Integrating Transportation Demand Management into the Development Process: A Dialogue with Chula Vista

July 2014

Prepared for: CITY OF CHULA VISTA

Prepared by: SANDAG, KTUA + PARKING + LANDSCAPE ARCHITECTURE
Introduction and Overview

The City of Chula Vista, in partnership with the San Diego Association of Governments (SANDAG), initiated a series of two workshops to discuss approaches to integrating Transportation Demand Management (TDM) through the development process. City staff and developers attended the workshops to learn about a wide range of TDM strategies and to offer ideas, share concerns, and provide input on possible approaches to implementing and sustaining the City of Chula Vista’s existing TDM-related plans and policies. The workshops also built upon the SANDAG technical assistance guidebook, *Integrating TDM into the Planning and Development Process: A Reference for Cities* (May 2012).

This report provides an overview of both workshops and summarizes the comments received during each session by presenting trends and themes that characterize the major discussion topics.

Purpose and Objectives of Workshops

Supporting local jurisdictions in efforts to expand their TDM policies and programs is a strategy in the 2050 Regional Transportation Plan and Sustainable Communities Strategy (2050 RTP/SCS). As a first step, SANDAG staff developed a guidebook for local jurisdictions on integrating TDM into the planning and development process. This guidebook was the basis for the workshop series.

The City of Chula Vista has incorporated TDM elements into existing planning documents:

- The General Plan includes a policy to reduce traffic demand through the increased use of transit, bicycles, walking, and other trip reduction measures.
- Similarly, the Chula Vista CO2 Reduction Plan lists several action measures that can be classified as TDM, such as enhanced pedestrian and cycling facilities, increased housing and employment density near transit, and reduced commercial parking requirements.
- The Chula Vista Climate Action Plan recommends that the City facilitate smart growth development around trolley stations, a provision that aligns with the General Plan.
- The Eastern Urban Center Sectional Planning Area Plan recognizes the importance of engaging large employers to develop programs that promote off-peak hour commuting and reduced parking demand.
- The Otay Ranch Village 8 West and Village 9 Sectional Planning Area Plan cites TDM strategies such as designing multimodal streets and flexible parking standards to achieve reduced traffic congestion and improved air quality and livability.
- The City of Chula Vista Clean Transportation Energy Roadmap includes ways the City can expand upon its employee commuter benefit program.

The City of Chula Vista has implemented successful TDM programs in the last 20 years. Two telecenters operated in the mid-1990’s to encourage telework on the part of Chula Vista residents. Then, two Chula Vista Xpress bus routes connected Eastern Chula Vista residents to downtown San Diego or the H Street Trolley station between 2005 and 2007. Riders were paid to participate in the Xpress bus program until funding was exhausted.
Given this history, the workshops were intended to increase awareness of the benefits of TDM and to solicit feedback on the opportunities for formalizing TDM as part of the development review process in the City of Chula Vista. Specific objectives of the workshops included:

- Increasing the awareness of TDM measures and their direct and indirect benefits
- Identifying Chula Vista’s existing TDM-related policies and programs
- Exploring a range of TDM strategies that could be integrated into Chula Vista's planning and development process
- Identifying opportunities and challenges associated with integrating TDM into Chula Vista’s planning and development process
- Reviewing case studies, best practices, lessons learned, and data from other cities on TDM strategies that have been integrated into the planning and development process
- Identifying sample policies, model ordinances, developer agreement examples, transferable programs, and other resources

The workshops were not intended to design a new TDM program for the City of Chula Vista; rather, they were intended to gather preferences regarding the program’s approach, goals, and potential measures.

Workshop #1

Workshop #1 was held on March 10, 2014, at the City of Chula Vista Civic Center. This workshop, entitled "Bending the Trend: Integrating TDM into the Development Process," included a presentation and interactive small group exercises. Thirty-six participants from various divisions within the City of Chula Vista’s Development Services Department and local developers were in attendance. The presentation provided workshop participants with an overview of TDM principles, strategies, and implementation mechanisms and shared different ways that peer cities have incorporated TDM into the development process. The benefits of TDM were also highlighted during the presentation, including how TDM can help achieve LEED certification.

Following the introduction to TDM, two case studies were presented that demonstrated examples of developments that incorporated TDM strategies as part of their approval process; each one was followed by a small group discussion. Contra Costa Transit Village, a mixed-use development featuring retail, office, and multi-family housing along a regional rail line in Contra Costa County, CA, was the first case study presented. The history, context, and development scenario were provided to the workshop attendees. Working in groups, attendees were asked to select from a list of TDM strategies to develop a formal TDM program for the project. Each strategy on the list was assigned a relative cost and effectiveness value for reducing vehicle miles traveled that was developed by Contra Costa County and included in their 2009 “TDM Ordinance Guide.” Each group was asked to achieve a target level of effectiveness within a given budget.
The second case study featured a large commercial/office development in Arlington, VA. The site’s development history, context, and approved TDM program were reviewed including details of a TDM policy established in 1990. Workshop attendees were presented with a comprehensive list of strategies that comprised a part of Arlington’s TDM program. In small groups, attendees were asked to prioritize the menu of strategies used in Arlington and identify those strategies that might be applicable to Chula Vista. Participants were also asked to identify whether the City or the developer should be responsible for strategy implementation.

Workshop #2

Also held at the City of Chula Vista Civic Center, Workshop #2 took place on April 3, 2014, with 25 participants in attendance. The goal of this workshop entitled, “Focus on Chula Vista: Integrating TDM into the Development Process” was focused on implementing and sustaining TDM programs. The workshop included a presentation that provided a review of discussion topics from Workshop #1, highlighted past TDM efforts in Chula Vista, reviewed TDM implementation mechanisms, and discussed sustainment strategies. During the presentation, two local developers were given the opportunity to discuss projects in Chula Vista that have considered TDM measures as part of their approval. An Otay Land Company representative stressed the importance of mixed uses, including neighborhood-serving retail and other services, and pedestrian-friendly design as a way to reduce vehicular traffic in and around a development. A representative of Corky McMillin Companies spoke about the Millenia development in southeast Chula Vista and the challenges associated with implementing shared parking on a site upon which specific uses/tenants have not yet been identified. If a particular development is not yet a destination, parking availability is necessary to attract tenants.

Following the presentation, workshop attendees engaged in an interactive exercise that highlighted three different geographic areas of Chula Vista with varied development characteristics. Participants worked in small groups to design TDM programs and implementation strategies for three different development sites in Chula Vista. The sites reflected varying contexts and assumed development programs ranging from intensive urban redevelopment, to green-field master plans, to an individual infill project in differing transportation settings. This allowed participants to better understand how potential TDM programs and strategies might vary across the City.

Discussion Trends and Themes

The following discussion summarizes the topics, ideas, and comments shared by workshop participants. They were developed based on a review of workshop meeting minutes, discussion notes, comments from the workshops, and survey responses. They are organized by overall considerations, challenges, and favorable strategies identified in both group discussion and individual tabletop discussions in Workshops 1 and 2.
Overall Considerations

- The TDM application and implementation processes should be consistent and predictable, especially from the perspective of the developers. The incorporation of TDM requirements should be a known, quantifiable process so as to minimize risk and cost. It should be clear where/how TDM requirements will overlap with existing (non-TDM) requirements so the entire entitlement process is coordinated up-front.

- Any proposed TDM program should be flexible and responsive to the development’s context. A menu of TDM options for developers allows strategies to be tailored to a specific development. TDM measures could be implemented and monitored through a membership organization, such as a Transportation Management Association, providing a single purpose and being member-driven.

- In order for a formal TDM program to be successful there needs to be a consistent method for managing and sustaining it. However, the program should also be adaptable and respond to changing needs over time.

- The City of Chula Vista and developers are already incorporating elements of TDM. Any future program should recognize and build upon what’s already being done.

- At the regional level, SANDAG provides a wide range of TDM programs and support services that both the City and developers can leverage rather than starting from scratch.

Challenges

- Success of any TDM program/ordinance will require an educational component to help change the culture/mindset away from driving alone.

- Convenient transportation alternatives that are competitive with the single occupant vehicle need to be available for TDM to succeed.

- Cost is the biggest variable for all aspects of a TDM program, from program creation to sustainment/verification. The level of cost, and who is assigned to pay certain costs, will greatly influence how programs should be structured.

- Any program/ordinance will need to address the various players involved at the different stages over the life of a project, from master developer, to builder, to tenant/occupant. Additional detail related to who is involved/responsible at all stages of the project will need to be defined.

- TDM requirements will need to be responsive to market conditions. For large projects, phasing of TDM requirements is more feasible, but harder to ensure all measures are incorporated/executed.

- The City will need to identify staffing resources to monitor the implementation of TDM strategies, especially the programmatic strategies.

Most Appealing Strategies

The small working groups expressed a variety of opinions as to which combination of TDM strategies would be most effective for reducing vehicle trips and increasing the use of transportation alternatives. While all tables were in favor of including strategies with no or minimal associated cost, they did not limit their choices to the least expensive options altogether. Although the remainder of selections varied, the tables gravitated to four areas: 1) physical improvements, such as bicycle and pedestrian amenities and improving access to transit; 2) direct transit incentives, such as the federal tax benefit; 3) parking management solutions; and 4) alternative work
arrangements, such as telework or compressed workweeks. The selection of these types of strategies for a hypothetical TDM program could be attributable to the participants’ familiarity with these strategies; all four currently exist in the San Diego region in one form or another. Furthermore, the alternative work schedules and physical improvements were seen as being highly effective in Chula Vista, specifically.

There was widespread discussion about physical improvements being the most quantifiable and predictable strategies to implement. This was appealing to developers who want to minimize risk. Physical improvements also were appealing to City staff who viewed these strategies as permanent and requiring little to no monitoring.

Transit/tax incentive strategies were selected because they built upon existing systems. These strategies were seen as reinforcing existing behavior for current transit riders and potentially enticing current drivers to consider transit. Both were attractive because they provided immediate tangible benefits through direct cost savings to the user.

There was wide consensus that effective transportation management must include parking management. Both developers and City staff understood the relationship between transportation behavior and the cost and supply of parking. Nuances of certain parking strategies emerged once the element of context was introduced. The developers, in particular, understood that parking reductions and/or parking charges were only feasible in areas where demand was already high. In outlying areas of the City, ample (and even, surplus) parking was seen as necessary to attract sufficient business/residents.
Lastly, participants indicated that alternative work schedules are both effective and applicable to the Chula Vista context. The popularity of alternative work schedules was a combination of their (perceived) low implementation cost as well as their suitability for Chula Vista. Some forms of this strategy, such as compressed work weeks and telework, can indeed be implemented with little to no cost, but are only viable for specific types of businesses.

Next Steps and Recommendations

The workshops initiated a dialogue about TDM in the City of Chula Vista. However, follow-up actions are needed for the City to implement TDM in a comprehensive and strategic manner. Recommendations are provided for the City to consider when developing a standardized TDM program.

1. Develop a Reference Matrix to Guide Future Discussions

The City should develop a reference matrix to distill information about existing TDM programs in other cities. This should also incorporate programs that the City of Chula Vista can leverage to help implement TDM. Some of this information was presented during the workshops and additional information is included in the references section of this report. Developing a reference matrix will help the City define objectives and outcomes of the TDM program and guide the discussion of a “Stakeholder Advisory Group.” The reference matrix should be prepared to highlight different solutions that are appropriate for the different contexts in Chula Vista.

2. Establish a Stakeholder Advisory Group to Inform the Development of a Formal TDM Program

A “Stakeholder Advisory Group” should be created to serve as a forum for discussing key questions about how a TDM program can be structured in Chula Vista. The City of Chula Vista could leverage the existing Development Services Oversight Committee. This group primarily consists of members of the development community who have advised the City of policy in the past. The group could be expanded to include additional stakeholders (e.g. business owners of varying size and type, transportation-related interest groups and agencies) with different perspectives and interest in how TDM can be implemented in the City. Industry leaders from the San Diego Metropolitan Transit System and SANDAG also should be included to provide input on best practices and regional programs. Incorporating representatives from different City departments should also be considered to draw on the experiences and knowledge about existing City programs and policies.

The role of the “Stakeholder Advisory Group” should be clearly defined and the City should carefully consider a strategy on how to efficiently and effectively get input from this group within a set timeframe. Defining the problems to be solved by the group and the opportunities that can be leveraged will help structure the dialogue. Some questions to consider include:

- Should a TDM program apply to the entire City, or focused areas?
- What voluntary or required elements might be required? Can incentives be provided for participation?
- Are all projects subject to the same standards? Are there differences based on scale or use?
- What City departments will manage and monitor TDM? How will the performance of TDM be measured and sustained?
3. **Develop an Implementation Framework**

An implementation framework will help determine the scope and structure of the TDM program that is appropriate for the context and needs of Chula Vista. A standardized TDM program would provide the City with an effective set of tools that are predictable for developers. Standardizing a TDM program is important to ensure that implementation is equitable and consistent, but it must also be sensitive to varied scales of development (e.g., Sectional Planning Area plans versus individual development projects). The framework should leverage the existing TDM policy foundation and current practices. As an outcome of the implementation framework, the effects of *not* implementing a TDM program should also be considered and quantified, if possible.

4. **Execute the Implementation Framework**

The recommendations of the implementation framework should provide specific direction and a schedule for moving forward with execution. The implementation framework should include education programs for City staff, developers, and the public. Recommendations should describe the existing policies or practices that will need to be updated or streamlined and/or new policies needed to support implementation. The framework should take advantage of regional TDM programs and services that are currently available to employers and commuters through SANDAG.

**TDM Research Reports**

Other

Contra Costa Centre Transit Village
Contra Costa Centre Transit Village, a 125-acre district surrounding the Pleasant Hill/Contra Costa Centre BART station

Contra Costa Centre Transit Village hosts 7,000 residents, 6,000 employees, and 6,000 BART customers a day.
Contra Costa Centre Transit Village

Recognized by BART Board of Directors to change the BART station name in 2008 to Pleasant Hill/Contra Costa Centre.
Contra Costa Centre Transit Village

- Public and private partnerships encourage private responsibility, and mobilize private resources for public good
- Contra Costa Centre Transit Village is located in Contra Costa County
Contra Costa Centre Transit Village

- Contra Costa Centre Association was incorporated in 1985 as a nonprofit mutual benefit corporation
  - Coordinate planning and services of mutual interest including landscaping, child care, marketing, transportation demand management programs and security
  - The 14 project owners incorporated to voluntarily work together as a single entity
Transportation Demand Management is a critical piece. Provide planning designed to promote efficient transportation services.

Primary example of how jobs and housing near transit can work and get people out of their cars. Over 30% of the employees have taken a commute alternative for over 20 years.

In 1989, 14 project owners comprising of CCCA contributed over 1.5 million dollars to be used for TDM.

In 2002, project owners voted to approve a $200,000 annual tax assessment for TDM with the creation of CSA M-31 District.
Contra Costa Centre Transit Village

- Funding for projects available through local or national grants

- Over the history of the Contra Costa Centre Transit Village, Contra Costa Centre has received over $500,000 in grants for TDM programs including vanpool vans, BART tickets, shuttle bus and bike lockers.

- In 2011, Department of Energy awarded Contra Costa Centre Transit Village a grant for 14 electric vehicle charging station equipment. EV charging station grants were worth $90,000.

Introduction

The Transportation Demand Management (TDM) Ordinance Guide is provided to developers to encourage the use of creative and effective ways to reduce motor vehicle trips and their associated impacts created by new development projects, pursuant to the County’s TDM Ordinance.

County staff will review development projects with the applicant based on this guide and determine if a combination of acceptable options/measures will reduce the net number of trips that the project is anticipated to generate. This document contains recommended TDM measures and guidance based on the County’s TDM Ordinance.

The County faces the inevitability of a growing population, in conjunction with an expanding job market. The County’s TDM Ordinance Guide will help property owners and developers reduce traffic congestion through measures designed to encourage the use of alternatives to the driving alone by car.
1.0 Intent and Purpose

This is a guide to help property owners and developers comply with the requirements of the County’s Transportation Demand Management (TDM) Ordinance. Text in italic font is taken directly from the ordinance.

(a) The intent of this chapter is to further the transportation goals of the County General Plan, the Measure C Growth Management Program, Contra Costa County’s Congestion Management Program, and the Bay Area Clean Air Plan.
(b) The purpose of this chapter is to implement the provisions of the general plan to promote a more balanced transportation system that takes advantage of all modes of transportation by:
   (1) Incorporating pedestrian, bicycle, and transit access into improvements proposed in development applications;
   (2) Incorporating the overall intent and purpose of this chapter into the land use review and planning process;
   (3) Allowing requests for reductions in the off-street parking requirements for residential or nonresidential projects that have a conceptual TDM Program;
   (4) Providing information to residents on opportunities for walking, bicycling, ridesharing and transit.¹

Pursuant to the County’s zoning ordinance or possibly under a project’s conditions of approval, County staff has the authority to require the submittal and approval of a TDM program prior to the issuance of a building permit for a project. TDM programs associated with development projects typically aim at achieving the following general outcomes:

- Reduce the frequency and distance of auto trip making;
- Spread peak-hour trip making to off-peak time periods;
- Shift trips towards the use of environmentally friendly and non-motorized modes of transportation; and
- Provide technological solutions to reduce the environmental impacts of vehicular traffic, such as provision of charging stations to encourage the use of electric/hybrid vehicles, and provision of real-time or interactive information on bus services.

There is no single TDM measure that can effectively reduce a project’s traffic impacts. Relative effectiveness of each TDM measure within a program; and the effectiveness of the overall program can be evaluated by how well the aforementioned outcomes are achieved. The following sections of this guide provide information on the different TDM measures that can be deployed by different types of developments, as well as means for their implementation and, if applicable, monitoring their effectiveness.

There should also be a reference to a significant community resource, namely 511 Contra Costa, which can be of great use for employers and developers pursuing the deployment of TDM

¹ Ch. 82-32.004
strategies. The www.511contracosta.org web site has information on the different transit services and regional connections (e.g. ACE commuter rail, AC Transit, BART, County Connection, and others). The web site also has information on park & ride lots, taxicab services, clean fuel vehicles and infrastructure, bicycle programs, racks and lockers as well as different commuter and employer services. Subject to current programs and availability of resources, 511 Contra Costa could supply free transit and bicycle maps, transit and vanpool vouchers with tax benefits for employers and employees, free taxi rides as part of the Guaranteed Ride Home Program, and free gas cards and transit passes to encourage employees to try a commute alternative. The 511 Contra Costa staff could also assist by providing presentations on the transportation options, alternative work schedules, telework, as well as assist in conducting and analyzing employee transportation surveys, developing parking management programs, providing a specialized rideshare or parking management program at the worksite, and other TDM initiatives.

It should be noted that development projects are also subject to the potential requirement of Traffic Impact Analysis (TIA), which may include mitigations to individual and cumulative project impacts at study intersections, roadway segments, and/or freeways as well as on-site and site access improvements. Such analysis and mitigation requirements are not addressed in this guide.

2.0 Definitions

The TDM Ordinance defines important terms to clarify the type of projects subject to its requirements.

(a) "Residential Project" means any residential development application containing thirteen or more dwelling units that must be approved through a public hearing process and has not received final approval.

(b) "Non-Residential Project" means any non-residential or, mixed-use development application that must be approved through a public hearing process and has not received final approval. Non-residential project also includes an application to expand an existing office or industrial structure that has at least five thousand square feet of gross floor area, by twenty-five percent or more of the structure’s gross floor area.²

3.0 Application for Off-Street Parking Reductions

The requirements of this chapter shall apply to all development projects, residential or nonresidential.³

(a) A project may qualify for reductions in off-street parking requirements pursuant to this section. A sponsor requesting parking reductions shall submit a conceptual TDM program to the community development department concurrently with the application for the project. If the tenant is known, the project sponsor and tenant shall jointly submit the conceptual TDM program.⁴

² Ch. 82-32.002
³ Ch. 82-32.006
⁴ Ch. 82-32.006
The two main benefits to project sponsors associated with a reduced off-street parking requirement are: (1) Significant savings in construction and maintenance costs for off-street parking; and, (2) The availability of space/land that otherwise would be used for parking. Such space could be utilized to provide on-site amenities, landscaping, or increased project density subject to County approval.

A mixed-use development application can have characteristics that could qualify for a reduction in off-street parking required by the zoning code. Different uses can vary in their peak parking demands in a day, week and/or season which could support the concept of shared parking. For example, parking associated with a general office use on a weekday takes place at 10:00 a.m., while parking of a movie theatre peaks at 8:00 p.m. and 10:00 p.m. The Institute of Transportation Engineers (ITE) Parking Generation Manual is a professional source for obtaining information on the variations in parking demands during a weekday and weekend day, as well as variations in the different months and seasons during a year. Currently, the 3rd Edition of the ITE Parking Generation Manual is in use with expected future updates. Also currently in use is the 2nd Edition of the “Shared Parking” report produced by the Urban Land Institute, which can be utilized to obtain parking rates for mixed-use developments. Different combinations of uses would result in different overall peak parking demands. Such analysis also typically relies on surveys of similar projects established in similar communities.

3.1 Required Information for Development Permit Application

3.1.1 Conceptual TDM Program

*The conceptual TDM program shall identify TDM measures that can be demonstrated to attain the trip reduction necessary to qualify for the requested parking reductions. The department shall review the project’s conceptual TDM program and make a recommendation to the division of the planning agency hearing the project application*.5

TDM measures potentially suitable for consideration in a residential project’s Conceptual TDM Program can be found in Appendix A, with cost and implementation comparisons in Appendix D of this guide.

TDM measures potentially suitable for consideration in a non-residential or mixed-use project’s Conceptual TDM Program can be found in Appendix B of this guide, with cost and implementation comparisons in Appendix D of this guide.

All Conceptual TDM Programs shall contain a monitoring, evaluation and enforcement component.

Monitoring: Monitoring a TDM program can be accomplished by periodically surveying occupants or residents to determine the success or failure of the TDM measures individually or in combination. A commute survey typically gathers quantitative data (e.g., % use of the various modes of transportation) and qualitative data (e.g., respondents’ perception of the alternative transportation programs). The survey data can then be used to decide on any needed adjustments to the TDM measures. They can also be used to focus future marketing initiatives. 511 Contra Costa

---

5 Ch. 32-32.008(a).
staff can assist with the preparation of the survey questionnaire, collection of the data and analysis
in the form of survey reports. Some survey tips are provided at the end of this section of the TDM
Ordinance Guide.

Allowing completion of the survey on-line can help reduce the time and effort spent on circulating
and administering the survey. When possible, conducting a baseline survey before starting the
TDM program can later assist in evaluating the program’s effectiveness (Before and after
comparative analysis). In addition, comparing results of the survey to previous surveys can assist in
evaluating the program’s progress and potential modifications. It is possible to add survey questions
to assess such new improvements.

Evaluation: TDM programs are not static, but must change as the needs of commuters change or as
transportation services available to a project change. The effectiveness of TDM measures should be
monitored and evaluated to determine if changes are needed. Effectiveness is typically based on a
cost/benefit analysis of the individual TDM measure. For example, is the cost of providing a shuttle
service to a BART station justified by the number of shuttle users? Such cost/benefit analysis can
assist in identifying measures that the participants’ needs at the least cost. TDM Program costs
typically include the capital and operating costs, such as the cost of bike lockers, shuttle fleet, cost
of training and educational materials, TDM staff hours and rates, cost of office equipments provided
to telecommuters, etc.

Enforcement: To ensure the success of the TDM program, it is important that the project sponsor
establish mechanisms that guarantee the perpetuity of the program. Examples of such mechanisms
are described below:

- Incorporate the TDM program requirements into the Covenants, Conditions & Restrictions
  (CC&Rs) of the property to ensure that the TDM program runs with the land. Wording of
  the CC&Rs has to ensure that the property, as well as every owner and occupant shall be
  subject to, abide with, and satisfy each and all of the provisions and obligations contained in
  the TDM program. This includes any obligation to provide funding and resources to
  implement the TDM program and comply with all requirements of associated conditions of
  approval imposed by the County. It is important to clarify that the TDM program
  requirements apply equitably to all portions of the property. They also apply to all owners
  and tenants, as well as their successors in case the property is transferred, sold or leased.
  Should the County apply a penalty fee system for lack of compliance with the set
  percentages of trip reduction, this also must be stated in the CC&Rs to avoid any surprises.

- Incorporate the TDM program requirements into the tenant lease agreement to ensure that
  occupants of the project site cooperate with the property owner/sponsor, property manager
  and/or the County in meeting all requirements. The wording of the lease agreement may
  also specify that a person shall be designated to act as a liaison with the landlord, the
  County, etc.
3.1.2 Proposed Improvements

The sponsor shall include in the tentative map, land use permit, or development plan application, any improvements that will provide access to public transit, ridesharing opportunities and nonmotorized forms of travel.\(^6\)

Typical on-site improvements include internal paths, bicycle parking, pedestrian/cyclist connections to off-site facilities, pedestrian signage and lighting, etc. The site plan should also acknowledge access to bicycle lanes/routes, sidewalks/paths or transit stops adjacent to the project site.

A more detailed description of proposed improvements potentially suitable for reducing a residential project’s off-street parking needs can be found in Section IV of this guide.

Proposed improvements potentially suitable for reducing the off-street parking needs of a non-residential or mixed-use project can be found in Section V of this guide.

If the project lies within a transit service area identified in the circulation element of the General Plan, the sponsor shall consult with the transit service provider on the need to provide infrastructure to connect the project with the transit services. Evidence of compliance with this requirement may include correspondence from the local transit provider(s) regarding the potential need for installing bus turnouts, shelters or bus stops at the site.\(^7\)

Transit facilities may be needed for existing transit service or to allow the project to be served by new transit routes in the future. The transit service areas are shown in Figure 5-3 of the General Plan. The 511contracosta.org website has the contact information and route schedules and maps for all San Francisco Bay Area transit providers, including those that serve Contra Costa. A listing of the transit service providers for these areas follows:

- AC Transit serves El Cerrito, Richmond, San Pablo and neighboring unincorporated areas.
- West CAT serves Pinole, Hercules, Rodeo and Crockett.
- County Connection serves Lamorinda, Martinez, Concord, Clayton, Walnut Creek, Pleasant Hill, Danville, San Ramon, and neighboring unincorporated areas.
- Tri Delta serves Antioch, Brentwood, Pittsburg, Oakley, and unincorporated communities in eastern Contra Costa.

---

\(^6\) Ch. 82-32.008(c)
\(^7\) Ch. 84-32.008(d)
3.1.3 Final TMD Program

Final TMD Program. The design and implementation of the final TMD program shall be a condition of a project’s approval. The sponsor and all subsequent owners of the project shall provide deed notification of mandatory participation in the final TMD program to all subsequent purchasers and owners of the project.  

---

8 Ch. 84-32.008(e)
The County’s approval of a TDM program for a reduction in off-street parking is discretionary. County staff will review the Conceptual TDM Program, in consultation with the applicant, and determine its potential to achieve the off-street parking reduction requested in the development application. A recommendation for a Final TDM Program will be made to the approving body. Approval may be conditional and include performance standards which, if not met, would require reconsideration of the Final TDM Program. If the TDM Program is not approved, there will be no reduction in off-street parking requirements.

Following the County’s review and approval process, the Final TDM program will be set as a condition of approval on the project. The project sponsor and all subsequent owners of the project shall provide deed notification of mandatory participation in the Final TDM program to all subsequent purchasers, owners and tenants of the project.

4.0 TDM Requirement for Residential Projects

4.1 TDM Program Content

A sponsor of a residential project containing thirteen or more dwelling units shall prepare and implement a TDM program that includes at least the following:

(1) Owner-Occupied Units. Upon a residential dwelling being sold or offered for sale, the sponsor shall notify and offer to the buyer or prospective buyer, as soon as it may be done, materials describing public transit, ridesharing, and nonmotorized commuting opportunities available in the vicinity of the project. Such information shall be transmitted no later than the close of escrow;

(2) Rental Units. Upon a residential dwelling being rented or offered for rent, the sponsor shall notify and offer to the tenant or prospective tenant, materials describing public transit, ridesharing, and nonmotorized commuting opportunities in the vicinity of the development. The materials shall be approved by the Department of Conservation and Development. The materials shall be provided no later than the time the rental agreement is executed.

The sponsor and all subsequent owners of the project shall provide deed notification of mandatory participation in the TDM program to all subsequent purchasers and owners of the project.9

The TDM Program for a residential project should be understood as a disclosure document to the occupants of the residential project. It discloses the transportation facilities and services located on-site and off-site that are available to the occupants. It should be of a format and size that can be easily incorporated into other disclosure documents prepared for the project. A format adaptable to a letter-size 3-ring binder is typically used.

The TDM Program must be approved prior to issuance of the first building permit for the project, unless the conditions of approval indicate otherwise. The applicant must submit an initial submittal to County staff for review. County staff will review this submittal and identify any revisions needed, in consultation with the application, to receive approval. County staff’s primary concern is

9 Ch. 82-32.010
that the TDM program be accurate regarding the on-site and off-site transportation services available for project residents and that it be easily understood by residents.

4.2 Proposed Improvements

(b) A sponsor shall include in the tentative map or development plan application, all improvements that will provide access to public transit, ridesharing opportunities and nonmotorized forms of travel.

(c) A sponsor whose project lies within a local transit service area identified in the circulation element of the general plan shall consult with the local transit service provider on the need to provide infrastructure to connect the project with transit services. Evidence of compliance with this requirement may include correspondence from the local transit provider(s) regarding the potential need for installing bus turnouts, shelters or bus stops at the site.10

Proposed improvements are a primary feature of a TDM Program for residential projects. The Program will incorporate a copy of the project’s site plan showing the internal paths, bicycle parking, pedestrian/cyclist connections to off-site facilities pedestrian signage and lighting, etc. It will also require including a plan/map showing bicycle lanes/routes, sidewalks/paths in the area around the project site. If the project lies within a transit service area identified in the Circulation Element of the General Plan, a map showing the transit services and the stops closest to the project site is also required. The aforementioned information and supportive maps and graphs should be submitted in a three-ring binder. For further guidance on complying with the above requirements, see Section 3.1.2.

5.0 TDM Requirement for Non-Residential Projects

(a) A sponsor shall include in the tentative map or development plan application, all improvements that will provide access to public transit, ridesharing opportunities and nonmotorized forms of travel.

(b) A sponsor whose project lies within a local transit service area identified in the circulation element of the general plan shall consult with the local transit service provider on the need to provide infrastructure to connect the project with transit services. Evidence of compliance with this requirement may include correspondence from the local transit provider(s) regarding the potential need for installing bus turnouts, shelters or bus stops at the site.11

The guidance previously provided for the TDM requirement for residential projects in section 4.2 also applies to non-residential projects.

---

11 Ch. 82-32.012
APPENDIX A

POTENTIAL TDM MEASURES FOR RESIDENTIAL PROJECTS

TDM measures that can be deployed by project sponsors of residential projects are described in this section. These measures can be physical improvements incorporated into the project’s design, or operational programs implemented once the project is occupied.

Project Design

On-Site Amenities
There are on-site amenities that can be provided within residential developments to help reduce the need for vehicular trip making to external facilities. Example on-site amenities are listed below. The on-site amenities will need to be customized depending on the size and density of the residential development.

- fitness center;
- Tennis court, basketball court, and/or game court area;
- swimming pool with adjacent deck and lawn area;
- children’s play apparatus area;
- Family picnic area;
- Turf playfield;
- childcare room;
- Information kiosks including cycling maps, transit routes and schedules, shuttle services, etc.
- Bicycle racks, secure bicycle lockers, bicycle cages
- On-site transit pass sales; and,
- Mail drop and supplies.

On-Site Vehicular Parking
There are several parking design techniques that can potentially manage and/or reduce vehicular traffic demands. Example of these design techniques are listed below.

1. Locate a park and ride lot within or adjacent to your project. A park and ride lot provides a safe and convenient location for long-distance commuters on their way to work to leave their personal cars and transfer to a carpool, vanpool, or express bus route to complete their journey. Preferred locations for these lots include parcels that have convenient access to major thoroughfares or freeways, or at a bus stop serving one or more express bus routes.

2. On-site parking location and design should not interfere with pedestrian and bicycle circulation (e.g. paths, bike routes, etc.). Parking location and design should not obstruct or make less convenient pedestrian access from sidewalks and transit stops to building entrances. Parking should generally be located on the side and/or back of buildings; not in front of the buildings to avoid increasing the distance between sidewalks and building entrances.
Cycling Facilities
A TDM strategy is shifting short distance trips made by automobiles to the use of bicycles, and thereby reduce congestion, air pollution and parking demand. Effective cycling initiatives take advantage of the positive aspects of cycling, and offer solutions to the negative aspects when possible. Example advantages associated with bicycle use include a low cost and environmentally friendly means of travel, and a convenient way to incorporate exercising into one’s commute. On the other hand cyclists are more susceptible to serious injuries in collisions, exposure to adverse weather, poor pavement conditions and are restricted by age and health conditions. Design solutions to some of the negative aspects of bicycling include the following:

1. Provide adequate bicycle parking both for residents and guests. Residents parking needs to be long-term such as bicycle lockers, or secured bicycle racks within a garage. Bicycle parking for guests would typically be in the form of racks placed at convenient locations throughout the project site. Special attention needs to be given when placing bicycle parking. For example, near building entrances, in well lit areas, sheltered when possible, secured (some bicycle types are expensive and may be equipped with electric motors), and on the ground level unless elevators are provided in the buildings.

2. Ensure safe and convenient access and movements of cyclists within residential projects. Design elements to be considered include the provision of an interconnected web of shaded paths and crosswalks, traffic calming for auto traffic, adequate lighting, signage, and easily accessible bicycle parking.

Pedestrian Facilities
Walking is an effective mode of transportation for short distance trips, and can be undertaken by a wider range of population relative to cycling. There are different design elements that can be considered when developing project sites. Example design elements are described below.

1. Minimize walking distances within project sites, and provide direct connections to the public streets including transit stops. Provide pedestrian pass-throughs in soundwalls bordering arterials.

2. Give a priority to establishing and maintaining pedestrian facilities such as sidewalks, marked crosswalks and stop bars, in-pavement lighted crossing, bulbouts and other traffic calming devices, pedestrian-scale lighting, signage, sheltered seating areas, and landscaping.

3. Other design considerations that are safety related include the provision of adequate sight triangles at project driveways and internal intersections, as well as preventing parking encroachment within pedestrian sidewalks and walkways.

Transit Facilities
Project site design can play a key role in supporting the use of public transit. A few examples of such design elements are listed below.

1. Provide pedestrians and cyclists with safe and direct paths to public roads where transit services can be provided.
2. Provide an on-site information kiosk where current transit information is offered along with transit maps, schedules, etc.

3. Provide necessary transit facility in the vicinity of the project site based on consultation with the transit agencies and the County. Possible improvements can be a bus shelter, bus turnout, concrete pad/road surface, seating at transit stop, and lighting.

Project Occupancy/Operation

On-Site Parking Operation
Limit the time periods at designated visitor parking to discourage residents from using such spaces for long-term parking of their second and third vehicles.

Cycling Initiatives
Provide educational information that encourage cycling as a healthy living lifestyle and environment friendly mode of transportation in homeowners association or tenant newsletters/bulletins. Include information on bicycle commuting events and services offered by 511 Contra Costa (e.g. Bike to Work Day).

Walking Initiatives
There are operational means that can be practiced by homeowner associations and building managers to encourage walking to/from neighborhoods.

1. Provide annual and seasonal events that promote walking as a healthy way of living and as an environment friendly mode of transportation. Prizes and other incentives can be offered to encourage participation at the events.

2. As will later be explained under the Monitoring and Evaluation section of this guide, the survey data can be used to identify residents who are interested in walking and the approximate locations of their frequent destinations. Such information can help the formation of a walking buddy system to encourage participants to walk to/from work, shopping facilities, school, etc.

Public Transit Initiatives
Transit plays a particularly important role in serving peak period travel demands associated with commute trips to work and school. Transit also provides basic mobility for people who do not have an alternative. For many commuters, transit is the preferred choice of travel during the peak periods since it can be faster in HOV lanes or a dedicated rail line. Commuters can utilize the trip time for reading, or another activity that benefits them.

1. Depending on the project size, consult with relevant transit agency to seek changes to bus routes and/or routes capacity to better support transit ridership projected for the project.

2. Encourage the use of public transit through promotional and educational materials. Also, if possible, allow for the purchase of transit passes on site to facilitate transit use. Supporting
the use of public transit can benefit the environment, transportation system, and social equity.

Rideshare Initiatives

1. Encourage and facilitate a car cooperative program using a car sharing service. (e.g. City Carshare or Zipcar Carshare). Deploying such a cooperative program could potentially minimize the need for owning a car.

2. Carpooling to schools, daycares, work and other destinations. Carpooling can be deployed in a formal fashion through services provided by 511 Contra Costa, or through informal communications among the residents.

TDM Coordinator

A TDM Coordinator is typically responsible for developing, marketing, implementing and evaluating the TDM programs. The TDM Coordinator can be a designated on-site resident, a community association representative, or a property management representative. The Coordinator’s responsibilities can also be contracted out with a commute company. It should be noted that one of the most effective TDM measures is by having an on-site transportation coordinator. Example functions of a TDM Coordinator are listed below:

1. Distribute pertinent information to all residents regarding the facilities, programs and services available at the project site. Also regularly update any information kiosks and information boards at the project site for displaying TDM information. The regular information update makes it useful and interesting for users.

2. Obtain and circulate educational and promotional information from BART, bus operators, 511 Contra Costa and other transportation service providers.

3. Act as a liaison to all appropriate transit agencies. This includes distribution of appropriate transit information and maps, transit passes, and any other responsibilities related to the utilization of transit services or car sharing.

4. Distribute carpool/vanpool, school pool matching applications to all new residents upon occupancy, as well as on an annual basis.

5. Develop and implement promotional programs such as on-site transportation fairs and promotional events. Also coordinate with regional promotional programs such as Bike to Work Day and Spare the Air Days.

6. Conduct the annual commute survey, evaluate survey results and potential need for improvements, and update the program elements accordingly. Develop the annual status report and submit it to the County for projects conditioned to achieve a certain trip reduction rate.
Home-Based Work
Supporting home-based businesses is an effective TDM strategy and has co-benefits for economic development. Properly developed and advertised information on small business support groups, by-laws and guidelines, key information on home-based businesses and possible means for starting a business type, tax information, land use permits, etc. can assist in increasing home-based businesses. Such information can be obtained from a number of governmental and reliable private agencies. Also having common access to key office equipment, such as photocopy machines, can also support the formation and ongoing operation of home-based businesses.
APPENDIX B

POTENTIAL TDM MEASURES FOR NON-RESIDENTIAL OR MIXED-USE PROJECTS

TDM measures that can be deployed by project sponsors of non-residential or mixed use projects are described in this section. These measures can be physical improvements incorporated into the project’s design, or operational programs implemented once the project is occupied.

Project Design

On-Site Amenities

On-site amenities provide services at the development site to minimize vehicular traffic, especially mid-day trips. Such on-site amenities can include the following:

- Clothes lockers and showers;
- fitness center;
- On-site cafeteria preferably with hot food service;
- Lunchroom with microwave and refrigerator;
- Vending machines;
- Automatic teller machine;
- dry cleaner;
- childcare service;
- Mail, copying and shipping services;
- On-site transit pass sales;
- Car rental or car share service;
- Convenient and/or gift stores;
- Dental services; and,
- Shoe repair.

The on-site amenities would be customized depending on the size and type of proposed development. It would also depend on the types of services already available in the area surrounding a project site. The example on-site amenities listed above can be of use at employment centers, hotels, mixed-use developments, and others.

On-Site Vehicular Parking:

1. Establishing user fees for on-site parking; combined with a strong TDM program can help shift drivers behavior to the use of alternative modes of transportation and higher occupancy vehicles.
2. Designate premium parking spaces for carpools and vanpools. Such parking stalls have to be clearly marked with signing and pavement marking. Number of the designated stalls depends on the desired strength of deployed TDM program. In general, the designated carpool/vanpool spaces should not be less than 5% of the total number of parking spaces for large projects and 10% for smaller scale projects. This parking design technique is especially effective at project sites with limited on- and off-site parking supply.
3. Place the on-site parking on the side and/or back of buildings to avoid creating a physical separation between the buildings and abutting public streets, which could discourage pedestrians and cyclists access. Limit the on-site conflict locations between vehicular parking and pedestrian/cyclists movements, and clearly identify walking paths and crossing locations with appropriate pavement markings and signing according to the 2006 California Manual on Uniform Traffic Control Devices (MUTCD), or future document updates.

**Cycling Facilities:**
The design measures listed below need to be established by the project sponsor and approved as part of the development application review process.

1. Provide secure short- and long-term bicycle parking (i.e. bicycle racks and lockers, respectively) at prime locations of the development sites. Such prime locations need to be visible, accessible, on a flat area, and in close proximity to building entrances. It is also advisable to provide the bicycle parking at sheltered locations free of mud, dust and debris. When placing bicycle parking on upper building floors, elevator access needs to be provided. Wherever bicycle parking is located, sufficient clearances for accessing and maneuvering the bicycles need to be provided. Adequate protection needs to be ensured when placing bicycle parking near car parking or traffic lanes. In general, some of the bicycle racks need to be made available for short-term parking by guests, couriers, shoppers, etc. The individual bike lockers or locked bike room are typically reserved for longer-term parking by tenant employees and residents. Bicycle parking needs to be distributed to serve main entrances of all buildings on a project site. Preferably within view of security personnel or a security camera.

2. Provide showers, change facilities, and clothes lockers at convenient locations within business buildings in order to encourage cycling for longer distances. Such facilities need to be available free of charge to increase its potential use, and need to be placed in close proximity to the on-site bicycle parking.

3. Ensure safe and convenient access and movements of cyclists within development sites. Design elements to be considered include the provision of an interconnected web of paths, signage and crosswalks (preferably protected with traffic control devices) on the internal street system. Also the provision of adequate lighting, sheltered bicycle parking, and shaded paths.
Pedestrian Facilities:
Walking can be regularly practiced by a wide range of the population. To encourage walking, safe and convenient pedestrian access and movement need to ensure as part of the project site design. Example design elements are described below.

1. Minimize walking distances along the internal street/path network to provide convenient connections between the different buildings, services, etc. Also provide direct and convenient connections to the public streets including transit stops.

2. Design gathering areas where enhanced landscaping, adequate lighting, signage, and street furniture are provided. Undertaking such an action can help in providing good quality of life by facilitating enjoyment of the outdoors, as well as encouraging community interactions along with associated development of sense of security. Walking can be naturally encouraged with the provision of such design elements.

3. Establish traffic calming devices where feasible on the internal street system. Example of traffic calming designs can be through the provision of traffic circles, speed tables at pedestrian crossing locations, textured and/or colored street surface, staggered parking arrangements, and corner bulbouts. These design elements can assist in reducing vehicular traffic speeds, enhance good safety conditions, increase visibility of pedestrians, reduce pedestrians crossing distances and exposure to vehicular traffic, and improve overall street aesthetics,
4. Other design considerations that are safety related include the provision of adequate sight triangles at project driveways and internal intersections, as well as preventing parking encroachment within pedestrian sidewalks and walkways.

5. Give a priority to establishing and maintaining pedestrian facilities such as sidewalks, marked crosswalks and stop bars, in-pavement lighted crossing, bulbouts and other traffic calming devices, street and pedestrian lighting, sheltered seating areas, and landscaping.

**Transit Facilities:**

1. Provide safe and direct site access to the public streets where transit services are provided.
2. Provide necessary transit facilities in the vicinity of project site (such as bus shelter, bus turnout, concrete pad, seating, lighting, etc.), in order to support transit use. Private land dedication may be needed to provide for future transit facilities such as a bus turnout.
3. Establish an on-site information kiosk where information on transit routes, schedules, and fares can be provided.
4. Intersection geometry and road structure should be capable of supporting the length and weight of buses, including internal project circulation roads if bus or shuttle service is anticipated to enter the project site.

**Rideshare Facilities:**

1. Designate a number of on-site parking spaces at prime locations (i.e., close to buildings access, well lit, etc.) for carpools and vanpools privately operated by tenants. Also designate
prime parking stalls for company operated high occupancy/shuttle vehicles. Short-term parking spaces or passenger loading areas are also needed for taxi and outside shuttle services. Establishing carpool/vanpool initiatives can reduce the overall demand for on-site parking.

2. Provide on-site internet connections to facilitate access to agencies that provide ride-matching services such as 511 Contra Costa, Enterprise Rideshare and others.

3. Establish on-site car rental or carshare services so that tenants do not need to rely on personal cars for work-related purposes.

Project Occupancy/Operations:

On-Site Parking Operation:

1. Charge for on-site parking. The provision of free on-site parking encourages the use of private automobiles. Drivers tend to be more aware and sensitive to direct out-of-pocket charges. For example, drivers tend to be more aware of their regular expenses on gas, parking, and bridge tolls rather than the costs associated with the depreciation of their vehicles. Charging for on-site parking needs to be coordinated with adjacent properties to discourage spillover of parking demand to other properties.

2. In the event that a site has paid parking, provide free or reduced fee parking for carpools and vanpools.

3. In the event that a site has paid parking, the Federal Commuter Choice Benefits Package (Transportation Efficiency Act-21) allows employers to establish a parking cash-out program. Such program provides the employees with the opportunity to forego parking and receive instead a taxable cash value of the parking, or receive a tax-free transit or eligible vanpool benefit for up-to $230 per month (the value of this benefit is typically increased every year). This compensation also allows employees to finance other commuting means not currently qualified as fringe benefits, such as walking, bicycling and carpooling.

4. Limit the time periods at designated visitor parking to discourage employees from using such spaces for their long-term parking. When feasible, consider establishing shared parking between the different uses at mixed-use development sites.

5. When designating preferential parking spaces for carpools or vanpools it is important to register participants. Registration information needs to at least include the name and telephone number of participants, as well as the make, model and license plate number of their vehicles. The registration information needs to be updated on a regular basis to ensure that participants are still active and vehicles data is current. In addition, participants need to be provided with placards to be displayed inside their vehicles at a visible location (such as placed on the dashboard, hung on the front mirror, etc.). Taking these actions facilitates monitoring and enforcement of the preferential parking by on-site security, TDM coordinator, or other authorized person. It should also be noted that there should be a project-wide parking policy outlining rules dictating on-site parking including preferential parking, and procedures for handling parking misuse and violations.

Cycling Initiatives:

1. Employers can provide travel allowance per round-trip to employees using their bicycles for commute and/or work related trips. To avoid considerable increase in travel times and delays, the use of bicycles for work related trips can be restricted to short distances or a
series of stop-and-start visits. Employers can also provide insurance that covers bicycle usage except for losses or damages caused by negligent or deliberate actions.

2. Employers, especially of large businesses, can purchase and maintain a fleet of bicycles and safety devices (i.e., lights, helmets, etc.) for the use of employees traveling on work related trips. To facilitate use, bicycles can possibly be accessed by an identification card from a storage room or other form of secured parking.

3. Offering free or reasonably priced cycling seminars and training courses in order to promote cycling, available cycling facilities, and transit access. Training information can cover cycling skills, appropriate clothing and bicycle maintenance.

4. Organize cycling tours to recreational and shopping facilities where cyclists can benefit from each others’ experience. Food and drinks, for example, can be offered to encourage participation.

5. Provide other TDM initiatives that complement the use of bicycles, such as establishing a Guaranteed Ride Home program in case of emergencies (511 Contra Costa provides a free GRH program for all employees who take a commute alternative in Contra Costa).

Walking Initiatives:
Walking is practiced by the vast majority of people, yet a relatively small percentage walk to their destinations such as work and shopping. For example, establishing mixed-use developments where services are provided within walking distances can help build the habit of walking at least within the neighborhood. Adequate selection of the types of supportive services (such as a local convenient store, a dry cleaner, a restaurant, a coffee shop, etc.) can further support walking and assist in eliminating vehicular trips. There are also operational means that can be practiced by developers, property management, or tenants in order to encourage employees and residents within a project to walk to/from their destinations as follows.

1. Provide annual and seasonal events that promote walking for health and environmental reasons. Offer food, drinks, prizes and other incentives to encourage participation at the events.

2. TDM Coordinator or other community organizer can also identify residents and employees who are interested in walking and the approximate locations of their frequent destinations. Such information can help the formation of a walking buddy system to encourage participants to walk to/from work, shopping facilities, schools and daycares, etc.

Public Transit Initiatives:
An increase in transit use is fundamental to the overall reduction of automobile use. In general, people associate utilities with each mode of transportation (such as safety, reliability, comfort, accessibility, speed, cost, travel time, etc.), and their mode choice is based on the relative costs associated with one versus another mode. The two characteristics of travel modes most likely to influence mode choice are monetary cost and travel time. Some of the measures that can potentially increase public transit rideshare are:

1. Establish an employer based subsidized transit pass program. This can be achieved by providing commuter checks/vouchers to subsidize transit passes/fares. It can also be accomplished if the employer purchase the passes and offer them to the employees at
reduced prices. It should be noted that employers are allowed to provide monthly tax-free
transit subsidy.

2. Employee programs can allow employees to use pre-tax income to pay for commute
expenses, which can reduce the cost of transit and vanpooling and thereby encourage their
use. Employers can establish eligible pre-tax spending account for employees pursuant to
Section 125 of the Internal Revenue code. The money an employee allocates to a spending
account for commute expenses is not subject to federal, state, Social Security or Medicare
taxes. Employees can allocate up to $1,380 annually to such spending accounts. Employers
can establish this account in-house or through a vendor (e.g. Commuter Choice Program).

3. Allow the purchase of transit passes on site to facilitate transit use. This can be achieved,
for example, by contacting the local transit agency to set-up an on-site transit pass outlet.

4. Participate in the Regional Transit Connection (RTC). The RTC is the transit ticket
clearinghouse serving Bay Area employers. By delivering transit tickets to the work site,
RTC enables employers to provide employees with tickets from eight Bay Area transit
systems (AC Transit, Alameda-Oakland Ferry, BART, Caltrain, County Connection, Golden
gate Transit, MUNI, and SamTrans). Employers decide the type and quantity of tickets to
purchase based on a monthly order. Employers then can choose to either sell them to their
employees or offer them as part of a transit subsidy benefit. Each month, employers pay
RTC only for the tickets that get sold or distributed to employees.

5. Through direct communication with relevant transit agency, seek changes to bus routes
and/or routes capacity to better support transit ridership projected for the project.

6. Provide shuttle service(s) to main transit stations during the morning and afternoon
commute periods. In addition, shuttle programs that run during the mid-day can reduce the
need for automobile driving for work related travel and lunchtime trips.

7. Promote the use of public transit as part of the solution to environmental and transportation
issues, such as global warming, air pollution and traffic congestion. Beside the promotional
materials, educational information can be provided in company’s newsletter, monthly TDM
e-mail messages, etc.

Rideshare Initiatives:

1. The developer, tenant, or TDM Coordinator can facilitate the formation of carpooling. A
carpool is four to six people sharing a ride in an automobile. Carpool can be as simple as a
husband and wife, neighbors, or co-workers carpooling together. The two most common
approaches for carpooling are for participants to rotate automobile use with no exchange of
money, or to use one car and share the commute expenses. Carpooling reduces the cost of
commuting and provides a stress-free ride for non-drivers. It can also save travel time and
expense by using the HOV lanes and exempted from freeway/bridge tolls during commute
periods. Carpools can provide door-to-door directness and a convenience level of flexibility
that is almost like a single occupant vehicle. The biggest challenges to carpooling is
committing to a common work schedule due to interruptions to work schedules, family
needs, etc. Often such problems can be addressed through schedule planning, part-time
carpooling, and the provision of a back-up service such as a Guaranteed Ride Home
(currently available through 511 Contra Costa).

2. A project sponsor can implement a vanpool program by subsidizing the cost of vanpooling
through a third party lease arrangement; an owner operated vanpool, or by providing
facility/company sponsored vanpools. A third-party lease can be carried out with an auto
dealership, van leasing company, transit agency, or a non-profit organization. Vans are generally leased on a 30-day basis and their lease rates are based on cost of the vehicle, as well as insurance, maintenance, mileage, and fuel costs. Owner-operated vanpool puts more responsibility on the owner to organize all financial, maintenance and insurance requirements. Depending on the size of the company, expected level of employee participation and areas of employees’ residences, companies can invest in purchasing, maintaining and insuring the vans which can be used for commute and other work related trips. Vanpools are comprised of 7 to 15 riders, and operate like a mini-transit service with an organized route, schedule and passenger fare charges. Fares depend on the commute distance, the total number of participants, the type of van, and company provided equipment and/or subsidies. Vanpooling can simply save time, money, energy consumption, and noise and air pollution.

3. 511 Contra Costa has a Guaranteed Ride Home Program that enables rideshare participants to get home in case of an emergency, and current provisions allows for up-to 16 free taxi rides per year. Employers, for example, can also establish their own Guaranteed Ride Home Program using company vehicles or a taxi service.

4. 511 Contra Costa provides rideshare rewards program. Current rewards include gift and gas cards to eligible carpoolers of up-to $100 over a three-month period with a yearend drawing for $600 in gift cards.

5. With regard to vanpooling, 511 Contra Costa currently offers vanpool reward $300 to $900 in gas cards to new vans that meet all eligibility requirements and successfully complete three to nine consecutive months of operation. The gas cards are offered on a first-come, first-served basis until the funds are exhausted. The 511 Contra Costa Program also offers a vanpool seat subsidy in the form of gas cards. The seat subsidy provides $100 per month for up-to three months per program year to help cover the fare of a lost vanpool participant. Again the gas cards are offered on a first-come, first-served basis until the funds are exhausted.

6. Commuters can travel toll free by carpooling, vanpooling or taking transit over one of the Bay Area’s eight bridges during peak commute hours. Specific Bay Area bridge toll information can be found at 511ContraCosta.org.

7. Promote ridesharing initiatives through communication mediums (newsletters, employee memos, e-mails, meetings, etc.), specialized events and marketing pieces. 511 Contra Costa can help with free services to help companies promote commute alternatives including a regional carpool/vanpool matching database.

8. Periodic contacts with employees interested in carpooling/vanpooling to ensure that they indeed achieve long-term switch in their modes of transportation. In addition, one of the measures suggested for monitoring TDM programs is by conducting an annual commute survey. Such survey results can be utilized in customizing new carpools and/or vanpools. The survey results can also be used for identifying design and operational measures that can support and increase participation in carpooling/vanpooling.

Flexible Work Schedules:

1. These TDM initiatives are appropriate for business type developments, such as office and research and development land uses. Flexible Work Schedule programs established by employers govern the time period in which employees travel to and from work. Such programs influence employees’ propensity to consider using transit, carpooling, and other
alternatives to driving alone to work. Employees tend to view these programs as a highly desirable benefit. Employers can use such programs as an attractive employee recruitment tool that enables employees to work around childcare, school schedules and other family responsibilities. A typical FWH system uses two types of time: (a) Core period of time when all employees are required to be on the job; and, (b) Flex-time which contains pre-established limits (e.g., 7:00 to 9:30 a.m. and 3:00 to 5:30 p.m.) from which employees can select their arrival and departure times. Similarly this strategy can encourage participants to avoid most congested times, and coordinate arrivals and departures to rideshare with other employees.

It should be noted that management still retains a significant degree of control over the allowable work schedule arrangements. Consequently, some work units within an organization may offer flexible work schedules and others may not.

**Telecommuting:**
Telecommuting exists in several forms, such as working at home, working at a satellite center with shorter commuting distance, and working at neighboring work centers that can be leased to several employees and where office equipment are provided. Telecommuting is a better fit for jobs that are computer oriented, do not require frequent on-site support, and do not require frequent face-to-face interactions with customers or other workers.

Allowing employees to telecommute can eliminate some commuting trips. This in turn helps in relieving congestion, reducing energy consumption and improving air quality. Experience has also shown that telecommuting assists in increasing productivity, decreasing absenteeism, improving employee morale, and eliminating the need for constant oversight. In addition, employees tend to consider telecommuting as a job benefit which could increase the employers’ competitiveness when recruiting for new employees, as well as reduce turnover of current employees along with associated recruitment and training expenses. It should also be noted that telecommuting from home or less costly office space can help decrease the employers’ overhead expenses associated office space and on-site parking.

The key to the success of telecommuting is “voluntary” as it requires both management approval and employees willingness. It also involves regulatory and legal parameters, which in some agencies could include unions’ regulations. Some of the administrative arrangements that need to be considered include establishing a telecommuting schedule, determining equipment needs and who will pay for the initial costs and monthly expenses, establishing realistic expectations of work that can be completed in 8-hour work days, and identifying work monitoring procedures.

**TDM Coordinator:**
A TDM Coordinator is typically responsible for developing, marketing, implementing and evaluating the TDM programs. The TDM Coordinator can be a designated on-site staff person (half- to full-time) with specific TDM responsibilities and authority. The Coordinator’s responsibilities can also be contracted out with a commute company. It should be noted that one of the most effective TDM measures is by having an on-site transportation coordinator. Example functions of a TDM Coordinator are listed below:
1. Distribute pertinent information to all tenants/employees regarding the facilities, programs and services available at the project site. Also regularly update any information kiosks and information boards at the project site for displaying TDM information. The regular information update makes it useful and interesting for users.

2. Contract with and/or act as a liaison with 511 Contra Costa and other transportation service providers. It should be noted that the 511 system offers one-stop shopping for traffic, transit, rideshare and bicycle information in the region.

3. Contract with and/or act as a liaison to all appropriate transit agencies. This includes distribution of appropriate transit information and maps, transit passes, commuter checks, administering contract for carsharing or car rental services, and any other responsibilities related to the utilization of transit services.

4. Distribute carpool/vanpool matching applications to all new tenants upon occupancy and/or new employees upon hire, as well as on an annual basis at Transportation Fair, Wellness or Benefits events, etc. The transportation coordinator can also research ZIP code data or work and residence locations and offer to match ridesharing. When using carpool/vanpool ridematching software, it typically provides individuals with a computerized list of other commuters near their employment or residential ZIP code along with the closest cross street, phone number, and hours they are available to commute to and from work.

5. Develop and implement promotional programs such as on-site transportation fairs and promotional events. Also coordinate with regional promotional programs relating to TDM. Example regional programs include the Bike to Work Day and Spare the Air Days and possibly free transit. 511 Contra Costa sponsors events and activities for these campaigns.

6. Conduct the annual commute survey, evaluate survey results and potential need for improvements, and update the program elements accordingly. 511 Contra Costa can assist with the survey development and analysis. Develop the annual status report and submit it to the County for projects conditioned to achieve a certain trip reduction rate.

7. Provide TDM training especially at the start-up of the program, and possibly on a regular basis. Inviting other agencies, for example 511 Contra Costa, can enhance such training.
APPENDIX C

IMPLEMENTATION MECHANISMS

A project condition of approval may require the project sponsor to implement a Transportation Demand Management (TDM) program.

Educational and Outreach Activities

There are educational and promotional means that can assist in launching, and achieving a long-term success of the TDM program. Examples of these educational and promotional means are listed below.

1. Promotional activities are usually needed to launch a TDM program. Upon 50% to 75% occupancy (depending on the type of development) of the new development, the project sponsor (through the help of a TDM coordinator if assigned) should coordinate and host a commute alternative kick-off event. Transportation service providers such as 511 Contra Costa, Enterprise Rideshare, ACE, BART, etc. can be invited to set-up information booths/tables. To encourage participation in the event, the project sponsor can provide give-a-ways, refreshments, etc. Such event needs to be advertised at least two weeks in advance via e-mail, flyers, on-site posters and/or other means.

2. Regular, possibly annual, commute event or fair is also advisable to encourage continued participation and to approach new tenants/owners. Similarly, proper event notification is needed. It is also advisable to invite participation of transportation service providers and to provide some give-a-ways.

3. Promote and encourage participation in events sponsored by other agencies such as Bike to Work Day (in May of each year), potential free transit on Spare the Air days, etc.

4. It is advisable that the project sponsor register with the Bay Area Air Quality Management District (BAAQMD) for the Spare the Air program so as to receive regional air quality forecast bulletins about poor and unhealthy air quality days. These e-mail updates can then be forwarded to all tenants. The 511contracosta.org website also has up to the minute Spare the Air alerts and air quality status.

Monitoring and Evaluation

Monitoring a TDM program can be accomplished by periodically conducting a commute survey to determine the success or failure of the TDM measures individually or as a combination. A commute survey typically gathers quantitative data (e.g., % use of the various modes of transportation) and qualitative data (e.g., respondents’ perception of the alternative transportation programs). The survey data can then be used to decide on any needed adjustments to the TDM initiatives. They can also be used to focus the marketing initiatives and efforts of the TDM Coordinator. It should be noted that 511 Contra Costa can typically assist with the preparation of the survey questionnaire. Some survey tips are provided at the end of this section of the TDM Guidelines.
Allowing completion of the survey on-line can help reduce the time and effort spent on circulating and administering the survey. When possible, conducting a baseline survey before starting the TDM program can later assist in evaluating the program’s effectiveness (Before and after comparative analysis). In addition, comparing results of the annual survey to previous years can assist in evaluating the program’s progress and potential modifications. It is possible to add survey questions to assess such new improvements.

Cost effectiveness of TDM measures should be monitored and evaluated. The cost effectiveness is typically based on a cost/benefit analysis of the individual TDM measures (for example, the cost of providing a shuttle service to the main transit stations relative to the number of shuttle users along with peak occupancy periods). Such cost/benefit analysis can assist in identifying the measures to better fit the participants’ needs at the least cost. TDM Program costs typically include the capital and operating costs, such as the cost of bike lockers and/or fleet, cost of training and educational materials, cost of awards and commute events, cost of shuttle vehicles, TDM staff hours and rates, cost of office equipments provided to telecommuters, etc. In larger developments, both residential and office/commercial, the developer should consider establishing a Transportation Management Association (TMA) to provide the mechanism for ongoing financial support of TDM elements, including monitoring and evaluation over a period of years. An example of a TMA is the Contra Costa Centre Association. (www.contracostacentre.com)

Typically within six months following the granting of a certificate of occupancy of the new development site, the project will submit to the Director of the Department of Conservation and Development a TDM notice that confirms the installation of facilities and site amenities, as well as implementation of commute program features and events (if required). A development project that receives a reduction in off-site parking requirement in return for implementing an approved TDM Program will be subject to penalties if the TDM Program is not implemented. Project sponsors must seek renewal of TDM Program for time periods specified by the County. Renewal of TDM Programs may require additional TDM measures if agreed-upon trip reduction targets are not achieved. If project sponsors fail to seek renewal of TDM Programs, the penalty typically involves reducing permitted occupancy to a level that matches the on-site parking supply (to be specified in the Development Permit).

**Commute Survey Tips**

The statistical reliability of a survey depends in part upon the response rate, which is the number of correctly completed surveys compared to the total number of distributed surveys. Thus, it is important to maximize the survey response rate. Some of the means that can be used to maximize the response rate are listed below:

- Attach a cover memorandum to the questionnaire, describing the purpose of the survey and requesting cooperation.
- Inform recipients of the duration it takes to respond to the questionnaire, and note that their responses are strictly confidential.
- Offer prizes to respondents preferably based on a drawing to ensure un-biases. Offer rewards to tenants, departments, etc. with the highest response rate.
• Offer a contact person and phone number to respond to any questions that survey recipients may have.
• Offer an hour of administrative leave, or other incentives, to recipients who complete the survey.
• Facilitate access to the survey questionnaire by posting it on a web-page. As an alternative, deliver the questionnaire and pick-up responses of the different tenants.
• Send one or more reminders (e-mail, flyer, etc.) requesting to complete the survey by the due date.

Survey questions at a minimum need to cover the type and frequency of modes of transportation used in a typical week (e.g., walk, cycle, drive alone, carpool, vanpool, use public transit, etc.), reasons behind driving alone (e.g., availability of free parking, needing privacy, flexibility to assist family members, etc.), means that would encourage drive alone respondents to use alternative modes of transportation (e.g., a guaranteed ride home program, subsidized transit passes, reliable rideshare matching services, etc.), whether or not they participate in telecommuting and/or flex work hour arrangements. It is also important to collect information regarding work addresses or residence ZIP codes.
APPENDIX D

COSTS, DEGREE OF DIFFICULTY AND IMPLEMENTING ENTITY

TRANSPORTATION STRATEGIES
There are five categories of strategies listed below which are described in more detail within this document. Three descriptive are listed in the columns to the right. They include:

Effectiveness – is a measurement tool to determine the value of the effort in reducing single occupant vehicle trips at the site. Effectiveness is on a scale of 1-10, with 10 being the most effective and 1 being the least effective. Effectiveness for certain projects may vary.

Cost – indicates the cost relative to the other options listed.
X = no cost
$ = low cost (less than $10/year per employee, or offered by 511 Contra Costa)
$$ = medium cost ($10-$30/year per employee)
$$ = high cost (more than $30/year per employee, or higher infrastructure cost)

Who – identifies who will likely implement this strategy. This may be the developer (D), (property owner) or employer (E), however in some cases, the regional rideshare agency 511 Contra Costa (511 CC) provides these services for free, or for a nominal charge. Your must register your worksite/property at www.511contracosta.org or call (925) 969-0841.

TECHNICAL MEMORANDUM

DATE March 11, 2009
TO Ira Dietrick
Sufism Reoriented
FROM Bruce Brubaker
RE Updated Transportation Demand Management Plan

I. INTRODUCTION

This technical memorandum contains a conceptual Transportation Demand Management Plan (TDM Plan) for the proposed Sufism Reoriented Sanctuary (Sanctuary) to be located along Boulevard Way in unincorporated Contra Costa County. This TDM Plan has been prepared to meet the requirements of Contra Costa County Code section 82-32.008.

Sufism Reoriented currently has approximately 357 participants in the San Francisco Bay Area. This number of participants has remained fairly constant over the years and is projected to remain stable in the future. Sufism Reoriented has proposed development of a new Sanctuary site in order to consolidate uses that are currently dispersed throughout the Walnut Creek area.

This TDM Plan identifies transportation demand management measures that would reduce the number of automobile trips generated by users of the proposed Sanctuary site. The reduced number of automobile trips would also reduce the demand for parking spaces at the Sanctuary site. This TDM Plan analyzes the existing transportation network, the origin and travel choices of Sanctuary participants, including a description of the Sanctuary’s walking, carpool and shuttle service programs.

II. PROJECT DESCRIPTION

A. Local Setting

The proposed Sanctuary is located in unincorporated Contra Costa County, south of Highway 24 and west of Interstate 680, just over a mile southwest of downtown Walnut
Creek. The 3.1-acre development site occupies seven parcels along Boulevard Way and is less than a block away from the Sanctuary’s current site. A regional context map and a map of the study area are provided in Figures 1 and 2.

As shown in the pictures, Boulevard Way contains a mix of residential and commercial uses, including higher density multi-family units, retail stores, office and industrial uses. The land uses immediately adjacent to the site include single-family and multi-family residential uses.

B. Site Design and Building Program

1. Site Plan

The site is bounded by Boulevard Way on the north and west. Warren Road is immediately south of the site. Private residential parcels border the south and east edges of the project area. The primary ground-level uses of the Sanctuary include the Prayer Hall, an existing residence and surface parking. Subsurface construction includes the Plaza, bookstore, offices and other uses described in more detail in the section on Building Program.

The project includes parking spaces for participants and residents. Vehicular parking for participants is accessed via a driveway on Boulevard Way and bicycle parking spaces are located adjacent to the ground-level entrance to the Sanctuary. Vehicular parking for residents in the parsonage is accessed from Warren Road. The proposed Sanctuary would also make improvements to the public transportation infrastructure, including construction of a sidewalk along the frontage of Boulevard Way, which would improve access to the site and to a County Connection Route 101 bus stop located along Boulevard Way at the project site.

2. Building Program

The principal uses on the proposed Sanctuary site are described in the following section:

a. Prayer Hall

The 5,000 square-foot prayer hall would have a capacity of 400 people. The ground floor of the Prayer Hall includes space for storage of items used in the prayer hall, such as chairs and video equipment. The prayer hall would be used for worship and devotional gatherings, chorus rehearsals and occasional larger celebrations.

STUDY AREA

FIGURE 2
b. Library
The 2,656 square feet of library space includes book, film and audio storage for reference and use in productions. The ground floor library would be used to read transcripts of classes and listen to CDs or watch DVDs of classes.

c. Classroom
The classroom space, 1,065 square feet, would be used for small class meetings.

d. Offices
This 3,095 square-foot area would be used regularly by Sanctuary staff and participants working on craft or computer projects.

e. Murshida
This 1,079 square-foot main office would be used for work and to meet with students and visitors.

f. Plaza
This 9,100 square-foot area would be used for church socials, often including live dramatic and musical skits.

g. Video and Audio Rooms
This area that comprises a total of 2,750 square feet would be used to shoot videos, edit videos, mix recordings and attach sound tracks.

h. Dance and Drama Studio
This 2,200 square-foot area would be used for drama, dance and music rehearsals and classes.

i. Searchlight Bookstore
The 1,450 square-foot bookstore would be open to the public Tuesday nights and Saturday and Sunday during the day.

Please refer to Figure 3 to view the site plan of the proposed Sanctuary site.
III. Sanctuary Travel Patterns

In order to understand demand for parking at the proposed Sanctuary, it is important to first understand how and when people would be accessing the site. The following section describes regular use and peak demand periods at the Sanctuary based on current use.

A. Regular Daytime Use

Regular daytime use of the Sanctuary site would typically involve at most 25 Sanctuary participants at a time. The regular stuff would consist of ten participants working in the administrative office area, the video editing studio, the music studio and at the reception desk. Landscaping and cleaning would also be carried out by Sanctuary participants. There would be 2 to 3 people cleaning on a regular basis. During each weekend day a seven-person crew would work on landscape maintenance. During the week, there would be occasional visitors to the Searchlight Bookstore, typically not more than one or two people each day. Work projects, involving at most 12 people, would take place on weekday evenings and during the day on weekend. A 15-person afternoon class would occur on weekend afternoons.

B. Regular Night Use

The Sanctuary is most active during the months of October through June. At that time, several activities that occur on a weekly basis would be attended by a great number of participants. The full membership (357) would attend Friday night classes, while 200 to 250 participants would attend Sunday night devotional gatherings. On Wednesday nights, a maximum of 70 people would travel to the site for chorus rehearsals. On Thursday nights there would be review classes for 30 to 50 people.

C. Annual or Semi-annual Events

The Sanctuary also holds special annual and semi-annual activities. During the four-day annual celebrations held in March, all members and guests (up to 400 people) would be traveling to the site. Rehearsals for the annual celebrations would bring as many as 100 people to the Sanctuary site. During the semi-annual musical and drama events, called Taverns, held nightly for five days at a time, a maximum of 175 people would be traveling to the site.

Table 1 summarizes the anticipated transportation demand patterns for the proposed Sanctuary site.

### IV. Parking Analysis

**A. Required Parking**

1. **Contra Costa County Code**

   According to interpretation of Section 82-16.018 of the Contra Costa Zoning Code, the Sanctuary site is required to provide 125 parking spaces. Table 2 below summarizes the Zoning Code's parking requirements for each of the uses contained within the Sanctuary site. The Prayer Hall with a capacity of 400 persons and classified as an assembly hall without fixed seats requires 125 spaces. The ancillary uses require a total of 114 parking spaces. The bookstore, classified as a retail use, requires one space for every 250 square feet; and the remaining uses, classified as office use, require one space for every 200 square feet.

   The Sanctuary travel patterns described earlier demonstrate that if the Prayer Hall were in use, none of the other uses would be active and vice versa. Therefore, the maximum parking demand is the greater of the Prayer Hall or ancillary uses demand: 125 spaces.

2. Institute of Transportation Engineers

According to the 3rd Edition of the Institute of Transportation Engineer’s (ITE’s) *Parking Generation*, uses similar to the Sanctuary site require 48 to 252 parking spaces. According to the report, the parking demand for churches ranges from 0.12 to 0.63 parking spaces per attendee.\(^1\)

B. Proposed Parking

This Plan will demonstrate how the number of required parking spaces can be reduced through the implementation of transportation demand measures, described in detail in Section V.

The project includes 74 parking spaces for motor vehicles. Most of the parking spaces are accessed from Boulevard Way and are located on the western edge of the site, linking them to the Sanctuary's main entrance. The spaces located on the eastern edge of the site are accessed from Warren Road and would be utilized as parking for residents. Three parking spaces are reserved for residents, five spaces are for participants who might need to drive

\(^1\) A church is the land use that most closely resembles the Sanctuary in the ITE report.
their cars, 55 spaces are for carpool cars, two parking spaces are reserved for the Sanctuary shuttle and the nine remaining parking spaces are for guests.

The Sanctuary will also include a bicycle rack for 12 bicycles located adjacent to the Sanctuary’s main entrance, a convenient, visible and secure location. Secure bicycle parking, along with the on-site showers help make bicycling to the Sanctuary a viable option for participants.

V. Transportation Demand Management Strategies

There are several TDM strategies that are well suited to reducing the number of vehicular trips to and from the proposed Sanctuary site for Sufism Reoriented. Probable impacts of TDM strategies for walking, transit, carpooling, and remote shuttling on parking demand are described in this section.

Sufism Reoriented tested the strategies described in this section at the current Sanctuary site during a 17-month implementation period that began in October, 2007 and extended to February, 2009. Implementation procedures and outcomes for the proposed Sanctuary site are expected to reflect outcomes for the current site, since the number and residential location of members is not likely to change. Information gathered during this period is therefore provided in this section as it relates to specific strategies and the overall implementation of the TDM plan.

The TDM strategies implemented at the current site were rooted in the commitment of members to reduce the number of cars accessing the site by walking, carpooling or using the shuttle service to attend regular Friday and Sunday night activities, annual celebrations and taverns under all conditions and all weather. During the initial implementation period, the number of vehicles parking on site did not reach or exceed the number of spaces proposed for the new site (74). A downward trend in the number of cars parking at the Sanctuary for both Friday and Sunday activities was also evident during this implementation period.

A. Walking

1. Existing Conditions

As shown in the picture, a wide variety of people, including mothers with baby strollers, children and joggers, travel by foot along the roads in the vicinity of the proposed

2 Sufism Reoriented continues to implement these strategies at their current site.
Sanctuary site. Although the surrounding residential streets do not all have sidewalks, most of the streets do not have high traffic volumes, making them safe and pleasant places to walk.

The traffic volume along Boulevard Way, the roadway that provides direct access to the Sanctuary, is higher than on surrounding residential streets, but this roadway has sidewalks along much of its right-of-way; and, as described in the project description, the proposed Sanctuary would further enhance the pedestrian environment by constructing an extension of the existing sidewalk along Boulevard Way.

2. Demand Strategies
Walking is an effective mode of transportation for the 224 Sufism Reoriented participants that reside within a ½-mile, a 10- to 15-minute walk, of the site. Figure 4 shows the participants' residences in relation to the proposed Sanctuary site. Most of these participants walk to the current Sanctuary site, which is only several hundred feet away from the proposed site.

Prior to the TDM implementation period at the current site, 167 of the 224 participants that live within walking distance of the proposed Sanctuary site made written commitments to walk to regular Friday and Sunday night activities, annual celebrations and taverns under all conditions and all weather. A list of names and signatures of participants who have made this commitment is attached to this memorandum as Attachment 1. In the event that illness prevented a member from walking, the designated carpool coordinator assigned them to a temporary or permanent carpool.

