

The Clean Air Campaign is a stand-alone organization that equally promotes all modes of transportation and facilitates travelers getting information and incentives to change travel behavior.
3.2. 2009 Transportation Management Association Survey

In 2009, a Transportation Management Association survey was conducted by UrbanTrans in association with the Association for Commuter Transportation’s TMA Council. Of 176 TMA’s contacted nationally and internationally, 78 responded, of those 68 were US based and the rest were based in Canada, United Kingdom, Netherlands, New Zealand, and Australia. The TMAs were based on self-identification of the respondents.

3.2.1 TMA Funding Sources

A total of 65 percent of the TMAs are incorporated organizations. In the US, most of the TMAS are non profit 501 (c)(3) or 501(c)(4) incorporated organizations. Of those that are not incorporated, 88 percent are a subsidiary or internal department of another incorporated parent organization. The most common parent organization is a Chamber of Commerce or other types of membership associations. Other parent organizations include Business Improvement Districts, a site-specific development, a University, or a local government agency or department.

TMA funding sources are also diverse. The following percentages indicate the percentage of TMAs that receive funding from each source type.

- 58 percent of TMAs receive funding from membership dues
- 32 percent of TMAs receive funding from services
- 31 percent of TMAs receive funding from government grants
- 10 percent of TMAs receive funding from developer funding
- 10 percent of TMAs receive funding from a business investment district
- 21 percent of TMAs receive funding from other sources

When analyzing the above data, it was found 20 percent of respondents receive 90 percent of their revenue from membership dues, while 21 percent receive 10 percent or less of their revenue from membership dues. 42 percent do not receive any income from membership dues.

3.2.2 Top Services Provided by TMAs

The TMAs mainly focus on employees who commute to and from work (76 percent). Geographically the TMAs serve a variety of geographic areas such as central business districts, corridors, citywide areas, an urban or suburban activity center, or a specialized activity center such as an airport, hospital, or university.

The five top services offered by TMAs include:

- Promotional/marketing materials
- Employer travel surveys
- Promotional events
- Trip reduction plan/travel plan development
- Rideshare matching

Other services offered by TMAs include:

- Email newsletters
- Guaranteed Ride Home
- Advocacy
- ETC training
- Cycling assistance
- Transit pass sales
- Employer networking events
- Parking management planning
- Web based travel information
- Land use/site design assistance
- Relocation services
- Tax benefit assistance
- Direct ridesharing incentive
- Individual journey planning
- Telework assistance
- Subsidized transit passes
- Real time alerts
- Vanpool services
- Shuttle provision

Some TMAs charge a fee, especially to non-members, for the provision of some of the services listed above. In addition, TMAs frequently contract the above services from a third party.

### 3.2.3 Measurement and Evaluation Practices of TMAs

To track performance and assess satisfaction with services, most TMAs conduct regular surveys of employees and organizations. TMAs also track emails, gather transportation data, and record attendance at events.

Over 50 percent of the TMAs said that they track performance by:

- E-mails and calls
- Surveys of employers and organizations
- Gathering raw data such as traffic counts or transit boardings
- Surveying travelers at a workplace or site
- Web site visits
- Surveying participants in a special program

The types of data TMAs compile from performance measurement activities include:

- Measuring mode shift at the workplace or TMA geography
- New ridematch database registrations
- Direct utilization rate (e.g., vanpool and carpool miles logged)
- Mode shift of new participants
- Cost per trip reduced
- Cost per vehicle mile reduced
- Cost of emissions reduced
- Member satisfaction with services
- Overall awareness of programs
3.3. Strengths, Weaknesses, Opportunities, and Threats Analysis

On December 7, 2009 the Advisory Committee associated with the Strategic TDM Plan met and discussed the strength, weaknesses, opportunities, and threats (SWOT) associated with their TDM programs. All four TMOs were present as well as representatives from MTS, Metro Transit, and MnDOT.

This summary contains a listing of the SWOT as identified by the Advisory Committee. In addition, a discussion is presented on how some of the future opportunities identified can outweigh the current weaknesses of the TDM program.

3.3.1 Strengths

- TMO focus
  - Localized Expertise
  - Regional Collaboration among TDM Stakeholders
- Metropolitan Council focus
  - Strong MPO to influence/support local efforts
  - Longitudinal Employer Household Dynamics (LEHD) data from Met Council
  - Single Centralized Guaranteed Ride Home (GRH) program for regional use
  - Single Vanpool provider (Van-GO!)
  - Bike2Benefits Program
- Municipal focus
  - Local ordinances increase awareness of TDM

To synthesize, the Twin Cities region has some strong implementation efforts due to the presence of four well established TMOs and the active role the Metropolitan Council takes in providing regional incentive programs, vanpool services, and challenge programs. Historically the region has supported TDM efforts and continues to recognize its importance by continuing to fund and develop new programs.

3.3.2 Weaknesses

- TMO and regional focus
  - Limited TMO credit for results
  - Potential double counting of TDM participants when each TMO is keeping track of programs independently
  - Perception that the TDM Program is focused on Metro Transit and a handful of organizations
  - Data sharing
  - Perception that regional TDM program could take over responsibility of TMOs
- Funding focus
  - TMO Competition for limited dollars
  - Funding pie not big enough
  - Lack of private sector funding
- Municipal focus
  - Cities of St Paul and Minneapolis have relatively cheap and abundant parking
- Measurement specific focus
  - Hard to track outcome of TDM program
  - Overlap of which TMO gets credit
  - How to place dollar value on cross-jurisdictional efforts
- Vanpool specific focus
The weaknesses described by the Advisory Committee mainly focus on partner collaboration, funding, measurement of effectiveness, and awareness of the vanpool program. However, there are ways to overcome each of these weaknesses and none are fatal flaws. Many of these weaknesses can be countered by future opportunities, especially as new funding sources are identified, which should also be viewed as new opportunities for partner collaboration and communication. It should be noted that others also thought the level of collaboration between partner organizations is a current Strength, not a weakness.

The measurement weaknesses noted are also important outcomes of the SWOT. Performance measurement recommendations for future TDM programs that will address this weakness are specifically addressed in the next chapter (Chapter 4).

### Table 10: Summary Strengths and Weaknesses

<td>• Vanpool awareness</td>
</tr>
</tbody>
</table>

### 3.3.3 Opportunities

- TMOs and Regional Collaboration
  - Cross marketing between TMOs
  - Seeking common goals with other transportation partners
  - Regular communication between transit partners
  - Strengthen relationships on regional committees
  - Tying TDM and TMOs efforts to performance measures on congested corridors
  - Design categories for types of TDM funding: TMO operations, competitive new pilot grants for TMOs, Metro Transit regional programs
  - Build upon eWorkplace
- Future TDM programs and strategies
  - Promote new and planned transit facilities
  - Promote use of future HOV infrastructure and structure future managed lanes as HOT (High Occupancy Toll) lanes
  - Transit partner coordination and testing of trip planning
  - Increase marketing of regional transit fare
Distinct opportunities the Advisory Committee members saw include many infrastructure related subjects, such as the opportunity to market and promote new managed lanes and transit service as well as the existing vanpooling and GRH programs. In addition to these opportunities in physical improvements, there are several initiatives and cultural shifts like health programs and technological advancements in communication that are critical areas for TDM providers spread their services to wider audiences.

There are also some relational opportunities as TMOs, regional agencies, and other transit partners recognize the need to improve relationships so that together they can obtain new funding and administer and implement new programs.

3.3.4 Threats

- Infrastructure focus
  - Managed lanes charging for HOV (just becoming toll lanes only)
- Funding focus
  - Multi-modal choice may not get fair funding or attention
  - MnDOT budget deficit
  - Questions about long term reliance on CMAQ and funds from federal government agencies
  - Future competition for limited transportation funding
  - Perceived lack of fairness in funding allocation
- Local TDM Ordinances
  - TDM ordinances can be interpreted as an obstacle to development
  - TDM ordinances have no “teeth”
- Population focus
  - High turnover of participants in TDM programs and population in general
  - High unemployment
- Vanpool focus:
  - Perception of service overlap and duplication with regular route express service
  - Funding concerns / sources (outstate Minnesota and Wisconsin vanpools)
  - Lack of support for program changes within MTS

The greatest threat to long-term TDM programs is funding. The Advisory Committee recognized the need to diversify their funding and move away from relying solely on CMAQ. However, the competition for funding will be high and TDM programs must prove their value in terms that decision makers can understand and feel are important. If the TDM programs can prove this value, other funding sources may materialize as decision makers realize the positive impacts that increasing a TDM effort could have.

<td>• Vanpool support and funding</td>
</tr>
</tbody>
</table>

3.3.5 How to turn the Weaknesses into Opportunities

The current weaknesses of the TDM program can be addressed by several of the opportunities identified by the Advisory Committee. A big opportunity is the promotion of future infrastructure and services, including HOT lanes and transit infrastructure and services. Because these transportation assets will provide a new service to travelers in the region, they need to be marketed accordingly to increase awareness and maximize their effectiveness. In summary, TDM providers need to take the successful programs they have today and show agencies such as MnDOT how TDM can improve ridership and vehicle occupancy.

Performance measurement is also part of the solution to demonstrating how TDM can increase utilization of new transportation infrastructure. The TMOs and partner regional agencies must have a consistent and standardized approach to measuring the benefits of TDM programs so that the administrators of assets such as managed lanes (MnDOT) can see the regional benefit of TDM programs. In addition, an equitable and transparent measurement process is also critical for TDM partner relationships and funding prioritization between current the TDM partner organizations.

3.4 Market Analysis

A TDM Market Analysis identifies the areas in the Twin Cities region that have population densities conducive to receiving marketing and promotion, but are not within a TMO service area or specific TDM program currently. These areas are truly the new areas for TDM efforts and identifying their travel characteristics can help pinpoint effective program recommendations. Full recommendations from the results of this analysis are presented in Chapter 4: Recommendations.

3.4.1 Employment Centers

Understanding how employment population centers are distributed throughout the Twin Cities region are the primary focus in this TDM Market Analysis. Because there are four healthy TMOs operating in specific service areas today, this analysis focused on the employment centers outside of the current TMO boundaries. Identifying these centers can help target TDM programs and services to new areas with high concentrations of employee travelers.

3.4.1.1 Employment Centers
Based on national research of screening tools from around the country, there are several screening tools that can be used to identify the strongest employment center markets for TDM in the region. In national land use and transportation research, employment density serves as a measurable variable that is really a proxy for many characteristics that influence the use of transportation alternatives, such as parking pricing, provision of transit service, and the level of local congestion. In places with high employment density, it is likely there will also be parking fees, frequent transit service, congestion, and other factors that influence the use of transportation alternatives. There are two downtown areas in the Twin Cities region today that have these characteristics. There are also areas of the region with low employment density where parking is likely to be free and little to no transit service is provided. However, congestion in these areas can still be pervasive and many other TDM strategies and techniques can be applied in these more suburban settings.

Overall, the host of TDM strategies and incentives provided in the Twin Cities region can serve both these types of areas. Specific thresholds of employment density and multimodal infrastructure availability that should be used to target TDM service areas include:

- A minimum of 10 employees per acre outside of downtown employment areas and greater than 25,000 employees overall. National research has shown that a minimum of 10 employees per acre is a baseline threshold density that influences the use of transportation alternatives in suburban office parks (Cervero 1988; Ewing and Cervero 2001). Employees in areas with this employment density were shown to use transportation alternatives such as carpooling, transit, vanpooling, and walking/bicycling more often than in areas with less density. However, the difference is very small, amounting to less than a 2 percent reduction in VMT solely due to the density of office development. Therefore, the provision of TDM in these areas is critical in boosting utilization of transportation alternatives that would not otherwise be appealing to commuters without the provision of incentives or specific strategies.

- A minimum of 50 employees per acre in downtown employment areas with over 50,000 employees. National research has also shown that areas with employment densities of 50 employees per acre and greater use transportation alternatives significantly more often than in areas with less employment density (Frank and Pivo 1994). This level of density is a proxy for many of the variables that would influence a commuter to use transportation alternatives, such as parking pricing, frequency of transit service, and congestion. The downtown areas of Minneapolis and St. Paul are currently the only downtowns in the Twin Cities region and are also within existing TMO service areas. While these areas have many characteristics that motivate people to use transportation alternatives without the influence of TDM, these areas are still very strong markets for TDM services. TDM services can market the wealth of transportation options provided in the area and facilitate individuals taking advantage of these programs more so than they would without TDM. The Parking for Poolers program in downtown parking ramps and the Commuter Connections store are two good examples of how TDM services in downtown settings can motivate travelers to take advantage of transportation alternatives.

Geographical employment data was obtained at the Census tract level from the 2008 Longitudinal Employer-Household Dynamics (LEHD) dataset for the Minneapolis-St.Paul-Bloomington Metropolitan Statistical Area (MSA). These data were refined to display employment centers with greater than 10 jobs per acre, as shown in Figure 9.

Figure 9: Employment centers in the Twin Cities region (2008 LEHD data)
Combined with the current TMO service boundaries, the figure shows that several tracts and clusters of tracts with over 10 employees per acre are not directly covered by TMO services.

In addition to these employment concentrations, many of the people who work in these tracts also live in areas not served directly by a TMO organization. To highlight more detail on the residential locations of the employees in these tracts, a series of successive figures are displayed in Figures 10 through 15 with one map per tract cluster. These figures show that many of the employees who work in the identified tracts in Figure 9 also live in areas that are not within TMO service areas currently. It should be noted, however, that these residents could be receiving TMO services, but in an indirect fashion and most likely not directly from their employer or the TMO itself.
Figure 10: Residential Home-end of Employees in Tract 1 (2008 LEHD data)
Figure 11: Residential Home-end of Employees in Tract 2 (2008 LEHD data)
Figure 12: Residential Home-end of Employees in Tract 3 (2008 LEHD data)
Figure 13: Residential Home-end of Employees in Tract Cluster 1 (2008 LEHD data)
Figure 14: Residential Home-end of Employees in Tract Cluster 2 (2008 LEHD data)
Figure 15: Residential Home-end of Employees in Tract Cluster 3 (2008 LEHD data)
The successive figures show that a large number of residents who commute to the targeted employment tracts and clusters do not reside in a TMO service area on the home end. There is a particularly strong residential population south of Minneapolis along the I-35W corridor, especially for the employment clusters in that area (Figures 8 and 9).

3.4.2 AM and PM Peak Congested Corridors

An additional data source that was available for the Market Analysis was 2008 congestion data from MnDOT. These data show the total hours of congestion during AM and PM weekday periods on roadway segments as compiled from their highway monitoring system. For the purposes of this analysis, these segments were overlain with the targeted employment tract clusters from the previous section. This enables an analysis that highlights areas where AM or PM congestion occur that are close or adjacent to the targeted employment centers that do not receive direct TMO TDM efforts today.

3.4.2.1 AM Congested Corridors and Targeted Marketing Areas

The AM Congested Corridor map is displayed as Figure 16. This map shows the congested corridors along I-394 Corridor to the west of Minneapolis and SR 100 in-between I-494 and I-394 are two areas that may warrant more specific attention for TDM services. However, the congestion that occurs in these corridor segments is likely generated by demand from many other areas than just theses segments along the corridor itself. Nonetheless, a part of this congestion is locally oriented travel and reducing that travel through TDM services would be beneficial.
Figure 16: AM Congested Corridors (2008 MnDOT data)
3.4.2.2 PM Congested Corridors and Targeted Marketing Areas

The PM Congested Corridor map is displayed as Figure 17. Like the AM Congested Corridor map, the PM map shows there is also congestion along I-394 and SR 100 west of downtown Minneapolis where there are currently no TMOs directly serving the corridor. As in the AM, reducing a part of the locally-bound PM congestion in this corridor would be beneficial. There is a particular high concentration of employment at the interchange of SR-100 and I-394.

The PM congested corridors maps also shows there is also a large degree of congestion along the I-35W corridor south of downtown Minneapolis. Presumably this is a large population of commuters leaving the urban area in the evening and commuting to residences south of Minneapolis. Because several of these segments show large levels of congestion and they are in areas of frequent transit service, further TDM service is warranted along this congested corridor. In addition there are several employment clusters (greater than 10 employees per acre) along this corridor just south of the Downtown Minneapolis TMO service area.
Figure 17: PM Congested Corridors (2008 MnDOT data)
Chapter 4: Recommendations

The recommendations in this chapter are directly linked to the Chapter 1 TDM Study Goals that guided the planning process of this study. These recommendations serve as a supporting implementation strategy for these goals. Implementing these recommendations will achieve the policies set forth in this plan, particularly the VMT reduction goal specified in TDM Study Goal 8.

The recommendations are supported, in part, by the research and analysis summarized in Chapter 3: Evaluation. Chapter 3 summarized the best practices of TDM programs throughout the United States. In addition to this research, several efforts of coordination with the Advisory Committee for the TDM Study were conducted between December 2009 and February 2010. These analyses included a meeting to identify the strengths, weaknesses, and future opportunities and threats to the Twin Cities TDM program as well as a meeting to discuss the best practices of other TDM programs and review the draft goals presented in this chapter.

4.1. A Traveler Focused TDM Program

TDM Study Goal 1: Traveler Focus. Develop a regional TDM program with a wide variety of strategies that are easily understood and utilized by travelers.

TDM Study Strategy 1.1: Consolidate provision of regional TDM tools and services.

Metro Transit will provide the majority of regional TDM program services. However, it is acknowledged the success of each of these services is significantly influenced by the outreach and promotion conducted by local TDM partners. These services and its annual Commuter Challenge:

- Bike2Benefits
- Parking Perks for Poolers program
- Guaranteed Ride Home
- Specialized transit pass products
- Commuter Choice Award and Best Workplaces

It is recommended Metro Transit also provide all regional TDM tools. These tools include:

- Online ridematching services to individuals. Increase the ability for local partners to share their data as well as access to the overall ridematching database.
- Leading marketing efforts related to the Van-GO! program (MTS will maintain administration of this program)
- Maintain and enhance the use of the regional TDM database of contacts and participants in the TDM program, from both regional efforts and local TMO efforts.

TDM Study Strategy 1.2: Develop a regional “one stop shop” web-based resource of commuting strategies and incentives for the traveler. Build this site to give equal weight to all modes of travel, including ridesharing, transit, bicycling, and walking.

Today, information about regional TDM tools and services are spread between Metro Transit and MTS. Drawing from best practices like Atlanta’s Clean Air Campaign, it is recommended that a “one stop shop” commuting resource be developed to enable a traveler to obtain information quickly and easily. Today it is not obvious to the traveler where to find information about most TDM strategies as they are spread across many web sites (either Metro Transit’s web site, the Metropolitan Council’s web site, or the TMO web sites). This web site will serve as a portal with
information about all modes of transportation and the TDM products and services available for each and should direct travelers to TMOs’ or other web sites as appropriate.

Because Metro Transit is currently developing a redesigned web site that provides more visibility, information, and resources on all modes and because it administers most of the TDM services and products available regionally today, it is recommended Metro Transit’s web site function as the “one-stop-shop” for regional TDM resources. Metro Transit should work with the TMOs to determine appropriate links to and from this web site.

A primary objective of developing this resource is to grant equal marketing and communications efforts to all modes and the TDM services available for each of them. Also, this web site should contain online enrollment forms and databases so that users can immediately request or apply for TDM products or services. A specific example includes enrolling new vanpool subscriptions online for the Van-GO! program, rather than the paper based system used today. For many of the regional TDM services, “paperless” registration and tracking is already the norm (such as the Bike2Benefits program). An example of a comprehensive online ridematching resource for carpoolers and vanpoolers is available in the San Francisco Bay Area through the Metropolitan Transportation Commission. The web site is available at https://www.ridematch.511.org/SanFrancisco/.

TDM Study Strategy 1.3: Metro Transit, MTS, and local TDM partners will work together to promote each other’s services via web sites and the internet.

Equal promotion of services and initiatives between the web sites of regional services and local TDM partners is strongly encouraged. Linking the regional services into local TMO efforts is an important component of the one stop web site. Conversely, it is also important that local TDM partners establish links and refresh their web sites to promote and link to regional services. The Metro Transit web site would serve as the primary portal for regional services (identified in Strategy 1.1). The TMO and other local web sites would serve as the primary portals for outreach and innovation at the local level. All web sites should include educational resources for travelers.

TDM Study Strategy 1.4: Coordinate updates to the ArriveMN web site (www.arrivemn.com), developed by MnDOT in 2006, with the one-stop web site. The ArriveMN web site can complement the one-stop web site and drive traffic to this region-specific resource.

4.2: Regional TDM Program Structure

TDM Study Goal 2: Program Structure. Structure the regional TDM program and the provision of funds to local TDM partners that ensures resources are maximized toward areas of greatest benefit.

TDM Study Strategy 2.1: Clearly outline the roles and responsibilities of local, regional, and state TDM partners.

All the TDM partners have critical roles to play in the TDM program of the Twin Cities region. Local governments and TMOs have a primary responsibility to perform the outreach and marketing necessary to link travelers with regional incentives and strategies. The regional and state agencies involved in TDM have primary responsibilities for planning, program administration, funding allocation, and evaluation. The proposed roles of TDM partners and agencies are different than the structure of the program as it exists today. Specifically, the proposed changes to the roles and responsibilities of the TDM partners are as follows:
• **Transportation Advisory Board (TAB).** The TAB remains responsible for distributing CMAQ funding to the various TDM programs. The TAB will determine the level of funding available for TDM and make final determinations on which programs are funded, either as ongoing activities or projects selected competitively.

• **Metropolitan Transportation Services (MTS).** MTS remains the regional organization for TDM strategic planning. New roles include providing recommendations to TAB for allocation of CMAQ funding for TDM programs, oversight of CMAQ TDM contracting performed by Metro Transit, and conducting region-wide TDM program evaluation in coordination with MnDOT and local and regional TDM partners. The contracting oversight will include an ongoing evaluation of internal roles and responsibilities to determine the best and most efficient way to deliver TDM funding to partners. Each of these CMAQ contracting and evaluation responsibilities will be applied uniformly across all TMOs and local TDM partners and adjustments will be made as recommended by MTS. MTS will also work to populate and provide a regional database of local TDM policies and regulations related to TDM ordinances and development review requirements.

• **Metro Transit.** Metro Transit remains the primary provider of regional TDM services and incentives as well as the provider of regional tools, such as the ridesharing web site and database. Metro Transit will also continue to provide CMAQ TDM contract management with local TMOs and other CMAQ TDM grant recipients. New roles include marketing the Van-GO! program which will be transferred from MTS in order that marketing of all regional TDM services and incentives are provided through one organization. Modified roles include targeting TDM efforts to residential and employment centers that are outside of TMO service areas.

• **MnDOT.** MnDOT’s primary responsibilities include coordinating with MTS to perform regional evaluation of the TDM program, potentially through the annual Omnibus survey. In addition, MnDOT will coordinate with MTS to incorporate TDM program results into future performance measures, particularly the impact TDM programs have on person throughput. As improvements are made to major corridors, especially those targeted with managed lane improvements, MnDOT will work with local TDM partners to promote high occupancy vehicle use in these areas. During construction periods, MnDOT will also work with local TDM providers on construction mitigation efforts.

• **Local Transportation Management Organizations (TMO).** Local TMOs will continue to implement their own TDM programs and services, pilot new TDM concepts locally, and continue the outreach and promotion of regional TDM services and incentives. New roles include following a streamlined process for monitoring participation in programs and evaluating the long-term impacts of local TDM projects. In addition, TMOs will be participating in a regional CMAQ funding application process (see TDM Study Goal 5).

• **Local government.** Local governments will also continue to develop their own policies that encourage use of transportation alternatives, such as transportation demand management ordinances and development review requirements. The cities and counties of the Metropolitan Council region will continue to support the TDM program through providing local matching funds and resources to CMAQ grant recipients.

The existing and new roles for TDM partners are reflected in a new organizational diagram for Twin Cities Region TDM programs (Figure 18)
TDM Study Strategy 2.2: Designate the responsibility of regional TDM program implementation within the Metropolitan Council to Metro Transit with oversight by Metropolitan Transportation Services (MTS). MTS oversight and grant management will ensure that equal attention is paid to all modes of transportation and not biased towards transit.

The recommendations for this strategy are the responsibility of both Metro Transit and MTS. These two subdivisions of the Metropolitan Council working together will ensure a cohesive regional TDM program is delivered to travelers. Recommendations by subdivision are:

- Metropolitan Transportation Services (MTS)
  - MTS will periodically review the regional one-stop web site and local TDM provider web sites to ensure current information is available for travelers.
  - MTS will be the primary author of the annual report on the TDM program that records the outcome of CMAQ TDM funded programs. Currently this effort is provided by Metro Transit. Transferring this responsibility to MTS will help
establish MTS as the regional organization that oversees the regional TDM providers, including Metro Transit and the local TMOs.

- **Metro Transit**
  - Metro Transit will host regular TDM provider meetings with TMOs and MTS where information can be shared and coordination encouraged between groups. Today these groups are meeting regularly, but this strategy ensures that coordination continues into the future. These meetings will also be opportunities to link to educational offerings, such as the University of Southern Florida’s Center for Urban Transportation Research (CUTR) periodic webinars on new advancements in TDM.
  - Metro Transit will ensure that the regional TDM services they implement are integrated into regional marketing efforts. The concept of the Metro Transit “one stop shop” web site will serve as a source of information on all modes.