3. Impact on Parking Demand
It is expected that during the large weekly events 167 to 224 people (approximately half the Sanctuary participants) would reach the site by walking.
LEGEND

- Proposed Sufism Reoriented Sanctuary Site
- Residential Location of Sanctuary Participant

Total Number of Participants Living within 1/4 or 1/2 mile of Sanctuary Site = 224

Source: Contra Costa County Mapping Information Center, Sufism Reoriented

Note: Each dot represents one participant. If two participants reside at the same address, this is illustrated by mapping two dots next to each other.
B. Transit

1. Existing Conditions
The site is currently served by County Connection Route 101. Route 101 has bus service weekdays and Saturdays. On weekdays, the first southbound bus stops at Boulevard Way and Kinney Drive, across the street from the proposed Sanctuary site, at 6:20 a.m.; the last bus passes at 7:33 p.m. The first northbound bus stops at Boulevard Way at Iris Lane in front of the Sanctuary site at 6:35 a.m.; the last bus stops at 6:49 p.m. Figure 5 shows the service area for County Connection Route 101. According to the Central Contra Costa County Transportation Authority's Short Range Transit Plan and the countywide Comprehensive Transportation Plan, there are no changes in service or alignment planned for County Connection Route 101.

As required by Contra Costa County Code section 82-32.00, representatives of Sufism Reoriented contacted the County Connection transit agency and they have approved the bus stop location proposed in their land use plan.

2. Demand Strategies
Although the County Connection Route 101 directly serves the project site, its hours of service do not include Friday or Sunday evenings, when the Sanctuary has its more highly attended events and when demand for parking would be highest. Staff members and participants who are at the Sanctuary during the week and in daytime hours may be able to use the County Connection service.

3. Impact on Parking Demand
The fact that County Connection Route 101 does not provide service during the Sanctuary's peak demand period will severely limit effectiveness of bus transit as a transportation demand measure for this project. Daytime staff may use the Route 101 service to access the site, but no reduction in parking demand is assumed based on this availability of service.

C. Bicycling

1. Existing Conditions
The surrounding streets do not have high traffic volumes and the terrain is relatively flat, making the bicycle a viable mode of transportation on the streets in the vicinity of the Sanctuary site.
2. Demand Strategies
As described earlier, the project would provide secure bicycle parking on site. In addition, the Sanctuary would have amenities, such as showers and changing rooms for all participants, including those who arrive by bicycle. This could encourage participants to arrive at the site by bicycle.

3. Impact on Parking Demand
It is expected that 1 to 5 people might arrive to the Sanctuary site by bicycle. However, because this number is so small, bicycling is not considered to have an impact on transportation demand for purposes of this Plan.

D. Carpool

1. Existing Conditions
One hundred and sixty-six (166) members participated in the carpool program during the TDM initial implementation period at the current site. This section summarizes carpool activities, monitoring procedures, and overall impact on the number of cars parking at the current site during this period.

2. Demand Strategies
Members who live near each other are grouped together to ride in one vehicle to the Sanctuary’s Friday and Sunday events and during the annual event held in March. The location and number of people within each of the carpools is included as Attachment 2. Each carpool has been assigned a number and only cars showing the carpool numbers are allowed to park on site. Members are advised to park only on site or at the Meher School during the Sanctuary’s Friday and Sunday night events. As described earlier, the proposed Sanctuary site would include reserved parking spaces for carpool vehicles.

In order to ensure the effectiveness of the carpool program, the Sanctuary has assigned staff to manage and monitor its implementation. A carpool coordinator is responsible for making changes to carpool assignments when necessary, monitoring the program, making periodic reports and issuing reminders to participants when necessary. A carpool monitoring team is responsible for monitoring and recording carpool activity. Since full implementation began in October 2007, two members of the TDM carpool monitoring team were stationed in the parking areas with lists of approved carpools and permit card numbers at Friday and Sunday night activities, annual celebrations and taverns. Monitors check parking permit cards for each carpool as they enter the parking lot and provide a final count of cars parking on the site for each event. All cars at the site, including shuttle cars and cars belonging to residents, members and guests, are included in the counts.
If parking permit cards are left at home, carpool drivers give their parking card number to the monitor who checks it against the names on the monitoring list. If a carpool arrives before the monitors are in place, it will be checked by monitors upon their arrival. If a permit is not displayed, monitors leave a reminder form on the windshield and still include the car in the final count.

3. Impact on Parking Demand
The Sanctuary's carpool program will reduce the number of single-occupancy vehicles arriving to the site. Currently, a total of 166 participants have formed carpools that occupy 55 parking spaces. These numbers are expected to be the same for the proposed Sanctuary site, since the number and residential location of members is not likely to change.

E. Remote Lot Shuttle Service

1. Existing Conditions
The proposed Sanctuary site has the potential to increase its parking capacity by utilizing the parking facilities of Meher School, located at 999 Leland Drive in Lafayette, less than 1 mile away from the proposed Sanctuary site. Figure 2 illustrates the location of the Meher School in relation to the proposed Sanctuary site. Meher School, an educational institution associated with Sufism Reoriented, has a total of 40 parking spaces. The Meher School's parking spaces are occupied during school hours and are available for use during the Sanctuary's large night-time events.

2. Demand Strategies
In order to capitalize on the additional parking capacity, Sufism Reoriented, while located at its current Center, provides 2 to 3 cars as shuttle service. Once the new building is completed Sufism Reoriented will purchase a large van to serve as the shuttle service for a limited number of participants who park at the Meher School. Participants who live far away (in cities beyond the Lafayette-Walnut Creek area) and those who must arrive early or late and cannot be part of a carpool will participate in the shuttle service. As with the carpool program, the Sanctuary staff will monitor and ensure the effectiveness of the shuttle service.

3. Impact on Parking Demand
The shuttle service would allow the Sanctuary to utilize existing off-site parking spaces to increase parking capacity. Most of the participants who would regularly utilize the shuttle service would otherwise reach the site by single-occupancy vehicle. Therefore, implementation of the shuttle service would reduce the number of single-occupancy
vehicles arriving at the Sanctuary and the demand for on-site parking space. Twelve to 24 participants currently use the shuttle service.

F. Results of TDM Implementation at the Current Sanctuary Site

The TDM strategies implemented and fully monitored by Sufism Reoriented at the current site from October, 2007 to February, 2009 were highly effective. Figure 6 shows the number of cars parked on site for Friday nights (7:15 - 9:30 pm) when the full membership attends classes, Sunday evenings (7:15 - 9:00 pm) when more than half the membership attends devotional gatherings, and for annual celebrations during the Christmas/New Year Holiday period and during mid-March that involves all the membership and some outside guests. Highlights of the TDM implementation at the current site include the following:

- The number of cars parked on-site never reached the parking capacity of the proposed Sanctuary site plan (74).
- The average number of car parked on-site on Friday nights was 59 vehicles, which would result in 15 unused spaces at the proposed Sanctuary site.
- The average for Sunday night devotional gatherings was 49 vehicles, which would result in 25 unused parking spaces at the proposed Sanctuary site.
- During the six special events that occurred during the implementation period, the number of parked cars ranged between 39 and 57. These events potentially have the largest number of attendees.
- Parking trends for Friday and Sunday evenings indicate a decline in the number parked cars during the TDM implementation period.
G. Conclusions

1. Implementation of Transportation Demand Management Strategies

Table 3 summarizes the types of activities that would take place at the proposed Sanctuary and the number of people participating in those activities. The table also identifies the transportation management strategies that would be implemented in order to reduce the demand for parking.

*Demand management strategies not necessary for daily use of the Sanctuary, since, even if every person arrived in a single-occupancy vehicle, the 74 parking spaces would not be filled.

As described earlier, the Sanctuary would have a dedicated staff person to monitor travel patterns, parking demand and the smooth operation of the walking, carpool and shuttle service programs. The staff person will monitor the schedule of events at the Sanctuary and if a combination of scheduled events will require exercise of the transportation demand management plan it will be implemented.
2. **Summary of Impact on Parking Demand**

Table 4 calculates the parking demand at the proposed Sanctuary based on how people would be expected to arrive at the site.

</tbody>
</table>

*aAs discussed earlier, the Meher School site, located at 999 Leland Drive, would supply an additional 14 to 24 (up to 40) parking spaces for participants who utilize the shuttle service.*

The TDM strategies implemented at the current site have more than achieved the parking demand target of 65 to 69 identified in Table 4.

**VI.  LOOKING TO THE FUTURE**

The success of TDM implementation at the current site has led Sufism Reoriented to set parking demand targets that would reduce the average number of vehicles parked on the proposed Sanctuary site an additional ten percent from the numbers recorded during the TDM implementation period at the current site. These targets for Sufism Reoriented for 53 or fewer vehicles parked on site for Friday class nights and 44 or fewer vehicles for Sunday night devotional gatherings will further reduce vehicular use and traffic associated with the Sanctuary. Sufism Reoriented fully expects that these targets will be reached at the proposed Sanctuary site for the following reasons:

- Members have tended toward living as close as possible to the Sanctuary, as evidenced by the fact that more than half currently live within a ½-mile. The vast majority of these members are part of the walking program. The number of members living close to the Sanctuary who walk to activities is expected to grow, especially once the new Sanctuary is constructed.
- There is additional capacity within current carpools that can accommodate members who move closer to the Sanctuary, but for whom walking is not possible.
Central principles of Sufism Reoriented are to protect the environment and to put their core values and ideals into practice in everyday life. Reducing automobile traffic, with the resulting reduction in air pollution and the use of scarce natural resources, is seen by the membership as a natural extension of their view of the sacredness of the earth and their responsibilities as stewards.

Institute of Transportation Engineers. Case Study: Contra Costa Centre Transit Village, Contra Costa County, California, n.d.
Introduction
A successful application of the principles of context sensitive solutions (CSS) is, by its nature, a subjective point of view. This case study documents the gradual creation of a transit-oriented district in a most challenging development area that continuously failed to gain approval of development proposals until the introduction of an innovative CSS planning process. Ultimately, a successful application of CSS, whether used in the planning and design of a transportation facility or in the entitlement of a land development, is measured by the stakeholders and the community who participated in the project's planning and took an active role in the decision-making process. Those outside of the process may not always view the results as “successful”—as they might feel that too many compromises were made or that more could have been achieved.

This case study illustrates how the principles of CSS integrated with a new planning process achieved a near unanimous consensus on a transit-oriented development (TOD) where traditional processes resulted in a long string of failed attempts. The case study also illustrates how tradeoffs in the design of walkable thoroughfares can be used strategically to secure larger benefits for the community. Even though some of the specific design solutions highlighted in this case study do not adhere to standard CSS design, the overall solution worked well for this community.

Overview
The Contra Costa Centre Transit Village is a transit-oriented-development district surrounding the Pleasant Hill Bay Area Rapid Transit System (BART) station. The station is located approximately 30 miles northeast of San Francisco, California, USA in a pocket of unincorporated Contra Costa County at the nexus of three cities: Walnut Creek, Pleasant Hill, and Concord (see Figure 1). BART, a 104-mile commuter rail system, has 44 stations serving five counties and an annual ridership approaching 350,000 people. The San Francisco Bay Area has a population of nearly 8,000,000 people of which about 11 percent reside within walking distance of BART.1 Figure 2 shows the station area circa 2000.

Before the station opened, the Pleasant Hill BART station area was characterized as semi-rural with low-density single-family residential and widely dispersed neighborhood serving commercial. When the station opened in the mid-1970s and the surrounding area began to transition to a more suburban form, the Pleasant Hill BART station (now known as the Pleasant Hill /Contra Cost Centre Station) quickly attracted long-distance commuters. Even as late as the early 2000s, the station had the highest rate of morning passenger boardings in the BART system and consistently had the highest weekday ridership of any of the Contra Costa stations. The station's combination of having the most parking spaces in the BART system,2 easy access to I-680, adjacent to a route of regional significance, and trains that initiate service at the Pleasant Hill/Contra Costa Centre station established a commuter park-and-ride function that attracted riders from a wide area. In this role, the area around the station was dominated by vehicular traffic. Treat Boulevard, the station’s primary access, is a major six-lane arterial that connects the station area to I-680. There were few pedestrian amenities and no bicycling facilities until the Iron Horse Trail was constructed within an abandoned railroad corridor 200 feet from the station in the 1980s. Initially, however, there was no connection between the trail and the station. Although the growing number of residential developments surrounding the station provided sidewalks for pedestrian access to BART, the pedestrian and bicycle environment was uninviting as a result of the station being dominated by a surface parking lot.

1 Characteristics of Rail and Ferry Station Area Residents in the San Francisco Bay Area: Evidence from the 2000 Bay Area Travel Survey, Metropolitan Transportation Commission, 2006.
2 Pleasant Hill Bart Station Access Plan, BART, August 2002.
The Vision and Early Plans
Initially, there were no developments around the station. Although no formal vision for the station area existed, in the 1970s elected officials believed it was important to co-locate and concentrate housing and jobs with access to BART. In 1975, the first plan for the area recognized the future desirability for intensified development near the station because of its accessibility. The plan established a minimum parcel size in anticipation of commercial development, but the area’s land use remained governed by the county general plan. In 1978, a general plan amendment permitted higher-density, transit-oriented development around the station. Even though the first development project (a three-story office building surrounded by parking) met the requirements of the general plan amendment, it did not reflect the type of development envisioned by elected officials: a high-density, urban, walkable, mixed-use and transit-oriented place. Despite the convenient transit access provided by the station and the Iron Horse Trail nearby, development remained conventionally suburban in nature.

After the failure of the initial development to achieve the vision for the station area, the county considered ideas for achieving transit-oriented-development and settled on the adoption of a specific plan to guide the appropriate type, mix and density of development. A redevelopment plan was also developed establishing a mechanism to finance the significant infrastructure upgrades needed to accommodate the development and to achieve full land assembly on the development sites. With the tools in the Pleasant Hill BART Station area-specific plan and redevelopment plan guiding new development, the station area became more transit-supportive and by the late 1990s the area was nearly three-fourths built out with two million square feet of office and commercial space and approximately 2,300 housing units. Eventually, the area became known as the Contra Costa Centre Transit Village.

The Final Puzzle Piece
One of the last remaining challenges to completing the transit village was the redevelopment of the BART station’s surface parking lot. Although the specific plan set the stage for development, what remained was a need for a plan that was both economically viable as well as supported by stakeholders and the public. For years, stakeholders had disputed the type and scale of development on the BART-owned property and the impasse was forestalling any proposal from going forward. Figure 3 shows the boundaries of the areas described in this case study. At the heart of the issue was the need to build and finance a parking structure to replace the 1,500 surface parking spaces used by BART commuters. Redeveloping the parking lot would remove both a physical and visual barrier to accessing the station and would allow subsequent developments to activate the space and to create a vibrant mixed-use center.

The predicament became an urban planning catch-22: Achieving the vision and financing public infrastructure improvements was not possible without private developer participation, but private development could not afford to construct the BART replacement parking garage.

The first plans for an entertainment and retail complex on the BART property fell through when it was perceived to compete with neighboring cities’ plans to build downtown multiplex theaters. The entertainment center proposal was followed by a plan, developed through the traditional iterative planning process over a two-year period, for an office complex that neither satisfied community concerns regarding traffic generation nor seemed to be economically sustainable.

Integrating Context Sensitive Solutions (CSS)
BART Property Charrette
A breakthrough of the stakeholder impasse was achieved when a then newly elected board of supervisors member championed a relatively new planning tool, the charrette, as a means of finding a workable solution for the development of the BART property’s surface parking lot (see Figure 4). In 2001, the County of Contra...
Costa held an intensive six-day public design charrette that included 80 hours of “open design studio” spanning the entire charrette. More than 500 participants\(^3\) took part in the process. Participants included two county supervisors, local residents, redevelopment agency representatives, and elected officials from the surrounding municipalities. More than six months were spent preparing for the charrette, analyzing existing conditions and setting the context for discussions such that meeting time was productive and effective.

Over the course of the charrette, participants addressed the future development on the BART property, pedestrian and cyclist issues, the need for 15 bus bays, parking capacity for BART patrons and residents, and new services and facilities for area residents. Participants also articulated desire for mixed-use developments with ground floor retail/restaurants and attractive streetscapes (see Figure 5). The result of the collaboration was a conceptual plan for which there was near-unanimous support.

The charrette process incorporated principles of CSS in its approach. It was led and facilitated by a planning and architectural consultant with an interdisciplinary team of engineers, economists, transportation planners, retail and housing specialists, and public financing experts. The process began without a predetermined outcome and instead focused on the longstanding vision for the BART station area contained in the specific plan and satisfying the diverse needs of the stakeholders. As a result, community values were integrated into the conceptual plan from the beginning. The supervisor who had championed the charrette approach earned support from other community leaders, giving political space for open and honest communication with stakeholders. This set the stage for a meaningful and inclusive process based on the core principles of CSS that addressed multiple facets—circulation, aesthetics, land use, environmental, and placemaking elements. The supervisors and the agencies responsible for implementing the plan committed to the stakeholders that “what you see is what you’ll get”.

**The Charrette as a Tool to Achieve the Vision**

A longstanding vision for the BART property, established in the 1983 Pleasant Hill BART Station area specific plan, was the creation of a housing and employment center that would benefit from convenient access to the BART station, I-680, and Treat Boulevard. More specifically, the vision consists of a higher-density transit-oriented “village” that affords a mix of uses—office, retail, housing, hotel, and civic—and a public facilities realm (see Figure 6). The premise is that the right mix of uses, physically and functionally well-integrated, set the stage for a vibrant and highly valuable development. The convenient transportation connections provided by the BART station, Treat Blvd, the Iron Horse Trail, and I-680 make the area too important to be underutilized. For the charrette participants, this vision was the armature upon which they built various concepts for a new neighborhood—a neighborhood that could be enjoyed by all, with features that addressed concerns about traffic, massing, and aesthetics; a neighborhood that would be financially successful.

A design philosophy was developed to support the vision of a mixed-use transit-oriented village. The design philosophy in the specific plan fosters a local identity through the creation of attractive features that complement the surrounding context. By creating a sense of place and by providing a network of public open spaces with amenities, the vision entails an enhanced public realm around the station area. For pedestrians, the design philosophy specifies that the village’s features are at a human scale that visually and functionally create a vibrant neighborhood.

---

\(^3\) Contra Costa Centre: Financing Transit Oriented Development, presentation by Jim Kennedy, Contra Costa County Redevelopment Director, Rail-Volution, October 20, 2010.
**Resulting Plan**

The charrette culminated in a site development plan that was approved by Contra Costa Council County in 2005. The charrette process articulated a conceptual plan for the BART parking lot that would see it transformed into a mixed-use, walkable urban neighborhood with shops, office space, and residential units. The plan includes affordable housing, placemaking features, and a balance of jobs and residential units. Subsequent planning identified the innovative financial arrangements that would facilitate implementation of the plan. All stakeholders and the public were invited to participate in the charrette as a means of maximizing input so that all alternatives could be considered. Figure 7 illustrates the site plan resulting from the charrette.

The plan itself incorporated principles of CSS, a circulation network that both complements the surrounding site developments and accommodates pedestrians, bicycles, transit, and motor vehicles. The circulation system truly accommodates all users, with major thoroughfares and minor streets that complement the site and surrounding developments. The mixed land uses in close proximity to one another captured travel internally as well as brought people to the neighborhood for purposes other than public transportation. The pedestrian-scaled buildings, landscape, and streetscape design with pedestrian amenities helped support all of the development’s function from access to transit to outdoor dining. All of these things were achieved while maintaining Treat Boulevard’s vehicular capacity consistent with regional priorities.

**Implementing the Vision for the BART Property**

The conceptual plan that came out of the charrette process in 2001 was taken forward and refined by McLarand Vasquez Emsiek & Partners and Sasaki Associates. The plan for the 18-acre site focuses on a residential mixed-use transit-oriented village. AvalonBay Communities and Millennium Partners developed the site and implemented the plan. The designers reduced the scale of the BART parking lot to five pedestrian-scale blocks, with retail and live/work spaces fronting on to smaller-scale internal streets. Each block is no more than 200 feet in length. Although each contains a mix of uses, some focus more on retail or office space while others have a more residential focus. Figure 8 is a rendering of the mixed-use development fronting Treat Boulevard, and Figure 9 is the completed building.
Three of the blocks are designed with development on a continuous edge around the block enclosing a space that is used for either a parking structure or a courtyard. The plan is being implemented in two phases. Phase I has been completed and phase II will begin construction in five years. When completed the Transit Village originally developed in the charrette and refined by AvalonBay Communities and Millennium Partners’ architects will include:

- 522 residential units;
- 35,590 square feet of local serving retail (including restaurants, business services, and convenience retail);
- 10 live-work units;
- 290,000 square feet of office; and
- 20,000 square feet of business conference center.

Walkable Thoroughfare Design
The streets for the site are walkable by design. Vehicles are discouraged from speeding by short blocks, closely spaced controlled intersections, and landscaping features. Placemaking features, such as pedestrian-scaled lighting, attractive sidewalks wide enough for outdoor dining, visually interesting building facades, public open space with seating and water features, and street frontages that include several smaller-scale retail and live/work spaces create an inviting promenade for pedestrians and cyclists.

The interior streets are markedly different from the urban arterials that surround the site; Treat Boulevard, Jones Road and Oak Road. Pedestrian crossings are given greater prominence through highly visible street markings or colored/textured concrete; which conveys the priority of pedestrians (Figure 10). The streets provide on-street parking that is also highly visible through pavement markings and curb extensions at pedestrian crossings.

A solid strip of colored pavement delineating the parking lane space creates a buffer between the pedestrian path and traffic lane and clearly differentiates the space from a regular traffic lane (unlike many other streets that provide on-street parking).

The incorporation of barrier-free design, with pedestrian space level to travel lane space introduces some ambiguity to the prioritized user of the space that, in turn, encourages drivers to slow down. Wayfinding and placemaking features, such as community chessboards and a plaza with a water mister, signal that the space has been designed with the pedestrian in mind. The town square will also include a public art feature and discovered art in the near future.

Connections
Supporting and enhancing the transportation connections to the station is a key element of the vision for the BART property. The vision supports all modes—local transit, pedestrian, cycling, and motor vehicle—but specifically discourages any through traffic in the station area. To this end, the plan includes improved access for underserved communities and initiatives that address capacity issues, particularly through enhancements to the pedestrian and transit facilities and services. The plan sees the use of parking primarily by commuters accessing the BART station and indicates a need for replacing all BART patron parking displaced by development on the BART property.

Pedestrian connections throughout the BART property are prioritized, with direct connections to the BART station from each block in the village. Pedestrian paths directly link to surrounding neighborhoods through highly visible pedestrian crossings at intersections. An east-west pedestrian and bicycle route, the “town green,” connects the Iron Horse Trail with bicycle parking at the station.

The site provides vehicular access throughout the site to each of the blocks. The design of the internal streets, however, discourages their use as through routes from one side of the transit village to the other.

Innovative Solutions and Design Flexibility
Transforming a Major Arterial into a Walkable Thoroughfare
Creating a walkable thoroughfare along a major arterial was one of the most challenging aspects of the project. Treat Boulevard connects I-680 near the Pleasant Hill/Contra Cost Centre BART Station to Central Concord. As a route of regional significance, it carries significant through traffic, connects multiple jurisdictions, and serves a major transportation hub, the Pleasant Hill/Contra Cost Centre BART Station. This six-lane facility is part of a corridor of arterials that conveys more than 125,000 vehicles per day. With limited ability to add roadway capacity, transportation improvements on routes of regional significance focus on efficiency. The importance of Treat Boulevard as a critical regional traffic conduit amplifies the challenge to balance multimodal objectives and create a walkable thoroughfare.
In addition to its role as an important pedestrian connection to the BART station, the design goals for Treat Boulevard were to create a comfortable, intimately scaled streetscape that, combined with ground floor retail, cafes, and locally serving shops, encourages pedestrian activity. The street standards for the station area mandated “human-scaled elements at the street level” including street trees, wide sidewalks with space for commercial activity, on-street parking, benches, and pedestrian-scaled lighting. The station area’s architectural code required large windows on the first floor and awnings to create shade.

The pedestrian-oriented, ground floor retail frontage specified for Treat Boulevard is an exceptional treatment for a high-speed six-lane arterial with traffic volumes that rival some freeways. The design and implementation of two of the frontage’s elements required innovation, design flexibility, or a process of building consensus amongst stakeholders, as discussed below.

**On-Street Parking**
Of primary concern to the engineers in the county’s public works department was how to safely incorporate on-street parking into a two-block segment of Treat Boulevard. In the charrette, on-street parking was identified as a crucial element of the success of Treat Boulevard as an exceptional treatment for a high-speed arterial (Pleasant Hill BART Comprehensive Station Plan, Recommendation W3). During off-peak times, however, the speeds are typically over 40 mph near the Pleasant Hill BART station.

Concerns centered around two issues: first, the hazards caused by vehicles maneuvering into and out of parking spaces and drivers exiting their vehicles adjacent to high-speed traffic and, second, the impediment to traffic flow caused by parking maneuvers on a route of regional significance for which uninterrupted flow is a critical regional priority.

The negotiated solution was the creation of space within the traveled way that buffered the parking lane from moving traffic. This 12-foot wide buffer serves as a refuge for drivers waiting to park and provides maneuverability without impeding traffic flow (Figure 11), resolving the county public works concerns. The buffer’s visibility is enhanced through the use of bands of colored concrete. One concrete band forms the gutter for stormwater drainage at the outer edge of the parking lane. Although designed this way for a variety of reasons, the location of the gutter assists drainage around the curb extensions, which can be a challenge to properly drain. The buffer also benefits pedestrians by increasing the distance between the streetside and moving traffic—best practices on the design of pedestrian facilities universally agree that distance from moving traffic is an important factor in pedestrian comfort. The buffer also provides benefits for streetside activities such as outdoor dining, reducing the noise and exhaust of traffic. The sidewalk becomes a true public space, not just an access path for pedestrians.

The buffer space solution did not come without controversy and conditions. Although it resolved the initial concerns about safety and impeding traffic, there remained concerns that the buffer will be used as a right-turn lane pitting higher-speed traffic against vehicles maneuvering into parking spaces. The final agreement permitting on-street parking on Treat Boulevard contained a condition that allows the county public works department to remove the parking if monitoring shows that the buffer is being misused and creating safety concerns. This solution may not be ideal as an example of a walkable thoroughfare, but it illustrates the very real tradeoffs and compromise that frequently occurs in thoroughfare design. A hallmark CSS principle is collaboration amongst stakeholders early in the planning to resolve tensions between community and economic needs and traffic safety concerns.

**Streetside Design**
The Pleasant Hill/Contra Costa Centre BART Station property regulating plan and codes did not include an explicit streetscape design. However, all of the planning and regulating documents convey the creation of a place that focuses on streetside activity. Below are quotes from key regulating documents:

*Shopfront and workplace buildings are common in every American downtown. These building types are designed to foster active street life. Their ground floor fronts have large windows to encourage a connection between the commercial activity within and the public life of street and sidewalk. Street trees are part of an overall streetscape plan designed to give special character to each public space and coherence to each area.* (Pleasant Hill/Contra Cost Centre BART Station Property and Architectural Codes).

*Develop quality pedestrian streets and sidewalks – Work with AvalonBay Communities and Millennium Partners and County Redevelopment to ensure that streets, sidewalks and pedestrian amenities are inviting to pedestrians.* (Pleasant Hill BART Comprehensive Station Plan, Recommendation W3).

---

4 Treat Boulevard has a posted speed limit of 35 mph, making it applicable to the guidance in *Designing Walkable Urban Thoroughfares*. During off-peak times, however, the speeds are typically over 40 mph near the Pleasant Hill BART station.
The transit village’s Treat Boulevard frontage and internal streets provide walkable streetsides through the application of many of the principles of context sensitive design, urban design, and walkable thoroughfare design as described in Designing Walkable Urban Thoroughfares (see Figure 12). The features along the Treat Boulevard frontage and internal streets that create walkable thoroughfares include:

- A wide streetside that can accommodate frontage or furnishings zones sufficient for outdoor dining and other commercial activities;
- Public realm amenities and placemaking features such as benches, pedestrian-scaled lighting, trash receptacles, and bicycle racks;
- Buildings with arcades and articulated ground floors incorporating architectural elements that are interesting, attractive, and scaled to the pedestrian;
- Street trees in treewells spaced to form a shaded canopy when mature;
- Curb extensions at intersections to reduce crossing distance and improve pedestrian visibility, and pedestrian refuges at unsignalized crossings of multilane collector streets;
- On-street parking to serve the short-term parking needs of the ground floor retail and, in combination with the additional buffer space, to separate pedestrians from moving traffic;
- Wayfinding signs directing users to the BART station, transit center, and stops for individual bus routes;
- Plazas and public space that can be utilized for civic and/or community functions, dining, and as a pleasant place to wait for transit; and
- Colored pavement creating highly visible pedestrian crossings and slow-traffic zones adjacent to on-street parking.

Figures 13 through 15 illustrate some of the features described above (which all conform to the guidance in Designing Walkable Urban Thoroughfares). The design of the streetside did not require any particularly innovative solution to gain initial agreement among the stakeholders. Although additional right of way was required to accommodate the width of the streetside and parking buffer space along Treat Boulevard, the additional right of way was part of BART’s land development agreements. The most challenging aspect of the streetside was not related to design or construction but to maintenance of the high-quality urban design features. County public works declined the long-term financial responsibility of maintaining the nonstandard elements and extensive landscaping.
Rather than settle for lower-quality amenities and risk the attractiveness of the pedestrian environment, the private development partner, AvalonBay Communities and Millennium Partners, agreed to “take ownership” of the maintenance of the streetscape within the public right of way.

**Connectivity and BART Station Access**
The vision for the Pleasant Hill/Contra Cost Centre BART Station property relied on the streets to define the block pattern for the site. The connected street system, therefore, established the size and configuration of the buildings, parks, and plazas that comprise the development’s built environment.

Figure 16 depicts the plan’s street layout, its relationship to surrounding streets, and illustrates the pedestrian and bicycle connectivity to the BART station. Key aspects of the plan’s connectivity and station access include:

- Multiple direct pedestrian connections approach the station from any direction, each oriented with a vista of the station platform or the BART parking structure’s tower;
- Regional pedestrian and bicycle access provided via the Iron Horse Trail paralleling the east side of the station area. An award-winning pedestrian and bicycle overcrossing (Robert I. Schroeder Bridge) of the daunting Treat Boulevard grade crossing at Jones Road was recently completed;5
- Pedestrian access to the transit village primarily occurs at grade. Two signalized intersections provide access to the BART Station across Treat Boulevard (Figure 17);
- The nexus of the pedestrian system is a cluster containing the BART station fare gates, the bus transit center, and the town square;
- A direct connection from the Iron Horse Trail passes through the Village Green and the Town Square crossing only on one street; and
- Bicycles access the station via either the off-street Iron Horse Trail or the on-street bike lanes on Oak Road. Both routes lead to the station's bike racks/lockers and proposed bike station.

---

5 Pedestrian grade-separations are generally avoided on walkable urban thoroughfares because they divert pedestrian activity from the street and promote higher vehicle speeds by removing activity that normally cues motorists they are entering a pedestrian district. However, the overcrossing was planned in the original specific plan to allow continuous flow along the county's most important regional multi-use trail. It eliminates a major impediment to long-distance pedestrian and bicycle travel. Signalized at-grade crosswalks remain on Treat Boulevard.
The plan originally included a direct connection between the Iron Horse Trail and the Town Square and BART fare gates via a greenway within the median of what is now called Harvey Drive. This original design envisioned a 110-foot wide right of way with a pair of one-way lanes paralleling a 54-foot-wide greenway that also served as public open space (see Figure 18). As a low-speed residential street that primary functions as a pedestrian and bicycle connection to BART and community open space with a secondary function for vehicle access, the travel lanes were 10 feet wide adjacent to eight-foot-wide parking lanes.

The greenway design faced the classic dilemma between lane width and minimum clearance for fire vehicle access. The fire district required a 20-foot-wide clear travel way, which the greenway design did not provide. The clear travel way allows fire vehicles to pass a stopped vehicle or for ladder engines to extend their stabilizers. This is particularly important on streets with tall buildings. Three- to four-story buildings were proposed adjacent to the greenway.

The fire district’s 20-foot requirement was nonnegotiable so the designers sought an alternative to widening the street. The solution that was eventually constructed narrowed the right of way and placed the greenway to one side of the street. While the street did not result in the grand entry and neighborhood park originally envisioned, the greenway is an attractive multi-use connection between the Iron Horse Trail and the BART station and provides a limited amount of open space (see Figure 19) and neighborhood amenity.

**Project Funding**

Although a prominent feature of using the principles of context sensitive solutions in creating places and walkable thoroughfares is their design, funding the project often requires the most innovation and flexibility. Development of the BART property overcame many financing challenges and highlighted the value of public/private partnerships in achieving a vision.

First and foremost, the primary obstacle to developing the property, funding the BART replacement garage and upgrading the backbone infrastructure, had to be addressed. Once it became clear that any financially feasible development that could absorb the cost of these fundamental elements contradicted the objectives of the Contra Costa Centre Transit Village, the County Redevelopment Agency decided to fund these significant prerequisites through the sale of tax-exempt bonds (secured by the tax increment from the entire 125-acre redevelopment area) with secondary contributions from an assessment district, development impact fees, and from their private partners, AvalonBay Communities and Millennium Partners (Figure 20).

---

**Figure 18** The greenway developed in the charrette had a 110-foot right of way with ample space for public open space and a multi-use connection, but had narrow lanes that didn’t meet Fire District requirements. Source: Pleasant Hill BART Community Plan.

**Figure 19** The greenway actually built had a narrower right of way then envisioned (83 ft. versus 110 ft.) and the greenway was situated to one side rather than in the median to meet Fire District requirements for a 20 ft. clear travel way. The greenway is an attractive multi-use connection between the Iron Horse Trail and the BART station. Source: Arup.

**Figure 20** The 1,500 space replacement garage under construction in 2008. The County Redevelopment Agency funded the structure using tax increment financing (housing bonds), an assessment district, and developer contributions. Source: Jim Kennedy.
Once the major infrastructure hurdle was passed, the partnership devised an innovative win-win financing strategy that created long-term revenue for the private partner and an income-generating arrangement for the public partner. BART leased the property to a newly formed Joint Powers Authority (comprised of the County, the Redevelopment Agency and BART), which in turn sub-leased the property to the private partner. Revenue from the private lease is divided between BART and the County, with the large majority going to the County in recognition of the significant up-front investment by the County Redevelopment Agency.

Benefits of the Project

After many decades of development around the Pleasant Hill/Contra Cost Centre BART station, the area lacked a “heart.”

The county initiated a process based on the principles of CSS to improve past performance and build consensus on development of the BART property to create that heart. Now completed and nearly fully leased, the entire Contra Costa Centre benefits from a well-conceived plan that used collaboration to reach a consensus on the needs of the stakeholders, that creates a new “place” in the community, that encourages the use of public transportation, and that financially beneficial to both sides of the public/private partnership. Residents and businesses have moved into the station area. Contra Costa Centre development includes:

- Specific plan area: 7,000 jobs and 6,000 residents within a quarter-mile of BART fare gates;
- BART property: 522 units and 345,000 square feet of commercial space;
- Exceeded goal of 30% reduction in single occupant vehicle use by employees (see Figure 21);
- TDM programs: Guaranteed Ride Home, Mid-Day Shuttle Service and the Centre’s progressive Green Fleet Program provide more services to commuters who choose to leave their cars at home;
- Residential occupancy: 98% leased; and
- Commercial occupancy: 95% leased.

A 2008 analysis of residential values in the area external to the Pleasant Hill BART Station Specific Plan area indicated that at no time did the existence of higher density transit-oriented-development negatively influence surrounding housing prices, even during the period 1996–2001 when the public was opposed to the several proposed developments in the specific plan area.

Lessons Learned

The planning of the Pleasant Hill/Contra Costa Centre BART station area was an arduous process spanning over 30 years. Over this time, planning techniques, markets, and transit systems saw numerous changes. The planning of the station area experienced successes and setbacks along with these changes but remained steadfast on achieving the objective of a well-connected, high-density, mixed-use transit village centered on the BART station. After the 1978 general plan amendment failed to attract the

As a result of these lessons, the county prepared the Pleasant Hill BART Station specific plan and redevelopment plan, which, employing traditional planning methods, guided development into the 1990s until the last remaining undeveloped property in the station area was the BART surface parking lot. The final piece of the puzzle turned out to be the most challenging due to the complexities of site ownership, market conditions, infrastructure needs, financing, and achieving stakeholder concurrence. After various strategies failed to produce a feasible or acceptable plan, a relatively new planning technique using a “charrette” process resulted in a successful plan. Lessons learned through the BART property-planning process included:

- The traditional planning process, which takes one land-use concept through multiple iterations of refinement, can be excessively long and often fails to gain consensus on a plan;
- The economics of developing the BART property with required replacement parking and long-term ground leasing requires an innovative financing strategy and public/private partnership;
- Replacement of BART parking at a 1:1 ratio makes many development proposals infeasible (in 2006 the replacement garage cost 50 percent more than the value of the property);
- Neighboring jurisdictions are more likely to accept development proposals that don’t compete with their own development strategies;
- Stakeholder ownership of a plan gained through a participatory planning process such as a charrette can substantially reduce the time required to adopt the plan;
- The redevelopment agency needs to be prepared to take a significant financial risk before final development agreements are in place;

CSS Qualities: Process
The Pleasant Hill BART Station specific plan area was mostly developed using a traditional planning process; some principles of CSS have been used since the first development project. Until the rigorous application of the CSS process in planning the BART station property, stakeholder involvement was limited to elected officials and a steering committee mostly made up of agency staff. Consensus on the vision and development projects was achieved infrequently and over long periods of time. Of all of the elements highlighted in this case study, the decision to use an open charrette process involving all stakeholders make this a great example of how multiple agencies and a diverse community can collaborate to plan and implement an exceptional transit-oriented and pedestrian-friendly walkable place within one of the most challenging site-planning environments in the Bay Area. The CSS principles related to outcomes (see “Appendix 2: Introduction to Context Sensitive Solutions” in ITE’s recommended practice Designing Walkable Urban Thoroughfares) applied on this project include:

- Commitment to a participatory process from local leaders;
- Process addressed multiple facets – circulation, aesthetics, land use, financing, environmental, and placemaking elements;
- Provision of a full interdisciplinary team to work with stakeholders to develop the plan;
- Extensive involvement of a full range of stakeholders;
- Completely open and transparent process with regular and frequent communication;
- No predetermined outcome at the start of the process;
- A process with a clearly defined purpose and timeline for developing the plan;
- Extensive facilitation and assessment of alternatives to seek consensus on the transportation, community and environmental objectives of the plan, even when they are in conflict;
- Flexibility and innovation in transportation design and project financing;
- Formation of partnerships in the interest of achieving a vision;
- Process emphasized an outcome that coordinated multimodal transportation and land use decisions; and
- Interdisciplinary team use of a full range of communication and visualization tools to inform stakeholders, encourage dialogue, and increase credibility of the process.

CSS Qualities: Outcomes
The development of the BART station property successfully achieved the vision of the Pleasant Hill BART station specific plan in terms of land use, mix of uses, transit orientation, multimodal connectivity, and aesthetics. While the segment of Treat Boulevard along the BART property was not fully transformed as envisioned in the charrette, it did replace a pedestrian-unfriendly connection to BART with a significantly improved pedestrian environment serving the activities of adjacent retail and restaurants and directs BART patrons through an attractive new neighborhood once occupied by a bleak asphalt parking lot. The design of Treat Boulevard may serve as the prototype for other segments of this automobile-dominated arterial undergoing redevelopment. The tradeoffs negotiated into the design should not be considered an example of conceding defeat but rather an example of how small design tradeoffs can be leveraged to secure larger benefits for the community.

The CSS principles related to outcomes (see “Appendix 2: Introduction to Context Sensitive Solutions” in ITE’s recommended practice Designing Walkable Urban Thoroughfares) applied on this project include:

- A transportation system and street designs that are compatible with the surrounding context and effectively and safely serve all users;
- A street design that balances the provision of a walkable and commercially viable streetside with the region’s priority of traffic movement on routes of regional significance using solutions agreed upon by a full range of stakeholders;
- Thoroughfares and local streets that integrate usable public open space and that combine attractive urban design with multimodal functionality;
- The preservation of an abandoned railroad corridor, it development as a multi-use trail, and the construction of a unique and aesthetic bridge that preserves and enhances the environmental, scenic, aesthetic, historic, and natural resource values of the station area;
- A resulting built project that both met and exceeded the expectations of both designers and stakeholders and added value to the community, the environment, and the transportation system; and
- Finally, a planning and design process (six-day charrette) that was highly efficient and expeditious, making the best use of resources.
TDM Cost Effectiveness
How VMT Reduction Translates to Congestion Mitigation and Improved Air Quality

Lynn Osborn
TDM Program Manager
Contra Costa Commute Alternative Network
Walnut Creek, CA 94596
(925) 407-0353
FAX (925) 407-0356
losborn@cccan.org

One of the most elusive and difficult aspects of Transportation Demand Management (TDM) is determining the effectiveness of projects. Demand Management strategies are the cost effective partners to capacity improvements (e.g. highway or capacity widening). Although it is easy to see when a new freeway lane is built, it is more subtle to notice changes in commute behavior based on the effectiveness of TDM strategies.

Most large metropolitan areas concede that there is no way to build their way out of ever-increasing traffic congestion, and worsening air quality. The opportunity to mitigate some of these problems is to decrease the demand for the roadway capacity. The challenge for TDM is to be taken seriously and to be valued in a world of civil engineers who like to build infrastructure, and elected officials who can point to things that can be seen and are more easily identified.

Transportation dollars are becoming tighter due to budget problems at the Federal, State and local levels. Since many rideshare programs are funded by Congestion Mitigation Air Quality (CMAQ) or local Air District funds, it is now more important than ever to determine the effectiveness of projects and demonstrate how that translates to congestion management or air quality benefits.

TDM strategies are 'softer' and less tangible mitigation methods than capacity enhancements. To ensure an appreciation of the benefits of TDM strategies, it is more important than ever for advocates and TDM professionals to provide more substantive results. Calculating the cost effectiveness (based on performance measures) of projects can be challenging, however the reward for monitoring, tracking and documenting the cost effectiveness can make the difference if the project is to compete well for future funding.

The basis for this analysis of cost effectiveness is a list of program elements of a comprehensive TDM Program implemented by the Contra Costa Commute Alternative Network (CC CAN) in northern California. A brief project description of each element is included, with the corresponding methodology for determining the cost effectiveness for each. These will serve as sample project types in order to show examples of ways to calculate effectiveness for some projects. These particular projects are subject to the cost effectiveness criteria established by the Bay Area Air Quality Management District (BAAQMD) in the San Francisco Bay Area. Although some projects in Contra
Costa are funded by local half cent sales tax funds, and in some cases CMAQ funds, the more stringent BAAQMD cost effectiveness criteria are used for all projects. This is not only easier due to the standard monitoring methodology, but also provides more credibility to the programs due to these high standards. As a note, the BAAQMD re-evaluates its calculations on a biennial basis, making them more and more stringent, due to the cleaner newer vehicles on the road. Cleaner vehicles means that programs must take more single occupant vehicle (SOV) trips off the road to achieve the same cost effectiveness levels each year. In FY 2002/03 the BAAQMD required the cost effectiveness ratio to be lower than $50,000/ton of emissions reduction to qualify for TFCA funding (Transportation Fund for Clean Air).

The projects evaluated in this report include:
- Carpool Incentive Program
- Employer Based Trip Reduction
- Vanpool Incentive Program
- Transit Incentive Program
- Guaranteed Ride Home
- Bicycle Rack/Locker Project
- SchoolPool Program

Each project type is calculated separately due to different default trip lengths, different vehicle miles traveled (VMT) reduction, varying numbers of days per year of effectiveness, and the fluctuating cost of each project. At the end of each fiscal year (usually 2-3 months after the end of the year), follow-up surveys are conducted for all projects to retrieve information in determining one-way trip lengths, frequency of use of the alternative commute mode, and duration of use. Most project types are calculated on an annual basis, however some infrastructure projects (such as bicycle racks and lockers) are calculated based on 20 years (the reasonable useful life of the racks/lockers). This information gathering produces information about each project which is used to determine its cost effectiveness. The maximum number of days/year for which any project can receive credit is 240 days. Projects such as EBTR, vanpool and bicycle projects often receive 240 days of credit, whereas some transit projects receive only 90 days, for instance.

**Cost Effectiveness (Performance) Measurements**

The cost effectiveness measures calculated for each project type include the following:

1. **Vehicle trips reduced** is based on the number of participants, multiplied by 2 to determine one-way trips reduced, multiplied by the number of days/year of effectiveness. For instance if a carpool project has 800 participants averaging 189 days of carpooling during the year, the number of vehicle trips reduced would be $800 \times 2 \times 189 = 302,400$ VTR
2. Vehicle miles reduced is based on the number of one-way trips, multiplied by the number of days of effectiveness per year, multiplied by the average one-way trip length. The carpool project calculation would read:

\[1600 \text{ (one-way trips/day, based on 800 participants)} \times 189 \text{ (days per year)} \times 32 \text{ (average one-way trip length)} = 9,676,800 \text{ VMT reduction}\]

3. Days of effectiveness (DOE) is based on the average number of days that participants use the commute alternative. The total number of days of participation for all participants is added together and then divided by the number of participants. The BAAQMD has certain default DOE rates based on its own statistics, however if a project proponent can demonstrate a higher number of DOE for a given project, that will be considered. For instance, the BAAQMD default number of DOE for a transit rider is only 90 days, whereas based on Contra Costa follow-up surveys over 85% of respondents continue to take transit over 180 days after receiving the incentive.

4. Tons of emissions reduction includes calculations for ROG (Reactive Organic Gases), Nox (Oxides of Nitrogen), PM 10 (Particulate Matter), and CO2 (Carbon Dioxide). The ultimate reduction number is calculated by taking the total VMT and multiplying by various factors for each type of emission. The attached tables include the formulas for the various types of emissions reduced for each project. The sum of the emissions reduction provides the basis by which the cost effectiveness per tons of emissions reduction is calculated.

5. Cost savings per commuter is calculated by taking the average one-way trip length, multiplied by two (for the total round-trip savings), multiplied by the number of days, multiplied by the cost per trip (California DOT 2003 average cost per mile is $.36, however the 2003 AAA average cost is even higher at $.48 per mile).

**Carpool Incentive Program** (see Attachment A)

The CC CAN Carpool Incentive Program offers a $40 gas card to anyone who forms a new carpool or joins one. Based on origin/destination calculations from follow-up surveys, the average one-way trip length for a carpool in Contra Costa is 32 miles. The average in the Bay Area is 16 one-way miles. (Contra Costa provides much of the residential housing for employment destinations such San Francisco and Silicon Valley/San Jose).

Attachmentments A-G provide spreadsheets for each project which automatically applies the macro formulas and calculates the cost per tons of emissions. If any of the factors including the total TFCA Cost (in the upper right hand corner), or columns A (# trips/day), B (days/year), or C (one-way trip length) change, then the calculations across the page also change, as each one of those factors determines the cost effectiveness. This project had 800 participants which totaled 800 round trips, or 1600 one-way trips. (Calculations are actually computed differently, based on the number of carpool riders in each carpool, however for the purposes of this exercise it is assumed only one rider per carpool.)
At a cost of $146,000, the Carpool Incentive Program calculation indicates:

- 1600 (# one-way trips) X 189 (days/year) X 32 (one-way miles) = 9,676,800 VMT reduced. This translates to a total cost effectiveness ratio of $10,081/ton of emissions reduction. The emissions reduced include:
  - ROG = 5.52 tons
  - NOx = 6.83 tons
  - PM = 2.13 tons
  - CO2 = 4504.7

The cost savings for each carpool participant totals:

32 (one-way trip length) X 2 (for round trip) X 189 (days/year) X $.36 (cost to drive per mile) = $4,354.56 savings per year

**Employer Based Trip Reduction (EBTR) Program** (See attachment B)

The EBTR program includes a budget of $96,000 with many activities to promote the use of commute alternatives to all workplaces in Contra Costa, regardless of size or type (multi-tenant buildings are included, as well as retail big box). Due to the voluntary trip reduction environment in the San Francisco Bay Area, employers are encouraged to survey their employees each year. CC CAN conducts marketing campaigns such as California Rideshare Week, Bike to Work Day, Spare the Air, and Vanpool Appreciation Day, as well as the promotion of the Countywide Incentive Programs (including the Carpool Incentive Program, Vanpool Incentive Program, Transit Incentive Program and a Guaranteed Ride Home Program).

Due to the difficulties in determining changes in overall countywide employee commute modes, the BAAQMD default for the number of employees who likely change to a commute alternative based on the above efforts is 1% of the database employee population. CC CAN uses a 1.5% ratio instead, based on several factors including: CC CAN has an extensive residential marketing program, working with developers, Home Owner Associations, Chambers of Commerce, service organizations, title companies, realtors, and colleges; Contra Costa has the highest rate of BART train ridership in the Bay Area; and finally, in a voluntary trip reduction environment, only about 10% of the active employers survey each year, and even then, not all of the same ones survey each year. The Central/East Contra Costa EBTR Program, includes over 250 active employers with 41,000 employees, the effectiveness ratio includes:

- 1.5% of 41,000 employees = 615 participants, multiplied by 2 (for one-way trips) = 1230, multiplied by 240 days per year, multiplied by 34 one-way miles = 10,036,800 VMT reduced

The days/year for EBTR is 240 days (working 50 weeks/year and receiving 2 weeks vacation and 10 holiday days off = 240). In addition, for projects which access transit, any 'new' trips generated when commuters access transit must be added back into the equation. For EBTR it is estimated that 10% of the total trips require 'new' trips to access transit. (No new trips are generated accessing standard bus lines). This addition
is posted on Line 31 (and more below if necessary) on each cost effectiveness spreadsheet (Attachments A-G).

The CC CAN EBTR cost effectiveness ratio is $3,549/ton of emissions reduction.

The emissions reduced include:
- ROG = 5.62 tons
- NOx = 6.98 tons
- PM = 2.19 tons
- CO2 = 4631.1

The cost savings for each EBTR participant equals:
34 (trip length) X 2 (for round trip) X 240 (days/year) X $.36 (cost to drive per mile) = $5,875.20 per year savings

**Vanpool Incentive Program** (see Attachment C)
The Vanpool Incentive Program offers half off to new riders for the first three months after joining a vanpool. In addition, vanpool drivers who keep an active van on the road for one year receive a $1,000 bonus. In Contra Costa, the default one-way trip length for vanpools is 41.5 miles. Since vanpoolers ride in vans 5 days/week, the number of days/year is 240.

- 250 participants, multiplied by 2 (one-way trips), multiplied by 240 days/year, multiplied by 41.5 one-way miles = 4,980,000 VMT reduction

The Vanpool Incentive Program budget is $90,000 with a cost effectiveness which calculates to $17,246/ton of emissions reduction.

Emissions reductions include:
- The emissions reduced include:
  - ROG = 1.38 tons
  - NOx = 1.73 tons
  - PM = .55 tons
  - CO2 = 1154.9

The cost savings for each Vanpool participant equals:
41.5 (trip length) X 2 (for round trip) X 240 (days/year) X $.36 (cost to drive per mile) = $7,171.20 per year

**Transit Incentive Program** (see Attachment D)
At a cost of $170,000, the Transit Incentive Program offers free transit passes for new riders traveling to, from, or through Contra Costa. Commuters must sometimes trip link in order to get to work (using more than one form of transit). As a further complication, there are 27 transit agencies in the Bay Area. Due to the differing one-way trip distances, each type of transit has a different default for not only trip length, but number of days of effectiveness/year too. More details can be seen on Attachment D. In the notes to the
right of the table are explanations for the varying defaults as well as new trips generated by accessing transit. To illustrate the way defaults can differ, a one-way trip on BART averages 27 one-way miles, and a total days of effectiveness of 240 days/year, whereas a standard bus trip averages only 4.3 miles with a total days of effectiveness of 90/year. Consequently, the calculations have to be listed separately.

BART trips total:
- 1004 (# one-way trips) X 240 (days/year) X 27 (one-way miles) = 6,505,920 VMT reduction

Bus trips total:
- 400 (# one-way trips) X 90 (days/year) X 4.3 (one-way miles) = 154,800 VMT reduction

Express Bus trips total:
- 214 (# one-way trips) X 240 (days/year) X 46 (one-way miles) = 2,362,560 VMT reduction

Amtrak/ACE train trips total:
- 40 (# one-way trips) X 240 (days/year) X 60 (one-way miles) = 576,000 VMT reduction

Total VMT reduction for this project is 9,599,280 one-way trips.

New trips accessing transit also differ. No new trips are generated by commuters catching the local bus. For Express Bus service, 10% are SOVs to the pick up point. BART riders average a 30% SOV ridership to the BART station. All of these new trips accessing transit hubs average 3 one-way miles. These new trips must all be added back into the calculation to determine the true cost effectiveness.

The total cost effectiveness ratio for the Transit Incentive program is $12,200/ton of emissions reduction. The emissions reduced include:
- ROG = 5.3 tons
- NOx = 6.58 tons
- PM = 2.06 tons
- CO2 = 4357.0

The cost savings for each transit participant equals:
For bus riders: 4.3 (trip length) X 2 (for round trip) X 90 (days/year) X $.36 (cost to drive per mile) = $139.32 per year

For BART riders: 27 (trip length) X 2 (for round trip) X 240 (days/year) X $.36 (cost to drive per mile) = $2332.80 per year

For Express bus riders: 46 (trip length) X 2 (for round trip) X 240 (days/year) X $.36 (cost to drive per mile) = $3,974.40 per year

For Amtrak/ACE train riders: 60 (trip length) X 2 (for round trip) X 240 (days/year) X $.36 (cost to drive per mile) = $10,368 per year

**Guaranteed Ride Home** (see Attachment E)
At a cost of $115,500 the GRH Program offers six free taxi vouchers or a rental car six times per year in the event of personal or family illness, a loss of a rideshare ride home, or unscheduled overtime. This program has 3,360 participants in an annually updated and purged database. It includes over 750 registered employment sites. The BAAQMD does not equate all registrants to be reduced trips, therefor only 1,680 (50% of the total) are considered participants for the purpose of calculating the effectiveness. As a result, the 3,360 total equals 1,680 multiplied by 2 for # one-way trips/day.

- 1,680 (participants) multiplied by 2 (one-way trip), multiplied by 240 days/year, multiplied by 34 (one-way miles) = 27,417,600 VMT reduction

An additional 336 new trips are added back into the formula (10% of the total trips accessing rideshare options to GRH), averaging 3 one-way miles. The GRH budget is $115,500 with a cost effectiveness which calculates to $2,858/ton of emissions reduction.

Emissions reductions include:
- ROG = 15.34 tons
- NOx = 19.08 tons
- PM = 5.99 tons
- CO2 = 12,650.7

For GRH participants: 34 miles (trip length) X 2 (for round trip) X 240 (days/year) X $.36 (cost to drive per mile) = $5875.20 per year

**Countywide Bicycle Rack/Locker Program** (see Attachment F)
The Countywide Bicycle Rack/Locker Program provides racks and lockers to both public and private locations throughout the County, with public agencies receiving priority. CC CAN maintains a waiting list annually for locations requesting bicycle infrastructure. With $36,000 available for this program (all of which goes toward capital costs only), many locations were able to be served. The project includes the installation of a total of: four wave racks with a 7 bike capacity; sixteen double lockers with a 32 bike capacity; and four 15 loop racks with a 60 bike capacity, totaling 99 spaces/participants. The BAAQMD default number of days of effectiveness for bicycle projects is 240 days/year. The average one-way bicycle commute trip is 3 miles.

- 99 (participants) multiplied by 2 (one-way trips), multiplied by 240 days/year, multiplied by 3 (one-way miles) = 142,560 VMT reduction/year, for a total of 2,851,200 total VMT reduction.

The overall cost effectiveness calculates to $25,585/ton of emissions reduction:
Emissions reductions include:
- The emissions reduced include:
  - ROG = .03 tons
  - NOx = .03 tons
PM = .01 tons
CO2 = 25.1
The cost savings for bicycle riders is: 3 (trip length) \times 2 (for round trip) \times 240 (days/year) \times \$0.36 (cost to drive per mile) = \$518.40 per year

SchoolPool Program (see Attachment G)
The SchoolPool Program provides ridematch services for schools in West/Central and East areas of Contra Costa County (public and private). In addition, since there is little, or no school busing in most districts, public bus tickets are offered to those students for whom a carpool doesn’t work. Since there are four bus operators in the County, tickets must be distributed based on the location of the school and the corresponding operator. The operators assist in providing specialized transit schedules indicating which routes serve which schools, and in some cases even time schedules. For those parents who wish for their students to try the bus, a $20 pass is given.

For those students who take the bus, it constitutes one trip to school, and one trip home. For those with non-siblings in carpools, it is actually four one-way trips. The parent drives the children to school, then drives home, and then the two way trip is repeated in the afternoon again. Based on follow-up surveys, about 25% of the four trips are reduced by parents either dropping children off on the way to work, or children getting home by some other means in the afternoon. Therefore for SchoolPoolers in a carpool, the number of trips saved is actually 3 one-way trips/day. In order to do the calculations to determine total VMT reduction:

- 450 (SchoolPoolers/participants) multiplied by 3 (one-way trips) added to 550 (bus riders), multiplied by 2 (one-way trips) multiplied by 180 days/year, multiplied by 4.3 (one-way miles) = 1,896,300 VMT reduction

The overall cost effectiveness calculates to $20,274/ton of emissions reduction:
Emissions reductions include:
- The emissions reduced include:
- ROG = 1.58 tons
- NOx = 1.58 tons
- PM = .41 tons
- CO2 = 864.7

The cost savings for SchoolPoolers is: 4.3 (trip length) \times 3 (for three one-way trips), \times 180 (days/year) \times \$0.36 (cost to drive per mile) = \$835.92 per year

As is evidenced by the descriptions above, there are not only many cost effectiveness and performance measures for TDM projects, but there are also many variables within each project which can affect the overall cost effectiveness. In addition, the methods listed here are only some of the many ways in which to determine cost effectiveness or on which to base performance. With the ability to quantify the effectiveness of each however, the importance of these Demand Management strategies becomes more supportable by being the necessary elements to complement roadway enhancement projects.
CONTRA COSTA COUNTY PLANNING COMMISSION
TUESDAY, OCTOBER 18, 2011

SUFISM REORIENTED RELIGIOUS SANCTUARY

I. INTRODUCTION

SUFSISM REORIENTED (Owner and Applicant), County Files LP08-2034 and MS09-0008: Applicant requests approval of a Land Use Permit AND Minor Subdivision as follows:

Land Use Permit # LP08-2034: This is a request for a Land Use Permit to allow construction of a new sanctuary on approximately 3.12 acres. The proposed project includes: (1) a 66,074 square foot sanctuary building that includes a prayer hall, administrative offices, a library, classroom, archives, art and music program space, and related ancillary uses. Approximately 46,074 square feet of the building would be located below ground, including the administrative offices, bookstore, art studio, art storage, chorus rehearsal, video and audio production, music mixing and scoring, reception area, multi-purpose room, film/video and photo library, a music, drama, and dance studio, a coat room, women’s and men’s restrooms, and a kitchen. The 46,074 square feet includes approximately 13,800 square feet as open areas referenced as a rotunda, plaza, and east and west galleries (hallway) and a grand staircase; (2) a request for parking reduction based on a Transportation Demand Management Program (TDM) which includes the promotion of carpool, shuttle service, pedestrian and secure bicycle parking; (3) the removal of approximately 58 trees and the planting of at least 165 new trees; (4) the excavation and removal of soil (approximately 40,000 cubic yards of soil) an estimated 3,300 truck load of soil to be exported; and (5) demolition of three existing single family residences.

Minor Subdivision # MS09-0008: The applicant requests approval of a minor subdivision for the merging of seven (7) lots into one (1) parcel to create approximately 3.12 acres. The project addresses are 11 White Horse Ct., 1354, 1360, 1364, 1366, and 1384 Boulevard Way within the unincorporated (Saranap) Walnut Creek area of Contra Costa County [Zoning: Single Family Residential, 10,000 square foot minimum parcels (R-10); (General Plan: Single Family Residential High Density (SH), (Census Tract: 3410.00) (Parcel Nos. 184-450-006, 007, 012, 031, 032, 033, 034) (Zoning Atlas page:N-13)]

II. RECOMMENDATION

Staff recommends that the County Planning Commission take the following actions:

A. ACCEPT the recommendation from the County Zoning Administrator regarding the adequacy and completeness of the Final Environmental Impact Report (Final EIR).
B. CERTIFY the Final Environmental Impact Report ("Final EIR") dated September 2011, finding it to be adequate and complete, finding that it has been prepared in compliance with the California Environmental Quality Act (CEQA) and the State and County CEQA Guidelines, and finding that it reflects the County’s independent judgment and analysis, and specify that the Community Development Division (located at 651 Pine Street, Martinez, CA) is the custodian of the documents and other material which constitutes the record of proceedings upon which this decision is based.

C. CERTIFY the contents of the Final EIR and that the information was reviewed and considered prior to making a decision on the project.

D. ADOPT CEQA findings that address environmental impacts and mitigation measures, and that adopt a Mitigation Monitoring and Reporting Program. (Exhibit A)

E. APPROVE the minor subdivision, County File #MS09-0008 and the land use permit, County File #LP08-2034 with a minor modification to Project Variant B, based on the CEQA Findings, Growth Management Standards and Land Use permit findings and subject to the attached conditions of approval (Exhibit B).

F. APPROVE the Final Transportation Demand Management Program (TDM) as set forth in the conditions of approval.

G. DIRECT staff to file a Notice of Determination with the County Clerk.

III. PROJECT BACKGROUND

The project sponsor has proposed to develop a religious facility (sanctuary building) on approximately 3.12 acres in the Saranap neighborhood of unincorporated Walnut Creek. The applicant is Sufism Reoriented, a non-profit religious corporation recognized by the State of California and the Federal government.

The proposed 66,074 square foot sanctuary building includes a prayer hall, administrative offices, a library/bookstore, classroom and art program space, and related ancillary uses. Approximately 46,074 square feet of the building would be located below ground, including the administrative offices, a library/bookstore, classroom, and art program space. A list of each space and the respective square footage is located on page 5 of the Transportation Demand Management Plan (Exhibit C).

The project site would be further developed with a plaza, parking area, and landscaping. Sufism Reoriented's current sanctuary is located at 1300 Boulevard Way. If this project is approved and the new sanctuary building is constructed, Sufism Reoriented would cease its use of 1300 Boulevard Way, selling or leasing that property to another unknown user.
The new Sufism Reoriented Sanctuary will contain a concourse level, mechanical mezzanine plan, and ground level floor plans. The parsonage residence will remain and three existing single family homes that either are renter occupied or vacant will be demolished.

The concourse level which is below ground will be approximately (46,074 square feet) and consist of office space, a square foot bookstore and storage, consortium rehearsal, storage and Art Studio, video posting, music scoring, reception area, multi-purpose room, film video and photo library, a music, drama and dance studio, a coat room, women and men restrooms, and a kitchen. In addition, approximately 13,800 square feet are open areas referenced as a rotunda, plaza, and east and west galleries (hallway), a grand staircase.

The mechanical mezzanine is concrete and above the concourse level and will contain the equipment for the building elevator, heating, ventilation and air conditioning system. No part of this space will be useable space for activities.

The ground level will be approximately (20,000 square feet) and is proposed for the Prayer Hall, art vault, library, and archives display, (3) three areas designated for prayer hall storage space, classroom and classroom storage space and the Murshida’s Office (spiritual leader). Below is page 5 from the Transportation Demand Management Plan which describes the uses and square footage.

**SUFISM REORIENTED**  
TRANSPORTATION DEMAND MANAGEMENT PLAN  
PAGE 5

a. **Prayer Hall**
The 5,000 square-foot prayer hall would have a capacity of 400 people and include a backstage area with storage for items, such as chairs and video equipment. The prayer hall would be used for worship and devotional gatherings, chorus rehearsals and occasional larger celebrations.

b. **Library**
The 2,656 square feet of library space includes book, film and audio storage for reference and in use in productions. The ground floor library would be used to read transcripts of classes and listen to CDs or watch DVDs of classes.

c. **Classroom**
The classroom space, 1,065 square feet, would be used for small class meetings.

d. **Offices**
This 3,095 square-foot area would be used regularly by Sanctuary staff and participants working on craft or computer projects.

e. **Murshida**
This 1,079 square-foot main office would be used for work and to meet with students.

f. **Plaza**
This 9,100 square-foot area would be used for large group dining often followed by live dramatic and musical skits.
g. **Video and Audio Rooms**
   This area that comprises a total of 2,750 square feet would be used to shoot videos, edit videos, mix recordings and attach sound track.

h. **Dance and Drama Studio**
   This 2,200 square-foot area would be used for drama, dance and music rehearsals and classes.

i. **Searchlight Bookstore**
   The 1450 square-foot bookstore would be open to the public Tuesday nights and Saturday and Sunday during the day.

Please refer to Figure 3 to view the site plan of the proposed Sanctuary site.

This is a hearing on the proposed Sufism Reoriented “New Sanctuary” project. The land use permit was submitted on July 3, 2008 and the minor subdivision for the merging of lots to create one parcel was submitted on June 15, 2009. Due to the submittal of over 3,000 letters from those who opposed and supported the project, the County Zoning Administrator elected to refer the projects to the planning commission for hearing, consideration and initial decision. The letters and petitions can be located on the County website at the following link:

On October 3, 2011, the Zoning Administrator at a public hearing recommended the County Planning Commission certify the Environmental Impact Report (EIR) along with a chart added to Volume I listing the changes from the Draft EIR in the Final EIR. Exhibit G includes two letters received requesting the Zoning Administrator to not certify the EIR and a transcript of other oral comments provided.

IV. **GENERAL INFORMATION**

A. **General Plan:** The property is currently designated SH (Single-Family Residential High Density) under the Land Use Element Map to the Contra Costa County General Plan (2005-2020).

B. **Zoning:** The sites are zoned R-10 (Single-Family Residential, 10,000 square feet minimum parcel sizes).

C. **CEQA Status:** The Department of Conservation and Development determined that an EIR was required for the project and distributed a Notice of Preparation (“NOP”) on March 9, 2010. The Draft EIR was released for public review on March 29, 2011. The initial comment period was scheduled for 45 days ending on May 13, 2011. A public hearing before the Zoning Administrator to receive comments on the Draft EIR was held.
on April 18, 2011. During the public hearing several members of the public requested an extension of the time. On April 26, 2011, the Department distributed a revised notice extending the period to receive comments to May 27, 2011.

The Final EIR was published and distributed in September of 2011. The EIR identified potentially significant environmental impacts that would occur if the project was implemented and recommended mitigation measures that would reduce all of the potentially significant impacts to less than significant levels. All mitigation measures are included within the Mitigation Monitoring and Reporting Plan attached to the CEQA findings, which describes the timing and responsibility for monitoring compliance with all mitigation measures. All mitigation measures are included in the conditions of approval. (Exhibit B)

D. **Surrounding Land Use and Settings:** The subject parcels are surrounded by single family and multiple family developments to the north. The multi family development directly abutting the subject parcels is a 36-unit apartment building. To the south is predominantly single-family residential development. To the east, is a mix of uses consisting of single family homes, the existing Sufism Reoriented worship facility, and various commercial developments leading into the City of Walnut Creek. To the west, is additional single family residential development leading into the City of Lafayette. The neighborhood is predominantly an established neighborhood within the Saranap community, and has mature trees and fully grown vegetation.

E. **Existing Site Description:** The subject land is relatively flat topographically with a slight two and half percent grade gently descending from the east towards the northwest and fronts on Boulevard Way. The project involves seven (7) parcels. Parcel 184-450-032 contains a single family residence referred to as the parsonage that will remain. Parcels 184-450-007, 012, and 006 also contain single family residences that are either renter-occupied or vacant. Currently, access to the parsonage is either by White Horse Court to Boulevard Way or by a private access easement to Warren Road. All other parcels are accessed via Boulevard Way. In addition to the residential development the parcels contain mature trees, a grass lawn and concrete paving for vehicular parking.

F. **Regulatory Programs:**

1. **Flood Hazards:** This project is within Flood Zone X. The project site is considered not within a flood hazard and will not be required to comply with the Floodplain Management Ordinance prior to the issuance of building permits.
2. **Active Fault Zone:** The project is not within the Alquist Priolo Zone. No faults cross the property. The nearest active Concord fault is mapped approximately 5 miles northeast of the site. The active Hayward fault is approximately 8 miles southwest of the site and the non-active Calaveras fault line is north of the Town of Danville.

3. **Noise Hazards:** The project sites range from less than 50 dBA to 63 dBA (noise levels) according to the noise contours within the County General Plan for the Walnut Creek area and the noise study. The highest range is due to vehicular traffic. The long term effect of the sanctuary would not increase the noise level beyond an unacceptable level however the construction related noise and vibration activity such as the construction activity used to excavate soil will be mitigated as identified under NOI-4.10-1 and 4.10-2 on page 4.10-11 and 12 of the Draft EIR.

4. **Previous Applications:**

The previous applications on various parcels consisted of the following:

A. **MS020007:** This application was approved on July 21, 2003 for a Vesting Tentative Map to subdivide approximately .67 acres into two parcels on parcel 184-450-007.

B. **LL020009:** This application was a request for a lot line adjustment that was submitted in error and subsequently withdrawn by the applicant for parcel 184-450-007.

C. **TP030034:** This application was approved on October 4, 2003 for the removal of 1 Elm Tree with a trunk size of 36-inches in diameter on parcel 184-450-007.

D. **ZI 87-35:** This application was a zoning violation in 1987 for the removal of inoperable vehicles and rubbish on site.

E. **ZI 8610:** This was approval of cleanup and remediation associated with a request for the Ultramar clean fuels project, Phase II, approved on April 23, 2002.

F. **VR011013:** This application for an 8-foot wall with a variance to the front property line was withdrawn on August 16, 2001.

G. **SD978125:** This application was for the removal of 6 trees and the development of an 8 lot residential subdivision involving 1360 and
1364 Boulevard Way. This application was withdrawn in 1998.

H. TP010008: This application was approved on March 20, 2001 for the removal of 1 tree near a fence on a vacant lot for parcel 184-450-029.

I. MS990005: This application was withdrawn on February 7, 2000 for the subdivision of approximately 1.34 acres into 3 parcels.

J. LL990006: A lot line adjustment was approved between parcels 184-450-013, 019, & 027 on April 13, 1999.

K. VR001088: This application was approved on February 16, 2001 for an 8 foot fence (concrete) with a 0-foot setback.

L. TP000008: This application was approved on May 4, 2000 for the removal of a Ash Tree 18" in diameter and denied for a 20" Oak on parcel 184-450-028.

V. PROPOSED PROJECT

The proposed New Sanctuary consists of the following components:

A. **Height:** The sanctuary would be located partially underground. The portion of the building which is visible at grade will be 35-feet in height from original grade and 33.5-feet in height from finished grade to the top of the proposed main (center) dome and approximately 20-feet from ground to the smaller domes.

B. **Construction and Grading:** Approximately two-thirds (46,074 square feet) of the building is proposed to be constructed underground. Extensive soil excavation will be required. An estimated 3,310 truck loads of soil are expected to be exported from the site (approximately 40,000 cubic yards of soil). The project proposes no pile driving activity. Excavation on the site would occur to a depth of approximately 18- feet on the east side and 23-feet on the west side. It is anticipated that excavation will take approximately 6 to 8 weeks and approximately 16 to 18 months to complete the entire project. The haul route would transport soils via Boulevard Way to State Route 24 and I-680 and on to the Acme Landfill in Martinez.

C. **Parcels of Land:** The Sufism Reoriented Sanctuary will merge (7) seven lots into (1) parcel of land for a combined acreage of approximately 3.12 acres.

D. **Design:** The Sanctuary will include 13 (thirteen) circular domes. (12 small domes will be constructed around 1 larger dome) with a height ranging from approximately 20- feet from grade to the top of the small domes and a maximum of 35-feet from grade to the
top of the larger dome. The color scheme is proposed to be an off-white color palette with a lot of natural light provided by skylights.

E. **Aesthetics:** The proposed “new sanctuary” architecture reflects the spiritual value of Sufism Reoriented with the emphasis on spaciousness, light, and openness as well as a sacred place of worship. The proposed architectural design is unique. It is circular in shape with 12 small and medium domes will be constructed around 1 larger dome. The architecture reflects the symbolic imitation of planets in the solar system.

F. **Transportation Demand Management (TDM) and Parking:** The County Code would require 125 parking spaces if there were no TDM program. The project sponsor proposes to construct 74 parking spaces and implement the TDM program to reduce the number of automobile trips to the project site. Sixty (60) parking spaces for general use will be a pervious grass surface and eleven (11) spaces will be a pervious concrete and the remaining (3) spaces are reserved for the parsonage. In lieu of the 51 additional spaces required and as part of the program, the project sponsor proposes members walking, bicycling, public transit, carpool, and a remote lot shuttle service as alternative modes of transportation to reduce to the number of vehicles on project site and number of vehicle trips.

G. **Landscaping and Circulation:** At the entrance the project sponsor proposes a marble plaza with a reflection pool with sidewalks made of permeable pavers that would circle the sanctuary. The replacement landscaping plan will consist of drought tolerant plants and trees after the removal of 58 trees with the replacement of 165. In addition, a six foot high perimeter wall will be constructed around the property boundaries.

H. **Size:** The proposed 66,074 square foot “new sanctuary” is to accommodate the activities of the members in one facility. Currently various activities and preparation of such activities take place in the private homes of the members. Having one facility for all activities and preparation on the same grounds as the Murshida (spiritual leader) parsonage is the primary objective of the project sponsor. Below is the list of programs from Table 3-1 of the EIR that are likely to occur.

* - "Taverns" is a cabaret style dinner and musical drama performance for members. Taverns are not concurrent with any other use. Friday Night Classes and Sunday Devotional Gatherings are suspended when Taverns take place.

Letters Received Prior to Application Process

In summary, the majority of the opposition letters received prior to processing the above applications were concerned with the scale of the sanctuary in comparison to a 350 membership count; the style of architecture, soil movement and instability, removal of mature trees to maintain wildlife habitats, the reduced parking spaces yielding only 59.2 percent of the total requirement, the removal of residence, the feasibility of the TDM plan when in inclement weather, the decline of the request to install story poles, the flow of water on adjacent property and into Las Trampas Creek, widening of the private road to the parsonage, no sidewalks and narrow streets, excess traffic and vehicular speeds, and visual impact of the Saranap semi-rural character. While there are other comments the above were the most commonly expressed oral and written comments.

The majority of the concerns listed above were discussed within the Final Environmental Impact Report with the exception of the request for story poles. The County does not have an Ordinance which requires the installation of story poles. As the Final EIR explains, the photo
simulations prepared by the County’s sub-consultant was sufficient to provide an adequate analysis of aesthetic impacts.

The comments related to soil stability were discussed in Chapter 4.5, page 4.5-1 (Geology and Soils) of the Draft EIR. Appendix I consists of the Geotechnical Engineering Investigation report and foundation recommendations. The flow of water was discussed in Chapter 4.8 (Hydrology and Water Quality) page 4.8-1, this section describes surface waters and groundwater resources. Streets and sidewalks were addressed in Chapter 4.13 (Traffic and Circulation) p. 4.13-1 of the Draft EIR. All potentially significant impacts were mitigated and can be found in the Mitigation Monitoring Reporting Program. (Exhibit A)

In reference to the style of architecture and scale of the sanctuary, the architecture is an expression of Sufism Reoriented spiritual values and beliefs with emphasis on space, both physical and solar. A large portion approximately 13,800 square feet of the 46,074 square feet is dedicated to hallway space, a rotunda, and a grand staircase and the remaining square footage is dedicated toward the expression of religion through dance, music, and performances.

In April of 2009, the environmental review for the project was started and resulted in the preparation of an Environmental Impact Report (EIR). The treatment of Boulevard Way has been the subject of many discussions between the County and the applicant. The Draft EIR evaluates two “Project Variants” [A (applicant) and B (public works)] which differ mainly in terms of improvements to the Boulevard Way right-of-way frontage. Project Variant B with a modification to eliminate a crosswalk is the recommendation of the Public Works Department and included within the conditions of approval.

The key differences are shown below on Table 3-2, (page 3-9 of the Final EIR, Volume I- Revised Draft EIR).

VI. AGENCY COMMENTS or CONSULTATIONS

The Department of Conservation and Development received comments from a very large number of members of the community (public) and various local and county agencies prior to the preparation of the EIR (Environmental Impact Report) and at the beginning stages of processing the land use and minor subdivision applications. Approximately 3,296 letters...
letters of support and 566 were letters of opposition. No comments were received from the Parkmead Community Association.

On April 21, 2009, the Saranap Community Association (SCA) provided a letter stating that the letter (dated July 31, 2008) regarding the Project did not reflect the usual process followed by the Association to evaluate and discuss projects and was not authorized by the Association as a whole. In addition, the Association requested to reserve its comments and recommendation until the distribution of the Draft EIR. The comments provided by the Association during the distribution of the Draft EIR are referenced as Letter 73 on page 3-365 of the Final EIR.

On July 9, 2011, the SCA provided a letter in support of the Project. The Association raised two concerns as follows:

- Boulevard Way-Kinney Drive intersection: The Association oppose any changes to encourage speeding along either Boulevard Way or Kinney Drive and widening of Blvd. Way without stop signs.

- Pedestrian safety: The Association believes adding one or more crosswalks would not only make the area safer but more pedestrian and bicycle friendly.

Correspondence was received in response to the NOP (Notice of Preparation) filed on March 9, 2010, and the Draft EIR released with a Notice of Completion and Availability on March 29, 2011. The initial comment period was scheduled for 45 days ending on May 13, 2011 then extended to May 27, 2011. All correspondence received during the 59-day public comment period for the Draft EIR and all of the responses to those comments are included in the Final EIR dated September 2011. The NOP and Notice of Completion have also been attached as Exhibit E.

VII. SUMMARY OF ENVIRONMENTAL IMPACTS

The Draft EIR identified environmental impacts which would occur if the new sanctuary project was implemented. Potentially significant impacts mitigated to less than significant were identified in the following Draft EIR areas: Aesthetics, Air Quality, Geology and Soils, Hydrology and Water Quality, Noise, and Transportation and Traffic and Cumulative Impacts.

**Aesthetics:** discussed in detail in Draft EIR Section 4.1 (page 4.1-16) and in the Final EIR. The project would result in the potential for substantial nighttime lighting which could adversely affect nighttime views. All potentially significant impacts can be mitigated to a less-than-significant level.

**Air Quality:** discussed in detail in Draft EIR Section 4.2 (page 4.2-14) and in the Final EIR. The project construction would result in emission of particulate matter in the form
of dust and create objectionable odors affecting a substantial number of people. All potentially significant impacts can be mitigated to less than significant.

**Biological Resources:** discussed in detail in Draft EIR Section (page 4.3 -17) A potential purchase of neighboring property would trigger a County Fire Protection District requirement to widen the secondary road access to the project site from Warren Road. In addition, the removal of trees could have an adverse effect on special status species. All potentially significant impacts can be mitigated to less-than-significant.

**Cultural Resources:** discussed in detail in Draft EIR section 4.4 (page 4.4-9) Demolition of existing structures and/or construction activities could inadvertently uncover human remains or damage previously unidentified historical resources. All potentially significant impacts can be mitigated to less-than-significant impacts.

**Geology and Soils:** discussed in detail in Draft EIR Section 4.5 (page 4.5-11) The proposed Project variants could expose people and structures to potential adverse effects to seismic ground shaking, soil erosion or be located on expansive soils, soil instability on site and adjacent properties. All potentially significant impacts can be mitigated to less-than-significant levels.

**Hazards and Hazardous Materials:** discussed in detail in Draft EIR Section 4.7 (page 4.7-8) Demolition of existing structures on the site could result in release of lead, asbestos and other contaminants. All potentially significant impacts can be mitigated to less-than-significant levels.

**Hydrology and Water Quality:** discussed in detail in Draft EIR Section 4.8 (page 4.8-14) and the Final EIR Improvements could impact storm water flow and construction could contribute sediment to Las Trampas Creek affecting water quality. All potentially significant impacts can be mitigated to less-than-significant levels.

**Noise:** discussed in detail in Draft EIR Section 4.10 (page 4.10-11) construction activity could generate a temporary increase in noise. Construction and operational activities could temporarily expose persons or structures to excess ground borne vibration. All potentially significant impacts can be mitigated to less-than-significant.

**Traffic and Circulation:** discussed in detail in Draft EIR Section 4.13 (page 4.13-23) proposed reliance on a TDM program would increase the number of bicyclists and pedestrians along Blvd Way frontage and Project Variant A would not allow adequate stopping sight distance creating a significant impact regarding a potential safety concern. All potentially significant impacts, including the site distance-related impact, can be mitigated to less-than-significant.

**Utilities and Service Systems:** discussed in detail in Draft EIR Section 4.14 (page 4.14-10) the proposed project would generate an increase in demand for water supply over exiting
uses. All potentially significant impacts can be mitigated to less-than-significant.

All mitigation measures are included in the Mitigation Monitoring and Reporting Program (CEQA Findings - Exhibit A and the conditions of approval - Exhibit B)

**Public Comments:**

Approximately 90 letters and/or correspondences were received during the public comment period for the Draft EIR. Prior to the determination of completeness of the applicant's application and during the processing of the application the County received approximately 3,296 letters from residents and businesses who opposed or support the project. Only those comments received during the release of the Draft EIR and the public hearing held on April 18, 2011 during the 59 day comment period are included in the Final EIR.

Oral and written comments were received during the public hearing related to the Draft EIR held on April 18, 2011. The Final Environmental Impact Report (FEIR) responds to and incorporates the written comments submitted at the public hearing on April 18, 2011.

**VIII. STAFF ANALYSIS AND DISCUSSION**

**A. General Plan Compliance:** The General Plan for the project is Single Family Residential – High Density (SH). This designation allows between 5.0 and 7.2 single family units per net acre. Population density would normally range from about 12.5 to about 22 persons per acre with an average of 2.5 to 3 persons per household. However, secondary land uses permitted within the SH designation are permitted that are compatible with low density homes including childcare facilities, churches and other similar places of worship. The General Plan states the (R-10) zoning district is consistent with the (SH) designation.

The new sanctuary project is consistent with the General Plan designations.

**B. Zoning Compliance:** According to Sections 84-8.404 and 84-4.404 (3), the (R-10)-Single Family Residential Zoning District permits the construction and establishment of churches and religious institutions and parochial and private schools including nursery schools with the issuance of a land use permit. The project as described above in section IV of this staff report is consistent with County Codes for building height and setbacks.

**C. Traffic and Circulation:** The subject site fronts Boulevard Way, a public road, along its northerly and westerly boundaries and is located at the intersection with Kinney Drive and Garden Court, both public roads. The existing pavement width varies from approximately 20 to 40 feet along the project frontage of Boulevard Way.

There is an existing private access easement, White Horse Court, located on the subject site, but it is not expected to be used as access to the developed site. The Parsonage
structure will continue to gain access from Warren Road via an existing private access easement located on the adjacent properties to the east and south.

The project sponsor proposes two driveways off of Boulevard Way along the northerly boundary. The main entrance, which will be used as access to the parking lot, will be located approximately 180 feet east of the intersection with Garden Court and Kinney Drive. The second driveway is located at the easternmost frontage of Boulevard Way approximately 450 feet from the intersection and will primarily provide access for trash pickup.

D. Boulevard Way Precise Alignment: Boulevard Way is an arterial per the County General Plan for which a Precise Alignment (PA 3851-69) was adopted in 1969. It had provided for a four-lane facility with a 500-foot centerline radius curve through the intersection within an 84-foot wide ultimate right of way.

However, a smaller facility has been determined to be more appropriate for the traffic needs in the area. Therefore, a new Precise Alignment (PA 3851-00) was developed around year 2000 which provided for two 12-foot lanes, one 14-foot left-turn lane in the middle, and 5-foot bike lanes with a 300-foot radius curve through the intersection within a 68-foot right-of-way.

The 1969 Precise Alignment was rescinded in May 2010 by the Board of Supervisors based on a Public Works recommendation. Although the 2000 Precise Alignment has not been formally adopted by the Board of Supervisors, compliance with this precise alignment has in the past been the requirement for all land development projects along Boulevard Way in lieu of the more imposing 1969 alignment.

E. Frontage improvements requirements: After discussing the site constraints with the project sponsor, Public Works Department recommends that the frontage improvements along Boulevard Way shall at a minimum accommodate pavement (half-width) of 17-feet from the existing striped centerline of Boulevard Way, thus retaining the existing geometry and providing a 12-foot wide travel lane and a 5-foot wide paved shoulder. Existing utility poles would need to be relocated but not required to be placed underground. A 5-foot wide sidewalk shall be provided along the entire frontage and extend to the intersection of Warren Road. Sidewalk should be constructed monolithically with the new curb, but may meander around the utility poles, as needed. Conforming pavement would be required to fill the gap between the existing street and the new sidewalk South of the Project Site.

F. Right-of-way requirements: The current right of way half width along the project frontage of Boulevard Way is approximately 25 feet, as measured from the existing striped centerline. The proposed conditions of approval attached as Exhibit B require that the new right of way or public utility easement shall be 10 feet from the new face of curb; therefore, to accommodate the 17-foot wide pavement, the right of way shall be
minimum 27-foot wide (half-width). The sidewalk, bus pullout, and curb ramps must be contained within the public right of way.

G. Intersection control: Currently, the intersection features stop signs at two of its legs – at Garden Court and Kinney Drive. The traffic flow along Boulevard Way (which has 4500 daily trips) moves through the intersection without stopping.

The project sponsor’s consultant has suggested installing one stop sign on Boulevard Way at the southern leg of the intersection. The Public Works Department does not recommend this modification for the following reasons:

- Stop sign warrants are not met
- Reduction of the free flow of the main movement along Boulevard Way
- Increased traffic congestion along Boulevard Way
- Speed increase as drivers tend to make up time lost due to stopping
- Increased air pollution due to vehicle stopping and acceleration

H. Drainage: The project site is located within unformed Drainage Area 121. The property drains to three drainage areas, all of which drain to Las Trampas Creek.

Of the three drainage areas, one is of particular concern due to inadequate drainage system on the private property located at the southeast corner of Warren Road and Boulevard Way with a “marginal” outfall into Las Trampas Creek located on the same property. There is an approved minor subdivision (MS03-0015) at this property that is conditioned to upgrade this private drainage system. However, there has been no recent activity on that property.

The second area, which drains generally eastward along Warren Road, has an inadequate 12-inch culvert at Warren Road. This culvert will be replaced by the applicant with an 18-inch pipe. The rest of this drainage system appears to be adequate, including a section of a collapsed pipe recently replaced by a private owner.

The third area drains along Boulevard Way via storm drain system that appears to have sufficient capacity for the 10-year design storm.

A drainage report prepared by Aliquot Associates (dated January 3, 2011) shows that the applicant proposes to utilize pervious paving systems for the parking lot to reduce the stormwater runoff and maintain the post-project design flows below the pre-project levels. Since certain types of pervious paving systems become silted in and clogged over time, the project sponsor will be required to develop a long-term maintenance plan to guarantee the infiltration performance of these systems.

I. Transportation Demand Management (TDM): In accordance with Chapter 82-32 of the County Code, pertaining to Transportation and Demand Management, the project sponsor may qualify for reductions in off-street parking requirements. The conceptual
TDM program must identify measures that can be demonstrated to attain the trip reductions necessary to qualify for a parking reduction. The TDM requirement does apply to all development projects residential and non-residential. The intent and purpose of this Chapter is to further the goals of the General Plan, Bay Area Air Quality and Growth Management Standards. The project sponsor’s conceptualized TDM incorporates bicycle use, walking, transit, carpool, and van/shuttle service programs. Approximately 224 members live within one-half mile of the new site. In addition, the project sponsor has submitted a pledge from approximately 167 members who will walk to the new facility under all weather conditions. The vast majority of members live within one quarter mile of the Project site.

The Program of Activities shown on Table 3-1, page 3-6 indicates the days and time of activities that have had with the most membership attendance, and projects they will occur predominantly in the evenings around 8pm. Given the above information and in review of the Traffic Study prepared, the Final TDM meets the intent and purpose of the County code. The project sponsor will replace the conceptual TDM with a Final TDM pursuant to condition of approval #7. Specifically, the project sponsor shall perform the following:

A. Walking: Continue the written commitment of a substantial number of its members to walk to the site, particularly for special or regularly scheduled general membership events and any other events with similar attendance, (including but not limited to Friday and Sunday night activities, annual celebrations and taverns), as necessary to achieve goal (b).

B. Transit. Install bus stop(s) as shown on approved plans.

C. Bicyling: Install and maintain racks for 12 bicycles. Construct shower facilities as proposed in application.

D. Carpools: Continue to organize and use car pools for special or regularly scheduled general membership events and any other events with similar attendance (including but not limited to Friday and Sunday night activities, annual celebrations and taverns), as necessary to achieve goal (b). Register carpools and reserve on-site parking spaces for them.

E. Remote Lot Shuttle Service. Provide over-flow, off-site parking for large events with a minimum of parking for 54 vehicles with shuttle service to site as necessary to achieve goal (b). The off-site parking shall be located at the Lafayette School District property now leased to The Meher Schools. If that site becomes unavailable, applicant shall notify CDD and provide another off-site location or locations, within two miles of the site, for the parking of no fewer than 54 vehicles.

F. Van. Initially, the shuttle service shall continue to be provided in passenger cars. Within 30 days of written notice from CDD, based on a need demonstrated by monitoring reports or other evidence, Applicant shall purchase a van for the shuttle service.

Given the above information and in review of the Traffic Study prepared, the TDM will meet the intent and purpose of the County Code.
J. **Stormwater:** This project is required to be in compliance with Provision C.3 of the National Pollutant Discharge Elimination System (NPDES) Permit and the County's Stormwater Management and Discharge Control Ordinance (§1014). A Stormwater Control Plan dated February 17, 2009 was reviewed and determined to be preliminarily complete. A final Stormwater Control Plan must be submitted prior to issuance of building permits.

The newly-issued Municipal Regional Permit (MRP) has changed requirements that apply to projects that have not passed certain thresholds in the development process by specified dates. The MRP requires projects to comply with new regulations unless they have had funding committed and are scheduled to begin construction no later than December 1, 2012. **If funding has not been committed by and construction is not scheduled to begin by December 1, 2012, then the project may be required to implement “Low Impact Development” requirements by managing stormwater runoff through harvesting and reuse, infiltration or evapotranspiration, unless these methods are determined to be infeasible, in which case bioretention-type treatment (as is generally required under the superseded permit) may be employed.** Criteria for infeasibility and design criteria for harvest/reuse, infiltration and evapotranspiration, will be determined by reports that will be generated by permitees and subject to approval by the SFBRWQCB.

K. **Annexation to a lighting district:** Some of the subject parcels that are a part of the proposed development are annexed into the County Service Area L-100 Lighting District. Other parcels that make up this development proposal are not. Therefore, the project sponsor shall annex all parcels to Community Facilities District CFD 2010-1 for Countywide Street Light Financing.

**IX. CONCLUSION**

The project is consistent with the General Plan and zoning designations for the project. All environmental impacts would be mitigated to less-than-significant levels, the health and safety of the general public would not be threatened. Staff recommends that the County Planning Commission approve the project by adopting the recommendation as listed above in Section II.

CEQA Findings

Mitigation Monitoring & Reporting Program
CEQA FINDINGS FOR COUNTY FILES # LP08-2034 AND # MS09-0008, SUFISM REORIENTED (Applicant and Owner).

A. Introduction.

The Contra Costa County Planning Commission adopts the following findings for certification of the EIR and approval of a modification of Variant B of the New Sanctuary For Sufism Reoriented project pursuant to the California Environmental Quality Act, California Public Resources Code, Sections 21000, et seq. the Guidelines for Implementation of CEQA, Title 14 of the California Code of Regulations, Sections 15000, et seq. ("CEQA Guidelines") and the County’s CEQA Guidelines.

Pursuant to Public Resources Code Section 21081 and CEQA Guidelines Section 15091, no public agency shall approve and carry out a project where an Environmental Impact Report (the “EIR”) has been certified, which identifies one or more significant impacts on the environment that would occur if the project is approved, unless the public agency makes one or more findings for each of those significant impacts, accompanied by a brief explanation of the rationale for each finding. The possible findings, which must be supported by substantial evidence in the record, are:

a. Changes or alterations have been required in, or incorporated into, the project that mitigation or avoid the significant impact on the environment.

b. Changes or alterations are within the responsibility and jurisdiction of another public agency and have been, or can and should be, adopted by that other agency.

c. Specific economic, legal, social, technological or other considerations make infeasible the mitigation measures or project alternatives identified in the EIR.

For those significant impacts that cannot be mitigated to below a level of significance, the public agency is required to find that specific overriding economic, legal, social, technological or other benefits of the project outweigh the significant impacts of the projects. The New Sanctuary for Sufism Reoriented Project did not present any significant impacts that cannot be mitigated below to a less-than-significant impact level.

B. Project and EIR.

The Project is a new religious facility (sanctuary) on approximately 3.12 acres in the Saranap neighborhood of unincorporated Walnut Creek. The Project includes a 66,074 square foot sanctuary building that includes a prayer hall, administrative offices, a library, classroom, archives, art and music program space, and related ancillary uses. Approximately 46,074 square feet of the building would be located below ground, including the administrative offices, bookstore, art studio, art storage, chorus rehearsal, video and audio post production, music mixing and scoring, reception area, multi-purpose room, film/video and photo library, a music, drama and dance studio, a coat room, women's and men's restrooms, and a kitchen. Approximately 13,800 square feet of the 44,074 square feet are open areas referenced as a rotunda, plaza, and east and west galleries (hallway), and a grand staircase.
The Project Site would be further developed with a plaza, parking area, and landscaping. Further details are provided in Chapter 3 of the EIR. The term “Project” as used in these findings refers to the Project as described in the EIR. That project has two variants: Variant A is the project as proposed by the applicant. Variant B adds frontage and additional sidewalk improvements recommended by the County Public Works Department. These findings pertain to approval of Variant B, slightly modified.

Sufism Reoriented’s current sanctuary is located at 1300 Boulevard Way. Upon construction of the new sanctuary, Sufism Reoriented would cease its use of 1300 Boulevard Way, selling or leasing that property to another unknown user.

The Department of Conservation and Development determined that an EIR was required for the project. Accordingly, the County, as lead agency for this Project, distributed a Notice of Preparation on March 9, 2010. The Draft EIR, State Clearinghouse Number 2010032038, was released for public review on March 29, 2011. The initial comment period was scheduled for 45 days ending on May 13, 2011. A public hearing before the Zoning Administrator to receive comments on the Draft EIR was held on April 18, 2011. During the public hearing several members of the public requested an extension of the time. On April 26, 2011, the Department distributed a revised notice extending the period to receive comments to May 27, 2011.

The Final EIR was published and distributed in September of 2011. The Zoning Administrator held a hearing on October 3, 2011 and recommended certification of the EIR. The Zoning Administrator recommended that a chart be prepared that indicates where revisions to text can be found in the Final EIR. On September 27, 2011, the applicant’s counsel submitted a letter addressing alternatives and identifying where in the “Final EIR Vol. I - Revised Draft EIR” revisions to the text of the Draft EIR could be found. The County’s consultant have peer-reviewed that chart, determined its accuracy, and County staff has made it available to the public online at http://www.cccounty.us/DocumentCenterii.aspx?FID=621.

The “EIR” as referenced in these findings includes the Draft EIR (and its appendices) as supplemented and revised by the Final EIR, and the Final EIR (and its appendices). The Final EIR contains a Volume 1 that restates and revises some text, figures and tables of the Draft EIR. When these findings refer to sections, tables, figures or text of the EIR, and unless the context clearly indicates otherwise, these findings refer to the revised versions in Volume I of the Final EIR.

The EIR identifies potentially significant environmental impacts that would occur if the project were implemented, and feasible mitigation measures would reduce all of the potentially significant impacts to less than significant levels. The EIR provides a comprehensive analysis of the Project’s impacts, and cumulative impacts to which the Project would contribute. The EIR includes responses to all written and oral comments received during the comment period, and provides adequate, good faith, and reasoned responses to all comments raising significant environmental issues. The EIR also addresses a reasonable range of alternatives. Evidence regarding the range of alternatives, and the evidence indicating that offsite and reduced development alternatives were not studied in detail because they would not achieve most of the project objectives is in the EIR and in the record. The Commission adopts the analysis and conclusions of the EIR and bases its decision upon the evidence referenced in the EIR and its
appendices. The Commission further concludes that in these unique circumstances the No Project/No Build alternative represents a reduced density and off-site alternative.

The Commission also finds that, while no projection of future circumstances can be certain, the program of activities in Table 3-1 represents a reasonable projection of future activities, and it is that reasonable projection that informed the analysis of impacts. This conclusion is based upon the information and analysis in the EIR and in the applicant’s letter of June 30, 2011. The conditions of approval and mitigation measures are tied to the proposed program of activities in that the conditions and mitigation measures ensure that there will likely be no greater or more severe significant impacts from actual activities than would occur from implementation of the program of activities in Table 3-1.

The comprehensive analysis in the EIR provides the Commission with the necessary information required by the California Environmental Quality Act (CEQA) to properly analyze and evaluate any and all of the potential environmental impacts of the Project.

Certification of EIR.

The Commission finds that the EIR has been completed in compliance with CEQA; that the Commission reviewed and considered the information contained in the EIR prior to approving the project; and the EIR reflects the County’s independent judgment and analysis.

No Recirculation Is Required.

CEQA Guidelines Section 15088.5 requires a lead agency to recirculate an EIR for further review and comment when significant new information is added to the EIR after public notice is given of the availability of the Draft EIR but before certification of the Final EIR. New information added to an EIR is not “significant” unless the EIR is changed in a way that deprives the public of a meaningful opportunity to comment upon a substantial adverse environmental effect of the project or a feasible way to mitigate or avoid such an effect that the project proponent declines to implement. The Guidelines provide examples of significant new information under this standard, which involve evidence of a new or more severe significant impact, all as more specifically set forth in section 1.3 of the EIR.

The Commission recognizes that the Final EIR incorporates information obtained since the Draft EIR was completed, and contains additions, clarifications, modifications, and other changes. These include information regarding trees that have grown since the original studies were undertaken in 2009, and additional information about drainage and hydrology contained in Appendix R and in the applicant’s June 30, 2011 submittal to the County. Various minor changes and edits have been made to the mitigation measures, text, tables and figures of the Draft EIR, as described in the Final EIR. Information that confirms the conclusions of the Draft EIR has been provided in response to comments, and mitigation measures have been edited for clarity, feasibility and to strengthen them. With respect to this information, the Commission adopts the conclusions and analysis of the EIR (especially section 1.3) based upon the evidence to which the EIR refers. This information confirms and provides additional support for the conclusions of the Draft EIR, and further confirms that impacts will remain less than significant.
The Commission also recognizes that the project that is approved varies slightly from Variant B of the Project studied in the EIR, as it incorporates mitigation measures, further refinements and details that have been developed since the Draft EIR was published, and reflects the factors regarding project refinement that are described in response to comment 21.3. The changes are environmentally beneficial or minor, and do not rise to the level of recirculation.

Based on the foregoing, and having reviewed the information contained in the EIR and in the documents comprising the administrative record the Commission finds that no significant new information has been added since public notice was given of the availability of the Draft EIR that would require recirculation of the EIR.

**Differences of Opinion Regarding Environmental Analysis.**

In making its determination to certify the Final EIR and to approve the Project, the Commission recognizes that the Project involves controversial environmental issues and that a range of technical and scientific opinion exists with respect to those issues. The Commission has acquired an understanding of the range of this technical and scientific opinion by its review of the Draft EIR, the comments received on the Draft EIR and the responses to those comments in the Final EIR, as well as other testimony, letters, and reports submitted for the record. The Commission recognizes that some of the comments submitted on the EIR, and at the hearing, disagree with the conclusions, analysis, methodology and factual bases stated in the EIR. The EIR was prepared by experts, and that some of these comments were from experts, thus creating an disagreement among experts. The Commission has reviewed and considered, as a whole, the evidence and analysis presented in the EIR and in the record, and has gained a comprehensive and well-rounded understanding of the environmental issues presented by the Project. In turn, this understanding has enabled the Commission to make its decisions after weighing and considering the various viewpoints on these important issues.

**Impact Conclusions and Mitigation Measures**

**Exhibit 1** (the summary of impacts, mitigation measures and resulting levels of significance that appears as Table 2-1 in the EIR) is attached to these findings and incorporated herein by reference. **Exhibit 1** summarizes the environmental determinations of the EIR about the Project’s impacts and describes mitigation measures. This exhibit does not attempt to describe the full analysis of each environmental impact contained in the EIR. Instead, **Exhibit 1** provides a summary description of each impact, describes the applicable mitigation measures identified in the EIR and adopted by the Commission, and states the Commission’s findings on the significance of each impact after imposition of the adopted mitigation measures. A full explanation of these environmental findings and conclusions can be found in the EIR. The Commission ratifies, adopts, and incorporates the analysis and explanation in the EIR, and ratifies, adopts, and incorporates in these findings the determinations and conclusions of the EIR relating to environmental impacts and mitigation measures. These findings are based upon the evidence contained in and referenced in the EIR, in staff reports, in the submittals from the applicant, and on the record as a whole.

**Exhibit 2** (the Mitigation, Monitoring and Reporting Program that appears as Chapter 4.0 in Volume II of the Final EIR) is attached to these findings, is hereby adopted by the Commission,
insofar as the mitigation measures pertain to Variant B, and is incorporated into these findings. The mitigation measures set forth in Exhibit 2 will feasibly reduce or avoid the potentially significant and significant impacts of the Project to less than significant levels, and will reduce some less-than-significant impacts as well. In adopting these mitigation measures, the Commission intends to adopt each of the mitigation measures identified by the EIR. Accordingly, in the event a mitigation measure recommended in the EIR and applicable to Variant B has inadvertently been omitted from Exhibit 2, such mitigation measure is hereby adopted and incorporated in these findings by reference. In addition, in the event the language describing a mitigation measure set forth in Exhibit 2 fails to accurately reflect the substance of the mitigation measures in the EIR due to a clerical error, the language of the mitigation measure as set forth in the EIR shall control, unless the language of the mitigation measure has been specifically and expressly modified by these findings. Some language has been modified to reflect County practices and procedures regarding department approval processes, and to reflect technical details of the project that do not substantively affect the mitigation of impacts.

The Commission finds that changes or alterations have been required in, or incorporated into, the Project which feasibly avoid or substantially lessen the significant environmental effects on the environment. As shown in Exhibit 2, primary responsibility for implementation, monitoring and enforcement of all mitigation measures except one lies with the County. The agency responsible for Mitigation Measure 4.14-1 is EBMUD. Other agencies may play a role in approving the project. For example, there may be consultation with the Regional Water Quality Control Board regarding stormwater plans and other water quality aspects of the Project, and resource agencies may become involved should any resource issues need their input as a result of pre-construction surveys. To these extent participation by other agencies involves discretionary approvals that implicate mitigation measures, and with respect to Mitigation Measure 4.14-1, the Commission finds that mitigation measures are within the responsibility and jurisdiction of another public agency and have been, or can and should be, adopted by that other agency.

In comments on the Draft EIR, various measures were suggested by commenters as proposed additional mitigation measures or modifications to the mitigation measures identified by the EIR. Some of the EIR’s mitigation measures were modified in response to such comments. Other comments requested minor modifications in mitigation measures identified in the Draft EIR, requested mitigation measures for impacts that were less than significant, or requested additional mitigation measures for impacts as to which the Draft EIR identified mitigation measures that would reduce the identified impact to a less-than-significant level; these requests are declined as unnecessary. With respect to the additional measures suggested by commenters that were not added to the EIR, the Commission adopts the reasons set forth in the responses to comments contained in the EIR as its grounds for rejecting adoption of these mitigation measures. The alternative and additional mitigation measures are not necessary to reduce impacts to a less than significant level, some would have imposed requirements on this Project that are not generally imposed on similar projects in the County, and some purported to address an impact that was not potentially significant.

C. The Administrative Record.

Various documents and other materials constitute the record upon which the Commission bases these findings and the approvals contained herein. These findings cite specific pieces of
evidence, but none of the Commission’s findings are based solely only those pieces of evidence. These findings are adopted based upon the entire record, and the Commission intends to rely upon all supporting evidence in the record for each of its findings.

The location and custodian of the documents and materials that comprise the record is Contra Costa County, Department of Conservation & Development, Attn: Lashun Cross, 651 Pine Street, 4th Floor – North Wing, Martinez, CA, 94553, telephone (925) 335-1210.

</tr>
<tr>
<td>Impact 4.1-1: Either Project Variant would result in the potential for substantial nighttime lighting which could adversely affect nighttime views.</td>
<td>S</td>
<td>Mitigation Measure 4.1-1: The applicant shall submit a lighting plan and a photometric study which shall demonstrate, to the satisfaction of the Department of Conservation and Development, that no bare bulbs will be visible from offsite. The plan shall also demonstrate that no lighting will be directed across property lines, and all lighting visible from offsite – including spillover onto adjacent properties – will be compatible with offsite private and public right-of-way lighting in the vicinity. The plans shall reflect the effect of lighting both before and after proposed site landscaping achieves maturity. <strong>If needed, the plans may include recommendations for turning off lights at specific times to reduce effects to nighttime views.</strong></td>

| Impact 4.2-1: Construction would result in emissions of fugitive dust. | S                        | Mitigation Measure 4.2-1: Prior to the approval of a grading plan, County DCD shall ensure that grading and demolition plans include the following measures for all phases of construction as recommended by BAAQMD to reduce the air quality impacts of particulate matter (PM$_{10}$ and PM$_{2.5}$) associated with grading and new construction:

- All exposed surfaces (e.g., parking areas, staging areas, soil piles, graded areas, and unpaved access roads) shall be watered a minimum of two times per day;
- All haul trucks transporting soil, sand, or other loose material off-site shall be covered; | LTS                                    |
Air Quality (continued)

**Impact 4.2-1,continued**

- All visible mud or dirt track-out onto adjacent public roads shall be removed using wet power vacuum street sweepers at least once per day. No dry power sweeping shall be performed (i.e., prohibited);
- All vehicle speeds on unpaved roads shall be limited to 15 mph;
- All roadways, driveways, and sidewalks to be paved shall be completed as soon as feasible possible. Building pads shall be laid as soon as feasible possible after grading unless seeding or soil binders are used;
- Idling times shall be minimized either by shutting equipment off when not in use or reducing the maximum idling time to two minutes. Clear signage shall be provided for construction workers at all access points;
- All construction equipment and haul trucks shall be maintained and properly tuned in accordance with manufacturer’s specifications. All construction equipment and haul trucks shall be checked by a certified mechanic and determined to be running in proper condition prior to operation; and
- A publicly visible sign shall be posted with the telephone number of the Construction Manager and BAAQMD to report dust complaints. This person shall respond and take corrective action within 48 hours. The BAAQMD complaint line telephone number shall also be visible to ensure compliance with applicable regulations.

**Impact 4.2-2: Emissions of diesel exhaust during construction would exceed BAAQMD thresholds for NOx.**

**Mitigation Measure 4.2-2: Emissions of NOx from construction activities shall be limited to less than 54 pounds per day. This performance standard would be achieved by limiting vehicle miles travelled (VMT) for standard hauling trucks to 4,764 VMT per day.**

<tr>
<td>Assuming 13 cubic-yard-trucks and delivery to the Acme landfill, and assuming a round trip of 31.2 miles, this would mean that soil hauling would be capped at 74 60 round trips per day, which would extend the excavation schedule from an earlier projection by the applicant of 35 working days to 45 55 working days. If other sites at a different distance were identified to accept the fill, the schedule could be revised accordingly to fit within the same VMT limitation. However, all hauling trucks must use a haul route that leaves the project site, heads east on Boulevard Way, and enters Highway 24 near Mt. Diablo and Boulevard Way.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

| Impact 4.2-3: The Project Variant ultimately selected could create objectionable odors affecting a substantial number of people during construction. | S | Mitigation Measure 4.2-3: Prior to the approval of a grading permit, County DCD shall verify that grading plans include a requirement that limits the allowable idling time of diesel-powered construction equipment to two minutes or less | LTS |

| Biological Resources | | | |
| **Impact 4.3-1: Potential future purchase of the adjacent Odell property would trigger a County Fire Protection District requirement to widen the existing secondary road providing access to the project site from Warren Road. This would result in the removal of and/or damage to several existing trees.** | S | Mitigation Measure 4.3-1: If the applicant purchases the Odell property, compliance with the CCCFPD condition to widen the secondary access drive to Warren Road shall be required. In compliance with Chapter 816-6.8002 of the Tree Protection and Preservation Ordinance, a permit shall be obtained for the removal of all protected trees. If the applicant purchases the Odell property after August 2012, a qualified arborist shall examine the property and the recommendations of the arborist reports dated June 22, 2009 and August 4, 2009, included as Appendix G to this EIR, to confirm and/or append to the conditions included in the earlier reports. | LTS |
Mitigation Measure 4.3-2a: Given the potential for occurrence of roosting bats on the project site, the Contra Costa County Department of Conservation and Development (DCD) shall require a qualified biologist to conduct pre-construction surveys for roosting bats prior to issuance of demolition permits.

If roosting bats are detected, DCD shall require that a qualified biologist, in consultation with the California Department of Fish and Game (CDFG), shall exclude/evict the bats prior to removal of the occupied structure or tree. Abandoned structures or trees that are proposed for removal shall be removed before ground-disturbing activities begin to avoid conflicts with potential nesting periods. Immediately prior to construction, DCD shall require another pre-construction survey to be conducted to detect presence and confirm absence of active nesting in the trees that will remain.

During the pre-construction survey, the qualified biologist may enact other measures to protect roosting bats on the project site. These measures must be followed throughout the pre-construction and construction period.

Mitigation Measure 4.3-2b: Given the potential for occurrence of special-status bird species on the project site and the possibility for overlap of demolition and tree removal with the nesting season, DCD shall require a qualified biologist to conduct pre-construction surveys for nesting birds prior to issuance of demolition permits and no more than one week prior to tree removal.

If an occupied bird's nest is detected, a buffer zone of 50 to 300 feet shall be implemented to protect adults and nestlings from construction disturbances. If occupied nests are detected, exclusion areas are required until young birds have fledged.
### Biological Resources (continued)

#### Impact 4.3-2, continued

During the pre-construction survey, the qualified biologist may enact other measures to protect raptors and birds on the project site. These measures must be followed throughout the pre-construction and construction period. Destruction of occupied nests would be in violation of the Migratory Bird Treaty Act (MBTA) and the CDFG Code.

#### Cultural Resources

| Impact 4.4-1: Demolition of existing structures and construction activities could inadvertently damage previously unidentified historical, archaeological, and paleontological resources on the project site. | S | Mitigation Measure 4.4-1: **When demolition and site clearing activities are complete, a qualified archaeologist, hired by the applicant, shall reinspect the project site to ascertain whether clearance activities exposed any previously undetected archaeological resources.** In the event that any buried cultural (historical, archeological, and/or paleontological) resources are encountered, the Contra Costa County Department of Conservation and Development (DCD) shall ensure that construction, excavation, and/or grading activities within 100 feet of the find are temporarily halted until a qualified archaeologist or paleontologist, hired by the applicant, can assess the significance of the find and provide proper management recommendations to be incorporated in to the Project Variant ultimately selected. Prehistoric cultural materials include, but is not limited to, shell midden deposits, hearth remains, stone and/or shell artifacts, and/or burials. Historic materials, including but not limited to, whole or fragmentary ceramic, glass or metal objects, wood, nails, brick, or other materials may occur. | LTS |
### Cultural Resources (continued)

**Impact 4.4-1 continued**

On the project site in deposits such as old privies or dumps. If the site is found to contain significant cultural or paleontological resources (as determined by the CEQA Guidelines) by a qualified archaeologist or paleontologist, funding shall be provided by the applicant to identify, record, report, evaluate, and recover the resources as necessary. Construction within the area of the find shall not recommence until impacts to the cultural or paleontological resource are mitigated. Additionally, as required by Public Resources Code Section 5097.993, the applicant must inform project personnel that collection of any Native American artifact is prohibited by law.

**Impact 4.4-2: Construction activities could inadvertently uncover human remains.**

| S                                      | Mitigation Measure 4.4-2: In accordance with Public Resource Code Section 5097.98, should human remains be found on the site at any time during pre-construction or construction activities, the Contra Costa County Department of Conservation and Development (DCD) shall ensure that no further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent human remains shall be disturbed until:

- The County Coroner in which the remains are discovered is contacted and determines that no investigation of the cause of death is required; and

- If the County Coroner determines the remains to be Native American then:

  1. The coroner shall contact the Native American Heritage Commission within 24 hours; | LTS |
Geology and Soils

| Impact 4.5-1: Either Project Variant could expose people and structures to potential adverse effects from strong seismic ground shaking. | S | Mitigation Measure 4.5-1: Prior to the issuance of a building permit, the County Building Official shall verify that plans incorporate the following CBC seismic site categorization and design coefficients, in conformance with the most recent version of the California Building Code as shown in the table below:: | LTS |

The County Building Official shall certify that a qualified geotechnical engineer has reviewed final plans and specifications for consistency with CBC and UBC design standards. The County Building Official shall verify that all pertinent recommendations of the geotechnical engineer are incorporated into final building plans.

### Impact 4.5-2: The project site is located on soil that could become unstable as a result of construction activities, and potentially result in instability on neighboring sites.

**Mitigation Measure 4.5-2a:** Prior to the issuance of a grading permit, where permitted by the owner or tenant in possession, the County Building Official shall direct the applicant or their contractor to complete the following actions:

- inspect existing structures/utilities to document any evidence of then existing damage, cracking, distortion, weaknesses in structural elements, deterioration, corrosion, excessive stress, overloading, or use of the structure in a manner which may not have been intended by its design prior to issuance of any...
construction permits. The inspection shall include an assessment of the condition of the following structures and facilities:

- the parsonage
- structures on neighboring properties adjacent to the project site
- Boulevard Way
- potentially affected utilities within the project site, as determined by a qualified engineer

All inspections and notations of pre-existing damages shall be thoroughly documented, to the extent permitted by the relevant owner or tenant in possession, prior to the issuance of a demolition or grading permit. Photographs and mapping, and reference markings or measurement points shall be established on critical or previously damaged structures/utilities to assist in determining whether any damage or movement has occurred as a result of construction.

Such inspections shall be completed before issuance of the grading permit and again, after construction of the building shell is substantially complete. To the extent required by Civil Code Section 832, the applicant shall be responsible to repair or compensate for damage caused by the project. The County Building Official shall, prior to issuance of an occupancy permit: (a) confirm that the applicant has undertaken a written obligation to repair or compensate for damage caused by the construction of the project as recommended by the architect of record, or has established procedures that assure such repairs will be made or such compensation will be paid; and (2)
**Geology and Soils (continued)**

**Impact 4.5-2 continued**

- confirm that any such repairs or payment of compensation is planned to be completed within a time frame the Official deems reasonable under the circumstances.

Where existing structures are in close proximity to the excavation, additional measures beyond pre-construction inspection, such as building underpinning, shall be required as determined by the geotechnical consultant.

Mitigation Measure 4.5-2b: Prior to the issuance of a grading permit, the County Geologist shall review the final plans to ensure that proposed excavation shoring and dewatering systems meet minimum performance requirements. These minimum performance requirements include:

a. Protect personnel that enter excavations;

b. Protect adjacent existing utilities, pavements, and structures;

c. Installation should not cause settlement or heave of the ground surface nor produce construction vibrations that could damage adjacent utilities or structures;

d. Prevent caving or lateral movement of excavation walls and associated loss of adjacent ground and adjacent ground surface settlement, even when subjected to construction vibration;

e. Prevent heave and or piping (boiling) of the excavation bottom; and

f. Where applicable, resist hydrostatic pressures and lateral loads for adjacent structural foundations, vehicular traffic, construction equipment, and spoils.

### Geology and Soils (continued)

**Impact 4.5-2 continued**

Mitigation Measure 4.5-2c: Prior to the issuance of a grading permit, the County Building Official shall ensure that grading plans show a requirement that a qualified geotechnical engineer monitor and document soil and groundwater conditions on an ongoing basis during excavation, grading, and construction. The geotechnical engineer shall anticipate changes and modifications to shoring systems and sloping (on the west side) in response to changes in soil and groundwater conditions. All sheeting and shoring shall be evaluated for stability by the geotechnical consultant prior to entry by personnel. The County Building Official and County Geologist shall review and consider the recommendations of the geotechnical engineer and incorporate any or all recommendations into final grading plans.

**Impact 4.5-3:** Either Project Variant would result in substantial soil erosion.

Reoriented Impact 4.5-4 continued

Greenhouse Gas Emissions

- There would be no significant impacts to greenhouse gas emissions.

Hazards and Hazardous Materials

| Impact 4.7-1: Demolition of existing structures on the site could result in the release of lead, asbestos, and other contaminants. | S | Mitigation Measure 4.7-1a: At least fifteen days prior to issuance of a demolition permit, a state certified contractor shall complete an asbestos and lead-based paint survey for all structures proposed for demolition that were constructed prior to 1980. The survey shall be submitted to the Department of Conservation and Development, Community Development Division for review and approval. If LBP or asbestos-containing materials are identified in the survey, they shall be removed from the site and properly disposed of in accordance with CAL/OSHA requirements:
  - Known or suspected asbestos-containing materials shall be abated by a certified asbestos abatement contractor in accordance with BAAQMD regulations and notification requirements.
  - Intact lead-based paint found to be secure (not flaking, peeling or cracked) may be discarded along with demolition debris during the demolition of the structure. | LTS |
Loose and peeling paint shall be disposed of as state and/or federal hazardous waste if the concentration of lead exceeds applicable waste thresholds.

- Hazardous wastes shall be appropriately managed, labeled, transported, and disposed of by trained workers in accordance with local requirements.

- The demolition and removal of materials potentially containing lead-based paint would be required to follow the CAL/OSHA Lead in Construction Standard, Title 8, California Code of Regulations (CCR).

- Other hazardous materials associated with buildings, such as fluorescent lights and electrical switches, shall be disposed of in accordance with DTSC hazardous waste regulations.

Mitigation Measure 4.7-1b: Prior to the issuance of grading or demolition permit, the County Building Official and Community Development Division shall review a Risk Management Plan prepared for the Project Variant ultimately selected by a qualified professional. The plan shall include, but is not limited to the following conditions:

- Should tanks, drums, free product, or other potential chemical hazards be encountered during excavation, the County, environmental consultant and the owner shall be consulted prior to proceeding. Excavated material shall be segregated and stockpiled in a designated area and covered in plastic. Stockpiles shall be maintained for profiling and disposal. A qualified environmental consultant shall take samples of each stockpile for analysis. Stockpiles and other hazardous wastes
### Hazards and Hazardous Materials (continued)

**Impact 4.7-1 continued**

- The contractor shall include specific information related to chemical hazards that could be present during the excavation. This information shall include, but shall not be limited to, the proper use of personal protective equipment (PPE), worker air monitoring, and action levels for use of PPE and stop work. Workers engaged in the excavation of petroleum-affected soil shall be trained per OSHA standards for hazardous waste operations and emergency response.

### Hydrology and Water Quality

**Impact 4.8-1:** Improvements, primarily the introduction of a parking area for 74 cars, could affect the quality of stormwater flowing from the project site.

<table>
<thead>
<tr>
<th>Level of Significance Without Mitigation</th>
<th>Mitigation Measure</th>
<th>Level of Significance with Mitigation</th>
</tr>

<tbody>
<tr>
<td>S</td>
<td></td>
<td>LTS</td>
</tr>
</tbody>
</table>

Mitigation Measure 4.8-1a: Prior to the approval of a building permit, the County Department of Conservation and Development shall ascertain that final landscaping plans for the Project Variant ultimately selected shall:

- Be designed to minimize irrigation and runoff and to minimize use of fertilizers and pesticides that can contribute to stormwater pollution.
- Specify plantings within planters and swales that are tolerant of the sandy loam soils and periodic inundation.
- Include pest-resistant plants.
Hydrology and Water Quality (continued)

Impact 4.8-1 continued

- Include plantings appropriate to site soils, slopes, climate, sun, wind, rain, land use, air movement, ecological consistency and plant interactions.

- Note that all on-site storm drain inlets shall be marked with the words “No Dumping! Drains to Creek” or similar language.

Mitigation Measure 4.8-1b: Prior to the approval of a building permit, the applicant shall submit a Final Storm Water Control Plan to the Public Works Department in general conformance with the Preliminary Drainage Report for review and approval. The Final Drainage Report and Storm Water Control Plan shall demonstrate use of GrassPave2 and pervious pavers or pervious concrete with comparable or better infiltration and storage capacity.

Mitigation Measure 4.8-1c: Prior to the approval of a building permit, the applicant shall submit a Maintenance Program to the Public Works Department. The Maintenance Program shall include procedures for maintaining the pervious surfaces employed within the project site in the Operation and Maintenance Plan of the SWCP. The Maintenance Program shall include the following measures:

- Landscaping grades shall follow a post-project Sediment Control Plan. Landscape areas shall be designed to drain away from pervious surfaces in the parking lot area wherever possible in order to curtail run-off from carrying silt onto the pervious pavements. The Sediment Control Plan would be included in the Storm Water Control Plan and grades directing water away from the parking lot area shall be shown on the Grading plan.
### Hydrology and Water Quality (continued)

| Impact 4.8-2: During construction, excavated materials could contribute sediment to Las Trampas Creek that could adversely affect water quality. | S | Mitigation Measure 4.8-2: Prior to the issuance of a grading permit, the Public Works Department and the County Building Official shall approve a Storm Water Pollution Prevention Plan (SWPPP) prepared by the applicant. The SWPPP shall comply with current San Francisco Bay Regional Water Quality Control Board guidelines and shall adopt acceptable best management practices (BMPs) for control of sediment | LTS |
Hydrology and Water Quality (continued)

Impact 4.8-2 continued

and stabilization of erosion in the project area. The SWPPP shall include acceptable BMPs for the protection of water quality. **PWD shall ensure that the project site is annexed into Community Facilities District 14.**

Land Use and Planning

There would be no significant impacts to land use and planning.

Noise

<table>
<thead>
<tr>
<th>Impact 4.10-1: Construction activities could generate a temporary increase in noise in the project vicinity.</th>
<th>$</th>
<th>Mitigation Measure 4.10-1: The DCD shall ensure that applicant adheres to the following mitigation measures in order to generate the least noise impacts <strong>feasible</strong> during construction:</th>
</tr>
</thead>
<tbody>
<tr>
<td>All construction activities shall be limited to the hours of 8:00 AM to 5:00 PM, Monday through Friday, and shall be prohibited on state and federal holidays, <strong>except as provided below:</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>The applicant shall hold a pre-construction meeting with the job inspectors and the general contractor/onsite manager to confirm that all noise mitigation measures and practices (including construction hours, neighborhood notification, posted signs, etc.) are completed prior to beginning construction;</td>
<td></td>
<td></td>
</tr>
<tr>
<td>The applicant shall notify neighbors within 300 feet of the construction area, at least 30 days in advance of extreme noise generating <strong>excavation and grading</strong> activities, about the estimated duration of the activity;</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
The applicant shall designate a construction noise coordinator who will be responsible for implementing the noise control measures and responding to complaints. This person's name and contact information shall be posted clearly around the project site and shall also be distributed to properties within 200 feet of the site boundaries. The construction noise coordinator shall be available during all times during construction activities and shall maintain a log of complaints. A copy of the log shall be provided to the DCD monthly on the 30th day of each month;

The applicant shall require construction contractors to limit noise generating construction activities as required by the DCD. No construction activities shall be allowed before 8 AM or after 5 PM, or on weekends without prior authorization of the Zoning Administrator, and no extreme noise generating excavation and grading shall be allowed after hours or on weekends and holidays;

The applicant shall require construction contractors to implement the following measures to reduce daytime noise due to construction activities:

- Equipment and trucks used for construction shall utilize the best available noise control techniques wherever feasible (e.g., improved mufflers, equipment redesign, use of intake silencers, ducts, engine enclosures and acoustically-attenuating shields or shrouds, wherever feasible).
Impact tools (e.g., jack hammers, pavement breakers, and rock drills) used for construction shall be hydraulically or electrically powered wherever feasible to avoid noise associated with compressed air exhaust from pneumatically powered tools. However, where use of pneumatic tools is not feasible, an exhaust muffler on the compressed air exhaust shall be used; this muffler can lower noise levels from the exhaust by up to about 10 dBA. External jackets on the tools themselves shall be used where feasible, and this could achieve a reduction of 5 dBA. Quieter procedures shall be used, such as drills rather than impact equipment, whenever feasible.

Stationary noise sources shall be located as far from adjacent receptors as feasible, and shall be muffled and enclosed within temporary sheds, insulation barriers, or other measures to the extent feasible.

Prior to the start of construction, the applicant shall construct a temporary sound barrier along those portions of the northern and southern property lines that do not, at the time of grading and construction, already have a wall that meets the following standards, to provide the maximum protection feasible for the residential uses to the north and south. The barriers can be constructed out of wood or other materials as long as they have a minimum surface weight of approximately 2.5 pounds per square foot. Possible materials include 1-1/8-inch-thick plywood or fully overlapping 1x redwood boards (1-1/2-inch thick total). The barriers would likely be 6 to 8 feet tall but this would be refined and approved by a qualified acoustician prior to the issuance of grading permits. Issues to consider when...
4.10-1 continued

**Impact 4.10-2: Construction and operational activities could temporarily expose persons or structures to excessive groundborne vibration.**

- Level of Significance Without Mitigation: S
- Mitigation Measure: Mitigation Measure 4.10-2: The DCD shall ensure that the applicant isolates the equipment in the mechanical well per the American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE) Guidelines. ASHRAE is considered the industry standard for mechanical system design standards.
- Level of Significance with Mitigation: LTS

**Population and Housing**

There would be no significant impacts to population and housing.

**Public Services**

There would be no significant impacts to public services.

**Traffic and Circulation**

Impact 4.13-1: The proposed reliance on a TDM program would increase the number of pedestrians and bicyclists along the Boulevard Way frontage of the project site, thereby necessitating a sidewalk along this frontage.

- Level of Significance Without Mitigation: S
- Mitigation Measure: Mitigation Measure 4.13-1: If Project Variant A is ultimately selected and approved, the County Department of Conservation and Development and County Public Works Department shall verify that final plans incorporate a sidewalk on the Boulevard Way frontage similar to that incorporated in Project Variant B. Plans shall show the sidewalk along all project frontage and extending to Warren Road. Sidewalk plans shall conform to prevailing County standards.
- Level of Significance with Mitigation: LTS
**Traffic and Circulation (continued)**

**Impact 4.13-1 continued**

In addition, if Project Variant A is approved, prior to the approval of any building or grading permit, the County Department of Conservation and Development and County Public Works Department shall verify that final plans for the public right-of-way area show a north-south crosswalk at a location mutually acceptable to the aforementioned County departments and the applicant. The crosswalk shall conform to any pertinent state or County regulations regarding crosswalk location and safety. As appropriate, final plans for the crosswalk shall incorporate features to help reduce conflicts between vehicles and pedestrians. Such features may include but are not limited to signage advising motorists of the crosswalk, lighting at the crosswalk, and the use of contrasting color and/or reflective paint to improve nighttime visibility of the crosswalk area.

**Impact 4.13-2: Project Variant A would not allow for adequate stopping sight distance, thus creating a potential safety concern.**

Mitigation Measure 4.13-2: If Project Variant A is ultimately selected and approved, the County Department of Conservation and Development and County Public Works Department shall verify that final plans reflect the inclusion of adequate sight distance to the west of the project driveway. This can be achieved by relocating the proposed perimeter wall from its current location to the same location as shown in the plan for Project Variant B (Figure 3-8) and keeping the area north of the wall free of potential visual obstructions (trees or other tall vegetation).
### Utilities and Service Systems

<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
| **Impact 4.2-1 continued** | - All roadways, driveways, and sidewalks to be paved shall be completed as soon as feasible. Building pads shall be laid as soon as feasible after grading unless seeding or soil binders are used;  
- All vehicle speeds on unpaved roads shall be limited 15 mph;  
- Idling times shall be minimized either by shutting equipment off when not in use or reducing the maximum idling time to two minutes. Clear signage shall be provided for construction workers at all access points;  
- All construction equipment and haul trucks shall be maintained and properly tuned in accordance with manufacturer's specifications. All construction equipment and haul trucks shall be checked by a certified mechanic and determined to be running in proper condition prior to operation; and  
- A publicly visible sign shall be posted with the telephone number of the Construction Manager and BAAQMD to report dust complaints. This person shall respond and take corrective action within 48 hours. The BAAQMD complaint line telephone number shall also be visible to ensure compliance with applicable regulations. | | |
| **Impact 4.2-2: Emissions of diesel exhaust during construction would exceed BAAQMD thresholds for NOx.** | Mitigation Measure 4.2-2: Emissions of NOx from construction activities shall be limited to less than 54 pounds per day. This performance standard would be achieved by limiting vehicle miles travelled (VMT) for standard hauling trucks to 1,872 VMT per day. Assuming 13 cubic-yard-trucks and delivery to the Acme landfill, and assuming a round trip of 31.2 miles, this would mean that soil hauling would be capped at 60 round trips per day, which would extend the excavation schedule from an earlier projection by the applicant of 35 working days to 55 working days. If other sites at a different distance were identified to accept the fill, the schedule could be revised | Department of Conservation and Development | Approval of VMT calculations prior to excavation; VMT limitation during project construction |

<td>according to fit within the same VMT limitation. However, all hauling trucks must use a haul route that leaves the project site, heads east on Boulevard Way, and enters Highway 24 near Mt. Diablo and Boulevard Way.</td>
<td>Department of Conservation and Development</td>
<td>Prior to the approval of a grading plan</td>
</tr>
</tbody>
</table>

| Impact 4.2-3: The Project Variant ultimately selected could create objectionable odors affecting a substantial number of people during construction. | Mitigation Measure 4.2-3: Prior to the approval of a grading permit, County DCD shall verify that grading plans include a requirement that limits the allowable idling time of diesel-powered construction equipment to two minutes or less | Department of Conservation and Development | |

#### Biological Resources

| Impact 4.3-1: Potential future purchase of the adjacent Odell property would trigger a County Fire Protection District requirement to widen the existing secondary road providing access to the project site from Warren Road. This would result in the removal of and/or damage to several existing trees. | Mitigation Measure 4.3-1: If the applicant purchases the Odell property, compliance with the CCCFPD condition to widen the secondary access drive to Warren Road shall be required. In compliance with Chapter 816-6.8002 of the Tree Protection and Preservation Ordinance, a permit shall be obtained for the removal of all protected trees. If the applicant purchases the Odell property after August 2012, a qualified arborist shall examine the property and the recommendations of the arborist reports dated June 22, 2009 and August 4, 2009, included as Appendix G to this EIR, to confirm and/or append to the conditions included in the earlier reports. | Department of Conservation and Development and project applicant | If the applicant purchase the Odell property |

| Impact 4.3-2: Demolition and tree removal activities could have an adverse effect on special-status species including roosting bats that are potentially nesting in trees and/or abandoned buildings found on the project site, as well as migratory birds and raptors that may nest in mature trees. | Mitigation Measure 4.3-2a: Given the potential for occurrence of roosting bats on the project site, the Contra Costa County Department of Conservation and Development (DCD) shall require a qualified biologist to conduct pre-construction surveys for roosting bats prior to issuance of demolition permits. If roosting bats are detected, DCD shall require that a qualified biologist, in consultation with the California Department of Fish and Game (CDFG), shall exclude/evict the bats prior to removal of the occupied structure or tree. Abandoned structures or trees that are | Department of Conservation and Development | Prior to the issuance of demolition permits and throughout pre-construction and construction |
### Biological Resources (continued)

</tr>
</thead>
<tbody>
<tr>
<td><strong>Impact 4.3-2 continued</strong></td>
<td>proposed for removal shall be removed before ground-disturbing activities begin to avoid conflicts with potential nesting periods. Immediately prior to construction, DCD shall require another pre-construction survey to be conducted to detect presence and confirm absence of active nesting in the trees that will remain. During the pre-construction survey, the qualified biologist may enact other measures to protect roosting bats on the project site. These measures must be followed throughout the pre-construction and construction period. Mitigation Measure 4.3-2b: Given the potential for occurrence of special-status bird species on the project site and the possibility for overlap of demolition and tree removal with the nesting season, DCD shall require a qualified biologist to conduct pre-construction surveys for nesting birds prior to issuance of demolition permits and no more than one week prior to tree removal. If an occupied bird’s nest is detected, a buffer zone of 50 to 300 feet shall be implemented to protect adults and nestlings from construction disturbances. If occupied nests are detected, exclusion areas are required until young birds have fledged. During the pre-construction survey, the qualified biologist may enact other measures to protect raptors and birds on the project site. These measures must be followed throughout the pre-construction and construction period. Destruction of occupied nests would be in violation of the Migratory Bird Treaty Act (MBTA) and the CDFG Code.</td>
<td>Department of Conservation and Development</td>
<td>Prior to the issuance of demolition permits</td>
</tr>
</tbody>
</table>

**Impact 4.3-3**: Construction activities could disturb potential nesting habitat in trees that are not proposed for removal. **Implement Mitigation Measures 4.3-2a and 4.3-2b.** **Department of Conservation and Development** **Prior to the issuance of demolition permits**
## Cultural Resources

### Impact 4.4-1: Demolition of existing structures and construction activities could inadvertently damage previously unidentified historical, archaeological, and paleontological resources on the project site.

**Mitigation Measure 4.4-1:** When demolition and site clearing activities are complete, a qualified archaeologist, hired by the applicant, shall reinspect the project site to ascertain whether clearance activities exposed any previously undetected archaeological resources. In the event that any cultural (historical, archeological, and/or paleontological) resources are encountered, the Contra Costa County Department of Conservation and Development (DCD) shall ensure that construction, excavation, and/or grading activities within 100 feet of the find are temporarily halted until a qualified archaeologist or paleontologist, hired by the applicant, can assess the significance of the find and provide proper management recommendations to be incorporated in the Project Variant ultimately selected. Prehistoric cultural materials include, but is not limited to, shell midden deposits, hearth remains, stone and/or shell artifacts, and/or burials. Historic materials, including but not limited to, whole or fragmentary ceramic, glass or metal objects, wood, nails, brick, or other materials may occur on the project site in deposits such as old privies or dumps. If the site is found to contain significant cultural or paleontological resources (as determined by the CEQA Guidelines) by a qualified archaeologist or paleontologist, funding shall be provided by the applicant to identify, record, report, evaluate, and recover the resources as necessary. Construction within the area of the find shall not recommence until impacts to the cultural or paleontological resource are mitigated. Additionally, as required by Public Resources Code Section 5097.993, the applicant must inform project personnel that collection of any Native American artifact is prohibited by law.

**Mitigation Measure:** Department of Conservation and Development

**Responsible Agency:** Department of Conservation and Development

**Timing:** When demolition and site clearing activities are complete, and during grading.

### Impact 4.4-2: Construction activities could inadvertently uncover human remains.

**Mitigation Measure 4.4-2:** In accordance with Public Resource Code Section 5097.98, should human remains be found on the site at any time during pre-construction or construction activities, the Contra Costa County Department of Conservation and Development (DCD) Department of Conservation and Development

**Responsible Agency:** In the event that human remains are found on the project site

**Timing:**

**Impact 4.4-2 continued**

shall ensure that no further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent human remains shall be disturbed until:

- The County Coroner in which the remains are discovered is contacted and determines that no investigation of the cause of death is required; and

- If the County Coroner determines the remains to be Native American then:
  1. The coroner shall contact the Native American Heritage Commission within 24 hours;
  2. The Native American Heritage Commission shall identify the person or persons it believes to be the most likely descended from the deceased native American; and
  3. The most likely descendent may make recommendations to the landowner or the person responsible for the excavation work for means of treating or disposing of, with appropriate dignity, the human remains and any associated grave goods as provided in Public Resources Code Section 5097.98.

The landowners or their authorized representative shall rebury the Native American human remains and associated grave goods with appropriate dignity on the property in a location not subject to further subsurface disturbance if the following conditions occur:

- The NAHC is unable to identify a most likely descendant or the most likely descendant failed to make a recommendation within 24 hours after being notified by the commission;

- The descendent identified fails to make a recommendation; or
4.0 Mitigation Monitoring and Reporting Program

Cultural Resources (continued)

Impact 4.4-2 continued

- The landowners or their authorized representative reject the recommendation of the descendent, and the mediation by the NAHC fails to provide measures acceptable to the landowner.

Geology and Soils

Impact 4.5-1: Either Project Variant could expose people and structures to potential adverse effects from strong seismic ground shaking.

Mitigation Measure 4.5-1: Prior to the issuance of a building permit, the County Building Official shall verify that plans incorporate the following CBC seismic site categorization and design coefficients, in conformance with the most recent version of the California Building Code shown in the table below:

## Environmental Impacts

<table>
<thead>
<tr>
<th>Impact 4.5-2: The project site is located on soil that could become unstable as a result of construction activities, and potentially result in instability on neighboring sites.</th>
</tr>
</thead>
</table>

## Mitigation Measures

Mitigation Measure 4.5-2a: Where permitted by the owner or tenant in possession, the County Building Official shall direct the applicant or their contractor to complete the following actions:

- inspect existing structures/utilities to document any evidence of then-existing damage, cracking, distortion, weaknesses in structural elements, deterioration, corrosion, excessive stress, overloading, or use of the structure in a manner which may not have been intended by its design prior to issuance of any construction permits. The inspection shall include an assessment of the condition of the following structures and facilities:
  - structures on properties adjacent to the project site
  - Boulevard Way
  - potentially affected utilities within the project site, as determined by a qualified engineer

All inspections and notations of pre-existing damages shall be thoroughly documented, to the extent permitted by the relevant owner or tenant in possession, prior to the issuance of a demolition or grading permit by photographs and mapping, and reference markings or measurement points shall be established on critical or previously damaged structures/utilities to assist in determining whether any damage or movement has occurred as a result of construction.

Such inspections shall be completed before issuance of the grading permit and again, after construction of the building shell is substantially complete. To the extent required by Civil Code Section 832, the applicant shall be responsible to repair or compensate for damage caused by the project. The County Building Official shall, prior to issuance of an occupancy permit: (a) confirm that the applicant has undertaken a written obligation to repair or compensate for damage caused by the construction of the project as recommended by the architect of record, or has established procedures that assure such repairs will be made or such compensation will be paid;

| **Geology and Soils (continued)** | and (2) confirm that any such repairs or payment of compensation is planned to be completed within a time frame the Official deems reasonable under the circumstances. Where existing structures are in close proximity to the excavation, additional measures beyond pre-construction inspection, such as building underpinning, shall be required as determined by the geotechnical consultant. Mitigation Measure 4.5-2b: Prior to the issuance of a grading permit, the County Geologist shall review the final plans to ensure that proposed excavation shoring and dewatering systems meet minimum performance requirements. These minimum performance requirements include:  
a. Protect personnel that enter excavations;  
b. Protect adjacent existing utilities, pavements, and structures;  
c. Installation should not cause settlement or heave of the ground surface nor produce construction vibrations that could damage adjacent utilities or structures;  
d. Prevent caving or lateral movement of excavation walls and associated loss of adjacent ground and adjacent ground surface settlement, even when subjected to construction vibration;  
e. Prevent heave and or piping (boiling) of the excavation bottom; and  
f. Where applicable, resist hydrostatic pressures and lateral loads for adjacent structural foundations, vehicular traffic, construction equipment and spoils. Mitigation Measure 4.5-2c: Prior to the issuance of a grading permit, the County Building Official shall ensure that grading plans show a requirement that a qualified geotechnical engineer monitor and | County Geologist | Prior to the issuance of a grading permit |

New Sanctuary for Sufism Reoriented
Final EIR – Volume II
### Environmental Impacts

**Mitigation Measures**

**Geology and Soils (continued)**

**Impact 4.5-2 continued.**

Document soil and groundwater conditions on an ongoing basis during excavation, grading, and construction. The geotechnical engineer shall anticipate changes and modifications to shoring systems and sloping (on the west side) in response to changes in soil and groundwater conditions. All sheeting and shoring shall be evaluated for stability by the geotechnical consultant prior to entry by personnel. The County Building Official and County Geologist shall review and consider the recommendations of the geotechnical engineer and incorporate any or all recommendations into final grading plans.

**Impact 4.5-3: Either Project Variant would result in substantial soil erosion.**

Incorporate Mitigation Measure 4.8-2.

**Impact 4.5-4: Either Project Variant would be located on expansive soils that could create a risk to life and property.**

Mitigation Measure 4.5-4a: Prior to the issuance of a grading permit, the County Building Official shall ensure that plans for building foundations have been reviewed by a qualified geotechnical engineer to ensure measures are included to reduce potential future structural damage to the religious facility from expansive soils. Such measures shall include but are not limited to minimum requirements for the expansion potential of fill material, soil compaction, and soil moisture content. The County Building Official and County Geologist review and approval shall ensure that all pertinent recommendations of the geotechnical engineer are incorporated into final grading plans.

Mitigation Measure 4.5-4b: Prior to the issuance of a building permit, the County Building Official shall ensure that plans are revised as necessary to show that foundations for the new facility consist of a reinforced concrete floor slab or a mat slab, consistent with recommendations of the County Geologist.

**Responsible Agency**

- The project applicant and the County Building Official

**Timing**

- Prior to the issuance of a grading permit

- Prior to the issuance of grading permits
Mitigation Measure 4.7-1a: At least fifteen days prior to issuance of a demolition permit, a state certified contractor shall complete an asbestos and lead-based paint survey for all structures proposed for demolition that were constructed prior to 1980. The survey shall be submitted to the Department of Conservation and Development, Community Development Division for review and approval.

If LBP or asbestos-containing materials are identified in the survey, they shall be removed from the site and properly disposed of in accordance with CAL/OSHA requirements:

- Known or suspected asbestos-containing materials shall be abated by a certified asbestos abatement contractor in accordance with BAAQMD regulations and notification requirements.
- Intact lead-based paint found to be secure (not flaking, peeling or cracked) may be discarded along with demolition debris during the demolition of the structure.
- Loose and peeling paint shall be disposed of as state and/or federal hazardous waste if the concentration of lead exceeds applicable waste thresholds.
- Hazardous wastes shall be appropriately managed, labeled, transported, and disposed of by trained workers in accordance with local requirements.
- The demolition and removal of materials potentially containing lead-based paint would be required to follow the CAL/OSHA Lead in Construction Standard, Title 8, California Code of Regulations (CCR).

Other hazardous materials associated with buildings, such as fluorescent lights and electrical switches, shall be disposed of in accordance with DTSC hazardous waste regulations.

<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Impact 4.8-2: During construction, excavated materials could contribute sediment to Las Trampas Creek that could adversely affect water quality.</td>
<td>Mitigation Measure 4.8-2: Prior to the issuance of a grading permit, the Public Works Department and the County Building Official shall approve a Storm Water Pollution Prevention Plan (SWPPP) prepared by the applicant. The SWPPP shall comply with current San Francisco Bay Regional Water Quality Control Board guidelines and shall adopt acceptable best management practices (BMPs) for control of sediment and stabilization of erosion in the project area. The SWPPP shall include acceptable BMPs for the protection of water quality. PWD shall ensure that the project site is annexed into Community Facilities District 14.</td>

Noise

Impact 4.10-1: Construction activities could generate a temporary increase in noise in the project vicinity. | Mitigation Measure 4.10-1: The DCD shall ensure that applicant adheres to the following mitigation measures in order to generate the least noise impacts feasible during construction: | County Department of Conservation and Development | During project construction |
| | | | |
| | * All construction activities shall be limited to the hours of 8:00 AM to 5:00 PM, Monday through Friday, and shall be prohibited on state and federal holidays except as provided below; | |
| | * The applicant shall hold a pre-construction meeting with the job inspectors and the general contractor/onsite manager to confirm that all noise mitigation measures and practices (including construction hours, neighborhood notification, posted signs, etc.) are completed prior to beginning construction; | |
| | * The applicant shall notify neighbors within 300 feet of the construction area, at least 30 days in advance of excavation and grading activities, about the estimated duration of the activity; | |

**Impact 4.10-1 continued**

- The applicant shall designate a construction noise coordinator who will be responsible for implementing the noise control measures and responding to complaints. This person’s name and contact information shall be posted clearly around the project site and shall also be distributed to properties within 200 feet of the site boundaries. The construction noise coordinator shall be available during all times during construction activities and shall maintain a log of complaints. A copy of the log shall be provided to the DCD monthly on the 30th day of each month;

- The applicant shall require construction contractors to limit noise generating construction activities as required by the DCD. No construction activities shall be allowed before 8 AM or after 5 PM, or on weekends without prior authorization of the Zoning Administrator, and no excavation and grading activities shall be allowed after hours or on weekends and holidays;

- The applicant shall require construction contractors to implement the following measures to reduce daytime noise due to construction activities:
  - Equipment and trucks used for construction shall utilize the best available noise control techniques wherever feasible (e.g., improved mufflers, equipment redesign, use of intake silencers, ducts, engine enclosures and acoustically-attenuating shields or shrouds).
  - Impact tools (e.g., jack hammers, pavement breakers, and rock drills) used for construction shall be hydraulically or

**Noise (continued)**

- **Impact 4.10-1 continued**

  - Electrically powered wherever feasible to avoid noise associated with compressed air exhaust from pneumatically powered tools. However, where use of pneumatic tools is not feasible, an exhaust muffler on the compressed air exhaust shall be used; this muffler can lower noise levels from the exhaust by up to about 10 dBA. External jackets on the tools themselves shall be used where feasible, and this could achieve a reduction of 5 dBA. Quieter procedures shall be used, such as drills rather than impact equipment, whenever feasible.

  - Stationary noise sources shall be located as far from adjacent receptors as feasible, and shall be muffled and enclosed within temporary sheds, insulation barriers, or other measures to the extent feasible.

  - Prior to the start of construction, the applicant shall construct a temporary sound barrier along those portions of the northern and southern property lines that do not, at the time of grading and construction, already have a wall that meets the following standards, to provide the maximum protection feasible for the residential uses to the north and south. The barriers can be constructed out of wood or other materials as long as they have a minimum surface weight of approximately 2.5 pounds per square foot. Possible materials include 1-1/8-inch-thick plywood or fully overlapping 1x redwood boards (1-1/2-inch-thick total). The barriers would likely be 6 to 8 feet tall (but this would be refined and approved by a qualified acoustician prior to the issuance of grading permits). Issues to consider when determining the ultimate height, length, and location of the barriers are the actual construction practices, including equipment to be used and the location and duration.

### Traffic and Circulation

| Impact 4.13-1: The proposed reliance on a TDM program would increase the number of pedestrians and bicyclists along the Boulevard Way frontage of the project site, thereby necessitating a sidewalk along this frontage. | Mitigation Measure 4.13-1: If Project Variant A is ultimately selected and approved, the County Department of Conservation and Development and County Public Works Department shall verify that final plans incorporate a sidewalk on the Boulevard Way frontage similar to that incorporated in Project Variant B. Plans shall show the sidewalk along all project frontage and extending to Warren Road. Sidewalk plans shall conform to prevailing County standards. In addition, if Project Variant A is approved, prior to the approval of any building or grading permit, the County Department of Conservation and Development and County Public Works Department shall verify that final plans for the public right-of-way area show a north-south crosswalk at a location mutually acceptable to the aforementioned County departments and the applicant. The crosswalk shall conform to any pertinent state or County regulations regarding crosswalk location and safety. As appropriate, final plans for the crosswalk shall incorporate features to help reduce conflicts between vehicles and pedestrians. Such features may include but are not limited to signage advising motorists of the crosswalk, lighting at the crosswalk, and the use of contrasting color and/or reflective paint to improve nighttime visibility of the crosswalk area. | County Department of Conservation and Development and County Public Works Department | If Project Variant A is ultimately selected and approved and prior to the approval of any building or grading permit |

---

4-19
### Traffic and Circulation (continued)

| Impact 4.13-2: Project Variant A would not allow for adequate stopping sight distance, thus creating a potential safety concern. | Mitigation Measure 4.13-2: If Project Variant A is ultimately selected and approved, the County Department of Conservation and Development and County Public Works Department shall verify that final plans reflect the inclusion of adequate sight distance to the west of the project driveway. This can be achieved by relocating the proposed perimeter wall from its current location to the same location as shown in the plan for Project Variant B (Figure 3-8) and keeping the area north of the wall free of potential visual obstructions (trees or other tall vegetation). | County Department of Conservation and Development and County Public Works Department | If Project Variant A is ultimately selected and approved and prior to the approval of any building or grading permit |

### Utilities and Service Systems

| Impact 4.14-1: The proposed sanctuary building would generate an increase in demand for water supply over existing uses on the project site. | Mitigation Measure 4.14-1: In the event of multiple drought years, the applicant shall comply with EMBUD's then-applicable Drought Management Program. In the event of critical shortages (shortages of 25 percent or more), the applicant shall comply with reduction goals based on customer categories set by EBMUD. | EBMUD and the project applicant | In the event of multiple drought years |

Exhibit B

Growth Management Standards
Land Use and Tree Permit Findings
Conditions of Approval
FINDINGS AND CONDITIONS OF APPROVAL FOR COUNTY FILES LP08-2034 and MS09-0008, SUFISM REORIENTED (Applicant and Owner).