**TDM Study Strategy 2.3:** Move the marketing of the Van-GO! program from MTS to Metro Transit. Having the vanpooling program marketed within the transit organization will promote vanpooling more equally with the other regional TDM services that are currently managed by Metro Transit.

Marketing Van-GO! through Metro Transit will likely boost participation in vanpooling as it will be marketed more consistently by all TDM partners and branded with the overall TDM program. In addition, potential vanpooling participants will find information easier when the program is bundled with other TDM services that Metro Transit markets.

4.3. **Targeted Markets**

**TDM Study Goal 3: Target Markets.** Target the geographic areas of the region detailed in Section 3.4.1 where TDM strategies will be most successful and would make more efficient use of existing transportation infrastructure and services. National research indicates that centers of high employment and high employment density are the most successful target markets for TDM activities.

**TDM Study Strategy 3.1:** TMOs will focus outreach and local services in territories where they are established. Metro Transit TDM Employer outreach services will primarily be focused on employment centers with 10 or more employees per acre and greater than 25,000 employees overall that fall outside of TMO service areas. These employment centers are highlighted in Chapter 3: Evaluation, Section 3.4.1.1. MTS will continue to track employment growth in the region and identify these employment areas in coordination with Metro Transit.

**TDM Study Strategy 3.2:** Local and regional TDM efforts should also be focused in corridors where the region has made significant investments in multimodal options, including transit service, managed/HOV lanes, and bicycling/walking facilities. The presence of these options enables TDM efforts to be more successful.

**TDM Study Strategy 3.3:** MTS will screen proposed transportation management organizations for funding eligibility for CMAQ and make recommendations to the TAB.

A standard set of criteria for transportation management organization (TMO) formation will help determine whether TMOs qualify for the CMAQ funding described in TDM Study Strategy 5.1.
If a new TMO forms and desires to share in regional CMAQ funding for TDM, the criteria will be used by MTS to determine potential success.

The recommended criteria for defining successful TMOs are presented in Figure 19. These criteria were developed by UrbanTrans from experience and research in the development of these organizations nationwide. Recognizing that each TMO service area has unique characteristics, these criteria can only serve as general guidelines for future TMO formation.

In Figure 2, the column labeled “high” displays the kind of characteristics that are highly desirable for successful TMO formation and implementation of TDM services. In the Stakeholder Commitment and Financial Sustainability categories of the criteria as many of the high characteristics as possible should exist in the area before a TMO is formed. If there are weaknesses in some of these categories, an action plan should be developed that identifies steps and actions to take to remedy these weaknesses.

4.4. TDM Strategy Recommendations

TDM Study Goal 4: Strategy Recommendations. The region will invest in TDM strategies with a proven track record of success. These strategies may include those that exist in the region today as well as piloted new strategies from national best practices.

TDM Study Strategy 4.1: Metro Transit and local TDM partners will continue to expand and refine current TDM strategies.

The current strategies implemented today by regional and local TDM partners include:

- Rideshare services
- Van-GO! services
- Transit services (MetroPass and CollegePass)
- Guaranteed Ride Home
- Commuter Challenge
- Bike2Benefits
- Parking for Poolers
- Local TMO outreach efforts in service areas (fairs, events, etc)
- Anoka County construction mitigation efforts
- Downtown Minneapolis TMO Commute Connection store transit pass sales, carpool/vanpool registrations and other commuter assistance
- St. Paul Smart Trips Individualized Marketing programs
- 494 Commuter Services Individualized Marketing programs

Recommended programs to refine include ideas drawn from national best practices and recent experience piloting new programs. Recommendations include:

- **Flexible employer pass products.** Metro Transit should continue to provide discounted pass products to employers (e.g., MetroPass). They can work to increase the flexibility of current pass contracts with employers to allow for monthly enrollment. Many regional transit agencies, including the Denver region’s FlexPass program, have started using monthly pass programs that let employers choose how many passes they would like to purchase monthly for their employees. In addition, many agencies have also implemented flexible programs where employees can choose if they want a pass month to month and have the option to purchase those passes pre-tax.

- **Enhanced social media tools to promote ridesharing.** With the development of the new ridesharing database tool, Metro Transit should also look for social media tools to increase registration in the database and carpool matches.

- **Individualized marketing.** Continue to improve the use of social marketing in TDM and build on the recent successful experience of residential-based individualized marketing project pilots in the region. Expand to target employers with individualized marketing programs.

- **Telework.** Depending on the success of the eWorkplace program, utilize the tools and resources that were built and implement telework programs at the local level.

- **Carsharing.** Work with local carsharing providers as demand for these services grows and is warranted in other parts of the region. Support carsharing services as they look for new markets by raising awareness and helping with promotion.
• **Construction mitigation.** Working in coordination with agencies such as MnDOT or county highway departments, Metro Transit and local TDM partners should look for opportunities to provide construction mitigation services such as temporary vanpool services, express transit services (shuttle or fixed route), and assisting employers to implement flexible workplace arrangements (telework, flex hours, and compressed work weeks). Both Metro Transit and local TDM providers will typically be supporting a larger construction mitigation program led by MnDOT and/or county highway departments by implementing specialized local TDM projects.

TDM Study Strategy 4.2: The region will pilot new TDM strategies at both the regional and local level. Initial concepts for these strategies include:

**Basic Strategies**

• **Ongoing incentive campaigns.** Develop ongoing incentive campaigns, modeled after the programs implemented in regions such as Atlanta and San Francisco.

• **Employer grants.** Create a grant program for employers to implement specialized TDM strategies such as telework, modeled after the Telework!va program.

• **Pre-tax benefit assistance.** Formally implement a pre-tax training and development program for employers. Metro Transit could also work with third-party administrators of these programs to facilitate implementation.

• **Promote new multimodal infrastructure.** As managed/HOV lanes, new transit services, bikesharing, carsharing, and other multimodal infrastructure is built or provided in the region, local TDM partners should develop campaigns and other activities to increase the use of these facilities. Partnerships with MnDOT, Metro Transit, and other agencies will need to be formed to achieve successful programs.

• **Implement TDM for special events and fare-free transit zones.** Special events, such as Twins baseball games, concerts, and large events in the downtown areas are good opportunities to encourage use of transportation alternatives. Strategies include offering discounted parking for carpools and transit pass discounts and/or fare free zones for pre and post event rides.

• **Trip Reduction Calculator.** Trip reduction calculators are typically online tools that calculate the personal financial savings in gas, parking, and vehicle maintenance costs by using a transportation alternative to driving alone. Users enter information such as trip distance, vehicle fuel efficiency, and frequency of travel and the calculator details how much they could save on a monthly or annual basis if they used a transportation alternative.

**Advanced Strategies**

• **Add TDM messaging to variable message signs and other real-time information sources.** Work with MnDOT and local governments to identify appropriate locations to add TDM-related messaging to freeway variable message signs. For example, other cities have successfully integrated messaging about available Park-n-Ride capacity and express bus travel times along congested corridors with HOV lanes.

• **Implement parking cash-out/parking opt-out.** Parking cash-out is a strategy for commuters that have parking paid for by their employers and are offered the cash equivalent of that parking if they decide to use transportation alternatives. Parking opt-
out is a similar case where parking is not paid for by employers, but still permitted (for example hospitals or government sites) and the employee has the option of opting out of the available parking permit for a significant subsidy from the employer to use alternative transportation. Piloting this strategy at the right locations can have a very significant impact on trip reduction, but high density of transportation alternatives and services are needed to support this strategy.

4.5. CMAQ TDM Funding Process

TDM Study Goal 5: CMAQ TDM Funding Process. Allocate future funding for TDM based on monitored performance and sound estimates of impact.

TDM Study Strategy 5.1: Categories of TDM funding will be developed that ensure critical activities are supported during each funding cycle.

The Twin Cities Metropolitan Area Travel Demand Management Program 2008 Annual Report documented the funding distribution of CMAQ TDM funds by organization. Table 12 contains these organizations and their respective CMAQ TDM funding percentages. It is recommended that CMAQ TDM funding categories in the future be designed based on the needs of regional and local TDM programs based, in part, on this table.

Table 12: 2008 CMAQ TDM funding distribution

<table>
<thead>
<tr>
<th>Organization</th>
<th>Percentage Funding</th>
</tr>
</thead>

<td>11%</td>
</tr>
<tr>
<td>Metro Transit</td>
<td>58%</td>
</tr>
<tr>
<td>Van-GO!</td>
<td>4%</td>
</tr>
</tbody>
</table>

Moving forward into future funding allocation processes for 2011 and beyond, CMAQ TDM funding should be structured through the following categories to clearly delineate regional versus local sources of CMAQ TDM funding:

- Regional services. These services include regional tools and services such as operation of the regional “one stop shop” web site, the ridesharing database, and the marketing of the Van-GO! program. In addition, evaluation and administration efforts conducted by MTS and Metro Transit will be covered under this category of funding.

- Baseline local TMO funding. This category is intended to provide TMOs with a steady source of operating funds for local outreach and promotion of the regional TDM program and related services.

- Competitive projects. Specific project grants will be awarded competitively for local and regional TDM pilot projects depending on funding availability. The emphasis of this category is to pilot new and invocative TDM ideas that may be successful enough to eventually warrant baseline local TMO funding or regional services funding.
The amount of funding available for TDM in all three categories above will vary between funding cycles and the availability of funding in the overall CMAQ program. Funding for each cycle will be determined by the Transportation Advisory Board (TAB) in a sub-process that uses funding set aside during the larger transportation improvement program (TIP) process. MTS will provide funding recommendations to TAB based on evaluated performance and specific identified needs.

**TDM Study Strategy 5.2:** Funding allocation for the competitively awarded projects will be determined through a biennial application process managed by MTS (for TAB) that is open to all public agencies, non-profits, and entities of the state.

The application process for competitively awarded local projects will serve as an open and transparent way to fund CMAQ TDM grants for the whole region. It is also a performance-based process to allocate funding to TDM strategies that will produce the greatest impact in terms of VMT reduction and other factors. Each regional and local TDM partner will apply to the TAB for a CMAQ TDM grant to fund a specific project. Before each funding cycle is posted, all local TDM partners will be invited to a regional TDM workshop where the ranking system for projects is finalized. A preliminary ranking system is shown in Table 13.
Table 13: Suggested CMAQ TDM Scoring Criteria

<table>

<tr>
<td>Level of innovation (new ideas or concepts not yet implemented in the region)</td>
<td>10</td>
</tr>
<tr>
<td><strong>Grand Total Maximum Points</strong></td>
<td><strong>100</strong></td>
</tr>
</tbody>
</table>

Once applications are completed, MTS will review the accuracy of the applications and give feedback as necessary to applicants on VMT savings estimates or other details on scoring criteria. All applicants will review the applications for accuracy and score the subjective-based component of the applications. The TAB will convene a series of meetings to make final ranking and funding decisions.

**TDM Study Strategy 5.3:** A new TMO that applies for any source of CMAQ TDM funding will be screened against the criteria established in TDM Study Strategy 3.3.

**TDM Study Strategy 5.4:** TMOs can expand their current service area boundaries to work with employers, governments, or other organizations with an interest in TDM. Funding for these expanded boundary projects will be eligible for the competitive grant funding summarized in Strategy 5.1. For those projects that demonstrate success, TMOs can permanently expand their service area boundary and may receive an increase in baseline funding to support efforts in that new area. For those projects that are not successful, the TMO boundary will not permanently expand into that area and Metro Transit will continue to provide a baseline level of service with regional services funding.

**TDM Study Strategy 5.5:** TAB and MTS will develop a funding cycle for TDM CMAQ funds that recognizes the shorter implementation timeline for TDM activities, relative to larger construction projects.

**TDM Study Strategy 5.6:** MTS and Metro Transit will work to streamline the sub-recipient process of providing funding for local TDM partners.
4.6. Performance Measurement

TDM Study Goal 6: Performance Measurement. Develop consistent measurement methods for evaluation of the CMAQ-funded TDM program.

TDM Study Strategy 6.1: Incorporate a series of questions to evaluate the effectiveness of the TDM program with the region-wide annual statistically significant surveys administered by MTS and MnDOT.

The addition of TDM questions to region-wide annual surveys is a recommended measure because it will provide information about the performance of the overall TDM program and individual efforts being conducted in the region. This method eliminates the potential for double counting between TMOs and regional efforts when they are assessed separately. It also provides a uniform basis to compile the total regional vehicle miles of travel (VMT) saved from the TDM program, which is a component of the VMT goal in Goal 8.

Regional TDM question themes should include:

- Length of participant involvement in regional and/or local TDM programs, such as the annual Commute Challenge, local TMO programs, and participation in ongoing incentive programs like Parking for Poolers.

- Participant’s awareness of the presence of local TDM strategies, many of which could be employer or site based. Examples include:
  - Charging for parking
  - Preferential parking for carpools/vanpools
  - Employer based financial incentives or tax credits to use transit or other transportation options
  - On site amenities such as bike lockers, day care, cafeteria, etc.
  - Alternative work schedules

- For those who are new recruits to transportation alternatives, questions should capture the primary mode to work as a result of involvement in the TDM strategy (e.g., did the person change their travel behavior due to involvement with the strategy).
  - For those who did change their behavior as a result of a TDM strategy, also record the frequency with which they use alternative modes currently and the average length of their trip.

- For those who use transportation alternatives currently, questions regarding how TDM services help them maintain their behavior. This is particularly relevant for TDM efforts like the Commuter Connection store where services like Metro Transit pass sales help commuters conveniently maintain their use of transit. It is critical to understand how these travelers are maintaining their travel behavior through the assistance of ongoing TDM services.
  - For these ongoing participants, also capture the frequency with which they use alternative modes currently and the average length of their trip.

TDM Study Strategy 6.2: Each local organization that implements TDM strategies will record the impacts of their programs in terms of new recruits to TDM and retention of current users. These
participation data will be used by MTS to develop the regional vehicle miles of travel reduction estimate for the entire TDM program.

- **New Recruits:** The local new recruits measure is recommended because it focuses on growing the number of participants in TDM strategies and it is easy to implement for local TMOs and other organizations. The measure should track new participants across different events, allowing organizations to evaluate what events were most successful in terms of recruitment. In addition, the measure should also identify what types of businesses (IT, healthcare, etc.) are growing in their participation with TDM, allowing local and regional organizations to recruit new participants from similar businesses.

- **Retention:** The local retention measure focuses on retaining current alternative mode users in their alternative mode due to TDM efforts. This measure provides important information to agencies about length of time that users remain in alternatives modes with the support of TDM and what types of efforts need to be made to retain them. The measure also enables local organizations to track what programs/activities have the highest participation rate and what activities may need to be modified. The measure is easy to institute and can be applied universally to all local organizations.

With both the new recruits and retention measures, the local organizations should provide this information to MTS. MTS will be the primary entity responsible for taking this information and developing the VMT reduction estimate from the results of participation in local TDM efforts. This will serve to streamline the VMT estimation process in several ways. First, parameters from the MTS-maintained regional travel demand model such as trip distance will be compiled consistently between the different activity areas where TDM strategies are implemented. Second, MTS will also standardize the methods used for estimating the impact of the wide variety of TDM strategies. MTS will need to develop these standard methods and equations for evaluation through collaborative efforts with the TDM partners.

MTS will also work with Metro Transit to compile the results from the regional ridesharing database, Bike2Benefits, Parking for Poolers, and other regional programs. Between both the local and regional results, MTS should ensure there is no double-counting between organizations, particularly in ridesharing.

**TDM Study Strategy 6.3:** Evaluation of local TDM partner programs will be distinct between the CMAQ TDM funding categories described in Strategy 5.1. TMOs will evaluate the impacts of their “baseline” services separately from evaluating the impacts of “competitive grant” funded programs that are intended to pilot new TDM ideas and strategies.

**TDM Study Strategy 6.4:** MTS and Metro Transit will work together to produce an annual report on effectiveness of TDM and its return on investment. All local TDM partner results will be included in annual reporting.

Currently the annual reporting performed by Metro Transit of the regional TDM program may be missing some local partners and TDM strategies. A comprehensive list of the TDM efforts ongoing in the region include:

- Rideshare services
- Van-GO! services
- Transit services (MetroPass and CollegePass)
- Guaranteed Ride Home
- Commuter Challenge
- Bike2Benefits
- Parking for Poolers
- Commuter Choice Awards and Best Workplaces
- Local TMO outreach efforts in service areas (fairs, events, etc)
- Anoka County construction mitigation efforts
- Downtown Minneapolis TMO Commute Connection store transit pass sales, carpool/vanpool registrations and other commuter assistance
- St. Paul Smart Trips Individualized Marketing programs
- 494 Commuter Services Individualized Marketing programs

These efforts should be tracked for their efforts in both recruiting new travelers to transportation alternatives as well as retaining existing users. The effort of collecting and compiling this information will serve as a good resource of information to report to the public on how CMAQ dollars are being spent. It will also serve as a good check against the regional TDM survey described in TDM Study Strategy 6.1.

The annual report should be circulated to decision-makers and others to increase the distribution of the annual report and overall awareness about the regional TDM program. A web site page available through the Metro Transit and/or MTS web sites should dedicated to these annual reports to facilitate information sharing. In addition, TDM program highlights should be included at events such as the Metropolitan Council’s State of the Region report.
4.7. New Sources of Funding for TDM

**TDM Study Goal 7: New Funding.** Develop additional sources of funding for the TDM program.

**TDM Study Strategy 7.1:** With a future documented evaluation of the TDM program, present these results to decision makers at MnDOT, local government, large employers, and others to build support for more funding of TDM activities.

**TDM Study Strategy 7.2:** Local TDM partners should work to increase the diversity of their funding and not rely exclusively on federal programs such as CMAQ. As seen from the diversity of TMA funding mechanisms nationwide summarized in Chapter 3, Section 3.2, most of the TMAs nationwide use a mix of local and national funding. Examples of local funding include employer-based TMO membership fees, fees for specific TMO managed services such as shuttles, transit pass sales, and customized employee trip plans, property assessments through special districts, and user-based fees to pay for specialized TDM services such as downtown employee transit pass subsidies paid by parking fees or revenue from the operation of managed lanes.

**TDM Study Strategy 7.3:** Encourage the development of TDM ordinances that require developer participation, financially and otherwise, in the TDM program. Monitor the effectiveness of these programs and present the results to regional stakeholders.

4.8. Regional and Local VMT Reduction Goals

**TDM Study Goal 8: VMT Reduction Goals.** The region will track the vehicle miles reduced (VMTR) due to TDM efforts from all CMAQ funded activities. Using a consistent methodology year-to-year, the VMTR will be compiled annually and compared to performance in past years.

**TDM Study Strategy 8.1:** MTS and Metro Transit will benchmark the progress of the TDM program annually.

Using the results of the performance measurement activities in Goal 6, MTS and Metro Transit will develop a region-wide estimate of the VMTR due to the TDM program. These regional agencies will ensure that all local efforts are reflected in these estimates as well as the results of region-wide surveying.

With the VMTR results compiled, MTS will compare the results of the regional program to the total VMT driven in the region annually for all trips. This total VMT is available from the biannual Texas Transportation Institute’s (TTI) Mobility Report. Table 7 in Chapter 3 displays the TTI data and results of 5 regional programs nationwide as well as the Twin Cities region. Table 14 below is replicated from Table 7 in Chapter 3 and shows that the current VMT reduced expressed as a percentage of regional total VMT is 0.38 percent. As MTS and Metro Transit benchmark the TDM program in the future, the goal of the program should be to match or exceed 0.38 percent.
Table 14: Results of the 2008 regional TDM program results compared to regional characteristics.

<table>
<thead>
<tr>

USING MODELS TO PLAN TDM PROGRAMS FOR NEW DEVELOPMENT

Peter Valk, Transportation Management Services
Presentation

• Good News...Bad News
• Case Studies
• Lessons Learned
Good News

• Anecdotal findings were primary data source

• Models bring together findings from 25+ years of evaluation and plan documentation

• Development by agencies offers ‘good housekeeping’ seal of approval
  – COMMUTER Model uses same time and cost coefficients as regional travel demand models
On the Other Hand…

- Do not account for site specific variation
  - Surrounding land uses
  - Site characteristics
  - Nuances of TDM program
- Do not include full range of TDM options
- Results must be used with ‘professional’ judgment
- Concern for relying on model results
Case Studies

• Workcenter
  – Century City (Los Angeles)

• Worksite
  – Seattle Children’s Hospital Master Plan

• Special Application
  – Corporate Relocation Analysis
Century City (Los Angeles)

- 176 acres
- 13MSF non-residential space
- 26 buildings housing 1,200 tenants with 40K employees
- 2,500 residents living in 1,800 units
Existing Conditions

• Good transit
• High % drive alone
• Expensive parking, but employers pay
• 9 large employers and 4 buildings have TDM requirements
• Perceived as congested
• Little coordination among sites
Analysis Process

1. Identify trip reduction target needed to balance forecast trips with existing capacity

2. Develop solid baseline data
   – Property Mgr, Employer, Commuter surveys

3. Identify existing mode share and commute management practices

4. Develop five TDM strategy scenarios using:
   – Transit service improvements
   – Financial incentives
   – Rideshare support services
   – Work schedules and telework
# Results of TDM Model Runs

* Shuttle modeled as 5 minute walk time savings for regional transit users
Use of Results

• Iterations based on client feedback
  – Less costly financial incentives; further enhance transit
• Develop costs
  – Apply ‘modeled’ mode share to costs
    • # of carpoolers ÷ 2.4/persons per CP * $100 per CP sign
• Start with low cost, low effectiveness and add
• Identify how to best implement
  – Employer, TMA, City
• Set targets for participation, mode share and phasing
Seattle Children’s Master Plan

2008
- 250 beds
- 2,000 employees

2028
- 500 - 600 beds
- 2,600 employees
- + 1.3 MSF
- up to 3,000 parking spaces

Area is congested at peak
Concern for increased traffic
Existing Commute Program

- $50 /mo charge for parking
- $50/ mo bonuses for not driving
- On-site carshare vehicles
- Daycare facilities
- On-site exercise facilities
- Compressed work week
- Flex time/Telecommuting
- On-site vehicle fleet
- Guaranteed-Ride-Home
- 100% annual transit pass
- Invest in local transit service

- Subsidized bicycle tune-ups
- Showers and lockers
- Secure bike parking
- 100% vanpool fare
- Incentives to VP drivers
- Priority CP/VP parking
- Internal rideshare matching
- Six shuttle routes to other facilities and transit connections
Children's Mode Shift 2002-2007

Graph showing the percentage of commute trips for SOV (solid orange), Non-SOV (light blue), and Est. CTR-affected employees (dark red) from 2002 to 2007. The y-axis represents the percentage of commute trips, while the x-axis represents the years from 2002 to 2007. The graph indicates an increase in the percentage of employees commuting by SOV and a decrease in the percentage of employees commuting by Non-SOV, with a notable increase in the estimated CTR-affected employees.
Challenge: Prove Effects of TDM

• Identify Enhancements
  – Commute services, facilities, benefits
  – Transit

• Needed more than ‘judgment’ findings to support program with City & community
  – ITE-type ‘seal of approval’ verification

• Multi-step “modeling” process
“Modeling Process”

• **Step 1: Develop Employee Transportation Strategy Packages**
  – Develop Trip Reduction from Shuttle, Parking and Alternative
  – Reduce Total Daily Trip Forecasts by Estimates Developed in Step 1
  – Model TDM Packages Using EPA COMMUTER Model
  – Develop Scenario Descriptions and Develop Costs

• **Step 2: Develop Patient Travel Program Options**

• **Step 3: Develop Neighborhood Travel Program Option**

• **Step 4: Balance Employee, Patient & Neighborhood Programs**
Strategy Packages

• Enhanced Commuter Services & Incentives (COMMUTER Model)
  – Triple ‘bonus
  – Moderate shuttle increase
  – Increase bicycling/walking emphasis
  – Extend transit pass benefits to all campus

• Transit (No model)
  – Extend transit pass benefits to all campus
  – Increase shuttle route LOS
  – Add Park & Ride service
  – Provide transit connections

• Parking Pricing/Management
  – Triple parking cost
  – Moderate transit enhancements (no model)
Results

• Increase parking to $65/mo
• Operate shuttle-to-transit service
  – 19% reduction in net new PM peak-hour trips
• Innovative bicycle programs
  – Increase bicycle commute from 6% (‘07) to 10% (‘28)
• Increase financial rewards for not driving alone
  – 17% reduction in new PM peak-hour trips in 2028
Use of Results

• Demonstrate effectiveness
  – Internal
    • Build credibility
    • Identify costs
    • Re-run to balance cost and effectiveness
  – External
    • City staff
    • Neighbors
Lessons Learned

• Model results must be used in conjunction with professional judgment
  – A tool to start with and not to end
  – Do the figures look “reasonable”?  
    • Past performance, local setting, external conditions (gas, less congestion)?

• Models have not been calibrated to ‘forecast’ existing conditions
  – Can models represent existing mode share?

• How can models be improved?
  – Compare to trip generation and mode share data of sites with and without TDM programs
Quantifying the Business Benefits of TDM

Quantifying the Business Benefits of TDM

Abstract
Transportation demand management (TDM) is more than carpooling. It is a set of strategies that fosters increased efficiency of the transportation system by influencing travel behavior by mode, time, frequency, trip length, cost or route. Many TDM strategies encourage the use of alternatives to driving alone to help lessen congestion and air pollution. The effectiveness of these efforts depends on employer cooperation and policies supporting these strategies. Employees’ use of transit depends on the compatibility of the employer work hour policies and attendance policies such as flextime with transit schedules. The ability of employees to take advantage of advanced traveler information systems to alter arrival and departure times to avoid congested periods depends on those same employer policies. Employer work-life friendly programs such as compressed workweek programs and telework reduce traffic and parking demands. Employer parking policies determine the availability and price of parking that influence mode choice by employees. The provision of bike and locker facilities by employers can make the difference between someone choosing to drive or use a non-motorized method.

Public transportation professionals have long believed that TDM provides a variety of benefits to employers. Telework programs can improve productivity, enhance recruitment and retention of employees, and reduce absenteeism. Compressed work week programs enable the employer to expand coverage to enhance customer service. Employers allowing employees to pay for transit passes and parking as a pre-tax benefit save payroll taxes.

The TDM industry must largely depend on empirical evidence of these TDM strategies implemented by employers. Most of the tool sets available to assess the impacts of TDM programs have focused on the transportation and air quality benefits. These public benefits may have little relevance for most employers unless they were subject to a trip reduction mandate. Ironically, TDM programs target employers to carry out their missions. Therefore, the quantitative evidence of benefits that accrue directly to businesses from a wide range of programs could offer a strong motivation for employers to begin, continue, and/or expand travel alternatives support activities.

The goal of this project was to identify the key business benefits of TDM and provide techniques for quantifying those benefits. This information should enhance the transportation professions understanding of TDM’s value to business. This increase in awareness, in turn, should allow agencies to improve levels of employer participation in TDM and other transportation programs and thus provide reductions in congestion and air pollution for Florida and other states. From this point, a subsequent step for future research is the enhancement of existing tools (such as a custom-designed software application) to assist employers in assessing the costs and potential business benefits of implementing TDM programs.
Conclusions and Recommendations
The review of the efforts to quantify business benefits by employers and agencies points to several clear conclusions and recommendations: (1) Increase public sector research and technical assistance efforts to evaluate employer TDM programs for the impacts on business, not only transportation and emission impacts (2) Expand the tracking of employer-provided commute benefits to include parking by the Bureau of Labor Statistics and (3) integrate, update, and aggressively distribute the tools.
Chapter 1 – Introduction

Many strategies to encourage the use of alternatives to driving alone to help lessen congestion and air pollution depend on employer cooperation and policies supporting these strategies. For example, employees’ use of transit depends on the compatibility of the employer work hour policies with transit schedules and system reliability. The ability of employees to make use of 511 and other advanced traveler information systems to alter arrival and departure times to avoid congested periods depends on employer attendance policies such as flextime programs. Employer-provided work-life friendly programs such as compressed workweek programs and telework reduce vehicle trips as well as provide employers with a means for increasing productivity and reducing costs. Employer parking policies determine the availability and price of parking that influence mode choice by employees. The provision of bike and locker facilities by employers can make the difference between someone choosing to drive or use a non-motorized method.

Despite these direct connections between employer policies and efforts of the transportation demand management (TDM) community to reduce congestion, little is known of the consequences of congestion on business, specifically the magnitude of these costs and significance to profitability.\(^1\) A NCHRP study developed a typology of congestion impacts on business was developed to begin to understand these consequences.

</table>

The NCHRP study concluded that congestion costs are a relatively small portion of the total cost of doing business for many organizations. At the same time, the study points out that businesses do not explicitly account for the costs of congestion. However, it noted that companies do adapt business practices to minimize the consequences of congestion (e.g., flexible scheduling of deliveries, hiring of additional drivers of delivery vehicles). Simply stated, most companies do not internalize these costs. They do not measure and track the costs of congestion so alternatives such as transportation demand management (TDM) can be evaluated as directly influencing business profitability.

NCHRP study did note that employees adapt to traffic congestion by moving and/or adjusting work schedules. Such adapted behavior comes at a considerable cost to the
employee and the company. The NCHRP report found that the direct costs of congestion and the indirect costs of congestion avoidance by employees such as residential relocation impose a substantial cost on business. The study suggests that strategies beyond providing additional capacity at critical bottlenecks should be considered to reduce the cost of urban congestion to business. Specifically, they noted the need for monitoring and communicating information about the system’s performance. Businesses are adept at adjusting their operations to minimize the costs of congestion, especially when the patterns are understood and relatively predictable.

The staggering cost of congestion is not lost on the business community. According to the U.S. Chamber of Commerce, “The cost of road congestion to the U.S. economy was about $78 billion in 1999, more than triple the $22 billion cost in 1982.”

While employers often agree that traffic congestion is a real problem, but they may not recognize the full range of potential consequences of congestion on their workforce. This view may mean they may fail to see the need for implementing TDM strategies to address those problems. For example, a study concerning marketing high occupancy vehicle (HOV) lanes along the I-95 corridor in South Florida found a disconnect between the traffic congestion problem as perceived by businesses and the affect on their organization. About 85 percent of surveyed employers strongly agreed that traffic congestion was a serious problem; but only 20 percent strongly agreed that traffic congestion could make their employees late for work.2

Approaches to force employers to assume more responsibility for congestion and its consequences via regulations have evolved. In most markets, regulatory mandates on large employers in severe or extreme ozone nonattainment areas have given way to market-based solutions or emphasis on sound business practices for addressing their needs. In addition to the general move toward deregulation, the issue of the cost to employers for carrying out these mandates helped push deregulation. The omission of benefits is akin to evaluating a company’s performance on its expenses but not considering its revenues or profitability.

Though not extensive, TDM research has focused on the costs of TDM to business while largely ignoring the savings that accrue from those investments. An often-cited study by Ernst and Young, Regulation XV Cost Survey, attempted to quantify the employer's costs for complying with the Regulation XV trip reduction ordinance (now referred to by as Rule 2202). The consultants prepared the study for the South Coast Air Quality Management District (SCAQMD) to estimate the annual compliance costs incurred by employers and the change in employee commute trips associated with those costs.

Ernst and Young sent the survey to each of the 5,763 regulated private and public sector sites in the SCAQMD's four county area and achieved a 19 percent response rate. Employers were directed to split their costs into four areas: training of the Employee Transportation Coordinator, plan preparation and approval, plan implementation and

---

maintenance, and other costs. In addition to cost information, the survey requested data about the employer type, location, and the number of employees at the site from 6 a.m. to 10 a.m. The following results were estimated after the survey data was extrapolated to the regulated population:

**Table 2. Regulation XV Cost Survey.**

<table>
<thead>
<tr>
<th>Performance Measure</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Regulation XV annual costs</td>

</tr>
<tr>
<td>Employees per reduced vehicle</td>
<td>29 employees per reduced vehicle</td>
</tr>
<tr>
<td>Average annual expenditure per employee</td>
<td>$105 per year</td>
</tr>
</tbody>
</table>

One major finding was the weak correlation between the amount spent and the commute trip reduction received. In other words, high expenditures were not necessarily result in the largest changes in average vehicle ridership.

However, the study also ignored the benefits accruing to those businesses associated with reduction in employee trips. Benefits such as decreased demand for parking; improved employee morale and productivity may offset some or all of the costs and show the cost-effectiveness of the program.

A follow-up examination of the results casts doubt on the accuracy of the self-reported data. Due to a wide variety of responses, the SCAQMD directed Ernst & Young to re-survey some employers to determine why there was a wide variance in annual per employee costs among employers. They interviewed a sample of 20 employers who responded to Ernst & Young's first survey to clarify their responses. The sample included 10 of the 50 employers reporting the highest costs and 5 each from the middle and lower levels. Ernst & Young found that 90 percent of the companies who reported the highest costs had overstated their costs. Over the entire sample, the total revised costs were about 50 percent *less* than the original estimates. This small sample may not represent the surveyed population. However, the full survey may provide a conservative estimate of the compliance costs.

SCAQMD also found that employers were including costs associated for providing the program to employees other than those regulated (i.e., employees who arrive outside the regulated morning peak period of 6 AM to 10 AM). The focus of this survey was on estimating the cost of complying with the regulation, not the total investments made by businesses. For example, an employer may have pragmatically decided to offer a particular benefit to all employees (e.g., 2nd and 3rd shift workers) rather than limit it to those who arrive within the morning peak period.
The investment in TDM is anything but trivial from a business perspective. For example, the State of Washington’s Commute Trip Reduction program estimates that employers invest $12 for every $1 spent by public agencies. However, SCAQMD survey, as many others, did not inquire about the benefits received by the employers for this investment (e.g., reduction in parking spaces). This glaring omission can mislead employers – as well as policymakers - as to the value of TDM program to the employer as well as the commuter and the community.

While the focus has been on the cost to business, there are also intangible business and societal benefits touted by government for the purpose of encouraging employer voluntary participation in commuter choice programs.

The transportation literature was largely void of rigorous studies that document the link between the TDM strategies and tangible business benefits such as reducing the need to build parking. Attempting to quantify the value of seemingly harder-to-measure benefits, such as improved employee morale and job satisfaction and reduced employee stress and attribute such benefits to TDM is also extremely challenging. While human resource (HR) managers have trouble measuring the value of work/life initiatives, some believe that the most significant work/life initiatives are the less tangible ones, such as flexibility and provision of day care facilities. The next section identifies methods for measuring the costs or savings for key business benefits.

These solutions aim at increasing the desirability among employers for TDM strategies to solve business problems such as employee turnover and parking. Understanding the role of the employer in influencing employee travel behavior is the first step toward addressing how to demonstrate the benefits of TDM to business.

Understanding How TDM Benefits Business

How people choose to travel is intricately linked with and influenced by the policies of their employer. For example, parking policies determine how much an employee may have to pay for parking or where they may park. Work hour policies affect the employee’s ability to adjust their schedule to catch a bus or carpool with a commuter who works for a nearby employer. Overtime requirements influence whether or not the employee is on a reasonably predictable schedule to make a monthly commitment to join a vanpool. The process of evaluating job performance and the degree of information technology support may determine the prospects for employee participation in telework programs at that company. Clearly, employer policies directly influence employee commute behavior on many levels.

---

A review of the literature found the following benefits cited when discussing the business benefits of TDM.

- **Reduce Overhead Costs.** Increased competition and need to build shareholder value place more pressure on businesses to lower their cost of doing business as well as increase revenues and/or margins. Strategies such as telecommuting and parking management can make a difference. Telecommuting can reduce office space requirements. Parking management can eliminate the need to build additional parking.

- **Enhance Employee Recruitment and Retention.** A shrinking labor force has increased competition for qualified applicants. Similarly, the cost of replacing an employee in productivity and direct costs can be very expensive.

- **Expand Employee Benefits at Low/No Cost.** Employers can take advantage of changes in the federal tax treatment of commute-to-work fringe benefits to benefit employees and reduce costs. Employers can now provide employees with a tax-free benefit and/or offer to subtract the cost of transit, vanpool, or parking as a pre-tax payroll deduction option.

- **Enhance Corporate Image.** Employers with environmental image problems and/or difficulties with their neighbors often seek to mitigate the problems using a combination of trip reduction strategies.

- **Solve Localized Transportation Problems.** Employers are well-aware of the value of banding together to address common problems. More employers are joining transportation management associations (TMAs) to address access and mobility problems in their immediate area.

- **Expand service hours.** Work hour schedules such as flextime, staggered work hour programs, compressed work week programs enable organizations to provide additional coverage with the same total number of employers.

- **Lower absenteeism and tardiness.** Employees may earlier time commitments to their carpool partner or to meet the bus. Telework may allow work to be accomplished when travel to the office isn’t possible.

- **Increase employment opportunities for the disabled and others unable to meet traditional work hours.** Telework provides an alternative to having to physical transport.

- **Reduce employee stress.** Employee health is significantly related to the distance and duration of the trip. People who are exposed to high levels of traffic congestion arrive at work with higher blood pressure than people who are not exposed. The more sensitive long distance commuters are to the effects of commuting on family life, the greater the inclination to try alternatives to solo driving.

- **Enhance employee productivity.** One of the oft-cited benefits of telework is productivity increase.

The factors that relate to the profitability of a business must be understood in order to relate TDM strategies in business terms. The following section identifies these factors.
Factors Contributing to Business Profitability

There are eight factors that affect the profitability of a business (See Figure 1). TDM strategies can affect one or more of these factors to increase the profitability. There are four main factors that directly change in profit (productivity, cost, margins, and revenue) and an additional four contributing factors (resource quantity, resource price, price, and quantity sold). These main and contributing factors are interrelated. Each main factor is affected by two contributing factors. Each contributing factor affects two different main factors. Understanding how the factors influence profitability will shed light on how various TDM strategies can benefit a business.

Change in Productivity – This factor is positively correlated with profit; i.e., profitability increases as productivity increases, all other factors being equal. Changes in productivity are influenced by changes in the quantity of resources used, such as the number of hours worked by employees, and the volume of products or services sold. Productivity increases, for example, as the sales volume increases for a given resource such as total hours worked. If sales per employee increase from 100 units per employee to 110 units per employee then profitability also increases.

Change in Costs – Perhaps the factor most focused on from a TDM perspective is the change in the costs. Decreasing the costs will increase the profitability holding all other factors constant. Strategies to decrease office space needs, for example, by introducing a telework program, are aimed at reducing overhead costs associated with the space. The quantity of resources used and the price of those resources affect the change in costs. For example, a reduction in square footage and/or reduction of the cost per square foot will reduce the cost of office space. A reduction in costs with the same margins, revenues and productivity factors will result in higher profits.

Figure 1. Interrelations of Prices, Products, and Resources to Profit.  

Change in Productivity (e.g., widgets/hour)  
Change in Cost (e.g., $ expenses)  
Change in Margins (e.g., 10%)  
Change in Revenue (e.g., $ gross revenue)  
Change in Resource Quantity (e.g, hours)  
Change in Resource Price (e.g., $/widget)  
Change in Price (e.g., $/widget)  
Change in Quantity Sold (e.g., # widgets)

4 Adapted from James L Riggs and Thomas M. West. Engineering Economics. Third Addition. 1986 p634
Change in Margin - The margin or the contribution to profit related to price is affected by the change in the unit price (e.g., price per product or service) and the resource price (e.g., cost to produce the product or service). TDM strategies can affect changes in margin most likely through changes to the cost to produce the product or service. For example, high absenteeism may require the company to hire additional labor to fill the production task. Reductions in the absenteeism rate may reduce the cost of labor and thus enhance the margins.

Change in Revenues – The remaining factor, change in revenues, is a function of the product’s price and the change in the amount of product sold. Though there has been little research to directly attribute TDM strategies to increases in sales, the fact that TDM helps some employers achieve the image of “green” company may contribute to increasing sales based on the consumer support for environmentally friendly companies. Many ISO 14000 companies are requiring suppliers to also becoming ISO 14000 certified may, in fact, require companies to take some environmentally friendly actions or affect sales.

In response to an inquiry about the role of TDM in their environmental management system, Verie Sandborg with Baxter International Inc., “Some of us at corporate are trying to make transportation impacts more visible. In our 2000 reporting, we gave an estimate of carbon dioxide emissions for employee commuting to be 100,000 metric tons per year, or approximately two percent of our total global warming impact. Some effort is also being made to require fleet cars to be fuel-efficient.”

Some organizations already include their TDM program in their EMS as part of a larger commitment. Beers, an Atlanta based company, began the ISO 14000 certification process in February 1997. Beers specializes in construction services for a wide range of markets. The company included each of its eight offices in the certification. As part of the certification, Beers employees set up 11 main environmental aspects in areas such as transportation, air emissions, endangered species and wetlands and energy conservation. They report that Beers saved over 43,581 vehicle miles through carpooling and public transportation. (20% of Beer employees use public transport)

Case Study: Beers Construction

Beers claimed to have achieved the following in the 18 months before ISO 14000 certification:

- Saved over $230,000 in waste removal cost by reducing, reusing, and recycling in the first half of 1999.
- An estimated 50,000 cubic yards of waste diverted from landfills.
- Saved over 43,581 vehicle miles through carpooling and public transportation. (20% of Beer employees use public transport)

Many TDM strategies are directed at reducing expenses for the employer. However, another method of presenting the impacts would be to relate what would have to happen
to one of the other factors to achieve a similar change in profitability. For example, TDM could relate the reduction of costs to increases in revenue that would have been required for have a similar contribution to profitability.

Many of these expenses affected by TDM would appear on a business’ income statement within the “Selling General and Administrative Expenses (SG&A)” line item. SG&A expenses consist of the combined payroll costs (e.g., salaries and commissions executives and employees) and related overhead costs (e.g., advertising, rent, office supplies, legal, accounting and travel expenses). SG&A expenses are completely separate from the other than the costs of readying the product for sale (i.e., Cost of Goods Sold). SG&A expenses as a percent of revenue are generally recognized as a leading indicator of administrative productivity and can provide an accurate picture of how well a company is managing the costs required for its sales revenue.

Limiting SG&A expenses to a certain percentage of revenue can be a significant challenge for almost any business. Controlling expenses is usually accomplished through tactics such as cost-cutting initiatives and employee lay-offs. The need for controlling costs can be due to a variety of reasons. For example, if a competitor lowers its price and the business must respond in kind then the business must seek to reduce the costs of production if it is to maintain a certain gross profit percentage. Companies may overlook the opportunity to control costs out of concern that the reduction of SG&A might reduce sales. However, the issue is one of efficiency rather than sales revenue.

One of the financial ratios used to monitor the business’ performance is the SG&A to Sales ratio. A steady or decreasing percentage of the SG&A to Sales ratio indicates that the company is controlling its overhead expenses. This ratio is the percentage of selling, general and administrative costs to sales and is determined by dividing the Selling, General & Administrative Expenses by Sales revenue.

<table>

<tr>
<td></td>
</tr>
<tr>
<td>Sales revenue</td>
</tr>
<tr>
<td>Selling, general and administrative costs</td>
</tr>
<tr>
<td>SG &amp; A as a percentage of revenue</td>
</tr>
</tbody>
</table>

As partially reflected in the large standard deviation in the above table, SG&A across companies and industries makes it difficult to generalize what is the appropriate SG&A
rate across industries and how to position the impacts of TDM. For example, SG&A expenses account for 16.3 percent for Best Buy\(^5\) and 24.1 percent of expenses for MCI.\(^6\)

One way to position the savings to SG&A is in terms of additional revenue necessary to maintain the same SG&A to sales ratio. For example, Costco's average selling, general and administrative expenses, or SG&A, per store grew 11.3% in fiscal 2000, 3.8% in 2001 and 4.3% in 2002, surpassing the rate of sales growth in each of those years. SG&A climbed to 9.4% of sales in fiscal ‘02 from 8.6% in 2000. Sales increases to necessary to offset increases in SG&A can be very significant. One report cites analysts’ views that “Costco needs to grow monthly same store sales by 70%-80% to offset further increases in SG&A.”\(^7\) Clearly, rising SG&A rates require companies to increase revenues to maintain their ratios. Falling SG&A rates would allow a company’s revenues to fall by an equivalent share (assuming COG also declined proportionately) and still maintain the same rate of profit.

There are several reasons why businesses may benefit from examining TDM strategies that affect SG&A expenses. First, businesses can track the SG&A ratio over time to assess its impact on revenues and profits to improve planning. They also may monitor SG&A as a measure of how the company is managing its knowledge-based employees. Finally, monitoring SG&A rations can help some businesses understand the marketing and sales expenditures that may be a significant portion of its costs. One study reported that the sales and marketing expenses accounted for more than 55 percent of SG&A expenses.\(^8\)

The key for controlling SG&A expenses is for each company to carefully review those expenses and maintain an ongoing review to further improve the bottom line. Increased control over SG&A should lead to increase efficiency, productivity, and profits.\(^9\) Positioning TDM strategies such as the introduction of pretax payments and/or co-payments by business for qualified transportation fringe benefits (as well as several other TDM strategies) offers an opportunity for a company to reduce its SG&A.

Benefits of TDM – Business’ Perspective

No comprehensive evaluation of business benefits of TDM was found during the course of the literature review. There are at least three plausible reasons why there is a void in the direct linkage of business benefits and TDM. First, evaluations on TDM focus on the motivations of the funders, typically public environmental or transportation agencies most interested in reducing vehicle trips, vehicle miles of travel, and/or emissions. Second, employers base commute related decisions on regulatory requirements and employee requests without the quantitative rigor of other business decisions. For example, TCRP B-4 Cost-Effectiveness of TDM study found that employers base decisions as to which are the most appropriate TDM strategies on employee requests and business objectives. Rarely were baseline measures on transportation impacts or business objectives identified at the outset. Or they may choose not to report the program’s impacts to protect their business advantage. Finally, the cause-and-effect relationship of specific TDM strategies is difficult to discern due to the numerous factors that could influence program impacts such as changes in gasoline prices and the economy.

The lack of data does not suggest that employers don’t value the contributions TDM makes to overall business goals. It is abundantly clear that employers do adopt TDM strategies and may exceed minimum requirements when they recognize the value of the programs to meeting business objectives. The following case studies summarize the programs and benefits as seen by from leading businesses.

Case Study: Walt Disney Company

A noteworthy example of a comprehensive TDM program aligned with business needs can be found at The Walt Disney Company in Southern California.10 The Walt Disney Company in Southern California is located in the South Coast Air Basin, which is regulated by the South Coast Air Quality Management District (SCAQMD) and subject to SCAQMD Rule 2202 to reduce emissions by various options including TDM. Several years ago, this SCAQMD changed the rule to allow companies to opt out of TDM programs by choosing another method of compliance, (e.g., scrapping old vehicles or paying on a per employee basis to an Air Quality Investment fund used to underwrite programs and services that demonstrate reductions in vehicle emissions.)

The Walt Disney Company chose to continue its 'good faith' effort to meet a 1.5 AVR instead of the other options. According to Linda Ballew, Manager Corporate Commuter Transportation, there were several business reasons why this was done:

- Scrapping old vehicles or paying a dollar amount per employee to the District does not help employees get to work;

---

10 Personal communication with Linda Ballew, Manager Corporate Commuter Transportation, Walt Disney Company
• By subsidizing transit for employees Disney is underwriting and supporting the expansion and development of public transit in the region.
• Disney has commitments to the communities in which it operates (cities of Burbank and Anaheim) to meet requirements under site-specific plans. Failure to meet these commitments could impact future development in this region.
• Disney has historically supported conservation of resources, air, water, land, and that tradition would have been inconsistent with the other compliance options provided by the District.
• Disney invests heavily in clean fuel technologies within the Disneyland and WDW Resorts, and for Cast shuttles. It would have been inconsistent with this long time emphasis for it to abandon its rideshare program.
• Parking at some locations is in critical supply and the reduction of vehicles is a business necessity.
• Disney encourages employee involvement in the environment at an individual level, both personally and professionally. To abandon support for ridesharing would jeopardize this position.
• In light of the 1994 Northridge quake, subsequent El Nino activity in the area, and the current concern for safety and security, having a fully realized rideshare system means that Disney can react quickly and effectively in transporting employees in the event of an emergency (this was proved in the 1994 earthquake).
• Program benefits are extended to all employees at all sites (regardless of regulatory status) and all shifts, 24/7, --about 38,000 employees, so Disney is doing much more than is required by the district.
• Moving from a "good faith" effort to a target based compliance option did not seem a good business decision for this company.

Currently, Disney offers the following comprehensive program in Southern California:

• Subsidies for public transit (equals 50% to a maximum of $60)
• Points for daily participation in vanpool, carpool, transit, bicycle, walk, telecommute and compressed work week (equals $1 a day)
• Bonus points for enrollment, referral and special challenge days and weeks
• Emergency ride home
• Vanpool program (company subsidized) -- Between 60-70 vans on average
• Customer service locations in two counties at four major locations
• Web site for recording and redeeming points
• Full marketing and promotion of services and incentives
• Management reports by division/dept. on activity
• Swipe card reporting for those without access to a computer
• Bicycle program and incentives
• Inter-site shuttles for L. A. County employees between buildings
• On-site purchase of subsidized (discount) train tickets
• Pretax transit and vanpool benefits (rollout to be completed by third qtr 2002)
• A 4/40 - 9/80 (compressed workweek) policy at the Disneyland Resort
• Fairs and informational events
• Opportunity drawings and gifts
• Other services include: commute assistance, ridematching, focus groups, newsletter, etc.

Elements of the program are available to Disney employees working in 10 states on the east coast:
• Pretax transit and parking benefits through WageWorks.