A. General Plan Growth Management Element Performance Standards

1. **Traffic:** The County's Growth Management Plan (as part of voter approved Measure C) establishes that no traffic study is required when a project would add fewer than 100 vehicle trips during the peak hour of adjacent street traffic. However, should a project be expected to generate more than 100 peak hour trips a full transportation impact analysis would be required. The project sponsor submitted a Transportation Management Plan (TDM) for the reduction of parking spaces indicating the trip contribution would not exceed the CCTA threshold. As a result a traffic analysis was prepared for an understanding of traffic impacts in the neighborhood and effectiveness of the TDM program. The finding of the traffic study was that all intersections along Boulevard Way would continue to operate at acceptable conditions of (Level of Service) LOS B or better with small increases in daily volume during the AM and PM peak commute hours with project volumes but would continue to function within the capacity of the roadways.

2. **Water:** The project site is located within the service area of the East Bay Municipal Utilities District. Potential significant impacts mainly would result due to the “New Sanctuary” to generate an increase in demand for water supply over existing uses. The potential impacts would be mitigated to less-than-significant levels through implementation of the mitigation measure 4.14-1 described in the Draft EIR. All infrastructure and service to be reviewed and approved by the District.

3. **Sanitary Sewer:** The project site is served by the Contra Costa County Central Sanitary District. The project applicant intends to install and/or upgrade the existing infrastructure for the new facility. The project sponsor will be required to obtain the necessary permits from the District prior to issuance of any building permits from the County Building Inspection Division.

4. **Fire Protection:** The project site is within the service area of the Contra Costa County Consolidated Fire Protection District. The District has commented on the project in reference to the widening of a secondary access drive from Warren Road, hydrant locations, turnarounds, and paving systems for the facility. The project sponsor shall comply with all Fire District requirements for the proposed development.

5. **Public Protection:** The performance standard is 155 square feet of Sheriff’s station area and support facilities for every 1,000 members of the population. Implementation of the project would not create new housing opportunities or permanent new jobs, so no population growth is expected. Therefore, the facility would not result in an impact to the demand on public protection from the proposed use.

6. **Parks and Recreation:** Implementation of the project would not create new housing opportunities, so no population growth is expected, therefore no impact to existing parks
and recreation facilities. The completed landscaped grounds proposed for the sanctuary is an additional source for a park setting within the neighborhood.

7. Flood Control and Drainage: The site is located within Flood Zone X, which is not within the 100-year flood plain. The proposed project has been reviewed by the Public Works Department and shall be required to comply with their requirements for C.3 and drainage. Compliance with standard conditions of approval and the hydrology and water quality mitigation measures described in the Draft EIR would ensure the onsite and offsite drainage is adequate.

B. Land Use Permit Findings:

1. The proposed project as conditioned will not be detrimental to the health, safety and general welfare of the County.

Project Finding: The conditions of approval and mitigation measures will adequately mitigate and minimize all known health, safety, and general welfare impacts. These include implementation of the control measures to minimize construction related air pollutant emissions; pre-construction survey protection measures for animal species; protection of archaeological and paleontological resources. All potentially significant impacts will be mitigated for air quality, aesthetics, biological, cultural, geologic and soils, hazards and hazardous material hydrology and water quality, noise, traffic and circulation, and utilities and service systems. Based on above, the Sufism Reoriented “New Sanctuary” will not be detrimental to the health, safety, and general welfare of the County.

2. The proposed project as conditioned will not adversely affect the orderly development of the property within the County.

Project Finding: The proposed project will not adversely affect the orderly development in the area. The project site is located in the (SH) Single family residential High Density General Plan designation and the (R-10) Single Family Residential, 10,000 square foot minimum parcel sizes as designated by the County Zoning Code. The project is a secondary land use that is permitted within the SH designation upon the issuance of a land use permit. The proposed project is within the boundaries of existing developed parcels and will consolidate the existing parcels for construction. Implementation of the project would not adversely affect the orderly development of the property within the County.

3. The proposed project as conditioned will not adversely affect the preservation of the property values and protection of the tax base within the County.

Project Finding: Property values and the protection of the tax base within the County will not be adversely impacted by allowing the proposed project to be constructed on the existing parcels. The facility is a use that is compatible with the surrounding residential development with the granting of a land use permit. The project will help preserve the property value of the project site as a church facility without having a detrimental impact.
on other uses on site and within the community. The project will not change the current zoning or general plan land use designation of the site. Typically Religious facilities do not adversely affect the preservation of property values and tax base related to surrounding properties. There is no evidence that implementation of the project would adversely affect the preservation of property values and tax base related to surrounding properties.

4. The proposed project as conditioned will not adversely affect the policy and goals as set by the General Plan.

Project Finding: The project site is designated (SH) Single family residential high density under the County's General Plan Land Use designations. The purpose of the (SH) designation is to allow for residential development as a primary use and secondary uses such as home occupations, small residential care and childcare facilities, churches and other similar places of worship. The General Plan states that the designation is compatible with the R-10 zoning district. The R-10 zoning district allows religious facilities with a use permit. Hence, Sufism Reoriented sanctuary is a compatible use in the single family residential zoning designation.

5. The proposed project as conditioned will not create a nuisance and/or enforcement problem within the neighborhood or community.

Project Finding: The project’s conditions of approval and mitigation measures require reporting on the Transportation Demand program, a off-site parking agreement along with monitoring of the project by the Department of Conservation and Development and several conditions of approval will be in place to further ensure the proposed project would not create a nuisance and/or enforcement problem within the neighborhood. In addition, the project must comply with the building and zoning codes, which are designed to avoid the creation of nuisances. Based on the above, and because the proposal is a compatible use for the area and the General Plan, there is no substantial evidence that implementation of the project would create a nuisance or enforcement problem.

6. The proposed project as conditioned will not encourage marginal development within the neighborhood.

Project Finding: Sufism Reoriented operated at 1300 Boulevard Way for the past 20 years. This project has not encouraged marginal development. The proposed use permit for the facility would be privately owned and maintained. Therefore, there is no substantial evidence that the project will result in marginal development in the neighborhood.

7. That special conditions or unique characteristics of the subject property and its location or surroundings are established.

Project Finding: The applicant had indicated other parcels in the area are not available for the project or are not contiguous. Several hundred members of Sufism Reoriented
reside within one mile of the locations. In addition, the Murshida parsonage currently exists on this property. Hence, the proposed location is ideally suited for this facility. All parcels associated with this project are held by the project sponsor. The combination of above scenarios is already established and is also a unique characteristic of the area.

C. Minor Subdivision Findings

The advisory agency shall not approve a tentative map unless it shall find that the proposed subdivision, together with the provisions for its design and improvement, is consistent with the applicable general and specific plans required by law. When approving the tentative map for a minor subdivision, the advisory agency shall make findings as required concerning the fulfillment of construction requirements.

This Project if approved merges the existing adjacent parcels into one parcel, rather than subdividing an existing parcel into additional parcels. The merger is consistent with the General Plan, as the General Plan does not prohibit the resulting parcel size. Construction requirements are detailed in the attached conditions of approval. The application meets the requirements for a merger. The parcels are under common ownership, and the resulting parcel size conforms to General Plan and Zoning requirements.

D. Criteria for Review of the Tree Permit

1. Required Factors for Granting Permit. The County Planning Commission is satisfied that the following factors as provided by County Code Section 816-6.8010 for granting a tree permit have been satisfied as marked:

   a. ___ The arborist report indicates that the subject tree is in poor health and cannot be saved.

   b. ___ The tree is a public nuisance and is causing damage to public utilities or streets and sidewalks that cannot be mitigated by some other means.

   c. ___ The tree is in danger of falling and cannot be saved by some other means.

   d. ___ The tree is damaging existing private improvements on the lot such as a building foundation, walls, patios, decks, roofs, retaining walls, etc.

   e. ___ The tree is a species known to be highly combustible and is determined to be a fire hazard.

   f. ___ The proposed tree species or the form of the tree does not merit saving.
Findings & Conditions of Approval – LP08-2034 and MS09-0008

g. **X** Reasonable development of the property would require the alteration or removal of the trees and this development could not be reasonably accommodated on another area of the lot.

h. ___ The tree is a species known to develop weaknesses that affect the health of the tree or the safety of people and property. These species characteristics include but are not limited to short-lived, weak wooded and subject to limb breakage, shallow rooted and subject to toppling.

i. **X** Where the arborist or forester report has been required, and the Director of the Department of Conservation and Development is satisfied that the issuance of a permit will not negatively affect the sustainability of the resource.

j. ___ None of the above factors apply.

2. **Required Factors for Denying a Tree Permit.** The County Planning Commission is satisfied that the following factors as provided by County Code Section 816-6.8010 for denying (or modifying) a tree permit application have been satisfied as marked:

a. ___ The applicant seeks permission for the alteration or removal of a healthy tree that can be avoided by reasonable redesign of the site plan prior to project approval (for non-discretionary permits).

b. ___ It is reasonably likely that alteration or removal of a healthy tree will cause problems with drainage, erosion control, land suitability, windscreen, visual screening, and/or privacy and said problems cannot be mitigated as part of the proposed removal of the tree.

c. ___ The tree to be removed is a member of a group of trees in which each tree is dependent upon the others for survival.

d. ___ The value of the tree to the neighborhood in terms of visual effect, windscreen, visual screening, privacy and neighboring vegetation is greater than the hardship to the owner.

e. ___ If the permit involves trenching or grading and there are other reasonable alternatives including an alternate route, use of retaining walls, use of pier and grade beam foundations and/or relocating site improvements.

f. ___ Any other reasonable and relevant factors specified by the Director of the Department of Conservation and Development.

g. **X** None of the above factors apply.
CONDITIONS OF APPROVAL FOR COUNTY FILES #LP08-2034 AND #MS09-0008: SUFISM REORIENTED (APPLICANT AND OWNERS).

General/Administrative

1. This approval is to allow development of the Sufism Reoriented “New Sanctuary” project based on the following revised exhibits and documents:

   A. Land Use Permit application received on July 3, 2008 and revised supporting material received on July 31, 2008 and Minor Subdivision application received June 15, 2009 by the Community Development Division.

   B. Draft Environmental Impact Report and Appendices dated March 2011, as supplemented and revised by the Final Environmental Impact Report and Appendices (reports) dated September 2011.

   C. Mitigation Monitoring Reporting Program dated September 2011.

   D. Updated Transportation Demand Management Plan submitted in March 2009.

   E. Revised site plans, elevations, floor plans, sections, and topographic map submitted on July 1, 2009.

Indemnity/Hold Harmless Agreement

2. Upon approval of this Land Use Permit, the Applicant agrees to defend, indemnify, and hold harmless Contra Costa County and its agents, officers, and employees from any claim, action or proceeding against the County or its agents, officers, and employees to attack, set aside, void or annul this approval. The project sponsor also agrees to defend, indemnify, and hold harmless Contra Costa County and its agents, officers, and employees from any and all liability caused by negligent or wrongful acts of the project sponsor, its agents, or employees arising out of the issuance or exercise of this Land Use Permit or the interpretation of any of its provisions, and to pay all claims, damages, judgments, legal costs, adjuster fees, and attorney fees incurred by the County or its agents, officers, and employees related thereto. The project sponsor shall be entitled to select its own legal counsel in the defense of all such actions. The project sponsor shall submit a letter on company letterhead verifying acknowledgment and acceptance of this condition of approval.

Fees

Payment of Outstanding Application Processing Fees

3. This application is subject to an initial application deposit of $2,700 for the land use permit and $4,800 for the minor subdivision, which was paid with the application submittal, plus time, and material costs if the application review expenses exceed
100% of the initial deposit. **Any additional costs due must be paid within 60 days of the permit effective date or prior to use of the permit, whichever occurs first.**
The project sponsor may obtain current costs by contacting the project planner. If you owe additional fees, a bill will be sent to you shortly after permit issuance.

**Payment of CEQA Notice of Determination Filing Fee**

4. ___ ___ **Within two (2) business days of project approval,** the Project Sponsor shall pay the California Department of Fish & Game (CDFG) CEQA filing fee of $2,839.25. Payment of this fee is mandated by Assembly Bill 3158, which became effective on January 1, 1991. Pursuant to Fish & Game Code Section 711.4(c)(3), the project will not be operative, vested, or final, and any local permits issued for the project will be invalid until the fee is paid. If the fee is not paid by the date specified, then the 30-day statutory time limit to file a legal challenge against the approval will automatically extend to 180 days.

**Payment of Mitigation Monitoring Fees**

5. ___ ___ If the County elects to hire a third-party consultant to assist in monitoring the environmental mitigation measures set forth in the Final EIR and this permit, then the project sponsor shall be responsible for payment of all fees associated with the consultant’s contract.

**Permit Compliance**

**Application for Condition of Approval Compliance Verification**

6. ___ ___ **Prior to commencing construction-related activities, issuance of grading permits or issuance of building permits, whichever occurs first,** the project sponsor shall submit an application for Condition of Approval Compliance Verification. The initial deposit for a project of this size is $5,000, which is subject to staff time and materials costs. Should staff costs exceed the deposit, additional payment will be required. Submittals for this application shall include a checklist describing how each condition of approval has been or will be satisfied and applicable proof that each condition has been satisfied (i.e. appropriate documentation, plans, photographs, etc.). This application will remain active throughout the life of the project and additional submittals will be required to ensure compliance with each phase of the project (demolition, grading, building, reclamation, etc.).

**Transportation Demand Management Program (TDM)**

7. ___ ___ The TDM program shall be monitored periodically, a Final TDM Plan, and a TDM Program Monitoring Report (TDM PMR) shall be submitted to DCD for review by the County Zoning Administrator, or designee. Reporting requirements for the TDM PMR are established as follows:
TDM PMR Reporting: (Transportation Demand Management-Program Monitoring Report)

The first report shall be submitted to DCD no later than 3 months after the date of the issuance of Building Inspection final;

After the initial report submittal, subsequent reports are to be submitted to DCD every 6 months;

The frequency of TDM reporting to the Department of Conservation and Development (DCD) may be reduced administratively by the County Zoning Administrator, or designee, if over time it is demonstrated that the TDM program is performing successfully on a consistent basis. Requests for reporting modifications shall not be made sooner than 1 year after final build-out.

The contents of the TDM PMR shall include, but not be limited to:

Parking demand/on-site lot occupancy counts for no less than 3 Fridays, or any peak demand period during a non-special event (which ever has greater attendance), within the 6 month monitoring period;

Parking demand/on-site lot occupancy counts for the March special event and at least one rehearsal occurring February through March;

Walking and carpool pledge list (Updated TDM Plan – DCE, Attachment 1, Walking Program Participants) to be updated to reflect most accurate level of membership participation in these alternative transportation modes. The updated list shall be signed and dated by property owner/project applicant;

In the event the Zoning Administrator determines that the TDM program is not consistently successful in reducing parking demand, or the program is not enforced or reported, the County may consider revocation of the land use permit.

Off-site Parking Agreement

8. _____ The Project Sponsor shall maintain a written parking agreement with The Meher Schools for use of the parking lots for overflow parking for evening and weekend events held at the subject site. If the site becomes unavailable, the project sponsor shall notify Department of Conservation and Development and provide another off-site location within two miles of the site, for the parking of no fewer than 54 vehicles.

9. _____ The Project sponsor will provide for off-site pedestrian safety improvements along the pedestrian routes to the project site. These are necessary because the TDM Program in COA #7 cannot be safely accomplished unless the pedestrian routes to the project site are made safe. The pedestrian safety improvements will be made at
locations near the project site, as determined by the Contra Costa County Public Works Department in roadway improvements.

**Additional Requirements**

10. ____ No loudspeakers or amplified music shall be permitted outside the enclosed building.

11. ____ All on-site storage of excavated soil shall be covered and watered at least once per day or if necessary twice per day.

**Signage**

12. ____ No signs shall be permitted with the exception of a sign not exceeding 12 square feet in area for purposes of identification and announcement of church services. The design, color and location of the sign and any size modification shall be subject to Zoning Administrator review and approval. No interior illumination shall be allowed. Signage shall be a monument style.

**Submittal of Grading Plans**

13. ____ Prior to issuance of grading permits, the Project sponsor shall submit grading plans for review and approval by the County Zoning Administrator. The grading plans shall be compliant with the requirements of the County Code and shall incorporate all applicable mitigation measures identified in the Final EIR. The grading plans shall be accompanied with a $750 deposit.

14. ____ Haul routes shall be generally limited to those areas of the site which are proposed to be graded to avoid unnecessary disruption.

15. ____ The transporting of all debris material from the construction site shall be covered when in transition from project site to Landfill.

16. ____ This use permit is approved for a religious facility comprising of members and invited guests. The events at the facility may include night classes, annual celebrations, devotional gatherings, taverns, chorus rehearsals and other ancillary activities.

**Events**

17. ____ The facility shall not be leased or rented for special events. The dome lights shall be turned off at 11pm.

18. ____ The granting of this use permit does not allow Temporary Events, as defined in the Temporary Events Ordinance (County Code Chapter 82-44), except such events as are allowed subsequently by issuance of a temporary event permit pursuant to that Ordinance.
Parking

19. Prior to issuance of building permits, the Project Sponsor shall record a statement to run with the deeds to the property acknowledging the approved Final TDM program and on-site parking reduction to 74 parking spaces in lieu of 125 spaces is mandatory. Handicapped spaces shall be appropriately identified. The deed disclosure shall be subject to review and approval of the Zoning Administrator.

Site Inspections for Compliance

20. The Project sponsor shall allow staff of the Contra Costa County Department of Conservation & Development, California Department of Fish & Game, and any other responsible agency to conduct site inspections during construction and operation of the project in order to ensure compliance with approved permits, plans, and conditions of approval. Inspections shall be conducted at the discretion of said agencies. Discovery of noncompliance may be cause for commencement of proceedings to revoke this Land Use Permit, and for payment of applicable bonds.

Grading Bond

21. Prior to the issuance of a grading or building permit, a grading bond shall be required for the work necessary to carry out the recommendations of the soils engineer, reviewed and approved by the Building Inspection Division and Zoning Administrator. Sufficient subsurface information shall be provided to estimate the cost of the required soil improvements.

**Performance Bond Amount:** The amount of bond shall be based upon the number of cubic yards of material in excavation or fill, whichever is greater, plus the cost of all drainage and other protective devices or work necessary to eliminate geological hazards. That portion of the bond valuation based on the volume of material in excavation or fill shall be computed as set forth:

- Ten thousand cubic yards (7646 cubic meters) or less, one hundred (100) percent of the estimated cost of grading work; Over ten thousand cubic yards, one (100) hundred percent of the cost of the first ten thousand cubic yards, plus fifty percent of that portion in excess of ten thousand cubic yards.

- When the rough grading has been completed in conformance with the requirements of this code, the County Building Official may at his discretion consent to a proportionate reduction of the bond to an amount estimated to be adequate to ensure completion of the grading work, site development, or planting remaining to be performed. The cost referred in this section shall be estimated by the County Building Official.

**Performance bond- Conditions:** Every bond shall include the conditions that the principal shall comply with all the provisions of Article 716-4.12 of the County Code, applicable laws and regulations and all terms and conditions of this permit. No extension of time under the permit shall release the surety upon the bond.
Performance bond- Term: The term of each bond shall begin on the date of its posting and shall end on the satisfactory completion of the terms and conditions of the permit as evidenced by a certificate of completion, a copy of which will be sent to any surety on request.

Performance bond- Notice of default: Whenever the County Building Official finds that a default has occurred in the performance of any term or condition of any permit, he or she shall give written notice thereof to the principal and surety on the bond, stating the work to be done to achieve a safe and satisfactory condition, its estimated cost, and the period of time deemed reasonable and necessary to complete the work. If a cash bond has been posted and the notice of default has been given to the principal and if the principal does not comply within the specified time limit, the building official may use the deposited cash to have the required work done, by contract or other means to the discretion of the County Building Official.

If the County Building Official finds that a default has occurred in the performance of any term or condition of the permit, the surety, County Building Official, or any person employed on behalf of either shall have the right to go on the site to complete the required work or make it safe.

Restitution for Approved Tree Removal

22. Required Restitution for Approved Tree Removal - The following measures are intended to provide restitution for the trees that have been approved for removal.

A. Tree Restitution Planting/Irrigation Plan - Prior to issuance of a grading permit, building permit, or occupancy, the applicant shall submit a tree planting and irrigation plan prepared by a licensed arborist or landscape architect for the review and approval of the Zoning Administrator. The plan shall provide for the planting of at least 165 trees, minimum 24-gallons in size either on the owners property or within the area of the right of way easements with approval of the respective County agency. (Also, note below requirement that plans include a provision for other tree plantings for purposes of contingency restitution in the event that trees to be replanted are nonetheless damaged.) The plan shall be accompanied by an estimate prepared by a licensed landscape architect or arborist of the materials and labor costs to complete the improvements on the plan.

B. Required Security to Assure the Completion of Plan Improvements - Prior to issuance of a grading permit, building permit, or occupancy, the applicant shall submit a security (e.g., bond, cash deposit) that is acceptable to the Zoning Administrator. The bond shall include the amount of the approved cost estimate, plus a 20% inflation surcharge. Until evidence is submitted that the applicant has satisfactorily installed the required improvements, the County may hold the security for up to three years following the exercise of this permit.
C. **Initial Fee Deposit for Processing a Security** - The County ordinance requires that the applicant pay fees for all time and material costs of staff for processing a landscape improvement security (Code S-060B). At time of submittal of the security, the applicant shall pay an initial deposit of $100.

D. The landscaping and irrigation plan shall include select plants that will have foliage year-round that are endemic to the vicinity of the subject property. The plan shall comply with the state’s Model Water Efficient Landscape Ordinance, if the County’s Ordinance has been adopted, and verification of compliance shall accompany the plans.

**Merging of Parcels**

23. Prior to the issuance of a grading or building permit, the Project Sponsor shall provide documentation to the Public Works Department and Zoning Administrator, for the review and approval of the Zoning Administrator, the separate parcels have been merged and recorded.

**Monitoring of Groundwater**

24. A. Prior to requesting a building permit for the Sanctuary, the Project Sponsor shall submit a comprehensive plan for monitoring of groundwater levels. That plan shall be subject to review by the Peer Review Geologist and review/approval of the Zoning Administrator. The purpose of the monitoring plan is to ensure that fluctuations in the elevation of the water table are consistent with the criteria provided by the geotechnical engineers. If the water level begins to rise after the construction period, monitoring will allow early recognition of the changing water levels. That in turn would provide an opportunity to identify the source of the water (e.g. leaking utility pipes) and take corrective action.

B. The plan shall include (a) a map showing the location of monitoring stations, (b) provide details on the equipment and approaches to be used to measure water levels, (c) provide standards for the frequency of water level readings, (d) provide thresholds for notifying the geotechnical engineers of the situation, and (e) identify the responsible parties/staffing positions for compliance with the monitoring requirement.

C. The monitoring data shall be submitted to the Zoning Administrator and Public Works Department annually by July 1st. Monitoring shall go on for a period of at least 5 years beyond the certificate of occupancy. It may be extended if there is evidence of water levels that rise above elevation +222½ ft. (i.e. bathtub foundation)

D. After the construction period, it is anticipated that no groundwater will be pumped. If ultimately there is a need for pumping ground-water, no
groundwater may outfall into storm drainage facilities without first obtaining the approval of the Public Works Department. Prior to making a request to the Department for approval the Project Sponsor would need to provide data on the duration and maximum rate of pumping, along with water quality data and any other technical data that may be required by the Public Works Department.

**Mitigation Measures for Impacts to Aesthetic Resources**

25. _____ **Mitigation Measure 4.1-1.** The Project Sponsor shall submit a lighting plan and a photometric study which shall demonstrate, to the satisfaction of the Zoning Administrator, that no bare bulbs will be visible from offsite. The plan shall also demonstrate that no lighting will be directed across property lines, and all lighting visible from offsite – including spillover onto adjacent properties – will be compatible with offsite private and public right-of-way lighting in the vicinity. The plans shall reflect the effect of lighting both before and after proposed site landscaping achieves maturity. If needed, the plans may include recommendations for turning off lights at specific times to reduce effects to nighttime views.

**Mitigation Measures for Impacts to Air Quality**

26. _____ **Mitigation Measure 4.2-1.** Prior to the approval of a grading plan, County DCD shall ensure that grading and demolition plans include the following measures for all phases of construction as recommended by BAAQMD to reduce the air quality impacts of particulate matter (PM10 and PM2.5) associated with grading and new construction:

- All exposed surfaces (e.g., parking areas, staging areas, soil piles, graded areas, and unpaved access roads) shall be watered a minimum of two times per day;
- All haul trucks transporting soil, sand, or other loose material offsite shall be covered;
- All visible mud or dirt track-out onto adjacent public roads shall be removed using wet power vacuum street sweepers at least once per day. No dry power sweeping shall be performed (i.e., prohibited);
- All vehicle speeds on unpaved roads shall be limited to 15 mph;
- All roadways, driveways, and sidewalks to be paved shall be completed as soon as feasible. Building pads shall be laid as soon as feasible after grading unless seeding or soil binders are used;
- Idling times shall be minimized either by shutting equipment off when not in use or reducing the maximum idling time to two minutes. Clear signage shall be provided for construction workers at all access points;

- 13 -
- All construction equipment and haul trucks shall be maintained and properly tuned in accordance with manufacturer’s specifications. All construction equipment and haul trucks shall be checked by a certified mechanic and determined to be running in proper condition prior to operation; and

- A publicly visible sign shall be posted with the telephone number of the Construction Manager and BAAQMD to report dust complaints. This person shall respond and take corrective action within 48 hours. The BAAQMD complaint line telephone number shall also be visible to ensure compliance with applicable regulations.

27. **Mitigation Measure 4.2-2.** Emissions of NOx from construction activities shall be limited to less than 54 pounds per day. This performance standard would be achieved by limiting vehicle miles traveled (VMT) for standard hauling trucks to 1,872 VMT per day. Assuming 13 cubic-yard-trucks and delivery to the Acme landfill, and assuming a round trip of 31.2 miles, this would mean that soil hauling would be capped at 60 round trips per day, which would extend the excavation schedule from an earlier projection by the project sponsor of 35 working days to 55 working days. If other sites at a different distance were identified to accept the fill, the schedule could be revised accordingly to fit within the same VMT limitation. However, all hauling trucks must use a haul route that leaves the project site, heads east on Boulevard Way, and enters Highway 24 near Mt. Diablo and Boulevard Way.

28. **Mitigation Measure 4.2-3** Prior to the approval of a grading permit, County DCD shall verify that grading plans include a requirement that limits the allowable idling time of diesel-powered construction equipment to two minutes or less.

**Mitigation Measures for Impacts to Biological Resources**

29. **Mitigation Measure 4.3-1:** If the project sponsor purchases the Odell property, compliance with the CCCFPD condition to widen the secondary access drive to Warren Road shall be required. In compliance with Chapter 816-6.8002 of the Tree Protection and Preservation Ordinance, a permit shall be obtained for the removal of all protected trees. If the project sponsor purchases the Odell property after August 2012, a qualified arborist shall examine the property and the recommendations of the arborist reports dated June 22, 2009 and August 4, 2009, included as Appendix G to this EIR, to confirm and/or append to the conditions included in the earlier reports.

**Mitigation for Impacts to Roosting Bats**

30. **Mitigation Measure 4.3-2a:** Given the potential for occurrence of roosting bats on the project site, the Contra Costa County Department of Conservation and Development (DCD) shall require a qualified biologist to conduct pre-construction surveys for roosting bats prior to issuance of demolition permits.
If roosting bats are detected, DCD shall require that a qualified biologist, in consultation with the California Department of Fish and Game (CDFG), shall exclude/evict the bats prior to removal of the occupied structure or tree. Abandoned structures or trees that are proposed for removal shall be removed before ground-disturbing activities begin to avoid conflicts with potential nesting periods. Immediately prior to construction, DCD shall require another pre-construction survey to be conducted to detect presence and confirm absence of active nesting in the trees that will remain.

During the pre-construction survey, the qualified biologist may enact other measures to protect roosting bats on the project site. These measures must be followed throughout the pre-construction and construction period.

31. ____ Mitigation Measure 4.3-2b. Given the potential for occurrence of special-status bird species on the project site and the possibility for overlap of demolition and tree removal with the nesting season, DCD shall require a qualified biologist to conduct pre-construction surveys for nesting birds prior to issuance of demolition permits and no more than one week prior to tree removal. If an occupied bird’s nest is detected, a buffer zone of 50 to 300 feet shall be implemented to protect adults and nestlings from construction disturbances. If occupied nests are detected, exclusion areas are required until young birds have fledged.

During the pre-construction survey, the qualified biologist may enact other measures to protect raptors and birds on the project site. These measures must be followed throughout the pre-construction and construction period. Destruction of occupied nests would be in violation of the Migratory Bird Treaty Act (MBTA) and the CDFG Code.

**Mitigation Measures for Impacts to Cultural Resources**

32. ____ Mitigation Measure 4.4-1a. When demolition and site clearing activities are complete, a qualified archaeologist, hired by the project sponsor, shall reinspect the project site to ascertain whether clearance activities exposed any previously undetected archaeological resources. In the event that any buried cultural (historical, archeological, and/or paleontological) resources are encountered, the Contra Costa County Department of Conservation and Development (DCD) shall ensure that construction, excavation, and/or grading activities within 100 feet of the find are temporarily halted until a qualified archaeologist or paleontologist, hired by the project sponsor, can assess the significance of the find and provide proper management recommendations to be incorporated into the Project Variant ultimately selected. Prehistoric cultural materials include, but is not limited to, shell middens deposits, hearth remains, stone and/or shell artifacts, and/or burials. Historic materials, including but not limited to, whole or fragmentary ceramic, glass or metal objects, wood, nails, brick, or other materials may occur on the project site in deposits such as old privies or dumps. If the site is found to contain significant cultural or paleontological resources (as determined by the CEQA Guidelines) by a
qualified archaeologist or paleontologist, funding shall be provided by the project sponsor to identify, record, report, evaluate, and recover the resources as necessary. Construction within the area of the find shall not recommence until impacts to the cultural or paleontological resource are mitigated. Additionally, as required by Public Resources Code Section 5097.993, the project sponsor must inform project personnel that collection of any Native American artifact is prohibited by law.

33. Mitigation Measure 4.4-2. In accordance with Public Resources Code Section 5097.98, should human remains be found on the site at any time during pre-construction or construction activities, the Contra Costa County Department of Conservation and Development (DCD) shall ensure that no further excavation or disturbance of the site or any nearby area reasonably suspected to overlie adjacent human remains shall be disturbed until:

- The County Coroner in which the remains are discovered is contacted and determines that no investigation of the cause of death is required; and

- If the County Coroner determines the remains to be Native American then:
  1. The coroner shall contact the Native American Heritage Commission within 24 hours;
  2. The Native American Heritage Commission shall identify the person or persons it believes to be the most likely descended from the deceased native American; and
  3. The most likely descendent may make recommendations to the landowner or the person responsible for the excavation work for means of treating or disposing of, with appropriate dignity, the human remains and any associated grave goods as provided in Public Resources Code Section 5097.98.

The landowners or their authorized representative shall rebury the Native American human remains and associated grave goods with appropriate dignity on the property in a location not subject to further subsurface disturbance if the following conditions occur:

- The NAHC is unable to identify a most likely descendent or the most likely descendent failed to make a recommendation within 24 hours after being notified by the commission;

- The descendent identified fails to make a recommendation; or

- The landowners or their authorized representative reject the recommendation of the descendent, and the mediation by the NAHC fails to provide measures acceptable to the landowner.
Mitigation Measures for Impacts Related to Geology and Soils

34. Mitigation Measure 4.5-1. Prior to the issuance of a building permit, the County Building Official shall verify that plans incorporate the following CBC seismic site categorization and design coefficients, in conformance with the most recent version of the California Building Code as shown in the table below:

<table>
<thead>
<tr>
<th>Categorization/Coefficient</th>

1From ASCE/SEI 7-05 (2006)

The County Building Official shall certify that a qualified geotechnical engineer has reviewed final plans and specifications for consistency with CBC and UBC design standards. The County Building Official shall verify that all pertinent recommendations of the geotechnical engineer are incorporated into final building plans.

35. Mitigation Measure 4.5-2a. Where permitted by the owner or tenant in possession, the County Building Official shall direct the project sponsor or their contractor to complete the following actions:

- inspect existing structures/utilities to document any evidence of then existing damage, cracking, distortion, weaknesses in structural elements, deterioration, corrosion, excessive stress, overloading, or use of the structure in a manner which may not have been intended by its design prior to issuance of any construction permits. The inspection shall include an assessment of the condition of the following structures and facilities:
  - structures on properties adjacent to the project site
  - Boulevard Way
  - potentially affected utilities within the project site, as determined by a qualified engineer

All inspections and notations of pre-existing damages shall be thoroughly documented, to the extent permitted by the relevant owner or tenant in possession, prior to the issuance of a demolition or grading permit by photographs and mapping, and reference markings or measurement points shall be established on critical or previously damaged structures/utilities to assist in determining whether any damage or movement has occurred as a result of construction.
Such inspections shall be completed before issuance of the grading permit and again, after construction of the building shell is substantially complete. To the extent required by Civil Code Section 832, the applicant shall be responsible to repair or compensate for damage caused by the project. The County Building Official shall, prior to issuance of an occupancy permit: (a) confirm that the project sponsor has undertaken a written obligation to repair or compensate for damage caused by the construction of the project as recommended by the architect of record, or has established procedures that assure such repairs will be made or such compensation will be paid; and (2) confirm that any such repairs or payment of compensation is planned to be completed within a time frame the Official deems reasonable under the circumstances.

Where existing structures are in close proximity to the excavation, additional measures beyond pre-construction inspection, such as building underpinning, shall be required as determined by the geotechnical consultant.

36. **Mitigation Measure 4.5-2b.** Prior to the issuance of a grading permit, the County Geologist shall review the final plans to ensure that proposed excavation shoring and dewatering systems meet minimum performance requirements. These minimum performance requirements include:

- Protect personnel that enter excavations;
- Protect adjacent existing utilities, pavements, and structures;
- Installation should not cause settlement or heave of the ground surface nor produce construction vibrations that could damage adjacent utilities or structures;
- Prevent caving or lateral movement of excavation walls and associated loss of adjacent ground and adjacent ground surface settlement, even when subjected to construction vibration;
- Prevent heave and or piping (boiling) of the excavation bottom; and
- Where applicable, resist hydrostatic pressures and lateral loads for adjacent structural foundations, vehicular traffic, construction equipment and spoils.

37. **Mitigation Measure 4.5-2c.** Prior to the issuance of a grading permit, the County Building Official shall ensure that grading plans show a requirement that a qualified geotechnical engineer monitor and document soil and groundwater conditions on an ongoing basis during excavation, grading, and construction. The geotechnical engineer shall anticipate changes and modifications to shoring systems and sloping (on the west side) in response to changes in soil and groundwater conditions. All sheeting and shoring shall be evaluated for stability by the geotechnical consultant prior to entry by personnel. The County Building Official and County Geologist shall review and consider the recommendations of the geotechnical engineer and incorporate any or all recommendations into final grading plans.

38. **Mitigation Measure 4.5-4a.** Prior to the issuance of a grading permit, the County Building Official shall ensure that plans for building foundations have been reviewed by a qualified geotechnical engineer to ensure measures are included to
reduce potential future structural damage to the religious facility from expansive soils. Such measures shall include but are not limited to minimum requirements for the expansion potential of fill material, soil compaction, and soil moisture content. The County Building Official and County Geologist review and approval shall ensure that all pertinent recommendations of the geotechnical engineer are incorporated into final grading plans.

39. Mitigation Measure 4.5-4b. Prior to the issuance of a building permit, the County Building Official shall ensure that plans are revised as necessary to show that foundations for the new facility consist of a reinforced concrete floor slab or a mat slab, consistent with recommendations of the County Geologist.

Mitigation Measures for Impacts Related to Hazards and Hazardous Materials

40. Mitigation Measure 4.7-1a. At least fifteen days prior to issuance of a demolition permit, a state certified contractor shall complete an asbestos and lead-based paint survey for all structures proposed for demolition that were constructed prior to 1980. The survey shall be submitted to the Department of Conservation and Development, Community Development Division for review and approval. If LBP or asbestos-containing materials are identified in the survey, they shall be removed from the site and properly disposed of in accordance with CAL/OSHA requirements:

- Known or suspected asbestos-containing materials shall be abated by a certified asbestos abatement contractor in accordance with BAAQMD regulations and notification requirements.
- Intact lead-based paint found to be secure (not flaking, peeling or cracked) may be discarded along with demolition debris during the demolition of the structure.
- Loose and peeling paint shall be disposed of as state and/or federal hazardous waste if the concentration of lead exceeds applicable waste thresholds.
- Hazardous wastes shall be appropriately managed, labeled, transported, and disposed of by trained workers in accordance with local requirements.
- The demolition and removal of materials potentially containing lead-based paint would be required to follow the CAL/OSHA Lead in Construction Standard, Title 8, California Code of Regulations (CCR).
- Other hazardous materials associated with buildings, such as fluorescent lights and electrical switches, shall be disposed of in accordance with DTSC hazardous waste regulations.

41. Mitigation Measure 4.7.1b. Prior to the issuance of grading or demolition permit, the County Building Official and Community Development Division shall review a Risk Management Plan prepared for the Project Variant ultimately selected by a qualified professional. The plan shall include, but is not limited to the following conditions:

- Should tanks, drums, free product, or other potential chemical hazards be encountered during excavation, the County, environmental consultant and the owner shall be consulted prior to proceeding. Excavated material shall be segregated and stockpiled in a designated area and covered in plastic. Stockpiles
shall be maintained for profiling and disposal. A qualified environmental consultant shall take samples of each stockpile for analysis. Stockpiles and other hazardous wastes shall be appropriately managed, labeled, transported, and disposed of by trained workers in accordance with all applicable laws and regulations.

- The contractor shall include specific information related to chemical hazards that could be present during the excavation. This information shall include, but shall not be limited to, the proper use of personal protective equipment (PPE), worker air monitoring, and action levels for use of PPE and stop work. Workers engaged in the excavation of petroleum-affected soil shall be trained per OSHA standards for hazardous waste operations and emergency response.

Mitigation Measures for Impacts Related to Hydrology and Water Quality

42. ____ Mitigation Measure 4.8-1a. Prior to the approval of a building permit, the County Department of Conservation and Development shall ascertain that final landscaping plans for the Project Variant ultimately selected shall:
- Be designed to minimize irrigation and runoff and to minimize use of fertilizers and pesticides that can contribute to stormwater pollution.
- Specify plantings within planters and swales that are tolerant of the sandy loam soils and periodic inundation.
- Include pest-resistant plants.
- Include plantings appropriate to site soils, slopes, climate, sun, wind, rain, land use, air movement, ecological consistency and plant interactions.
- Note that all on-site storm drain inlets shall be marked with the words “No Dumping! Drains to Creek” or similar language.

43. ____ Mitigation Measure 4.8-1b. Prior to the approval of a building permit, the project sponsor shall submit a Final Storm Water Control Plan to the Public Works Department in general conformance with the Preliminary Drainage Report for review and approval. The Final Drainage Report and Storm Water Control Plan shall demonstrate use of GrassPave2 and pervious pavers or pervious concrete with comparable or better infiltration and storage capacity.

44. ____ Mitigation Measure 4.8-1c. Prior to the approval of a building permit, the project sponsor shall submit a Maintenance Program to the Public Works Department. The Maintenance Program shall include procedures for maintaining the pervious surfaces employed within the project site in the Operation and Maintenance Plan of the SWCP. The Maintenance Program shall include the following measures:
- Landscaping grades shall follow a post-project Sediment Control Plan. Landscape areas shall be designed to drain away from pervious surfaces in the parking lot area wherever possible in order to curtail run-off from carrying silt onto the pervious pavements. The Sediment Control Plan would be included in the Storm Water Control Plan and grades directing water away from the parking lot area shall be shown on the Grading plan.
- The project sponsor shall engage an outside contractor experienced in maintenance of pervious pavers. The contractor will follow the procedures listed in the Operation and Maintenance Plan of the Storm Water Control Plan.
- Permeable paver surfaces will be kept clean of organic materials. Leaves and other organic material shall be swept and removed from the paver surfaces periodically when debris accumulates and weekly during the rainy season (October 15 to April 15), or as otherwise directed by the Public Works Department for any other wet times of the year.
- Periodic vacuuming should be used to clear out voids with conventional street sweepers or like equipment with vacuums and brushes, a minimum of two (2) times a year, but the actual required frequency shall be determined by conditions of the site. With an interlocking paver system, additional aggregate fill material will be added after cleaning, if needed to return aggregate fill material to its initial installation levels.
- The landowner shall be obligated to comply with the Operation and Maintenance Plan and Agreement. The landowner’s maintenance obligations shall be reflected in such recorded documents as the County lawfully and routinely requires.

45. **Mitigation Measure 4.8-2.** Prior to the issuance of a grading permit, the County Building Official shall approve a Storm Water Pollution Prevention Plan a (SWPPP) prepared by the applicant. The SWPPP shall comply with current San Francisco Bay Regional Water Quality Control Board guidelines and shall adopt acceptable best management practices (BMPs) for control of sediment and stabilization of erosion in the project area. The SWPPP shall include acceptable BMPs for the protection of water quality.

**Mitigation Measure for Impacts Related to Noise**

46. **Mitigation Measure 4.10-1.** The DCD shall ensure that project sponsor adheres to the following mitigation measures in order to generate the least noise impacts feasible during construction:
- All construction activities shall be limited to the hours of 8:00 AM to 5:00 PM, Monday through Friday, and shall be prohibited on state and federal holidays, except as provided below;
- The project sponsor shall hold a pre-construction meeting with the job inspectors and the general contractor/onsite manager to confirm that all noise mitigation measures and practices (including construction hours, neighborhood notification, posted signs, etc.) are completed prior to beginning construction;
- The project sponsor shall notify neighbors within 300 feet of the construction area, at least 30 days in advance of excavation and grading activities, about the estimated duration of the activity;
- The project sponsor shall designate a construction noise coordinator who will be responsible for implementing the noise control measures and responding to complaints. This person’s name and contact information shall be posted clearly around the project site and shall also be distributed to properties within 200 feet of the site boundaries. The construction noise coordinator shall be available during all times during construction activities and shall maintain a log of complaints. A copy of the log shall be provided to the DCD monthly on the 30th day of each month;

- The project sponsor shall require construction contractors to limit noise generating construction activities as required by the DCD. No construction activities shall be allowed before 8 AM or after 5 PM, or on weekends without prior authorization of the Zoning Administrator, and excavation and grading activities shall be allowed after hours or on weekends and holidays;

- The project sponsor shall require construction contractors to implement the following measures to reduce daytime noise due to construction activities:

  1. Equipment and trucks used for construction shall utilize the best available noise control techniques wherever feasible (e.g., improved mufflers, equipment redesign, use of intake silencers, ducts, engine enclosures and acoustically-attenuating shields or shrouds).

  2. Impact tools (e.g., jack hammers, pavement breakers, and rock drills) used for construction shall be hydraulically or electrically powered wherever feasible possible to avoid noise associated with compressed air exhaust from pneumatically powered tools. However, where use of pneumatic tools is not feasible, an exhaust muffler on the compressed air exhaust shall be used; this muffler can lower noise levels from the exhaust by up to about 10 dBA. External jackets on the tools themselves shall be used where feasible, and this could achieve a reduction of 5 dBA. Quieter procedures shall be used, such as drills rather than impact equipment, whenever feasible.

  3. Stationary noise sources shall be located as far from adjacent receptors as feasible possible, and shall be muffled and enclosed within temporary sheds, insulation barriers, or other measures to the extent feasible.

- Prior to the start of construction, the project sponsor shall construct a temporary sound barrier along those portions of the northern and southern property lines that do not, at the time of grading and construction, already have a wall that meets the following standards, to provide the maximum protection feasible for the residential uses to the north and south. The barriers can be constructed out of wood or other materials as long as they have a minimum surface weight of approximately 2.5 pounds per - square foot. Possible materials include 1-1/8-inch-thick plywood or fully overlapping 1x redwood boards (1-1/2-inch thick total). The barriers would likely be 6 to 8 feet tall but this would be refined and approved by a qualified acoustician prior to the issuance of grading permits. Issues to consider when determining the ultimate height, length, and location of
the barriers are the actual construction practices, including equipment to be used and the location and duration of noisier activities. The topography will also need to be considered in the final determination of barrier heights and effectiveness.

47. Mitigation Measure 4.10-2 The DCD shall ensure that the project sponsor isolates the equipment in the mechanical well per the American Society of Heating, Refrigerating and Air-Conditioning Engineers (ASHRAE) Guidelines. ASHRAE is considered the industry standard for mechanical system design standards.

Mitigation Measure for Traffic and Circulation

48. Mitigation Measure 4.13-1. If Project Variant A is ultimately selected and approved, the County Department of Conservation and Development and County Public Works Department shall verify that final plans incorporate a sidewalk on the Boulevard Way frontage similar to that incorporated in Project Variant B. Plans shall show the sidewalk along all project frontage and extending to Warren Road. Sidewalk plans shall conform to prevailing County standards. In addition, if Project Variant A is approved, prior to the approval of any building or grading permit, the County Department of Conservation and Development and County Public Works Department shall verify that final plans for the public right-of-way area show a north-south crosswalk at a location mutually acceptable to the aforementioned County departments and the project sponsor. The crosswalk shall conform to any pertinent state or County regulations regarding crosswalk location and safety. As appropriate, final plans for the crosswalk shall incorporate features to help reduce conflicts between vehicles and pedestrians. Such features may include but are not limited to signage advising motorists of the crosswalk, lighting at the crosswalk, and the use of contrasting color and/or reflective paint to improve nighttime visibility of the crosswalk area.

49. Mitigation Measure 4.13-2 If Project Variant A is ultimately selected and approved, the County Department of Conservation and Development and County Public Works Department shall verify that final plans reflect the inclusion of adequate sight distance to the west of the project driveway. This can be achieved by relocating the proposed perimeter wall from its current location to the same location as shown in the plan for Project Variant B (Figure 3-8) and keeping the area north of the wall free of potential visual obstructions (trees or other tall vegetation).

Mitigation Measure for Utilities and Service Systems

50. Mitigation Measure 4.14-1. In the event of multiple drought years, the project sponsor shall comply with EMBUD’s then-applicable Drought Management Program and reduce water usage by 20 percent. In the event of critical shortages (shortages of 25 percent or more), the project sponsor shall comply with reduction goals based on customer categories set by EBMUD.
Findings & Conditions of Approval – LP08-2034 and MS09-0008

Construction of Sound Barriers

51. Prior to the Zoning Administrator approval of the temporary sound barriers located on the north and south property lines, a brief report shall be submitted by an approved qualified acoustician indicating how the noise reduction is achieved in mitigation measure 4.10-1.

Litter Control and Recycling

52. The Project sponsor shall maintain the project site and surrounding areas in an orderly fashion. Litter and debris shall be contained in appropriate receptacles and shall be disposed promptly. All construction materials and construction-related debris shall be removed following cessation of construction activity.

53. To the extent possible, demolition debris and construction waste shall be diverted from the waste stream. Prior to commencing demolition or construction, the Project sponsor shall consult with Department of Conservation & Development – Conservation Programs Section staff to identify opportunities for debris/waste diversion.

Geologic/Soils Report

54. The project sponsor shall record a statement to run with deeds to property acknowledging the approved report by title, author (firm), and date, calling attention to approved recommendations and noting that the report is available from the seller.

Setbacks

55. The building shall comply with the building setbacks of the R-10 Zoning District, including the portion of the building located underground.

Construction Trailers

56. The Project sponsor must remove construction trailers from the project site within 30 days following completion of construction activities.

CONDITIONS OF APPROVAL ENFORCED BY THE PUBLIC WORKS DEPARTMENT

Unless otherwise stated, the Project sponsor must comply with the following conditions of approval prior to obtaining building permits or initiation of the use authorized by this Land Use Permit County File # LP082034 and Minor Subdivision # MS09-0008

General Requirements

57. Improvement plans prepared by a registered Civil Engineer shall be submitted, as necessary, to the Public Works Department, Engineering Services Division, along
Findings & Conditions of Approval – LP08-2034 and MS09-0008

with review and inspection fees, and security for all improvements required by the Ordinance Code for the conditions of approval of this land use permit. These plans shall include any necessary traffic signage and striping plans, for review by the Transportation Engineering Division of the Public Works Department.

Roadway Improvements (Boulevard Way)

58. _____ The Project Sponsor shall construct a 5-foot wide concrete sidewalk, curb and gutter, necessary longitudinal and transverse drainage, re-striping, street lighting (as necessary), pavement widening and transitions along the frontage of Boulevard Way. The Project Sponsor shall construct face of curb 17-feet from the existing striped centerline of Boulevard Way, providing a paved half-width consisting of a 12-foot wide travel lane and a 5-foot wide paved shoulder. Parking in the shoulder shall not be permitted. Striping or other pavement delineation shall be installed to clearly identify the shoulder along the Boulevard Way frontage.

59. _____ The Project Sponsor shall extend sidewalk and pavement conformance from the southwestern limits of the project frontage to the Warren Road intersection. A curb ramp, meeting minimum County standards, shall be constructed at the terminus of the sidewalk extension at the northeastern corner of the Warren Road and Boulevard Way intersection.

60. _____ The Project Sponsor shall construct a street-type connection with minimum 20-foot radius curb returns in lieu of a standard driveway depression at the intersection of the main on-site driveway and Boulevard Way. A standard driveway ramp may be used for the utility/emergency access driveway proposed at the eastern end of the property limits.

61. _____ Any vehicular entrance gate shall be a minimum of 20 feet from the edge of pavement to allow vehicles to queue without obstructing through traffic. Any proposed gate and the associated improvements shall be outside the public right of way.

62. _____ The Project Sponsor shall enter into a landscape maintenance agreement for any landscape improvements proposed within public right-of-way.

Construction Traffic

63. _____ Prior to the start of construction-related activities, the project sponsor shall prepare a Traffic Control Plan (TCP), including a haul route, for the review and approval of the Public Works Department.

64. _____ The Project sponsor shall perform a pre-construction survey of the roadways to be used as part of the haul route.
Findings & Conditions of Approval – LP08-2034 and MS09-0008

65. _____ The project owner shall restore any public roads, easements, and/or rights-of-way that have been damaged due to project-related construction activities to the pre-project conditions.

Access to Adjoining Property:

Proof of Access

66. _____ The Project Sponsor shall furnish proof to the Public Works Department of the acquisition of all necessary rights of way, rights of entry, permits and/or easements for the construction of off-site, temporary or permanent, public and private road and drainage improvements.

Encroachment Permit

67. _____ The Project Sponsor shall obtain an encroachment permit from the County’s Application and Permit Center, as necessary, for construction of any improvements within the Boulevard Way or other public road rights of way.

Sight Distance

68. _____ The Project Sponsor shall provide sight distance along the curve and at the intersection of the on-site driveway(s) and Boulevard Way for a design speed of 35 miles per hour pursuant to Figure 3-8 in the Final EIR. The project sponsor shall trim vegetation, as necessary, to provide sight distance at the intersection. Any new landscaping, fencing, retaining walls, or other obstructions proposed at the intersections shall be setback to ensure that the sight lines are clear.

Parcel Map

69. _____ The Project Sponsor shall record a parcel map to merge the separate parcels.

Right of Way Dedications

70. _____ The Project Sponsor shall dedicate on the parcel map or convey by a separate instrument, the right of way necessary to accommodate the required frontage improvements. The right of way shall be a minimum 10 feet back from the improved face of curb except east of the entrance driveway the applicant may dedicate a public utility easement for areas beyond the sidewalk. The sidewalk, bus pullout, and curb ramps must be contained within the public right of way.

Annexation to Lighting District

71. _____ The Project Sponsor shall annex to the Community Facilities District formed for Countywide Street Light Financing (CFD 2010-1).
Utilities/ Undergrounding

72. ____ ____ All new utility distribution facilities shall be installed underground. Existing utility poles located along Boulevard Way shall be relocated to accommodate the required frontage improvements.

Drainage Improvements

Collect and Convey

73. ____ ____ The Project Sponsor shall collect and convey all storm water entering and/or originating on this property without diversion to a different watershed and within an adequate storm drainage facility, to a natural watercourse having definable bed and banks, or to an existing adequate public storm drainage facility which conveys the storm waters to a natural watercourse, in accordance with Division 914 of the Ordinance Code.

74. ____ ____ Prior to issuance of building permits or approval of the parcel map, the Project Sponsor shall submit to the Public Works Department for review, an updated drainage study and analysis that details how stormwater runoff is collected and discharged into the area wide storm drain systems. The drainage study and analysis must confirm that post-project drainage flows do not exceed pre-project flows for the 10-year storm event.

75. ____ ____ The Project Sponsor shall replace the existing 12-inch diameter culvert crossing Warren Road with an 18-inch diameter pipe.

Miscellaneous Drainage Requirements

76. ____ ____ The Project Sponsor proposes to utilize pervious paving systems for the parking lot to reduce the stormwater runoff and maintain the post-project design flows below the pre-project levels. Since certain types of pervious paving systems become silted in and clogged over time, the applicant shall develop a long-term maintenance plan to guarantee the infiltration performance of these systems.

Provision C.3 of the National Pollutant Discharge Elimination System (NPDES) Permit

77. ____ ____ Improvement Plans shall be submitted to the Public Works Department to verify compliance with Provision C.3 of the National Pollutant Discharge Elimination System (NPDES) Permit and the County’s Stormwater Management and Discharge Control Ordinance (§1014).

78. ____ ____ A final Storm Water Control Plan (SWCP) shall be submitted to and approved by the Public Works Department for consistency with Provision C.3 prior to issuance of building permits. All time and materials costs for review and preparation of the SWCP shall be borne by the project sponsor.
79. Storm water management facilities shall be subject to inspection by Public Works Department staff; all time and materials costs for inspection of stormwater management facilities shall be borne by the applicant.

80. A final Storm Water Control Operation and Maintenance Plan (O+M Plan) shall be submitted to and approved by the Public Works Department for consistency with Provision C.3 prior to final building permit inspection.

81. The property owner(s) shall enter into a standard Stormwater Management Facility Operation and Maintenance Agreement with Contra Costa County, in which the property owner(s) shall accept responsibility for operation and maintenance of the stormwater facilities and grant access to relevant public agencies for inspection of stormwater management facilities. Such an agreement shall be fully executed and recorded prior to obtaining building permits.

82. The property owner(s) shall annex the subject property into Community Facilities District (CFD) No. 2007-1 (Stormwater Management Facilities), which funds responsibilities of Contra Costa County under its NPDES Permit to oversee the ongoing operation and maintenance of stormwater facilities by property owners. Annexation to CFD 2007-1 shall be completed prior to obtaining building permits.

83. Any proposed water quality features that are designed to retain water for longer than 72 hours shall be subject to the review of the Contra Costa Mosquito & Vector Control District.

National Pollutant Discharge Elimination System

84. The Project Sponsor shall comply with all rules, regulations, and procedures of the National Pollutant Discharge Elimination Systems (NPDES) for municipal, construction and industrial activities as promulgated by the California State Water Resources Control Board and the San Francisco Bay Regional Water Quality Control Board.

Compliance shall include developing long-term best management practices (BMP’s) for the reduction or elimination of storm water pollutants. The project design shall incorporate, wherever feasible, the following long-term BMP’s in accordance with the Contra Costa County Clean Water Program for the site’s storm water drainage:

- Minimize the amount of directly connected impervious surface area.
- Place approved markers ("No Dumping, Drains to Creek") on all storm drains.
- Construct concrete driveway weakened plane joints at angles to assist in directing runoff to landscaped/pervious areas prior to entering the street curb and gutter.
- Shallow roadside and on-site grassy swales.
- The owner shall sweep the paved portion of the site quarterly, at least once a year with a vacuum type sweeper. Verification (invoices, etc.) of the sweeping
shall be provided to the County Clean Water Program Administrative Assistant at 255 Glacier Drive, Martinez CA 94553 (925) 313-2238

- Trash bins shall be sealed to prevent leakage, OR, shall be located within a covered enclosure.
- Project Sponsor shall incorporate the use of pavers and/or pervious pavement on-site to reduce the amount of directly connected impervious surface area.
- Other alternatives, equivalent to the above, as approved by the Public Works Department.

Area of Benefit Fee Ordinance

85. _____ The Project Sponsor shall comply with the requirements of the Bridge/Thoroughfare Fee Ordinance for the South Walnut Creek Area of Benefit, as adopted by the Board of Supervisors. This fee shall be paid prior to the issuance of a building permit.

86. _____ The applicant shall comply with all mitigation measures recommended in the Final EIR, and with the Mitigation Monitoring and Reporting Program for Project Variant B.

ADVISORY NOTES

A. NOTICE OF 90-DAY OPPORTUNITY TO PROTEST FEES, DEDICATIONS, RESERVATIONS, OR OTHER EXACTIONS PERTAINING TO THE APPROVAL OF THIS PERMIT.

This notice is intended to advise the project sponsor that pursuant to Government Code Section 66000, et seq., the project sponsor has the opportunity to protest fees, dedications, reservations, and/or exactions required as part of this project approval. The opportunity to protest is limited to a 90-day period after the project is approved.

The ninety (90)-day period in which you may protest the amount of any fee or the imposition of any dedication, reservation, or other exaction required by this approved permit, begins on the date this permit was approved. To be valid, a protest must be in writing pursuant to Government Code Section 66020 and delivered to the Community Development Department within 90 days of the approval date of this permit.

B. Project must comply with the requirements of the Contra Costa County Department of Conservation & Development – Building Inspection Division. The Building Inspection Division will require three complete sets of plans that are approved by the Community Development Division.

C. Project must comply with the requirements of the California Department of Fish & Game. It is the Project Sponsor’s responsibility to notify CDFG (P.O. Box 47, Yountville, California 94599) of any activities that may affect any fish and wildlife resources, per the Fish and Game Code.

D. Comply with the requirements of the Central Contra Costa Sanitary District,

E. Comply with the requirements of the East Bay Municipal Utility District,
F. Project must comply with the requirements of the County Health Services Department, Hazardous Material Division.

G. Project must comply with the requirements of the Bay Area Air Quality Management District.

H. Project must comply with the requirements of the Regional Water Quality Control Board.

I. Project must comply with the requirements of the Contra Costa County Fire Protection District.

Notice of Preparation, Completion and Extension
NOTICE OF PREPARATION
NOTICE OF SCOPING SESSION

FOR AN ENVIRONMENTAL IMPACT REPORT
FOR THE PROPOSED SUFISM REORIENTED SANCTUARY PROJECT
(County Files: # LP08-2034 and #MS09-0008)

TO: ALL INTERESTED AGENCIES, ORGANIZATIONS AND INDIVIDUALS

1. PROPOSED PROJECT

The Sufism Reoriented Church is proposing to construct a new sanctuary on approximately 3.12 acres. The sanctuary would permanently replace the organization's current facility at 1300 Boulevard Way. The proposed design would locate approximately two-thirds of its total floor area (46,064 square feet) underground, including space for administrative offices, a multi media library, rehearsal and video studios for choral music, art studio, a kitchen, a bookstore, and a multi purpose room. The prayer hall, a classroom, and ancillary facilities (totaling 20,000 square feet in area) would be located above ground.

In addition, the project includes a request for parking reduction based on a Transportation Demand Management Program that includes the promotion of carpool, shuttle service, pedestrian and secure bicycle parking. The project includes the removal of approximately 43 trees, and the planting of at least 165 new trees. The project will require a land use permit under the Contra Costa County R-10 Single Family Residential District, Sections 84-8.404 and 84-4.404 (3) and a minor subdivision with a vesting tentative map for the merging of seven lots into one parcel to create the approximate 3.12 acre site.

The site currently contains a parsonage building at 11 White Horse Court plus three single family residences along Boulevard Way. The applicant, Sufism Reoriented, owns all of these buildings. The applicant proposes to retain the parsonage building at 11 White Horse Court and demolish the three residences along Boulevard Way.
Height

The sanctuary would be located partially underground. The facility will have the appearance of a single story building. The portion of the building which is visible above grade will range from approximately 20 to 34 feet in height from the ground to the top of the proposed domes.

Construction and Grading

Approximately two-thirds (46,064 square feet) of the building is proposed to be constructed underground therefore extensive soil excavation will be required. An estimated 3,510 truck loads of soil are expected to be exported from the project site (approximately 34,350 cubic yards). The project will not require pile driving. It is anticipated that excavation will take approximately 5 to 6 weeks and approximately 1 year to complete the entire project as proposed.

Environmental Impacts

The County has not determined the probable environmental impacts at this time. The Environmental Impact Report will evaluate all issues with a short discussion on Agricultural, Mineral and Recreational impacts. The County intends to use the amended California Environmental Quality Act (CEQA) guidelines in response to Senate Bill 97.

II. LOCATION OF PROJECT

The proposed new sanctuary is located within the (Saranap) Walnut Creek area of the County. Seven abutting parcels form the project site. To the north and east are single family residential uses, apartment buildings, condominiums and commercial and retail stores. To the south and west the site is surrounded by single family residential uses. The sites are 11 White Horse Ct., 1354, 1360, 1364, 1366 and 1384 Boulevard Way. {General Plan: Single Family High Density (SH); Zoning: Single Family Residential, 10,000 square foot minimum parcels (R-10); Census Tract: 3410; Assessor Parcel Numbers: 184-450-006, 007, 012, 031, 032, 033, 034}

III. PUBLIC COMMENTS

The Contra Costa County Department of Conservation and Development is the Lead Agency for the preparation of the Environmental Impact Report for this project. All responsible agencies, interested agencies and individuals are invited to submit comments, which address environmental concerns resulting from the implementation of the proposed project.

Responses to this Notice of Preparation must be received by the Contra Costa County Community Development Division by 5:00 p.m., Thursday, April 8, 2010.
Responses should be sent to:

Contra Costa County Community Development Division
Attention: Lashun Cross
651 Pine Street, 4th Floor - North Wing
Martinez, California 94553

Facsimile (925) 335-1350
Email: Lashun.Cross@ced.cccounty.us

IV. SCOPING SESSION

A Scoping Session will be held on Monday, March 22, 2010 at 3:30 p.m., in Room 107 of the McBrien Administration Building, 651 Pine Street, Martinez, California. Interested agencies and individuals may submit oral and written comments, which pertain to environmental concerns resulting from implementation of the proposed project.

V. SUPPORTING DOCUMENTS

The Land Use Permit Application and Minor Subdivision and supporting documents are available for viewing at the Contra Costa County Department of Conservation and Development. If you wish to obtain a copy of any supporting document related to this project, you may contact Lashun Cross of the Community Development Division at (925) 335-1229.

Draft Environmental Impact Report

State Clearinghouse #2010032038

PROPOSED 66,074 SQUARE FOOT SANCTUARY PROJECT IN CONTRA COSTA COUNTY

County File #s LP082034 and MS090008

Notice is hereby given pursuant to the California Environmental Quality Act (CEQA) that a document entitled "New Sanctuary for Sufism Reoriented Project, Environmental Impact Report" (hereafter referenced as "Draft EIR") has been prepared for the proposed 66,074 square foot Sufism Reoriented religious facility within the Saranap neighborhood of the unincorporated Walnut Creek area of Contra Costa County.

The Sufism Reoriented Church is proposing to construct a new sanctuary on 3.12 acres. The sanctuary would permanently replace the organization’s current facility at 1300 Boulevard Way. The proposed design would locate approximately two-thirds of its total floor area (46,074 square feet) underground, including space for administrative offices, a multimedia library, rehearsal and video studios for choral music, art studio, a kitchen, a bookstore, and a multi purpose room. The prayer hall, a classroom, and ancillary facilities (totaling 20,000 square feet in area) would be located above ground.

In addition, the project includes a request for parking reduction based on a Transportation Demand Management Program that includes the promotion of carpool, shuttle service, pedestrian and secure bicycle parking. The project includes the removal of approximately 43 trees, and the planting of at least 165 new trees. The project will require a land use permit under the Contra Costa County R-10 Single Family Residential District, Sections 84-8.404 and 84-4.404 (3) and a minor subdivision with a vesting tentative map for the merging of seven lots into one parcel to create the approximate 3.12 acre site.
Approximately two-thirds (46,074 square feet) of the building is proposed to be constructed underground therefore extensive soil excavation will be required. An estimated 3,310 truck loads of soil are expected to be exported from the project site (approximately 43,000 cubic yards). The project will not require pile driving. It is anticipated that excavation will take approximately 6 weeks and approximately 16 to 18 months to complete the entire project as proposed.

The proposed new sanctuary is located within the (Saranap) Walnut Creek area of the County. Seven abutting parcels form the project site. The sites are 11 White Horse Ct., 1354, 1360, 1364, 1366 and 1384 Boulevard Way. (General Plan: Single Family High Density (SH); Zoning: Single Family Residential, 10,000 square foot minimum parcels (R-10); Census Tract: 3410; Assessor Parcel Numbers: 184-450-006, 007, 012, 031, 032, 033, 034)

ENVIRONMENTAL IMPACTS OF THE PROPOSED PROJECT: Potentially significant impacts were identified in the following environmental topic areas:

- Air Quality
- Geology and Soils
- Noise
- Traffic and Circulation
- Cumulative Impacts

All potentially significant impacts can be mitigated to less than significant levels.

PUBLIC REVIEW & COMMENT PERIOD: There will be a forty-five (45) day review and comment period for the Draft EIR, which begins on the date listed at the top of this notice. Comments on the adequacy of the Draft EIR must be submitted by 5:00 p.m. on Friday, May 13, 2011. Comments must be in writing and submitted to the following address:

Attn: Ms. Lashun Cross, Senior Planner
Contra Costa County Department of Conservation and Development
651 Pine Street, 4th Floor- North Wing
Martinez, CA 94553

For accuracy of record, the County File Numbers, LP082034 and MS090008 should be included on all correspondence.

During the 45-day review period, the County Zoning Administrator will hold a public hearing to provide additional opportunity for public comment on the Draft EIR. The date and time of the Zoning Administrator hearing is as follows:

Monday, April 18, 2011, at 3:30 p.m.
Room 107, McBrien Admin. Building
651 Pine Street, Martinez, CA 94553
REPORT AVAILABILITY: Copies of the Draft EIR are available for review and purchase at the offices of the Contra Costa County Department of Conservation and Development, Community Development Division at the address listed above. The Draft EIR is available for purchase in both hard copy format ($20.00 [add $10.00 if mailing is required]) and CD format ($2.00 [add $1.25 if mailing is required]). The Draft EIR is also available for viewing on the Department website at http://www.cocoplans.org.

In addition to copies of the Draft EIR, supplemental information including maps and other material related to the project and the preparation of the Draft EIR are available for public review at the offices of the Department of Conservation and Development, Community Development Division.

The Draft EIR is also available for review at the following additional locations:

Office of Supervisor Gayle B. Uilkema, District II
McBrien Administration Building
651 Pine Street
Room 108-A
Martinez, CA 94553

Contra Costa County Library-Pleasant Hill, Main Branch
1750 Oak Park Boulevard

Walnut Creek, CA 94595

Contra Costa County Library- Lafayette
952 Moraga Road
Lafayette, CA 94549

Martinez Library
740 Court Street
Martinez, CA 94553

ADDITIONAL INFORMATION: For additional information on the Draft EIR, please contact Ms. Lashun Cross of the Contra Costa County Department of Conservation and Development by email at lashun.cross@dcd.cccounty.us, by telephone at 925-335-1229 or by fax at 925-335-1250.

NOTICE ISSUED MARCH 29, 2011
Notice is hereby given pursuant to the California Environmental Quality Act (CEQA) that a document entitled “New Sanctuary for Sufism Reoriented Project, Environmental Impact Report” (hereafter referenced as “Draft EIR”) has been prepared for the proposed 66,074 square foot Sufism Reoriented religious facility within the Saranap neighborhood of the unincorporated Walnut Creek area of Contra Costa County.

The Sufism Reoriented Church is proposing to construct a new sanctuary on 3.12 acres. The sanctuary would permanently replace the organization’s current facility at 1300 Boulevard Way. The proposed design would locate approximately two-thirds of its total floor area (46,074 square feet) underground, including space for administrative offices, a multimedia library, rehearsal and video studios for choral music, art studio, a kitchen, a bookstore, and a multi-purpose room. The prayer hall, a classroom, and ancillary facilities (totaling 20,000 square feet in area) would be located above ground.

In addition, the project includes a request for parking reduction based on a Transportation Demand Management Program that includes the promotion of carpool, shuttle service, pedestrian and secure bicycle parking. The project includes the removal of approximately 43 trees, and the planting of at least 165 new trees. The project will require a land use permit under the Contra Costa County R-10 Single Family Residential District, Sections 84-8.404 and 84-4.404 (3) and a minor subdivision with a vesting tentative map for the merging of seven lots into one parcel to create the approximate 3.12 acre site.

Approximately two-thirds (46,074 square feet) of the building is proposed to be constructed underground therefore extensive soil excavation will be required. An estimated 3,310 truck loads of soil are expected to be exported from the project site (approximately 43,000 cubic yards). The project will not require pile driving. It is anticipated that excavation will take approximately 6 weeks and approximately 16 to 18 months to complete the entire project as proposed.
The proposed new sanctuary is located within the (Saranap) Walnut Creek area of the County. Seven abutting parcels form the project site. The sites are 11 White Horse Ct., 1354, 1360, 1364, 1366 and 1384 Boulevard Way.

ENVIRONMENTAL IMPACTS OF THE PROPOSED PROJECT: Potentially significant impacts were identified in the following environmental topic areas:

- Air Quality
- Geology and Soils
- Noise
- Traffic and Circulation
- Cumulative Impacts

All potentially significant impacts can be mitigated to less than significant levels.

PUBLIC REVIEW & COMMENT PERIOD: The County has extended the time for receiving public comments from May 13, 2011 to May 27, 2011. Comments on the adequacy of the Draft EIR must be submitted by 5:00 p.m. on Friday, May 27, 2011. Comments must be in writing and submitted to the following address:

Attn: Ms. Lashun Cross, Senior Planner
Contra Costa County Department of Conservation and Development
651 Pine Street, 4th Floor- North Wing
Martinez, CA 94553

For accuracy of record, the County File Numbers, LP082034 and MS090008 should be included on all correspondence.

REPORT AVAILABILITY: Copies of the Draft EIR are available for review and purchase at the offices of the Contra Costa County Department of Conservation and Development, Community Development Division at the address listed above. The Draft EIR is available for purchase in both hard copy format {$20.00 [add $10.00 if mailing is required]} and CD format {$2.00 [add $1.25 if mailing is required]}. The Draft EIR is also available for viewing on the Department website at http://www.cocoplans.org

In addition to copies of the Draft EIR, supplemental information including maps and other material related to the project and the preparation of the Draft EIR are available for public review at the offices of the Department of Conservation and Development, Community Development Division. The Appendices are provided on the CD listed above for purchase, can be purchased by itself for $60, or reviewed at the County Application and Permit Center during normal business hours.

ADDITIONAL INFORMATION: For additional information on the Draft EIR, please contact Ms. Lashun Cross of the Contra Costa County Department of Conservation and Development by email at lashun.cross@dcd.eccounty.us, by telephone at 925-335-1229 or by fax at 925-335-1250.

Re: Review submittal LP08-2034 (Sanctuary for Sufism Reoriented)

Dear Mr. Cross:

We appreciate the opportunity that was provided to review and comment on the above noted application that is located within the City’s Sphere of Influence. Please consider the following comments on the proposed project.

1. The 70 parking spaces may be adequate but it is hard to tell because the Transportation Demand Management (TDM) program written by DC&E was not included in the packet. They probably do have 50% of the membership in the area because according to their website they have been in this location for a long time. However I am concerned that members may not walk to church because they are not providing a sidewalk along the entire frontage of the project. This is crucial to the success of a TDM program. The sidewalk should be provided along the entire frontage.

2. The intersection of Boulevard Way, Kinney Drive, and Garden Court can be difficult for pedestrians to cross due to its design. Additionally, there are limited opportunities for pedestrians to cross from the north side of the street elsewhere on or near the site. Given the size of the project and the expected pedestrian traffic, the County may wish to explore with the applicant the possibility of some improvements to the intersection or possibly a mid-block crossing with bulb-outs (which would also double as a traffic-calming measure).

3. The plans show that the 50-foot street right-of-way will remain. I believe this is substandard for this street, however if it is I would expect that the County Public Works Department will require additional right-of-way.

4. The driveway location is problematic because it is just past the turn of Boulevard Way. There may be a sight distance problem for the exiting traffic seeing northbound
Boulevard Way traffic. This may be further compounded by the 6-foot wall along the right-of-way and the shrubbery proposed to be planted within the ROW.

Again, thank you for considering our comments in your review of this application. Please feel free to contact me directly if you would like to discuss any aspect of this letter further or if I can be of any assistance.

Sincerely,

Andrew M. Smith
Senior Planner

Martinez, CA 94553  

Dear Ms. Cross,

This letter addresses two related issues: the SCA board of directors’ position on Sufism Reoriented’s LUPA and the board’s views on proposed changes to the adjacent Boulevard Way–Kinney Drive intersection.

**Sufism Reoriented’s LUPA.** Meeting in executive session on June 2, the SCA board voted by a vote of 10 to 0, with one member unavailable, to support the church’s LUPA. This was the culmination of a process that began in November 2007 when representatives of Sufism Reoriented first presented their plan for their proposed sanctuary to our board. Our position reflects the overwhelming support of the Saranap community for the project as expressed at three public meetings we have held on the project and the number of letters and petitions for and against the project that have been submitted to your office, as well as the views of board members.

**Community meetings.** The purpose of our three community meetings has been to educate the community (and ourselves) about the sanctuary project and to gauge community sentiment. These were forums at which neighbors could comment in favor of or opposition to the project and to state any concerns they might have. The meetings were publicized not only to our own members but via postal mailings to our entire Saranap mailing list, which includes some 1300 homes and apartments. All were open to the public, and all were attended by more than 100 people.

At the first of these, held in November 2008, representatives of Sufism Reoriented made a presentation about the project and responded to questions. The second meeting was held two months later to respond to questions raised at the November meeting that could not be answered that evening.

The third community meeting, held April 19 this year, focused on the draft EIR. In the postcard we mailed to announce the meeting, we included the URL of our Website, where the Executive Summary of the draft EIR was available for downloading, and the URL of the County Website, where the full report was available. Copies of the Executive Summary were also available at the meeting. A member of our Application Review Committee began the meeting with a 40-minute summary of the findings of the draft EIR, and the floor then was opened for questions and comments. (The EIR-specific results of this meeting were outlined in our May 16 letter to you.)

Also at this meeting, which was attended by about 140 people, attendees were invited to complete an anonymous form on which they could indicate whether they support the project, support it with certain reservations, or do not support it. Space was provided for them to state their reasons for their position. Ninety-six people responded (some cited more than one reason for their position):
• 90 people indicated they support the project—42 said it would enhance the neighborhood; 32 mentioned the aesthetics of the landscaping and/or the building itself; 15 mentioned the positive impact on traffic, especially at the Boulevard Way–Kinney intersection; 6 mentioned environmental elements of the project; 5 spoke positively about having a church in the neighborhood, religious freedom, or the right of Sufism Reoriented to build a church in the neighborhood where most of its members live; and 5 commented on the thoroughness of the draft EIR.