According to Ballew, Walt Disney Company realizes a range of quantitative and qualitative benefits:

• Reduction in size of parking structure (saved $2M) due to level of rideshare participation
• Saved significant costs ($200,000+) over hiring outside consultants to provide commuting data in development planning
• Reduced parking demand for Cast Members at Resort to offset potential shortfalls of parking on busy summer days (unquantifiable)
• Competitiveness in hiring (never been quantified)
• Meeting requirements of Environmental Impact Reports, which require traffic mitigation (not quantified)
• Keeping in compliance with the SCAQMD Rule 2202 (non-compliance can cost up to $50,000 a day)
• Keeping in compliance with Burbank Site Specific Plan (non-compliance could impact development)
• Keeping in compliance with the Disneyland Resort Specific Plan with the City of Anaheim (non-compliance would impact the development of a planned third gate)
• Providing a needed benefit to employees (unquantifiable)
• Helping to underwrite the development and expansion of transit services and routes in Southern California (unquantifiable)
• Coordinated with transit agencies and TMA/TMO's the development and planning of future transportation services (unquantifiable).
• Provides a backup plan for emergency situations (prevented the loss of millions in productivity after the 94 quake.
• Promotes the image of the Disney Company as an environmentally aware company (unquantifiable)

Currently, about one-third of employees participate regularly in Disney’s programs.

Part of the challenge in quantifying the business benefits of TDM is the lack of data from employers. This isn’t entirely surprising as Disney, for example, will not make cost information available outside the company. In the case of Disney, however, the costs are considered minimal, at a per head basis and are considered to be a very inexpensive benefit.
Finally, Disney has an investment well into the billions in Southern California; if traffic and air quality become significantly worse, it will impact the travel and resort business well into the millions. She states, “It is a small investment to provide a comprehensive rideshare program to help offset this problem. Hopefully, other companies will take our model and move to take this problem seriously also.”

As the literature and interviews with award-winning programs illustrate, the failure to quantify the benefits in business terms is not a deal breaker, even for those investing hard cash. There is an intrinsic value placed by many of these companies on the programs. These programs also tend to evolve as the employers seek to balance the program features with changing needs.

**Case Study: Nike**

Nike is an example of a business learning to adapt the TDM program to reduce their costs while increasing the benefits to the company. In 1992, Nike was offering employees $1 voucher per day, called “Nike Bucks”, to be used in the company cafeteria, gift shop, daycare center or fitness center. Employees using transit received a comparable discount on the cost of a monthly pass. As the number of Nike employees grew and moved to other locations, the voucher program became difficult to administer as well as costing in excess of $200,000. Nike replaced the voucher program with “Traveling Responsibly via Alternative Commuting,” or TRAC. TRAC offers monthly prize drawings, with prizes valued from $60 to $200. The program has yielded a lower drive-alone rate (79%) than with the Nike buck program (84%) and is costing $43,000 per year.

According to Linda Bainbridge, Nike’s transportation specialist, the Nike Buck program costs got out of hand as more people started to commute by alternative mode. She said she tracks participation in SOV trip reduction according to the number of persons who electronically sign up for monthly and quarterly prize drawings, in addition to the weekly ridership numbers collected for Nike’s shuttle from the work site to a light rail station ½ mile away.

The cost burden of the prize drawings approach is easier and cheaper than the Nike Bucks because it is a fixed cost so it does not matter how many participate. She believes that the prizes attract people to use alternative transportation; but she also said that many carpoolers do not register for the prizes and that while over 300 carpoolers per week sign up, the trip reduction survey, in which she surveys approximately 500 employees, indicates a participation rate of 24%.

While Nike is currently under a trip reduction mandate, their program started many years before the mandate. Nike has a corporate philosophy of “doing the right thing” on behalf of employees as well as for society. Since the program has management support, Bainbridge does not attempt to quantify benefits from the program. It comes down to management concern about business sustainability over the long haul. So the self-interest
is there in a desire to conduct business in a way that is perceived to sustain the company for the long term. 11

**Case Study: Bayer Corporation**

Similarly to Nike, Inc., the Bayer Corporation work site in Berkeley is mandated to conduct trip reduction activities but they do more than they have to because it makes business sense. Deborah Bellush, Site Development/Community Relations Manager, said that prior to the mandate, they already had a shuttle in place and had implemented carpool parking. According to Bellush, without the mandate, they probably would not be going to the lengths they now are. With the mandate, it is as though they think they might as well make it a good effective program if they have to have one anyway. Bellush reported that Bayer spends on the order of $300,000 per year on alternative transportation assistance with a participation rate of 400 employees out of 1,200. The program has been in place for 10 years.

She said there are benefits but they are very hard to quantify. Benefits from the program include a reduction in parking needs. The City requires employers to park on their own property. Since the commute is “horrendous”, participants are happy to have a program that improves their quality of life. Bayer pays 75% of the cost of a shuttle to a BART station that the rest of the community can also use, so there is a community relations benefit to Bayer. Bellush said that if everything else were the same between Bayer and another company, the $45/mo per employee subsidy for vanpooling would give them an edge by making Bayer an employer of choice.

While Bayer does not quantify many of the benefits, the cumulative value of the program means that the investment significantly exceeds development agreement thresholds. In an overview of the Bayer Trip Reduction Program for the year 2001, Bayer reported that the trip reduction program cost more than $288,000, as compared to the estimated cost of $35,000/year, as specified in their development agreement. Bayer also contributed $78,716 to the Berkeley Gateway TMA for the West Berkeley shuttle, which is $28,716 more than mandated under the 1999 Amendment to the development agreement.12

**Case Study: Georgia Pacific**

Failure to examine the costs and benefits of the extensive programs isn’t unusual. According to Robin Taylor with Georgia-Pacific (G-P), the company does not conduct surveys to relate the cost of their investment in commuter assistance to benefits derived. These costs are not trivial but the costs are compared with alternatives such as parking.

11 Linda Bainbridge. Transportation Specialist, Nike, Inc. Portland, Oregon (From TDM Review
12 Personal communication. Deborah Bellush. Site Development/Community Relations Mgr., Bayer Corporation, Berkeley, CA
Case Study: Georgia Pacific

In just one year, transit ridership among downtown Georgia-Pacific employees increased 10% and the number of carpools increased by 57%.

The teleworking pilot program measured improved productivity and job satisfaction and a reduction in absenteeism.

The Cumberland distribution center avoids a $100,000 parking expansion through carpooling, vanpooling and transit usage.

Georgia-Pacific was motivated to participate in The Clean Air Campaign to achieve three goals: further its environmental efforts, offer an attractive benefit for its employees, and, at one metro area location, reduce parking demand by 130 spaces to avoid a $100,000 surface lot expansion cost. Since 1997, Georgia-Pacific has invested more than $2.5 million in environmental projects across the country allowing the company to meet all three goals.

In the downtown corporate office, 55-percent of the company’s 3,000 employees participate in its Clean Air Campaign program. At the company's Distribution Division Headquarters in the Cumberland area of Cobb County, more than 16-percent participate and this location has successfully avoided the parking crisis that it faced in 1997.

The challenge in evaluating the impact of any TDM program can be found in the diversity of programs and incentives offered by the company. Georgia-Pacific offers employees: carpool and vanpool ridematching; subsidized vanpools; a subsidized transit pass program; alternative work schedules; teleworking; biking and walking programs. Ongoing education efforts include the use of brochures, periodic Lunch n’ Learns, email and the company Intranet. The Cumberland location was able to supplement its company transit subsidy with an additional discount offered by the area transportation management association.

Costs cited by Taylor include approximately $100 per participating employee per month for commuter assistance, which includes $70 per month for vanpool subsidy plus cash prizes and other perks.

G-P also has learned to adapt the program like Nike. The vans used to be fully subsidized at $100 per month per employee, costing G-P $8,000 per month per van. Now they have 11 operating vans, and G-P required participants co-pay $30 per month. So now vans cost $1,000 per month per van for the 11 vans. G-P is paying $132,000 per year in vanpool subsidies, which is offsets the need for additional parking spaces.

Unlike the previous examples, G-P is not required by a local trip reduction regulation or other mandate to provide these benefits. Taylor cites that the benefits accruing to G-P are what they get from the employee in return, which is improved productivity, improved morale, improved employee retention, and good public relations. The company recognizes costs a lot to get and retain good people, but this has not been quantified.

Georgia-Pacific was motivated to participate in The Clean Air Campaign to achieve three goals: further its environmental efforts, offer an attractive benefit for its employees, and, at one metro area location, reduce parking demand by 130 spaces to avoid a $100,000 surface lot expansion cost. Since 1997, Georgia-Pacific has invested more than $2.5 million in environmental projects across the country allowing the company to meet all three goals.

In the downtown corporate office, 55-percent of the company’s 3,000 employees participate in its Clean Air Campaign program. At the company's Distribution Division Headquarters in the Cumberland area of Cobb County, more than 16-percent participate and this location has successfully avoided the parking crisis that it faced in 1997.

The challenge in evaluating the impact of any TDM program can be found in the diversity of programs and incentives offered by the company. Georgia-Pacific offers employees: carpool and vanpool ridematching; subsidized vanpools; a subsidized transit pass program; alternative work schedules; teleworking; biking and walking programs. Ongoing education efforts include the use of brochures, periodic Lunch n’ Learns, email and the company Intranet. The Cumberland location was able to supplement its company transit subsidy with an additional discount offered by the area transportation management association.
Monthly drawings for prizes encourage continued participation. Other incentives include free car washes or oil changes for carpoolers; and complimentary access to the company health club showers for bike riders. During smog season, the company also institutes operations and maintenance changes by asking landscape contractors to postpone services on Smog Alert Days until after 6:00 PM.

Participation in the program is voluntary but the incentives and communications have resulted in a high percentage of participation. In just one year, transit ridership among downtown Georgia-Pacific employees increased 10% and the number of carpools increased by 57%. The teleworking pilot program also measured improved productivity and job satisfaction and a reduction in absenteeism. The Cumberland distribution center continues to avoid a costly parking expansion.

**Approaches to Assessing the Impacts of Business Benefits**

Similarities exist between measuring the business benefits of TDM and assessing the impacts of work/life interventions to address the changing needs of the workforce. According to Lobel and Faught, there are four main approaches to measuring the value added of work/life support programs.\(^{13}\)

- **The human-cost approach** highlights the reduced labor costs associated with specific interventions.
- **The human-investment approach** emphasizes the long-term payoffs associated with meeting employee work/life needs.
- **The stakeholder approach** identifies benefits that accrue to important organizational stakeholders, such as shareholders, employees, and customers, as a result of specific work/life interventions.
- **The strategy approach** demonstrates how work/life supports reinforce broad business strategies, such as globalization or providing superior customer service.

These methods also correspond to four criteria regarding the selection of approaches for measuring value. The questions include:

1. What is the specific work/life intervention?
2. How much does the intervention cost?
3. Who benefits from the intervention?
4. How is the effectiveness of the intervention measured?

The human-cost approach is the easiest way to measure the value that work/life investments and demonstrating the reduction of labor costs. Tracking absenteeism and turnover rates and costs before the intervention is offered and comparing those rates to

rates measured after the intervention is provided can do this. Another way is to compare rates between users and nonusers of the intervention. Turnover rates can provide the information needed to calculate the savings as a result of reduced employee termination costs, employee hiring costs and training costs.

In the human-investment approach, workers are assets in which the firm wants to invest. Work/life initiatives, including various TDM-related strategies like compressed work week programs, are investments in human capital rather than as a means of reducing labor costs. The long-term payoff tends to be retention of high-performing employees.

In the stakeholder approach, the emphasis is proving the value of the work/life initiative with positive impact on some stakeholder group of concern, such as employees, shareholders, customers, suppliers and the government. It is recommended to identify a wide range of possible stakeholders, then select the most relevant to consider. For example, a study by Chauvin and Guthrie showed that public companies that appeared on the list of best companies for working mothers, published by the magazine, Working Mother, had a small but statistically significant increase in their stock prices.

Whether the employers implicitly or explicitly quantify the benefits of TDM to their business, the need remains for tools to help quantify the business as well as the community benefits of TDM.

---

14 Professor Kathleen Christensen, City University of New York
Chapter 2 – Existing Tools for Calculating Costs and Benefits

This chapter provides an overview of the current tools commonly used to assist employers in predicting the changes in travel behavior due to TDM and/or estimates the benefits accruing to businesses. Four models are briefly reviewed: EPA’s COMMUTER Model, EPA’s Business Benefits Calculator, FHWA’s Commuter Choice Decision Support System, and FDOT-funded CUTR_AVR.

EPA’s COMMUTER Model

The Environment Protection Agency’s (EPA) COMMUTER Model is designed to analyze the impacts of TDM programs in regard to mode share, vehicle miles, vehicle trips and emissions. This model can be used to estimate the number of vehicle trips reduced to help estimate the savings by reducing the need to construct parking garage. It can also be used to measure changes in alternative work hour programs as well as changes in mode splits due to changes in parking and/or commute subsidies.

The COMMUTER Model uses two procedures for calculating travel response to TDM strategies:

1. Logit pivot-point model: A multimodal pivot-point model using coefficients and computational procedures from accepted logit-based mode choice models;

2. Look-up tables: The impacts of some strategies are estimated using relational factors from empirical research. The impacts are arrayed in lookup tables where increments of change are associated with particular types of programs, reflecting different application assumptions, levels of intensity, and setting.

The COMMUTER Model is essentially used as part of a three-step procedure, which can be followed for the area and employer worksite levels:

1. The user establishes a baseline by supplying essential information on current conditions (e.g., current mode split).
2. An analysis scenario is selected from among available program options.
3. Changes in peak and non-peak vehicle trips and vehicle miles of travel are calculated and used to estimate the change in emissions using the logit component and look-up tables.

The baseline is established by entering data inputs for local demographic, mode splits, and alternative work schedule. The fact that COMMUTER is a pivot-point model means that the higher the levels of use of a particular mode, for example, then greater the impact. For example, an employer providing $1 per day subsidy for transit benefits provided to employees will have a lower shift to transit for an employer with a transit share of 2% versus another employer with a transit share of 10%, holding all other factors constant.
There are a wide variety of TDM program options that can be analyzed by the COMMUTER model. The four primary program areas include: site access; financial incentives and parking costs; employer support programs; and alternative work schedule programs. Table 2 shows the options under each of these areas, how they are measured and what additional information is required.

### Table 4. COMMUTER Model Inputs.

NOTE: For area applications (i.e., multiple employers), *workforce participation* represents the number of commuters who work for employers that offer the particular TDM program.

The COMMUTER Model is used to forecast the impacts of a variety of TDM program scenarios on VMT, vehicle trips, and emission reductions. However, there are challenges and trade-offs that employers may have to make in using it.\(^{16}\)

Since COMMUTER is based on pivot model, it needs a starting mode share to show any change. This poses a problem for employers with little or no use of a particular mode, such as vanpooling. In order to get the model to recognize vanpooling and a mode share greater than 0 must be established as the starting point. In effect, the model will not show the impacts of new modes or options as well as changes to existing mode shares.

While the COMMUTER model is spreadsheet-based, establishing the baselines or estimating the changes due to certain strategies may be difficult for employers to estimate or even obtain help from the agencies to provide. For example, the section on transit improvements requires data on various changes to transit service (e.g., frequency, speed, etc.) that an employer may not be able to easily estimate. Employers may need to work with transit agency staff to estimate a set of inputs for the model.

The mode share input section also fails to include a “work at home” category. However, it appears on the results page. This can create a misleading picture and creates a situation in which mode share percentages have to be manipulated to remove those that work at home.

The level of effort supported by the employer will affect the impact of the programs and strategies. The COMMUTER model developed five scenarios (Level 0 = no program to Level 4 = subsidies and full-time employee transportation coordinators) to represent levels of support for the transit, carpool, vanpool and bicycle modes. The aforementioned look-up tables use values corresponding to these levels to adjust the final

\(^{16}\) Hagelin, Christopher A. “Opportunities and Limitations of the EPA’s Commuter Model” (unpublished) Center for Urban Transportation Research, University of South Florida.
results. The following table provides the general description of each level but some professional judgment may be used to determine the appropriate level. Financial incentives and disincentives (e.g., transit passes, parking charges) are captured separately and used by the logit model portion of the model.

The appendix contains screen captures showing the process of using the COMMUTER Model and the output obtained.

**Business Benefits Calculator**

EPA’s Business Benefits Calculator (BBC) is an online tool available on the EPA’s Commuter Choice website (www.commuterchoice.gov). The purpose of the tool is to assess the benefits and costs of TDM programs to the employer, employees and community. It is also a means for determining if the employer qualifies for the National Standard of Excellence (i.e., Commuter Choice Leadership Initiative), a program intended to brand employers in the country as among the best workplaces in the country for commuters.

Similar to other tools, BBC obtains information about the worksite such as state and location within their urban area (e.g., downtown, suburbs) and the organizational structure (See Figures 3 and 4). Since the qualified transportation fringe benefit option (Section 132(f) of the Internal Revenue Code) can reduce the taxes paid by employers, information about their corporate income tax classification is obtained.
Figure 2. Business Benefits Calculator Welcome Screen.

Figure 3. Business Benefits Calculator Input Employer Information Screen.
Similarly, employees may also received reductions in payroll taxes for participating in either pre-tax and/or transit/vanpool subsidy program. Information is collected about the average employee salary and the share of employees who make less than $84,900. The $84,900 per year was the limit where the federal government stops collecting FICA from employees and the matching by employers. In May 2003, the limit was raised to $87,000, retroactive to January.

One of the limiting factors of this tool is need to use average salaries. The distribution of salaries may yield different benefits for employers with the same number of employees and same total payroll (e.g., Company A with a few highly paid employees with numerous low-paid employees versus Company B with a lower standard deviation).

Parking costs are a major factor in mode choice decisions by employees. The BBC seeks to identify the amount, form of payment (e.g., pre-tax or not), and the level of employer subsidy. Changes to the cost of parking, for example, are used in the COMMUTER Model to calculate changes in mode choice. BBC developers estimated changes in travel – and parking – behavior for the BBC using the COMMUTER Model. The BBC look-up tables were based on the evaluation of ten strategies for three types of locations (CBD, urban, and suburban). In addition, two financial incentive strategies (transit/vanpool benefits and parking cash out) were analyzed in $10 increments up to $100 per month. For inclusion into the BBC, the impacts were reported for total vehicle trip reductions, as well as transit/vanpool increase (used to calculate total taking advantage of transit/vanpool benefits) and bicycle/pedestrian increase.17

![Business Benefits Calculator Input Employer Information Screen.](image)

17 Personal communication. Michael Grant, ICF Consulting
Employers must select at least one primary benefit options and at least three supporting benefit options in order to meet the National Standard of Excellence in commuter benefits and qualify for the Commuter Choice Leadership Initiative (CCLI). Employers must also offer access to a Guaranteed Ride Home program and meet a 14% target for the share of employees that do not drive alone to work to qualify as a CCLI employer. The next entry screen (Figures 5 and 6) is designed to allow the employer to pick strategies to implement as well as inform them of the requirements of CCLI.

The required benefits to meet National Standard of Excellence are:

- Guaranteed ride home
- Employer-paid Transit/Vanpool Benefits where the employer provides at least $30 per month in benefits or the full value of commuting costs
- Parking Cash Out where the employer provides the option of cash instead of parking. CCLI requires the employer to offer at least $30 per month and at least 75% of the actual saved costs of parking to classify this option as a primary benefit.
- Telecommuting as a primary benefit requires the employer to meet or exceed a 6% average participation rate as expressed as the percent of employees telecommuting on an average day (e.g., 10% of employees who telecommute an average of 2 days per week would not meet the standard)
- Employer-defined Benefit Program is a designed to allow employers to suggest that other strategies allow them to achieve the standards. Employers must achieve demonstrable benefits the Federal Commuter Choice Team must agree if this option is to qualify as the primary benefit.
Figure 5. Business Benefits Calculator – Select Benefits Screen.

Figure 6. Business Benefits Calculator – Select Benefits Screen (cont.).
Many of the other traditional TDM programs (e.g., ridematching, preferential parking for carpools) are treated as supporting benefit options for the purposes of CCLI but do contribute to changes in travel behavior. In addition, programs that don’t meet the minimum investment criteria such as employer-paid transit/vanpool benefits where there are less than $30 per month in benefits are treated as supporting programs. If the strategy is selected as a primary benefit, it may not be selected as a supporting program.

The other supporting programs include:

- Ridesharing or carpool matching
- Shuttles from transit stations
- Preferred parking for carpools / vanpools
- Secure bicycle parking, showers and/or lockers
- Financial incentives for bicyclists or walkers

Employers are then asked to estimate participation of employees with the introduction of the new program(s). A range of participation is estimated based on the employer’s own inputs based on values in the COMMUTER Model that are hard-coded into the BBC. These ranges are shown in grayed-out boxes. The employer has the ability to override these values.

Figure 7. Business Benefits Calculator – Participation Estimation Screen.
Based on these inputs, the Business Benefits Calculator estimates how travel behavior would change upon implementing the commuter benefit programs selected by the employer.

However, one of the COMMUTER Model’s and the calculator’s limitations is the assumption that the employer started with no commuter programs. In other words, it treats all of the programs as brand new. Many employers have one or more of these programs in place. If the assumption is made that COMMUTER Model accurately predicts changes in behavior, then the calculations may inflate the benefits. However, the use of ranges of impacts was a reasonable trade-off between simplicity and accuracy (at least accurate in comparison to the same program analyzed in the COMMUTER Model itself).

In recognition of this limitation, the BBC advises organizations that already have a commuter benefit program to use the low end of the range to represent the change in use for a particular mode or strategy. According to the documentation, the estimated range was developed by examining program scenarios for employers in different types of metropolitan areas.

After entering in the above information, the employer can view the results in the form of an easy-to-read summary. The summary provides an overview of the total annual costs and benefits, the direct costs and savings to the employer and employees, facility savings, recruitment and productivity benefits, and community impacts such as the change in emissions.

For Details or to Change Assumptions
The aforementioned savings depends on some fundamental assumptions regarding everything from administrative time spent managing the various programs to current gas prices to the dollar value of employee retention. The following summarizes some of the assumptions as documented in the BBC. The next chapter will provide some guidance in refining some of these values (e.g., the cost of turnover) that may significantly increase the benefits calculated by the BBC.

**Administrative Time Estimates**

BBC notes that the time to administer a program can vary considerably depending on employer size and the way programs are administered. For example, the range of time to administer a commuter benefits program (i.e., enroll employees and distribute passes or vouchers) ranged from only hour per month to a full-time position at 40 hours per week. The calculator default is set at 8 hours per month to administer a program with transit/vanpool benefits. Time could be greater or less depending on the number of employees, number of office locations, and whether administration is outsourced. The calculator default value for administering other TDM programs is set at 4 hours per month though geographic and organizational factors will also affect this value.

**Employee Gas and Auto Maintenance Cost Savings**

Multiplying the average cost of driving per mile by the expected number of miles reduced by employees results in the reduction in driving expenses among employees. Estimated gasoline costs and other vehicle operating-related costs (oil, maintenance, tires, and per-mile vehicle depreciation) are used to calculate the per-mile driving costs. Vehicle ownership costs, such as vehicle financing, insurance, license, registration, taxes, and annual depreciation are not included in this figure.

**Parking Cost Savings**

The expected reduction in employees driving to work daily multiplied by the average cost per space is used to calculate the parking savings. BBC adds “Since [employer-paid] parking expenses are deducted from corporate income [as a business expense] when calculating corporate income taxes, when an employer reduces parking, it saves the cost of the parking minus the corporate income tax savings associated with the parking space.”

**Office Space Cost Savings**

Office space cost savings are solely attributable to telecommuting by the BBC. Compressed work week programs, for example, are not figured into the savings. The reduction in office space is calculated by multiplying the number of employees who telecommute full-time by the average space used per employee. This figure is then multiplied by the estimated cost per square foot, which the user can change, to estimate

---

18 “Strategies for Increasing the Effectiveness of Commuter Benefits Programs” Transit Cooperative Research Program Report 87, Washington DC 2003 p.94-95
total cost savings. Apparently, the BBC does not make any adjustment for deductibility of rental expenses in the calculation of the benefit. The calculator also assumes home-based telework. It does not account for leasing space at telecenters.

**Recruitment/Retention Benefits**

Recruitment and training costs per employee are estimated at one-third of the average reported salary. The next chapter will provide a means of estimating the average cost of turnover. Generally, the costs of turnover approximate the annual cost of the departing employee. The calculator assumes a reduction in turnover from 1 to 3 percent depending on programs selected though the direct relationship between given strategies is not well-established.

**Increased worker productivity**

The BBC assumes productivity increases around 10 to 20 percent based on studies of telecommuting. Some employers may be skeptical of the productivity benefits of telecommuting since there are also some potential losses in productivity due to reduced personal interaction with co-workers.

Based on these findings, the calculator uses a default value of 10 percent productivity improvement for full-time telecommuters. The calculator assumes no productivity improvement with other commuter benefits since empirical data on these effects are not available.

**Reduced Vehicle Miles of Travel**

The number of vehicle miles reduced is calculated by multiplying the estimated number of vehicle trips reduced by the average vehicle trip length.

**Reduced Fuel Consumption**

Fuel consumption is calculated by dividing the number of vehicle miles traveled by the average miles per gallon of the U.S. fleet, 20.4 miles per gallon.