• 4 indicated they support the project, but with reservations. These included concerns about traffic at the Boulevard Way–Kinney Drive intersection (3 comments), and construction-related dust and noise. (One person checked this box but wrote only, “I think it will be very uplifting to the quality of the neighborhood.”)

• 2 indicated that they do not support the project. The reasons they gave were the size and location of the project; “visual not comparable to neighborhood”; “dewater with likely adjacent subsidence” related to excavation; “needed housing will be removed”; “glare study is not adequate”; “Saranap is not an easy access”; and concerns about construction-related emissions, dust, and damage to roads.

Signatures on file with the county. Signatures on letters of support and petitions in favor of the project on file with your office as of June 28 totaled 2,855; signatures on letters and petitions in opposition to the project totaled 564. This is a margin of five to one.

Other considerations. During the discussion leading up to the board’s vote on June 2, we took these additional factors into account:

• Churches are a permitted use in R-10 zones; the site of the proposed sanctuary is in an R-10 zone.

• The applicant is seeking no variances.

• The draft EIR on this project found “no significant unavoidable impacts.”

• Plans for the site include a landscaped garden park that would be open to neighbors. There are no other settings like this in the Saranap.

• The church has gone to great lengths to address the concerns of the neighborhood.

More than three years have passed since Sufism Reoriented announced plans to build a sanctuary on Boulevard Way. From the beginning, our process for evaluating this project has been open, inclusive, and transparent. We have stated publicly that our decision on the project would be a reflection of the views of the community as well as those of individual board members. Information we have at hand indicates that support for the project outweighs opposition to it by a very substantial margin.

While we respect the views of those who oppose the project, we agree with the majority opinion of our neighbors that this project would be a positive addition to the neighborhood, and thus we support Sufism Reoriented’s application to build a sanctuary on Boulevard Way.

Boulevard Way–Kinney Drive intersection. Also at our June board meeting, the SCA board discussed the three variants for this intersection described in the draft EIR for the Sufism
Reoriented project. This intersection has long been, and remains, a source of concern in the neighborhood. While we did not vote on the three options, two clear themes emerged from our discussion:

• We are opposed to any changes that would tend to encourage speeding along either Boulevard Way or Kinney Drive. Widening Boulevard Way without additional stop signs would obviously have this effect. Leaving the road and intersection as currently configured and moving the wall back from the edge of the Boulevard Way would have the same effect unless a stop sign were placed on this road in the northbound direction, as this would remove the major deterrent to speeding in this part of Boulevard Way, a blind curve.

• We believe that two or more stop signs should be added at this intersection to discourage speeding. This is a residential neighborhood. Adding one or more crosswalks would not only make the area safer, it would make it more pedestrian- and bicycle-friendly.

Regardless of the County's decision on the Sufism Reoriented LUPA, we strongly encourage the County to take measures to make this intersection safer.

Respectfully submitted,

Lee S. Schroeder, President
Saranap Community Association

Re: County Files LP08-2034 and SD08-9262
Sufism Reoriented Sanctuary Project

Dear Ms. Cross,

The Saranap Community Association (SCA) would like to go on record as stating that the letter (dated July 31, 2008) sent last summer by Dennis Collins, then President of the SCA, regarding the Sufism Reoriented Land Use Application, was neither a legal summarization of the existing board’s view, nor did it reflect the usual process followed by the SCA board in evaluating County submittal applications. A full board meeting was not convened, and board members were given virtually no time to evaluate or discuss this complex submission. This, in itself, is in violation of the California Corporations Code, especially since several board members did not waive proper notice. In summary, this was a unilateral action, not legally authorized by the board as a whole, and can only represent Dennis Collins’s personal view.

The SCA’s usual procedure, is to wait until it has a chance to carefully review a submittal and then to comment on it as a group. Mr. Collins’s hastily prepared letter contains many conjectures, and reflects the fact that there was no due diligence in asking the applicant, Sufism Reoriented, about issues such as storm water runoff, soil testing, parking, etc. There really is no factual basis for denying the application that comes from reading his letter. This reflects poorly on SCA’s usual approach for evaluating such submittals, and we feel harms the creditability of our organization. We believe that his letter simply represents a personal view, rather than being representative of our community association.

As you are probably aware, as part of our commitment of the SCA to get input from the Saranap community on this submittal, we have held two, of three, public meetings
regarding this LUA. The first meeting, in November 2008, was held to hear information from the County on its process, information from the applicant about their plans, and the Saranap community an opportunity to raise any concerns or questions they might have. The second meeting, in January 2009, provided an opportunity for the community to hear answers to questions raised in the first meeting, and ample time for further inquires and comments from the community. Both meetings were well attended by the Saranap community with between 100 and 150 people at each meeting. Questions and answers from these meetings can be found on our Website (www.SaranapOnline.org). We plan to hold a third and final meeting, as soon as the County publishes the Initial Study associated with the SR LUA. Only after the third meeting, and after collecting input from other meetings with County officials, meetings with consultants, and completing our board of director’s internal review process, will the SCA board, as a whole, put together its final assessment of this application, and send its recommendation to the County DCD.

We respectfully ask you and the DCD to view the previous letter from Dennis Collins as that of a personal comment from an individual resident and nothing more.

Sincerely yours,

Lee S. Schroeder, President
Saranap Community Association

RE: COUNTY FILE LPo8-/ MS080011
Request for Land Use Permit for Sufism Reoriented
Property address: Combining seven R-10-zoned residential properties (in unincorporated Walnut Creek) at:

1354 Boulevard Way  1366 Boulevard Way
1360 Boulevard Way  1384 Boulevard Way
1364 Boulevard Way  11 White Horse Court
(The seventh address not specified in application packet)
Walnut Creek (Saranap Area of Contra Costa County), CA 94595

Dear Ms. Cross,

The Saranap Community Association has received your Agency Comment Request, dated July 3, 2008, with comments requested back to you by August 1, 2008.

Directors of the Saranap Community Association have reviewed the project and description for the Sufism Reoriented Sanctuary Project to be constructed on the combined properties listed above, generally between Boulevard Way and Warren Road, in the unincorporated portion of Contra Costa County between Walnut Creek, CA. and Lafayette, CA., south of State Highway 24.

SUMMARY

This Saranap Community Association (SCA) is opposed to the Sufism Reoriented sanctuary project as proposed. We are not opposed to the group nor to their continued use of their present facilities and site which were previously approved by the SCA. We are also not opposed to reasonable expansion within their current property sites at White Horse Court or 1300 Boulevard Way. However, structured as this proposal is, we ask that the application for the new sanctuary use permit be denied.

The proposed new sanctuary is a huge construction project, well beyond the needs of a neighborhood church with only 350 members in the neighborhood. Further, Sufism Reoriented claims no plans for future growth. The sanctuary proposed in the

"Dedicated to Preserving the Quality of Life in the Saranap Neighborhood since 1997"
Ms. LaShun Cross  
County File LPo8-/ MS080011  
July 31, 2008

Present application would overtake existing residential properties in the Saranap Area and convert them to non-residential uses, a serious encroachment into the Saranap’s precarious, semi-rural, residential nature.

Sufism Reoriented has been buying up properties around the present site, apparently in anticipation of this and future expansion of their facilities. The larger community has never been informed of their long-range plans, or given an opportunity to embrace or reject them. Sufism Reoriented claims to have no long range plans. Further, they claim they are not building a regional or national facility and have suggested they may need to sell some of their property holdings to pay for this sanctuary project. They have made no public commitment to limit their growth to a size that would be considered reasonable for a neighborhood church.

ALTERNATIVE APPROACH

The present compound at White Horse Court is, by itself, large enough to accommodate a sanctuary building sized more appropriately to a church in this neighborhood. The application for the currently existing compound was approved by the SCA years ago. It was then, and remains today, large enough to allow for the construction of additional buildings within the compound area to meet the reasonable needs of a growing neighborhood church whose membership, by their own claims, lives within walking distance of the present site.

We ask that the application for the new sanctuary use permit be denied as proposed. We ask the applicant to provide a reasonable long-range development plan for the benefit of the whole Saranap community. Last, we ask that the applicant scale the present sanctuary plan to one more appropriate to the immediate community environment and resubmit the application on that basis.

Whether the applicant downsizes his application or not, there are many concerns that the community wants to have resolved before any construction begins. These are described in the remaining paragraphs of this letter.

BACKGROUND

About November 2007, Sufism Reoriented (the applicant) requested a special board meeting of the SCA to make a presentation to the board members. A special meeting was scheduled for a week later, and Sufism Reoriented described their new, proposed sanctuary project. Only general information about the project was offered. No plans or descriptive information were given to the board at that time. The project was not well received by the board since it violated the basic mission and premise of the SCA which is to maintain the semi-rural residential nature of Saranap.

At that meeting it became clear that many board members shared the feeling that this sanctuary project was not suitable for the Saranap Area as it proposed to take as many as seven residential properties, destroying any existing homes thereon, and
converting those properties to non-residential uses if the County granted a land use permit for this purposes.

Saranap is a mature, residential community. There are few properties left for any major developments other than in-fill projects. The mission of the SCA has always been to work vigorously to maintain the semi-rural, residential nature of the Saranap Area. Any encroachment that is not residential, and even some higher-density housing projects, become a threat to this community, as each such encroachment erodes the community as a whole.

We were assured by the representatives of Sufism Reoriented that the County could not deny the use permit since the applicant was a “church,” presumably referring to the so-called RELUPA law. While that law does provide for reasonable growth of an established church in a residential neighborhood, it does not pro forma require the community to grant any approval for unlimited growth and expansion of this scope, especially to uses well beyond the reasonable needs of a church congregation.

Within a few weeks of the special board meeting, the majority of the board members of the SCA made their opposition to the project known to me as President of the board and the Association. It was clear that the majority of the board (seven of eleven members) were opposed to the project; the remaining four members who were not opposed are members of Sufism Reoriented.

THE SITE

The project design, as proposed, will overtake seven residential lots. The majority of the Saranap homeowners want the area to remain as a semi-rural, residential area. This sanctuary project will replace existing residential lots even though there is more than ample space on the existing property currently used by the church.

We did expect some growth for this church and believed that such growth could easily be accommodated within the current compound on White Horse Court which now houses the home of the Sufism Reoriented spiritual leader. We still feel that that property is more than adequate, even for a sanctuary. Since that compound was built, Sufism Reoriented has been buying more and more properties around their present site.

Owning so many properties in such a concentrated area would lead any reasonable person to “connect the dots,” and recognize that the properties owned are perfectly situated for a much larger, more ambitious, campus or enclave. Sufism Reoriented has claimed they would “probably” sell many of the properties to pay for construction of the sanctuary. This may or may not be true but in spite of many public opportunities to do so, they have made no promise to this community that expansion or construction would stop at this project.

Sufism Reoriented membership is cited as about 350 people, most of whom live within walking distance of the present church. Despite assurances from Sufism
Ms. LaShun Cross  
County File LP08- MS080011  
July 31, 2008

Reoriented that they think this project would accommodate all their needs for the future, we strongly suspect this project is just one more growth increment of a larger, regional plan leading to a major regional or national campus. It has been up to now, and all evidence points in that direction. Such growth will attract more Sufism Reoriented members to an increasingly expanding enclave. This would lead to devastation of the present Saranap Community.

ARCHITECTURAL DESIGN

The design, as proposed, is not suitable for this residential neighborhood. While the architect’s design is elegant and would fit well in a commercial setting, these domed buildings are an intrusion into a neighborhood of conventional single-family homes. To claim the domes represent the lines of the nearby hills yet won’t be visible from the street is disingenuous at best.

Based on the property holdings of the applicant, we expect to see growth of the compound as the congregation continues to grow – which, as pointed out earlier, it is bound to do with this larger facility. Again, we are not opposed to the church or its congregants. We are, however, vigorously opposed to any overtaking and conversion of any residential properties to accommodate this sanctuary, to the unsuitable architecture, and the likely future expansion into this older, quiet, residential neighborhood.

TRAFFIC

Sufism Reoriented claims there will be no increase in traffic. This certainly cannot be true at all for the construction phase, and we are concerned about the traffic of the occupancy phase, once the book store is opened and the sanctuary is available to its members. Despite assurances that church members will walk to church, we are sure that enough vehicular traffic will use the driveway opening onto Boulevard way to create a hazard. The driveway to this new and enlarged facility is proposed to be located at a point northbound on Boulevard Way after the sharp bend in the roadway at the Kinney Drive intersection. This intersection is already treacherous, requiring that drivers slow down to about 10 MPH in order to “look” around the bend for oncoming traffic before they can safely make a turn onto Kinney Drive. Furthermore, when turning into a driveway, they must do so rapidly to minimize the possibility of being rear-ended by northbound traffic on Boulevard Way that does not see the slowing vehicle until it’s too late. Increasing site distances may help, as could removing the proposed six-foot wall, but the reality is that accidents are going to occur.

BOOKSTORE IS A COMMERCIAL ENTERPRISE

Once built, the sanctuary building would hold a bookstore open to the public. Such a bookstore, even with its narrow interest, constitutes a commercial enterprise, and is definitely not suitable for a residential neighborhood. This would be true even if sales were limited to internet customers, as book deliveries and shipments will add
directly to the traffic burden near the treacherous intersections of Boulevard Way, Kinney Drive, Garden Court, and Iris Lane. Should this project be approved, we ask that the bookstore be disallowed.

COMPOUND WALL

Next, we object to a six-foot wall, or fence, around this compound. Granted, years ago we did not object to the present six-foot brick and stucco wall around the present White Horse Court compound, but in retrospect we see it clearly conveys a sense of exclusion and isolation to our Saranap visitors, neighbors, and passers-by. It is very institutional in form, and certainly not pleasant. And, by adding more, similar walls, the area will become an uninviting enclave resembling a penal institution.

ENVIRONMENTAL

We also have a number of concerns about the environmental impact of this project, both during construction phase and the later occupancy phase.

(1) SOILS: We are very much concerned about the condition of the deeper soil on the site and the disposal of excavation spoils. Since the plan is to build an underground complex over an acre in size (four times the size of a typical Saranap residential lot) and to a depth of greater than one story, we feel that before any soil is removed, the soil must be chemically sampled for contaminants by an independent, State-certified laboratory. Samples should be taken over the entire site at close intervals, at several levels, and to a depth of at least 20 feet. If any contaminants are found, a remediation plan must be developed and approved by the County before any soil removal begins.

A major portion of this site was previously the McGeehon Construction Company's corporation yard. Much of that yard was unpaved and heavy construction equipment repairs were done over the unpaved yard, year round, for many years— at a time when no one was concerned about the effects of dumping oils, solvents, or fuels into the ground. The existing facility on what is now White Horse Court did not reach as deep into the soil, compared to this new project. We expect a chemical analysis of deep soils will reveal diesel fuel and gasoline spills, asbestos, and hydraulic oils (a common source of Poly-Chlorinated Biphenyls (PCBs), a known cancer-causing agent (and banned by the State of California), ethylene glycol, and possibly elemental mercury from broken, high-current starter-contactor-relays used on diesel engines. The County’s experience with this type of site could suggest checking for other hazardous compounds, including lead-based paints.

(2) GROUNDWATER: During the 1990s, the State of California required that the oxidizing additive MTBE be included in gasoline. Later, MTBE was found to quickly contaminate soils around the stations dispensing this fuel, spreading much further than gasoline alone and contaminating water supplies long distances away from the source. Its use was discontinued by mandate of the State of California. However, the MTBE
plume remains in the soils and is still spreading. Cleanup is difficult if not impossible because of the mobility and nature of the MTBE compound itself. There are numerous groundwater springs in this area and a relatively high water table. It is more than likely that ground and/or ground water on or near this property has been contaminated.

(3) DRAINAGE: Any plan to develop this sanctuary, whether reduced in size or not, must include a comprehensive plan to accommodate any storm runoff safely. The Saranap Area has had continual problems with rain runoff and with storm drainage. Many homes face water damage during every winter during rainstorms. The properties directly across Warren Road have had severe erosion damage in recent years which has not been corrected by any agency.

We are also concerned that some of the chemicals mentioned in the previous paragraphs, as well as others, may be carried off the property, especially toward Las Trampas Creek which is located directly to the south of the proposed site. While the applicant has proposed interlocking pavers for their hardscape surfaces, ground saturation will allow hydrocarbon soil contaminants to float to the surface and be transported downhill. Should this new facility be approved, we would want a storm drain plan be prepared and implemented capable of handling 100-year storms without the runoff carrying chemicals off the site.

(4) LIGHTING: We are a “dark skies” neighborhood. We have no street lights and have resisted their installation. There are a number of amateur astronomers in the Saranap Area. In recent years, their numbers have reduced some due to light pollution, even in our semi-rural residential area. The applicant’s plan to illuminate the domes and the grounds, to heights of 33.5 feet above grade, will create a very objectionable sky-shine, seriously reducing the sensitivity of any astronomer’s instruments. Light pollution is “visible noise” and will mask the light of weaker stars otherwise visible on a dark, clear night, especially on more humid nights.

We object to any night lighting anywhere on or around this project. The Hidden Oaks project in nearby Lafayette agreed to this condition, and our night skies are reasonably free of scattered light from local sources that will impair and obscure night viewing. We do not wish to see any security or other lighting because this project should not impact our neighborhood astronomers.

(5) ENERGY IMPACT: While water fountains are lovely, we are well past the stage of being wasteful of water and electrical energy, especially in a state such as California where drought is a persistent problem. Water losses due to the increased evaporation of mist and the electrical energy needed to circulate the volume of water are a demand that should be eliminated to minimize the overall energy impact of this project.
NOTICING

We ask that you please notify us of any actions or hearings on this application and any projects related to this application, at the address above.

PUBLIC HEARING REQUEST

And finally, we request that a public hearing be held on this application with sufficient advance notice so that interested parties will be able to attend.

We appreciate the opportunity to comment upon the subject application for a land use permit on the multiple properties in question (parcel numbers 184-450-006, 184-450-007, 184-450-012, 184-450-031, 184-450-032, 184-450-033, and 184-450-034). Thank you for your consideration.

Sincerely,

\[Signature\]

RE: Parsonage for Sufism Reoriented  
11 White Horse Court  
Walnut Creek, CA 94595  

DATE: APRIL 26, 2010  
CCCFPD Project No. 113925-ALT  

The following is a response to your request for alternate methods approval concerning the above project. Your request to allow emergency vehicle access from Warren Road with approximately 104 feet of access being reduced to as low as 13 feet 6 inches in width has been approved based on the following conditions:

1. The existing fire sprinkler system in the Parsonage building shall be modified to include full protection without the omissions provided in Sections 6.8.2 through 6.8.6 of NFPA 13D 2002 Edition. The installing contractor shall submit three (3) sets of plans to this office for review and approval prior to installation.

2. Access from Warren Road to the Parsonage building (with the exception of the approved 104-foot portion stated above) shall have a minimum unobstructed width of 20 feet.

3. An approved fire truck turnaround shall be provided at the Parsonage building.

4. Emergency vehicle access, including the turnaround, shall have a paved surface capable of supporting an apparatus loading of 37 tons.

5. Signage shall be provided on Warren Road at the entrance to the private lane indicating the addresses for the residences that are accessed from this roadway.

6. "No Parking" signage shall be provided throughout the private access roadway.

7. Trees shall be trimmed and maintained to preserve a minimum vertical clearance of 13 feet 6 inches.

8. If the property at 2438 Warren Road (APN 184-450-022) is ever purchased by Sufism Reoriented, the private access roadway width at this location shall be increased to a minimum unobstructed width of 20 feet.

IF YOU HAVE ANY QUESTIONS, PLEASE CONTACT THE UNDERSIGNED.

Lewis Broschard - Acting Fire Marshal

I FD.161 FIRE ACCESS ROAD SHALL BE AN ALL-WEATHER ROAD THAT SUPPORTS FIRE APPARATUS WEIGHING UP TO 37 TONS.

I FD.171 PROVIDE AND INSTALL SIGNAGE ON WARREN ROAD OF ADDRESSES FOR RESIDENCES ACCESSED BY FIRE ACCESS ROAD.
Dear Mr. Cross:

We have reviewed the revised development plan and land use permit application to combine seven parcels into one parcel and construct a 20,000 square foot sanctuary with 10,000 square feet below grade at the subject location. The following is required for Fire District approval in accordance with the Health and Safety Code, the 2007 California Fire Code (CFC), the 2007 California Building Code (CBC), and County Ordinances:

1. Access as shown on Sheet P3.0, dated 6/12/09, does not comply with Fire District requirements.

   Although access for the proposed sanctuary building meets minimum requirements, adequate access to the parsonage building has not been provided. Currently, the existing parsonage building meets minimum access requirements. The proposed sanctuary project eliminates the conforming access from Boulevard Way to the parsonage building and proposes that access be provided by a non-conforming roadway from Warren Road. The existing access from Warren Road is only twelve (12) feet wide. If this roadway is to provide access to the parsonage building, it is required to have a minimum clear width of twenty (20) feet throughout.

2. The turnaround for the parsonage building as shown on Sheet P3.0, dated 6/12/09, does not comply with Fire District requirements.

   Plastic cell systems, such as Grass Pave2, are not permitted for this application, however, the Fire District has approved concrete cell paving systems for turnarounds provided that the civil engineer of record for the project provides the Fire District with a stamped analysis that the proposed product and subgrade is capable of supporting a vehicle loading of 37 tons with a maximum of one-fourth-inch deflection. Additionally, porous paving systems are required to be delineated by a minimum six-inch wide concrete edging strip with reflective markers spaced at 25-foot intervals for emergency response identification.

3. Access roadways of less than 28-feet unobstructed width shall have signs posted or curbs painted red with the words "NO PARKING – FIRE LANE" clearly marked. 22500.1 CVC, (503.3) CFC

4. The developer shall provide one hydrant of the East Bay type. Hydrant location will be determined by this office. (C103.1) CFC

5. The developer shall submit three (3) copies of site improvement plans indicating all existing or proposed fire apparatus access for review and approval prior to construction. (501.3) CFC

6. Emergency apparatus access and hydrant shall be installed, in service, and inspected by the Fire District prior to construction or combustible storage on site. (501.4) CFC
7. Access gates for Fire District apparatus shall be a minimum of twenty (20) feet wide and swing inward or slide horizontally. Electrically operated gates shall be equipped with a Knox Company key-operated switch. Manually operated gates shall be equipped with a noncase-hardened lock or approved Fire District lock. Contact the Fire District for information on ordering the key-operated switch. (D103.5) CFC

8. The developer shall provide an adequate and reliable water supply for fire protection with a minimum fire flow of 1500 GPM. Required flow shall be delivered from not more than one hydrant flowing for the duration of 120 minutes while maintaining twenty (20)-pounds residual pressure in the main. (608.1), (B105) CFC

9. The building as proposed shall be protected with an approved automatic fire sprinkler system complying with the 2002 Edition of NFPA 13. Submit three (3) sets of plans to this office for review and approval prior to installation. (903.2) CFC

10. The sanctuary building and the existing parsonage shall be addressed from the roadway in which it is served. Premises identification shall be provided. Such numbers shall contrast with the background and be a minimum of six (6) inches high with one(1)-inch stroke or larger as required to be readily visible from the street. (505.1) CFC, (501.2) CBC

11. The developer shall submit three (3) complete sets of plans and specifications of the subject project, including the following required built-in fire protection systems, to the Fire District for review and approval prior to construction to ensure compliance with minimum requirements related to fire and life safety. Plan review fees will be assessed at that time. (901.2) CFC, (108.4.1) CBC

- Building construction plans
- Private underground fire service water mains
- Fire sprinklers
- Fire alarm

Our preliminary review comments shall not be construed to encompass the complete project. Additional plans and specifications may be required after further review.

Please provide this office with a copy of the conditions of approval as set forth by your Planning Division. If you have any questions regarding this matter, please contact the undersigned at (925) 941-3547.

Sincerely,

Ted Leach
Fire Prevention Technician

Boulevard Way, Walnut Creek
CCCFPD Project No.: 109876-PL

We have reviewed the development plan and land use permit application to combine seven parcels into one parcel and construct a 20,000 square foot sanctuary with 10,000 square feet below grade at the subject location. The following shall be included as part of the conditions of approval in accordance with the Health and Safety Code, the 2007 California Fire Code (CFC), the 2007 California Building Code (CBC), and other applicable regulations:

1. Access as shown on Sheet P3.1B, dated 5/12/08, does not comply with Fire District requirements. Although access for the proposed sanctuary building meets minimum requirement, adequate access to the parsonage building has not been provided. Currently the existing parsonage building meets minimum access requirements. The proposed sanctuary project eliminates the conforming access from boulevard Way to the parsonage building and proposes that access be provided by a non-conforming roadway from Warren Road. The minimum required width for roadways providing access to more than two homes is 20 feet. The existing access from Warren Road is only 12 feet and would serve four residences. In addition, access roadways exceeding 150 feet in length require provisions for the turning around of Fire District apparatus, which has not been provided in this proposal.

The developer shall provide an emergency apparatus access roadway with an all-weather driving surface of not less than 20-feet unobstructed width, and not less than 13 feet six inches of vertical clearance, to within 150 feet of travel distance to all portions of the exterior walls of every building. Access roadways shall have a minimum outside turning radius of 45 feet, and must be capable of supporting the imposed apparatus loading of 37 tons. (503) CFC
2. Dead-end emergency apparatus access roadways in excess of 150 feet in length shall be provided with approved provisions for the turning around of Fire District apparatus. Contact the Fire District for approved designs. (503.2.5) CFC

3. Access of less than 28-feet unobstructed width shall have NO PARKING – FIRE LANE signs posted or curbs painted red with the words NO PARKING – FIRE LANE clearly marked. 22500.1 CVC

4. The developer shall provide one hydrant of the East Bay type. Hydrant location will be determined by this office. (C103.1) CFC

5. The developer shall submit three copies of site improvement plans indicating all existing or proposed fire apparatus access for review and approval prior to construction. (501.3) CFC

6. Emergency apparatus access roadways and hydrant shall be installed, in service, and inspected by the Fire District prior to construction or combustible storage on site. (501.4) CFC

Note: Gravel is not considered an all-weather roadway surface for emergency apparatus access. The first lift of asphalt concrete paving shall be installed as the minimum subbase material and capable of supporting the designated gross vehicle weight specified above.

7. Access gates for Fire District apparatus shall be a minimum of 20-feet wide. Access gates shall swing inward and be setback from public right-of-way by a minimum of 30 feet. Electrically operated gates shall be equipped with a Knox Company key-operated switch. Manually operated gates shall be equipped with a noncasehardened lock or approved Fire District lock. Contact the Fire District for information on ordering the key-operated switch. (D103.5) CFC

8. The developer shall provide an adequate and reliable water supply for fire protection with a minimum fire flow of 1500 GPM. Required flow shall be delivered from not more than one hydrant flowing for the duration of 120 minutes while maintaining 20-pounds residual pressure in the main. (508.1), (B105) CFC

9. The building as proposed shall be protected with an approved automatic fire sprinkler system complying with the 2002 edition of NFPA 13. Submit three sets of plans to this office for review and approval prior to installation. (903.2) CFC

10. The proposed sanctuary shall be addressed from Boulevard Way, whereas the existing parsonage building shall maintain addressing from Warren Road.

11. Premises identification shall be provided. Such numbers shall contrast with their background and be a minimum of four inches high with ½-inch stroke or larger as required to be readily visible from the street. (505.1) CFC, (501.2) CBC
12. The developer shall submit three complete sets of plans and specifications of the subject project, including the following required built-in fire protection systems, to the Fire District for review and approval prior to construction to insure compliance with minimum requirements related to fire and life safety. Plan review fees will be assessed at that time. (901.2) CFC, (108.4.1) CBC

- Building construction plans
- Private underground fire service water mains
- Fire sprinklers
- Fire alarm

*The above-referenced CCCFPD Project Number shall be required in all correspondence or communication with the Fire District.*

Our preliminary review comments shall not be construed to encompass the complete project. Additional plans and specifications may be required after further review.

Please provide this office with a copy of the conditions of approval as set forth by your Planning Division for our files.

If you have any questions regarding this matter, please contact this office at 925.941.3300.

Sincerely,

Ted Leach
Fire Prevention Technician

re: LP08-2034, MS080011 / 2428 Warren Road, Walnut Creek / Christopher D. Martin

Dear Lashun Cross:

Records at this office were reviewed to determine if this project could adversely affect cultural resources. Please note that use of the term cultural resources includes both archaeological sites and historical buildings and/or structures. The review for possible historic-era building/structures, however, was limited to references currently in our office and should not be considered comprehensive.

Previous Studies:
XX This office has no record of any previous cultural resource studies for the proposed project area.

Archaeological and Native American Resources Recommendations:
XX The proposed project area has the possibility of containing unrecorded archaeological site(s). A study is recommended prior to commencement of project activities.

XX We recommend you contact the local Native American tribe(s) regarding traditional, cultural, and religious values. For a complete listing of tribes in the vicinity of the project, please contact the Native American Heritage Commission at 916/653-4082.

Built Environment Recommendations:
XX The 1948 USGS Concord 15' quad depicts seven buildings in the proposed project area. Since the Office of Historic Preservation has determined that any building or structure 45 years or older may be of historical value, if any of these structures are still standing, it is recommended that prior to commencement of project activities, a qualified architectural historian familiar with Contra Costa County history conduct a formal CEQA evaluation.

If archaeological resources are encountered during the project, work in the immediate vicinity of the finds should be halted until a qualified archaeologist has evaluated the situation. If you have any questions please give us a call (707) 6640880.

Sincerely,

Jillian E. Guldenbrein

SUBJECT: LP 08-2034/MS 08-0011 — 30-Day Comments

FILES: 92-2034-08 & 1003-0011-08

MESSAGE:

We have reviewed the Land Use Permit (LP) and Minor Subdivision (MS) applications and Preliminary Site Plan for Sufism Reoriented located along Boulevard Way (APN 184-450-006, -007, -012, -031 through -034). The submittal was received by our office on July 30, 2008, and we offer the following comments:

1. The proposed project is located in Drainage Area 121, an unformed drainage area. Therefore, there are no drainage area fees due at this time.

2. According to our records, there was a complaint against APN 184-450-032 on January 19, 2001, regarding the 8-feet tall concrete wall built abutting APN 184-450-017 at that time. Complainant was concerned that the wall may impede the natural, historic drainage for his son’s property (APN 184-450-017). Complainant also asked about public comment period for the construction of the wall because he was unaware of one. We are not sure if the Complainant received a copy of Notice of Intent to Render Administrative Decision, dated January 11, 2001.

3. The developer should be conditioned to design and construct storm drain facilities to adequately collect and convey stormwater entering or originating within the development to the nearest adequate man-made drainage facility or natural watercourse, without diversion of the watershed, per Title 9 of the County Ordinance Code.
4. The applicant should be required to submit hydrology and hydraulic calculations to the Engineering Services Division of the Public Works Department that prove the adequacy of the in-tract drainage system and the downstream drainage system.

5. It appears that this development will create higher density than the zoned R-10 use, which may contribute more runoff than originally anticipated into Las Trampas Creek. The applicant should be required to submit hydrology and hydraulic calculations to the Engineering Services Division of the Public Works Department, showing how the 50-year design storm plus freeboard and the 100-year design storm affects Las Trampas Creek.

6. The applicant should be required to comply with the current NPDES (National Pollutant Discharge Elimination System) requirements under the County Stormwater Management and Discharge Control Ordinances and the C.3 Guidebook. We support the State's goal of providing best management practices to achieve the permanent reduction or elimination of stormwater pollutants and downstream erosion from new development. The Contra Costa County Flood Control & Water Conservation District is available to provide technical assistance for meeting these requirements under our Fee-for-Service program.

If you have any questions, please call Jane Kao at (925) 313-2179 or me at (925) 313-2363.

SUBJECT: PERMIT LP 08-2034/SUBDIVISION MS 08-0011 ADDITIONAL COMMENTS – BOULEVARD WAY (Sufism Reoriented/Boulevard Way/Walnut Creek/APN 184-450-006, -007, -012, -031 through -034)

FILE: LP 08-02034

As indicated in our previous memorandum, dated July 22, 2008, additional comments from our Transportation Engineering Division would be forwarded upon receipt. The following are additional comments from our Transportation Engineering Division:

**Boulevard Way**

- The Site Plan and Tentative Map, received by your office on July 3, 2008, were not consistent with the 'Revised Precise Alignment Study for Boulevard Way' (Study). The Study was distributed to the applicant's representative and engineer at a meeting on December 19, 2007, and is attached to this memorandum for your use and distribution.

- The applicant will be required to widen and improve Boulevard Way along the project frontage to provide a pavement half width of 24 feet and a right-of-way half width of 34 feet. The alignment shall be in accordance with the Study (see attached). Any future submittal of the Site Plan and Tentative Map shall clearly show the required right-of-way dedications and roadway improvements in accordance with the Study.

DMA Project # 3084.08

Dear Lashun:

Based on your authorization we have reviewed the application materials for the proposed religious facility. The property fronts on the southeast flank of Boulevard Way, just north of the Warren Road intersection. The materials reviewed included a project description, along with a geotechnical report.

Approach

We reviewed pertinent geologic literature, the Safety Element of the County General Plan, and 1973 aerial photographs. With this background we evaluated potential geologic and seismic impacts and mitigation measures. We then reviewed the geotechnical report.

Background

1. Graymer, Jones & Brabb

The most recent geologic map of Contra Costa County is a digitized bedrock geology map issued by the U.S. Geological Survey. This map, which was published in 1994, is based on compilation of previous mapping and thousands of hours of field mapping to resolve geologic problems. This map classifies all valley bottom and esturine deposits as “Undivided Quaternary Deposits” (Qu). According to this map, the proposed Sufism Reoriented property is mapped as Briones formation (Tbr).

---

With respect to geologic structure, the site is bracketed to the east and west by north-northwest trending faults (possible ancestral branches of the Calaveras fault). In areas underlain by alluvium, these traces are represented by black dotted lines (see Figure 1). This symbol indicates that the fault is not known to offset Quaternary deposits, and the location of the fault traces is not accurately located. By interpolation from nearby measurements of bedding, the site is inferred to be near the axis of a northwest-trending anticline.

2. Bedrock Geology

Perhaps the most detailed geologic map of Walnut Creek area is a color, bedrock geology map published by the California Division of Mines and Geology in 1973 (see Figure 2). This map was published at a scale of 1:12,000, and is based on field geologic mapping, along with photointerpretation and literature review. According to this map, the site is located on the floor of a narrow valley. The valley bottom area that is mapped as "Quaternary terrace deposits" (Qt), which are locally overlain by a thin accumulation of younger alluvial deposits described as "Slopewash" (Qsw). These are Holocene colluvial and alluvial fan deposits. Exposed in the banks of Las Trampas Creek approximately 300 feet south of the site, Saul indicated that bedrock of the Rodeo Formation (Tr) and Briones Sandstone (Tbs) are exposed. With regard to geologic structure, a northwest-trending trace of the ancestral Calaveras fault is mapped passing approximately 1/2 mile east of the site. This fault is not considered active by the U.S. Geological Survey (USGS). No faults cross the property but the axis of a northwest-trending anticlinal fold which is in the bedrock crosses the site. No landslides are mapped in the site vicinity. The nearest active Concord fault is mapped approximately 5 miles northeast of the site.

3. Quaternary Deposits

The project is located in the central portion of Contra Costa County, on the floor of the Las Trampas Creek Valley. Most published geologic maps interpret the site as being underlain by Quaternary alluvium (undifferentiated). However, in 1997 the U.S. Geological Survey issued a surficial deposits map of Contra Costa County and adjacent area that divides Quaternary deposits into nine categories. Briefly summarized, the map shows three types of Quaternary deposits in the general vicinity of the site: Alluvial fan and fluvial deposits (Holocene) - Qpaf; Alluvial fan and fluvial deposits (Pleistocene) - QpaP; and undifferentiated gravel deposits (Pliocene and Pleistocene) - QTu.

Table 1 provides data on the age, texture, depositional environment and engineering significance. According to this map the site is mapped as QTu. The upland areas that flank the valley floor are mapped as bedrock (br). The nearest bedrock outcrop is approximately 500 feet northwest of the site.

---

4 Graymer, Saul, R.B., 1973 Geology and Slope Stability of the SW 1/4 of the Walnut Creek Quadrangle, Contra Costa County, California, CDMG (now California Geological Survey) Map Sheet 16.

In 1975 the U.S. Geological Survey issued photointerpretative maps of landslides and other surficial deposits of Contra Costa County at a scale of 1 inch = 2,000 feet. This map set is included in the Safety Element, where it is used as screening criteria to determine if there are potential landslide hazards on sites proposed for subdivision or development. Figure 3 shows the site and vicinity. It indicates that the site is within an area mapped as “bedrock” (r), with “colluvial deposits” mapped along the Boulevard Way frontage of the property.

4. Seismicity

There are no Alquist-Priolo Earthquake Fault Zones in the Saranap area. The active Concord fault is mapped 5 miles northeast of the site. North of the Town of Danville the Calaveras fault is not considered active by the USGS or CGS because there is no confirmed evidence of surface fault rupture during Holocene time (i.e., within last 11,000 years before present). However, this fault system is a potential seismic source, and a 1998 report prepared by Geomatrix found evidence of activity during the Late Quaternary on this fault system within the Walnut Creek area (minor offset with a right-normal-oblique sense of displacement). The alluvium that was offset was dated 31,410 radio-carbon years before present. The active Hayward fault is mapped 8 miles southwest of the site.

5. Liquefaction Potential

With regard to liquefaction potential, the Safety Element of the General Plan divides Contra Costa County into three categories: “generally high,” “generally moderate to low,” and “generally low.” According to this map, the site is in the “generally moderate to low” category. The Safety Element includes a number of policies indicating that at-risk areas require evaluation of liquefaction potential and effective mitigation of the hazard posed to new development. Operative General Plan policies are presented in Table 2.

This map is used as a “screening criteria” by Contra Costa County during the processing of land development applications. The County requires rigorous evaluation of liquefaction potential in areas of “high potential,” and less comprehensive investigations are demanded in the “moderate to low” category. The classification “generally high” liquefaction potential does not imply the presence of liquefiable

<table>
<thead>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td>10-18</td>
<td>This General Plan shall discourage urban or suburban development in areas susceptible to high liquefaction dangers and where appropriate subject to the policies of 10-20 below, unless satisfactory mitigation measures can be provided, while recognizing that there are low intensity uses such as water-related recreation and agricultural uses that are appropriate in such areas.</td>
</tr>
<tr>
<td>10-19</td>
<td>To the extent practicable, the construction of critical facilities, structures involving high occupancies, and public facilities shall not be sited in areas identified as having a high liquefaction potential, or in areas underlain by deposits classified as having a high liquefaction potential.</td>
</tr>
<tr>
<td>10-20</td>
<td>Any structures permitted in areas of high liquefaction damage shall be sited, designed and constructed to minimize dangers from damage due to earthquake-induced liquefaction.</td>
</tr>
<tr>
<td>10-21</td>
<td>Approvals to allow the construction of public and private development projects in areas of high liquefaction potential shall be contingent on geologic and engineering studies which define and delineate potentially hazardous geologic and/or soils conditions, recommend means of mitigating these adverse conditions, and on proper implementation of the mitigation measures.</td>
</tr>
</tbody>
</table>

---

sands on a parcel. The map attempts to be conservative of the side of safety, and where geologically recent alluvial and esturine deposits are shown on soils maps of the County, the map considers the property to be in the "generally high" category. Site specific investigations are needed to determine if liquefiable sands are present and to provide stabilization measures where liquefiable sands are confirmed. Because the site is in the "generally moderate to low" category, rigorous evaluation of liquefaction potential is not required.

6. Soils

According to the Soil Survey of Contra Costa County, the soil on the site is Tierra loam, 9 to 15 percent slopes (TaD). This is a soil which forms on alluvial fans and flood plains. It is a Class IV (i.e., non-prime) agricultural soil. With regard to its engineering properties, it has low strength when wet, a moderate to high shrink-swell potential, and a moderately slow permeability, and high corrosivity.

DCM Engineering

1. Purpose

The purpose of the geotechnical investigation was to provide specific criteria and standards for the geotechnical aspects of the project. DCM Engineering (DCM) estimates that excavations for building construction will be on the order of 20 feet (east side) and 30 feet (west side).

2. Subsurface Investigation

DCM logged six borings on the 3.1-acre site during 2007. The borings ranged from 33 to 40 1/2 feet in depth. The location of the borings are shown in Figure 2 of the geotechnical report. Boring B-4 was located near the center of the proposed sanctuary building, and the other five borings were positioned near the corners of the building. Table 3 provides a summary of the borehole data. The logs indicate that the site is underlain by alluvial deposits that are 23 to 30 feet thick in the borings. The alluvium consists of clay and silty clay interbedded with poorly sorted sand and gravel. Typically sieve testing found the sands to be 30 to 60 percent matrix material (clay and silt). The bedrock is described as siltstone/claystone which is severely weathered with a 20% ± moisture content. The lithologic description is consistent with the Rodeo Shale bedrock.

Two generally east-west cross-sections were prepared by DCM. One section is near the north wall of the sanctuary, and the other near the south wall of the sanctuary. They indicate that the excavations for the structure will not extend into bedrock. The excavation for the sanctuary will penetrate up to

Page 5

5 feet of undocumented fill that is underlain by interbedded clayey sediments and gravelly/sandy soils. The elevation of the building lower floor is anticipated to be at or below the water table.

3. Geologic Hazards

DCM indicates that a detailed hazards assessment was not included in their scope of work. Nevertheless, preliminary comments are provided (see Table 4).

5. DCM Conclusions

The geotechnical constraints influencing design, construction and long-term performance of the sanctuary include a) shoring and dewatering during construction to protect existing improvements, b) excavation base stability (heave, boiling, pumping), c) differential depth to bedrock below lower floor level of sanctuary building, d) bedrock corrosivity, e) foundation subgrade (bearing capacity/settlement), f) structure backfill (engineering properties/compaction criteria), and g) seismic design parameters (2007 California Building Code) are not included.

6. Recommendations

The DCM report provides specific criteria and standards for grading, drainage, foundations, temporary support of construction walls, and other geotechnical aspects of the project. It also identifies the required geotechnical monitoring and construction observation.

DMA Evaluation

1. Geologic Setting & Potential Hazards. The subsurface data is consistent with the project site being underlain by 23 to 30 feet (or more) of Plio-Pleistocene alluvium (QTu). Beneath the alluvium the borings of DCM encountered clayey bedrock that can be inferred to be Rodeo shale. The soils are likely to be at least moderately expansive, and the bedrock is reported by DCM to be very highly corrosive, which will affect the concrete mix and specifications for steel in the project. The data provided indicate that the risk of landsliding, liquefaction and surface fault rupture are less-than-significant.

2. Findings. In our opinion the report is adequate for the processing of the land use permit application. However, the construction of the project must be based on the 2007 California Building Code. DCM should provide the project architects and engineers with seismic parameters from that code (not the 1997 UBC). It should also be recognized that the Building Official may have other requirements or require further geotechnical analysis prior to issuance of construction permits.

Table 4

DCM HAZARD ASSESSMENT

- Faults and Fault Rupture: No active faults are shown trending beneath the site.
- Seismic Shaking: DCM provides an overview of seismic setting of the site. The report provides 1997 UBC seismic parameters. (Compliance with the building code criteria and standards does not indicate risk of structural damage can be avoided, but codes are intended to mitigate damage potential.)
- Liquefaction: The liquefaction potential of the materials penetrated in the borings was rated “nil” by DCM due to their density and clay content.
- Expansive Soils: The clayey alluvial deposits are considered to be moderately expansive.
- Corrosivity: The bedrock resting indicated that the weathered bedrock is very corrosive.
Limitations and Purpose

It should be recognized that the purpose of our review was to provide a professional opinion on the documents provided by the applicant. Specifically, we provide technical advice to assist the Department of Conservation & Development with discretionary permit decisions. Our services have been limited to review of the referenced reports. Our opinions and conclusions are made in accordance with generally accepted principles and practices of the engineering geology profession.

We trust this letter provides the evaluation and comments that you requested. Please call if you have any questions.

Sincerely,

DARWIN MYERS ASSOCIATES

Terrace deposits
Gravel, sand, silt and clay.
Locally capped by gravel (Qig).

Orinda Formation
Generally soft sandstone, siltstone, and claystone,
some hard sandstone and conglomerate units.
Top = Pinole member
Typ. half breccia and indurated sediments.
Top = Moraga Basalt member
Fissile and dense non-vesicular basalt.

Neroly Formation
Sandstone and shales grading upward to increasing proportion of shales and some conglomerate.
sh denotes two main shale units.

Cerrito Sandstone
Massive to well bedded, fine to coarse grained,
abundantly fossiliferous sandstone.

Briones Formation
Tbs = Shale member
Clay shale and shaly siltstone. Plant/foraminifera sandstones with
neither parallel mapped.
Tbs = Sandstone member
Mostly fine to coarse grained sandstone, interbedded with shaly siltstone and mudstone.

Rodeo Formation
Shale, plant/foraminifera fissile and friable
mudstone, argillaceous siltstone and shaly
fine-grained mudstone, sandstone.

Zoning Administrator
Determination on Adequacy of EIR
Transcript
Two Letters Received
PAT ROCHE: First up, we have Marie Cooper with the applicant’s law firm.

MARIE COOPER: Good afternoon. My name is Marie Cooper. I’m with the law firm of Perkins Coie and I represent the applicants, Sufism Reoriented. We started this project back in 2008. It’s been well over three years of study. We’ve done more study than would normally be required for a project this size. County has a rule saying traffic studies are not required if you’re going to generate less than 100 trips during peak hours. We none the less agreed to do a traffic study. We requested the County to prepare an EIR even though every study we had showed that a mitigated negative dec would be appropriate. The County has studied this extensively. It’s been a very long, very expensive process and we have a full comprehensive document before us. The only issue that I can see in there is a practical one, not a legal one, and that it was difficult to find where the revisions to text in the Final EIR had been made. I submitted a chart to the County where we went through and detailed where you could find each of those revisions to text in the Final EIR. We urge that you recommend certification of this document is adequate and completed in compliance with CEQA. I would like to reserve any time at the end in case there are questions.

PAT ROCHE: Thank you. The next speaker is Patricia O’Leary.

PATRICIA O’LEARY: My name is Patricia O’Leary and I live at 1305 Boulevard Way in Walnut Creek. As a member of Sufism Reoriented, I coordinate large sewing projects like making gowns for the singers in our performing chorus, smocks for the teachers at the Meher school or dancewear for performers in our devotional programs. We have no room for these activities in our current church building, so for several years we’ve had the living room of my home entirely filled with sewing machines and tables of sewing equipment. I will be very grateful for this new building and its adequate space for activities like sewing that support the ways that we express our devotion. It’s a relief to me to see the EIR rejected the alternative of a smaller building because I know our need for space. I want to say thank you to the County for recognizing this.

PAT ROCHE: The next speaker is Tom Smith.

TOM SMITH: My name is Tom Smith. My wife and I live at 27 Camino Posado Court on the south side of Warren Road above the creek. Our home is on the creek. Many of my neighbors were concerned about the exasperation possibly of erosion along the hillside above the creek so I was pleased to see the thorough and scientific investigation that the EIR took to this issue of vibration from excavation and construction activities. That is very reassuring.
PAT ROCHE: The next speaker is Ivy Summers.

IVY SUMMERS: I’m Ivy Summers and I live in apartment 311 at 1336 Boulevard Way. My apartment is an end unit right next to the sanctuary site. My bedroom and my living room face Boulevard Way and I’ve been thinking about how the noise of construction and trucks coming to the site will affect me. I understand that there is always disruption during periods of construction and that’s a necessary cost for a neighborhood to bear to benefit from long term improvements. From the mitigations described in the EIR, it looks like construction noise will be kept to a minimum and will be well within normal working hours. I’m sure that everyone wishes that the building could just appear on site without going through a construction phase, but obviously that is not possible. I appreciate that the EIR sets clear limits on the noise that will be generated by the project. I think this is one of those tradeoffs where there is a short period of inconvenience and then there is the reward of a beautiful sanctuary. Thank you.

PAT ROCHE: Thank you. The next speaker I have is Lorraine Granite.

LORRAINE GRANITE: My name is DR. Lorraine Granite. I live at 1312 A Boulevard Way, Walnut Creek and I also have a psycho therapy office on Boulevard Way. I managed Sufism Reoriented’s Traffic Management Plan which limits the number of cars parking at the church. Four years ago, we set a limit of 71 cars for our regular meetings with the exception of one night within the first few nights of inception. We have met that goal for every regular meeting every year. To do that, one half our members walk and others carpool. Even though our TDM plan is not a CEQA topic, I am pleased to see that the EIR writes about our TDM plan in a very knowledgeable and positive way. The County has gained a good understanding of the benefits of our plan and that speaks well of a plan like ours and that speaks well for the quality of this entire EIR. Thank you.

PAT ROCHE: Thank you. The next speaker I have is Ken Hastings.

KEN HASTINGS: My name is Ken Hastings. I live at 1310 A Boulevard Way in Walnut Creek. I was concerned about the possible problem of increased traffic in the neighborhood, so I was pleased to hear that that was addressed. I have grandchildren in the area and it means a lot to me to be able to walk in the neighborhood with my grandchildren. I’d like to praise the EIR and the County for addressing this traffic question. I was relieved to read that there will be no significant increase. Thank you to the County for this evaluation. Thank you.

PAT ROCHE: Thank you. The next speaker I have is Terry Hogan-Johnson.

TERRY HOGAN-JOHNSON: My name is Terry Hogan-Johnson and I live across the street. My husband and I both live across the street for the proposed driveway entrance to the new sanctuary and we fully support the project. I was heartened especially to learn and impressed with the consideration that was given to the night-time lighting. I just
really wanted to thank the County for the thorough report that they had done and giving consideration to the issues that were of concern to my neighbors. Thank you.

PAT ROCHE: The next speaker I have is J. David Dacus.

David Dacus: My name is David Dacus and I live and work at 1308 C Boulevard Way, Walnut Creek and that’s a few hundred yards from the project site. I’m a board member and chairperson of the application review committee of the Saranap Community Association. I’m an architect and planner in private practice in the Saranap and I’ve written design guidelines for all building types on projects as large as a 45,000 person community and as small as individual offices and homes. I’ve served on design review committees and design consistency review boards for city and county building authorities and I’m currently under contract to both types of planning authorities to perform design review services to residential, commercial and civic projects. I’m very familiar with EIRs and the CEQA process and have followed with interest several projects that have required their preparation in the Saranap area and in other areas of California. I can whole-heartedly say that I have not seen one that is more thorough than this project before you and it is not for a building complex or a whole town, but rather for a single neighborhood worship facility. Our community association has followed the proceedings for almost four years as preliminary designs were prepared and shared with our association and then formally submitted to the Department of Conservation and Development in July of 2008. The SCA has held three open and advertised public meetings on this project to allow neighbors to share their opinions and concerns and we have had representatives of the DCD such as yourself and the applicant speak at our meetings. We have spent many hours reviewing this project and discussing it with DCD staff, our members, and our elected board of directors. Results of these public meetings have each time been presented to the DCD to inform your process that you followed prior to and during the development of the Draft EIR. The result of the public meetings have been utilized in scoping for the Draft EIR and in meetings presenting the Draft EIR. The results have also been utilized in official letters from the SCA boards recommendations to the DCD regarding the project. We have been consistently heartened by the balanced and respectful treatment of all views expressed by our members and neighbors who have attended our meetings to make their views known. Those views on this project, whether in favor or opposed, have been met with care and diligent attention by the County staff. This is reflected in the final product of the revised Draft EIR, the comments and responses and the mitigation and reporting documents before you today. The SCA application review committee has not had a single disappointment about the thoroughness and completeness of this document. Having read all the revised draft, the responses to comments and the mitigation and reporting program, we are assured of both the completeness of this document in every aspect and in the painstaking care in which the County’s EIR consultants have examined the CEQA sections and made their decision in each case. We have found no area of concern unexamined and examined in thorough and even frequent ways. We are grateful to those outside independent consultants who have evenly examined the work in such detail and we are also grateful to the applicant and their support team who have answered every question we have posed and who have lent themselves to our review process in an open and helpful way. The SCA board and an
impressive majority of our membership and neighbors are in support of the conclusions of the revised Draft EIR. We urge your certification of it today on behalf of the whole Saranap community; we thank you and the County DCD staff for your efforts and for your diligence and professionalism.

PAT ROCHE: With that, I’m going to call the next speaker, Wayne Fettig.

WAYNE FETTIG: My name is Wayne Fettig. I live at 178 Kendall Road in Walnut Creek. I am here on behalf of the Saranap Homeowners Association. I am the president. I have here a letter from our legal counsel that is too lengthy to read in front of you so I will just submit this and I’ll sit down. Thank you.

PAT ROCHE: For the record, the Department did also receive that letter from Mr. Flash. The next speaker that I have is Marvin Rassmassen.

MARVIN RASSMASSEN: Good afternoon. I’m Marvin Rassmassen. I live at 2434 Warren Road, Walnut Creek, California. My house is adjacent to the building, the parsonage and adjacent to the property of the proposed construction area. I object to the construction for the removal of approximately 58 trees and the evacuation of the soil that’s going to cause noise pollution and diesel pollution of the neighborhood. Another thing I want to address is the verging of seven lots into one parcel to create 3.12 acre lots and the use of a driveway off of Warren Road which was meant for three or four single family residences. This driveway through legal is for them to use, but I object to the use of that driveways since they are combining seven lots together. The driveway was never meant for that. They have a parsonage which is 11 Whitehorse Court and the other six are all off of Boulevard Way. The accesses are all off of Boulevard Way and I would ask the County to ensure that the parsonage and all buildings built on the property have access from Boulevard Way and no access from Warren Road. Thank you very much.

PAT ROCHE: Thank you. The next speaker I have is Tim Lynch.

TIM LYNCH: Good afternoon. My name is Tim Lynch. I live at 2735 Acacia Road which is two blocks from the proposed project. I want to address the parking and traffic that I don’t think was addresses fully in the EIR. The Sufis are now using the parking lot for the office building next door to the current center for their regular events as well as the lot in their center. Both lots were filled to capacity for many events as well as overflow parking on Boulevard Way and neighboring residential side streets. The Sufis propose to use their Mayher School parking lot with shuttle service for their special events. The school is owned by the Lafayette School District and leased to the Sufis. The neighborhood swim club directly across the street from the school has used this parking lot for years numerous times for their swim needs. On the days of their meets, the entire lot is full as well as parking on both sides of the streets for a five to eight block area around the school. The school parking lot was also used for parking when the athletic fields are being used by the Lafayette sports leagues. The overflow of parking at the school will double up on the days when the Sufis have a special event and other groups are parking in the school lot and the surrounding neighborhood. How many
vehicles are going to be used for parking for the Sufis for the special events off site? Is that figure in the EIR? How many times per month or per year is my neighborhood going to be impacted by vehicles and shuttles traversing from their proposed project through our neighborhoods to the school? How many blocks of my neighborhood will be impacted with the Sufi which leases the school refuse to allow the swim club or the Lafayette athletic teams on games day to use their lot? How many blocks of parking would be needed to accommodate all these vehicles on the same day? I urge you to carefully consider these facts and others presented to you in determining whether this proposed project is contusive with our neighborhood and if all these matters have been adequately addressed by this EIR. Thank you.

PAT ROCHE: Thank you. The next speaker I have is Patricia Perry.

PATRICIA PERRY: Patricia Perry. 30 Meek Place, Lafayette, California. When I first heard about this project, I said so what’s the problem? Then I found out it wasn’t going to be located right near the existing facility but down the street at the corner and that was when I knew our neighborhood had a problem. I commented on the EIR and I’m here now because I could give you 50 reasons why I think the EIR is not adequate. I only have three minutes. What I wanted to point out is what I learned in my professional life is that the assumptions frame everything. What the County has done is assumed the lowest possible impact of this project. They’ve assumed the parking can be 71 spaces, even though the County ordinance specifically says, assembly halls without fixed seats one space for each 40 square feet of gross area. Other cities and counties have different ordinances, but that is Contra Costa’s ordinance. So what does Contra Costa say in the FEIR? They say well we don’t typically follow or ordinance, this is how we do it. We interpret it other than the exact wording of the ordinance. That is an example of what’s happened all the way throughout this project. There is a tree ordinance. The tree ordinance talks about preserving heritage trees, but because they can only fit 71 spaces and I don’t call it 72 because I don’t count the parsonage space, because they will do anything to have it down to that corner where it’s unsafe everything else is being excused away. By the way, I’ve lived there 33 years and I decided in about the first month of living there that that was an unsafe corner before the sanctuary was ever proposed. Thirty three years of using that corner and knowing it’s unsafe. Sufism says themselves in the statement they submitted that they intend to have events and as I’ve pointed out, the County has assumed away everything. They assumed that the EIR can be based on exactly what’s happening now in a much smaller facility. I don’t know if you’re familiar with the Lafayette Park Hotel, but things do change over time. I’m actually mixing two points here. I asked the staff in the city of Lafayette, how did you ever approve the Lafayette Park Hotel with that much parking? They said they hoodwinked. Now I’m not suggesting that the Sufis are hoodwinking the County but I am suggesting that it was City of Lafayette’s responsibility to look into how much parking a facility of that size needed and we are talking about a 66,000 square foot facility that’s going to be there in perpetuity, let’s hope for they’re sake. Anyway, as someone who grew up in Oakland I have seen many churches change hands over the years and I think the County has neglected its responsibility to give an analysis of the probably impact of the 66,000 square foot facility by assuming away and assuming its going to be the same as a 5 or
10,000 square foot facility. I’m sorry I don’t know the square footage. Thank you for your time.

PAT ROCHE: With that, I have two more remaining speaker cards. If anyone is intending today, please fill out the green speaker card. The next person I have listed here is Matt Isaacs.

MATT ISSACKS: Hello my name is Matt Isaacs. My wife and I live at the corner of Boulevard Way and Kinney Drive and 2691 Kinney Drive. We are thrilled with what a complete job the County has done in considering the potential environmental impacts and providing mitigations that will lessen all impacts to less than significant. We are especially pleased that the new plantings designed by Sufism Reoriented architects will created not only an interesting and artistically arranged palate of 100’s of trees but that a new view of Mount Diablo will be opened for those approaching Boulevard Way along Kinney Drive. Thank you.

PAT ROCHE: My last speaker card, Teresa Montgomery Huffson. I hope I pronounced that correctly.

TERESA HUFFSON: My name is Teresa Huffson. My husband and I recently bought the house at 2471 Warren Road which is adjacent to the south side of the sanctuary site. We were pleased to see that the EIR thoroughly addressed the issues of the stormwater runoff. It was wonderful to learn that there would actually be less water runoff after the construction than there is now. We are grateful for the extensive use of pervious materials in the driveways and parking lots. Thank you.

PAT ROCHE: That’s the end of the speakers that I have green cards for. I also want to acknowledge for the record we have two other letters that have come in response to the Final EIR. We have received a letter from a person by the name of Joyce Coleman who lives at 7081 Hilton Road in Walnut Creek and I will submit that for the record for purposes of the hearing today. Also, we have received a letter from the law firm representing the applicant, Perkins Coie from Marie Cooper. I just want to acknowledge that we have received those two letters also in addition to the letter from Mr. Flashman. As I noted at the outset, the purpose for the Zoning Administrator hearing is on the adequacy of the Environmental Impact Report. It is not on the merits of the project. That will be the subject of a hearing before the County Planning Commission which is coming up here in the month of October. I’m sure all of you will be aware of that when that meeting is finally noticed for the public hearing. I have completed my review of both the Draft EIR and the Final Environmental Impact Reports. Both volumes I and II including all appendices referenced therein for the project entitled New Sanctuary for Sufism Reoriented. The project entails the County approval of a land use permit and minor subdivision to construct a new 66,074 square foot sanctuary building on a 3.12 acre site at the 1300 block on Boulevard Way in the Saranap neighborhood. I find that this EIR has been prepared with a sufficient degree of analysis to provide the County decision-makers with information about the project’s physical effects in order to make a decision about the overall project. The EIR meets the requirements of the California
Quality Act otherwise known as CEQA in that it identifies significant effects on the environment of the proposed project. It evaluated a reasonable range of alternatives to the proposed project and it identifies feasible mitigation measures to mitigate or avoid significant effects of the proposed project. As required by CEQA, the Final EIR Volume II includes a response to comments submitted on the Draft EIR. The response to comments portion of the Final EIR is thorough providing master responses to comments to the many letters with common underlying themes and individual responses to more specific comments in comment letters. The responses provide a reasoned analysis addressed significant environmental issues raised in the comments and importantly explained why certain suggestions about the projects environmental effects are being rejected and for proceeding with the project despite the environmental effects. Volume I of the Final EIR includes the entirety of the Draft EIR with boldface underline and strike-out to where the text and one figure have been revised. I would note that these revisions primarily relate to new information to clarify existing information and do not constitute substantial change to the analysis and/or conclusions in the final EIR. It is for these reasons that I am recommending certification of the EIR to the next hearing body which would be the County Planning Commission. As a final note, I would recommend that Volume I of the Final EIR include a note that clearly indicates to the reviewer that the Draft EIR has been printed in its entirety with changes to the text that are signified by strikeout where text has been removed and by underlining bold text where the new text is added. I am normally accustomed to reviewing Final EIRs where it’s just the portion of the Draft EIR that’s been revised. In this case, our consultant chose to provide the entirety of the text of the Draft EIR. With that, I’m also recommending that the staff provide a table as a simple guide to enumerate by chapter where the text changes have occurred to make it simpler for decision makers and/or other reviews to track where these changes have occurred. With that, that concludes the Zoning Administrator’s hearing. The next step in this process is the hearing before the County Planning Commission. Thank you.
October 3, 2011

Hearing Officer
Contra Costa County Dept. of
Conservation & Development
651 Pine Street, 4th Floor – North Wing
Martinez, Ca 94553

Dear Hearing Officer,

I am writing on behalf of my client, the Saranap Homeowners Organization, to comment on the Final Environmental Impact Report ("FEIR") for the above-referenced project (hereinafter "Project"). While my client appreciates the time and effort that the County and its consultants have put into preparing the FEIR, We must protest the proposed certification of the FEIR as being adequate under the California Environmental Quality Act ("CEQA"). As explained more fully below, the FEIR fails to fully document the Project's potentially significant impact. Further, contrary to the FEIR's conclusions, the proposed mitigation is not sufficient to reduce all potentially significant project-associated impacts to a level of insignificance. Finally, especially because the FEIR cannot demonstrate, based on substantial evidence, that all project impacts can and will be mitigated to a level of insignificance, the FEIR is inadequate in its consideration of project alternatives. Each of these points will be explained in greater detail below.

THE FEIR FAILS TO IDENTIFY ALL POTENTIALLY SIGNIFICANT IMPACTS

I, and others, submitted numerous letters during the scoping of this EIR identifying potentially significant project impacts. When the Draft EIR was released, many comment letters, including one that I wrote on behalf of my client, were submitted. Both the scoping and comment letters identified potentially significant impacts beyond those the County identified in its Notice of Preparation and in the DEIR. Nevertheless, the FEIR has refused to acknowledge the additional potentially significant impacts, and has therefore failed to consider how these impacts might be mitigated or avoided. Potentially significant impacts that the FEIR failed to acknowledge include the following:

- Visual and aesthetic impacts
- Public services (fire protection) impacts
- Land use impacts

In terms of visual impacts, the FEIR claims that the large white domes making up the project will have no significant visual or aesthetic impact, other than a potentially significant night time impact as a source of glare. The FEIR fails to consider the Project's visibility and the inconsistency of the proposed architectural style and scale of the facility with the surrounding architectural style and scale. The FEIR also underestimates the visual impact of the Project buildings due to their scale and incongruous style, which will combine to make them "stick out like a sore thumb."
Unlike *Bowman v. City of Berkeley* (2004) 122 Cal.App.4th 572, 589-590, this project is not being placed in the midst of a highly-urbanized city center. Rather, it is being placed in the context of an existing residential community made up almost entirely of small, single-family homes. The proposed complex of large domed buildings, plus the very long, six-foot high white barrier wall surrounding the property, will be entirely out of keeping with the visual style and scale of the surrounding structures. Based on this, the EIR should have identified a potentially significant visual impact and should have considered, in its alternatives section, alternatives that might reduce that impact, including a project made up of structures with a reduced maximum height or with an architectural style more harmonious with the surrounding structures, as well as the proposed “campus” alternative that would reduce the Project’s visual impact by spreading it through the community, rather than concentrating it at one site. As it stands, the Project fits in about as well as a modern office building would in historic Williamsburg.

As to public services impacts, it was pointed out in my DEIR comment letter that the proposed emergency vehicle access (“EVA”) would use a driveway that is subject to a private easement. The FEIR points to a letter from the County fire marshal indicating that the proposed EVA would be acceptable from a fire protection standpoint so long as certain conditions were met. (FEIR Appendix C.) However, that letter does not address the question of whether the use of the driveway is feasible from a property impacts standpoint. As noted in my comment letter, extending the existing mutual private driveway easement, intended to service four private dwellings, to service a large religious complex would overburden the easement and be objectionable on that basis. The FEIR provides no evidence to indicate that the easement has been modified by the written and recorded mutual consent of all the participating property owners to allow its expansion to an EVA for the Project. Without that, the proposed EVA, in violation of the existing easement, cannot be considered feasible. The fire marshal’s letter did not address the question of whether the Project would be acceptable without this EVA or an alternative EVA, but the implied answer (given his insistence on required conditions on the EVA) is that it would not. Thus, barring evidence showing use of the EVA would be feasible from a property rights standpoint, there is an unacknowledged significant fire protection impact.

Finally, as to land use impacts, the County’s zoning ordinance specifies findings that must be made in order to grant the required use permit. In particular, the DEIR failed to address the non-religious uses that would be included within the Project and whether those uses would satisfy the requirements for a use permit. The failure to address these questions not only violates CEQA, it leaves the Planning commission without the necessary information to consider whether to grant the requested use permit.

**THE PROPOSED MITIGATION MEASURES ARE INADEQUATE**

For those uses identified as potentially significant, the FEIR sets forth mitigation measures which it claims will suffice to reduce Project impact to a level of insignificance. However, many of these mitigation measures are either inadequate on their face or include insufficient details or requirements to assure the mitigation of significant Project impacts. The mitigation measures need to be revisited or revised to assure that potentially significant Project impacts will be adequately mitigated.
Aesthetics (light & glare)

While the FEIR identifies the need to ensure that night time lighting of the domes does not result in significant light and glare, it does not identify how that mitigation measure will be monitored or enforced. Nor does it identify clear, objective, and enforceable standards for the mitigation that would assure mitigation of the Project’s night time glare impacts\(^1\). These need to be identified in the EIR and included in the Mitigation Monitoring and Reporting Program (“MMRP”). The monitoring and enforcement needs to be such that it will continue to be effective in the long-term, (i.e., monitoring and compliance cannot be limited to assuring compliance prior to issuance of an occupancy permit, because the type of lights used and the timing of the lights turning on and off could be changed at a later time) and independent of County budget cutbacks.

Air Quality

During construction, either excavated soil should not be allowed to be stored on-site, or any on-site soil storage areas must be watered twice daily and covered to avoid creating dust. This mitigation measure needs to be added to those identified in the FEIR.

Geology & Soils

The mitigation measure requiring the applicant to repair or correct any damage caused to surrounding buildings due to soil shifting, subsidence, groundwater changes, or construction-related vibrations cannot be relied upon unless a sufficient bond is provided to assure that money will be available to make necessary repairs. The size of the bond should be identified through a licensed professional’s consideration of the potential costs to repair the structures on lots close enough to the Project site to have a significant risk of structural damage due to any of the above-referenced project-related impacts. The bond should be held for a minimum of one year after the finish of construction to take into account the potential for delayed or latent damages.

Hydrology

The EIR notes that the Project will decrease impermeable surface coverage of the Project site, and assumes this, plus the SCP for the Project, will mitigate any groundwater impacts. As pointed out in my comment letter, both the pervious pavers and the SCP are intended to reduce surface stormwater run-off from the site. The presumption is that once stormwater goes below the surface and becomes groundwater, it is no longer of concern. This is incorrect. It is well known that, depending on the subsurface hydrology, groundwater can resurface elsewhere at a lower elevation as springs or seeps and re-enter the surface water system, potentially contributing to downstream flooding. This potential is neither considered nor analyzed. The FEIR includes no analysis of off-site groundwater flows and makes the unwarranted assumption that the additional stormwater run-off shunted underground through the use of pervious pavers will not have any significant impact on groundwater or surface water flows off-site. The analysis needs to be revised to explain what will happen to

\(^1\) The FEIR identifies loss of night sky visibility as the only significant impact to be mitigated. Night time visibility and visual obtrusiveness should also have been identified. Brightly lit monuments may be appropriate in Washington D.C., but they do not fit in a suburban residential community.
stormwater flows that are diverted underground, and provide assurance, especially with the disturbance in groundwater flows introduced by placement of the large underground foundation, that there will be no off-site impacts from increased or diverted groundwater flows.²

Traffic

The FEIR’s analysis of the Project’s potential traffic impacts was conducted under the assumption that the project’s proposed TDM Program as well as on the location of most of the Project sponsor’s members walking to and from activities occurring at the Project. However, there is no long-term requirement that members of the Project sponsor continue to walk to and from activities at the Project. A condition of approval needs to be added as a mitigation measure requiring that the Project sponsor demonstrate, on an annual basis, that the number of members driving to and from Project activities on a regular basis not exceed 200 during any peak hour period. Violation of this condition would require re-evaluation of the Project sponsor’s TDM program and the imposition of additional requirements and incentives designed to reduce the number of vehicles entering or leaving the Project during peak hours. Incentives should include the potential to require paid parking for onsite parking spaces, at least during peak hours, with the proceeds to be used to promote alternative travel modes in the area.

ADDITIONAL ALTERNATIVES SHOULD HAVE BEEN CONSIDERED

Given the Project’s significant visual and aesthetic impacts (see above), at least one alternative should have been considered that would have decreased these impacts. In particular, an alternative that reduced the maximum height of the Project’s building and/or required that the Project buildings be redesigned to be less obtrusive in their architecture (e.g., building shape and color) should have been considered and discussed. As also noted above, a campus alternative should also have been discussed, rather than just being dismissed as not achieving all of the Project sponsor’s objectives. Just because an alternative does not achieve all the project sponsor’s objectives does not make it infeasible and is not a sufficient reason, in itself, for refusing to consider an alternative. (CEQA Guidelines §15126(d)(1); Friends of the Eel River v. Sonoma County Water Agency (2003) 108 Cal.App.4th 859, 873; Citizens for Responsible Government v. City of Albany (1997) 56 Cal.App.4th 1199, 1222.)

Given the potential infeasibility of the current proposed EVA, an alternative should have been added that looks at an alternative EVA or other way of mitigating the Project’s potentially significant impact on fire safety and fire protection.

CONCLUSION

The current FEIR fails to meet CEQA’s mandate of providing a good faith effort at full disclosure of significant project impacts and how they could feasibly be mitigated or

² It should be noted that comments from nearby neighbors indicate that there are already problems with basement flooding from existing subsurface flows. These problems are likely to be exacerbated if the project increases those flows. In addition, increased subsurface flows could increase slope instability, leading to the potential to foundation damage or even slides. These risks should have been investigated and discussed in the EIR.
avoided. The EIR should be rewritten to address the flaws identified in this letter and the revised EIR recirculated for additional public comments.

Most sincerely,

Stuart M. Flashman
October 2, 2011

Ms. Catherine Kutsuris  
Director, Department of Conservation and Development  
Contra Costa County  
651 Pine Street  
North Wing, 4th Floor  
Martinez, CA 94553

Subject: Proposed 66,074 sq. ft. Sanctuary Project in Contra Costa County, County File #'s LP082034 and MS090008

Dear Ms. Kutsuris:

This letter requests the County Zoning Administrator to not certify the current version of the Final EIR, for the above-reference proposed Sanctuary Project, because the off-street parking requirement is inadequate based on the following reasons:

1. Page 2-26 of the Final EIR, Volume II, Master Response 7, states, "At about 5,000 square feet in area (including the space between pillars as well as the space encompassed by the pillars), the prayer hall would thus trigger a requirement of 125 parking spaces under County Code Section 82-16.018. This application of County standards represents the manner in which the County typically applies and interprets its requirements, including the interpretation of "gross floor area" to encompass only the prayer hall space. County practice is not to include space that does not comprise part of the assembly area, such as hallways, foyers, or the ambulatory surrounding the prayer hall." [Emphasis Added]

I take exception to the typical application of Contra Costa County (CCC) Code Section 82-16.018 with regard to the Prayer Hall because this proposed building is not typical. It is highly unusual for an assembly area to be surrounded by such a large continuous areas (termed foyers in this instance) that is not being counted toward gross floor area in order to determine required off-street parking. The FEIR incorrectly claims that the Prayer Hall building only triggers a parking requirement of 125 spaces under CCC Code Section 82-16.018. I call into question the validity of following what was said to be the "typical" application of CCC County Code Section 82-16.018 in this particular instance where the foyers are a continuous part of the assembly area and amount to an additional 6,848 sq. ft. of assembly hall space (four continuous foyers at 1,737 sq. ft. each that are continuous with each other and are a part of the "assembly area"). Please refer to the photo below labeled Figure 1. Contra Costa County should not follow their stated "typical" application of the off-street parking code because the foyers are continuous and together dwarf the limited 5,000 sq. ft. of Prayer Hall "assembly area" space that CCC is using to calculate required off-street parking spaces for this project. When CCC is dealing with an "assembly hall" with no fixed seating, how many times have they encountered such large multiple foyers continuous with each other and a part of the "assembly area"? Contra Costa County Code Section 82-16.018, which is very clear about the off-street parking requirement, states: "Assembly halls without fixed seats: One space for each forty square feet of gross floor area" [emphasis added]. This CCC code makes no exception for hallways, foyers, or ambulatory surrounding area.
If CCC feels the design of the proposed sanctuary prayer hall is typical, I request CCC to provide an example of a religious facility where a continuous foyer, larger than the "calculated assembly area," was not included in the final calculation to determine required off-street parking places. I suggest that, in this particular case, the proposed prayer hall pillar design does not separate the continuous foyers from the assembly area adequately to qualify for what CCC says is a "typical" application of CCC Code regarding foyers. Based on CCC code, using the continuous gross floor area of the assembly area would require 246 off-street parking places instead of the 125 required off-street parking places stated as required with this FEIR. While someone may be able to understand or accept a minor exception to the CCC off-street parking code, it is not acceptable to evaluate parking requirements based on 5,000 sq. ft. of an "assembly area" when 11,948 sq. ft. of continuous and usable "assembly area" exists for planned events at the facility (such as weddings as mentioned in paragraph 2 below).