**Reduced Urban Air Pollutant Emissions and Reduced Greenhouse Gas Emissions**

Air pollutant emissions are estimated by multiplying the number of vehicle miles reduced by emission factors (in grams per mile) that represent national fleet averages. Actual emission reductions would vary based on location due to temperature, fuel standards, and the mix of the vehicle fleet, among other factors.

Carbon dioxide emissions are calculated by multiplying fuel consumption by factors to estimate carbon dioxide. Other greenhouse gas emissions are estimated by multiplying the number of vehicle miles reduced by emission factors that represent national fleet averages.
Commuter Choice Decision Support System

One of the newest tools is the Commuter Choice Decision Support System (CCDSS) [http://www.ops.fhwa.dot.gov/PrimerDSS/index.htm](http://www.ops.fhwa.dot.gov/PrimerDSS/index.htm) by the Federal Highway Administration. As stated in the companion document, this tool is targeted to “Employers that are trying to determine if a commuter program would be worthwhile for their site can use the CCDSS to determine potential benefits of a specific program. An employer who has already decided to start a program but is not sure what options to implement can use the CCDSS. By entering information about the worksite into the CCDSS, employers can obtain recommendations on specific strategies that may work best for their situation.”19

The CCDSS recommends commute options “most appropriate” for the employer’s needs, provides tips on how to get started and offers examples of effective strategies. This program advisor uses a simple checklist approach to gather information on employer motivations for implementing a TDM program, worksite characteristics and level of management support to recommend the top 5 options for the employer to implement from the following list:

1. Advanced route planning
2. Alternative work schedules
3. Bicycling and walking programs
4. Carpooling incentives
5. Financial incentives
6. Flexible work hours for employees
7. Live near your work programs
8. On-site employee services
9. Parking management
10. Real-time commuter services
11. Teleworking options for employees
12. Transit options and incentives
13. Vanpooling incentives
14. Worksite location and design

No impacts (e.g., benefits accrued to business or vehicle trips reduced) are calculated by CCDSS. It is intended to quickly point the employer to the strategies that would appear to make the most sense for the employer based on the issues identified by the employer and their self-reported situation.

The perceived employer benefits or issues listed in CCDSS are:

1. Improve ability to recruit appropriate employees
2. Increase employee retention / lower employee turnover

---

3. Increase employee productivity and reduce tardiness
4. Improve employee morale
5. Ease transition or move to relocated worksite
6. Reduce the need for facility expansion or relocation
7. Reduce the demand for parking
8. Enhance corporate image / be seen as a community leader
9. Reduce operating costs such as parking
10. Reduce tax burden
11. Want to update or enhance emergency preparedness plan
12. Need to comply with environmental or development requirements
13. Improve industry competitiveness

CCDSS recognizes that the unique characteristics of the worksite and organization will affect how employees commute to work. Information is collected with respect to worksite location, level of transit service and congestion frequency. CCDSS probes for information about the access to options such as whether the location is in pedestrian and friendly area. Recognizing the fact that some strategies won’t work without adequate facilities such as clothes lockers, showers, and/or bike storage facilities at the worksite for employees who choose to walk or bike to work. CCDSS also inquires whether there are nearby services where employees can eat, shop, bank, and conduct other personal business during lunch without having to use a personal car.

Based on the experience of the CCDSS developers, the CCDSS implies that the strategies selected should take into account several variables. These variables include the type of employer, the number of employees at the site, distribution of employees around the worksite, the relative mode split (not actual numbers but “most or few”, etc.) and parking situation. Employer policies are also considered such as the work hours at this site for the majority of employees, degree employees require their own vehicle for business, and whether or not the worksite includes jobs that would be feasible to conduct at home or other remote locations.

Finally, the CCDSS inquires as to the relative importance of commuting issues to the organization's management. It queries the employer as to management’s willingness to consider options to encourage employees to participate in a TDM program. For example, employers are asked if management consider purchasing equipment for new services (such as purchasing equipment for employees to work from home, paying for shuttle services, etc.) Provide financial incentives to employees (such as subsidizing the cost of transit passes or vanpool fares, reimbursing costs for employees to set up a home office, etc.)

The CCDSS is an easy to use web tool to quickly identified the strategies deemed most appropriate. As previously stated, it neither calculates the benefits or outcomes from these strategies nor estimates the costs of implementing these strategies.
CUTR_AVR – Worksite Trip Reduction Model

Using the results of research conducted previously for the Florida Department of Transportation, CUTR develop a model to predict change in average vehicle ridership (AVR) and its inverse, vehicle trip reduction (VTR) rate.\textsuperscript{20} Unlike the COMMUTER model, CUTR_AVR was built and validated based actual plans. It used more than 8,000 before and after employer trip reduction plans from Los Angeles, Tucson and Phoenix areas to build the model.\textsuperscript{21}

The model uses mode split information but only requires five incentives even though many others were examined. Picking the right input variables is critical to model development. A good subset of variables can substantially improve the performance of the model. The challenge is finding ways to select a good subset of variables to predict the change in average vehicle ridership while keeping the number input variables to a manageable level. The neural network software used to build the model uses a genetic algorithm that selects the variables. This algorithm is looking for sets of inputs (e.g., site characteristics and incentives) that act in a synergistic manner as good predictors of the output (i.e., change in AVR) rather than predicting the impact of every potential variable. The algorithm begins with population of random variable sets of limited size. As the algorithm progresses, the size of these variable sets will tend to increase if the problem requires larger data sets.

The idea of discarding potential substantial number of variables is sometimes hard to accept. It may seem unrealistic that only five TDM incentives can impact employee choice of how to commute. However, there are plausible reasons for their exclusion by the algorithm.

Some incentives that might seem effective, or even absolutely necessary for an effective TDM program, may not appear as input variables in the model. Some incentives such as marketing materials and Employee Transportation Coordinators (ETCs) were common to most companies in the data used to build the model. Thus their power to explain change in AVR was lost if nearly every plan had such an incentive. However, the fact that these types of incentive were not used in the model does not mean that the tactics aren’t necessary. It is essential that marketing materials and ETCs be put in place to support ongoing TDM programs, to improve awareness and understanding of any of the other incentives. So few companies may have offered other incentives such as facility improvements that it was impossible to accurately determine their impact.

Unlike the COMMUTER Model, CUTR_AVR treats the existence of an employer-provided financial subsidy as a dummy variable – it was either offered or not. One of the

\textsuperscript{20} CUTR_AVR model and users manual are available for download at www.cutr.usf.edu/tdm/download.htm
\textsuperscript{21} Winters, Philip L, Francis Cleland, Mark Burrs, Rafael Perez, and Michael Pietrzyk. “Neural Network Application for Predicting the Impact of Trip Reduction Strategies”. Center for Urban Transportation Research. University of South Florida. Tampa, FL February 1998.
reasons for the treatment of this financial incentive was the lack of information about the incentive contained in the various data sets. In addition, the extent of financial incentives offered by companies was likely constrained by the federal tax code (i.e., employers were less likely to offer more than the nontaxable amount allowed by the Internal Revenue Services. Tax-free transit subsidies were limited to $15 to $21 per month for all plans and any vanpool subsidy was subject to tax prior to 1993. It is assumed that when the variable indicating a financial subsidy is offered that it is at least $15 to $21 per month per employee using the incentive. Subsidies offered for multiply modes (e.g., transit, vanpool, etc.) could be expected to make a larger impact than the same subsidy for a single mode.

The model was used to develop the following table based on employer-provided incentives for a “typical” employer. The mode split for Scenario 1 closely replicates the mode split for Miami-Dade County in 2000.

**Table 7. Vehicle Trip Reduction - Scenario: Company with 200 employees and existing vehicle trip rate of 82.7 vehicles per 100 employees**

(74% drive alone, 14.5% carpools, 5% transit, 1.5% bike, 2% walk and 3% telecommute/compressed work week. 17% commute over 40 minutes)

Each of the above tools from the COMMUTER Model through CUR_AVR bring strengths and weaknesses as tools for estimating the impacts of TDM programs. The following chapter will provide guidance on how to estimate the costs of various strategies not adequately addressed in the aforementioned models or tools.
Chapter 3 Methodologies for Quantifying Select Business Benefits

The first chapter described the major factors that can benefit businesses (i.e., affect the profitability of the business). It also identified the business benefits often attributed to one or more TDM strategies. The Chapter Two described several tools to measure the transportation and air quality benefits of employer TDM programs (e.g., EPA’s Commuter Model). This chapter describes how to calculate select business benefits frequently cited but largely unmeasured as being associated with TDM.

While there are a variety of methods and tools for estimating impacts of TDM on vehicle trips and emissions, there is no standardized approach for measuring business benefits, in an acceptably rigorous manner. The methods used by business to estimate the costs of turnover, for example, are far less known to the public transit and TDM research communities. This chapter will provide information on how to measure the costs of turnover, absenteeism, and parking. A general introduction to a particular cost as well as available information as the current extent of use or cost will be provided. By providing detailed methods for calculating the cost or savings, the human-cost approach can be used which examines the rates and costs before the intervention is offered and comparing those rates to rates measured after the intervention is provided.

It also includes a method of calculating the savings accruing to employees and businesses for participating in the qualified transportation fringe benefit program. The detailed methods are accompanied with look-up tables to allow for quick estimates of the costs to business under a variety of scenarios.

Business Benefit: Reduction in Costs of Turnover

An organization’s success depends increasingly on its ability to attract and retain employees. The need for good employees is one constant shared by all types of organizations. Businesses invest substantial resources in recruiting employees, training to improve performance and creating opportunities for continuing growth. The loss of employees or turnover can increase direct and indirect costs to the business and, therefore, consume resources. TDM strategies such as compressed workweeks, transit subsidies and teleworking are examples of TDM strategies that can decrease turnover and attract a large pool of candidates.

Changing jobs happens quite frequently. In August 2002, the Bureau of Labor Statistics examined the number of jobs that people born in the years 1957 to 1964 held from age 18 to age 36. These younger baby boomers held an average of 9.6 jobs from ages 18 to 36. BLS defined a job as an uninterrupted period of work with a particular employer. Men
held an average of 9.9 jobs and women held 9.3 jobs. Both men and women held more jobs on average in their late teens and early twenties than they held in their mid thirties.  

Regardless of the amount of turnover that occurs, the need to attract qualified labor is not a trivial matter and will be an increasingly difficult challenge for more businesses in the near future as the labor pool and mix continues to change. Between 2000 and 2010, total employment is projected to increase by 15 percent, slightly less than the 17 percent growth during the previous decade. For the period covering 2000-2010, BLS projects a 1.1 percent growth rate in the labor force, the same rate as in 1990-2000. However, there will be changes in the mix. For example, the 55 and older cohort will grow 3.9 percent while the 25-54 will only grow at 0.5 and the 16 to 24 will grow at 1.4. The rate of growth of women in the labor force is expected to slow, but it will still increase at a faster rate than that of men.  

With competition for qualified employees expected to increase and the mix, strategies to attract the best candidates and to reduce employee turnover will come under more scrutiny by businesses.

One indicator that businesses see the need to be more competitive is the growing diversity of the benefit package from retirement and health benefits to subsidized commuting and flexible work place programs.

The Bureau of Labor Statistics is tracking the growth of some TDM-related benefits such as working from home. BLS tracks “flexible work place” as a formal program that allows employees who would otherwise work at the establishment to work either some or their entire work schedule at home. The following table captures the proliferation of portable technologies (laptops, cell phones, wireless connections, etc.) that is allowing more professional and technical members of the workforce to literally work anywhere at any time.

An organization’s success depends increasingly on its ability to attract and retain employees. Businesses invest substantial resources in recruiting employees, training to improve performance and creating opportunities for continuing growth. The loss of employees or “turnover” can increase direct and indirect costs and, therefore, the need for additional resources.

The purpose of this section is to identify the positive and negative consequences of employee turnover on the individual, work group, and organization. With an understanding of the consequences, TDM agencies will be better equipped to identify linkages between business problems and TDM strategies.

In introduction to the terminology is in order. Employee turnover is the rate of employee movement into and out of the organization over a given period. There are two types of movements: additions and separations. There also are two types of separations: voluntary (employee-initiated) and other (firing, death, retirement). Voluntary separations can be further classified as avoidable or unavoidable separations. Unavoidable separations are those that the company has no control such as the job transfer of a spouse. Avoidable separations are those that the company could have prevented in some manner. Raising the pay of an employee who has another job offer or providing a transportation allowance for

Case Study: Marriott Worldwide Reservations Center

According to David Barwick, Human Resources Manager for Marriott Worldwide Reservations Center, 40 percent of potential recruits could not be hired due to personal transportation challenges. Efforts to improve transportation included coordinating transit schedules with MWRC’s primary day shift, adding a Cobb County (Georgia) Transit bus to an existing route to accommodate late-shift workers, and extending service from 10 p.m. to 11 p.m. MWRC also enrolled in Cumberland Transportation Network’s TransAdvantage program for discounted bus and rail passes. Ridematching helped put over 270 workers in carpools. MWRC also offers Guaranteed Ride Home, preferential work schedules, and vacation time as incentives to use alternative transportation. As a result, MWRC’s turnover decreased 87 percent, saving the company $200,000 in 1998. The transportation program allowed them to expand from 90 employees to over 300 employees in two years.
employees who work in a high cost area are examples of prevention techniques to address avoidable separations.

Regardless of the reason, the loss of an employee can have positive and negative consequences on the individual and organization. Potential moderating circumstances can affect the nature and extent of the consequence including the cost of turnover. For example, some jobs, especially those with a high degree of customer-contact or those at the policy-setting level, can have a significant productivity and cost impacts throughout the organization. Other jobs such as those in the fast food service industry with predictable levels of turnover or limited customer contact can be replaced with less impact.

There are numerous possible consequences facing the individual who leaves the job, each with potential moderating factors. On the positive side of leaving the job, the individual may benefit economically and/or advance a career. They also may change jobs to move closer to their current residence or seek other employment when a company relocates from one part of town to another. For the departing employee, there may be negative consequences, too. When changing a job, the individual may lose seniority and benefits such as free parking or flexible work hours. The key moderating variable for these outcomes is the difference between the jobs.

Employees who remain behind after another employee departs can also benefit. For example, the opening may create a new opportunity for advancement or improved morale. Table 10 lists some of the positive and negative consequences associated with turnover for “leavers” and “stayers”.
Table 10. Consequences of Turnover for Individuals.

|                   | Opportunities for promotion (8,9) | Increased workload (3,5,6,9) | 1. Beliefs about why others leave  
|                   | More positive job attitudes (1,4,7,9) | Decreased performance (3,5,6,9) | 2. Social relationship to leavers  
|                   | Increased performance (3,5) | Stress and uncertainty (6,9) | 3. Task interdependence  
|                   | Stimulation at work (2,9) | Less positive job attitudes (1,4) | 4. Status of leaver  
|                   | Initiation of search that results in better job (1,6,7) | Loss of friendships (2) | 5. Performance of leaver  
|                   |                          |                              | 6. Job market conditions  
|                   |                          |                              | 7. Career orientation of stayer  
|                   |                          |                              | 8. Level in organization of leaver  
|                   |                          |                              | 9. Organization promotion policies |

*The numbers following each consequence refer to potential moderating variables thought to be most closely associated with that consequence.

Ultimately, the consequences of turnover are borne by the organization. Increased effectiveness of the individual and work group translates into increased productivity and profits. At the same time, the social costs of turnover disrupt the organization's cohesiveness. Possible positive consequences arising from employee turnover on the

---

organization could include increased effectiveness, new skills and abilities, and decreased conflict among employers. At the same time, disruption of the work flow to cover for departing employee and inefficiencies related to the new hire can negatively impact the organization.

If current labor market conditions make it a "buyers" market - the demand for jobs exceeds the supply then the duration and severity of the impact may not be severe. The same can be said for organizations with a strong program of advancement and a broad internal pool from which to draw replacement employees. Issues such as the difficulty of replacing the employee and characteristics of the replacement are moderating variables.

Given that there are potential benefits of turnover, why should companies worry about finding replacement workers? There are five major problems associated with new employees can be quite costly to the organization:

- Lost or dissatisfied customers
- Mistakes made and the time and expenses to correct them
- Fraud
- Shortages
- Higher overhead costs

For example, it isn't unusual to find new employees made 80 percent of the errors. High turnover, therefore, means more errors and more resources allocated to fixing the errors.

The cost of turnover can be surprising to some. Many employers think they miscalculated when they find turnover costs of $30,000 per employee. Even though the cost can be quite high, employers may not know the cost of employee turnover because it rarely shows up as a budget line item. Its costs are distributed all along the chain. As the first chapter explains, the direct costs often are only the tip of the iceberg. Employers find most of the costs are contained in the indirect costs. One of the keys to positioning TDM strategies as potential solutions to business problems is understanding the components of turnover and providing a basis for employers to evaluate the potential impact of those strategies. Employers then can measure the costs before an intervention (e.g., transit pass subsidy) is offered and compare those cost to those measured after the intervention is provided.

There are nine components that contribute to the cost of turnover:

1. Inefficiency of the Departing Employee
2. Inefficiency of those closely associated with departing employee
3. Inefficiency of position being filled while vacant
4. Out-of-pocket processing costs
5. Human resources department processing costs
6. Processing costs of other departments
7. Relocation costs (prorated across all hires)
8. Incoming employee inefficiency
9. Inefficiency of those closely associated with incoming employee

The following nine tables illustrate a process for calculating the cost of turnover. The values in the shaded boxes are the inputs required to estimate the cost though the actual values will vary. Table 21 totals the nine elements.

After estimating costs, employers can compare these costs to investment in strategies to reduce turnover. Table 22 shows data about the cost of turnover that can be used to estimate the “breakeven” point, expressed in terms of the number of employees retained by the employer. Assume the average cost per turnover was $40,000 and the average salary and benefits of the employee was also $40,000. The employer would recoup its investment of $100,000 (or $100 per month for 83 employees) in 12 months by reducing the number of employees leaving by five.

Of course, there is no assurance that a particular intervention such as the introduction of a telework program or the inclusion of a day care center will reduce turnover by such an amount. The above example does place the investments in the context of the business
objective – reducing turnover. Additional research is needed on the linkage between TDM and business benefits. Until then the question remains whether TDM agencies can actually have a substantial impact on these organizational variables through changes in either employer TDM policies or the incentives.

Any program of turnover control, including TDM strategies aimed at reducing turnover, must begin with accurate data on employee separations. Only with such information is management able to:

- Determine whether the rate of turnover is cause for concern, particularly by comparing data with national or industry averages.
- Identify major causes of employee separations, with special emphasis on avoidable separations and absences.
- Carry out measures for reducing the rate of turnover.

Exit interviews with employees or internal surveys are methods used by companies to identifying the major causes of employee separations. TDM agencies can encourage employers to include commuting-related issues in such exit interviews. For example, issues such as the price, availability or location of parking may be major concerns for a downtown employer. Strategies such as preferential treatment of carpools in assigning spaces may be a low cost way for reducing turnover. Long travel times or the quality and/or lack of transit service may be other issues employers may wish to examine, especially employers planning to relocate. These concerns may contribute to an employee's decision to leave.
Business Benefit: Reducing the Costs of Absenteeism

Absenteeism and lateness are two of the most costly and disruptive employee problems faced daily by all business operations. Employee absenteeism occurs when an employee fails to report for work as scheduled. Organizations may classify absences as “excused” and “unexcused”. Organizational policies communicate the acceptable norms from the organization to the employees. To provide a sense of the extent of the problem, the following tables provides information about the absence and lost work time rates for various occupations.

Source: Bureau of Labor Statistics

---

a. Absences are defined as instances when persons who usually work 35 or more hours a week worked less than 35 hours during the reference week for one of the following reasons: Own illness, injury, or medical problems; child-care problems; other family or personal obligations; civic or military duty; and maternity or paternity leave. Excluded are situations in which work was missed due to vacation or personal days, holiday, labor dispute, and other reasons. For multiple jobholders, absence data refer only to work missed at their main jobs. The absence rate is the ratio of workers with absences to total full-time wage and salary employment.

b. Hours absent as a percent of hours usually worked.
According to the Society of Human Resource Managers (SHRM), the three common ways of measuring absenteeism are incidence rate, inactivity rate, and severity rate. The incidence rate is a measure of the number of absences per 100 employees during any given work period. It may be adjusted to reflect a particular group of employees (e.g., employees by shift). The inactivity rate focuses on the share of time that is lost due to absenteeism. The total hours of absence is divided by the total scheduled work hours to calculate the inactivity rate. The severity rate measures the average time lost per absent employee during a specified period. The average number of hours lost by absent employers is divided by the average number of hours normally worked by the employees who are absent to estimate the severity rate.

It, therefore, becomes extremely hard for supervisors and managers to run a productive and efficient operation that runs on schedules based not only on time, but also on a specific number of employees. The cost of lower productivity, scheduling difficulties, overtime costs, lower product quality, damaged or downgraded products, shipping problems, customer service delays, and more cost millions of dollars annually.

According to the 1999 CCH Unscheduled Absence Survey by CCH Inc, Personal illness and family issues tied as the two most common reasons for unscheduled absences, each at 21%, followed by personal needs (20%). Quickly gaining as reasons were stress and entitlement mentality, each accounting for 19% of unscheduled absences. Stress has seen a 316% increase as a reason for absenteeism since 1995.\(^{25}\)

There are numerous challenges in measuring absenteeism or comparing the impacts of various interventions across employers. In order to effectively capture the data, it is necessary to make the time interval of recalling absences correspond to a relevant unit of time according to the work cycle and absence control system. For example, you would ask a teacher how many times s/he was absent within the last semester of a school year rather than over the past year. When unable to determine their relevant unit of time, the time interval must be long enough to allow for reliability but short enough to avoid memory loss. A review of the literature has shown that people begin to estimate instead of enumerate when the recall task is over a couple of months or involves more than a few events. Generally, 3 to 6 months is the suggested time frame, but it should be noted that there are seasonal variations in absence rates.

Perhaps most importantly, one must determine what constitutes absenteeism. Most often it is expressed as total time lost or frequency but some measure percentage of absence, 1-day absences, or frequency of absences.

Fundamentally, the assumption must be made that asking questions about absenteeism may be viewed as asking threatening questions about their behavior, which is directly related to why the majority of people underreport their absences. Attendance at work is well understood by employees to be a highly valued behavior by employers. To minimize this, Johns recommends the use of longer questions that assume s/he has been absent, such as “People have many reasons for missing work. Most people miss an

\(^{25}\) USA Today (Periodical) v. 128 no2659 (Apr. 2000) p. 4-5
occasional day once and a while. How many days of work did you miss in the past month?"26

The following example lists the steps necessary for calculating the cost of absenteeism for a company with 500 employees.

Table 24. Estimating the Cost of Absenteeism.

</tr>
</tbody>
</table>

The following table relates the total maximum investment allowed to reduce the cost of turnover by a targeted amount. The budget numbers are based on investments per 100 employees. For example, if the current cost per employee due to absenteeism is $600 per employee for a company with 500 employees and they expect the TDM program to

reduce the cost by 20% then the company could budget up to $30,000 to recoup the company’s investment in absentee reduction within one year.

Business Benefit: Reducing the Cost of Parking

Shoup and others have well documented the role of parking on mode choice.27 According to Shoup, “When commuters paid for parking, they drove an average of 53 cars to work per 100 employees. When commuters parked free, they drove an average of 72 cars per 100 employees. These studies show that, per 100 commuters, employer-paid parking replaced commuters’ payments for parking 53 cars (the number driven to work when commuters paid for parking), but also stimulated a 36 percent increase in the number of cars driven to work.”

Parking is the most prevalent commute benefit offered by employers. The provision of parking is seemingly so prevalent that surveys such as the employer benefit survey by the BLS do not track it. To gather information on the extent of employer-provided commute benefits of all types (parking, transit and carpool/vanpool), a national telephone survey of 603 employers was conducted in 1995. The survey found that parking benefits were provided by 80% of employers whereas vanpool/carpool benefits are provided by only 3.2% and less than 1% offer transit benefits.28

</tr>
</tbody>
</table>

This survey also sought to obtain an assessment of employer practices with respect to the provision of employee transportation benefits, including parking. As the report points out, the reasons for providing parking are not decision factors. The provision of parking by employers reflects a “continuation of long standing arrangements that have not been re-examined or reflect a pass through from employers to employees of a resource that does not have a market.” Only the fourth most cited reason recognizes the value to the business interests of the company.

</tbody>
</table>

Employers were asked to estimate the time spent administering each of these programs. Employers estimated the mean value of 7 hours per month to administer transit benefit program and 1 hour per month for the carpool/vanpool program. Perhaps the most revealing about attitudes regarding parking, is that most employers reported that administering the parking program required no time. Clearly, the costs of parking are not well-understood by the business community responsible for commute-related programs. The following section will outline the costs and a method for calculating the costs.

The cost of parking has two major components: capital (including construction) and operating. The capital cost for parking depends on numerous factors including land, design, development, and construction costs. Operating costs may include attendant, regular maintenance on the facility, security, etc.
Table 28. Construction Cost per Parking Space.

<table>
<thead>

</tr>
</tbody>
</table>

The following tables estimate the cost of constructing a new surface lot or above grade structure, with and without the need to acquire the land. Each scenario includes two financing periods – 10 and 20 years. Regardless of the scenario, it becomes abundantly clear that the cost to construct and maintain a parking facility would require significant revenue per month to breakeven. Given that employers provide most of the parking to employees for “free”, the employer is incurring this expense in SG&A.

Changes in parking demand will depend on the TDM program strategies offered. The COMMUTER Model and CUTR_AVR model provide the means for estimating the change in vehicle trips and, therefore, potential reductions in parking demand. As one might expect, the amount of vehicle trip reduction can vary significantly depending on the incentives and disincentives offered by employers. A review of the literature finds reductions in vehicle trips in the 20% to 40% range are possible though not typical.
Business Benefit: Employer-Provided Commuter Benefits

The "qualified transportation fringe benefit" (QTFB) is a provision of the Internal Revenue Code (IRC), Section 132 (f), that permits employers to subsidize their employees’ cost of commuting to work by transit and vanpools up to $100 per month. Up to $190 per month can be provided by employers to employees for parking at or near an employer’s worksite, or at a facility from which employee commutes via transit, vanpool, or carpool. It also allows employees to use pre-tax dollars to pay for their qualified transportation fringe benefits such as transit passes, vanpool fares, and qualified parking.

Employers are not required to provide the QTFB. How and under what circumstances an employer provides these benefits to its employees is entirely within the employer’s discretion. The employer may provide only one kind of benefit or all types of qualified transportation fringe benefits, at its sole discretion.

A closer look at commuting-related benefits finds that three percent of all private employers provide subsidized commuting in 2000, down from four percent in 1999. In 2000, this benefit was more common among companies with more than 100 employees with 5 percent versus 2 percent for companies with 1 to 99 employees.29 30

According to a survey by Bright Horizons Family Solutions and William M. Mercer, a human resources consulting concern, employers cited flexible work arrangements as the most beneficial work/life benefit.31 National statistics show that increasing numbers and proportions of full-time workers in the United States are able to opt for flexible work hours, allowing workers to vary the actual times they arrive and leave the work place. Among full-time wage and salary workers, according to BLS, nearly 28.8 percent had

---

flexible work schedules. About one-third of these workers (11.1 percent of the total) worked flexible hours as part of a formal employer-sponsored flexitime program.32

One frequently mentioned benefit cited is the ability to reduce taxes by providing commuter benefits to employees and/or allowing employees to similar to a flexible spending account. Section 132(f) of the Internal Revenue Code permits employers to provide employees tax-free qualified transportation fringe benefits. As of January 1, 2003, employers can provide employees with up to $100 per month for transit passes/vouchers or commuter highway vehicle. A commuter highway vehicle must hold at least 6 people excluding the driver, be used 80% mileage for commuting and carry at least 4 people including the driver.

Initially, employers may view the commuter choice tax benefits like other cafeteria benefit plans. However, there are several important distinctions between cafeteria benefits such as flexible spending accounts (FSAs) authorized under Section 125 and qualified transportation fringe benefit (QTFB) programs authorized under Section 132 that will have a bearing on participation and administration. Under medical flexible spending accounts, for example, eligible claims can be reimbursed up to the plan year election less any prior reimbursements. If the person elects to set aside $100 per month ($1,200 annually), for example, for eligible medical expenses and incurs $800 in eligible expenses in the second month, he or she can receive the full $800 though he may have only paid in $200 into the plan year.

Commuter benefit reimbursements programs also are different from the other traditional benefit programs that employers may offer their employees. These QTFB programs are not required to operate under a specific plan year concept with an open enrollment period; QTFBs can operate on a monthly basis (or other cycle). Therefore, all elections, deposits and reimbursements are calculated and recorded on a monthly basis, and each month is seen as a separate period of time from all other months employer’s employees participate. As a result, QTFB claims can only be reimbursed up to the balance in the account when the claim is processed and can not to exceed the IRS monthly maximum. Therefore, in the first month, the employee, in effect, pays twice for the same transit pass. For example, the employee’s pay is deducted $65 for a transit pass in May. However, since this is a reimbursement program, the employee must also purchase the transit pass from the employer or transit operator and submit a receipt or proof of purchase/use to the third-party administrator (TPA) for reimbursement. The employee will then receive a $65 check from the TPA (i.e., from the $65 taken out of their paycheck in May). The lag time between the cash outlay by the employee and receipt of the reimbursement will depend on employer policies and the processing speed of the TPA.

Eligibility for these programs is quite broad. Any type of transit service, publicly or privately owned or operated, including bus, rail, subway, ferry, subscription bus, shuttle bus, and commuter highway vehicles under contract which provides general or special service on a regular and continuing basis to the public and/or employees are eligible uses

---

under Section 132. In addition, transportation in a commuter highway vehicle (vanpool) which is provided "by-and for" (on behalf of) the employer is eligible for the Transportation Commute Benefit. These types of vanpool arrangements are: employer-owned; employer-leased; employee-owned; employee-leased, and public transit operated/

Under Section 132(f)(2), an employee may receive a qualified parking benefit in addition to the transit or commuter highway vehicle benefit. The designated employee "prime member" (often the driver or the person assigned the parking space) who travels in a commuter highway vehicle (e.g., vanpool) that uses commercial parking is eligible for the parking benefit (up to $190/month), and at the same time he is entitled to the commuter highway vehicle benefit (up to $100/month). All other employees commuting in a highway vehicle who are not the "prime member" are only eligible for the vanpool benefit, not the parking benefit. Another employee might choose to combine up to $100/month for using transit and up to $190 of the qualified parking benefit to subsidize the employee’s cost of parking at a train station and riding transit.

While transit riders and vanpool riders are eligible recipients, carpoolers, bicyclists and/or walkers are not covered under the Transportation Commute Benefit. However, employers may offer incentive programs that would be taxable subsidies for employees who chose to walk, bicycle, or carpool to work.

As noted above, employers can give their employees up to $100/month to commute via transit or vanpool and up to $190 per month for parking. Such expenses are tax deductible to the employer and cost the employer less than providing the employee an equivalent raise in gross income.

Employers can also allow employees to use pre-tax income to pay for qualified transportation fringes. Even the employer does not provide a transit subsidy or co-payment; employers will save on payroll taxes. Finally, employers have the utmost flexibility in offering any combination of the transit and vanpool benefits and the pre-tax options up to statutory limits.

In addition to providing flexibility on the investment in the program, employers can offer the benefit to any employee or group of employees within the work force. The amount can vary among employees, it can be provided on a regular basis or once a year instead of a bonus, or it can be provided as recruitment or an incentive payment to address a problem such as recurring absenteeism. It can also be used only for a limited group of employees or available to all employees, at the employer’s discretion. It must, however, be provided for commuting expenses—not for personal travel.

Employer involvement must occur if the benefits are to accrue to the business and the employees. While an employee may buy transit passes without going through the employer, there is no way that the employee can obtain the tax savings without employer involvement. QTFB are employer-provided benefits that allow employers to treat benefits provided to employees in a tax-preferred way. The employee cannot deduct the amount when they file their personal income tax forms. However, the employer can treat the
amount they provide to their employees in the form of qualified transportation fringe benefits as tax free and excludible from gross income of the employee thereby giving employees a financial saving.

Employers certainly incur costs for implementing the program, primarily in the administration and record keeping areas. The employer’s record keeping requirements of the QTFB require, in the case of cash reimbursements, a bona-fide reimbursement arrangement to meet the adequate record keeping requirement. Even then cash reimbursement option only exists for employers where a voucher program is not readily available. There are exceptions to this prohibition against the use of cash reimbursement. Employers are allowed to used cash reimbursement if faced with extenuating circumstances such as incurring handling charges of more than 1 percent and/or unreasonable minimum dollar or volume purchase requirements (e.g., employer would be required by the transit agency to purchase 100 passes per month but they only have 20 employees who ride transit each month).

In the case of the voucher system used for transit or vanpools, employers need only maintain a record of the purchase of the vouchers. In all other cases, the employer must maintain adequate records, which reasonably demonstrates expenditures under the benefit. As an example, in the case of an employer who participates in a transit pass program by selling passes of a local transit provider at a discount, the employer should keep records of the pass sales to employees in addition to the arrangement with the transit provider(s).

If the employer utilizes a cash reimbursement system, employees may have to provide the employer with receipts or some record of their expenses. If the employee receives vouchers from his or her employer to pay for transit expenses, for example, he or she may not have any record keeping requirements but the employee may have to certify to his or her use of transit and monthly expenses to the employer. There is no employee record keeping requirements for purposes of any tax filing such as the annual personal income tax form. The amount of the fringe benefit an employee receives from their employer will not be included in an employee’s W-2 form, for example.

The IRS may make annual adjustments to the limits each December for the following calendar year. Increases triggered by cost of living increases only occur in $5 increments. However, the employer makes the decision if and when to increase the benefit or even whether to provide the maximum regardless of whether the employer or employee is paying for the benefit.

The following example is provided to show the savings that could accrue to one individual and her employer. Nita Ryder lives in Florida (no state income tax), is single, earns $30,920 per year, claims one exemption, takes the standard deduction on her taxes, and is a dedicated transit rider (Table 32). After the tax break signed into law by President Bush in 2003, she has decided to estimate the increase in her spendable income if she decided to use pre-tax income to pay for her $100 per month transit pass.

</table>

Using Table 34 to estimate her tax liability, the first column in Table 33 shows that without the pre-tax commute benefit program her net income after paying taxes would be $26,972. After paying for her monthly transit passes ($1,200 for the year), she was left with $25,772 in spendable income. However, under Nita’s employer pre-tax commute benefit option, she could choose to deduct $100 per month from her gross pay before taxes to buy the transit pass. As a result, her spendable income increased by $263 per year.

It should be noted that while her FICA contribution also decreased by $92 per year so did her employer’s matching contribution. As a result of this new program, Nita saved $263 per year and her employer saved $92 per year (less the discount that would have been received by the business when it deducts the expense as a business expense).

</table>

The annual increase in spendable income depends on the marital status, number of exemptions, the pre-tax benefit set aside and the adjusted gross income. The following tables provide estimates of the increases in spendable income for several scenarios. For example, a single person with 1 exemption making $40,000 per year would increase spendable income by $392 per year by using $100 per month in pre-tax dollars to purchase a transit pass or parking permit. A married person making the same amount would increase spendable income by $272 with the same $100 amount set aside.

</table>

The use of pre-tax payments for commute benefits provides employers with a cost effective method for increasing the spendable income of employees without increasing the gross salary (and any benefits based on the gross salary such as retirement, life insurance, etc.). In addition, the employer will save on payroll taxes. For employees earning up to $87,000, the employers pay 7.65 percent of the taxable adjusted gross income as payroll taxes (FICA and Medicare). Over $87,000, the employees no longer pay FICA. This amount matches the employee-paid amount. Lowering the taxable adjusted gross income, therefore, decreases the payroll tax paid by the employer. At the same time, the amount of savings accruing the employers (before claiming corporate tax deductions) is modest.

Chapter 4 – Conclusions and Recommendations

The review of the efforts to quantify business benefits by employers and agencies points to several clear conclusions and recommendations.

1. **Increase public sector research and technical assistance efforts to evaluate employer TDM programs for the impacts on business, not only transportation and emission impacts.** Businesses do attribute benefits to various TDM programs but no systematic, consistent method of measuring these benefits exists. In fact, some employers are reluctant to share results because of the perceived competitive advantage it provides. This project has compiled various techniques for measuring some of the major benefits of TDM. Establishing a standard methodology for measuring the change across employers would allow for comparison of the relative effectiveness of given strategies whether or not the information is shared with the outside world. Employers and agencies should be encouraged and supported to use the human-cost approach, tracking costs before the intervention is offered and comparing those costs measured after the intervention. This is perhaps the easiest approach. Ideally, comparing costs and between users and nonusers of the intervention would provide a means of assessing the relative effectiveness.

2. **Expand the tracking of employer-provided commute benefits to include parking.** The Bureau of Labor Statistics tracks subsidized commuting benefits and flexible work place information. State departments of transportation and groups such as the Association for Commuter Transportation should encourage BLS to add parking (including the employer-provided subsidized parking) benefits to the list. This addition would begin to allow employers to see parking as a benefit rather than a right. The tracking of the subsidy amount would increase its visibility as a Selling, General and Administrative cost to the business, and, thus, controllable.

3. **Integrate, update, and aggressively distribute the tools to estimate the impacts and costs/benefits of TDM to businesses.** Whether the employers implicitly or explicitly quantify the benefits of TDM to their business, the need remains for tools to help quantify the business as well as the community benefits of TDM. The current tools each bring particular strengths and weaknesses. An effort to more closely integrate the tools to assist business would be beneficial. The mere existence of the tools does not mean they are widely used, or even known to exist among the target populations. One tactic would be to provide TDM agencies with a copy of the Business Benefit Calculator javascript program to place on their own websites so their businesses in their areas could find it. It should also allow for the locals to customize the default values to their communities. Another tactic would be to establish self-paced online training programs (e.g., streaming video) to help teach employers and TDM agencies how to use these particular tools.
Figure 11. Commuter Model Opening Screen.

Figure 12. Commuter Model – Scenario Information Screen.
The COMMUTER model can be used to evaluate commuter choice programs on both an urban area-wide and individual employer (or site-specific) basis. The Analysis Scope input controls whether the model calculates area-wide or site-specific impacts of commuter choice programs.

**Employment in Analysis Area**

</table>

Refers to "traditional" professional office space employment.

Manufacturing, warehousing, retail, medical, educational, entertainment and other employment-generating land uses.

The COMMUTER model may generate abnormally large mode shifts under a regional or area-wide analysis scenario if realistic limits are not applied in estimating the affected employment input above. For site-specific analysis, enter the employment of the workplace being analyzed. For area-wide analysis, the user is encouraged to consult Section 3.1 of the COMMUTER Model User Manual for more detailed guidance on estimating affected employment inputs for region being modeled.

**Programs (Mark All Programs Being Analyzed with an "X")**

1. Site Walk Access Improvements
   Includes preferential parking, improved access to transit

2. Transit Service Improvements
   Includes more frequent and/or faster transit service

3. Financial Incentives
   Includes parking costs, transit fare/pass subsidies, or other financial incentives

4. Employer Support Programs
   Includes support programs for carpooling, vanpooling, transit, and/or bicycling

5. Alternative Work Schedules
   Includes flex time, telecommuting, staggered work hours, and/or compressed work weeks

Figure 15. Commuter Model – Local Data Screen.

---

Baseline mode share, trip length, average occupancy and peak period data representing local conditions are entered in this input screen. From these inputs and data entered in the "Mode Choice Model Coefficients" screen, the COMMUTER model internally calculates final mode shares and travel changes resulting from TCM programs selected. If you want to supply your own estimates of final mode shares (such as might be obtained from employee survey data), mark the box labeled "Supply Final Mode Shares" (with an "X"). When this option is selected, the COMMUTER model displays an additional series of input cells below the box where final mode share inputs can be entered. Remember, these final mode shares should reflect work-trip mode choice after implementation of the TCM programs you're currently analyzing and override the mode share calculations made by the model.

The peak period includes the morning and evening time periods when highways are most congested. These periods may be defined differently in different areas. For the default "percent of work trips in peak period" provided, the AM peak is defined as 6:00 to 9:00 AM and the PM peak as 4:00 to 7:00 PM. The same peak period should be used for reporting percent of work trips in peak period and affected vehicle speeds (which are entered later in the "Other Emissions-Related Data" screen).

"Length of peak period" refers to the length (in hours) of the AM or PM peak period. If the AM and PM peak periods are different lengths, this can be an average of the two lengths.

"Percent of work trips in peak period" should also be reported as an average for the AM and PM peak periods combined. For example, assume there are 200,000 and 300,000 total vehicle trips in the AM and PM peak periods, respectively. If the number of work trips are 150,000 in the AM peak and 250,000 in the PM peak, then the percentage of work trips in peak period is \( \frac{150,000 + 250,000}{200,000 + 300,000} = 80\% \).

Figure 16. Commuter Model – Local Data Screen (cont.).
**SITE ACCESS & TRANSIT SERVICE IMPROVEMENTS**

### I. Site Access Improvements

<table>
<thead>
<tr>

<tr>
<td>Transit</td>
<td></td>
</tr>
<tr>
<td>Bicycle</td>
<td></td>
</tr>
<tr>
<td>Pedestrian</td>
<td></td>
</tr>
</tbody>
</table>

Employer Participation Rate: 100%

*Change in Walk Access Time* represents the difference in walking time associated with travel to or from the workplace as a result of worksite access changes. Walking time includes the time taken to walk from a parking lot or a bus stop to the actual worksite. Walk access time can be affected through policies such as preferential parking for carpoolers and vanpoolers or through improvements to the worksite or area which make access to transit easier. A decrease in walk access time for any particular mode should be entered as a negative value.

*Employer participation rate* refers to the percent of employers in the analysis area implementing the walk access improvements. (This option is not necessary for site-specific analysis because the "participation rate" is 100%.)

**Figure 17. Commuter Model – Site Access and Transit Service Improvements Screen.**

### II. Transit Service Improvements

#### IIa. More Frequent Service

| Change in avg. headway (min) | 0.0 |
| Employment Served            | 0%  |

#### IIb. Faster Service

| Change in route travel time (min) | 0.0 |
| Employment Served                | 0%  |

**Transit Operating Data**

| Increase in daily VMT by Transit Vehicles | 5   |
| Average speed of affected transit vehicles (mph) | 0.0 |
| Default average speed                | 19.6 |
| Check here to use default transit speed | X   |

**Figure 18. Commuter Model – Site Access and Transit Service Improvements Screen (cont.).**
“Change in average headway” refers to the average change in frequency of service for transit service to the employment center or analysis area. An increase in service frequency is entered as a negative number. For example, if peak period transit service frequency increases from 20-minute to 15-minute intervals, the change in average headway would be entered as “-5.0”.

“Change in route travel time” refers to the average change in total route travel time for all transit service to the area. A decrease in travel time is entered as a negative number. For example, if new express bus service decreases the overall route travel time by 5 minutes, this would be entered as “-5.0”.

“Employment served” refers to the percent of employment in the analysis area which is served by the improved transit service. (This option is not available for site-specific analysis).

“Increase in daily VMT by transit vehicles” refers to the additional transit vehicle-miles of travel as a result of the improved transit service. Refer to Section 4.1 of the COMMUTER Model User Manual for guidance on how to calculate this parameter.

Figure 19. Commuter Model – Site Access and Transit Service Improvements Screen (cont.).

</table>

Employer Participation Rate: 100%

“Financial incentives and parking costs” may include higher parking charges for single-occupant vehicles, reduced parking fees for carpools or vanpools, transit subsidies such as free monthly passes, or other financial incentives for specific modes. A decrease in cost is entered as a negative number. For example, provision of a transit pass valued at $30 a month would be entered as a change in fare cost of -$1.50 ($30 / 20 days). The cost change inputs are entered on a daily basis.

“Employer participation rate” refers to the percent of employers in the analysis area offering these incentives to their employees. (This option is not required for site-specific analysis because the “participation rate” is 100%.)

Figure 20. Commuter Model – Financial Incentives and Parking Screen.

</tr>
</tbody>
</table>

Figure 22. Commuter Model – Employer Support Programs for Alternative Modes – Site Specific Analysis Screen.

“Employer Support Programs” include programs such as provision for an on-site transportation coordinator, ridematching, transit information, and other actions aside from time and cost incentives which encourage employees to utilize alternative modes. Two entry options are available for site-specific analysis:

1. Specify existing and new program levels for Carpool, Vanpool, Transit, and Bicycle program support. A program level of “0” represents no program. Program levels of “1” through “4” indicate varying levels of effort for the programs. These program levels are described in Section 4.3 of the COMMUTER Model User Manual.

2. Specify an expected mode share increase for each mode. This increase is added to the baseline mode share as specified in the input data.

IMPORTANT: This entry option should not be utilized unless the user has definitive data indicating a likely mode share increase as a result of proposed programs. If a mode share increase is specified, the user should document existing support programs and programs to be implemented, along with survey or other data indicating the basis for the mode share increase estimates.
### Alternative Work Schedules

**A. Eligibility for Participation**

<table>
<thead>
<tr>

<td>0%</td>
<td>15%</td>
</tr>
<tr>
<td>Staggered Hours</td>
<td>0%</td>
<td>0%</td>
</tr>
<tr>
<td>Telecommute</td>
<td>5%</td>
<td>15%</td>
</tr>
<tr>
<td>Not Eligible</td>
<td>35%</td>
<td>30%</td>
</tr>
<tr>
<td><strong>Total</strong></td>
<td>100%</td>
<td>100%</td>
</tr>
</tbody>
</table>

**Figure 23. Commuter Model – Alternative Work Schedules Screen.**

### B. Participation Rates

<table>
<thead>
<tr>
<th>Program</th>
<th>% Participating</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Existing</td>
</tr>
<tr>
<td>Flex Time</td>
<td>100%</td>
</tr>
<tr>
<td>Compressed 4/40</td>
<td>100%</td>
</tr>
<tr>
<td>Compressed 9/50</td>
<td>100%</td>

</tr>
<tr>
<td>Telecommute</td>
<td>100%</td>
</tr>
<tr>
<td>Not Participating</td>
<td>100%</td>
</tr>
<tr>
<td><strong>Total</strong></td>
<td>100%</td>
</tr>
</tbody>
</table>

"Alternative Work Schedules" include the option to allow employees to utilize flex time, compressed work weeks, staggered work hours, or telecommuting. Flex time and staggered hours will have the effect of shifting some trips outside of the peak period, while compressed work weeks and telecommuting will have the effect of eliminating some work trips. Two program entry options are available:

1. The user can specify the percentage of employees eligible for each program. Both existing and new levels of eligibility should be specified.
2. The user can specify existing and expected participation rates for each program.

To accommodate instances where employees are eligible for, or participate in multiple programs, the model allows the user to enter rates that exceed 100% when summed across all alternative programs. The model then internally normalizes the rates before using them in the travel calculations. Section 4.5 of the COMMUTER Model User Manual presents an example for this situation.

**IMPORTANT:** Entry option (2) should not be utilized unless the user has definitive data indicating a likely participation rate as a result of proposed programs. If participation rates are specified, the employer/analyst should document existing support programs and programs to be implemented, along with survey or other data indicating the basis for the participation rate estimates.

**Figure 24. Commuter Model – Alternative Work Schedules Screen.**
Figure 25. Commuter Model – Fleet Emissions Information Screen.

Figure 26. Commuter Model – Fleet Emissions Information Screen (cont.).
Figure 27. Commuter Model – Fleet Emissions Information Screen (cont.).

The COMMUTER model has been designed to use pre-loaded MOBILESb emission factors for a defined range of input conditions or a set of user-supplied emission factors for specific local conditions. Before user-supplied emission factors can be used, they must be loaded into model using the "Import Emission Factors" command from the File menu. If the box above is marked and no user-supplied factors have been loaded, the model will signal an error when you try to view output results.

The "Calendar Year of User EFs" input identifies the specific calendar year factors from the set of user-supplied factors. You can load user-supplied emission factors for any number of individual calendar years. This input allows you to select and compute emission impacts for any one of the calendar years for which emission factors were supplied. If you enter a calendar year that doesn't match those in the user-supplied factors, an error is signaled.

Note: The VMT mixes (percent of travel by vehicle class) contained in the user-supplied emission factors are automatically loaded into the model and used in the emission calculations. If you are computing impacts with user-supplied emission factors, you cannot change the VMT mix from the "Other Emission-Related Data" input screen. When applying user-supplied emission factors, the VMT mix must be specified in the MOBILESb runs. However, you must still supply affected vehicle speed and cold start percentage inputs in the "Other Emissions-Related Data" screen, regardless of whether pre-loaded or user-supplied emission factors are being used.

Figure 28. Commuter Model – Other Emissions-Related Data Screen.
### OTHER EMISSIONS-RELATED DATA

#### Vehicle Fleet VMT Mix
MOBILE5b generates emission factors for each of the eight different vehicle classes listed. Fleet "composite" emission factors are then calculated by weighting these emission factors by the percentage of travel (i.e., VMT) in each vehicle class. The default VMT mixes provided by this program are MOBILE5b national default values. These defaults are calendar year and season specific. This input is required only when you are using the pre-loaded emission factors. If user-supplied factors are used, the VMT mix is obtained automatically from the MOBILE5b runs and these input cells are ignored.

#### Affected Vehicle Speed
Vehicle emissions vary with speed. The values entered here should represent regional network average speeds during the peak and off-peak periods. Default values supplied are based upon HPMS (Highway Performance Monitoring System) averages compiled by urban area size. This input must always be entered whether using either pre-loaded or user-supplied emission factors.