2. Page 2-7 of the Final EIR, Volume II, Master Response 3, states, "The Draft EIR evaluates the environmental effects of the project based on the program of uses presented in Table 3-1. Based upon historical use of the existing facility at 1300 Boulevard Way as well as uses in the surrounding neighborhood, this program of activities represents a reasonable forecast of the use of the new facility. The project does not include a large outdoor spring event. Such events, if proposed, would be subject to the County’s Temporary Events Ordinance (Chapter 82-44). The comments proposing that activities may change or that membership may increase are not relevant to the significance of the environmental impacts of this project. The streets have sufficient capacity that even a theoretical, several-fold increase in membership would not cause traffic to exceed the established Level of Service Standard. Such a theoretical event would affect the need for parking, but as explained below, the need for parking is not an impact under CEQA." [Emphasis Added]

This FEIR statement, in Master Response 3, explains that an event mentioned in the Comments to the DEIR (that is not currently listed in historical or surrounding uses within Table 3-1 of Volume I of the FEIR) would affect the need for parking. Regardless of this fact, CCC continues to limit its FEIR evaluation of required parking spaces to uses listed within Table 3-1 (historical use at 1300 Boulevard Way and uses in the surrounding neighborhood). Regarding the need for adequate parking at the proposed facility, CCC must consider planned usage information (which is not theoretical) provided by the applicant that was included on page 8-8 of Appendix B to the DEIR which states the proposed facility "will also be used for special occasions, such as weddings, bazaars, the Meher Schools graduation dinners, and so forth." Also, on May 22,
2011, the applicant held a "Children's Spring Party" open to the general public at their current parsonage on Boulevard Way that was advertised to the general public via a large sign on the outside wall of their current sanctuary and could be read by all Boulevard Way drivers (approx. 4,500 Average Daily Traffic). At a minimum, Contra Costa County is required to take these types of events into account when calculating the required parking spaces for the proposed off-street parking lot. The uses I have mentioned above are historical SR activities or planned uses of the proposed facility and cannot be ignored when determining the appropriate number of spaces for the proposed off-street parking lot.

For the above reasons, the FEIR, as is, should not be certified.

Sincerely,

Joyce A. S. Coleman

Re: Final EIR
SCH No. 2010032038
County File Nos. LP082034 and MS090008
Client-Matter No. 76921-0001

Dear Ms. Cross:

Thank you for publishing the comprehensive Final EIR. It appears that alternatives is one of the more commonly-raised issues for this project. The Final EIR clearly explains why off site and reduced density alternatives (including the no project alternative) would not be feasible. This discussion reveals why the impacts associated with grading and excavation cannot feasibly be avoided, and why any archeological or historic artifacts discovered during excavation cannot feasibly be preserved in place. We appreciate the County’s thorough review of alternatives.

The Final EIR includes the entire Draft EIR redlined to show revisions to text. We have compiled a chart that indicates where in the Draft EIR the redlined pages can be found. We suggest making this letter, including its chart, part of the Final EIR so that the public and decisionmakers have this information handy.

Arlington County Commuter Services. “Transportation Demand Management for Site Plans,”
Arlington County Commuter Services. Transportation Demand Management Benefits SP #249 NRECA Phase 1 Office 4301 Wilson Boulevard.
You are entitled to benefits required by Arlington County to be provided by the owners of the building in which you live or work. Those benefits are:

**NRECA Employees:**

- Secured bicycle storage areas.
- Registered carpools and vanpools of two (2) or more persons park for free.
- Carpool and vanpool parking is located convenient to garage entrances and the elevators serving the building.

**Tenant Employees:**

- Secured bicycle storage areas.
- Registered carpools and vanpools of four (4) or more persons park for free.
- Registered carpools and vanpools of three (3) or more persons park at half the monthly rate.
- Carpool and vanpool parking is located convenient to garage entrances and the elevators serving the building.
- Ask your employer to set up a pre-tax employee transit benefit program to facilitate distribution of transit benefits. This will save you and your employer money.
- Ask building management about the transit subsidy program for new tenants ($45 per month per employee for a six-month period).

**Contact building management for details.**

For more commuting information visit our website: [www.CommuterPage.com](http://www.CommuterPage.com)

For information on getting around the Ballston area: [http://www.carfreediet.com/pages/arlingtons-urban-villages/ballston/getting-around/](http://www.carfreediet.com/pages/arlingtons-urban-villages/ballston/getting-around/)
Transportation Demand Management (TDM) is the establishment of measures to influence travel behavior by mode, frequency, time, route, or trip length in order to achieve a maximally efficient use of transportation facilities.

Arlington’s TDM policy focuses on workplace commuter travel and looks to reduce peak hour work travel by achieving a reduction of single occupant vehicle trips. It seeks this goal by encouraging (or, if necessary, requiring) the use of transit, ridesharing, biking, walking or travel outside of peak hours by individuals going to or from workplace centers. The County pursues land use and zoning policies which reduce vehicle trips by promoting proximity of housing and employment.

TDM in Arlington is planned and carried out as a cooperative endeavor of transportation system users, employers, developers, builders, building complex management’s, residents and county government. Its objectives are consistent with and help support those of the County’s Master Transportation Plan, including achievement of major street and intersection level of service goals.

The key elements in TDM in Arlington include:

- A TDM plan for each development site plan consistent with the TDM Matrix.
- A standard site plan condition to implement the TDM Matrix.
- In-building parking provisions that extend preference to vanpools, carpools and bicycles.
- The encouragement by employers of employee travel to and from the work place by modes of travel other than single occupant automobile through various educational and incentive measures.
- Coordination and cooperation on such measures among employers, building owners and management companies of an employment area through transportation management associations TMAs or districts.
- Arlington County encouragement to TDM planning in its roles as developer of public buildings and as employer.

The County also works through its planning and zoning activities with developers and neighborhoods to achieve the Arlington 2000 goal of workplaces and living places built in close “urban village” proximity to each other.
Major components of carrying out a TDM program for Arlington include (1) ridesharing promotion, (2) parking management, (3) transit promotion, (4) on-site construction measures, (5) mutually agreed off-site provisions or contributions, (6) lease agreements, and (7) monitoring and compliance. The demand management program distinguishes the intensity of the strategies and the impact of the development on the transportation system. The greater the impact, the more intense the mitigation measures to be sought. The categories and density thresholds are described in the following matrix.

The Arlington TDM program seeks to achieve the following results, which may be employed as evaluators of the success of the program. The results sought in Arlington’s program are:

1. Maintain peak hour level of service at major intersections at or preferably above Level of Service D.
2. Limit single occupancy vehicle trips generated by development.
3. Reduce vehicle-generated air pollution.
4. Maximize transportation alternatives while minimizing single occupancy travel.
5. Utilize transportation facilities efficiently.
6. Encourage efficient, cost effective modes of transportation that focus on moving people, not vehicles.
7. Improve transit information and dissemination so people will be able to make the most efficient and friendly use of the system.
8. Utilize public transportation effectively and efficiently, through improved system information, frequencies, routing, connections, transfers; innovative technologies are encouraged.
9. Configure mass transportation to provide access to, through, and around employment centers.
10. Encourage innovative technologies that move people between home and work the most efficient and effective way.
11. Maximize convenience of intermodal transfers between the commuter rail system and feeder/distributor systems.
12. Encourage group riding and shared parking arrangements through parking management plans.
13. Minimize or eliminate barriers to group riding.
14. Review transportation management plans during the site development process.

1990 MATRIX TRANSPORTATION DEMAND MANAGEMENT PROGRAM (2008 dollars*)

Standard County policy is set forth in the TDM matrix. However, upon showing of clear and convincing evidence that particular elements of the TDM matrix may be inappropriate for a particular project, the developer may propose substitution of other elements which provide equivalent value.

### Land Use Category Code
- A. GLUP consistent, no forecast traffic problem
- B. GLUP consistent, forecast traffic problem
- C. GLUP amendment requested, no forecast traffic problem
- D. GLUP amendment requested, forecast traffic problem

### Footnotes
1. Less than 100,000 sq. ft. gross floor area
2. 100,000 - 200,000 sq. ft. gross floor area
3. More than 200,000 sq. ft. gross floor area

http://www.bls.gov/cpi/home.htm
Category A includes development proposals which are consistent with the General Land Use Plan in terms of both land use type and density (i.e., office, mixed use, 3.0 floor area ratio (F.A.R.) and is located in an area not forecast to have a traffic congestion problem. Mitigation strategies are tied to the size of the development and include strategies that are basic to promoting group riding.

Category B includes development which is consistent with the General Land Use Plan and is located in an area that is forecast to have a traffic congestion problem. The intensity or range of required mitigation strategies would be related to the degree of the traffic problem. For example, if a proposed improvement which is scheduled for construction would improve the situation, the strategy might be required until the time that the improvement is completed.

Category C includes development which is inconsistent with the General Land Use Plan in terms of either land use or density (or both) and is located in an area not forecast to have a traffic congestion problem. Like Category B strategies, the intensity of the strategies would be related to the degree of the development’s inconsistency. The inconsistency would be measured in terms of a comparison of the trip generation factors, for by-right, planned, and proposed development.

Category D includes development which is inconsistent with the General Land Use Plan in terms of either land use or density (or both) and is located in an area forecast to have a traffic congestion problem. Like Categories B and C, the intensity of the strategies would be related to the degree of inconsistency. Being both inconsistent and located in a traffic congestion area, a comprehensive program coordinating a combination of several strategies at the highest level of participation would be required.

A second and third level of stratification are included in the categorical program to incorporate the density of the development and its location with respect to transportation facilities, such as proximity to a Metrorail Station or other public transport system or high occupancy vehicle facility with the cost of implementing specific mitigation strategies. The additional levels of stratification reflect economies of scale and program effectiveness with respect to size and location. Three density thresholds are used for grouping developments by size. The thresholds are detailed below.

Footnotes
1. Less than 100,000 sq. ft. gross floor area
2. 100,000 - 200,000 sq. ft. gross floor area
3. More than 200,000 sq. ft. gross floor area

F.A.R. - The ratio of floor area is an expression of density allowed on a specific parcel of land. A 3.0 FAR on a 10,000 square-foot site would allow 30,000 square feet of gross floor area of development.
Following is a brief description of various strategies of transportation demand management.

Strategies

I. Ridesharing Marketing

a. Basic to the success of any TDM program are employee education and information dissemination. At a minimum, developments are required to work with the County Ridesharing Program in promoting group riding to persons employed within the development. Strategies include transportation fairs, distribution of ridesharing marketing material to tenants and employees, displaying information material, such as posters, brochures, etc., in common areas, including hallways, elevators, restrooms, water fountains, building management offices.

In order to set objectives and monitor performance, employee transportation surveys should be conducted on an annual basis. Surveys are useful in determining commuting patterns, mode split, average commute distance and travel times, employee attitudes, needs, and willingness to switch modes. The data is useful in developing successful transportation programs, such as transit subsidies, and car and vanpool programs.

b. The results of the employee transportation survey may indicate the applicability of operating a vanpool program. Depending upon site location, the program may entail a shuttle bus system operating between the site and a Metrorail Station or company vans which provide transportation from the suburbs to the site. The uniqueness of the program is commensurate with the need to reduce vehicle trips to the site.

c. Vanpools generally need to operate at full occupancy (14 riders) to cover their operating expenses. To assist new or potential operators a number of state and local governments provide startup seed money to vanpool drivers. The programs include interest free loans for a specified period of time and passenger subsidies. Developer assistance includes additional loan programs, outright purchase, matching or doubling passenger subsidy programs and backup vehicles.

d. The success of an employer TDM program is greatly assisted if implemented through an Employee Transportation Coordinator (ETC). An ETC is an employee of the building management team and is responsible for implementing the developer’s TDM program. The ETC tailors the TDM program in response to employee transportation survey results. The ETC can be either a part time or full time employee, depending upon the number of employees on-site and the complexity of the TDM program (which may be a function of the degree of impact associated with the development). ETC duties include: TDM program implementation; conducting transportation surveys; managing a preferential parking and transit subsidy programs; and promoting group riding to development tenant employees.
e. Transportation information stores (referred to as “transit stores”) and transportation management associations (referred to as “TMAs”) are proposed to be located throughout the Metrorail development corridors. The transit stores and TMAs provide in one convenient location a resource of employee commuter information. Transportation information, such as Metrorail and Metrobus route, schedule and fare information, commuter bus operations, rideshare matching applications, vanpool subsidy programs, is provided to the public on a walk-in basis. Depending upon the category of development, a contribution to a Metrorail Station area transit store may be required if one presently exists or is planned for the area in the future. Three levels of participation are identified - $5,000, $10,000, and $15,000 per year. The term of participation may range from 10 years to as long as the operation exists and should include provisions for adjusting the contributions annually by the Consumer Price Index (CPI) to account for inflation.

f. In Metrorail Station areas where a transit store has yet to open or in areas not conveniently served by an existing transit store, proposed developments may be required to dedicate commercial area to a new transit store operation. The transit store may be required to be dedicated for as long as the development exists on the site or until a more central and convenient location is dedicated in a future site plan. Transit store contribution obligations provided for in i.e. above go towards operation of the transit store on a collective basis to cover lease costs, staffing and program development.

g. A reason often cited to not participate in ridesharing arrangements is the need to have a personal vehicle at hand for emergency situations. A number of innovative programs have been developed which provide emergency transportation to one’s home or child’s school, daycare, etc. Programs include a limited taxi/bus fare subsidy, relaxed company vehicle policies.

II. Preferential Parking Management

a. Preferential parking programs involve reserving conveniently located parking spaces for car and vanpools. Within multi-story parking garages convenient location is defined as near the elevators and close to the entry/exit points to reduce travel time and distance in the parking garage. The spaces are to be clearly marked “Reserved for car and vanpools.” The number of spaces set aside shall be unlimited. At a minimum, 10 percent of the parking supply shall be accessible to vans by providing a vertical clearance of 86 inches.

b. To encourage group riding, the preferential parking program shall include a parking rate agreement charging market rates for single occupant vehicles. Annual parking surveys shall be conducted to determine local area price structures for determining “market rates” to be charged.
c. To ensure that parking rates will reflect true market conditions in a competitive environment, lease agreements with parking garage operators are encouraged. Although a set number of spaces may be reserved for a tenant, the cost of an individual parking space is not controlled by the tenant and subsidies are prevented from being passed along to specific persons.

d. Parallel to charging full market parking rates, subsidies are

e. encouraged to promote group riding by both car and vanpools. Depending upon the category of development and the need to reduce single occupant vehicle trips to the site, parking rates for car and vanpools may range from market rate, half-market rate, to no cost (full subsidy).

III. Transit Program

a. To improve access between Metrorail Stations, office, residential developments, and commercial businesses, many developers have proposed to operate local area shuttle buses. As a larger number of developments in the Metrorail Station areas are constructed and occupied the density required to sustain such transportation operations increases, improving the likelihood of the service being successful. Depending upon the category of development contributions to support the operation of local area shuttle buses may be required, such as the Arlington Trolley. Three levels of participation are identified - $5,000, $10,000 and $15,000 per year. The TMP should also include provisions for adjusting the contributions annually by the CPI to account for inflation.

b. Depending upon the category of development, a development may be required to operate an employer shuttle bus service. The shuttle bus system would provide improved pedestrian connections between a Metrorail Station and the site. The route and fare structure may be modified over time to include other development sites whose financial participation is obligated by III.a. above.

c. In addition to increasing the cost of commuting to work in a single occupant vehicle (through charging market based parking rates), subsidizing an employees transit costs can often make the monetary difference required to cause a mode shift in an employees commuting habits. Transit subsidy programs may include the regional Metrorail/Metrobus system, state commuter rail and commuter bus systems. Depending upon the category of development various transit program subsidies may be required. Three levels of subsidy are provided - 25-50 percent, 50-75 percent, and 75+ percent.
IV. On-Site Construction

All developments may be required to dedicate on-site easements to the County and to construct associated roadway improvements adjacent to the site, such as additional travel and turn lanes. “On-site” shall be deemed to include the site itself and all adjacent areas related to the site, consistent with established practice in the County.

a. All site plan development is required to provide secure bicycle storage facilities in a location convenient to office, commercial or residential development areas. The facilities shall be highly visible to the intended users and protected from precipitation. Additional requirements cover the minimum number to be provided by type (Class I, II, III) and location.

b. Depending upon the category of development, shower facilities may be required to be provided within the development as an amenity promoting bicycle or walking commuting by employees to the site.

c. All developments shall be required to provide parking facilities designed in such a way as to ensure access by vanpools. At a minimum, 10 percent of the parking capacity shall be accessible to vans by providing a minimum vertical clearance of 86 inches from the street to the parking areas and to the garage exit onto the street.

d. Site plans should incorporate into the design adequate short term off-street parking space for delivery vehicles.

V. Off-Site Construction

Whereas the previously discussed strategies may be associated with typical site plan review approval and would be included in part in virtually all site plan reviews, strategies which deal with off-site construction must be viewed as unique and must be addressed on a case-by-case basis. There will be instances where it will be mutually beneficial for the community and the developer to pursue off-site construction. The following strategies are put forth as guidelines which may be discussed as a part of the site plan negotiations dependent upon the scale of development and its relationship to the adopted General Land Use plan.

a. To improve pedestrian access between the site, Metrorail and other development, proposed developments may find it desirable to enhance the pedestrian system by widening Metrorail corridor sidewalks or providing connections or extensions of a elevated pedestrian skywalk system.

b. Pedestrian enhancements, such as direct tunnel connections, new station entrances and elevators to the Metrorail System to improve passenger access, protect passengers from inclement weather, and reduce overall travel time by transit, making transit commuting more enjoyable.
Some Metrorail Stations were designed with knock-out panels to facilitate tunnel connections between the system and high density development. Where applicable, all development is encouraged to utilize the knock-out panels which have been incorporated into the Metrorail Station areas. Depending upon the category of development and where appropriate, other system access improvements may be considered.

c. Local area circulation patterns and intersection levels of service are affected by new development as local traffic enters and exits the street network and merges with through traffic. In addition to constructing improvements adjacent to the site, other desirable improvements may be proposed by the developer depending upon the category of development, including, median closures or openings, signal system upgrading, and intersection geometric alignments.

d. Depending upon the category of development, substantial new facility construction may be desirable and could be proposed to increase arterial capacity in conjunction with unplanned trip growth. Improvements which could be negotiated as a part of the site plan revision process may include interchange reconstruction, improved entrance/exit ramp designs, and new grade separated intersections.

e. Depending upon the category of development new Metrorail Station(s) may be proposed by the developer to provide the necessary transit system enhancements to ensure an acceptable level of service to the adjacent street network.

VI. Lease Agreements: Progressive Employee Policies

a. Alternative work schedules, such as flex time, variable work hours and the compressed work week have been successful in spreading peak hour traffic volumes over the peak period and to reduce traffic volumes two days of the week. Flex time includes staggered and flexible work hours which allows employees to arrive or leave before or after the normal congested commuting period. The flexible working arrangements increases the opportunity of prospective rideshare employees having similar core period working hours. The compressed work week includes working four 10-hour days (4/10), or nine days over the two week period (5/4/9). Generally, with the 5/4/9 plan, employees are off every other Friday or Monday. Depending upon the category of development, developers might require tenants to support innovative work scheduling which limits peak period vehicle travel.

b. Recent advances in electronics and the vision of the future portrays a substantial growth in telecommuting, decreasing the number of employees who must commute to the site on a daily basis. The “smart” office building of the future will be constructed to facilitate telecommuting by development tenants.

c. Depending upon the category of development, trip generation restrictions may be incorporated into the development’s
approval as site plan conditions. Trip generation restrictions limit the number of vehicle trips allowed to enter or exit the development during a specified period of time, such as during the morning and evening peak hour of the adjacent street. Vehicle trips are monitored on an as needed basis to monitor conformance and a set of fines may be imposed for repeated violations.

d. A number of business development areas are formulating plans to develop transportation management associations (TMAs). TMAs are partnerships between businesses and local government, created to help solve transportation problems. TMAs provide a unified voice and forum for discussing local transportation issues and priorities, and enable developers and employers to pool resources and address problems on a joint basis. All developments are encouraged to become an active member of an area TMA should one be developed. It is the County’s goal to promote the development of transpiration management associations, representing the following areas: Crystal City, Columbia Pike, Pentagon City/Pentagon areas, National Airport, Shirlington/Four Mile Run areas, Rosslyn/Courthouse areas and the Clarendon-Virginia Square-Ballston areas.

VII. Monitoring and Compliance

a. Staff needs to monitor the transportation management plans to insure compliance. Without staff capability, the County will be unable to determine compliance with its requirements for transportation actions. The amounts listed represent private sector contributions to supervising the implementation and operation of the plans.

b. The county must be able to assure that transportation management plans are actually carried out. For Category D projects, developers will provide a performance guarantee to assure continuing performance. The performance guarantee will be determined by the County Board at the time of site plan approval. The performance guarantee will be in force for at least three years. At that time, if the County certifies compliance with the strategies, the County will not require that the performance guarantee be renewed.

c. Compliance will also be enforced through the Zoning Ordinance.

d. Contingent Phasing ties compliance to building permit approvals relating to the phasing of construction for the entire project. Subsequent phases of the project will not be approved unless compliance with the traffic mitigation program is demonstrated.
TO: The County Board of Arlington, Virginia

FROM: Ron Carlee, County Manager

APPLICANT: National Rural Electric Cooperative Association (NRECA)

BY: Nan E. Terpak, Attorney
Walsh, Colucci, Lubeley, Emrich and Terpak
2200 Clarendon Boulevard, 13th Floor
Arlington, Virginia 22201

SUBJECT: SP #249  MAJOR SITE PLAN AMENDMENT to increase the west office building (Phase Two) GFA by approximately 25,000 square feet and modifications of use regulations for density, parking, and exclusions from GFA; premises known as 4301 and 4401 Wilson Blvd. (RPC #14-051-351, -352)

RECOMMENDATION: Approve the major site plan amendment request to increase the GFA in the Phase Two office building by 19,311 square feet, with modifications of use regulations for bonus density, compact parking and density exclusions, subject to all previous conditions, including previously approved Conditions #53, 54, 62, 63, 65 through 67, and 72 which are contained in the staff report and apply to the Phase Two building, amended Condition #68 of the previously approved conditions, and new Conditions #1 through 70 which apply to the Phase Two building only.

ISSUE: None.

SUMMARY: The applicant is proposing to construct the second building of the two-building NRECA development. The applicant is requesting a total
of .087 FAR of additional density. In exchange for the additional density, the applicant has agreed to construct a building that would achieve the US Green Building Council’s LEED Green Building Rating at the Certified level, with 27 credits. The additional density would result from expanding the building footprint and above-grade floor plates. The applicant would maintain the approved building design and façade treatment which would mirror the design and height of the existing Phase One building. Staff supports the proposed site plan amendment, not only because it would result in a LEED Certified building, but also because the proposed building design would improve the streetscape, create a strong street wall, and conform to the County’s urban design standards for the Rosslyn-Ballston Corridor. The applicant has also agreed to the recommended Transportation Demand Management (TDM) Program and an acceptable Housing Reserve Fund (HRF) contribution.

BACKGROUND: The proposed major site plan amendment request is to add 19,311 square feet of gross floor area (GFA) to the Phase Two office building. The original Ellipse at Ballston mixed use residential and office site plan was approved in 1987, and also includes The Jefferson elderly housing development, and the office building located at 4300 Fairfax Drive.

History of the NRECA Development: The following bullets outline the history of the NRECA development.

- The two-building NRECA development was approved in 1993. At that time, the developer was granted .04 FAR of additional office/commercial density for provision of funds for public street improvements to a portion of the site area required for public right-of-way. Both buildings were approved with equal building heights of 11 stories or 158.3 feet.

- The Phase One office building (NRECA 1, 4301 Wilson Boulevard) was completed in 1995.

- In 1999, a major amendment was approved for the Phase Two building to allow an expansion of the typical floor plate by 2,400 square feet (to a total of approximately 22,422 square feet) to make it more marketable by the then-current standards, resulting in an additional increase in the site plan’s office/commercial density of .10 FAR. The applicant was required to provide an amenities package in exchange for the additional density, including pedestrian safety improvements (construction and maintenance of two brick/concrete paver crosswalks, construction and maintenance of a new raised median in Wilson Boulevard, street realignment along the site’s Wilson Boulevard frontage, common entrance and shared drive aisle with the adjacent Arlington Gateway.
site plan) and enhancements to the existing conference facility in the phase one building (including enhanced audio-visual equipment to accommodate recorded programming by Arlington County Channel 31 cable TV).

- In 2001, a minor amendment was approved for the Phase Two building to allow 4,055 square feet of GFA on the P1 level of the garage for mailroom, storage space and computer room, resulting in an additional office/commercial density of .01 FAR.

- The total approved office/commercial density for the Ellipse at Ballston Site Plan is 3.158 FAR. The maximum permitted density under the “C-O-A” district is 3.0 FAR.

The following provides additional information about the site and location:

- **Site:** The site is Phase Two of the two-building NRECA development, which is part of the Ellipse at Ballston Site Plan. The site plan is located in the Ballston Sector Plan area, in the block bounded by Wilson Boulevard, Glebe Road, Fairfax Drive, and North Taylor Street.

- **Zoning:** The site is zoned "C-O-A", Commercial, Office and Apartment Zoning District.

- **Land Use:** The site is designated "Coordinated Mixed Use Development District" (High density mixed use district with actual density determined by site size. Allows up to 6.0 FAR with office not more than 3.0 FAR) on the General Land Use Plan.

- **Neighborhood:** The site is located within the Ballston-Virginia Square Civic Association.

**Proposed Development:** The following table sets forth the statistical summary for the major site plan amendment.
## Density and Uses

The proposed major site plan amendment would increase the total office/commercial density by .087 FAR, to 3.245 FAR. At the time of the proposal’s original filing, the applicant proposed additional GFA that would be incorporated into a new 12th floor. The proposal has been revised to eliminate the 12th floor and expand the building footprint to generally line up with the below grade garage wall. The expanded building wall would continue through the 11th floor. The additional GFA totals 19,311 square feet, including 1,475 square feet of computer and cable equipment space located on the P1 level of the garage that staff is recommending to be excluded from the density calculation through a modification of use regulations. This space would support the building’s communication and technology operations. With the

---

1. Parking ratio based on GFA of 242,514 s.f. (does not include 5,000 s.f. retail/restaurant credit & 4,500 s.f density exclusion).
2. Parking ratio based on total GFA of 684,238 s.f. Does not include residential building retail.
3. Parking ratio based on GFA of 258,926 s.f. (does not include proposed 1,475 s.f. density exclusion).
4. Parking ratio based on total GFA of 711,574 s.f. Does not include residential building retail.
recommended density exclusion, the net total office/commercial density would be 3.238 FAR.

To support the additional GFA, the applicant proposes to expand the P5 level of the garage and construct a partial P6 level. The approved garage design, including the lay-out of columns and stalls, would generally remain the same. Each level would slightly expand to accommodate the building columns of the expanded building wall. Approximately 60 compact parking stalls have been reconfigured and have widths varying in size to up to 8 feet, and lengths varying to up to 18 feet. The approved P1 connection between the phase one and two garages, as well as the entry points adjacent to North Taylor Street and the shared access drive, would be retained. Since the garage design was approved prior to the Zoning Ordinance Amendment to the parking requirements, the applicant is requesting a modification of use regulations to permit compact parking space sizes to remain as generally approved (7.5'x15' instead of the current standard of 8'x16'), and a compact parking ratio of approximately 36 percent for the site plan's total office/commercial development (instead of the required 20 percent). A compact parking ratio of approximately 48 percent was previously approved for the site plan's total office and commercial development.

- **Site and Design:** At the request of staff, the applicant agreed to revise its proposal to eliminate the 12th floor addition and instead expand the building footprint and above-grade floor plates. By expanding the footprint and floor plates, the applicant was able to recapture the additional space without compromising the original design concept of the NRECA approval, which was for a mirror-image design of the two buildings. The proposed expansion results in a building that creates a stronger street wall and lines up with the Phase One building.

As a part of the 1999 site plan amendment, the applicant agreed to redesign and construct improvements to the site's Wilson Boulevard frontage consistent with the recommendations of the Ad Hoc Committee for Glebe Road Pedestrian Safety. Extending the curb and narrowing the Wilson Boulevard and Glebe Road intersection resulted in a 29- to 62-foot wide sidewalk along that frontage. The expanded building footprint would narrow the sidewalk, resulting in an 18- to 26-foot wide sidewalk. The applicant would also relocate the garage's intake and exhaust vents out of the public sidewalk to the service drive.

- **LEED Scorecard:** The applicant proposes to construct sustainable design elements in the Phase Two building and to achieve the LEED Certified award under the U.S. Green Building Council's LEED Green Building Rating System. Under the County's expanded Green Building Incentive Program, the density incentive has been expanded to include the full range of LEED awards (including certified, silver, gold and platinum) and would award an appropriate amount of
density to the project (ranging from .15 FAR for Certified projects to .35 FAR for platinum projects). The applicant proposes a modification of use regulations to permit the proposed .075 FAR of bonus density (16,761 square feet of GFA) in exchange for achieving the LEED Certified award with 27 credits. This request is discussed further in the Modifications of Use Regulations section of the report.

- **Affordable Housing:** The applicant has proposed to make a contribution to the Housing Reserve Fund of $75,600, based on the current policy of 2% of the construction cost times the total increased density approved for the Phase Two building (45,788 square feet) since the initial site plan approval in 1993.

**Transportation:** The subject site is located on the north side of Wilson Boulevard at the North Glebe Road/Wilson Blvd. intersection. The Master Transportation Plan classifies Wilson Blvd. and North Glebe Road as principal arterial streets.

- **Trip Generation:** A Traffic Impact Analysis (TIA) submitted by the applicant, prepared by Wells & Associates, dated August 14, 2003, assessed the impacts of the development on the adjacent street system. The total peak trips for NRECA are estimated to be 523 (272 AM and 251 PM peak trips). The proposed 19,311 square foot addition will generate 32 peak hour trips (17 AM and 15 PM peak trips). The TIA analyzed six (6) intersections in the vicinity of this project. Two (2) intersections are controlled by traffic signals and the remaining four (4) are controlled by stop signs. An overall intersection level of service (LOS) was derived for the signalized intersections and the critical movements at the intersections controlled by stop signs were analyzed. The table below depicts the findings.

<table>

EBLR ~ eastbound left and right

- **Access and Parking:** Access to the development’s parking garage is available from an existing driveway entrance from North Taylor Street and a proposed shared driveway from North Glebe Road. The 21.5 foot wide shared driveway can accommodate turning movements for a 30 foot wide single unit vehicle;
however larger tractor trailer unit movement cannot be accommodated. The applicant’s loading dock management plan indicates that the larger vehicles will park in the shared driveway and use the loading dock accordingly.

The applicant is seeking a modification through the site plan process to allow a larger compact parking space ratio and smaller compact parking dimensions than permitted under the current Zoning Ordinance provisions. The applicant is providing 388 parking spaces on six (6) underground levels (10 handicap spaces, 265 full size spaces, 53 compact spaces at 7.5 ft. x 15 ft., and 60 compact spaces at 7.5 - 8 ft. x 15 - 18 ft.

- **Streets:** The existing street cross-sections are as follows:
  - Wilson Blvd., as it exists today is approximately 79 feet from face of curb to face of curb and is generally constructed with a raised median and four (4) travel lanes.
  - North Glebe Road, as it exists today is approximately 91 feet from face of curb to face of curb and is generally constructed with a median and six (6) travel lanes.

The applicant proposes to change the existing street cross-sections to reflect the following:
  - Wilson Blvd. will be modified to include two (2) parking lanes, a raised median, and five (5) travel lanes.
  - North Glebe Road will remain a six lane roadway with a median.

- **Transportation Demand Management (TDM) Program:** Consistent with site plan development and the County’s adopted Transportation Demand Management (TDM) Policy, staff recommends that the applicant implement a TDM Program to discourage single occupant vehicle commuting to the site to lessen the impact of the development on the local transportation system. The applicant has agreed to a revised TDM program that includes elements such as:
  - A transportation kiosk or information display to provide transportation-related information.
  - A commuter benefit program which includes, pre-tax employee contributions and/or Metrochek contributions of at least $65.00 per month.
  - SmarTrip cards for office building employees in the amount of $5.00 (one time contribution).
  - A contribution of $19,311.00 to the Commuter Assistance Program to sustain direct and indirect on-site and off-site services in support of TMP activities.
  - Reserved spaces for employee carpoolers and vanpoolers.
  - Establishment of monthly parking rates for single occupancy vehicles (SOV) consistent with comparable Arlington County office buildings.
Free parking for vanpools and parking subsidy for carpools.

- **Pedestrian Access:** The streetscape for Wilson Blvd. consists of a planting strip, which is consistent with the existing NRECA building, and sidewalks varying in width from 18 to 26 feet. The existing sidewalk along North Glebe Road will not change as a result of this development.

- **Pedestrian Safety:** Two (2) pedestrian crosswalks are proposed with this project, across Wilson Blvd. and across North Glebe Road. The crosswalks will be 20 feet wide with ADA compliant pedestrian ramps.

- **Bicycle Access:** Staff is recommending that the applicant provide 51 bicycle parking/storages spaces (35 for office building employees, 13 office building visitor spaces, one (1) retail employee space, and two (2) retail customer spaces).

- **Public Transit:** This site has access to Arlington Transit (ART) bus service, Metrobus service, and Metrorail service. ART bus route 51 and 52 provides access to the Ballston Metro Station, Metrobus Routes 1 B,C,D,E, and Z; 2 B,C and G; 10 B; 22 A,B,C and F; 23 A and C; 24 M and P, 25 A,B,F and J, and 38 B all serve the Ballston Metro Station.

**Utilities:** The utilities serving this site are designated to be placed underground per the County Board adopted Underground Utility Plan. The developer has contributed to the Utility Undergrounding Fund as part of their previous approval.

**DISCUSSION:** Staff supports the redesigned building. It would achieve desired urban design standards for the site and the Rosslyn-Ballston Corridor, as well as sustainable green building technology consistent with the recently expanded Green Building Incentive Program.

**Site Plan Issues:**

- **Modification of Use Regulations:** The applicant has requested modifications of use regulations for 1) bonus density in exchange for a LEED Certified building, 2) exclusion of computer and cable equipment space from the density calculations, and 3) substandard compact parking space size and ratio.

  1) **Bonus Density:** The applicant has requested a total of .087 FAR of additional density (19,311 square feet of GFA) in return for the provision of LEED-certified green building technology at the Certified level. The applicant has committed to 27 LEED credits. Under the County's expanded Green Building Incentive Program, the County Board can approve varied amounts of bonus density to reflect the range of LEED awards, from .15 FAR for the Certified award to .35 FAR for the Platinum award. The Certified award is for buildings which achieve...
between 26 and 31 LEED credits. The applicant proposes a number of sustainable elements, which would be implemented consistent with the requirements contained in new Condition #65. Staff recommends that the proposed .087 FAR of additional density be approved in exchange for the provision of a LEED Certified building. The sustainable elements proposed for this building include:

i. **Sustainable Site** objectives, including alternative transportation and stormwater management;

ii. **Water Efficiency** objectives, including water efficient landscaping;

iii. **Energy and Atmosphere** objectives, including optimizing energy performance through the use of efficient and environmentally sensitive systems;

iv. **Materials and Resources** objectives, including utilizing local and regional building materials and certified wood; and,

v. **Indoor Environmental Quality** objectives, including carbon dioxide monitoring and use of low-emitting materials, such as paints, adhesives, carpets and composite wood.

2) Density Exclusion: The applicant has proposed to exclude from the density calculation a total of 2,550 square feet of GFA located on the P1 through 11th floors. The proposed computer and cable equipment space would support the building's communications and technical support operations, providing the backbone for these operations. The space located on the P1 level of the garage (1,475 square feet) would not add to the bulk and mass of the building. In contrast, the space located on the first through 11th floors would be located within the exterior faces of the building's exterior walls and, by definition, is required to be counted as GFA. This space should be treated no differently than other above-grade mechanical spaces when calculating density. Section 36.H.5 of the Zoning Ordinance allows the County Board to modify the uses permitted and use regulations in harmony with the general purposes and intent of the Zoning Ordinance. The density exclusion for computer and cable equipment space located on the garage level would not be inconsistent with Section 36.H.5 of the Zoning Ordinance; however, the exclusion of such spaces located on the first through 11th floors would be. The County Board has previously approved density exclusions for printing and other similar uses on the P1 garage level of the Phase One building. For these reasons, staff recommends that 1,475 square feet of the requested 2,550 square feet be excluded from the density calculation, but included in the total GFA for the building.

3) Compact Parking: The applicant has proposed a modification of use regulations
to permit a smaller compact parking space size (7.5'x15') and a larger overall compact parking ratio for the site plan's total office/commercial development (approximately 36%), both of which do not conform to the current Zoning Ordinance standards for space size (8'x16') and ratio (20%). At the time of the 1993 and 1999 approvals, the compact parking space sizes were consistent with the Zoning Ordinance standards in effect at that time. Also, the County Board approved an overall compact parking ratio of 48%. While the garage would be slightly expanded to accommodate the relocated building wall, generally the same garage design and lay-out that was approved in 1999 would be retained, including the location of columns and the connection between the phase one and two garages. The approved 48% compact parking ratio would be reduced to approximately 36%. The applicant was able to reconfigure approximately 60 of the Phase Two building’s compact spaces to have widths varying in size to up to eight (8) feet and lengths varying in size from 15 feet to 18 feet. Staff supports the proposed modification of use regulations for compact parking. With the exception of the reconfigured compact spaces, the proposed parking is generally consistent with the 1993 and 1999 approvals for this site plan. Therefore, staff recommends that the modification of use regulation be approved.

- Affordable Housing: Staff and the applicant are in agreement on the proposed HRF contribution, as recommended in Condition #60.

- Community Amenities: The applicant has proposed the following community amenities:
  - Streetscape and street presence consistent with the urban design standards for the Rosslyn-Ballston Corridor.
  - Provision of a LEED Certified green building.
  - Decorative roof treatment.
  - Maintenance of the landscaping in the Wilson Boulevard median in perpetuity.
  - Provision of, or financial contribution toward, public art consistent with WALKArlington.
  - Provision of parking to the public after standard office hours on weekdays, weekends and holidays.
  - Provision of permanent public access easements over the open space and plaza areas in the site plan.
  - A Housing Reserve Fund contribution of $75,600.
  - As a part of the Transportation Demand Management Program, a contribution of $19,311 to the Commuter Assistance Program.

**Community Process:** The applicant has attended one Site Plan Review Subcommittee meeting. A Planning Commission meeting is scheduled for November 24, 2003.
• **Transportation Commission**: The Transportation Commission considered this major site plan amendment request at its meeting on November 19, 2003. The Commission voted to support the major site plan amendment request, subject to the following provisions:
  o That the TDM elements that staff has identified be discussed and given further consideration for inclusion in the TDM Program proposal.
  o That serious consideration be given to the developer contributing $20,000 toward improvements to the near-by Ballston Metro Station.

Staff has worked with the developer to address the outstanding TDM elements. The developer has agreed to revise the proposed TDM to include a contribution of $19,311 to the Commuter Assistance Program (Condition #47).

• **Planning Commission**: The Planning Commission considered this major site plan amendment at its meeting on November 24, 2003. The Commission voted to approve the major site plan amendment request, pending approval of the TDM Program and the Housing Reserve Fund contribution.

**CONCLUSION:** Staff supports this major site plan amendment. The additional density created from relocating the building wall and eliminating the originally requested 12th floor results in a much-improved streetscape and street presence which conform to the urban design standards for the Rosslyn-Ballston Corridor. The applicant has proposed a HRF contribution and TDM Program that are supported by staff. Staff supports the proposed modification of use regulations, which allow the additional density through achievement of a LEED Certified green building. The applicant has agreed to comply with the current standard conditions for the Phase Two building only, as well as the previous conditions of approval. Staff recommends that this major site plan amendment be approved, subject to all previous conditions, including previously approved Conditions #53, 54, 62, 63, 65 through 67, and 72 which apply to the Phase Two building, amended Condition #68 of the previously approved conditions, and new Conditions #1 through 70 which apply to the Phase Two building only:

• **The following conditions were approved on August 17, 1999 and apply to the Phase Two office building, including recommended amended Condition #68:**

54. The developer agrees to provide a shared service drive as outlined in condition #65 below. The service drive, which shall be located between the phase-two office building and the west property line, shall be one-way only and shall provide ingress from Wilson Boulevard and egress from two locations: from The Jefferson service drive onto Fairfax Drive and from the east office building’s garage exit adjacent to North Taylor Street. The width of the paved area of the
Major Site Plan Amendment Request
SP #249

service drive shall be 20 feet. A nine-foot brick paver walkway shall be constructed between the service drive and the phase-two building, extending from the 9th Street Greenway connection/crosswalk to North Glebe Road. The service drive and the walkway shall be shown on a revised final site development and landscape plan, which shall be reviewed and approved by the County Manager or his designee before the issuance of the first building permit for the phase-two office building.

65. The developer agrees to submit documentation to the Zoning Administrator of its agreement with the developer of the Arlington Gateway Site Plan (SP # 331) on shared use of the consolidated curb cut at the approximate location of the intersection of Wilson Boulevard and North Glebe Road adjacent to the frontage of the Arlington Gateway Site Plan, as well as expansion and/or shared use of the Ellipse Site Plan’s access drive, prior to the issuance of the Excavation/Sheeting and Shoring Permit for the NRECA phase-two office building. The access drive located adjacent to the west property line shall be extended across the property line onto the Arlington Gateway Site Plan and shall include a nine-foot brick paver sidewalk adjacent to the NRECA building linking the 9th Street Greenway with the sidewalk adjacent to Wilson Boulevard and North Glebe Road. The developer agrees to submit final site engineering plans which show the access to the site from the consolidated curb cut and extension of the access drive across the west property line. While the Arlington Gateway Site Plan is under construction, or in the event the developers of the two site plans are unable to follow through with the aforementioned agreements, then access to the western entrance of the NRECA phase-two office building garage shall be from the originally approved curb cut on the NRECA frontage adjacent to Wilson Boulevard. The final site engineering plans, including the shared use of the consolidated curb cut and access drive, shall be reviewed and approved by the Department of Public Works prior to the issuance of the Excavation/Sheeting and Shoring Permit for the NRECA phase-two office building.

66. The developer agrees to submit documentation to the Zoning Administrator of its agreement with the developer of the Arlington Gateway Site Plan (SP # 331) on establishing a minimum of 15 feet setback from each side of the shared property line by both parties (west property line of NRECA phase-two building) prior to the issuance of the Excavation/Sheeting and Shoring Permit for the NRECA phase-two office building. The developer agrees that the phase-two office building shall be set back no less than 15 feet from the west property line, and that no reduction in the setback may be made except through approval of a site plan amendment by the County Board.

67. The developer agrees to construct and maintain brick and/or concrete paver crosswalks approximately 15 feet in width, in North Taylor Street adjacent to Wilson Boulevard, and in the access drive adjacent to the west property line. Such crosswalks shall be constructed prior to the issuance of the first Certificate PLA-3425
of Occupancy for the NRECA phase-two office building. The crosswalk in the access drive shall provide a connection between the elements of the 9th Street Greenway as approved in the Ellipse Site Plan (Ellipse Park) and the Arlington Gateway Site Plan (SP #331). The crosswalks shall be distinctively designed to fit in with the Ballston streetscape, and the designs shall be reviewed and approved by the County Manager or his designee as a part of the final site development and landscape plan.

68. The developer agrees to construct a raised median in Wilson Boulevard, from North Taylor Street to North Glebe Road, as shown on the approved final engineering plan dated June 15, 1999 and titled Wilson Boulevard Median Design, and install and maintain landscaping in the raised median for a period of 23 years in perpetuity, which shall be reviewed and approved by the County Manager or his designee as part of the final site development and landscape plan. The raised median shall be constructed, and the landscaping shall be planted, prior to the issuance of the first Certificate of Occupancy for the NRECA phase-two office building.

72. The developer agrees to cooperate with the County on a redesign of the site’s Wilson Boulevard frontage. The streetscape improvements, including curb and gutter alignment and landscape improvements, shall be determined and approved as a part of the final engineering plan for the NRECA phase-two office building. The frontage alignment will remove the free-flow right-turn lane and island; construct new curb and gutter, and sidewalk and streetscape; and fund the cost of relocating the traffic signal equipment from the island to the new alignment location.

The following conditions were approved on July 10, 1993 and apply to the Phase Two office building:

53. If the developer constructs the west office building and desires to construct a pedestrian bridge to connect the east and west office buildings, then the developer shall request a site plan amendment for the pedestrian bridge which shall be reviewed by the Site Plan Review Committee and approved by the County Board.

62. The developer agrees to provide residential unit owners located in The Jefferson residential building access to parking spaces located within the areas designated for commercial/office uses on weekends and from 5:00 p.m. to 8:00 a.m., weekdays.

63. The plaza areas shall be open for public access 24 hours a day.

The following new conditions are recommended for the Phase Two office building only:

PLA-3425
The following Conditions of site plan approval (#1 through #11) are valid for the life of the site plan and must be met by the developer before issuance of the Clearing, Grading and Demolition Permit.

1. The developer (as used in these conditions, the term developer shall mean the owner, the applicant and all successors and assigns) agrees to comply with the standard conditions set forth below and as referenced in Administrative Regulation 4.1 and the revised plans dated November 10, 2003 and reviewed and approved by the County Board and made a part of the public record on December 6, 2003, including all renderings, drawings, and presentation boards presented during public hearings, together with any modifications proposed by the developer and accepted by the County Board or vice versa.

   This site plan approval expires three (3) years after the date of County Board approval if a building permit has not been issued for the first building to be constructed pursuant to the approved plan. Extension of this approval shall be at the sole discretion of the County Board. The owner agrees that this discretion shall include a review of this site plan and its conditions for their compliance with then current County policies for land use, zoning and special exception uses. Extension of the site plan is subject to, among other things, inclusion of amended or additional site plan conditions necessary to bring the plan into compliance with then current County policies and standards together with any modifications proposed by the owner and accepted by the County Board or vice versa.

2. The developer agrees to conduct a pre-construction meeting, and to coordinate participation in the pre-construction meeting by relevant County staff, including staff from DCPHD (Planning, Zoning, Inspection Services), DPW, DPRCR, DES and others as necessary, prior to the issuance of any permits for the site plan. The purpose of the pre-construction meeting is to discuss the requirements of the site plan conditions.

3. **Intentionally Omitted** Tree Protection and Replacement

   a. The developer agrees to complete a tree survey, which shows existing conditions of the site and locates and identifies all trees which are four inches in caliper and larger. The survey shall include any tree on adjacent sites whose dripline extends onto the subject site.

   b. The developer agrees to file and implement a tree protection plan for any trees proposed to be saved by the developer or specified to be saved by the approved site plan and shown on any filing in connection with this case. This plan shall include any tree on adjacent sites whose dripline extends onto the subject site. The tree protection plan shall be developed by a certified arborist or other horticultural professional with a PLA-3425.
demonstrated expertise in tree protection techniques on urban sites and shall be submitted and approved, and found by the County Manager or his designee to meet the requirements of this site plan, before the issuance of the Clearing, Grading and Demolition Permit. At a minimum, this plan shall include:

(1) A site grading plan at two (2) foot intervals, including the location of all proposed improvements and utilities.

(2) Detailed specifications for any tree walls or wells proposed.

(3) A description of how and where building materials and equipment will be stored during construction to ensure that no compaction occurs within the dripline of the trees to be saved.

(4) Identification of tree protection measures and delineation of placement of tree protection.

(5) Any tree required to be saved which dies (any tree which is 25% or more dead shall be considered to have died) within two (2) years of the issuance of the master certificate of occupancy shall be removed and replaced by the developer at his expense with the number of major deciduous and evergreen trees whose total calipers equals the caliper of the tree to be replaced and which meet the minimum size and other requirements of Condition #13 below.

c. The developer also agrees to replace all trees, as shown on the Tree Survey, that are removed as a result of the new construction in accordance with the Arlington County, Virginia Tree Replacement Guidelines. The developer shall prepare a tree replacement plan, developed with assistance of the County’s urban forester, to plant replacement trees on site or on County owned land. The developer agrees to submit and obtain approval of this plan by the County Manager or his designee as part of the final site development and landscape plan.

4. The developer agrees to produce a photographic record of development, starting with a record of the site as it appears before demolition is begun, including photographic records during construction, and ending with a photographic record of the development as it appears after completion of construction. These photographs shall comply with the following specifications:

All photographic records shall be taken using black and white film. Submission of a photo contact sheet and 8" x 10" prints on photographic paper shall be the minimum acceptable standard. Color photographs on compact disc must be
submitted in addition to black and white photographs and the photo contact sheet at the end of the project prior to the issuance of the Master Certificate of Occupancy.

The photographic record shall include the following:

a. **Before Clearing, Grading and Demolition of the site** (shall be submitted before issuance of the Clearing, Grading and Demolition Permit)–Views of north, south, east and west facades, as location permits, of buildings to be demolished, as well as at least one photo of the site before any clearing or grading including the existing physical relationship with adjacent buildings and streets. The photographic record shall also include all historic aspects of the facades of the building to be demolished, consistent with the requirements described in Condition #50 below.

b. **Site Clearance** (shall be submitted before issuance of the Footing to Grade Permit)–Views of cleared site facing north, south, east and west, as location permits, with adjacent buildings and streets included.

c. **Construction Phase** (shall be submitted before issuance of the Shell and Core Certificate of Occupancy Permit)–At a minimum, views of the site: during excavation, upon completion of the first floor above grade, at topping out, and during the exterior cladding phase.

d. **Site Completion** (shall be submitted before issuance of the Master Certificate of Occupancy)–North, south, east and west facades of completed building or buildings, as well as at least one view of completed project in context of adjacent buildings and streets.

The photographic record of the site as it appears before demolition shall be delivered to the Zoning Administrator prior to the issuance of a clearing, grading or demolition permit. The remaining records, including the completed compact disc with the entire photographic history, shall be delivered to the Zoning Administrator, before the issuance of a Master Certificate of Occupancy, for placement in the County archives.

If the developer uses the "Fast Track" Permit Process, the Site Clearance and Construction Phase photographs shall be submitted before the issuance of the Footing to Grade Structure Permit, or the first Building Permit, whichever comes first. The Construction Phase photographs, showing any construction to grade, shall be submitted before the Final Building Permit. The Construction Phase photographs showing all construction above grade and the Site Completion Photographs and completed compact disc showing the entire photographic history of the site shall be submitted before issuance of the Master Certificate of Occupancy.

PLA-3425
5. **Intentionally Omitted** In addition to funding and constructing the utility undergrounding work, the developer agrees to contribute in the amount specified in Site Plan conditions to the County utility fund before the issuance of the Building Permit or prorated consistent with an approved phasing plan for the development. The total utility fund contribution for this site is $___________ ($50,000 x ___ acres). These funds may, but need not, be used by the County for the purpose of providing the undergrounding of utilities along the properties which are not redeveloping in this undergrounding district. If the area of the site plan is subdivided, the contribution to be made by each owner shall be based proportionally on the amount of site area allocated to each subdivided parcel. The contribution, if not obligated by the County to pay for utility undergrounding projects within 10 years from the date of payment, will be refunded without any accrued interest to the development owners of record at the time of any refund.

6. The developer agrees to develop a plan for temporary pedestrian and vehicular circulation during construction. This plan shall identify temporary sidewalks, interim lighting, fencing around the site, construction vehicle routes, and any other feature necessary to ensure safe pedestrian and vehicular travel around the site during construction. The developer agrees to submit this plan to, and obtain approval of the plan from, the County Manager or his designee as meeting these standards, before the issuance of the Clearing, Grading and Demolition Permit. The County Manager may approve amendments to the plan, if consistent with this approval.

7. **Intentionally Omitted** The developer agrees to coordinate with the Arlington County Relocation Program Coordinator in order to provide each rental household living in either an apartment unit or a single-family dwelling which is displaced by the construction of this site plan, except those who sign initial leases for a unit in the project after the date of this site plan approval, with at least the following:

   a. A minimum of 120 days written notice to vacate;
   
   b. Relocation payments, in accordance with the *Arlington County Tenant Relocation Guidelines* adopted by the County Board and in effect on ________, a copy of which are attached to the report of the County Manager for this site plan approval;
   
   c. Relocation services in accordance with the *Arlington County Tenant Relocation Guidelines* adopted by the County Board and in effect on ________.

If the developer decides to limit relocation benefits to persons who executed initial leases before adoption of the site plan, the developer agrees to notify, in
writing any tenant moving in after the date that the site plan is approved of his/her ineligibility for relocation payments and services. Any tenant who has not signed a waiver of rights to relocation assistance must receive the assistance. In cases where State law requires 120-day notice to vacate (displacement from multi-family buildings containing four or more units), notice cannot be waived, but may be reduced by mutual agreement in writing. Compliance with this condition shall be shown before the issuance of the Clearing, Grading and Demolition Permit.

8. **Intentionally Omitted** The developer agrees to coordinate with the Department of Economic Development in order to provide the following relocation assistance to all retail tenants under lease as of the date of the approval of the proposed site plan:

   a. The developer agrees to keep all retail tenants informed of the redevelopment schedule by providing periodic updates with regard to material changes in the development program for the site, including the phasing of the project, anticipated schedules for eviction, construction and occupancy, and any anticipated material impacts on the tenants while they remain on the site, such as test borings, construction signs and fencing, asbestos removal, disruptions to customer parking and pedestrian paths, and the like.

   b. The developer will assist the County to make available to all retail tenants, either directly or through the developer, information on available commercial space in the County, business counseling services and appropriate business courses.

   c. The developer agrees to cooperate with the retail tenants by referring tenants who so request to private sources of professional assistance in regard to lease negotiation (i.e., understanding lease terms, trends and negotiation strategy), space planning and other related sources of help.

   d. Except for provisions in any lease to the contrary, the developer agrees to maintain the site, structures and systems in good repair and in a businesslike appearance until the last retail tenant vacates or until the notice to vacate expires, whichever comes first.

   e. The developer agrees to show compliance with the terms of this condition before the issuance of the Clearing, Grading and Demolition Permit.

9. The developer agrees to comply with all federal, state and local laws and regulations not modified by the County Board's action on this plan and to obtain all necessary permits. The County also has the authority to take actions to
include issuance of a stop work order when the developer is not in compliance with the agreed-upon conditions.

10. The developer agrees to file three copies of a site plan and the tabular information form, and one digital copy on compact disc in JPEG, PDF, and DXF formats, which complies with the final approval of the County Board and with Administrative Regulation 4.1, with the Zoning Administrator within 90 days of the County Board approval and before the issuance of the Clearing, Grading and Demolition Permit.

11. The developer agrees to comply with the following before issuance of the Clearing, Grading and Demolition Permit and to remain in compliance with this condition until the Master Certificate of Occupancy is issued.

   a. The developer agrees to identify a person who will serve as liaison to the community throughout the duration of construction. This individual shall be on the construction site throughout the hours of construction, including weekends. The name and telephone number of this individual shall be provided in writing to residents, property managers and business owners whose property abuts the site, and to the Zoning Administrator, and shall be posted at the entrance of the project.

   b. Before commencing any clearing or grading of the site, the developer shall hold a meeting with those whose property abuts the project to review the construction hauling route, location of construction worker parking, plan for temporary pedestrian and vehicular circulation, and hours and overall schedule for construction. The developer agrees to provide documentation to the Zoning Administrator of the date, location and attendance of the meeting before a Clearing, Grading and Demolition Permit is issued. Copies of plans or maps showing the construction hauling route, construction worker parking and temporary pedestrian and vehicular circulation shall be posted in the construction trailer and given to each subcontractor and construction vehicle operator before they commence work on the project.

   c. Throughout construction of the project, the developer agrees to advise abutting property owners in writing of the general timing of utility work in abutting streets or on-site that may affect their services or access to their property.

   d. At the end of each work day during construction of the project, the developer agrees to ensure that any streets used for hauling construction materials and entrance to the construction site are free of mud, dirt, trash, allaying dust, and debris and that all streets and sidewalks adjacent to the construction site are free of trash and debris.
e. The developer agrees that construction activity, not including construction worker arrival to the construction site and indoor construction activity, will commence no earlier than 7:00 a.m. and end by 9:00 p.m. on weekdays; and no earlier than 10:00 a.m. and end by 9:00 p.m. on Saturdays, Sundays, and federal holidays; and no earlier than 10:00 a.m. and end by 9:00 p.m. on Sundays. Indoor construction activity, defined as activity occurring entirely within a structure fully enclosed on all sides by installed walls, windows, and/or doors, shall comply with the Noise Ordinance and must not exceed the noise levels established by the Noise Ordinance. The developer agrees to place a minimum of one sign per street front indicating the permissible hours of construction around the construction site and at all construction and construction trailer entrances, to place one additional sign within the construction trailer containing the same information, and to provide a written copy of the permissible hours of construction to all subcontractors.

f. Storage of construction materials, equipment and vehicles shall occur on the site or an approved off-site location, or as approved by the County Manager of his designee.

• The following Conditions of site plan approval (#12 through #31) are valid for the life of the site plan and must be met by the developer before issuance of the Excavation/Sheeting and Shoring Permit.

12. The developer agrees to submit and obtain the County Manager’s approval of a revised detailed final site development and landscape plan for the Phase Two office building, prior to issuance of the Excavation/Sheeting and Shoring Permit. The revised final site development and landscape plan shall be submitted at a scale of 1 inch = 25 feet, in conjunction with the final site engineering plan as required in Condition #15 below, as well as a vicinity map with major streets labeled. The developer further agrees that both the revised final site development and landscape plan and the site engineering plan verify by means of survey that there are no conflicts between the street trees and utilities. The developer shall obtain approval by the County Manager or his designee for both plans as meeting all requirements of the County Board's site plan approval and all applicable county laws and plans before the issuance of the Excavation/Sheeting and Shoring Permit. The plan shall be consistent with the conceptual plan approved as a part of the site plan, and, at a minimum, shall conform to the landscaping requirements in Condition #13 below; the Rosslyn-Ballston Corridor Streetscape Standards if applicable; the Sector Plans if applicable; the County's landscaping, planting, and sidewalk and driveway construction specifications; and/or other applicable urban design standards approved by the County Board. In order to facilitate comparison with the final site engineering plan, the landscape plan shall be at a scale of 1 inch = 25 feet;
the County may require more detailed plans appropriate to landscape installation at a larger scale (1/16 inch = 1 foot, 1/8 inch = 1 foot, or 1/4 inch = 1 foot). The County may permit minor changes in building, street and driveway locations and other details of design as necessitated by more detailed planning and engineering studies if such changes are consistent with the provisions of the Zoning Ordinance governing administrative approval and with the intent of the site plan approval. The landscape plan shall include a Street Tree Plan which shall be reviewed by the Department of Parks, Recreation and Community Resources and shall be accompanied by the site engineering plan. The installation of all plant materials shown on the final landscape plan shall take place before the issuance of the first Certificate of Occupancy, for the respective phase of construction. The final site development and landscape plan shall include the following details:

a. The location and dimensions of traffic signal poles and control cabinets, utility meters, utility vaults and boxes, transformers, mechanical equipment, fire hydrants, standpipes, storm water detention facilities, the location of all existing and proposed utility lines and of all easements. The location of traffic control cabinets shall be shown on the final site engineering plan and placed so as not to obstruct pedestrian travel or be visually obtrusive. Traffic control cabinets shall not be located in the public sidewalk. Transformers shall not be placed above grade in the setback area between the building and the street.

b. Intake and exhaust garage ventilation grates may not be located within public sidewalks or streets, or within areas between the street curb and any building which is used as a walkway. The developer agrees to provide drawings showing how the garage will be ventilated prior to submission of the post-County Board Administrative Regulation 4.1 drawings required in Condition #10 above. Ventilation grates shall be located and/or screened so as not to be visible from public rights-of-way. The developer shall obtain approval from the County Manager or his designee on the location and screening of all ventilation grates as part of the review of the final site engineering plan and the final site development and landscape plan before issuance of the Footing to Grade Permit.

c. The location, dimensions, and materials, and pavement pattern where applicable, for driveways and access drives, automobile drop-off areas, driveway aprons, service drives, parking areas, interior walkways, plaza areas and sidewalks, as well as for address indicator signs. Brick or a concrete unit paver shall be used on the access drives, automobile drop-off areas, plaza areas, and interior walkways. Interior walkways shall have a minimum width of four (4) feet. Plaza areas shall contain special paver treatments that coordinate in design, color and materials with the treatment of the public sidewalk. The materials and colors used are
subject to approval by the County Manager or his designee according to adopted Sector Plans or other urban design standards approved by the County Board as a party of review and approval of the final site development and landscape plan.

d. The location and types of light fixtures for streets, parking, walkway and plaza areas, and associated utilities, as contained in the lighting plan required in Condition #49 below.

e. Topography at two (2) foot intervals, and the finished first floor elevation of all structures, and top-of-slab elevation for any proposed underground structures.

f. Landscaping for plaza areas, raised planters, surface parking areas, and service drives, including a listing of plant materials; and details of planting, irrigation and drainage; and proposed furnishings for all areas, including but not limited to style(s), materials(s), finish(es) and manufacturer(s) of seating, bollards, trash receptacles, bike racks, arbors, trellises, and water features.

g. The location and planting details for street trees in accordance with Department of Public Works Standards and Specifications for planting in public rights-of-way and as shown on the approved final site engineering plan.

h. The limits of demolition and construction.

i. The developer agrees to submit a maintenance agreement which shall ensure that all plaza areas and other landscaped areas located on private property are kept in a clean and well-maintained condition after the expiration of the two year guarantee required in #13 below and to follow the terms of that maintenance agreement approved for that purpose by the Zoning Administrator, as required in Section 32A of the Zoning Ordinance.

j. Details of the decorative treatment of the roof area and the penthouse, to be consistent with the design and treatment of roof area and penthouse of the Phase One building.

k. Details of the landscape treatment for the final phase of the Ellipse Plaza, which is required to be implemented and the full Plaza completed prior to the issuance of the first Certificate of Occupancy for the Phase Two office building.
13. The developer agrees that all landscaping shall conform to Department of Public Works Standards and Specifications and to at least the following requirements:

a. Planting materials shall be of good nursery stock and a nursery guarantee shall be provided by the developer for two years including the replacement, as needed, and maintenance (to include but not be limited to pruning, feeding, spraying, mulching, weeding, and watering) of all landscape materials following the issuance of the Master Certificate of Occupancy.

b. Plant materials and landscaping shall meet the then-current American Standard for Nursery Stock, and shall also meet the following standards:

   (1) Major deciduous trees (shade or canopy trees such as Oaks, Maples, London Plane Trees, Japanese Zelkovas, etc.) other than street trees—a minimum caliper of 4 to 4 1/2 inches, except as indicated in Condition #17 below.

   (2) Evergreen trees (such as Scotch Pines, White Pines, Hemlocks, etc.)—a minimum height of 7 to 8 feet.

   (3) Ornamental deciduous trees (such as Cherries, Dogwoods, Serviceberries, Hornbeams, etc.)—a minimum caliper of 3 to 3 1/2 inches.

   (4) Shrubs—a minimum spread of 18 to 24 inches.

   (5) Groundcover—in 2 inch pots.

c. All new lawn areas shall be sodded; however, if judged appropriate by the County Manager or his designee, based on accepted landscaping standards and approved in writing, seeding may be substituted for sod. All sod and seed shall be state certified.

d. Exposed earth not to be sodded or seeded shall be well-mulched or planted in ground cover. Areas to be mulched may not exceed the normal limits of a planting bed.

e. Soil depth shall be a minimum of four (4) feet plus 12 inches minimum of drainage material for trees and tall shrubs and three (3) feet for other shrubs. This requirement shall also apply to those trees and tall shrubs in raised planters. Soil depth for raised planters shall be measured from the bottom of the planter to the top of the planter wall. The walls of raised planters shall be no higher than seat-wall height (2 1/2 feet, maximum) above the adjacent finished grade.
f. Finished grades shall not exceed a slope of three to one or the grade that existed before the site work began.

g. The developer agrees to maintain the site in a clean and well-maintained condition before the issuance of the Clearing, Grading and Demolition Permit and agrees to secure and maintain the site throughout the construction and phasing process. Further, the developer agrees to submit a maintenance agreement which shall ensure that all plaza areas and other landscaped areas located on private property are kept in a clean and well-maintained condition after the expiration of the two year guarantee required in #13a. above and to follow the terms of that maintenance agreement approved for that purpose by the Zoning Administrator.

h. The developer agrees to notify the Department of Parks, Recreation and Community Resources (DPRCR) Urban Forester at least 72 hours in advance of the scheduled planting of any street trees in the public right-of-way and to be available at the time of planting to meet with staff of DPRCR to inspect the plant material, the tree pit and the technique of planting. Soil used in the tree pit must meet the specifications for street tree planting available from the DPRCR Urban Forester.

14. The developer agrees to contact all utility companies, including the electric, telephone and cable television companies, and offer them access to the site at the time of utility installation to install their underground cables. In order to comply with this condition the developer agrees to submit to the Zoning Administrator copies of letters from the developer to the utility companies offering them access as stated above.

15. The developer agrees to submit final site engineering plans to the Department of Public Works. The plans shall be drawn at the scale of 1 inch = 25 feet and be 24 inches by 36 inches in size. Neither the Excavation/Sheeting and Shoring permit nor the first Building Permit shall be issued until final site engineering plans which agree with the approved final site development and landscape plans, and the sequence of construction, has been approved by the Department of Public Works, as consistent with all site plan approval requirements and all County laws. Upon completion of the construction of a project, the developer agrees to submit one (1) set of as-built mylar plans for sanitary, storm sewer and water main construction to the Department of Public Works for recording.

16. The developer agrees to show on the final engineering plans pavement, curb and gutter along all frontages of this site in accordance with the then-current Arlington County Standard for concrete curb and gutter and the then-current standards for pavement and according to the following dimensions. The
pavement, curb and gutter shall be constructed prior to issuance of the first Certificate of Occupancy.

a. Wilson Boulevard - Construct a raised median and new curb and gutter as shown on the plot and location plan entitled NRECA Phase II The Ellipse at Ballston, Sheet C-3 of 4, prepared by VIKA, Inc., dated August 1, 2003 and revised through November 10, 2003, and as shown on the final engineering plan approved by the County Manager or his designee.

b. North Glebe Road - Construct a raised median and new curb and gutter on the plot and location plan entitled NRECA Phase II The Ellipse at Ballston, Sheet C-3 of 4, prepared by VIKA, Inc., dated August 1, 2003 and revised through November 10, 2003, and as shown on the final engineering plan approved by the County Manager or his designee.

c. The developer agrees to construct a total of two (2) 10-foot wide brick paver crosswalks as shown on the final site development and landscape plan and approved by the county Manager and his designee at the following locations:

i. Across Wilson Boulevard, east of the Wilson Boulevard/North Glebe Road intersection, as shown on the final engineering plan approved by the County Manager or his designee.

ii. Across North Glebe Road west of the Wilson Boulevard/North Glebe Road intersection, as shown on the final engineering plan approved by the County Manager or his designee.

iii. The developer agrees to construct and maintain brick and/or concrete paver crosswalks approximately 15 feet in width, in North Taylor Street adjacent to Wilson Boulevard, and in the access drive adjacent to the west property line. Such crosswalks shall be constructed prior to the issuance of the first Certificate of Occupancy for the NRECA phase-two office building. The crosswalk in the access drive shall provide a connection between the elements of the 9th Street Greenway as approved in the Ellipse Site Plan (Ellipse Park) and the Arlington Gateway Site Plan (SP #331). The crosswalks shall be distinctively designed to fit in with the Ballston streetscape, and the designs shall be reviewed and approved by the County Manager or his designee as a part of the final site development and landscape plan.

d. The developer agrees to construct curb ramps at the ends of and aligned with the Wilson Boulevard and North Glebe Road crosswalks, as shown on
the final engineering plan approved by the County Manager or his designee.

e. The developer agrees to construct a median nose extension, approximately 24 feet in length, contiguous to the raised median in North Glebe Road, as shown on the final engineering plan approved by the County Manager or his designee.

The developer agrees to construct a median nose extension, approximately 24 feet in length, contiguous to the raised median in North Glebe Road, as shown on the final engineering plan approved by the County Manager or designee.

All improvements to curb, gutter, sidewalks and streets for pedestrian and/or vehicular access or circulation shall be in full compliance with the Americans with Disabilities Act (ADA) and any regulations adopted thereunder, as well as any other applicable laws and regulations. The developer further agrees that all improvements to curb, gutter, sidewalks, crosswalks, and streets for pedestrian and/or vehicular access or circulation shall be as determined by the County Manager or his designee on the final Site Development and Landscape Plan and on the final Site Engineering Plan, in accordance with the Rosslyn-Ballston Corridor Streetscape Standards or other applicable urban design standards in effect at the time of final Site Engineering Plan Approval; provided, however, that the provision of such improvements shall not increase the projected cost anticipated for such improvements as shown on the site plan drawings dated November 10, 2003 unless the County provides additional funding to offset such increased cost.

17. The developer agrees that the final sidewalk pattern/design and final selection of materials and colors to be used shall be as determined by the County Manager or his designee on the final site development and landscape plan and final engineering plan, in accordance with the Rosslyn-Ballston Streetscape Plan or other applicable urban design standards approved by the County Board and in effect at the time of the site plan approval. The developer further agrees to construct the sidewalk improvements detailed below prior to the issuance of the first Certificate of Occupancy for the site plan. The sidewalks along the street frontages of this development shall be paved with brick or an interlocking concrete paver and shall be placed on a properly-engineered base approved as such by the Department of Public Works. The sidewalk treatments shall continue across all driveway aprons for loading and garage entrances along all frontages of the site plan, and there shall be no barriers to impede the flow of pedestrian traffic. The sidewalks shall contain street trees placed in either tree pits, tree grates or planting strips, consistent with the Standards for Planting and Placement of Trees in Site Plan Projects, and as specified below. Placement, planting and root enhancement options shall be consistent with the Standards for Planting and Placement of Trees in Site Plan Projects, and as specified below.
Street trees shall not be placed within the vision obstruction area. All public walkways shall be constructed to County Standard. The developer agrees to maintain and replace the street trees and sidewalks for the life of the site plan. The sidewalk sections and street tree species shall be as follows:

**Wilson Boulevard** - A minimum 20-foot wide sidewalk measured from the back of curb, including the continuous four (4) foot wide planting strip with structured soil, planted with 4 ½ inch caliper Willow Oak street trees and such ground cover as liriope muscarii, hypericum, calycinum (Aarons Beard), or juniperius conferta (Shore Juniper), placed 28 to 32 approximately 30 feet apart on center.

The streetscape element shall include a paving treatment across driveway entrances and ramps located along with the public sidewalk area which is similar to the sidewalk in material, texture and color. This paving may include some differentiation from the public sidewalk for the purpose of public safety.

There shall be no obstructions within the public sidewalk, such as bollards, planters, kiosks, etc.

18. The developer agrees that in order to accommodate the subsurface requirements of utilities and streetscape elements (including street trees), the final design of the project shall provide a structure-free zone under the public sidewalk along all street frontages, as required in the *Standards for Planting and Placement of Trees in Site Plan Projects*. This zone shall be a minimum of five (5) feet deep and shall extend from the back of the street curb to the far edge of the public sidewalk (the sidewalk width shall be as defined in condition #17 above). No subterranean structures (such as parking garages) shall intrude into this five foot deep zone. Within the zone, underground utilities and utility vaults shall not be located in a manner that interferes with the appropriate spacing and replacement of street trees, consistent with the approved final site and development and landscape plan. Utility lines shall not be located beneath street trees. The location of all existing and proposed utility lines shall be shown on both the final landscape plan and the final site engineering plan.

19. The developer agrees that the location of the water services will be determined at the time of the review of the final engineering plan in accordance with the following standards: water meter installations shall be located behind and adjacent to the curb line in an area clear of driveways, a minimum of five (5) feet clear of other utilities and a minimum of 10 feet clear of structures; a clear space 15 feet wide by 20 feet long by 10 feet deep shall be provided for three (3) inch and four (4) inch meter installations, and 20 feet wide by 25 feet long by 10 feet deep for six (6) inch and larger meter installations; and the building walls shall be adjusted as necessary to provide these clearances.
20. The developer agrees that all sanitary sewers and water mains, including water services, shall have a minimum of ten (10) feet horizontal clearance from each other and five (5) feet clearance from all other utilities, and shall have a minimum of 10 feet horizontal clearance from buildings and other structures. Water mains 16 inch and larger, and mains placed more than 10 feet deep shall have a minimum of 15 feet horizontal clearance from buildings and other structures; and sanitary sewers 15 inches and larger, or sewers placed more than 10 feet deep shall have 15 feet minimum clearance from buildings and other structures. All water mains and sanitary sewers shall meet County Standard design criteria.

21. The developer agrees that no existing water main or fire hydrant shall be taken out of service or made inaccessible without the prior written approval of the Department of Public Works. This approval shall be obtained before the issuance of the Excavation/Sheeting and Shoring Permit.

22. The developer agrees to show, on the final engineering plans, water main improvements in accordance with the following. The water main improvements shall be constructed prior to the issuance of the Final Building Permit for the respective phases of construction.

23. The developer agrees to show, on the final engineering plans, and to construct sanitary sewer main improvements in accordance with the following. The sanitary sewer main improvements shall be constructed prior to the issuance of the Final Building Permit.

The two (2) buildings fronting Wilson Boulevard shall be sewered to the existing sanitary sewer in Wilson Boulevard, and the service connections shall be by means of manholes.

The County will TV-Inspect the sanitary sewer lines serving the site and shall identify any improvements that are necessary to adequately service the development. The developer agrees to repair or replace any sections or appurtenances of the sanitary sewer serving the development that are found to be deficient or damaged by the developer, as identified by County staff and as shown on the final engineering plan approved by the County Manager or his designee.

The developer agrees to submit and obtain approval from the County Manager or his designee of a sanitary sewer capacity study prior to approval of the site engineering plan.

24. The developer agrees to show, on the final engineering plan, horizontal standpipes or fire hydrants at intervals of not more than 300 feet in order to provide adequate fire protection. The County shall specify kind of service and
locations at the time of the final site engineering plan approval based on applicable safety standards. The horizontal standpipes or fire hydrants shall be installed prior to the issuance of the Final Building Permit.

The developer agrees to provide calculations to demonstrate the needed fire flow as defined in the Arlington County Department of Public Works Standards and Specifications. This information shall be clearly shown on the cover sheet of each plan set submitted.

25. The developer agrees to remove and replace any existing curb, gutter and sidewalk along the street frontages of this site which is in poor condition or damaged by the developer according to Arlington County standards and specifications, prior to the issuance of the first Certificate of Occupancy.

26. The developer agrees to show on the final engineering plans street lighting along all frontages of the site prior to the issuance of the Excavation/Sheeting and Shoring Permit. The developer agrees, at its cost, to purchase and install approved Arlington County street lighting along the frontages of the site prior to the issuance of the Shell and Core Certificate of Occupancy. In addition, the developer agrees to furnish and install all conduit and junction boxes necessary for the lighting system. All construction shall meet Virginia Power standards. Lighting shall be in accordance with the following:

The developer agrees to purchase and install double-globe Virginia Power "Carlyle" standard street lights along all frontages of the site in accordance with adopted County Lighting Policy. The developer agrees to pay the cost of installing additional standard thoroughfare lights at the adjacent intersections, should the County decide that they are necessary to provide adequate lighting for street safety purposes.