---

**Figure 29. Commuter Model – Other Emissions-Related Data Screen (cont.).**

#### OTHER EMISSIONS-RELATED DATA

#### Cold Start Percentages
Emission factor models address the fact that vehicles have higher emission rates when started "cold" before the catalyst and engine are fully warmed up. In MOBILE5b, trips are defined as either cold starts or hot starts, depending on the time the engine was off (referred to as "soak time") prior to the previous trip. A cold start is defined as any start with a soak time of at least 4 hours for non-catalyst vehicles and at least 1 hour for catalyst vehicles. In MOBILE5b, all other starts are hot starts. For example, if the cold start percentage is 80%, the hot start percentage is 20% (100-80%)

The user must enter the cold start trip percentage of trips for both the baseline trips and for the trips that would be eliminated by TCMs. Note that separate cold start percentages must be entered for both peak and off-peak periods. This input must always be entered whether using either pre-loaded or user-supplied emission factors.

**NOTE TO MOBILE5b USERS:** The cold start percentage inputs used by this program should not be confused with the operating mode fraction inputs required by MOBILE5. Those fractions include specification of the amount of stabilized (Bag 2) operation. In this program, the amount of stabilized operation is internally calculated from the start percentage inputs and the average trip length.

HOW DOES YOUR DEVELOPMENT REVIEW PROCESS AFFECT ECONOMIC DEVELOPMENT?
Development Review as Economic Development

By Michael Blue, FAICP

Development review is more than just a series of perfunctory steps to run a project through prior to approval.

Done well, it is an economic development tool for a community to attract and secure desirable development, implement plans, and add to the local tax base. Conversely, an unpredictable development approval process can discourage development that the community wants. It can lead to difficulty in implementing plans and create the impression that the community is not a good place to do business.

We’ve all been to a meeting like this: The planning and zoning commission is on its third review meeting of a major retail development on the main commercial corridor in town. The staff has worked with the developer to understand city codes and expectations, and the proposal has begun to reflect those needs. In keeping with the outline of the staff report, the commission has dutifully considered land use, zoning, site plan and circulation, traffic, landscaping, signage, lighting, light fixtures, and now, building materials. The discussion has gone as expected so far, with the commission requesting “just a couple more” details on types of plant materials and a bit of discussion over which of the light fixture styles was most appropriate.

Then the commission turns its attention to the awnings. The signage on the awnings for the project’s anchor tenant was within code and the color was the company’s usual red. One of the commission members suggested that while the awning was the company’s standard and was in context with the overall building, perhaps a different shade of red would be more attractive, maybe even a maroon. A second commission member chimes in that maroon is much too dark, and that something more vibrant, perhaps leaning toward orange, would be better. The debate on which shade of red was best for the awning rages on for 45 minutes. To resolve the matter, the chair suggests that the applicant return to the next meeting with three samples of shades of red they would like to propose for the commission to evaluate and then adds that it is now too late to make any formal decisions.

The aftermath of the meeting is predictable. The applicant is frustrated because there is a corporate deadline to start construction that this “hurdle” will delay. He will tell the planner how the whole project is now in jeopardy and that all those people who warned him not to build in this town were right! A call from the mayor or city administrator wanting to know what happened is also likely since this is a project the community wants.

Development review is an essential element of municipal operations, and when done well, it provides an opportunity for planners to bring a great value to the communities they serve. The process should always improve marginal developments and reject those that are inappropriate, but it should not be the stumbling block that inhibits desirable outcomes.
THE WARNING
Elected and appointed officials, planners, and other development process participants can become comfortable with their communities’ zoning approval processes. However, we must realize that just because a process worked in the “old” economy, prior to the mid-2000s, it will not necessarily function well today. Well-capitalized builders and developers who feel they can put a project in the ground on spec and then attract tenants are rare, if they exist anywhere. Communities are faced with a new range of development and financial challenges. For these reasons, it is time to revisit approval processes and find the next set of best practices to ensure that development review tasks and requirements add value to our communities.

THE CHARGE
A development review processes should incorporate three essential themes:
• The process must be predictable to the applicant, elected and appointed officials, other departments, and the public in order to assure the best outcomes.
• Each step in the development approval process must add value to the process, the development, and the community.
• The process must ensure open and continuous communication to the applicant, elected and appointed officials, other departments, and the public.

Communities should audit their processes in light of these three themes. But remember, the purpose is not just to do “more with less” or to streamline a process. Yes, efficiency and timely review are important, but we must be careful that streamlining is not just doing the same work in less time. A faster development review isn’t necessarily a better review. Rather, the question should be to look at the aspects of the review and determine if they advance the community vision. Did the commission need to review awning colors (or, for that matter, landscape and lighting, which could be defined in a code and approved administratively)? If the answer for the community is yes, these are important elements that must be considered by a formal body, and the community should continue to do so. However, if items of limited significance are being reviewed or approval through a commission process isn’t essential to enhancing development, they should be eliminated, made administrative, or set to meet clearly defined code standards. This is the type of process streamlining that will save time and money for the community by focusing effort on the issues that matter most and making it a more attractive place to pursue development.

THE CAVEAT
Is this about tossing out the way communities have conducted development review and starting over? Absolutely not. The steps in development review that reflect the unique values and

About the Author
Michael Blue, FAICP, is a principal with Teska Associates of Evanston, Illinois, a firm providing public- and private-sector clients with services related to planning, landscape architecture, site design, economic development, and community engagement. He worked in the public sector for 15 years as a community development manager for Mount Prospect, Illinois, and Highland Park, Illinois, focusing in both locales on development review and approval, long-range planning, and policy related projects. As a consultant, Blue has prepared numerous long-range plans, development impact studies, and public participation efforts. For much of his career, he has been active in the American Planning Association at the local, state, and national levels, and he is currently the Planning Officials Development Officer for APA Illinois.

Figure 1. Single-family housing sales, January 2000–November 2013.
needs of the community should continue. And while it should go without saying, the purpose is not about accepting development the community neither wants nor needs, nor is it about assuring large profits to an applicant. The objective is to strike a balance in approval processes so as to smoothly facilitate quality development outcomes for the community and its residents.

**WHY IS THIS IMPORTANT NOW?**

To state the obvious, the world of development, and therefore development approval, has changed over the last several years from what it was prior to the Great Recession. Figures 1 and 2 for new home sales and building permits reflect the very familiar trend line of peaking in the middle part of the last decade, falling sharply, and now returning (slowly) to an upward trend. But even as the economy begins to gain traction, it is important to ask: Will it ever be 2005 again in the development world? Can communities expect or count on that pace of development returning? Communities cannot rely on securing tax-base support from desired development at the pace they did 10 years ago. That economy is past. The way in which development is done has changed, and development approval practice must reflect that reality. It must be thought of as part of the community’s economic development toolbox.

**The Development Business Has Changed**

Figure 3 (showing the familiar pattern and an uncertain 2013) indicates annual rates of private construction in the U.S. Anecdotal stories heard at building counters reflect that while developers are out there looking to take on projects, capital is hard to find and is impacting the number of projects being initiated. Not only will developers be limited by access to capital, but they will be more likely to seek public financial participation. More to the point of this discussion, developers will be more risk averse and less likely to pursue development where the approval process is unpredictable.

**Development Approval and Economic Development Have Changed**

The capacity of municipalities to regulate and support development has been threatened and impacted by state referenda on property rights and Supreme Court cases such as _Nollan_, _Dolan_, and _Kelo_. These challenges have not gutted the role of municipalities in developing their communities, but they do give communities reason to be cautious. In this environment, a sound and predictable development approval process becomes an even more valuable economic development tool.

**Public Finance Has Changed**

Established revenue sources to communities have been reduced. In addition, local governments all over the country are dealing with having lost, or the risk of losing, funds from state and federal sources. Further, municipalities are facing challenges imposed by funding pension responsibilities; the table below shows the increasing trend of these payments. As those obligations grow, so will the pressure to find new revenue sources to support them. Again,
the need for attracting desirable development to support fiscal needs becomes an important element of municipal finance.

**Government Operations Have Changed**

The mantras heard at budget hearings everywhere are the echoes of very real fiscal constraints: “do more with less,” “consolidate,” “share services,” “outsource,” “think like a business,” etc. These concepts have merit, but at some point (and many places are already there) budget reductions are cutting bone, not fat. A number of communities set staffing levels based on average, or typical, operations. In areas that do not have a year-round construction season, maintaining staff needed during a busier summer season allows for “catching up” or project work during the winter. Communities unable to carry staff in this way may move to third-party services for peak times. No matter how communities address the budget and staffing challenge, it is important to maintain the emphasis on quality development review. Too often the concern in light of budget constraints is how to do development review faster, but the question should be how to do it better.

**THE WARNING SIGNS**

So how do you know when the process isn’t functioning optimally and you need to look at serious change? Keep your eyes open for some warning signs:

**A Lack of Understanding or Respect for the Process**

The approval process is not always going to be smooth. It is inherently a negotiation and may well be contentious. But it does not need to be mean spirited or belligerent; it doesn’t have to be cops and robbers. If there is a lack of trust, communication, or respect at meetings between staffs and applicants, realize that this is not normal and acceptable. It is time to find and eliminate the cause of a caustic working relationship.

In addition, some applicants will go through the motions of the approval process with little regard for staff review or commission evaluation. This approach may be a political calculation by the applicant in the hope that a desire for their project by the community negates the need for in-depth vetting through a public process. This is not the case and should be a warning sign. A deliberative process that seeks and applies concerns brought up by the staff, commissioners, and public input creates a thoughtful deliberation and brings a well-reasoned recommendation to the elected officials. Further discussion at that stage isn’t a problem, but officials should be working from a foundation established in the process.

**Development by Litigation**

In some cases an approval process will result in litigation. While always possible, the keys to avoiding this outcome are a well-crafted comprehensive plan and set of development policies, practices, and regulations that reflect that plan. In addition, a predictable approval process will lessen the chances of a community being sued by an applicant. Working from the notion that the applicant will most likely proceed if there is a reasonable chance for success, it is the denial that seems unexpected to them or comes from a late shift in the position of the community that inspires litigation. A predictable process, well communicated and well executed, can help diminish the potential for litigation.

**Amending Unnecessary or Inappropriate Requirements**

It is essential to know and be able to explain why code requirements exist. Dismissive answers such as “because the code says so” or “because we’ve always done it that way” do not communicate properly to applicants or the community the value of development (and building permit) review. Also, there is efficiency to be found in making sure that every step has a purpose—benefiting both the community and applicants. The question is whether the review requirement adds value to the development and the community. If it does, keep it; if not, look to amend the code.

That said, change for the sake of change (or to give the appearance of progress) has no value. Likewise, a knee-jerk code or policy change in response to a single undesirable outcome (like an unusual sign or odd-sized porch) is not always necessary. But if patterns appear in approvals that are contrary to community desires or a “loophole” is identified that creates unwelcome development forms, communities should be willing to amend local codes to support desired outcomes. The same is true should the need arise to consider updates to the approval process. In making changes, communities should take note that seeking out different perspectives and being open to the changes they propose (even small ones) can improve the process and are appreciated by applicants.

**A Reliance on Last-Minute Negotiation**

As stated earlier, development includes negotiations. When that negotiation happens is important, and the earlier in the process the better. The ability to be flexible diminishes, for both municipality and applicant, as the process moves forward. A last-minute demand will either be a genuine issue or create a perception of unreasonableness (from either party) and may upend a desired outcome.

**A Lack of Internal Communication**

In most communities the team that conducts development review is multidisciplinary and from different departments. Communication...
among these groups is essential. A lack of com-
munication will limit desirable outcomes and
send the message that the community is not
ready to do business.

A Lack of Positive Development Outcomes
Securing desired developments that advance
the community’s plans, vision, and quality
of life is the ultimate aim of an effective de-
velopment approval process. To ensure this
is working, always go back and see how the
development turned out. See what the local
commissioners, residents, and elected officials
think. Not everyone will like every develop-
ment, but finding that the community is consis-
tently not pleased with outcomes is reason to
reconsider how projects are approved.

HOW TO IMPROVE THE DEVELOPMENT
APPROVAL PROCESS
If you notice any of the warning signs above,
it’s time to start an internal discussion. Identify
a point person to talk with staff, commissions,
and elected officials to understand what the
community needs and wants from the process.
Talk to the customers (developers) about their
take on the process. Review your development
approval steps to see that they add value. You
should ask: Why do we do this? Who does it
help? Is the cost for review greater than the
benefit? Evaluate the system in light of the
themes, truisms, and best practices outlined
below.

Predictability
The best development approval process will
have a defined structure understood by all
involved. To facilitate such an outcome, com-
munities should be cognizant of the numerous
perspectives in the process and work to create
a common understanding of how the process
functions.

Certainty versus flexibility. Communities
want to know precisely what will be built, who
will occupy it, when it will be finished, and
what it will look like. Developers want to make
many of these determinations later (to be sure
the construction material is in stock, negoti-
ate leases over time, change the appearance
depending on tenants plans, etc.). There is no
way to completely bridge the certainty versus
flexibility gap, but the answer is to provide
predictability. Approval ordinances, codes,
or development agreements should spell out
what can change after approval, including what
can be signed off on administratively and what
will require a new hearing.

Different game for the little guys. Large
developers or businesses may have a team of
attorneys, architects, traffic engineers, land-
scape architects, and other professionals to as-
sist with review processes. Smaller applicants
will not. They may have never been through
an approval before. The process will be full of
jargon and intimidating meetings. They will
need assistance (and time) from staff to make
it through the process. Many communities
note a desire to emphasize locally owned busi-
nesses as part of their economic development
program, and having an approval process they
can navigate is a great place to start.

Conduct commissioner training. The com-
munity members sitting on various develop-
ment-related boards and commissions more
often than not have no technical training or
professional expertise in development review
or code preparation. Even the best staff reports
cannot make them experts in the field, and
many will be unwilling to ask questions they
feel are too simple. They are on the commis-
sions because of their interest in and commit-
ment to their community. Further, as residents
they will certainly have a keen understanding
of the town’s quality of life, expectations of
community members, local history, etc. While
volunteer board members will bring these
insights to the commission deliberations, staff
can help enhance the efficacy of these boards
and commissions by finding the time and op-
portunity to provide training in commission
operations and development review practice.

Communicate the process and expecta-
tions. Developers should know early in the
process what information, studies, meetings,
and approvals will be required. This need not
be sugarcoated; it should be realistic. Part of
this communication is also to understand the
applicant’s position (with an open mind). Be

Desirable developments that implement community plans are the most direct indicator that a development approval process is succeeding.
Dealing with limited staff resources.

Frequent applicant communications, in-depth technical analysis, and being available to elected and appointed officials can be difficult for planners in communities with limited resources. However, this does not diminish their importance. A review of the approval process should certainly consider how to meet local objectives with limited staff resources.

Little efforts can make a big difference.

Revisiting a development approval process does not require wholesale change, especially just for the sake of change. It may be that an updated explanation or diagram of the process, or consolidating steps, serves the community and applicants well. In addition, involving the development and business community in the evaluation provides value by showing that the community is committed to reviewing proposed development in the most effective manner available.

Communication

Open and continuous communication with applicants, community officials, other staff, residents, and other stakeholders is foundational to all of the concepts described in this article. This point is often forgotten, either because it is so basic or because in some situations it is inconvenient, but no approval process can succeed without this key ingredient.

No surprises.

The city manager, public commissions, and elected officials should be well informed (early on) of issues or questions that are likely to be controversial. Likewise, a developer should be made aware of what they may expect in the process; again, it should be realistic and reflect an understanding of previous project approvals.

Communicate early and often in the process.

A clear and comfortable path for communication is essential. This must exist between the staff and the applicant and between staff and appointed and elected officials. This can be formal or informal, but it must be present. If you haven’t already, consider establishing single points of contact for such communications.

Communicate internally.

Organizational “silos” are problematic in many instances. This is certainly the case for effective development review; the process must include discussion among all work groups on a regular basis (this cannot be stressed enough). The process may be led by a planning or community development department, but must involve public works, fire, police, parks and recreation, corporation counsel, and other internal stakeholders. These groups should meet regularly to assure consistency and be available to the applicant to clarify matters early in the review process.

CONCLUSION

It is not the place of any municipality to swing open the doors and allow development at all costs or to tilt the process in favor of anyone’s profit motive. That is not the intent of the concepts raised here. The point is that to conduct development review as if it were 2005—or to use the same process that was in place in 2005—is detrimental to the community. Creating an environment that facilitates a good development process leads to desired outcomes that benefit the entire community; it is a role for which planners are uniquely qualified and should be leading in their municipalities.

Focus on Community Satisfaction

How satisfied are Americans with their communities? This fact sheet shares key findings from “America in 2013” on community satisfaction.

“America in 2013” is a national survey conducted by Belden Russonello Strategists LLC on behalf of the ULI Terwilliger Center for Housing and the ULI Infrastructure Initiative.

About Half of Americans Are Very Satisfied with the Quality of Life in Their Community
According to the survey, 49 percent of Americans are somewhat or very satisfied with the quality of life in their community. The oldest Americans report the highest satisfaction levels, with 67 percent of war babies/the silent generation saying they are very satisfied with their community’s quality of life. However, only 40 percent of gen Yers report being very satisfied with their community.

Overall, 38 percent of Americans say they are somewhat satisfied, leaving some room for improvement. Dissatisfaction is especially pronounced among gen Yers and baby boomers: 16 percent of gen Yers and 14 percent of baby boomers say they are somewhat or very dissatisfied with life in their community.

Satisfaction with Community Quality of Life Varies by Income and Location
Satisfaction with the quality of life in a community correlates with income. Lower-income Americans report the lowest levels of satisfaction, with 20 percent of those making less than $25,000 annually per household saying they are somewhat or very dissatisfied with their community’s quality of life, and only 42 percent saying they are somewhat satisfied. In contrast, 60 percent of people making more than $75,000 report being very satisfied with their community.

Americans Generally Think Community Quality of Life Will Remain the Same
About 63 percent of Americans expect the quality of life in their community to stay the same. However, a significant portion of the country—17 percent—thinks life in their community is getting worse. Nineteen percent thinks things are getting better. Baby boomers are the most pessimistic of all the generations, with 22 percent thinking things are getting worse and 17 percent thinking things are getting better. The oldest Americans expect no change in the status quo.

Jobs Are a Key Area of Dissatisfaction
In contrast with other categories, where Americans tend to report higher satisfaction levels, on quality and quantity of jobs, only about half of Americans say they are satisfied. Gen Yers are the most dissatisfied, followed by baby boomers.

Rural dwellers also tend to be dissatisfied with job quality and quantity, with 56 percent reporting dissatisfaction, compared with 40 percent of big-city dwellers. Fifty-five percent of Latinos are dissatisfied with the job situation in their community, as are 58 percent of African Americans. Among general feelings of satisfaction in other areas, job opportunities stand out as a key challenge.

Americans Are Fairly Satisfied with Their Home; Gen Y, Lower-Income People, Big-City Dwellers, and Renters Are Least Satisfied
Most Americans—89 percent, according to the survey—are fairly satisfied with their current home; 11 percent report dissatisfaction. However, for gen Yers, there is plenty of room for improvement: 20 percent indicate they are dissatisfied with their current home. Baby boomers follow, with 9 percent reporting dissatisfaction. The oldest Americans are the most content in their home: 96 percent say they are satisfied, and only 3 percent report dissatisfaction.

**Americans are Fairly Satisfied with Local Housing Options; Gen Y, Lower-Income People, Big-City Dwellers, and Renters Are Least Satisfied**

When it comes to the range of housing types to choose from in communities, most Americans are fairly satisfied: 83 percent of the population reports satisfaction, and 15 percent reports dissatisfaction. Gen Yers are the least satisfied, with 21 percent indicating dissatisfaction with housing options.

Focus on Community Preferences by Generation

When it comes to their communities, what are Americans looking for? What do they value, and what do they see as important? What kind of community would they prefer to live in?

This fact sheet shares key findings about community preferences from “America in 2013,” a national survey conducted by Belden Russonello Strategists LLC on behalf of the ULI Terwilliger Center for Housing and the ULI Infrastructure Initiative.

Americans Place a High Value on Safety and Schools
When asked to rank certain community characteristics on a scale of 1 to 10, all generations place neighborhood safety and the quality of public schools at the top. (Of note: the importance of schools declines with the age of each generation, falling from 87 percent of gen Yers ranking it at the top to 68 percent of members of the oldest generations.)

<td>57</td>
<td>45</td>
<td>50</td>
<td>56</td>
</tr>
</tbody>
</table>

As shown in the table, gen Y expresses preferences that differ from those of the other generations in interesting ways. Gen Y is the least likely to value neighborhood safety or space between neighbors, but the most likely to want high-quality public schools, a short distance to work or school, walkability, and proximity to amenities like shopping and transit.

Members of generation X have less of a preference for urban living than do gen Yers, though being a short distance from work or school is important to them, matching the strength of preference for U.S. residents
as a whole. Compared with the U.S. average and with other generations, gen X has a strong preference for having more space between neighbors.

The rankings for baby boomers’ preferences tend to mirror those of the nation as a whole, but baby boomers put less emphasis on schools and on being near work or school. America’s oldest generations—war babies and the silent generation—place a high value on being close to medical care but do not care as much about being near work or school.

Compact Development: An Appeal That Cuts Across Generations

“America in 2013” found that more than half of Americans—representing nearly 127 million people—prefer a mix of community attributes typically associated with compact development. When asked to choose between tradeoff choices—living in a community with a mix of incomes or one with similar incomes, having available public transportation or not having it, among others—54 percent of Americans choose three or more of the five community attributes typically associated with compact development.

As shown in the table, preferences for compact development are stronger in some age cohorts than in others—the strongest being among gen Yers, followed by baby boomers. However, across all generations, about half of all Americans prefer a mix of community attributes traditionally associated with compact development.

</tbody>
</table>

For Older Americans, the Appeal of a Shorter Commute Is Strong

As shown in the table, among older Americans, many of whom have spent substantial time in the workforce and may continue working beyond the traditional retirement age, the preference for a shorter commute is very strong, even if it means living in a smaller home. Seventy-two percent of baby boomers, or nearly 53 million people, would make that tradeoff.

Similarly, 65 percent of war babies and members of the silent generation—nearly 23 million people—would trade a larger home for a shorter commute. Almost 51 percent of these older Americans (representing 18 million people) also show a slight preference for living in areas close to a mix of shops, restaurants, and offices, reinforcing their preference, particularly as they age, for walkable communities near amenities.

Visit www.ult.org/communitysurvey to learn more about “America in 2013.”
Gen Y Is Focused on Access and Convenience in Compact, Diverse Communities
Among gen Yers, 54 percent—representing nearly 39 million people—would trade a larger home for a shorter commute. Among all generations, gen Y is the most attracted to living in a neighborhood close to a mix of shops, restaurants, and offices. Sixty-two percent of gen Yers (representing more than 44 million people) prefer this type of mixed-use community over one where shops, restaurants, and offices are farther away.

Gen Y is also the only age cohort that shows a preference for living in a neighborhood where there is a mix of housing types. Fifty-nine percent of gen Yers—representing more than 42 million people—would like to live in a community where there is a range of housing. Similarly, 52 percent of gen Yers (representing more than 37 million people) would like to live in a community where there is a range of incomes.

Urban, Compact Living Least Likely to Appeal to Gen X
Gen Xers are the least likely to find community attributes associated with compact development appealing. Despite this, 49 percent prefer three or more of the community attributes associated with compact development. Fifty-three percent of gen Xers value income diversity, and 50 percent would like to be close to a mix of shops, restaurants, and offices.

Focus on Movers

How many Americans are planning to change homes in the next five years? And what are likely movers looking for in the communities they are moving to? Who has moved recently, and did they move to a bigger home or downsize? This fact sheet shares key findings from “America in 2013” about likely and recent movers.

“America in 2013” is a national survey conducted by Belden Russonello Strategists LLC on behalf of the ULI Terwilliger Center for Housing and the ULI Infrastructure Initiative.

Many Americans Plan to Move in the Next Five Years; Gen Yers Are the Most Likely to Move

Many Americans report that they are likely to change homes during the next five years. “America in 2013” found that 42 percent of Americans—representing 98 million people—are likely movers. Making up that 42 percent are 25 percent who are very likely to move and 17 percent who are somewhat likely. Gen Yers are the most likely to move: 63 percent say they expect to move during the next five years. America’s oldest generations are the least likely to move.

<table>

Most Movers Expect to Own Their New Home; Gen Yers and Older Americans Are More Likely to Expect to Rent

Most movers—73 percent—believe they will own the primary residence they move into; one-quarter expect to rent. Gen Yers and the oldest Americans are the most likely to expect to rent their new home, and gen Xers are the least likely to expect to rent. Just 20 percent of the baby boomers expect to rent.

Most Prospective Movers Want Single-Family Homes, but Some Desire Other Housing Types

Sixty-five percent of Americans who are moving expect to move into a single-family home. However, 15 percent of movers expect to move to an apartment, and 14 percent expect to move to a duplex, townhouse, or rowhouse. Gen Yers are especially likely to expect to live in an apartment or duplex, townhouse, or rowhouse. Of note: baby boomers are the most likely to expect to live in a manufactured/mobile home.

Most movers in generation X—87 percent—expect to live in a single-family home. For the oldest generations, 30 percent of movers expect to move to apartments or compact homes like townhouses or rowhouses.

Movers See Themselves in All Different Kinds of Communities
American movers are headed to many different kinds of communities. In fact, likely movers are roughly evenly split among wanting rural, small-town, suburban, and medium- or big-city life. Gen Yers have a stronger preference for big cities than do other generations, and baby boomers feel the pull of rural settings.

About Half of Recent Movers Moved into a Bigger Home; Older Americans Are Likely to Have Downsized

About half the people who report moving within the past five years say they moved into a house that is larger than their old one. About a quarter of recent movers say their new home is the same size as their previous one, and 27 percent say it is smaller. Gen Xers are most likely to have moved into a larger home.

Baby boomers and war babies/members of the silent generation are the most likely to have downsized in their most recent move. In fact, 50 percent of the oldest Americans report that their new home is smaller than their old one. One-third of baby boomers report moving into a smaller home, and 44 percent say they have moved into a larger home.

Focus on Owning and Renting

How many Americans own their homes, and how many rent? What do Americans think about homeownership as an investment? This fact sheet shares key findings from “America in 2013” about owning and renting.

“America in 2013” is a national survey conducted by Belden Russonello Strategists LLC on behalf of the ULI Terwilliger Center for Housing and the ULI Infrastructure Initiative.

Two-Thirds of Americans Own Their Home; Baby Boomers Are Most Likely to Own, Gen Y to Rent

America is a nation of homeowners. Survey responses indicate that 66 percent of Americans own their home and 32 percent are renters. Gen Yers are the least likely to own their home: over half—54 percent—currently rent and 40 percent own. Baby boomers are the most likely to own a home, with 80 percent reporting that they own their primary residence.

Current Homeownership Status, by Generation

<table>
<thead>
<tr>

<td>26</td>
</tr>
</tbody>
</table>

Most People See Homeownership as a Good Investment, but Many Older Americans Don’t See It That Way

Despite recent upheavals in the housing market, most Americans still believe that buying a home is a good investment for them. That sentiment is strongest among members of generation X. Interestingly, the oldest Americans are the most skeptical of homeownership, with 40 percent of war babies/members of the silent generation saying homeownership was not so good of an investment for them.

Views on Buying a Home as an Investment, by Generation

Owners and Renters Express Preferences for Many of the Same Community Attributes
When it comes to community attributes, owners and renters express very similar preferences in some cases, but different preferences in others. Owners and renters have similar preferences when it comes to being in a community with a mix of incomes; they also express a similar willingness to trade a longer commute and a larger home for a shorter commute and a smaller home.

Renters are much more likely than owners to want public transportation options; they are also more likely to want to be in a community with a mix of homes, as well as one that is close to shops, restaurants, and offices.

Owners and Renters Place Similar Importance on Most Community Characteristics; Renters Are More Likely to Place High Importance on Public Transportation
When asked to rank certain community characteristics on a scale of 1 to 10, owners and renters place about the same emphasis on most characteristics.

In only three categories is the difference between the rankings by owners and renters more than 10 percentage points. Renters are much more likely than owners to rank convenient public transportation as a high priority. Renters are also more likely to highly value being a short distance from both family and friends and work or school.

Terwilliger Center for Housing
Focus on Transportation Satisfaction

How satisfied are Americans with their transportation system? This fact sheet shares key findings about transportation satisfaction from “America in 2013.”

“America in 2013” is a national survey conducted by Belden Russonello Strategists LLC on behalf of the ULI Terwilliger Center for Housing and the ULI Infrastructure Initiative.

Americans Are Generally Satisfied with Transportation Options; Baby Boomers and Rural Dwellers Are Least Satisfied

Seventy-two percent of Americans are satisfied with the range of transportation options available in their community. Baby boomers report the least satisfaction, with only 68 percent saying they are satisfied and 29 percent indicating dissatisfaction.

<table>
<thead>
<tr>
<th>Satisfaction with Range of Transportation Options Available, by Generation</th>
<th>Satisfied</th>
<th>Dissatisfied</th>
</tr>
</thead>
<tbody>
<tr>
<td>All adults</td>
<td>72</td>
<td>25</td>

<tr>
<td>Baby boomers</td>
<td>68</td>
<td>29</td>
</tr>
<tr>
<td>War babies/silent generation</td>
<td>72</td>
<td>17</td>
</tr>
</tbody>
</table>

Evaluated by community type, the survey results show rural residents are the least satisfied with the transportation options available, with 31 percent expressing dissatisfaction. In fact, satisfaction with transportation options increases by size of community, with 79 percent of big-city dwellers indicating they are satisfied with their transportation options and only 18 percent expressing dissatisfaction.

<table>

Focus on Transportation Preferences

What do Americans want from their transportation system? This fact sheet shares key findings about transportation preferences from “America in 2013.”

“America in 2013” is a national survey conducted by Belden Russonello Strategists LLC on behalf of the ULI Terwilliger Center for Housing and the ULI Infrastructure Initiative.

When Choosing a New Community, Most Americans Think Walkability and Transit Are Important

“America in 2013” asked respondents to rank, on a scale from 1 to 10 with 10 being the highest, how important various community attributes would be to them if they were moving in the next five years. Overwhelmingly, Americans want walkable communities. A preference for walkability is especially strong among gen Yers, 76 percent of whom give walkability a score of 6 or higher.

Respondents representing over half of Americans, 52 percent, give public transportation a score of 6 or higher. Convenient public transportation is least likely to be important to members of gen X, but is important to many gen Yers, as well as to war babies/members of the silent generation.

Importance Rankings for Walkability and Public Transportation, by Generation

Public Transit Is a Meaningful Community Attribute to a Majority of Americans

“America in 2013” also asked respondents to indicate if they preferred public transportation, or if it did not matter. Strength of preference for public transportation varies across the generations, and is strongest among Gen Yers. However, even among the group with the weakest preference for transit, war babies/the silent generation, nearly half, 48 percent, would prefer to live in a community that has public transit they can use.

Focus on Transportation Habits

How do Americans use their transportation systems? This fact sheet shares key findings from “America in 2013” about transportation by mode.

“America in 2013” is a national survey conducted by Belden Russonello Strategists LLC on behalf of the ULI Terwilliger Center for Housing and the ULI Infrastructure Initiative.

Americans Use a Variety of Transportation Modes to Get Around

Americans are frequent drivers, but they also regularly walk, bike, and use transit to get to their destinations. While 91 percent of Americans go somewhere by motor vehicle at least once a week, 44 percent walk to a destination once a week or more. That makes walking the most important mode of transportation after driving. Eleven percent of Americans take public transit as frequently as once a week. Though few Americans are daily bike riders, 12 percent report biking weekly, and another 12 percent use a bicycle at least once a month.

Most Americans Drive Daily, Especially Gen Xers
Generation X is the most likely to drive on a daily basis, and older Americans are the least likely to do so. Eight percent of the oldest Americans report that they do not drive much at all, and 28 percent say they drive about monthly. About 3 percent of gen Xers say they do not drive much either.

**Frequency of Travel by Car, Truck, or Motorcycle, by Generation**

<td>28</td>
<td>8</td>
</tr>
</tbody>
</table>

Next Comes Walking
Second only to driving, walking to a destination is a frequent habit of Americans, with 44 percent reporting that they walk to a destination daily or weekly. However, 46 percent report that they never walk several blocks or more to a destination.

The percentages of people walking to a destination at least weekly is relatively consistent across the generations, with 47 percent of gen Yers saying they do so, along with 46 percent of gen Xers and 43 percent of baby boomers. Only the oldest Americans—war babies and members of the silent generation—tend to be less active than that.

**Frequency of Walking Several Blocks or More to a Destination, by Generation**

</tbody>
</table>

Mode Use Varies by Type and Size of Community
How people get around correlates with the nature of the community in which they live. Residents of big cities employ more modes of transportation more frequently, taking transit and walking more than people living in less-populated places. Rural residents and suburbanites drive the most. Of note: rural residents are frequent bikers, with 2 percent biking daily and another 17 percent biking at least once a week. People who live in medium-sized cities also embrace several transportation modes and are both frequent transit users and walkers.

Public transit use is most common among big-city residents, 34 percent of whom use transit nearly every day or at least once a week—with 19 percent using it almost daily.

Focus on Commuting

How do Americans commute, and how does this behavior differ by generation and by location? This fact sheet shares key findings from “America in 2013” about commuting behavior.

“America in 2013” is a national survey conducted by Belden Russonello Strategists LLC on behalf of the ULI Terwilliger Center for Housing and the ULI Infrastructure Initiative.

Two-Thirds of Americans Commute to Work or School
Sixth-three percent of Americans commute to work or school three or more days a week. Members of generation Y are the most likely to commute to work or school, followed by gen Xers and then baby boomers. About 8 percent of older Americans commute three days a week or more. The percentages of those who report commuting vary by gender—71 percent of men and 57 percent of women.

Transit Is Heavily Used for Commuting by Gen Y, Big-City Dwellers, and People with Low Incomes
The survey found that 85 percent of Americans commute by car on most days. Eleven percent of the population usually commutes by public transit, and about 5 percent walks or bikes. Eighteen percent of gen Yers take transit, making them the most likely of all the generations to do so. Nine percent of baby boomers are also regular transit users.

Focus on Public Transportation

When it comes to public transportation or transit, what do Americans think and do? This fact sheet shares key findings from “America in 2013” about public transportation.

“America in 2013” is a national survey conducted by Belden Russinello Strategists LLC on behalf of the ULI Terwilliger Center for Housing and the ULI Infrastructure Initiative.

Public Transit Is a Meaningful Community Attribute to a Majority of Americans
The survey asked several questions to illuminate how people feel about public transit. About half of Americans think convenient public transportation is a meaningful community attribute. The strength of that preference varies across the generations and is strongest among members of generation Y. However, even among the group with the weakest preference for transit, war babies/members of the silent generation, nearly half the respondents—48 percent—would prefer to live in a community that has public transit they can use.

</tr>
</tbody>
</table>

Americans Place a Lot of Importance on Public Transportation
“America in 2013” asked respondents to rank on a scale from 1 to 10, with 10 being the highest, how important public transportation would be to them in choosing a community if they were moving. Over half of Americans, 52 percent, give public transportation a score of 6 or higher. Convenient public transportation is least likely to be important to gen Xers, but is important to many gen Yers, as well as to war babies/members of the silent generation.

Importance Rankings for Public Transportation, by Generation

Many Americans—Especially Those in Cities—Report Being Frequent Users of Public Transit

Although driving is the dominant mode of transportation in the United States, 11 percent of Americans use transit on a daily or weekly basis. Transit use is especially high among gen Yers, 29 percent of whom report using transit at least once a month or more. Older Americans are the least frequent users of public transit.

Focus on War Babies and the Silent Generation

What do America’s oldest residents desire when it comes to housing, transportation, and community choices? This fact sheet shares key findings from “America in 2013” about the war babies and the silent generation.

“America in 2013” is a national survey conducted by Belden Russonello Strategists LLC on behalf of the ULI Terwilliger Center for Housing and the ULI Infrastructure Initiative.

The Oldest Generations Share Similar Attitudes on Housing, Transportation, and Community Choices

The silent generation, born before 1931, and war babies, born between 1932 and 1946, are the smallest generations in America in numbers. Combined, the war babies (currently age 67 to 82) and members of the silent generation (age 83 and older) account for 35 million people. These generations hold very similar attitudes on community preferences and have been combined for this analysis.

War babies and the silent generation are among the least affluent of America’s generations: 49 percent of members of these generations earn less than $50,000 a year, and many live on a fixed income. A number of other characteristics set members of these generations apart from their younger counterparts: 61 percent are women, compared with 52 percent of the overall population, and 41 percent live alone, compared with 17 percent of Americans overall.

### The Oldest Americans Are Highly Satisfied with the Quality of Life in Their Community

The oldest Americans overwhelmingly say that they are very satisfied with the quality of life in their community. Sixty-seven percent of the oldest Americans say this, compared with 49 percent of the U.S. population overall. What’s more, they are more likely than the broader population to say they expect this high quality of life to continue.

Many Older Americans Plan to Age in Place
Twenty-two percent of the members of these generations expect to move in the next five years, the lowest percentage of any generation. These oldest Americans expect to be able to age in their own homes.

These findings parallel those discussed by John McIlwain, ULI senior resident fellow and ULI/J. Ronald Terwilliger Chair for Housing, in his report *Housing in America: The Baby Boomers Turn 65*. McIlwain cites the growing popularity among older Americans of aging in place and living alone! As these older generations continue to age in their homes and communities, new models of supportive living may be needed for them. In *Housing in America*, McIlwain identifies alternatives to traditional senior care facilities, including multigenerational living.

Compact Development Appeals to Half of the Oldest Americans
Fifty-one percent of the oldest Americans say they prefer three or more of the community attributes typically associated with compact development.

Like the baby boomers, many members of these generations would give up living in a larger home in exchange for a shorter commute. Sixty-five percent of this cohort would choose a smaller house and a shorter commute over a larger house with a longer commute, compared with 61 percent of Americans overall (and 72 percent of baby boomers).

Focus on the Baby Boomer Generation

What do baby boomers desire when it comes to housing, transportation, and community choices? This fact sheet shares key findings from “America in 2013” about the baby boomer generation.

“America in 2013” is a national survey conducted by Belden Russonello Strategies LLC on behalf of the ULI Terwilliger Center for Housing and the ULI Infrastructure Initiative.

Baby Boomers Are More Affluent Than the U.S. Average
Members of the baby boom generation, now ages 48 to 66, were born between 1947 and 1965. A total of 73 million baby boomers currently live in the United States, making up 31 percent of the total adult population. Compared with the U.S. population overall, baby boomers have a higher income level. They are also more educated than the U.S. population as a whole and are less diverse.

Baby Boomers Are More Likely Than the U.S. Average to Say Things Are Getting Worse

Baby boomers are relatively satisfied with the quality of their community, with satisfaction levels that tend to mirror those of the U.S. population as a whole. Eighty-four percent of baby boomers say they are very or somewhat satisfied with the quality of life in their community, roughly comparable with the 87 percent of the U.S. population overall with that opinion.

However, baby boomers are more likely than Americans overall to think life in their community is getting worse. Twenty-two percent of baby boomers have that impression, compared with 17 percent of the U.S. population overall.

Baby Boomers Are Found in Every Community Type, But Many Would Prefer Rural Living

Baby boomers are relatively evenly distributed across all community types: about 28 percent live in a small town, 20 percent in the suburbs, and 30 percent in a medium-sized or big city.

For baby boomers, the pull of rural living is strong. Baby boomers are more likely than the U.S. population overall to say that if they could live anywhere in the next five years, they would like to live in a more rural area, with 30 percent holding that view, rather than a big city, at 9 percent. Twenty-nine percent of baby boomers would like to live in a small town.

Many Baby Boomers Are Looking to Age in Place
Baby boomers, most of whom are now empty nesters—though 40 percent still have children at home—are not as anxious to move as the younger generations. Baby boomers may have less reason to move: 80 percent own their own home.

About three in ten baby boomers—31 percent—say they expect to change residence in the next five years, considerably less than the U.S. average of 42 percent, and lower than the percentages for gen Xers (41 percent) and gen Yers (63 percent).

Though Most Boomers Live in Single-Family Homes, Many Are Open to Other Options
Unlike previous generations, many baby boomers will need to continue working beyond retirement age, says John McIlwain, ULI senior resident fellow and ULI/J. Ronald Terwilliger Chair for Housing, in his report *Housing in America: The Baby Boomers Turn 65.* McIlwain attributes this change to concerns about long-term financial security and the need to build suitable retirement savings, particularly as life expectancy for older Americans continues to rise.

Perhaps because of these concerns, there is a hint of an increased market for compact housing among this age group. Sixty-five percent of baby boomers who are looking to move have their sights set on a single-family home—a smaller percentage of this group than currently lives in such housing (76 percent). This is a contrast with every other generation, for which a higher percentage of movers want to be in a single-family home than currently live in one.

**Current and Expected Housing Type, Baby Boomers versus All Adults**

*Among those likely or very likely to move in the next five years.

**Baby Boomers Desire Many of the Characteristics of Compact, Mixed-Use Development**

Baby boomers stand out as the generation most likely to give up living in a larger home if it means they could have a shorter commute. Close to three-quarters of this cohort (72 percent) would choose a smaller house with a shorter commute over a larger house with a longer commute, compared with 61 percent of Americans overall.

Baby boomers are divided on their views of living in mixed-use communities close to shops, restaurants, and offices (49 percent preferring a mix, 50 percent preferring no mix) and show a preference for communities with a similar housing stock (55 percent similar and 42 percent a mix).

Baby Boomers Place a High Value on Safety and Schools
When asked to indicate how they view the importance of certain community characteristics, baby boomers’ preferences closely mirror those of the broader U.S. population. Safety and schools top the list of considerations for baby boomers, followed by distance to medical care.

Baby boomers might be willing to forgo the large house, but among the generations they are neither the most nor least interested in living in communities close to shopping and entertainment. Sixty-seven percent rank this attribute 6 or higher in importance on a scale 1 of 10, compared with 71 percent of gen Yers and 58 percent of gen Xers. Baby boomers are also in the middle of the pack when it comes to rating the importance of being close to family and friends (60 percent rank this attribute 6 or higher), close to medical care (72 percent rank it 6 or higher), and walkability (67 percent rank it 6 or higher).

Focus on Generation X

What does generation X desire when it comes to housing, transportation, and community choices? This fact sheet shares key findings from “America in 2013” about generation X.

“America in 2013” is a national survey conducted by Belden Russonello Strategists LLC on behalf of the ULI Terwilliger Center for Housing and the ULI Infrastructure Initiative.

Generation X Is More Affluent Than the U.S. Average
Members of generation X—Americans currently between the ages of 35 and 47—have been raising families during times of both economic boom and bust, and are better educated and more financially well off than most other generations. Born between 1966 and 1978, generation X is made up of 55 million Americans. Gen X is not a particularly diverse generation. The typical gen Xer is married with children, and 44 percent of this generation has an income of $75,000 or more.

Members of Gen X Tend to Be Highly Satisfied and Believe Life Is Getting Better
Gen Xers are very satisfied, with 91 percent saying they are very or somewhat satisfied with the quality of life in their community, compared with 87 percent of the U.S. population overall. Gen Xers also tend to believe that life in their community is getting better.

Gen X Prefers Suburban, Rural, and Small-Town Life
Gen X is not a very urban generation: 34 percent of gen Xers live in a small town, and 17 percent live in a rural area. Gen Xers also tend to prefer living in a smaller setting. Only 23 percent would like to live in a medium or big city, compared with 28 percent of Americans as a whole.

Generation X Is on the Move
Gen X is a generation that is moving around: about 31 percent of its members have moved in the past five years, and 41 percent expect to move in the next five. These numbers are comparable with those for the U.S. population overall, but are somewhat lower than those for gen Y, which is the generation most likely to have moved or expect to move.

<table>

**Gen X Is a Generation of Homeowners**
Most members of gen X own their own home and, if they move, they expect to own the next one, too. It is perhaps not surprising then that 79 percent of gen Xers consider homeownership a good investment, a higher percentage than for the broader U.S. population—71 percent.

*Among those likely or very likely to move in the next five years.

**Gen Xers Commute to Work or School, and They Commute by Car**
Eighty percent of gen Xers commute to school or work three or more days a week, and the vast majority commute by car—92 percent, compared with the U.S. average of 85 percent. About three in five gen Xers (63 percent) report that public transportation is available in their community, slightly lower than the U.S. average of 69 percent.

Gen X Has Mixed Feelings about Mixed Use
When it comes to the kind of communities gen X prefers, places featuring attributes associated with compact development appeal to about half the generation. Although gen X’s preferences are less urban than those of gen Y and baby boomers, half of gen Xers prefer being close to a mix of shops, restaurants, and offices, and more than 53 percent prefer communities with a mix of incomes.

Focus on Generation Y

What does generation Y desire when it comes to housing, transportation, and community choices? This fact sheet shares key findings from “America in 2013” about gen Y.

“America in 2013” is a national survey conducted by Belden Russnello Strategists LLC on behalf of the ULI Terwilliger Center for Housing and the ULI Infrastructure Initiative.

Generation Y Is America’s Most Diverse Generation

Generation Y, also known as the millennial generation, is the youngest group of adults surveyed as part of “America in 2013.” Gen Y is composed of people born between 1979 and 1995, who are now between the ages of 18 and 34. There are 72 million members of gen Y, a number that continues to grow as immigrants in this age cohort enter the United States.

Gen Y stands out as the most urban, multicultural, and transient generation in America today. Forty percent of generation Y is Latino or African American. Compared with the U.S. population as a whole, gen Y has comparatively low levels of education and income—a testament to their relative youth, as well as to the fact that they are just starting their careers amid a challenging job market.

Gen Y Is Less Satisfied Than the U.S. Population as a Whole, But Thinks Life Is Getting Better

Gen Yers’ satisfaction with the quality of life in their community lags that of the overall U.S. population: whereas 82 percent of gen Yers say they are very or somewhat satisfied with the quality of life in their community, 87 percent of the U.S. population as a whole says this. For gen Y, there is room for improvement.

Gen Y is the least satisfied of all the generations with the range of housing options available (25 percent say they are dissatisfied) and with the quality and quantity of job and career opportunities in their community (49 percent express dissatisfaction).

However, gen Yers are optimistic. About 21 percent of gen Yers say life in their community is getting better, compared with 19 percent of Americans overall; 16 percent say it is getting worse, compared with 17 percent of the U.S. population overall.

Gen Yers Can Be Found in Every Community Type, But Many Are Drawn to Urban Living

Gen Yers are relatively evenly distributed across all community types: about 30 percent of gen Yers live in a small town, 17 percent in the suburbs, and another 39 percent are in a medium-sized or big city.ii

For gen Y, the appeal of urban living is strong. Gen Yers are more likely than the U.S. population overall to say that if they could live anywhere in the next five years, they would live in a medium-sized or big city. Forty percent of gen Yers express that preference, compared with only about 28 percent of the U.S. population as a whole.

**Generation Y Is on the Move**

Gen Y is a generation on the move: 53 percent of gen Yers say they have moved recently, and 63 percent say they expect to move in the next five years. These numbers are much higher than for the U.S. population overall, and specifically for baby boomers, 31 percent of whom say they expect to move in the next five years, and gen Xers, 41 percent of whom expect to move.

</tr>
</tbody>
</table>

**Gen Y Is a Generation of Renters**

Generation Y is a generation of renters: 54 percent of gen Yers currently rent. Of note: only 31 percent of gen-Y movers say they expect to own their new home—perhaps an acknowledgment of a difficult job market.

Despite this generation’s limited experience with owning a home, 72 percent of gen Yers say homeownership is a good investment.

**Homeownership Statistics, Gen Y versus All Adults**

<table>
<thead>
<tr>

<td>71</td>
</tr>
</tbody>
</table>

*Among those likely or very likely to move in the next five years.*

**Gen Y Uses Public Transit**

About 86 percent of gen Yers commute to work or school three or more days a week. Eighty-one percent reports having access to public transportation, a higher percentage than for the U.S. population as a whole, of which 69 percent says it has access to transit. Though the vast majority of gen Yers commute by car, many take advantage of public transit or other options: the percentage of gen Yers commuting by automobile is lower than for the U.S population overall.

For Gen Y, the Desire for a Single-Family Home Is Strong

Although only 49 percent of gen Yers currently live in a single-family home, 60 percent of those who expect to move in the next five years say they want to move into one. Still, 39 percent of the gen Yers expecting to move think they will end up in an apartment or duplex, townhouse, or rowhouse, higher than the U.S. average of 29 percent.

Gen Y’s Preferences Tend to Be More Urban Than Those of the U.S. Population Overall

When it comes to community attributes, members of gen Y express preferences that skew more urban than those of the country as a whole. Fifty-nine percent of gen Yers like communities with a mix of housing types, compared with 48 percent of the U.S. population overall; 62 percent want to be in community with a mix of shops, restaurants, and offices, compared with 61 percent of the U.S. population overall; and 55 percent want public transportation options, compared with an overall U.S. figure of 51 percent.

Of note: there is one area where gen Y lags the overall U.S. population: only 54 percent of gen Yers would give up a larger home if it meant a shorter commute, compared with 61 percent of the U.S. population overall. Perhaps gen Y has not yet experienced the agony of a long commute.

**Gen Y Values Proximity, Walkability**
When asked to indicate how they view the importance of certain community characteristics, gen Yers respond with answers similar to those of the broader population in some areas. As is the case for the country overall, safety and schools top the list of considerations for gen Y. In fact, local public schools are more important to gen Y than to any other generation.

However, gen Y tends to place more importance on being a short distance from work or school and on walkability than does the U.S. population overall. Gen Y ranks other proximity factors—being close to parks and recreational areas, to shopping and entertainment, and to family and friends—high in importance as well.iii Gen Y also places high importance on public transportation.

Gen Y also walks the walks. Like baby boomers, gen Yers walk more than the other generations. Nearly one in four people in generation Y (23 percent) reports walking several blocks to a destination nearly every day.

iii *Generation Y: America’s New Housing Wave* also found that generation Y ranks distance to family and friends high in importance among community features, along with proximity to work. The authors note that gen Yers desire to balance work and life through their community choices. Lachman and Brett, *Generation Y: America’s New Housing Wave*, 13.