27. The developer agrees to remove or place underground all existing aerial utilities within or along the periphery of this site prior to the issuance of the final building permit, as shown on the final side development and landscape plan and the final engineering plan approved by the County Manager or his designee. Any utility improvements necessary to provide adequate utility services to this development or utility work necessary to provide a terminus to the underground facilities shall be paid for by the developer and shall not result in the installation of any additional utility poles, or aerial devices. All utility relocation shall be completed prior to the issuance of the Shell and Core Certificate of Occupancy.

28. The developer agrees to provide off-street parking for all construction workers without charge to the workers. In lieu of providing parking, the developer may provide a subsidy for the construction workers in order that they may use Metro, provide a van for van pooling, or use another established method of transportation to provide for construction workers to arrive at the site.

PLA-3425
Compliance with this condition shall be determined based on a plan which shall be submitted to the Zoning Administrator before the issuance of the Excavation/Sheeting, and Shoring Permit. This plan shall set forth the location of the parking to be provided at various stages of construction, how many spaces will be provided, how many construction workers will be assigned to the work site, and mechanisms which will be used to encourage the use of Metro, carpooling, vanpooling, and other similar efforts. The plan shall also provide for a location on the construction site at which information will be posted regarding Metro schedules and routes, bus schedules and routes, and carpooling and vanpooling information. If the plan is found to be either not implemented or violated during the course of construction, a correction notice will be forwarded to the developer. If the violation is not corrected within ten (10) days, a "stop work order" will be issued, and construction halted until the violation has been corrected.

29. The developer agrees to install address indicator signs on the site which comply with Section 27-12 of the Arlington County Code or successor provision in a location visible from the street and as shown on the final site development and landscape plan.

30. The developer agrees that the design of the facade treatment for the buildings and the materials to be used on the facades shall be consistent in design and treatment with the Phase One office building, as specified and shown on the submitted drawings dated November 10, 2003 and as presented to the County Board and made a part of the public record on December 6, 2003, including all renderings, drawings, and presentation boards presented during public hearings. The building facades shall be brick with precast concrete accents, and the penthouse facades shall be brick and/or precast concrete to match the color of the brick on the building and consistent with the treatment of the penthouse on the Phase One office building. The developer agrees to submit colored drawings and renderings, and material samples, for review by the County Manager or his designee prior to the issuance of the Footing to Grade Permit. The developer further agrees to obtain the approval of the County Manager or his designee of the facade treatment as being consistent with the County Board approval before the issuance of the of the Final Building Permit.

31. All required public easements and public dedications right-of-way agreements shall be submitted to the Department of Public Works prior to the issuance of the Excavation/Sheeting and Shoring Permit, and be approved and recorded among the land records of the Clerk of the Circuit Court of Arlington County, by the developer before the issuance of the Final Building Footing to Grade Structure Permit. The developer agrees that there shall be no building construction within the easement area without approval by the County Manager or the County Board. Dedications granted by the developer for street improvements shall be
dedicated in fee simple to the County. Dedications granted by the developer for sidewalk improvements may be dedicated by easement to the County.

- **The following conditions of site plan approval (#32 through #40) are valid for the life of the site plan and must be met by the developer before issuance of the Footing to Grade Structure Permit.**

32. The developer agrees to submit one (1) plat, drawn at the scale of 1 inch = 25 feet and 24 inches x 36 inches in size, of the excavated area showing spot elevations which confirm that the construction drawings are consistent with the average site elevation, and with the building’s ground floor elevation(s) at the building’s lowest level(s), as approved by the County Board and as indicated in the plans referenced in Conditions #1 and #10 above.

33. Upon approval of the final site engineering plan the developer agrees to submit a performance bond estimate for the construction or installation of all facilities (to include street trees and all landscape materials) within the public rights-of-way or easements to the Department of Public Works for review and approval. Upon approval of the performance bond estimate by the Department of Public Works, the developer agrees to submit a performance bond in the approved amount of the estimate and agreement for the construction or installation of all these facilities (to include street trees and all landscape materials) within the public rights-of-way or easements to the Department of Public Works and this bond shall be executed by the developer in favor of the County before the issuance of the Above Grade Building Permit.

Prior to the release of the public improvement bond, the Developer agrees to submit as-builts for all underground utilities (water, sanitary sewer, and storm sewer) that will be maintained by Arlington County.

34. The developer agrees that all new electrical transformers shall be placed underground in vaults which meet Virginia Power standards. These vaults may be placed in the street right-of-way or in driveways if approved by the County on the final site engineering plan. Ventilation grates may not be located within public sidewalks or streets, or within areas between the street curb and any building which is used as a walkway. The locations of the vaults shall be coordinated with other utility locations so as to have a minimum clearance of five (5) feet to conduits and manholes and a minimum clearance of 10 feet to water mains and sanitary sewers unless otherwise approved by the owner of that utility. The developer shall obtain approval from the County Manager or his designee on the location of all vault ventilation grates and utilities as part of the review of the final site engineering plan and the final site development and landscape plan before the issuance of the Footing to Grade Structure Permit.
35. The developer agrees that interior space shall be provided and used for the collection, storage, compaction, and removal of trash, as well as appropriate facilities for the recycling of reusable materials as defined by the County. The collection, storage, compaction, and removal of trash shall not occur outside the interior loading space. This space may not conflict with the use of a loading berth. Drawings showing compliance with this condition shall be approved by the Zoning Administrator before the issuance of the Footing to Grade Structure Permit.

36. The developer agrees that all loading spaces shall be in the interior of the building and shall also comply with the requirements of Section 1 (minimum 12 foot clear width [including entrances], 30 foot length and 14 foot height clearance) and Section 33.C.5 of the Zoning Ordinance, and shall contain roll-down doors. Use of the loading dock for deliveries or trash pick-ups, excluding moving vans, shall be limited to the hours from 8:00 a.m. to 6:00 p.m., seven (7) days a week. The loading dock door shall also be closed when the loading dock is in use, except when necessary for entry or exit of vehicles, venting of vehicle exhaust, or when required for similar operational or safety measures.

37. The developer agrees that new parking garages shall be designed to allow access and use by vans. At least 10% of the total new parking supply shall be accessible to vans, shall be conveniently located on the level of the garage closest to street level, and on the two upper most levels of the garage. The parking level closest to the street and shall have a minimum clearance of 98 inches, the second uppermost level shall have a minimum clearance of 86 inches, and.—All other areas of the garage shall have a minimum clearance of 84 inches. Compliance with this condition shall be determined by review of the building plans by the Zoning Administrator before the issuance of the Footing to Grade Structure Permit, which review shall not relieve the developer from constructing in accordance with this condition.

38. The developer agrees to ensure that all parking spaces comply with the requirements of Section 33 of the Zoning Ordinance. Unless otherwise approved by the County Board, the number of compact spaces for the Phase Two office building shall not exceed 137 spaces or 35.3 percent of the total spaces in the Phase Two office building may not exceed the Zoning Ordinance requirement. The developer shall submit drawings showing that these requirements are met, and shall obtain approval by the Zoning Administrator before the issuance of the Footing to Grade Structure Permit.

39. The developer agrees to provide, at no charge to the user, secure bicycle storage facilities in locations convenient to office, residential and retail areas on the following basis at a minimum:

**Office and Residential-Bicycle Storage Facilities:**

PLA-3425
One (1) employee bicycle parking space for every 7,500 square feet, or portion thereof, of office floor area and one (1) additional such visitor space for every 20,000 square feet, or portion thereof, of office floor area.

One (1) resident bicycle parking space for every 10 three (3) residential units, or portion thereof, of residential units and one (1) visitor space for every 50 residential units, or portion thereof, of residential units.

These bicycle parking facilities shall be highly visible to the intended users and protected from rain and snow within a structure shown on the site plan. The facilities shall not encroach on any area in the public right-of-way intended for use by pedestrians nor any required fire egress. The facilities for office users residential bicycle parking must meet the acceptable standards for Class I storage space as contained in the Arlington Bicycle Transportation Plan, dated April 1994 with Amendments through March 2003, and be highly visible from an elevator entrance, a full-time parking attendant, a full-time security guard or a visitor/customer entrance. Visitor parking must be located within 50 feet of the primary building entrance. Any bicycle parking racks used on the site must conform to the Arlington County Standard or be approved by the Bicycle and Pedestrian Program Manager. Drawings showing that these requirements have been met shall be approved by the Zoning Administrator before the issuance of the Footing to Grade Structure Permit.

In addition, the developer agrees that for every 50,000 square feet or fraction thereof of office Gross Floor Area (GFA), one (1) shower per gender shall be installed, up to a maximum of three (3) showers per gender. Also, a minimum of one (1) clothes storage locker per gender shall be installed for every required employee bicycle parking space. The lockers shall be installed adjacent to the showers in a safe and secured area and both showers and lockers shall be accessible to all tenants of the building. The location, layout and security of the showers and lockers shall be reviewed by the Arlington County Police Department before issuance of the Footing to Grade Structure Permit. The developer agrees that an exercise/health facility containing a maximum of 1,000 square feet shall not count as density (FAR) but shall count as GFA if this facility meets all of the following criteria: 1). The facility shall be located in the interior of the building and shall not add to the bulk or height of the project; 2). Showers and clothes lockers shall be provided as required above; 3). The lockers shall be installed adjacent to the showers in a safe and secured area within the exercise facility and both showers and lockers shall be accessible to all tenants of the project; 4). The exercise facility shall be open only to tenants of the project and shall not accept or solicit memberships from outside of the project. The exercise facility, including the showers and lockers, shall be open during normal working hours. If the required number of showers (3 showers per gender) and lockers (51 lockers) for the Phase Two office building, above and beyond the required number of showers and lockers for the Phase One
building, have been provided in the Phase One office building, then the developer shall be relieved from meeting this requirement in the Phase Two building, provided that the developer can demonstrate that office and retail tenants, employees, customers and visitors of the Phase Two office building will have access to the showers and lockers in the Phase One office building.

**Retail Bicycle Storage Facilities:**
Two (2) retail visitor/customer bicycle parking spaces for every 10,000 square feet, or portion thereof, of the first 50,000 square feet of retail floor area; one (1) additional retail visitor/customer space for every 12,500 square feet, or portion thereof, of additional retail floor area; and one (1) additional retail employee space for every 25,000 square feet, or portion thereof, of retail floor area. The retail visitor/customer bicycle spaces shall be installed at exterior locations that are convenient to the retail visitors/customers, and such locations shall be reviewed by the Department of Public Works. The developer agrees to obtain approval of the location, design and details of the retail visitor/customer bicycle spaces as part of the final site development and landscape plan. Facilities for retail visitors/customers must meet the County standards for bicycle racks, and be located close to retail visitor/customer entrances or the closest retail vehicle parking spaces.

40. The developer agrees to construct all plaza areas used for vehicular access and all surface parking areas to support the live load of any fire apparatus. Bollards or curbs shall be used on pedestrian plazas to separate the areas intended for emergency vehicle use from areas intended for pedestrian use. No above-grade structure shall be allowed to encroach in fire lanes. The requirements of this condition shall be incorporated in the drawings submitted for the Footing to Grade Structure Permit.

- **The following conditions of site plan approval (#41 through #45) are valid for the life of the site plan and must be met by the developer before the issuance of the Final Building Permit.**

41. The developer agrees to submit one (1) original and three (3) copies of a wall check survey to confirm its consistency with the plans approved by the County Board, as referenced in Conditions #1 and #10 above.

42. Mechanical equipment shall be screened so as not to be visible from public rights-of-way.

43. The use of any penthouse shall be limited to mechanical equipment and equipment maintenance space or telecommunication transmitter and/or receiver equipment as required in Condition #53 below.
44. The developer agrees to coordinate with the Operations Division of the Arlington County Police Department for comments regarding security measures.

45. The developer agrees to obtain from the Federal Aviation Administration (FAA), before the issuance of the final building permit, a written statement that the project is not a hazard to air navigation or that the project does not require notice to or approval by the FAA.

- The following conditions of site plan approval (#46 through #52) are valid for the life of the site plan and must be met by the developer before the issuance of the First Certificate of Occupancy.

46. The developer agrees to develop and submit a comprehensive sign plan and that all exterior signs shall comply with the conditions of the approved Comprehensive Sign Plan for the Ellipse at Ballston Site Plan, as well as shall be consistent with the guidelines contained in “Sign Guidelines for Site Plan Buildings and with Section 34 of the Zoning Ordinance, except that retail signs may have a design which differs from the approved Comprehensive Sign Plan. The Comprehensive Sign Plan and be revised to include retail signage for the Phase Two office building, which revisions shall be reviewed and approved by the County Manager or his designee. The Zoning Administrator shall determine whether the signs meet the standards of the approved Comprehensive Sign Plan, the guidelines and the Ordinance, and no sign permits will be issued until this determination has been made or, as deemed appropriate, a revised Comprehensive Sign Plan has been approved. A comprehensive sign plan is approved. The comprehensive sign plan shall be approved before the issuance of the First Certificate of Occupancy. All proposed rooftop signs, defined as all signs that are 35 feet or more above the ground, shall require a site plan approval or amendment. Further, the developer agrees that any signage facing The Jefferson residential building, including retail tenant identification signage, shall not be illuminated after 11:00 p.m.

47. The developer agrees to develop and implement a transportation management plan, as outlined in the attached Transportation Demand Management Program submitted to Arlington County by Wells and Associates, letter from (applicant) dated to (staff), and the attachment thereto, as amended below, prior to the issuance of the first Certificate of Occupancy. Such plan shall include a schedule for and details of implementation and continued operation of the elements listed in the attachment letter.

a. The developer agrees to contribute $19,311 to the Commuter Assistance Program to sustain direct and indirect on-site and off-site services in support of the TMP activities. The contribution shall be made before the issuance of the first Certificate of Occupancy for the Phase Two office building.
48. **Intentionally Omitted** The intent of this condition is to ensure that at least one parking space is available in perpetuity for parking use by each residential unit in the project. Accordingly, the developer agrees to offer the use, for rental units, and the purchase or use for condominium units, of at least one parking space for each dwelling unit.

Further, for condominium units, the developer agrees to notify the Zoning Administrator at the time of the settlement of the last dwelling unit. If excess parking spaces are available at the time of settlement of the last dwelling unit, the number of excess parking spaces equaling the number of dwelling units which were sold without a parking space, shall first be offered exclusively for a period of twelve (12) months to the owners of those dwelling units which were sold without a parking space. Any other remaining spaces shall be offered to all dwelling unit owners or transferred to the condominium, cooperative or homeowners association. By the end of twenty-four (24) months following the settlement of the last dwelling unit, the developer agrees to relinquish in writing to the condominium, cooperative or homeowners association any and all remaining interest in the parking spaces or garage and a copy shall be filed with the Zoning Administrator. The future purchase of any parking spaces shall be limited to the dwelling unit owners or condominium, cooperative or homeowners association of the building.

For both rental and condominium buildings, the use of the parking spaces shall be limited to parking use by the residents of the building and their guests, unless otherwise permitted by the Zoning Ordinance, and shall not be converted to storage or other use without approval of a site plan amendment.

The developer agrees to submit to the Zoning Administrator a parking management plan which outlines how guest and visitor parking for the residential building, and parking for retail tenants' employees and customers for retail located in the residential buildings, will be provided, where the parking will be located and how guests and visitors, and retail employees and customers, will be directed to the parking spaces. The developer further agrees to make a minimum of ____ residential visitor parking spaces, and ____ retail tenant parking spaces, available within the residential garage. The parking management plan shall be submitted to the Zoning Administrator, and reviewed and approved by the County Manager or his designee, prior to the issuance of the first Certificate of Occupancy for the first residential building.

49. The developer agrees to include a lighting plan for all internal and external public areas, including parking areas, as part of the final site development and landscape plan. This lighting plan shall be subject to review by the County Manager or his designee, including street lighting as described in Condition #26 above. The developer shall include in the site development and landscape plan
certification that the lighting plan meets the minimum standards of the Zoning Ordinance, Section 2, Subsection H, and the Illumination Engineering Society of North America Standards. The lighting shall be installed and tested before the issuance of the First Certificate of Occupancy.

50. The developer agrees to be responsible for documenting any historical artifact or historical natural feature uncovered during construction on the site. This documentation shall include written notation describing the artifact or natural feature, color photographs, and mapping of the location and/or depth of the site excavation at which the item was found. The developer agrees to submit a copy of this documentation to Arlington County before issuance of the First Certificate of Occupancy.

In the event an historical artifact or natural feature is found on the site, and is to be disturbed or removed from the site during construction, the developer agrees to contact the Arlington County Historic Preservation Program, Neighborhood Services Division before removing or disturbing the artifact or natural feature. Arlington County shall be given the opportunity to accept donation of the artifact or natural feature before the item is offered to any other organization or individual.

51. **Intentionally Omitted** If the project includes a residential, condominium, or cooperative component, then the developer agrees that a copy of the conditions of this site plan approval shall be made available with the condominium's, cooperative's or homeowners association's bylaws or agreements. Documentation that this condition has been satisfied shall be provided to the County Manager or his designee before the issuance of the First Certificate of Occupancy. If the project includes a residential rental component that is converted to a condominium or a cooperative, then the developer agrees that a copy of the conditions of this site plan approval shall be made available with the condominium's, cooperative's, or homeowners' association's bylaws or agreements prior to the issuance of the first Certificate of Occupancy following the conversion.

52. Before the issuance of the Master Certificate of Occupancy, the developer agrees to submit drawings certifying the building height as measured from the average site elevation to both the building roof and to the top of the penthouse roof.

- **Post Certificate of Occupancy:** the following Conditions of site plan approval (#53 through #58) are valid for the life of the site plan.

53. In order to maintain the effectiveness of the County's public safety systems, the County reserves the right to install telecommunications transmitter and/or receiver equipment and conducting wire in or on the penthouse or top floor, and antennae and traffic monitoring systems on the roof of the proposed buildings at
no charge to the County in a location and design that is acceptable to the County and the building owner based on a reasonable exercise of judgment by both upon request by the County. Upon request by the County, the developer agrees to provide access to electrical service separately metered, including auxiliary electrical power, and telephone radio control lines to the penthouse in the defined area. Any radio transmitter or receiver equipment and antenna to be installed or used by others must not interfere with the emergency communication system of the County.

54. The developer agrees that any structural addition shall be subject to the approval of the Zoning Administrator consistent with Section 36.H.2.c of the Zoning Ordinance. If the Zoning Administrator determines that any proposed improvements have a significant impact on the site plan, or otherwise meet Zoning Ordinance requirements for site plan amendments that go to the County Board, a site plan amendment shall be required.

55. The developer or owner agrees to remove snow from all interior streets and interior and exterior sidewalks, including accessibility ramps and gutter areas within crosswalks, within a reasonable time after snow has stopped falling but in no case later than snow removal provided for vehicular access to the site.

56. **Intentionally Omitted**

57. The developer agrees to provide parking for each building according to the approved parking ratio; when this parking is not located within the parcel designation of each building but located within the overall project, it shall continue to be committed to the entire project for purposes of administering the Zoning Ordinance.

58. The density allocated for any new construction pursuant to the site plan on any subdivided parcel of the site shall be the same as the approved density for the entire site. No additional density shall be allowed on any individual parcel formed by subdivision of the site.

*The following unique site specific conditions (#59 through #74) are valid for the life of the site plan and must be met before the issuance of the permit specified in each Condition.*

59. Retail Elements
   a. The developer agrees to develop and implement a retail attraction and marketing plan for the 13,977 square feet of retail space located on the
first floor of the office building. The plan shall identify the types of retail
desired, the marketing strategy to attract the retail, and strategies to
retain the retail. The retail attraction and marketing plan shall be in
accordance with the approved Retail Action Plan for the Rosslyn-Ballston
Corridor, dated January 2001. The retail attraction and marketing plan
shall be reviewed and approved by the Department of Economic
Development before being submitted to the Zoning Administrator. The
above-grade building permit shall not be issued until documentation has
been provided to the Zoning Administrator assuring that the plan has
been approved by the Department of Economic Development. Any
change in the use of the retail space from retail to office or other non-
retail use shall require a site plan amendment.

b. The retail spaces shall be designed and constructed to include interior and
exterior improvements necessary to ensure that they are functional and
attractive to prospective retailers and that they animate the street
frontage. These elements shall include, but not limited to: approximately
17-foot floor to floor heights, as shown on the plans dated November 7,
2003; access to the service corridor/areas as shown on the architectural
plans dated November 10, 2003; direct street frontage and access;
provision for any venting systems required for any food preparation or
restaurant use; and sufficient transparency of the building facade to
achieve adequate street exposure.

c. The developer agrees that all retail storefronts along public rights-of-way,
as shown on plans dated November 10, 2003, are required to have an
overall minimum transparency of 50%. In addition, the portion of the
retail storefronts that is located between three and eight feet from grade
is required to be at least 80% transparent. The purpose of this condition
is to allow pedestrians to view the activity within the retail establishment
and to allow patrons and employees of the retail establishments to view
the activity on the sidewalk and street. “Transparency” shall mean using
glass or other transparent exterior material offering a view into an area of
the retail establishment where human activity normally occurs and shall
not be satisfied by views into areas blocked by display cases, the rear of
shelving, interior walls, blinds, hallways, or the like. Provided that the
exterior material is glass or other transparent material, a tenant may
apply to the County Board for a site plan amendment to grant an
exception to this condition for a specified duration.

60. The developer agrees to provide for a public art component within the site
consistent with the objectives outlined in the WALKArlington report issued March
2001, the WALKArlington Ballston Pilot Study, and the Public Art Master Plan
(anticipated adoption by the County Board spring 2004). Public art may include
integrated design elements such as, but not be limited to, the following:
markers, paving designs, seating areas, landscaping, fountains/water sculpture, banners, kiosks, bus shelters, special public places and other aesthetic and functional elements that forward the WALKArlington mission. The developer agrees to involve an artist as a member of the project's design team. The artist will work with the project architects, to provide public art in the site plan development. The developer agrees to fund the public art at a cost no less than $50,000. The budget amount shall include all reasonable costs of the work, including the direct costs (e.g., maquettes or proposals) and indirect costs (excluding any in-house or internal costs to the developer, third party reimbursements or art consultant fees) of interviewing artists, artist fees, all costs of design, fabrication, installation, and all costs of any structural enhancements to the building and or sidewalk to support said art work. Notwithstanding this minimum amount, the developer agrees to fund all costs of the public art. The developer shall coordinate with the County Manager or his designee (including staff from DPRCR and DCPHD) on the selection of the artist and the design, fabrication, installation and maintenance plan for the public art. Prior to any installation, the developer shall provide the County Manager with, and obtain his approval of, a reasonable budget for the art work, which budget demonstrates compliance with this condition. The County's Arts Commission shall be consulted. The public art shall be commissioned prior to the issuance of the above grade building permit, and installed prior to the issuance of the final Certificate of Occupancy. In lieu of the development of public art in consultation with the County Manager or his designee, the developer may opt to make a contribution in the amount of $50,000 to the County's Public Art Fund toward realizing the public art as described above, either off site in the Ballston Metro station area or on site, including such space as may be necessary to locate the public art if on site, whereupon the process for developing the art components would be managed by the County. This contribution shall be made prior to the issuance of the above grade building permit.

61. The developer agrees to make all parking on the P1 level of the garage available to the public for parking after standard office hours (weekday evenings after 6:00 p.m., weekends, and all legal holidays) until 12:00 midnight or until the close of business of retail operations, whichever is later. The developer further agrees to make a minimum of 24 parking spaces on the P1 level of the garage (equivalent to a ratio of one space per 580 square feet) available for use exclusively by the retail tenants' employees and customers; at a minimum, the number of spaces to be so reserved shall be consistent with the requirements of the Zoning Ordinance for the retail uses that occupy the space, but need to leave sufficient spaces for other uses. The developer agrees to implement a validation program to allow free use of such spaces for retail customers and employees between 6:00 p.m. and 12:00 midnight or until the close of business of retail operations, whichever is later.
62. Outdoor cafes shall be permitted in the public right-of-way or within public easements along Wilson Boulevard in accordance with the applicable provisions of the Zoning Ordinance, with a maximum seating area and all other applicable requirements as set forth in the Zoning Ordinance and as determined by the Zoning Administrator. A minimum of eight (8) feet of clear sidewalk width must be maintained along Wilson Boulevard. Upon application to the Zoning Administrator, an additional two (2) feet of outdoor café space may be considered administratively. Plans for all outdoor cafes shall be subject to prior administrative approval by the Zoning Administrator for consistency with County ordinances, regulations and policies. Any outdoor café shall be administratively reviewed one year following its approval to evaluate it after a season of operation. At that time, the Zoning Administrator may review the approval, impose conditions on the operation of the outdoor café, or revoke the prior approval.

63. The developer agrees to make a contribution to the County's Housing Reserve Fund of $75,600. The payment shall be made to the Department of Community Planning, Housing and Development and compliance with this condition shall be provided to the Zoning Administrator. The developer agrees that the contribution will be paid prior to the issuance of the final building permit.

64. Building Security Requirements

a. In order to address exterior building security needs that may be required by a federal government agency(s) that may potentially occupy the building(s) as the primary tenant(s), the developer agrees to coordinate with County staff on the design of exterior building security measures in order to limit or mitigate any adverse impacts that these measures may have on the project's urban design (including street and retail base) and streetscape. All exterior building security measures shall be shown on, and approved as part of, the final site development and landscape plan. The base of the buildings, as shown in the drawings dated November 10, 2003, and consistent with Condition #59 above, have been designed to accommodate retail uses and provide interest and activate the streetscape. Any change in the use and design of the base shall require a site plan amendment.

b. The developer agrees that it is the policy of the County to maintain the maximum number of on-street parking spaces around the perimeter of a site, and that it will not remove or reduce the number of on-street parking spaces around the perimeter of a site whether at the request of the developer or a tenant or otherwise. Accordingly, the developer agrees that it shall notify tenants of the aforesaid policy prior to execution of any lease with a tenant.
65. The developer agrees that the County Board has approved additional density for this project based on the applicant’s agreement to achieve a LEED score on the LEED Green Building Rating System, Version 2.1 (May 2003) of 27 points or higher by including components in its development that earn the LEED credits listed below. These components are referred to herein as a group, as the “Green Elements.” The developer agrees that the LEED rating system described above shall apply to this site plan, irrespective of whether the US Green Building Council revises its rating system. The developer agrees that no permits will be issued for the project unless the Green Elements that would reasonably be shown on such permit are included therein. The developer further agrees that certificates of occupancy will be issued for parts of the development only after all of the applicable Green Elements have been included in that part of the development. The developer further agrees that, together with its application for a Building Permit, it shall include a listing of the Green Elements, with a notation of where and how each element has been incorporated into the construction of the project. To the extent a Green Element is not included in drawings, or has not been incorporated into the project at the time a Building Permit application is submitted, the applicant agrees to provide a plan for providing the Green Element. Such plan shall include sufficient specificity to enable the County Manager or designee’s approval (as including all Green Elements) of the plan prior to issuance of a Building Permit. A building permit based on such plans will be issued only after the County Manager has approved the plan as fulfilling the requirements of this condition. Within ninety (90) days after the issuance of the first certificate of occupancy for any part of the last floor of floors two through eleven, the applicant agrees to provide a certification by a LEED-certified consultant, or other person with substantial experience with the LEED system, approved by the County in its sole discretion. The certification shall state that all of the Green Elements, or substitutes as provided for below, have been incorporated into the project and that, in the consultant’s opinion, the project will qualify for a LEED Score of 27 points or higher. Prior to the issuance of the first certificate of occupancy for the building, the developer agrees to provide to the County financial security (in the form of a bond or letter of credit or other form approved by the County Attorney) in the amount of two hundred fifty thousand dollars ($250,000) guaranteeing that, within eighteen months from the date of issuance of the first certificate of occupancy for any part of the last floor of floors two through eleven, the developer will have received its “Certified” certification, with 27 or more points, from the United States Green Building Council. Should the developer fail to achieve that rating or to obtain the USGBC’s within the eighteen month period, the developer shall automatically forfeit the security, which shall be immediately paid to the County. The developer agrees to implement this site plan approval so as to earn the points achievable under the LEED Green Building Rating System, Version 2.1 (May 2003). Should the developer find that it is impossible to include any of the Green Elements in construction of the development, the developer agrees to notify the County Manager in writing of the basis for the developer’s finding and
of what LEED Rating Credits will be substituted to maintain a LEED score of 27 points or higher. The developer will obtain the County Manager’s approval of any substitute Green Element, which shall be given if the County Manager determines that the substitute will enable the developer to maintain a LEED score of 27 points or higher. The developer agrees to permit the County Manager or his designee to access the USGBC records for the project, and to provide the County Manager with such authorization as may be necessary to allow such access. Should there be a dispute between the County and the developer as to whether any Green Element has properly been included in the development so as to qualify for the applicable number of LEED Rating System points, the County and the developer will select a mutually agreeable third-party LEED-certified individual, or other person with substantial experience in the LEED system if approved by the County Manager, and accept the determination of that individual as to whether the developer has qualified for those points. If the third-party person determines that the Green Element has properly been included, the County will issue the permit. Such a determination shall in no way relieve the developer of the obligation to achieve the level of certification called for in this condition.

a. **Innovation and Design Credit 1.1 and 2:** two points;

b. **Sustainable Sites Prerequisite 1, Erosion and Sedimentation Control:** no points;

c. **Sustainable Sites Credits 1, 2, 4.1, 4.2, 4.3, 4.4, 6.1:** seven points;

d. **Water Efficiency Credits 1.1 and 1.2:** two points;

e. **Energy and Atmosphere Prerequisites 1, 2, and 3:** no points;

f. **Energy and Atmosphere Credits 1, 4, 5 and 6:** four points;

g. **Materials and Resources Prerequisite 1:** no points;

h. **Materials and Resources Credits 2.1, 4.1, 5.1, and 7:** four points;

i. **Indoor Environmental Quality Prerequisites 1 and 2:** no points; and

j. **Indoor Environmental Quality Credits 1, 3.1, 4.1, 4.2, 4.3, 4.4, and 7.2:** eight points.

66. The developer agrees to grant a permanent public access easement to the County Board of Arlington County providing for public access to the development’s open space and plaza area, including the plaza area located between the Phase One and Two office buildings, which extends northward from
Wilson Boulevard to the Ellipse Plaza, and the Ellipse Plaza. The final location of the easement may change with the preparation of the final building plans. The developer agrees to construct and landscape this area, as shown on plans dated **November 10, 2003** and made a part of the public record on **December 6, 2003**. Final landscape plan design and implementation, including installation of landscape materials, shall be approved by the County Manager or his designee as part of the final site development and landscape plan. Construction and landscaping of this area and granting of the public access easement shall be completed prior to issuance of the first certificate of occupancy for the building. The easement shall be granted by deed, in form and substance acceptable to the County Manager, and shall be recorded among the land records of the Clerk of the Circuit Court of Arlington County. The developer shall be responsible for maintaining this area.

67. The developer agrees to deliver all refuse, as defined by the Arlington County Code, to an operating refuse disposal facility designated by the County Manager. The developer further agrees to stipulate in any future lease or property sale agreements that all tenants or property owners shall also comply with this requirement.

68. The developer agrees to have, as a part of its parking management plan, provisions relating to the towing of impermissibly parked vehicles. Such provisions shall include, but not be limited to:

   a. Requirements for signage at the developer’s parking lot(s) providing notice of all applicable parking restrictions enforced by towing, the location of the towing contractor(s)’ impoundment yard, and the name and telephone number of the developer’s on-site representative responsible for towing-related complaints, as well as the telephone number of the Arlington County Office of Citizen and Consumer Affairs;

   b. Disclosure by the developer and its towing contractor(s), at the developer’s parking lot(s), of all fees and charges for towing; and

   c. Evidence that the developer has a contract with the towing contractor that requires the towing contractor to clearly display all fees and charges for towing.

69. The developer agrees to install speed bumps adjacent to the top of garage exit ramps at locations where ramps abut the pedestrian sidewalk, in order to slow vehicular traffic prior to vehicles crossing the sidewalk. The locations of the speed bumps shall be shown on the site engineering and building plans approved by the County Manager or his designee.
70. The developer agrees to install and maintain in operable condition, in a manner acceptable to the County Manager or his designee, an internal antenna/amplifier system that permits public safety radio communications to transmit in the 806-825 MHz frequency and to receive in the 851-870 MHz frequency from all areas within the building. The developer agrees to provide documentation in the approved electrical engineering drawings that adequate accommodations have been made in the building to meet this requirement.
PREVIOUS COUNTY BOARD ACTIONS:

January 10, 1987
Approved [Z-2181-80-6 (SP-5)] a mixed-use office, residential and retail development.

January 9, 1988
Approved a site plan amendment [Z-2181-80-6 (SP-5)] to convert the residential portion of the approved site plan to a lifecare facility with 350 independent living units, 32 personal care rooms, and 50 nursing care beds.

Approved a site plan amendment [Z-2181-80-6 (SP-5)] to re-configure the access drives serving the residential (lifecare) buildings.

May 13, 1989
Approved a site plan amendment [Z-2181-80-6 (SP-5)] to increase the GFA, decrease the number of units, decrease parking spaces and increase the building height on the approved site plan for a life care facility.

August 11, 1990
Deferred a site plan amendment [Z-2181-80-6 (SP-5)] request to convert retail space to office use to the September 8, 1990 County Board Meeting.

Approved a site plan amendment [Z-2181-80-6 (SP-5)] to convert the approximately 2,524 square feet of retail space to a dentist office subject to all previous conditions and one (1) new condition.

Deferred a site plan amendment request [Z-2181-80-6 (SP-5)] for two tenant identification signs on the east and west pavilion arms of the Ellipse building to the December 8, 1990 County Board meeting.

November 17, 1990
Denied a site plan amendment request [Z-2181-80-6 (SP-5)] to convert approximately 900 square feet of retail gross floor area to office use.

Deferred a site plan amendment request for a comprehensive sign plan [Z-2181-80-6 (SP-5)]
Major Site Plan Amendment Request
SP #249

February 9, 1991
Approved a site plan amendment for a comprehensive sign plan [Z-2181-80-6 (SP-5)] for the Ellipse at Ballston, subject to all previous conditions and six (6) new conditions.

May 20, 1993
Ratified a contract for the sale of the portion of the out-parcel not needed for public right-of-way.

July 10, 1993
Approved a site plan amendment for the balance of the office development at the Ellipse at Ballston, including incorporation of a portion of the out-parcel and development of two (2) 11-story office buildings.

March 5, 1994
Approved a site plan amendment to exclude 4,500 square feet of storage from the floor area ratio (Condition #64), to amend Condition #34 to allow separate parking management element, and to amend Condition #32 to extend vanpool parking to the P-2 level of the parking garage, subject to all previous conditions, amended Conditions #32 and 34, and new condition #64.

July 20, 1996
Approved a site plan amendment for a free-standing retail tenant identification sign within the site (4301 Wilson Boulevard), behind the public sidewalk and right-of-way on Wilson Boulevard.

August 17, 1999
Approved a site plan amendment to increase office gross floor area by 25,419 (revised to 20,919) square feet to the West Building (typical floor increase by approximately 2,400 square feet, from approximately 20,100 square feet to approximately 22,422 square feet) and reduce the building setback from the western property line from the approved setback of 30.1 feet to proposed setback of 15 feet, subject to all previous conditions, and the following amended conditions number 54 and 59 and new conditions number 65 through 72.
July 28, 2001

Approved a site plan amendment to add 4,055 square feet of space to the garage of the NRECA Phase Two building, and to construct an arched sheltered walkway between the two NRECA buildings.

Arlington County

- 25.8 square miles
- Population 214,500 (2012)
- Employment 227,500 (2012)
- Housing Units 107,519 (2012)
- Daytime Population 301,100 (2012)
- 11 Metrorail Stations
• Located in the core of a rapidly growing Washington region (over 5 million residents, 3 million jobs and 1,200 sq. miles of urbanized area)
Setting the Stage

Arlington County - 1960

- 7.5 million sq. Ft. Office
- Declining retail corridors
- Emerging market for government office space
- Strong single family neighborhoods
- Large number of garden apartments, some of which were beginning to decline
- 97,505 jobs
- 71,230 housing units

R-B Corridor: 1972

Photo Credit: Arlington County Department of Community Planning, Housing & Development.
Setting the Stage

1960s and 1970s

• Beginning of the planning for a regional transit system

• Embarked on an ambitious community planning effort

• Had already debated the impacts of development vs the benefits of growth and decided we wanted to encourage growth as well as encourage riders

Photo Credit: Images originally produced by WMATA. Found in the RB '72 Land Use Alternatives, Arlington County Department of Community Planning, Housing & Development.
The Proposed Metrorail Route

Arlington lobbied strongly for an underground route along the old commercial corridor vs along the median of future highway.
Setting the Stage

The Bull’s Eye

- Concentrate high and mid-density redevelopment around transit stations (highly targeted) and taper down to existing neighborhoods
- Encourage a mix of uses and services in station areas
- Create high quality pedestrian environments and enhanced open space
- Preserve and reinvest in established residential neighborhoods

Image Source: Arlington County Department of Community Planning, Housing & Development. Found in the RB '72 Land Use Alternatives.
Walkability & Multimodal Transportation Planning

- Focus community development around transit and require appropriate investments in transportation
- Emphasize community walkability
- Maximize travel choice for residents, workers and visitors
- Provide comprehensive and easy to access information about travel options
- Employ transportation demand management strategies
- Manage curb-space and parking efficiently
- Emphasize multi-modal street operations

Photo Credit: Arlington County Department of Community Planning, Housing & Development.
Sector Plans

• Adopted a corridor-wide GLUP based on agreed-to development goals

• Then focused on developing sector plans to create distinctive “urban villages”

  – Overall vision for each station area
  – Desired public improvements
  – Location for retail
  – Urban design standards
  – Public infrastructure needs
  – Open space, streetscape standards
  – Each focused on an area of approximately 1/4 mile to ½ mile from the metro station

Clarendon Sector Plan - 1984

Clarendon Sector Plan - 2006

Illustrative Plan

Concept Sketch

How We Did It

Zoning

Planning for Metro

- 11% of county (2 rail corridors) re-planned to encourage mixed-use, high density development
- Zoning in the 89% was primarily low density so little unplanned development can happen

General Land Use Plan

For Metro Corridors

- Land remains zoned for low density, but GLUP indicates willingness to rezone for higher density.
- In response to proposals, county would rezone to higher density as shown on GLUP
- Requires a special exception. **Site Plan** is used to approved the development. Requires County Board approval.
How We Did It

The General Land Use Plan (GLUP)
Site Plan

- Site Plan allows flexibility but is tied to the GLUP and the adopted sector Plans in terms of uses, density, height and design
- Property owner always maintains underlying by-right zoning until they implement approved site plan
- By-right development is at a much lower density with a more limited array of uses allowed
- The site plan allows significantly higher density & height than underlying zoning

<table>
<thead>
<tr>
<th>By-right</th>
<th>Site Plan</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.5 F.A.R.</td>
<td>3.8 – 10 F.A.R.</td>
</tr>
<tr>
<td>35-45 ft (height)</td>
<td>100-300 ft (height)</td>
</tr>
<tr>
<td>4 Parking spaces per 1,000 SF</td>
<td>2 Parking spaces per 1,000 SF</td>
</tr>
</tbody>
</table>
Site Plan

Site Plan is Approved IF:

- It complies with the standards of the zoning ordinance,
- Is in compliance with the mix required by the GLUP
- Provides the features called for in the sector plan for the area - including public improvements
- Matches the FORM identified in the Sector Plan

Increased density in return for

- Building the development we want
- Where we want it
- And building significant amount of the required and desired public improvements
- LEED & Affordable Housing

Photo Credit: Arlington County Department of Community Planning, Housing & Development.
New Zoning Tools

• Some of the zoning tools we’ve created include

  Mixed use
  - C-0-A: 50/50 res/off mix up to 6.0 FAR can be 100 % residential
  - R-C: 1.24 FAR office, 2.0 FAR residential - residential must proceed first or concurrent with office

Redevelopment
- C-O Rosslyn: 10.0 FAR
Early Results

• Early results were successful from a development perspective
• But not from a place making perspective
Mid-Course Review

Early Results

Rosslyn – 2000s
Mid-Course Review

Early Results

Photo Credit: Arlington County Department of Community Planning, Housing & Development.
Responding to Early Results: Mid Course Review - 1989

• Worked with a group of Architects and Urban Designers to evaluate efforts to date
• Led to development of corridor-wide urban design concept
• Raised awareness of design issues
• First new Sector Plan to utilize what we learned was Rosslyn followed by Clarendon
• Going forward design and architecture became much more important
  • First critical lesson was that it’s not about the density
  • It’s about the form, and what place we were trying to create

Where are we now?

Demographic Overview

• R-B Corridor is 21% of the County Population

• The R-B Corridor is young.

• According to the 2010 Census, Arlington County had the highest percentage of 25-34 Year Olds out of any other city or county in the U.S.

Source: American Community Survey 2006-2010 5-Year Sample. Tabulated by the Planning Research and analysis Team, Arlington County Department of Community Planning, Housing & Development.
Where are we now?

Demographic Overview

- 70% of R-B Corridor residents are white

- 82% of R-B residents have a Bachelor’s degree or higher.

- Median Household Income for R-B Corridor: $92,000 - $98,000 (2010 dollars)

Source: American Community Survey 2006-2010 5-Year Sample. Tabulated by the Planning Research and analysis Team, Arlington County Department of Community Planning, Housing & Development.
Demographic Overview

- R-B Corridor: 40% of residents take public transportation to work.

- R-B Corridor has “Car-Light” households
  - 16% have no vehicle available.
  - 59% have one available.

Prepared by Community Planning, Housing and Development - Planning Division: Planning, Research and Analysis Team (PRAT), December 2012.
• Car ownership (vehicles per household)
  – Nationally, almost 91% have a car; 58% have 2 or more
  – In Fairfax, 96% have at least one; 66% have 2 or more
  – Arlington: 12% have zero cars; less than 40% have 2 or more

Source: 2010 5-Year American Community Survey

Prepared by Community Planning, Housing and Development - Planning Division: Planning, Research and Analysis Team (PRAT), April 2012.
Numbers are more dramatic in Arlington’s Metro corridors

- Car ownership: 16.7% have zero cars, while less than 25% have 2 or more
- Getting to work: Less than half drive alone (39.8%)
  - 42.8% use transit
  - 9.5% walk or bike
  - 3.1% work at home

Source: 2010 5-Year American Community Survey

Prepared by Community Planning, Housing and Development - Planning Division: Planning, Research and Analysis Team (PRAT), April 2012.
Real Estate Assessments

• $27.5 billion of a total $57.5 billion in assessed land and improvements value in the county is in the metro corridors which is 11% of total land

• Today Arlington has more office space than downtown
  – Dallas, Los Angeles, Denver, or Boston

• County has maintained low property tax rate ($0.935 per $100 fmv) and maintains amongst the highest levels of services

• Tax base divided between 46% commercial and 54% residential

• County consistently maintains AAA bond rating from all rating agencies

Awards

EPA Smart Growth

• League of American Bicyclists -- Bicycle Friendly Community designation

• APTA -- Outstanding Public Transportation System Award (for ART)

• American Podiatric Association -- Best Walking City in America

• APA Great Streets Award
• Transit investments can be used as a catalyst to reshape communities
• Multimodal transportation strategies can result in substantial benefits – allowing continued growth with less reliance on autos
• Establish the vision, design supportive public policies/plans and tools and be patient
• Build community consensus
Lessons Learned

• Ensure that transit is integrated with development – not secondary
• An attractive and functional pedestrian environment is important
• Develop public-private partnerships to continue consensus building and assist in the implementation
• Integrity of plan – be consistent
• Do the detailed planning at the sector area to avoid the battles at development review time
Lessons Learned

- Station areas must be able to satisfy the daily needs of users if they are to really leave their cars behind (mixed use)
- Reduce parking requirements
Challenges

Refining the Vision

• Transportation Demand Management (TDM)
• Affordable housing
• Parking
• Pedestrian improvements
• Expansion of transportation options
• Architecture
Refining the Vision

• Affordable housing
  – 22,000 new market rate units in R-B since 1980
  – Few affordable
  – New tools
    • Special affordable housing protection district
    • 25 % bonus
    • State enabled mandatory contribution

### APPENDIX G. MENU OF TDM MEASURES

**Table G-1. Alameda County TDM Program: City and Public Agency Measures**

<table>
<thead>
<tr>
<th>TDM Program</th>
<th>Description</th>
<th>Primary Agency Responsible</th>
<th>City Implementation mechanism</th>
<th>Recommended Application/Context</th>
<th>% Trip Reduction</th>
<th>Factors</th>
<th>Source</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set trip reduction requirements for multifamily residential or commercial development</td>
<td>Require as a condition of approval for developments (either commercial, multifamily residential, or both) that certain TDM measures are implemented on an ongoing basis, or that specified vehicle trip reduction requirements are met.</td>
<td>Cities or business associations</td>
<td>Planning code or other municipal ordinance</td>
<td>Any urban area with good transit service; suburban downtowns, commercial and mixed use areas; transit stations (particularly in high-growth areas)</td>
<td>6%-10%, Enables other strategies</td>
<td>Effects of this strategy depend on the location/accessibility of the development site(s), demographics of the project's residential/commercial occupants/tenants and the type of measures required. The US EPA notes that &quot;reasonable initial targets for the programs established under a trip reduction ordinance (TRO), might be a 5-10 percent reduction in single occupant vehicle (SOV) trips, with somewhat larger reductions (perhaps 15 percent) if substantial fees for parking are imposed.&quot;</td>
<td><a href="http://www.epa.gov/oiaa/stateresources/policy/transitcmt/tp_reduction.pdf">http://www.epa.gov/oiaa/stateresources/policy/transitcmt/tp_reduction.pdf</a></td>
</tr>
<tr>
<td>Establish a Transportation Management Association</td>
<td>Establish an organization to assist businesses in reducing vehicle trips, either by administering programs, providing services (such as shuttle service), or providing technical assistance to businesses. Often implemented together with a trip reduction requirement.</td>
<td>Cities or business associations</td>
<td>Planning code or other municipal ordinance; or voluntary action by business association</td>
<td>Commercial area or other major business or employment districts</td>
<td>6%-7%</td>
<td>The TDM Resource Center (1996) estimated that just by improving coordination, and providing information on travel alternatives, establishment of a TMA can reduce commute-related vehicle trips by 6%-7%, with greater impact when implemented in concert with other trip reduction, TDM and parking management programs and services.</td>
<td>TDM Resource Center (1996), Transportation Demand Management, A Guide to Including TDM Strategies in Major Investment Studies and in Planning for Other Transportation Projects, Office of Urban Mobility, USDOT (<a href="http://www.wsdot.wa.gov">www.wsdot.wa.gov</a>), as cited in the Victoria Transportation Policy Institute's TDM Encyclopedia (<a href="http://www.vtpi.org/tdm/tdm44.htm">http://www.vtpi.org/tdm/tdm44.htm</a>).</td>
</tr>
<tr>
<td>Implement an employee-trip reduction program for municipal employees</td>
<td>Appoint an employee commute coordinator, and implement incentive programs to reduce single-occupant vehicle commuting among municipal employees. Elements may include: Subsidized transit passes; employee parking and/or parking cash-out programs; commuter checks; Direct financial incentives to bike, walk, carpool or take transit; Ride sharing; Shuttles; Vanpools</td>
<td>Cities</td>
<td>Modify agency procedures</td>
<td>Any</td>
<td>4-20%</td>
<td>Management support and the presence of an on-site employee transportation corridor are important factors in the success of a program. Mandatory employee/commute trip reduction (CTR) ordinances often require employers with more than 50 or 100 employees at a given employment site to implement a CTR program. This reduces the costs of administering TDM programs and compliance with survey and reporting requirements, but prevents such programs from reaching the majority of employees in a given city/region who work for small to mid-sized firms and organizations with less than 50 employees.</td>
<td>Marlon G. Boarnet, Him-Ping Hsu and Susan Handy (2010), Draft Policy Brief on the Impacts of Employer-Based Trip Reduction Based on a Review of the Empirical Literature, for Research on Impacts of Transportation and Land Use-Related Policies, California Air Resources Board <a href="http://arb.ca.gov/cc/375/policies/policies.htm">http://arb.ca.gov/cc/375/policies/policies.htm</a>); Philip Winters and Daniel Rudge (1995), Commute Alternatives Educational Outreach, National Urban Transit Institute, Center for Urban Transportation Research, University of South Florida; Tom Rye (2002), &quot;Travel Plans: Do They Work?&quot; Transport Policy, Vol 9, No. 4. (<a href="http://www.elsevier.com/locate/transportpol">www.elsevier.com/locate/transportpol</a>), Oct. 2002, pp. 287-298.</td>
</tr>
<tr>
<td>Safety Net</td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Guaranteed Emergency Ride Home program</td>
<td>Provide a guaranteed ride home for people who do not drive to work alone to ensure they are not stranded if they need to go home in the middle of the day due to an emergency, or stay late for work unexpectedly.</td>
<td>Any</td>
<td>Guaranteed/Emergency Safety Net</td>
<td>Alameda County is provided by Alameda CTC</td>
<td>9%-38%</td>
<td>Coupled with active program marketing by employers, including marketing of other TDM programs and financial incentives; such as parking pricing, the Alameda County Guaranteed Ride Home program has been shown to reduce drive alone vehicle trips to participating employment sites by as much as 38% (Draft Alameda County Guaranteed Ride Home Program Evaluation (Nelson/Nygaard 2012))</td>
<td>Draft Alameda County Guaranteed Ride Home Program Evaluation (Nelson/Nygaard 2012)</td>
</tr>

<th>TDM Program</th>
<th>Description</th>
<th>Primary Agency Responsible</th>
<th>City Implementation mechanism</th>
<th>Recommended Application/Context</th>
<th>% Trip Reduction</th>
<th>Factors</th>
<th>Source</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parking Management</td>
<td>Set on-street parking prices based on parking demand in area to achieve parking availability targets.</td>
<td>Cities</td>
<td>Urban or suburban downtowns, commercial and mixed use areas; transit stations.</td>
<td></td>
<td>4%-12%</td>
<td>One of the most significant factors affecting motorists’ choice of whether to drive or travel by another mode is the price of parking at the destination. Moreover, up to 26% of traffic in mixed-use districts is attributable to cruising for parking. By encouraging use of alternative modes and reducing parking search related delays for transit, demand responsive pricing can significantly reduce vehicle trips to major destinations/districts. The impact of parking pricing depends on the overall supply and availability of both on-street and off-street parking and the extent to which employers subsidize such parking.</td>
<td>Low-end estimate per Harvey and Deakin (1997), who estimated that parking pricing for work and non-work trips would reduce regional vehicle trips by 2.0% (Greg Harvey and Elizabeth Deakin (1997), “The STEP Analysis Package: Description and Application Examples,” Appendix B, in Apogee Research, Guidance on the Use of Market Mechanisms to Reduce Transportation Emissions, USEPA (Washington DC; <a href="http://www.epa.gov/omswww/market.htm">www.epa.gov/omswww/market.htm</a>)). High end estimated based on the Victoria Transportation Policy Institute, Trip Reduction Tables (<a href="http://www.vtpi.org/tdm/trm41.htm">http://www.vtpi.org/tdm/trm41.htm</a>). Additional resource: <a href="http://www.spur.org/publications/library/report/critical_cooling/option27/Urbanist">http://www.spur.org/publications/library/report/critical_cooling/option27/Urbanist</a>, Issue 482, May, 2009 (<a href="http://www.spur.org/publications/library/report/critical_cooling/option27/">http://www.spur.org/publications/library/report/critical_cooling/option27/</a>).</td>
</tr>
<tr>
<td>Use of new meter technologies to allow multiple forms of payment and dynamic pricing</td>
<td>Install parking meters that allow payment by credit card, phone, and that connect to a central system in real-time, allowing for remote programming and management of parking prices.</td>
<td>Cities</td>
<td>Urban or suburban downtowns, commercial and mixed use areas; transit stations.</td>
<td>Enables demand responsive parking pricing</td>
<td>Installation of new parking management technologies, including new meters and infrastructure to support payment by cell phone and real-time monitoring of parking space utilization and turnover enable implementation of demand responsive parking pricing, which in turn reduces vehicle travel (see Demand Responsive Parking Pricing).</td>
<td>San Francisco Planning and Urban Research (2009). “Critical Cooling,” The Urbanist, Issue 482, May, 2009 (<a href="http://www.spur.org/publications/library/report/critical_cooling/option27/">http://www.spur.org/publications/library/report/critical_cooling/option27/</a>).</td>
<td></td>
</tr>
<tr>
<td>Use of parking revenue to support other mobility/neighborhood programs</td>
<td>Dedicate meter revenue from designated area to uses such as mobility improvements, neighborhood or business improvement programs, potentially through the creation of a parking benefit district.</td>
<td>Cities</td>
<td>Any area with paid parking</td>
<td>Enables investment in Multimodal Infrastructure and TDM Programs.</td>
<td>Creation of parking benefit district can directly support vehicle trip reduction by providing funding for investments in other multimodal access programs and services that increase opportunities for access by non-auto modes. The establishment of such districts and provisions requiring meter and permit revenues to be spent within the district can also indirectly support vehicle trip reduction by increasing local political support for demand responsive, market-based pricing of on-street and off-street parking.</td>
<td>Additional Guidance on the Use of Market Mechanisms to Reduce Transportation Demand and Emissions, USEPA (Washington DC; <a href="http://www.epa.gov/omswww/market.htm">www.epa.gov/omswww/market.htm</a>)). Additional resource: <a href="http://www.spur.org/publications/library/report/critical_cooling/option27/Urbanist">http://www.spur.org/publications/library/report/critical_cooling/option27/Urbanist</a>, Issue 482, May, 2009 (<a href="http://www.spur.org/publications/library/report/critical_cooling/option27/">http://www.spur.org/publications/library/report/critical_cooling/option27/</a>).</td>
<td></td>
</tr>
<tr>
<td>Require “Unbundling” of parking costs from rents and leases</td>
<td>Separate the charge for leasing or buying a unit or square footage in multifamily residential or commercial buildings from charges for parking spaces.</td>
<td>Cities</td>
<td>Any</td>
<td>6%-16%</td>
<td>For residential development, unbundled parking may prompt some residents to dispense with one of their cars and to make more of their trips by other modes. The elasticity of vehicle ownership with respect to price is typically -0.4 to -1.0. Assuming total annual vehicle spending of $7,788 (BLS Consumer Expenditure Survey, 2011), unbundling of an average of $100/mo in parking costs would increase perceived transportation costs/vehicle by 15%/year for the typical hh, which in turn is expected to result in a decline in vehicle ownership of 6% (at a price elasticity of -0.4) to 16% (at -0.4), with corresponding declines in vehicle trips.</td>
<td>Appendix G, Menu of TDM Measures, Transportation cost/vehicle elasticity: 0.4, 0.5, 0.6, 0.7, 0.8, 0.9, 1.0.</td>
<td></td>
</tr>
</tbody>
</table>
### Appendix G | Menu of TDM Measures

<p>| TDM Program                                      | Description                                                                 | City Implementation Mechanism | Recommended Application/Context | % Trip Reduction | Factors                                                                 | Source                                                                 |
|--------------------------------------------------|-----------------------------------------------------------------------------|-------------------------------|---------------------------------|-----------------|-------------------------------------------------------------------------|                                                                      |
| Reduced or eliminated minimum parking requirements | In areas that are well-served by transit and other alternatives to driving, allow developers to build residential and commercial buildings with fewer parking spaces or no parking. | Cities                         | Modify planning code            | Any area with quality transit service | 9%-16%                                                                 | This policy reform does not directly influence vehicle travel demand associated with existing development, although elimination of minimum off-street parking requirements does remove a barrier to changes of use, and/or the lease or sale of underutilized private off-street parking constructed in accordance with previous requirements, supporting the development of market-based parking pricing that in turn reduces vehicle travel. | Range of vehicle trip reduction impact of eliminating minimum parking requirements on Los Angeles’ Westside, as incorporated in the vehicle trip reduction impact analysis conducted for the Los Angeles Westside Mobility Plan (<a href="http://www.westsidemobilityplan.com/transportation-demand-model/">http://www.westsidemobilityplan.com/transportation-demand-model/</a>) |
| District-based parking management                | Manage parking supply in a defined area as a unified whole in order to better manage parking demand between different facilities to eliminate cruising for parking and improve the customer experience. | Cities                         | Modify city agency procedures;  | Urban or suburban downtowns, commercial and mixed use areas; transit stations | Enables compact development | As with shared parking facilities, the coordinated provision and management of a shared, publicly accessible supply of on-street and off-street parking at a district scale can reduce vehicle trips by facilitating dense/compact, clustered, and mixed-use development and by reducing expenditure of land and financial resources on off-street parking, thereby reducing an effective subsidy for auto access and mobility. |                                                                      |
| Incentivize shared parking.                      | Facilitate the sharing of parking among multiple land uses that have complementary schedules (e.g. an office with greater demand during the day and restaurant with greater demand at night). | Enabled by cities, stimulated by private businesses or developments | Modify planning code            | Urban or suburban downtowns, commercial and mixed use areas. | Enables compact development | Shared parking facilities can reduce vehicle trips by reducing the need for construction of dedicated off-street parking facilities for each land use/activity commensurate with the peak parking demand for that use. By so doing, shared parking facilities can enable dense, clustered development that facilitates a greater share of trips by walking, cycling and public transit. | Shared Parking does not directly reduce vehicle travel if it substitutes for increased parking supply. To the degree that it increases the available supply of parking and reduces parking prices it can encourage automobile travel. To the degree that Shared Parking allows more Clustered Development it can encourage use of alternative modes. |
| Improved parking wayfinding signage             | Install wayfinding signage to make parking easier to find. This can help to shift parking demand away from overfull spaces to underutilized areas and can help reduce local traffic impacts caused by searching for parking. | Cities                         | Capital project                 | Urban or suburban downtowns, commercial and mixed use areas; transit stations | Not available | Enhanced wayfinding, signage and provision of real-time information about parking supply and availability can reduce Vehicle Miles Traveled (VMT), and traffic congestion by reducing parking search time, but impacts on total vehicle trips are unclear. |                                                                      |
| Urban Form and Land use                          | Compact, mixed use development and “park once” districts. Encourage development of districts that allow people to park just once if they drive to reach the district, and walk to destinations within the area once they are there. | Cities are responsible for zoning, land use planning, and development permissions | Amending general plans and zoning codes to plan for and facilitate compact, mixed-use development in appropriate areas. Support implementation of compact, mixed-use development by establishment of public development commissions and other mechanisms to support public investment. | Urban; suburb and downtown; transit station | 20%-40% | Recent literature indicates that compact development can reduce VMT per capita by 20%-40% compared to conventional “sprawl type” development characterized by low density and segregation of land uses and activities (vehicle trips are assumed to be reduced by a corresponding 20%-40%). Cumulative effects depend on the pace of new development in the County relative to the base of existing development (at a more rapid pace and extensive geographic scale, compact/mixed-use development/redevelopment can lead to greater reduction in vehicle trips. | Grewg, R, K. Bartholomew, S. Winkelman, J. Walters, and D. Chen (2008). Growing Cooler: The Evidence on Urban Development and Climate Change. Washington, DC: Urban Land Institute (ULI), p. 33. |</p>

<tbody>
<tr>
<td>Multi-Modal Infrastructure</td>
<td>Bicycles are available to members for short-term rental and can be returned at any bike share station. Bike share may be offered in city neighborhoods, near transit hubs, or at major employment centers.</td>
<td>Cities or private bicycle sharing companies (usually at invitation of a city)</td>
<td>Urban; suburban downtown; transit station</td>
<td>2% to 8%</td>
<td>The impact depends on the larger bike network and bicycling conditions. This research does not state if the shift from automobile trips to bicycle trips is for commute or non-commute trips, nor does the research state at what time of day these trips occur, i.e. peak or non-peak trips.</td>
<td>Victoria Transport Policy Institute (2008), Public Bike Systems: Automated Bike Rentals for Short Utilitarian Trips, <a href="http://www.vtpi.org/fhwa/hcm126.htm">www.vtpi.org/fhwa/hcm126.htm</a>.</td>
<td></td>
</tr>
<tr>
<td>Enhanced transit service</td>
<td>Improve transit service to better serve potential riders and shift travel from driving trips.</td>
<td>Transit agencies, funded by cities, counties, TMAs, BIDs, regional agencies</td>
<td>Any</td>
<td>5% to 30%</td>
<td>Impacts depend on the level and quality of improvements. The elasticity of transit use with respect to transit service frequency is about 0.5, which means that a 1.0% increase in service (measured by transit vehicle mileage or operating hours) increases average ridership by 0.5%. Not all persons will be shifting from auto to transit so the relationship is not one to one.</td>
<td>Richard Pratt (2000) Traveler Response to Transportation System Changes, Interim Handbook, TCRP Web Document 12. <a href="http://onlinepubs.trb.org/Onlinepubs/tcrp/tcrp_webdoc_12.pdf">http://onlinepubs.trb.org/Onlinepubs/tcrp/tcrp_webdoc_12.pdf</a>.</td>
<td></td>
</tr>
<tr>
<td>High Occupancy Vehicle/Toll (HOV/HOT) lanes</td>
<td>Implement a system of express lanes for high-occupancy vehicles, transit, and/or people who pay a toll. This provides a time savings to people who commute by modes other than driving alone.</td>
<td>Highway districts, often led by counties or regional agencies</td>
<td>Freeways, any context</td>
<td>2% to 30%</td>
<td>Comsys (1993) and Turnbull, Levinson and Pratt (2006) find that HOV facilities can reduce vehicle trips on a particular roadway by 4-30%. Ewing (1993) estimates that HOV facilities can reduce peak-period vehicle trips on individual facilities by 2-10%, and up to 30% on very congested highways if HOV lanes are separated from general purpose lanes by a barrier. (Turnbull, Levinson and Pratt, 2006) suggests that HOV highway lanes are most effective at reducing automobile use on congested highways to large employment centers in large urban areas with 25 or more buses per hour during peak periods, where transit provides time savings of at least 5 to 10 minutes per trip.</td>
<td>Comsys Corporation (1993), Implementing Effective Travel Demand Management Measures: Inventory of Measures and Synthesis of Experience, USDOT and Institute of Transportation Engineers (<a href="http://www.ite.org">www.ite.org</a>); available at <a href="http://www.bts.gov/ntl/DOCS/474.html">www.bts.gov/ntl/DOCS/474.html</a>. Katherine F. Turnbull, Herbert S. Levinson and Richard H. Pratt (2006) HOV Facilities – Traveler Response to Transportation System Changes, TCRB Report 95, Transportation Research Board (<a href="http://www.trb.org">www.trb.org</a>); available at <a href="http://onlinepubs.trb.org/onlinepubs/tcrp/tcrp_tr_95c2.pdf">http://onlinepubs.trb.org/onlinepubs/tcrp/tcrp_tr_95c2.pdf</a>.</td>
<td></td>
</tr>
<tr>
<td>Financial Incentives</td>
<td>Transit agency provides free rides in designated zone.</td>
<td>Transit agencies, can be initiated/funded by cities, transportation management associations (TMAs), Business Districts.</td>
<td>Can be implemented directly by transit agency, or another organization can form a funding partnership with the transit agency</td>
<td>Urban or suburban downtowns</td>
<td>Not available</td>
<td>Impact of transit fare-free zones is highly context specific. Some cities have seen very large increases in transit ridership within free-fare zones.</td>
<td><a href="http://www.theatlanticcities.com/jobs-and-economy/2012/10/what-really-happens-when-city-makes-its-transit-system-free/3708/">http://www.theatlanticcities.com/jobs-and-economy/2012/10/what-really-happens-when-city-makes-its-transit-system-free/3708/</a></td>

<tr>
<td>Car sharing services</td>
<td>Private companies offer shared vehicles that are available for short-term rental. These services reduce the need for car ownership for people who only need a vehicle occasionally.</td>
<td>Private car sharing companies (non-profit and for-profit)</td>
<td>Urban, suburban, downtown, transit station</td>
<td>Not available</td>
<td>Studies have focused on vehicle ownership rates not trips. According to the Transportation Research Board, each car-sharing vehicle takes nearly 15 private cars off the road – a net reduction of almost 14 vehicles, and the average reduction in vehicle ownership in North American cities with carsharing programs was 20%.</td>
<td>Transportation Research Board (2005), Car-Sharing: Where and How It Succeeds, Transit Cooperative Research Program Report 108. <a href="http://onlinepubs.trb.org/onlinepubs/tcrp_rpt_108.pdf">http://onlinepubs.trb.org/onlinepubs/tcrp_rpt_108.pdf</a>.</td>
<td></td>
</tr>
<tr>
<td>Secure bicycle parking</td>
<td>Offer secure bike parking to encourage travel by bicycle, especially at major transit hubs and employment centers and other areas where there is demand for long-term bike parking.</td>
<td>Cities, employers, housing developments, TMAs, transit agencies depending on ownership of right of way; counties and regional agencies can also purchase and facilitate installation of bicycle parking</td>
<td>Urban, suburban, downtown, transit station</td>
<td>Not available</td>
<td>Bicycle parking has limited impact as a standalone strategy; in combination with improved networks and other strategies to accommodate bicycles into development, it can promote cycling as a viable alternative to driving for shorter trips. As a rule of thumb, the Center for Clean Air Policy (CCAP) guidebook attributes a 1% to 5% reduction in VMT to the use of bicycles</td>

EXECUTIVE SUMMARY

In December, 2007 the City of Alexandria, with funding provided by the Metropolitan Washington Council of Governments initiated a four-month review of the City of Alexandria’s Transportation Management Plan Special Use Permit (TMPSUP) program. The project consisted of four major tasks:

- Review of Existing Conditions
- Review of Best Practices
- Focus Group Discussions
- Analysis and Conclusions

Following is a summary of the results of these tasks.

Existing Conditions

The review of existing TMPSUP program conditions was largely based on documents, data, and other information provided by the City of Alexandria to the Project Team, including:

- The program’s originating ordinance in the City Code;
- Sample TMP’s; and
- Reports and surveys including Semi-Annual Fund Reports, Residential and Commercial Surveys, and TMP Annual Reports.

Program Summary

- The program is one of the oldest in the country – in effect for over 20 years.
- The program covers all land uses.
- The program is triggered based on proposed development for aggregate usable square footage of:
  - 50,000 or more for commercial and/or professional office uses;
  - 40,000 or more for retail sales uses;
  - 150,000 or more for industrial uses; or
  - 250 or more for residential uses.

Developments that reach the requirement thresholds outlined above must receive an approved TMP/SUP before it can receive a building permit. Applications for the TMP/SUP must include: general information on the nature and ownership of the proposed development; a Traffic Impact Study (TIS) of the proposed use; and a Transportation Management Plan (TMP) designed to mitigate any negative impacts projected in the TIS.

TMP’s are further required to include a number of key program elements:

- Production of annual reports summarizing TMP activities and funding;
- Annual surveys capturing tenant transportation behavior; and
- TMP Fund maintenance, contributions, and administration.
**Key Issues**

Existing program conditions identified as key issues to be addressed through the study included:

- Residential Participation – especially the “disconnect” between the developer that enters into the TMP contract and the eventual building owners that are bound by it without having given their explicit consent;
- TMP Funds and contribution levels;
- Ensuring that TMP contributions are spent appropriately and effectively; and
- The site-specific focus of TMP’s vs. incorporation into districts.

**Best Practices**

The next major task was a review of long-standing, effective programs similar in scope, nature, and intention to the TMPSUP. Neighboring Arlington County, Virginia and Montgomery County, Maryland provided two regional examples of such programs that have gained wide-spread attention and praise. Additionally, programs established by the City of Cambridge, Massachusetts were reviewed.

Available literature was reviewed to provide an introduction to each program, while interviews were conducted with key program staff to identify practices specifically instructive to the situation in Alexandria. The following are the three standout practices identified during this review.

**Arlington County – Voluntary, Incentivized Participation**

The voluntary, incentivized participation approach utilized by Arlington County, known as the Site Plan Review Process, provides a unique strength to its program in the form of increased leverage. Developers enter into the program in order to receive highly-valued density bonuses for their projects; this provides the County leverage to seek appropriately aggressive TDM concessions. That roughly 90% of development in recent years has gone through the Site Plan Review process indicates that this leverage has allowed the County to achieve progressive levels of TDM commitments while encouraging high levels of development directed toward its transit corridors.

**Montgomery County – District Focus**

Montgomery County’s emphasis on mitigating vehicular congestion at the district level provides a useful example of “right-sizing” as a program’s focus. By concentrating on key commercial corridors at high levels of congestion-risk, the County’s program allows it to expend its resources where success is most critical. At the same time, district-wide performance targets broaden the focus beyond individual sites, and reinforce the most critical measure of success – district level congestion mitigation.

**Cambridge – Residential Inclusion**

Cambridge’s A19 process represents a direct attempt to include residential development in the City’s traffic mitigation efforts. This process has revealed challenges for incorporating traditionally commute-oriented strategies at residential sites. Effective
inclusion of such sites has been shown to require creative solutions in identifying strategies for a new kind of participant.

**Stakeholder Focus Groups**

For the next task, Nelson\Nygaard led a series of interviews and focus group discussions with stakeholders involved with the City’s TMPSUP program, including:

- City of Alexandria Department of Transportation and Environmental Services staff;
- City of Alexandria Department of Planning and Zoning staff;
- City of Alexandria City Attorney’s office
- Real estate developers with TMPSUP experience and/or their attorneys;
- Representatives from commercial and office developments with on-going TMPSUP obligations; and
- Representatives from residential developments with on-going TMPSUP obligations.

Combined, these interviews and focus group discussions provided a spectrum of feedback from the perspectives of program administrators and participants regarding current program structure and function – as well as how the program could better serve its stated goals, and perhaps whether those goals remain appropriate. Key findings include:

Generally developers view the program benignly, feeling at worst it is a necessary evil. It was specifically stated that the program was appreciated for not being an anti-development program. It was also clear that Alexandria is a sufficiently attractive real estate market to make it worth the added obligations of the program. Some developers were finding that within the local real estate market, it has become possible to sell the program’s obligations as a “green” amenity to prospective tenants.

Current non-residential development participants have had a wide range of experiences with the program. Some have found that the program guided them toward developing programs and services that their tenants have come to value — to the point that the program managers fund these programs beyond their TMP obligations and would continue them regardless of continued TMP obligations. Others expressed the need for more guidance from the City on what is expected of them beyond annual reports and surveys. Difficulties seem particularly significant where buildings have had a high rate of turnover in management.

City staff involved in the program expressed strong optimism for the program’s potential to be more effective. Interest in consolidating TMP’s into TMP districts was particularly keen. Among staff, however there were different views about whether the program should focus on performance measures or compliance with current funding and implementation obligations. The City Attorney’s staff noted particular interest in broadening current compliance measures to better match consequences to levels of non-compliance.
Residential development tenants expressed strong opposition to their program obligations. Opposition was expressed over both the financial obligations and the time and labor commitments required to administer their own TMP’s. Further frustration was also expressed over the difficulty in finding appropriate ways to invest their TMP funds – noting a consistent disconnect between what residents were interested in funding and what the City found appropriate. Many stated that it was futile to attempt to reduce driving rates where they lived, citing the relative affluence and/or age of residents, distance to transit, or location of primary employment sites.

Analysis and Conclusions – Program Recommendations

Nelson\Nygaard analyzed all task findings to identify a comprehensive set of recommended program improvements. Key recommendations include:

Policy Goals

It is recommended that the City broaden its TMPSUP program goals and objectives to include reduced VMT and the many benefits tied to the current official goal of reducing VMT and peak congestion conditions, such as:

- Environmental benefits: improved air quality, reduced carbon emissions, reduced noise pollution;
- Improved roadway conditions: shorter travel times on local roads (for transit and private vehicles), fewer barriers to walking and biking, and reduced roadway wear and tear;
- Livability: improving the attractiveness of Alexandria as a Smart Growth community; and
- Social-Capital: community-building benefits of increased walking, biking, carpooling, and transit use.

This broadening of program goals and objectives would expand opportunities for quantifying program achievements, while underscoring the rationale for including residential developments in the program.

Program Structure and Implementation – Consolidation and Program Options

It is recommended that the City facilitate TMP consolidation by offering various TMP models and options to better fit the variety of affected developments. The recommended process can be summed up in three steps:

1. All new TMP’s are organized into TMP Districts (non-residential uses), or a pay-only model (residential uses) that directly supports consolidated TMP Districts.
2. Develop program options to better fit conditions of each existing TMP development – TMP District, TMA, or pay-only.
3. Attract existing TMP’s into a consolidated or a pay-only model.
Program Focus – Emphasize Results over Process

It is recommended that the City shift from its current focus on program processes (setting funding levels, ensuring compliance with surveying and investment requirements at each TMP) to mandating outcomes (setting broad performance targets on the District/TMA level). To do so, the City should identify specific performance targets for each TMP District and TMA. Meeting these targets then becomes the primary compliance focus for the City.

TMP District staff and TMA administrators would then be freed to set funding, investment, survey, and reporting obligations for each participant as means for achieving performance targets – increasing obligations for under-performers and decreasing obligations for high-achievers. With such a change, participants will gain autonomy while the City gains accountability — as well as improved, goal-oriented program performance.

Non-Compliance Enforcement

Focusing on performance measures and targets, along with effective consolidation, will address many identified compliance enforcement issues and offer the following improvements for the City’s compliance efforts:

- Consolidation of compliance monitoring responsibilities via monitoring all program activities through the TMP District staff;
- Single-source of information for participants on both compliance requirements and non-compliance responses (TMP District staff or TMA); and
- Reduced compliance measures as the primary area of compliance becomes explicit targets.

Consolidation and accountability also add a number of new compliance tools, including:

- Performance accountability as TMP District staff will be able to adjust annual TMP plans to reflect prior-year compliance levels. For instance, a TMP District can require an employer that failed to submit an acceptable volume of completed surveys to hire an outside firm to either complete surveys or conduct driveway counts in the following year’s TMP plan.
- The TMA which would essentially be extended on credit. The potential dissolution of any TMA becomes the main incentive for participants’ compliance.

A table summarizing recommendations and the issues and opportunities identified during the TMPSUP review that they address is provided as an appendix to this report.
DETAILED SUMMARY OF TASKS

The following sections provide a detailed summary of each project task, including a more detailed review of all final recommendations, beginning with the review of existing program conditions.

Task I – Review Existing Program Conditions

Implemented as Ordinance No. 3204, the Transportation Management Plan Special Use Permit (TMP/SUP) program was enacted by the Alexandria City Council on May 16, 1987 and is now part of the Alexandria Zoning Code (Chapter 6, Title 7). The ordinance requires that proposed office, retail, residential, and industrial development projects which meet certain square footage thresholds submit a special use permit application including a Traffic Impact Study and a Transportation Management Plan.

All special use permit applications are considered by the Planning Commission and the City Council, with the City Council making final decision whether to approve the application. Any project requiring a Transportation Management Plan must receive a TMP/SUP before the project can proceed. Site plans and TMP/SUP applications must be submitted concurrently.

Purpose

The primary purpose of the TMP/SUP ordinance is to “reduce peak traffic congestion resulting from development within the City.”¹ The goals of the TMP are to:

- Reduce the proportion of single occupancy vehicle (SOV) trips;
- Increase the use of carpools, vanpools, and mass transit during the peak hour; and
- Spread the number of SOV trips outside of the peak hour.

The City’s administrators believe that traffic impacts must be mitigated to maintain the City’s attractiveness as a place to live and work. In this way, the TMP ordinance serves to maintain the viability of the city’s commercial centers and growth areas. Although the ordinance cannot directly address regional traffic problems, it can potentially have an important effect in mitigating localized traffic impacts. And, should the TMP ordinance be emulated and implemented by other jurisdictions, it can potentially contribute toward a regional approach to solving traffic congestion.²

TMP/SUP Triggers

Development proposals which include any of the following thresholds trigger the TMP/SUP process:

- Any individual building, structure, or complex of structures, with aggregate usable square footage of:

¹ City of Alexandria, “Administrative Guidelines Ordinance No. 3204”
² Ibid
Buildings constructed, or receiving final site plan approval, prior to May 16, 1987 are exempt from program requirements, unless expansion subsequent to this date results in developments that cross the above detailed thresholds.

**Application**

Developments that reach the requirement thresholds outlined above must receive an approved TMP/SUP before it can receive a building permit. Applications for the TMP/SUP must include: general information on the nature and ownership of the proposed development; a Traffic Impact Study (TIS) of the proposed use; and a Transportation Management Plan (TMP) designed to mitigate any negative impacts projected in the TIS.

**The Traffic Impact Study**

The extent of the TIS will vary depending on the location of the site and the size and nature of the project. The TMP must be prepared by a qualified transportation planner or traffic engineer, and may include some or all of the following elements, to be determined by the City:

- The streets and intersections to be included in the study;
- The adequacy of available traffic and turning movement counts and the need for additional data;
- The time period of the study (i.e., morning or evening peak period or both);
- The approximate trip generation rates of the proposed use;
- The directional distribution of the traffic generated by the proposed use;
- The modal split and vehicle occupancy assumption to be utilized in the study;
- The trends in the growth of traffic in the area but not generated by the proposed use;
- The transportation management programs operated by the city or other governmental units in the area of the proposed use, as well as the transportation management programs proposed for the area, to be considered in the study;
- The nature and level of public transit that will service the site of the proposed use;
- The years to be covered by the study;
- The intersection level of service analytical technique to be utilized in the study; and
• The identification of citizen and neighborhood associations whose membership will be proximately affected by the traffic and related impacts of the proposed use.\(^3\)

Typical actions conducted for the TIS include:

- A field reconnaissance of site access opportunities and constraints;
- AM and PM peak traffic counts at key off-site intersections;
- Analysis of existing peak hour levels of service;
- Estimation of AM and PM peak hour trips generated by proposed development;
- Projection and analysis of key intersection levels of service, with and without proposed development; and
- Identification of road improvements required to accommodate projected demand.
- Compliance with the Virginia Department of Transportation (VDOT) Traffic Impact Analysis Regulations which impose a fee based on the distance of the property line to a State maintained highway and the size of a project.

**The Transportation Management Plan**

The TMP is provided in narrative form and contains specific details and supporting documentation to ensure that the use will comply with the provisions of the TMP/SUP program. The TMP must be prepared by a qualified transportation planner or traffic engineer and must include a description of procedures to:

- Establish transportation activities to persuade SOV riders to switch to public transportation. These activities should be measured against a TMP percentage goal which is determined by demographic data and factors in the site’s distance to Metro stations.
- Establish a fund to finance the transportation activities. The fund is calculated on an annual rate per unit or square foot and increases every year as per the Consumer Price Index (CPI) of the United States;
- Biannual fund reports should be submitted to the City’s Office of Transit Services and Programs (OTS&P), detailing the expenses incurred and submitting supporting documentation;
- Restrict parking spaces to carpools and vanpool vehicles;
- Register carpool and vanpool vehicles with the City’s OTS&P;
- Manage and supervise on-site parking facilities proposed for the use;
- Enforce the parking management aspects of the TMP; and
- Appoint a transportation coordinator for the proposed use to:
  - Administer its TMP and coordinate its activities with the (OTS&P);
  - Distribute, display and promote literature on regional transportation services;
  - Conduct and submit annual transportation surveys; and
  - Prepare and submit annual reports that discuss activities conducted during the year pursuant to the TMP and the effect of these activities in

\(^3\) City of Alexandria, Zoning Ordinance Article 11-700, 1997.
reducing traffic and related impacts of the use. The report should also include the activities planned for the coming year.

The TMP is further required to include a combination of some or all of the following elements:

- **Ride-sharing incentive programs** which may include activities to encourage and assist the formation of car, van, and bus pools. These can include: cash payments or subsidies, preferential parking charges and/or location, and other analogous incentive programs.
- Establish a carshare program with Zipcar. The TMP fund would reimburse a percentage in usage fees or pay for subsequent annual fees, given that the City of Alexandria already pays for the first time membership and application fees.
- **Public transit incentive programs** which may include:
  - Providing shuttle services connecting to public transit stops and providing midday and evening services to non-driving employees/tenants;
  - Subsidizing transit services;
  - Constructing transit shelters and amenities;
  - Constructing transit stations and related facilities;
  - Dedicating land for transit facilities;
  - Providing transit fare media subsidies and marketing programs; or
  - Providing other analogous incentive programs.
- **Funding for Recommended improvements in public transit** which serves the site of the proposed use.
- **Bicycle and pedestrian incentive measures** which may include the provision of bicycle parking and storage facilities, the construction and extension of bicycle paths and pedestrian walkways, the provision of shower and locker facilities and similar incentive features.
- In the case of office and industrial uses, **variable work hour**, telework, or **flex time**, programs under which employees working at the proposed use will stagger their work hours in order to reduce the amount of peak period traffic to/from the use which would otherwise occur.
- **Measures to reduce the reliance on single-occupancy vehicles** which may include:
  - Parking fees to discourage single-occupancy vehicles;
  - Time and other access restrictions to parking spaces in on-site parking facilities; or
  - Programs to support and encourage the utilization of alternative transportation modes.
- **Use and accessory use design options** which reduce reliance on single-occupancy vehicles such as the provision of less parking area than that required under the provisions of this ordinance, shared parking arrangements, the incorporation of residential units (in the case of proposed commercial uses) and other analogous design features.
- **Any other** technique or combination of techniques capable of reducing the traffic and related impacts of the proposed use.
• **Demonstration** that reasonable and practicable actions will be taken in conjunction with, and over the life of, the use which will produce a significant reduction in the traffic and related impacts of the use.

**Approvals and Compliance**

The City will approve an application for a special use permit if it determines that the applicant’s TMP:

- Is in accord with the requirements of the TMP/SUP; and
- Together with any amendments deemed appropriate by council, demonstrates that reasonable and practicable actions will be taken that will produce a significant reduction in the traffic and transportation impacts of the use.

Any TMP/SUP granted by the City, unless revoked or expired, runs with the land and remains mandatory and binding upon the applicant, all owners of the land and all occupants and upon all of their heirs, successors and assigns. Any use authorized by a special use permit must be operated in conformity with such permit, and failure to so operate can be deemed grounds for revocation of such permit, after notice and hearing, by the city council. The City may attach conditions and requirements to the permit as it deems necessary to ensure that the TMP for the proposed use will be fully and continuously implemented throughout the life of the proposed use, unless revised or rescinded by City.

**TMP Products and Establishing Performance Measures**

One of the basic requirements of the program is conducting annual mode share surveys among tenants at each development subject to TMP/SUP conditions. This annual accumulation of mode split data represents a wealth of opportunities to track the effectiveness of the TMP/SUP program in general, as well as specific strategies implemented at each site. Yearly, systematic collection, analysis, and review of this data from each site will allow the City to track changes and shifts in transportation behavior at each site, within the program, and across the city — a vital performance measure for this program. Without this level of comprehensive analysis the City will be left only with “snapshots” of travel behavior at isolated sites.

**TMP Funds**

Tenants and/or owners of each site are required to contribute to, and manage, a fund for implementing their site’s TMP measures. Figure 1 summarizes current levels of annual contribution, by land use.

TMP Process Observations

The following sections present general observations about the current TMP process following a review of the following approved TMP’s:

- Avalon at Cameron Court (1996);
- Mark Center (2004); and

These issues raised by these observations are further explored in the analysis and conclusions deliverable of this study.

Common Strategies/Tactics

Common requirements among these TMP’s include:

- Employing a manager/ coordinator for the plan to control its funds and promote its objectives;
- Contribution of funds – as stipulated by formulas based on development scale;
- Annual surveys – documenting resident/ tenant transportation behavior;
- Administering a ride-sharing program; and
- Annual reports – documenting TMP activities and assessing their effectiveness in addressing TMP objectives.

Targets

Within the last two years the City has been incorporating mode split targets in all TMP documents. From the list above, the Madison Mixed Use Development TMP was approved by Council on January 12, 2008 and has a target of no less than 50% non-single-occupant-vehicle (non-SOV) mode share. Such a target provides a clear basis upon which the effectiveness of future TMP activities can be measured.

---

4 City of Alexandria, Office of Transit Services and Programs
Non-Binding Commitments
Some of the commitments contained in these TMP’s are obscured by non-binding language:

- “This TMP has been designed to be flexible and responsive to the inputs of these annual evaluations in prescribing… strategies and tactics to be implemented…”
- “Participating with other projects… and the City of Alexandria in the mutually agreed upon cooperative planning and implementation of TMP programs and activities…”
- “As dictated by demand, up to five (5) percent of the new parking spaces… will be reserved… for carpools and vanpools.”
- “The… Company will, to the extent practicable…”

There also seems to be minimal to no direct reference to results of the Traffic Impact Study, which neglects stated aims of the TMP/SUP program.

Fund Control
Each TMP commits the property owners to contribute to a TMP fund, which is in turn to be used only to fund TMP strategies and tactics. There appears to currently be no specified process for ensuring that any funds are applied to strategies for meeting aims of the program or individual TMP’s.

Each fund remains under the control of the participating development. One exception can be found in the Madison Mixed Use Development TMP, which states under the heading of “District Transit Management Program”:

“As the area near the Braddock Road Metro Small Area redevelops, the City hopes to organize a District Transit Management Program in the area. The Madison development is expected to be part of this group when the group is organized.”

The cited District Transit Management Program has yet to be established and implemented. The City, however, is including this concept in all new TMP’s.

Format
It is our understanding that the format incorporated in the Madison TMP is a standardized format that has been in use for approximately two years. This format appears to be one which presents information clearly and is easily used by the City and the TMP holder. Other TMP’s reviewed used a variety of formats, inconsistencies between which made review of these TMP’s more difficult.
Task 2 – Best Practices Review

Project Context
The following review of Best Practices for mandatory, municipally administered Transportation Demand Management programs is conducted for the benefit of the City of Alexandria’s Transportation Management Plan Special Use Permit program (TMPSUP). Implemented as Ordinance No. 3204, this program was enacted by the Alexandria City Council on May 16, 1987 in order to reduce the level of traffic congestion generated during peak commute times.

The ordinance requires that office, retail, residential, and industrial projects which meet certain square footage thresholds submit a special use permit application which must include a Traffic Impact Statement and a Transportation Management Plan that outlines strategies for mitigating the project’s impact on peak traffic conditions.

Objectives of Best Practice Review
The purpose of the Best Practice Review, like that of the overall project, is to identify means by which the current program can become more effective in meeting its traffic reduction objectives and the City’s quality of life goals. Specifically, the following review is intended to provide examples of successful program activities and achievements that may be reproducible within an improved TMPSUP program.

In addition to identifying general best practices, the City indicated that the review should address specific program areas that present unique challenges and/or opportunities for the TMPSUP. These include:

- Focusing on land uses at the development stage, in comparison to programs that focus on established land uses;
- Inclusion of residential developments – less common among programs focused on reducing “peak-hour” traffic and presents its own challenges and opportunities;
- Ensuring that TMP contributions are spent on implementing approved strategies;
- Advantages of one-time contribution payments versus annual fees;
- Specifying travel targets for TMP participants; and
- Organizing participants and their program activities into districts versus preserving individual autonomy of each development.

Selection of Best Practice Cities
Below is a brief summary of the process used to select “Best Practice” cities for the review.

Initial List (7)
Figure 2 identifies the initial set of trip reduction programs reviewed for selection.
Figure 2: Initial List of Peer Programs

<table>
<thead>

</tr>
</tbody>
</table>

San Francisco’s impact fee was decided to be too narrowly focused to provide much useful information – beyond serving as an example of a development fee that directly funds broad transit improvements. The legality of such fees varies from state to state, limiting the applicability of many of the strategy’s details to Alexandria.

The City of Cambridge provides two useful case studies for the City of Alexandria in its Parking and Transportation Demand Management Program and its Article 19 – Project Special Review Permit Program. The first covers existing developments that add any amount of on-site parking while the second addresses new development by anticipating and requiring the mitigation of traffic impacts.

Arlington County’s Site Plan Review provides another useful program for the review. Not only is it recognized nationally as a Best Practice for municipal traffic reduction programs, its location proximate to the City of Alexandria provides useful contextual comparability. Arlington’s program also shares Alexandria’s focus on new development.

Successful programs in Boulder, Colorado as well as Seattle and Bellevue, Washington, were also considered for the following review. It was decided, however that the Transportation Management Districts Program in Montgomery, County, Maryland would provide a more useful comparison due to its regional proximity. Additionally, the organization of the program into four cohesive districts addressed the City’s interest in this concept of combining program resources to maximize benefits.

Final List
Figure 3 presents the final set of peer programs to be reviewed and the key program components that are anticipated to provide useful comparison for specific components of the Alexandria program.

Background
The City of Cambridge established a Vehicle Trip Reduction Ordinance (VTRO) in 1992 to reduce overall auto trip impacts in the city. Out of this ordinance, the City has developed two new programs, one to mandate TDM participation at existing developments and one to cover new development projects — the City’s Parking and Transportation Demand Management (PTDM) ordinance and its Article 19 process (A19), respectively.

The PTDM enjoys widespread support among the city council, city planners, the business community, and the public. This is most clearly evident by the Cambridge City Council’s September 11, 2006 vote to eliminate the program’s sunset clause in order to expand the positive impact of the program. The A19 program is newer and has just recently begun to affect residential developments.

Vehicle Trip Reduction Ordinance
In 1992, the Cambridge City Council passed the Vehicle Trip Reduction Ordinance as part of an effort to address community concerns about increasing traffic congestion and environmental pollution. The ordinance required the City government to begin implementing Transportation Demand Management strategies such as transit subsidies and bicycle parking that would reduce vehicle trips by City staff. The most significant
effort was led by the Environmental and Transportation Planning Division of the City’s Community Development Department, which also began working cooperatively with citizens, businesses, and institutions in Cambridge and the Boston area to implement similar TDM benefits for their employees.

**Parking & Transportation Demand Management (PTDM) Ordinance**

In 1998, a formalized, mandated TDM program for businesses in Cambridge was approved by the City Council with the passage of the PTDM Ordinance (Section 10.18 of the *Cambridge Municipal Code*).

**Participation Trigger**

The PTDM Ordinance is triggered when any landowner in the City of Cambridge seeks any increase in the amount of off-street parking they maintain for non-residential uses. All landowners are required to register their parking with the City’s Traffic, Parking & Transportation Department (TPTD) which has maintained a comprehensive inventory of all off-street parking facilities in Cambridge since 1971. The Director of TPTD determines if a building permit or parking license to increase registered parking has triggered the PTDM Ordinance and if so, sends notification to the landowner.

**Compliance**

Compliance with PTDM requires approval of a PTDM plan by a PTDM Planning Officer. Parking facilities with a total of 5 to 19 spaces are considered “small projects” and must implement three unique TDM measures from a toolbox of suggested TDM measures (see Appendix) — as a one-time implementation with no required monitoring or performance targets.

The list of specific measures is not documented in the ordinance, but is rather maintained and updated by the Planning Officer. Commonly implemented measures include:

- subsidized transit passes;
- information kiosks;
- bike racks;
- bike showers;
- car-sharing spaces;
- carpool spaces; and
- a guaranteed ride home program.

Projects that create facilities of 20 or more parking spaces are considered “large projects” and are subject to greater implementation and reporting requirements. Most significantly, most projects must commit to reducing their percentage of drive-alone trips by 10% from 1990 levels for the census tract in which the site is located. To achieve this goal, landowners must prepare an aggressive package of TDM measures under the guidance of the Planning Officer.

Typical plans include many of the small project measures listed above as well as:

- Membership in a Transportation Management Association (TMA);
Each plan must also include a detailed monitoring program to determine the mode shares of all persons who may use the subject parking facility. Programs typically include annual or biennial employee surveys, parking utilization counts, and driveway counts — each of which are compared to a base-year set of observations.

All small or large project plans must be approved or rejected by the PTDM Planning Officer within 90 days of their submittal. If a plan is rejected, the landowner cannot receive a permit to expand their parking facility.

Large projects that are subject to monitoring must implement additional, more aggressive TDM measures if they fail to meet the mode split goal of a 10% drive-alone-rate reduction from 1990 levels for the census tract in which the site is located.

**Administration and Enforcement**

If a landowner fails to comply with the PTDM, the TPTD Director may take enforcement action until the landowner complies. Enforcement can consist of a fine of $10 per day for every parking space in the facility or even physical closure of the subject facility. Landowners are directed to work with the City’s PTDM Planning Officer who is appointed by the City Manager and works in the Community Development Department. The Planning Officer provides guidance to landowners, approves final PTDM plans, and reviews and approves any required monitoring reports.

Compliance has been very high and consistent. To date, non-compliance penalties have not been used. Survey return success has been aided by the fact that the State requires a number of annual surveys from employers. As a result, employers tend to have already implemented effective strategies for surveying, including contracting out for the services.

**Performance Measures**

The fixed 10% target reduction in drive-alone commute rates is the primary performance measure for the program. A secondary measure of the program’s impact is its own growth in terms of how many developments enter into PTDM agreements.

**Performance to Date**

The PTDM Ordinance has been very successful for Cambridge. Nearly 100 large projects have resulted in detailed monitoring plans — and dozens of small project landowners have implemented one-time TDM measures. The regular monitoring
requirement for large projects has demonstrated much success. Over 85-percent of the monitored businesses have met or exceeded their mode split goal. The average drive-alone mode split for monitored businesses by 2004 had dropped from 68% to 55%, removing an estimated 7,000 vehicle trips from Cambridge roads each day.

The ordinance is notable for both its impact on new developments and popularity. It enjoys widespread support among the city council, city planners, the business community, and the public. The original ordinance contained a sunset clause for the ordinance, which was lobbied for by the business community which feared the implications of TDM on the cost of business. After two renewals, the sunset clause has been eliminated in the latest version of the ordinance, so PTDM is now a permanent policy.5

Developers who originally received the ordinance with skepticism found that employees support the transit benefits program and that it has become an effective marketing tool to attract prospective employees.

Success stories include the Technology Square development which sought to double its office and research campus from 1M square feet to 2.6M square feet and add over 600 new parking spaces. During preparation of its PTDM plan, the developer cut back the parking expansion by over 200 spaces and was able to commit to a drive-alone rate of 50 percent. Within one-year, the project exceeded this goal, and was operating at only 40 percent drive-alone by year two. A smaller development with 220,000 square feet of office space and 220 parking spaces committed to a 56 percent drive-alone mode split in 2002, and has been performing at less than 48 percent since.

**Funding**

Program participants fund their own mitigation activities, but are not required to contribute to the overall cost of program administration.

**A19 and the Project Special Review Permit**

The success of the PTDM program, though significant, was limited in its impact on overall traffic generation by the program’s narrow focus — existing land uses for which parking expansions were sought. Throughout the 1990’s, Cambridge residents continued to oppose the overall level of local traffic growth due to rapid development within the city, especially in East Cambridge. Eventually, citizens demanded a halt on development, eventually settling for the Interim Planning Overlay Petition (IPOP) that sought detailed traffic review of new developments along with impact thresholds and mitigation requirements.

The IPOP became formalized as Article 19 of the City’s zoning ordinance. While the City’s PTDM did not require participation from residential developments, the only exclusion in A19 was for university housing.

---

5 Section 10.18.090
1. **Intent of A19**
The intent of A19 is to establish traffic and urban design standards for development projects likely to have significant impact on abutting properties and the surrounding urban environment.

To realize this intent, A19 codifies the city’s urban design objectives and establishes detailed building and site development standards to (1) regulate new building construction in the city’s commercial and high density residential areas; (2) establish standards by which significant adverse traffic impacts can be measured; and (3) establish procedures by which individual proposals can be reviewed by the Planning Board, city staff and the general public before a building permit is issued.

2. **Traffic Impact Review**
The Planning Board assesses the impact of the vehicular traffic, and pedestrian and bicycle circulation expected to be generated by a proposed development project. The procedures and requirements are intended to encourage applicants to adopt a development program that reduces the number of single occupancy vehicles coming to the site.

Such a program is also expected to encourage pedestrian and bicycle access to the site and throughout the neighboring district, while reducing potential negative impacts of the vehicles coming to the site on abutting properties. While the review focuses especially on the impacts affecting abutting properties and the immediate environment, the impacts on streets and locations more distant from the site, and on transit and bus facilities serving the site, are also assessed.

3. **Project Special Review Permit**
To ensure that new construction or changes of use in existing buildings do not impose substantial adverse impacts on city traffic, a special permit process was established as part of A19.

a. **Participation Threshold**
A Project Special Review Permit (PSRP) is required for new building construction based on the gross floor area (GFA) and nature of the proposed project, as stipulated within the ordinance (see Appendix). In an existing building, the PRSP shall be required where the total GFA of a new use or uses on a lot exceeds the threshold limits set forth for new developments.

b. **Application**
An application for the PSRP is made to the City Planning Board. The application must consist of the following materials:

   - Planning Board Special Permit Application Form. The application shall include all required plans and narrative statements. The site plan and other plans, elevations, and drawings shall clearly show:
     - The access and egress points for all forms of travel to the site;
     - The location of adjacent bus and transit stops;
The schematic design of proposed mechanical equipment; and
The architectural screening treatment proposed for that mechanical equipment.

Traffic Study. This must include a geographic and functional scope determined by the Traffic, Parking and Transportation Department (TPTD) to be appropriate to the location of the project. In general, the study must review intersections where the project will have significant and measurable impact.

The TPTD must issue a certification to the applicant within twenty-one (21) days of its submission that the traffic study has been done in a complete and reliable manner. Where that certification is denied, the applicant may revise the information in the traffic study and resubmit it; a certification of the revised study must be issued or denied by the TPTD within fourteen (14) days of the resubmission of material.

Based on guidelines established by TPTD, the traffic study must include a narrative discussion of:
- The nature and quantity of vehicles traveling to the site including, in addition to passenger cars, service, delivery and other commercial vehicles;
- The likely impact of such vehicular traffic on abutters, abutting streets, and nearby residential streets, including on-street parking behavior;
- The physical nature of pedestrian and bicycle access to the site and the quantity of movements anticipated for each;
- An analysis of the crash history at intersections within the study area; and
- Parking and transportation demand management measures proposed to ameliorate any adverse traffic impacts identified in the study.

Additional elements of the Application (not related to traffic) include:
- A Tree Study;
- An Urban Design Objectives Narrative;
- A Sewer Service Infrastructure Narrative;
- A Water Service Infrastructure Narrative; and
- A Noise Mitigation Narrative.

c. Approvals Evaluation
The Planning Board only grants the special permit if it finds that the project will have no substantial adverse impact on city traffic within the study area as analyzed in the Traffic Impact Review. In determining whether a proposal has substantial adverse impacts on city traffic the Planning Board assesses the following indicators:
- Project vehicle trip generation: weekdays and weekends for a twenty-four hour period, and A.M. and P.M. peak vehicle trips generated;
- Change in level of service at identified signalized intersections;
- Increased trip volume on residential streets;
- Increase of length of vehicle queues at identified signalized intersections; and
- Lack of sufficient pedestrian and bicycle facilities.
When one or more of the indicators is exceeded, it is indicative of potentially substantial adverse impact on city traffic. In making its findings, however, the Planning Board considers the mitigation efforts proposed, their anticipated effectiveness, and other supplemental information that identifies circumstances or actions that will result in a reduction in adverse traffic impacts.

Such mitigation efforts and actions can include, but are not limited to:

- Transportation Demand Management plans;
- Roadway, bicycle, and pedestrian facilities improvements;
- Measures to reduce traffic on residential streets; and
- Measures undertaken to improve safety for pedestrians and vehicles, particularly at intersections identified in the Traffic Study as having a history of high crash rates.

The precise numerical values that indicate potentially substantial adverse impacts for each of these indicators are revised periodically from time to time by the City Planning Board in consultation with the TPTD, and published and made available to all applicants.

4. Results
Around 2002, several large residential developments were proposed. This was the first real test of applying the new program’s requirements to residential development, which was met with much resistance. Residential developers claimed they were fulfilling an official City goal by providing more housing, and so shouldn’t be treated like commercial developers. However, traffic studies of the projected impacts of large residential developments were not easily dismissed — and the new legislation has been upheld.

**Residential Implementation – A New Challenge**

Residential projects tend not to trigger the primary VTRO criteria — peak-hour trip generation — as much as they do secondary criteria such as daily trip rates. Therefore, unlike commercial developments, impacts were not as clear for peak-hour intersections. Impacts on overall daily trip volumes, by contrast, are not as easy to quantify, nor as immediately noticeable. For instance, a large residential development may not significantly impact nearby intersections at any one hour of the day, though it produces a significant amount of trips throughout the day.

**TDM Measures for Residential Developments**

The most effective measures among commercial developments caused much debate and resistance among residential developers — contributions to the transit shuttles, subsidized transit passes, and ongoing, annual monitoring. These measures required on-going financial commitments, which were deemed to be unsustainable by some homeowners’ associations.

Cambridge’s zoning prevents unbundling (assessing a fee for parking distinct from rental fees or home purchases), so pricing parking is not an available tool for residential developments. Bike & pedestrian measures have been frequently implemented —
racks, sidewalks, paths, bigger elevators, etc. Other TDM toolbox measures that have been used include car-sharing, electric charging stations, posting transit information in lobbies and on websites, and on-site transportation coordinators (provided by the management office).

ARLINGTON COUNTY’S TDM PROGRAM FOR SITE PLAN DEVELOPMENT

Background
Arlington County’s coordinated policy approach to land use and transportation planning has allowed it to grow rapidly over the last 30 years without major expansions in the highway network and minimal traffic growth. In that time, nearly 18,000 residential units, 14 million square feet of office space, 1.5 million square feet of retail, and 1,218 hotel rooms have been built just in the area served by the county’s Orange-Line Metrorail corridor – Rosslyn, Courthouse, Clarendon, Virginia Square, and Ballston stations. Other major development areas include the Jefferson Davis and Columbia Pike Corridors. Today, the County contains more than 46 million square feet of office and retail space – more than downtown Dallas, Denver, or Seattle6

As intense as this development has been, it has generated only modest levels of traffic growth. Year 2000 U.S. Census data show that almost half of Orange-line corridor residents ride transit to work. Traffic counts from 1997 to 2004 show that while office and residential square footage increased by 17.5% and 21.5% respectively, traffic along the Rosslyn-Ballston corridor grew by only 2.3%. Surveys at large apartment buildings have shown peak hour auto trip generation rates of one trip per 5.9 units, far below the standard in the Institute of Transportation Engineers’ Trip Generation Manual.

The resulting economic prosperity has been remarkable, including the lowest property tax rate among the major cities and towns in northern Virginia and a AAA bond rating. The county’s Metrorail corridors provide 50% of the County’s tax base — on only 7% of the land. The County also enjoys far lower vacancy rates and higher lease and sale prices, compared to other regional locations.

**The TDM Program for Site Plan Development**

Arlington County’s TDM Program for Site Plan Development is an Arlington County Commuter Services (ACCS) program adopted by the County Board in 1990. This program was the product of a joint task force of the Arlington County Planning and Transportation Commissions, and an outgrowth of the comprehensive site-plan review process headed by the Arlington County Department of Community Planning, Housing and Development (DCPHD).

Arlington’s TDM policy focuses on workplace commuter travel and looks to reduce peak hour work travel by achieving a reduction of single occupant vehicle trips. Its objectives are consistent with, and help support, those of the County’s Master Transportation Plan, including achievement of major street and intersection level of service goals.

The key program requirements include:

- A TDM plan for each development consistent with the TDM Matrix (see Figure 4);
- A standard site plan condition to implement the TDM Matrix;
- In-building parking provisions that extend preference to vanpools, carpools, and bicycles;
- The encouragement of travel to and from the work place by modes of other than single occupant automobile through various educational and incentive measures;
- Coordination and cooperation on such measures among employers, building owners, and management companies. The county has one central transportation management agency (TMA), Arlington Transportation Partners, that serves this function for most developments; and
- Arlington County using its roles as developer of public buildings and as employer to encourage TDM practices.

---

7 Ibid
8 The county’s second TMA, the recently formed, Potomac Yards TMA, was established exclusively to assist in the implementation, coordination, and monitoring of TDM’s generated among developments within a single, large development area in southern Arlington County.
The Matrix

Recommended County TDM programs are set forth in the TDM matrix (see Figure 4). However, upon providing clear and convincing evidence that particular elements of the TDM matrix may be inappropriate for a particular project, the developer may propose substitution of other elements which provide equivalent value.

No Site Plan TDM Program is expected to incorporate all the strategies outlined in the matrix. Rather, the matrix provides a framework of options from which the County will help developers identify appropriate actions for their project. In doing so, the County distinguishes the intensity of the strategies, matching them with the assessed impact of different developments on the transportation system. The greater the impact, the more intense the mitigation measures in the approved Site Plan will be. The categories and density thresholds are described in the matrix below and through the following context codes:

Matrix Land Use Category Codes

A. Development plan is consistent with the General Land Use Plan (GLUP), and no traffic problems are projected related to the development and its surroundings.

B. Development plan is consistent with the GLUP, however, traffic problems are projected related to the development and its surroundings.

C. A GLUP amendment is requested for a non-conforming development plan, no traffic problems are projected however.

D. A GLUP amendment is requested, and traffic problems are projected.

</table>

9 To ensure that parking rates will reflect true market conditions in a competitive environment, lease agreements with parking garage operators are encouraged. Although a set number of spaces may be reserved for a tenant, the cost of an individual parking space is not controlled by the tenant and subsidies are prevented from being passed along to specific persons.
The DCPHD reviews submitted site plan proposals to assess transportation impacts and opportunities. Reviews incorporate an assessment of site characteristics, proposed land-uses, a traffic impact analysis (TIA) report, and a proposed parking plan (see “Parking Report and Charge Summary” template in Appendix). The ACCS then helps the developer identify site-specific strategies and prepare a TDM plan. Each TDM strategy is selected to mitigate the transportation impacts of the site on a case-by-case basis.

Developers can obtain further assistance in implementing their TDM plan requirements by contacting the County’s primary TMA – Arlington Transportation Partners (ATP), a division of ACCS – or the County’s TDM planner.

**Participation**

Participation in the Site Plan Review process is voluntary, but incentivized through density bonuses. Each zoning district permits a certain type and level of development "by-right." Beyond this, certain districts provide public review processes for a special exception by "site plan" that allows for greater flexibility in use, density, and form of development. The key to the success of the Site Plan Review Process is that additional

---

10 To date, approved Site Plans have no required either Contribution - to offset monitoring and compliance costs - nor Performance Guarantees.
development potential serves as an incentive to developers to seek a special exception by site plan and participate in the process.

To date, the density bonuses have been significant enough to attract the majority of new development projects into the process. By framing incentives in terms of added project density, the Site Plan Review Process supports the County’s objective of concentrating development around transit stations.

**Implementation**

The developer must follow conditions outlined in the final approved site plan in order to receive a building permit and to continue to be in compliance with the property’s existing zoning. While entering the site plan approval process is voluntary, once approvals are received, TDM conditions run for the life of the building, regardless of ownership, and guide all future decisions regarding development on the property.

The developer of an approved site plan property must implement the TDM program and obtain approval from the County before gaining the first Certificate of Occupancy. At this time the developer will prepare a property TDM Report. Subsequent to the first approval, the property owner will re-submit the property’s TDM Report on the anniversary of the approval of the first Certificate of Occupancy.

Common components of site plan implementation include:

- Ridesharing promotion;
- Parking management;
- Transit promotion;
- On-site construction measures;
- Mutually agreed off-site provisions or contributions;
- Lease agreements; and
- Monitoring and compliance

**Common Strategies**

Some of the most common strategies used today include:

- Conducting an employee transportation survey, provided free by ATP;
- Attending a free, ATP-sponsored employer workshop or seminar;
- Posting commuter information in a company newsletter, on a central bulletin board, internal e-mail system, or website;
- Installing a permanent display case, stocked with commuter information tailored to the specific worksite, in a central area;
- Hosting an on-site transportation event for employees;
- Providing preferred parking spaces for carpools and vanpools;
- Implementing an informal teleworking program;
- Installing bicycle and/or shower facilities to encourage bicycle and pedestrian commuting; and
- Offering employees flextime, compressed work week, or job sharing options.
More intensive TDM strategies include:
- Starting a formal telework program;
- Instituting a tax-free transit benefits program, either employer-sponsored or through pre-tax payroll deduction;
- Developing a commuting incentive program for those who carpool, bicycle or walk to work;
- Providing an employee/customer shuttle to local transit stations or other service areas;
- Supplementing the regional Guaranteed Ride Home program with an additional employer-sponsored service;
- Implementing a parking fee for solo drivers (for employers who previously offered free parking);
- Offering free or reduced-price parking for carpools and vanpools (where a fee previously existed);
- Starting business-sponsored or subsidized vanpools; and
- Implementing an active Air Quality Action Days program.

**Monitoring and Compliance**

The County’s TDM planner is assigned to cover TDM compliance and monitoring (see compliance checklist in Appendix). Staff for these tasks has increased along with the number of properties with Site Plan review obligations.

For Category D projects, developers can be required to provide a performance guarantee to assure continuing performance. To date this option has not been used by the County for any project.

**Performance Measures**

The Arlington TDM program seeks to achieve the following results, which may be employed as evaluators of the success of the program:

1. Maintain pre-construction peak hour levels of service at major intersections.
2. Limit single occupancy vehicle trips generated by development.
3. Reduce vehicle-generated air pollution.
4. Maximize transportation alternatives while minimizing single occupancy travel.
5. Utilize transportation facilities efficiently.
6. Encourage efficient, cost effective modes of transportation that focus on moving people, not vehicles.
7. Improve transit information and dissemination so people will be able to make the most efficient and friendly use of the system.
8. Utilize public transportation effectively and efficiently, through improved system information, frequencies, routing, connections, transfers; innovative technologies are encouraged.
9. Configure mass transportation to provide access to, through, and around employment centers.
10. Encourage innovative technologies that move people between home and work the most efficient and effective way.
11. Maximize convenience of inter-modal transfers between the commuter rail system and feeder/distributor systems.
12. Encourage group riding and shared parking arrangements through parking management plans.
13. Minimize or eliminate barriers to group riding.
14. Review transportation management plans during the site development process.

**Performance**
Arlington’s TDM initiatives have successfully evolved and expanded since authorization of the original policy in 1990. Today, over 110 site plans have been approved by the County board with TDM plans and ACCS now includes a ten-person sales team that serves 600 businesses. Ninety percent of all development is now conducted through the Site Plan review program - almost all of the remaining 10% consists of either single-family homes or small, town home developments.

**Funding**
The most fundamental obstacle to long-term operation of the TDM program is a lack of funding. Currently, no dedicated funding is available for ACCS; instead programs rely upon state and federal grants. Unlike most other civic functions performed by Arlington, TDM programs have no financial backing from the County. This leaves this important function in a precarious position, especially in its potential for continued growth. Recent changes that have brought improved financial security for the program include: indexing contribution increases to inflation (as indicated by the Consumer Price Index) and expanding the obligation for Transit Store/TMA contributions from 10 years to 30 years.

The key opportunity for the County continues to be the level of development demand. This has allowed the County to extract substantial civic improvements from private developers without slowing development activity. In fact, over time, the public investments secured by the program increase development demand by contributing to the distinct mobility environment that makes Arlington County a uniquely desirable place to live, work, and visit.
MONTGOMERY COUNTY’S TRANSPORTATION MANAGEMENT DISTRICTS

Background
Montgomery County Commuter Services (MCCS), a section of the Division of Transit Services in Montgomery County’s Department of Public Works and Transportation (DPWT), provides free commuter assistance to county employers and employees through education and promotional outreach services, as well as incentive programs and a transit store.11

Beginning in the late 1980’s, Montgomery County established Transportation Management Districts (TMD’s) to provide concentrated services to encourage the use of transit and other commuting options in the County’s major business districts — Downtown Bethesda, North Bethesda, Friendship Heights, and Downtown Silver Spring. A dedicated TMD staff was assigned to each district, to focus efforts in these areas.

The TMD Program
The County has four broad goals for its TMD’s:
  • Reduce traffic congestion;
  • Increase transportation capacity;
  • Reduce air and noise pollution; and
  • Promote bicycle and pedestrian access.

---

11 These are physical stores although online fare media sales are also available - http://www.montgomerycountymd.gov/cittmpl.asp?url=/apps/dpwt/fare_media/index.asp.
On November 26, 2002, the County Council passed legislation mandating that employers with 25 or more full- or part-time employees located within a TMD actively work with their TMD’s staff to reduce drive-alone commute trip rates. At a minimum, these employers are required to:

- Designate a TMP Coordinator to serve the company’s employees;
- Implement a Traffic Mitigation Plan (TMP) – developed in consultation with TMD staff;
- Submit an Annual Report of Activities; and
- Participate in the County’s Annual Commuter Survey.

1. **The Traffic Mitigation Plan**

   MCCS and its contractors assist County employers in developing a Traffic Mitigation Plan (TMP) designed to reduce the rates at which their employees drive alone to work (see sample TMP in Appendix). Each TMP is reviewed by the TMD staff and the Advisory Committee for that TMD which recommends approval or changes. The Director of DPWT has final approval authority.

2. **Annual Report of Activities**

   Once a year, employers are asked to summarize the activities they have undertaken to implement their plans. Employers who successfully encourage “Better Ways to Work” (used as the program’s tag line) are eligible for local and national recognition and awards.

3. **Annual Commuter Survey**

   Employers receive annual Commuter Surveys from Commuter Services for distribution to their employees. Employers are required to circulate the Commuter Surveys to their employees within 45 days for their completion. The completed Annual Commuter Surveys are submitted to each Employer’s TMD. All surveys are conducted in the spring (see sample survey in Appendix).

   These surveys are used to track employee commuting patterns in the TMD and to monitor progress toward reaching any commuting goals set in the County’s Annual Growth Policy. They help DPWT determine what changes to programs and services are necessary. Employers are asked to make a good faith effort to achieve an 80% response rate from their employees.

   The County assists employers in reaching the target response rate by supporting the efforts of the company’s TMP Coordinator in getting a survey into every employee’s hand. The TBC is the contact person at that employment site with whom MCCS and its contractors work to provide services and the person who is asked to distribute the survey. Surveys are available in hard copy format or online, distributed through the company email system. The County also provides detailed instructions, flyers, and prize drawings for participants who take the survey. If requested, TMD staff will hand out surveys at company-sponsored events and provide refreshments and additional prize drawings for participants.

4. **Common TMP Strategies**
• Designate contact person for employee transportation information (TBC);
• Distribute information on transit/pooling/other commute alternatives to employees on a regular basis;
• Commute information/alternatives presentations to employees at worksite by TMD staff;
• Information on commuting alternatives provided to new employees (orientation materials and presentations available from TMD staff);
• Attendance at free TMD-sponsored meetings/workshops permitted for TBC to learn about new services;
• Ozone Action Days participation (regional program to alert people to dangerous air quality days);
• Guaranteed Ride Home Promotion (free regional program offering emergency rides);
• Permanent display area for TMD-provided bus schedules and other transportation information;
• Provide ADA transportation options information;
• Tax-free monthly transit subsidies provided to employees (County subsidies and State commuter Tax credit may be available);
• Transit passes/tokens offered for purchase at worksite (at full or reduced price);
• Pre-tax payroll deduction for transit costs;
• Transit/pedestrian amenities at worksite, e.g. sidewalks, benches, etc.);
• Bike amenities at worksite - racks, lockers, and/or showers (TMD may be able to supply);
• Employee carpool matching service;
• Free or reduced rate parking for car/vanpools offered to employees;
• Preferred location and/or reserved parking for car/vanpools offered to employees;
• Alternative work schedules: Flex Time, Compressed Work Week; and
• Telecommute, telework, and job-sharing.

Compliance
The basic steps for compliance among qualifying employers include:
1. Contact TMD Staff for assistance in customizing an effective TMP.
2. Submit TMP to DPWT — DPWT reviews submitted TMP. Upon successful review, DPWT issues confirmation of approval.
3. Work with TMD Staff and employees to actively implement and promote the strategies that are included in approved TMP.
4. Participate in the Annual Commuter Survey.
5. Submit an annual “Report of Activities” documenting results of TMP implementation.

To date, compliance rates have been very high – estimated by one TMD administrator to be about 95%.\[12\] There are very few non-compliant companies in any of the TMD’s.

\[12\] Jim Carlson, Planning Specialist, Montgomery County Commuter Services
Those few will probably face fines in the near future. Failure to comply is a misdemeanor under County Code.

The County sets an 80% survey-response rate target in order to effectively measure the program’s performance. While this is a goal which many employers do not reach, most produce response rates significant enough to effectively track program performance. For some agreements, the TMD’s conduct their own mode split surveys, usually through driveway counts at the employment site.

**Enforcement**

An employer or owner that does not submit a traffic mitigation plan or provide survey data within 30 days after a second notice has committed a Class C violation. Continued non-compliance can result in fines.

To date, the County has not invoked any non-compliance penalties though enforcement efforts are being undertaken. There are no penalties for failing to achieve established survey-response rate targets.

**Performance Measures**

In addition to the broad goals set out for established TMD’s, commuting goals are identified for each district, stated as the percentage of participant-commuters not driving to work during peak times – tracked by the County as “non-auto driver mode share” (NADMS). Current NADMS targets for each TMD are as follows:

- Bethesda: 37%;
- North Bethesda: 39%;
- Friendship Heights: 39%; and
- Silver Spring: 46% (50% for new development\(^\text{13}\)).

While there are no individual NADMS targets established for participants, these targets serve as effective performance measures for the overall program.

**Performance**

Each TMD has active TMP’s from dozens of area employers, see Figure 5.

---

13 Establish developments in Silver Spring are grandfathered at 46% in order to allow the County to maintain and update ambitious NADMS targets for new development in this transit-rich location.
All TMD’s have achieved or exceeded their NADMS target, according to the latest processed survey data (2006).\(^{14}\)

**Funding – County**

A variety of funding structures have been established to support TMD efforts. The Bethesda and North Bethesda TMD’s are primarily funded from parking revenues: parking meter payments, parking violation revenue, monthly permits for public parking lots, and In-Lieu of Parking development fees. For the Bethesda TMD, revenues from the Bethesda Parking Lot District facilities (including lots and garages) are used to support TMD expenses as well as other types of transportation costs. In the North Bethesda TMD, the County installed more than 800 parking meters to manage its parking system which also generates revenue for TMD activities.\(^{15}\)

Silver Spring TMD is eligible to receive net revenue from the Silver Spring Parking Lot District when available, though net revenue is not always generated there. The TMD’s in Silver Spring and Friendship Heights are supported by other sources, including developer fees and funds from the County’s general operating budget. Friendship Heights is the only TMD that does not receive any parking revenue, as there are no County parking facilities in Friendship Heights.

Around 2005, the County began assessing an annual fee for most new projects within TMD’s. These revenues are collected by the County and allocated to traffic mitigation actions — identified in coordination with TMD staff and the TMD Advisory Committees. The fee is currently set at $.10/SF for all commercial uses. There is enabling legislation for applying a fee of up to $60 per unit for multi-family residential development, but the County has chosen not to implement this strategy. The fee is assessed upon use and occupancy of the development.

Developments deemed to produce significant increases in traffic may also be required to produce a Traffic Mitigation Agreement, which outlines measures they will take to mitigate their project’s traffic impacts.

This policy may soon be changing significantly with the recent adoption of a new County growth policy. This policy will likely increase the frequency with which Traffic Mitigation Agreements are required. In addition, developers usually are required to pay the cost of driveway counts and similar monitoring required as part of their development approval.

**Funding – Participants**

Participants must bear the cost of the specific strategies they implement as part of their TMP. However, MCCS and its contractors provide assistance to all County employers, including those mandated to participate in the TMD program. Free services provided include:

---

\(^{14}\) Carlson, Montgomery County Commuter Services

- Transportation Benefits Plans — How to design a suitable plan, while boosting productivity and morale;
- Transit Subsidies and Tax Credits — How commuter benefits can lower taxes for employers and employees;
- Public Transportation — Information on routes, fares, schedules, and where to buy transit passes, including pre-tax Metrocheck and other discounts;
- Carpools/Vanpools — Free assistance in forming or joining a carpool;
- Parking — Information on free/discount parking for carpools/vanpools and park-and-ride lots;
- Biking/Walking — Help with rental lockers, commuting routes, and other amenities;
- Guaranteed Ride Home — Free rides home in cases of emergency or unscheduled overtime;
- Teleworking/Alternative Work Schedules — How to design a program tailored to specific needs;
- Car Sharing — Programs that provide 24/7 access to a vehicle, available at Metro stations;
- Accessible Transportation — Freedom of mobility for those with special needs;
- HOV Lanes Information — Where, when, and how to access them;
- Customized Seminars and Presentations — For setting up a commuting benefits program that works for each business; and
- Commuter Information/Marketing Materials — Fact sheets, posters, flyers, exhibits fairs.

CONCLUSIONS
A number of common and standout practices can be identified within these program reviews which are applicable to Alexandria.

1. Common Practices

- **Program Focus**
  The programs all share the TMPSUP’s focus on SOV, or drive-alone, commute rates during peak hours. In addition, both the City of Cambridge and Arlington County have explicitly led by example by implementing TDM programs and commuter benefits covering their own employees.

- **Targets**
  The setting of specific performance targets is a strategy common to all three locations reviewed above. The target is, however, articulated in different ways in each. In Cambridge, the same target is set for all PTDM participants — reducing drive-alone rates by 10%. In Arlington, specific targets are assigned to each development, based on constraints and opportunities specific to each. Montgomery County’s approach — assigning distinct non-SOV commute targets for each of its four TMD districts — reflects a focus on key, high-congestion corridors.
• **Key Compliance Action – Surveys**
  The completion, collection, and review of annual employee surveys form a cornerstone of compliance for each program. These surveys are critical to assessing performance measures for each program reviewed. Consistent and effective survey completion and return is also critical to year-to-year amendments and improvements to individual mitigation plans in each location. These provide direct quantitative evidence on the impact of individual strategies as well as qualitative assessments of current and potential mitigation measures.

• **Support**
  Both Arlington and Montgomery counties provide a high level of support to program participants, especially to employers that seek their services. Dedicated County staff provide assistance in drafting effective mitigation plans and the implementation of their strategies. Compliance monitoring and assistance appears to be particularly robust in Arlington County.

• **Focus on Parking**
  Cambridge and Arlington each explicitly recognize the impact of on-site parking policies, especially at the workplace, on traffic mitigation. Cambridge’s PTDM program is triggered specifically by expansions of on-site parking inventories. Arlington County requires an approved “parking program” that combines costs for SOV parking and preferential treatment of bicycle and rideshare vehicle parking. This reveals a common understanding of the direct link between parking policy and travel choice at the workplace.

2. **Standout Practices**

• **Arlington County – Voluntary, Incentivized Participation**
  The voluntary, incentivized participation approach utilized by Arlington County provides a unique strength to its program in the form of increased leverage. According to John Durham, the County’s TDM Planner, the fact that developers enter into the program of their own volition in order to receive highly-valued density bonuses for their projects, gives the County leverage to seek appropriately aggressive TDM concessions. That roughly 90% of development in recent years has gone through the County’s Site Review process indicates that this leverage has allowed the County to achieve progressive levels of TDM commitments while encouraging high levels of development directed toward its transit corridors.

• **Montgomery County – District Focus**
  Montgomery County’s emphasis on mitigating congestion at the district level provides a useful example of “right-sizing” a program’s focus. By concentrating on key commercial corridors at high levels of congestion-risk, the County’s program allows it to expend its resources where success is most
critical. At the same time, district-wide performance targets broaden the focus beyond individual sites, and reinforce the most critical measure of success – district level congestion mitigation.

- **Cambridge - Residential Inclusion**

  Cambridge’s A19 process represents a direct attempt to include residential development in the City’s traffic mitigation efforts. This process has revealed challenges for incorporating traditionally commute-oriented strategies at residential sites. Effective inclusion of such sites has been shown to require creative solutions in identifying strategies for a new kind of participant.

3. **Performance and Achievements**

   Figure 6 provides a summary of the key achievements from each of the reviewed locations, in terms of the volume of participation and key performance measures.

**Task 3 – Stakeholder Focus Groups**

On Tuesday, February 19th, Nelson\Nygaard led a series of interviews and focus group discussions with stakeholders involved with the City’s TMPSUP program, including:

- City of Alexandria Department of Transportation and Environmental Services staff;
- City of Alexandria Department of Planning and Zoning staff;
- City of Alexandria City Attorney’s office;
- Real estate developers with TMPSUP experience and/ or their attorneys;
- Representatives from commercial and office developments with on-going TMPSUP obligations; and
- Representatives from residential developments with on-going TMPSUP obligations.

Combined, these interviews and focus group discussions provide a spectrum of feedback from the perspectives of program administrators and participants regarding current program structure and function – as well as how the program could be better serving its stated goals, and perhaps whether those goals remain appropriate.

An interview guide (provided as an Appendix to this report) was developed with the City to provide a general outline of suggested questions and areas of inquiry. The intent of the interviews, however, was to foster an open-ended discussion with all interviewees.
Input received during these meetings is summarized below, organized in the order in which they occurred.

**Summary of Discussion with Developers and Developers’ Representatives**

**General Comments on the Program**

- The study is a good idea. A “fresh set of eyes” to review the program is needed after 20+ years.
- One of the strengths of the program from the beginning is that it is not “just another technique for stopping development”. The City has remained faithful to this and has not rejected any project based on the TMPSUP process.
- Over the years, more requirements have been added: TMP Coordinator, posting materials in a central location, etc. This has increased a “boiler plate” feel to many TMP’s.
- One participant stated that he had gone through the process many, many times and the program has gotten “stale” to a certain extent. The intended accomplishments and effects have become lost in the process – or are not communicated to participants effectively.

**Comments on Program Components**

- The TIS is useful and necessary.
- One participant suggested that the terms used in the TIS – letter grades assigned to distinct levels of vehicle service – can be misleading. It was suggested that levels of service be stated as “seconds of delay” for vehicles at intersections. “The word ‘Fail’ feeds anti-development sentiments.”

**Comments on Program Effectiveness**

- Required actions are often hard to enforce.
- It was noted that some citizens have a strong desire for the program to be effectively and uniformly enforced, and complain when they perceive that a particular development is not living up to its obligations.
- Participation at commercial and office buildings is “a lot” more effective.
- The threshold for residential uses (development of 250 or more units) does shape projects as developers seek to avoid having to participate. However, it means there are several large projects just under the threshold.
- TMP Coordinators and Shuttles were identified as some of the more effective TMP strategies overall.
- Effective measures for residential uses include providing information and, to a lesser degree, shuttles.
- Cameron Station is a good example of a residential development with an effective shuttle. The Metrorail station is not close enough to be a real amenity without the shuttle. The distance is short enough, however, that the shuttle bridges the gap and attracts Metrorail trips from those that would otherwise drive.
Comments on Developer Buy-In

- As long as the developer understands the (TMPSUP) program, they tend to “buy in” to its value. Up-front information early in the development process is a key to achieving this result.
- Most developers have accepted the program as a “necessary evil” and “just another obligation” – the cost of doing business in a desirable market.
- Developers are aware of the program, but it is not generally brought up by the City until the end of the application process, so it feels like an afterthought.
- Developers do not perceive value in having a TMP attached to their development. Some, however, have effectively used their development’s TMP as part of a “green” marketing strategy. This is generally more effective for rental residential projects.

Comments on Program Process

- The TMPSUP process has always been smooth. There is very little public feedback or input.
- Developers have very little understanding of the implementation process for their developments. This happens after the developer has turned the development over to a home owners association or management company.
- There needs to be improved coordination between the TIS and the TMP. At best, the TIS informs the TMP as it is intended to do. Many times this does not appear to happen and the TMP is not used as a tool to address issues identified in the TIS. Preferably, the two would have an iterative relationship where the TIS and the TMP inform each other – TMP measures, for example, would be taken into account in a revised TIS.
- One developer noted parking reductions specifically as something that is not taken into account during the TMPSUP process. He suggested that such important demand management factors should inform the TIS and be accepted as a component of the TMP.

Comments on Compliance

- The City has been very hands-off in compliance and monitoring.
- “We didn’t really do a whole lot with it other than maintain a fund.”
- Some projects lack a “central” public space for posting TMP information (i.e., lower-density residential development without common areas.
- For residential developments especially, finding someone available and willing to administer the TMP is often an issue. “No one wants to do it.” Sometimes it’s a matter of a development’s size. “If it’s big enough for a management office or company, they take care of it.”
- While administering the TMP is an unwanted burden for some developments, the idea of a consolidated, district-focused fund is not likely to be appealing. The property-owners like self-control over the money. Developments will seek to pool their resources on their own if they see an advantage in it. Requirements to do so would be resisted.
• **Suggestion** – Management companies that administer TMP’s would be a good source for identifying the challenges and advantages of consolidating TMP administration.

**Comments on Public Perception**
- “The public does not care about it.”
- The public cares about parking and traffic. But they do not “buy” that the program reduces traffic.
- Citizens do pay attention to the TIS, because present impacts they can relate to.

**Current Annual Fee vs. One-Time Fee**
- All were opposed to the one-time fee concept.
- Upfront costs would hurt sales of owner-residential particularly.
- The annual fee structure provides more flexibility. For example, administrators can increase contributions to pay for one-time planned actions.

**Comparison to other TDM Programs**
- Generally, the Alexandria program was viewed favorably compared to other, similar programs. The flexibility of the Alexandria model was specifically noted as strength.
- “I like the give and take.”

**Summary**
In general, the attendees of this focus group were supportive of the program and its administration. While some of the obligations of the program are clearly viewed as, at best, “necessary evils”, the program is clearly not viewed as an “anti-development” program.
Opportunities Identified

- Promotion and conspicuous support of the program on the part of the City would reinforce it as a high priority component of development in Alexandria. There is clear indication that marketing the benefits of properties with TMP obligations to potential tenants is feasible and getting more so as current trends favoring “green” amenities continue.
- There was some skepticism as to whether participants would accept consolidation into a district TMP or TMA, in return for being relieved of administrative obligations. If this were an option for existing TMP’s, however, some may find it attractive.
- Creating an iterative process in which the TIS informs the TMP while the final TMP in turn is factored into a revised TIS would reward developers’ efforts to address demand management in their projects.

Constraints Identified

- Information and promotion. The program is often an afterthought in the development, sales and leasing, and occupancy process. Often parties involved only deal with the SUP terms toward the end.
- TMP administration. Identifying someone to volunteer to administer their program, especially at smaller residential developments, is a common challenge.
- Disconnect between the TIS and the TMP.

Commercial & Office Development Representatives Group

General Program Comments

- Transfer of responsibilities is often not smooth. One manager noted that her firm recently purchased a property with an active TMP. The previous management company had been neglecting its TMP obligations and her company had to develop a compliance plan from scratch with little experience with the program.
- The other attendee noted a high level of success at the development he manages – the Alexandria Technology Center (ATC). The primary TMP component noted was a shuttle running between the complex and the King Street VRE and Metrorail stations. Operating details of the service include:
  - Peak-only service – three hours in the morning and three in the afternoon;
  - Free service for employees of contributing tenants;
  - Cooperative service arrangements with other locations; and
  - Potential expansion into lunchtime service to respond to tenant demand.
• This TMP has effectively absorbed a number of other TMP’s within the service area of its shuttles. The ATC manager has accepted arrangements where other property-managers contribute some of their TMP funds to ATC in return for expanded shuttle service to their sites. These smaller locations could not support a shuttle service on their own. Such arrangements currently include residential developments – a key advantage of which is adding passengers on “return-trip” buses that would otherwise be running empty.

Additional ATC Comments
• The ATC management is currently examining providing car-sharing. Many tenants make midday trips to the pentagon and the motor-pool does not always have enough vehicles. Car-share vehicles could serve as a back-up to the motor-pool, allowing more employees to leave their cars at home.
• All parking is charged – with exemptions for military.
• While the TMP administrator does not like being forced to pay into the TMP fund, he acknowledging that:
  o He spends more on TMP activities than his TMPSUP requires in order to provide value-added services such as the shuttles;
  o There is “no question” that the shuttles add sufficient value to the property;
  o The shuttles would be continued even if the TMP went away;
  o The shuttles reduce SOV-commuting; and
  o “You can’t argue with the ridership”

Comments on Impact of Local Traffic Congestion
• The only problem is traffic. “We (the shuttles) get stuck in the same mess as everybody else.”
• Tenant-employees looking to avoid local traffic (in the “valley” especially) will park two Metrorail stations away and ride to King Street in order to take the ATC shuttle.

Comments on other Commercial and Office TMP Experiences
• The Winkler TMP seems to be enjoying success.
• Neither participant was aware of any particular struggles with the program among office and commercial buildings.

Summary
This focus group highlighted many of the potential benefits of effective TMP consolidation, including:
• More effective shuttle operations – more participants means more potential riders and more service coverage;
• Economies of scale – increasing access to, and the effectiveness and coverage of, employer-based shuttles without each site having to have a critical mass of employees;
• Incorporation of Residential Uses – these uses in particular struggle with means for investing their often modest TMP funds effectively; and
• Ridership – overall as well as reverse-peak trips as more types of land uses are incorporated.

The ATC TMP has effectively absorbed others based on points of mutual self-interest. The centralization of administration and the economies of scale that this has provided to all participants appear to be a significant and appreciated benefit.

On the other hand, this discussion also highlighted the potential for inaction when the program is not embraced by participants as well as the challenges of “handing off” TMP’s during transitions in ownership and/ or management.

**Opportunities Identified**
- Consolidation could address issues of continuing the TMP when property or management is transferred.
- TMP strategies benefit from economies of scale under effective consolidation.
- With effective consolidation, smaller TMP’s appear more than happy to delegate administrative control.

**Constraints Identified**
- Transitioning TMP administration when property or management is transferred.

**City Attorney’s Representative**

**General Program Comments**
- The City Attorney’s office’s interaction with the program occurs “as needed” rather than a part of standard program administration. Such interaction with the program comes in two contexts:
  - Enforcement – enforcing compliance with TMP obligations; and
  - Interpretation – defining compliance options and parameters.
- Overall, interaction occurs about a once-per-month.
- Once the attorneys get involved, compliance soon follows. At most, one “zoning ticket” is enough to get compliance.

**Comments on Areas for Improvement**
- Enforcement – There should be more enforcement options. Currently, the main option is zoning tickets, which have a daily monetary scale that – when exhausted – triggers a court procedure for revoking a development permit. It was expressed that measures that fell between the zoning ticket and permit revocation would be useful in better matching levels of enforcement to levels of non-compliance.
- Flexibility – Making changes to the SUP to adjust to changing circumstances should be easier. For example: a residential development that is required to
promote transit use, but has become a highly-affluent community is a common cause of unspent money – the people living there today are not likely to shift trips to transit. Administrative modification of approved SUPs should be allowed under such circumstances.

- **Suggestion** – A five-year schedule for revisiting approved SUPs, at which point administrative modifications can be made.
- **Suggestion** – Create hard triggers for enforcement actions. Move away from “personal judgments” on when to take legal recourse.
- **Suggestion** – Online surveys may be more effective for residential uses – mailbox surveys often feel “invasive” and get instinctively thrown out with the junk mail.

**Summary**

This interview highlighted the opportunity to improve enforcement in three ways:

- Providing more enforcement options;
- Creating “hard triggers” for enforcement actions that relieve City staff of making personal judgments on when to take legal action; and
- Allowing “administrative” modifications to approved TMP’s, perhaps on a fixed schedule of every five years – such as a five-year review period to allow City staff to review and update TMPs in accordance with what has worked as well as evolving opportunities and constraints.

**City Agency Group**

**General Program Comments**

- TMP’s are approved in perpetuity. Eventually TMP terms become out of date with current standards.
- Enforcement should be formalized. By contrast, the current system relies upon repeated attempts at correspondence before legal action is taken.
- There is no capacity to set performance standards and/or penalties.
- “It’s results that we need to be measuring.”

**Comments on Consolidation Options**

- What is the right size and forum for managing a TMP?
- Some developments are definitely too small.
- Creating a transportation management district system is key.
- Tie contribution levels to costs of meeting TMP obligations or meeting performance measures/mode shift targets.
- “Districting” will have to be voluntary (among existing TMP participants). Approved SUPs can only be amended when initiated by the development.

**City vs. Third-Party Management of District TMP’s**

- The City could provide a list of approved TMP managers. Ensuring that developments could not simply put someone in that would approve inappropriate use of TMP funds.
• With either city management or third party management, there should be a single clearinghouse for program information and benefits.
• The City already has a TDM Coordinator.
• The City must maintain control.
• If participants are held accountable for meeting performance measures – does the City need to control how funds are spent?
• “We have TMP’s that want to simply pay and be done. “

Reports and Surveys
• A lot of useful information is gathered through the program, but it is not coming in consistently and it is not being utilized fully.
• Surveys should ask more questions about the effectiveness of each program – how well is program and benefits information being distributed, for example.
• Suggestion – Offer rewards or recognition for highly-compliant participants: a “Best Place to Work for Commuters” type of award, for example.

Summary
This focus group discussion highlighted a key opportunity for the program and its interest in consolidating site-based TMP’s into district TMP. This opportunity comes in the form of a trade-off: Giving up control for the sake of gaining accountability.

The current system focuses on setting required funding levels and approving how the money is spent. The result that many TMP’s simply collect revenue without implementing any demand management strategies is recognized by most parties as a failure for the program. Shifting the emphasis to setting performance measures would allow the City to focus on results rather than process, while providing participants with more control to decide how to achieve them.

There is a strong reluctance, however, on the part of some City staff to relinquish fund control to participants that have historically shown an eagerness to spend funds on projects unrelated to program goals and objectives.

Residential Development Representatives Group

General Program Comments
• The discussion among this group was characterized by a nearly universal rejection of the program’s value and applicability to their own development or residential developments in general. Many members of this group expressed a strong desire to be removed from the program entirely – “Set us Free! Let us go!”
• Frustration is especially high among participants at developments that, post-construction, have divided into multiple, distinct housing associations. While the terms of the SUP bind each to original TMP obligations, the division has created many associations that, if constructed separately, would not have been obliged to seek an SUP. The small size of these associations further
reduces the effectiveness of potential TMP strategies such as shuttles and car-sharing.

- There was also an expression of frustration that, unless buyers read the fine print of their contract, they are typically unaware of the TMP obligations that come with their homes. When pressed, most acknowledged that this did not result in unexpected expenses, but rather the unexpected fact that some of the known expenses went into a TMP fund. Nonetheless it was expressed that such a commitment to the TMP represented developers “selling our rights away” and a “tax” that they did not support.

- The other most common sentiment expressed was a sense of futility in identifying uses for TMP funds that would both meet the terms of the SUP and have a meaningful impact on trip rates at their development. Most expressed that either the size of their fund and their development or the demographics of their community undermined any attempts to shift trips away from single occupancy vehicles.

- Participants expressed frustration that attempts to spend funds on efforts such as bus shelters were complicated by regulations that make them responsible for maintaining the shelter – a punishment in a sense for good intentions.

- Statements of sympathy with the program’s original intentions were made. These statements were verified by a number of additional comments regarding frustration over the level of development being allowed by the City – and the resulting impacts on local traffic and the environment.

- “We aren’t causing the traffic. It’s all this new development.”

Comments on Program Relevance

- Some expressed a sense that the program had become irrelevant and that other programs were performing functions for which it was intended more effectively – employer-based transit vouchers or discounts are very common among residents, for example.

- Others noted that many of the residential developments had become very wealthy communities whose residents “will never take the bus.”

- Others noted that many of the developments are not at all near transit and therefore do not attract those that use transit.

- Many expressed that the programs intentions and benefits are unclear –
  - “No one knows what it’s for.”
  - “No one knows why they have to pay.

- **Suggestion** – Requirement criteria for residential uses should be more context-sensitive, not just based on size.

- **Suggestion** – Broaden program goals to include environmental improvements.

- **Suggestion** – Create and distribute a “briefing booklet” on the program, its intentions, and benefits, as well as administrative guidance for TMP funds – use “plain English”

- **Suggestion** – Create an interactive website to guide TMP participants on administering and taking advantage of the program.
Comments on Administration Obligations

- Finding someone to manage the TMP is a constant struggle:
  - “No one wants to do it!”
  - “A lot of paperwork for something people just don’t use.”
  - “It costs more to run it, than the benefit we get out of it.”
- The City used to come to developments and suggest uses for TMP funds, but no longer does.

Comments on Administrative vs. Economic Hardship

- When asked which obligation, administrative or economic, was more of a burden, most agreed that, while both were unwanted, the economic obligation was more resented.
- When asked if being relieved of the administrative burden by pooling TMP contributions under the control of a centralized administrator – either the City or a third party – would offer an improvement, most strongly objected to giving up control of their money.
  - “I don’t want my money going anywhere else. I would rather see our fund grow to $300,000 and just sit there.”
  - “I would rather deal with the administrative time and effort and control my own funds.”

Proposed TMP Fund Uses

There was ambiguity about Fund expenditures that have been proposed and rejected by the City versus expenditures that were never proposed, but seemed certain to be rejected. Many participants have given up on approaching the City with ideas for TMP Fund projects. This also appears to be due in large measure to a lack of understanding about demand management concepts as well as the City’s expectations.

Summary

This focus group discussion underscored the uniqueness of program constraints at residential developments. Many of the most consistent issues with program compliance and effectiveness exist within residential TMP’s including:

- Limitations of smaller-development TMP’s;
- Administration – administrators often lack understanding, not only of this particular program but demand-management concepts in general;
- High rates of turnover in administration – the impact of which is increased when administrators are reluctant, inexperienced volunteers.

In addition to these shared constraints, residential TMP’s carry their own unique constraints, including:

- Varied trip patterns – Compared to employment-oriented uses, residential developments tend to generate trips that are more scattered throughout the day; and
• Communication – Reaching out to people is much more difficult when they are at home than when they are at work. Residents tend to be very protective of their private time at home, and less responsive to TMP surveys and marketing materials.

Opportunities Identified
• Creating a “pay-only” option for residential uses may remove many of the barriers to effective TMP implementation identified. Shifting from volunteer administration to a TMA or City control; creating economies of scale between smaller TMP’s; using varied trip patterns at residential developments to supplement ridership on employment-centered shuttles; and leaving people alone at home.
• While resistance to consolidation appears strong, this resistance may be based on long-simmering resentments of the program’s obligations. A sharp focus on simply being relieved of these obligations may delay a willingness on the part of some to voluntarily consolidate with other TMP’s if mutually beneficial relationships can be identified and arranged. Such consolidation can be offered as optional to existing TMP’s, while a pay-only level of participation is established for new residential TMP’s.

Constraints Identified
• Ineffective TMP’s at small residential developments.
• Lack of clear definition of applicable TMP program elements.
• Disagreement with overall program goals.
Task 4 – Analysis and Conclusions

The following section summarizes recommendations for improvements to the City of Alexandria’s Transportation Plan Special Use Permit Program (TMPSUP). These recommendations were derived from analysis of findings from all previous project tasks – Existing Conditions Review, Best Practices Review, and Stakeholder Interviews. All recommendations are intended to assist the City of Alexandria in updating its program and improving the ability for it to serve its goals and intentions.

Recommendations are organized by program component, as follows:

- Policy Goals;
- Program Structure and Implementation;
- Program Focus; and
- Non-Compliance Enforcement.

Policy Goals

The primary purpose of the TMP/SUP ordinance is to "reduce peak traffic congestion resulting from development within the City." The goals of the TMP are to:

- Reduce the proportion of single occupancy vehicle (SOV) trips;
- Increase the use of carpools, vanpools, and mass transit during the peak hour; and
- Spread the number of SOV trips outside of the peak hour.

The specificity of these goals and intentions is an opportunity to establish default performance measures up front in the program’s authorizing ordinance. The first recommendation is therefore to expand the goals of the program to recognize the spectrum of benefits that derive from reducing overall traffic congestion and SOV reliance as key program objectives. Whether formally incorporated in the ordinance, or merely officially recognized as key program objectives, these benefits should include at a minimum:

- Environmental benefits: improved air quality, reduced carbon emissions, reduced noise pollution;
- Improved roadway conditions: shorter travel times on local roads (for transit and private vehicles), fewer barriers to walking and biking, and reduced roadway wear and tear;
- Livability: improving the attractiveness of Alexandria as a Smart Growth community; and
- Social-Capital: community-building benefits of increased walking, biking, carpooling, and transit use.

Additionally, adding “reducing overall ‘Vehicle Miles Travelled’” as an explicit program goal would broaden options for quantifying program achievements, and underscore the rationale for including residential developments in the program.

---

16 City of Alexandria, “Administrative Guidelines Ordinance No. 3204”
Program Structure and Implementation – Consolidation

The City has indicated a strong interest in shifting to a consolidated approach to TMP participation. Conversely, many current participants have expressed reservations, some quite strongly, to such an approach. Nonetheless, the advantages of consolidation are significant enough to recommend that the City place all new developments and attract as many existing TMP’s as possible into consolidated TMP’s. Advantages of consolidation include:

- **Economies of Scale for TMP Investments** – larger, centrally-controlled funding and participant pools allow more efficient investments in mitigation strategies, from shuttle services to ride-share programs;
- **Streamlined Administration** – a limited number of administrators, organized into districts, presents the opportunity to reduce human resource redundancies, bring a new level of program focus, and arguably places administration in the hands of those most suited to understand its unique barriers and potential achievements;
- **Provides Options** – a district-based administration would allow the City to provide two new, viable TMP model options: participation in a Transportation Management Association (TMA); and a pay-only option for residential developments; and
- **Improved Program Performance** – a consolidated approach would allow for program investments to be concentrated in areas and among populations within each district that offer the greatest potential impact on overall program goals and objectives.

It is recommended that the City facilitate TMP consolidation by shifting away from its current single-model approach to all TMP’s. Due to the different characteristics of residential and non-residential developments, and legal right of existing TMP’s to refuse to consolidate, a range of consolidation strategies and participation options are outlined below.

**Residential Developments**

The current TMP approach requires each residential development to fund and implement its own program. Many residential developments rely on volunteers who contribute their valuable personal time for TMP administration – volunteers that are likely to have limited experience with, and possibly no natural affinity for, the program or mitigation concepts and aims in general. Others spend TMP funding to hire outside administrative support.

Furthermore, all residential TMP’s suffer to some extent from barriers identified in the City of Cambridge (see Best Practices section above) as peculiar to residential developments – mainly that their trip generation impacts are not as easily quantified as are an employment destination’s. This makes it difficult to identify mitigation strategies that address peak-congestion-oriented program goals effectively. As a result, identifying appropriate TMP investments has been a challenge for both residential TMP’s and City staff. Such challenges are the likely reason that, among the three Best Practice peers
reviewed, only one has chosen to require residential participation – despite a second peer (Montgomery County) having the legal authority to do so.

Establishment of a “pay-only” TMP option would offer an opportunity to shift time and responsibility commitments from volunteers to professional, experienced district TMP staff, chosen specifically for their understanding and support of program aims and benefits. This pay-only model would also allow funding from residential developments to be consolidated and investments to be shifted to locations and populations where greater impact on program goals can be expected.

This pay-only option should be the standard model for new residential TMP’s to avoid the unique and chronic administrative issues which have created frustration in both participant-support for the program’s aims and the effectiveness of its implementation. For established residential TMP’s, shifting to the pay-only format must be offered as an option – open to all, any time they wish to switch over from their originally established TMP.

For all pay-only TMP’s, annual contribution levels can be set following the same process used for those choosing to continue under the traditional TMP model. Contribution levels, however, should be discounted for “pay-only” TMP’s to encourage existing TMP’s to opt in, and to reflect the efficiency gains offered by:

- Consolidating administration;
- Economies of scale resulting from consolidating TMP investments; and
- Performance improvements expected from shifting investments to populations and locations offering greater potential traffic and SOV-reliance impact.

While the loss of control over investment of TMP contributions may keep many existing residential TMP’s from opting into this model immediately, the savings in direct costs as well as time and labor offered by the pay-only option will become clearer over time. For TMP’s struggling to find investment opportunities, remaining in the traditional model will amount to paying for added administrative obligations and work. Holding onto funds for the sake of holding onto them will likely lose its appeal in time, especially with a cheaper and easier option waiting for them.

To further attract interest in this option, a good will gesture is proposed to permit existing TMP’s that opt into the pay-only model to spend any accrued TMP funds in any way they choose. This gesture is anticipated to be effective in attracting residential TMP’s into the new pay-only option as many interviewed in Task 3 stated that their TMP’s have accrued sizable funds — funds that would be theirs to spend as they see fit if they opt in. This would likely require a City Council-approved change to the TMP ordinance.

**Non-Residential Consolidation – TMP Districts**

Similar to the TMD District approach successfully implemented in Montgomery County (see Best Practices section above), it is recommended that the City of Alexandria establish TMP Districts across the city. The TMP Districts would cover the whole city, or
at least the parts of it within which TMP investments would likely be most effective. Districts would be defined strategically based on geography as well as land use commonalities and/or transportation synergies. The City would assign dedicated TMP District staff to assist each district individually. Such staff should be selected for:

- Significant understanding of traffic mitigation and transportation management concepts and strategies;
- Appropriate dedication to the value and potential of the program; and
- Demonstrable ability to market the program’s benefits to Alexandria businesses.

The described TMP District staff would:

- Receive all monies collected from “pay-only” TMP’s within their district;
- Receive modest administrative fees from all participating employers (optional);
- Operate as an extension of either the City’s Transportation and Environmental Services or Planning and Zoning department — similar to the City of Cambridge — or as a newly created body — similar to Montgomery County’s TMD Districts;
- Provide dedicated staff to support TMP-participating employers within district boundaries;
- Market the program’s intents and benefits to all district employers, utilizing websites, printed materials, and on-site training and information sessions similar to Montgomery and Arlington counties;
- Establish appropriate, district-wide performance measures;
- Assist employers in identifying demand-management strategies for achieving performance measures;
- Have the administrative authority to require and approve or reject annual TMP implementation plans, and initiate non-compliance measures; and
- Collect, organize, and analyze all survey data to assist in tracking performance among districts and across the city.

Coordinating with the City’s dedicated TMP staff member, employers with TMPSUP obligations would be required to:

- Develop annual implementation plans based on the terms of their SUP;
- Fund all implementation costs;
- Implement a set of basic program requirements similar to what is currently required: TMP Coordinator, annual employees surveys, annual reports, etc.

Each TMP District will be responsible for meeting its performance measures – as demonstrated through annual surveys and reports. Should measures not be met, each TMP District would rely upon surveys and reports to determine which TMP plans are under-performing and make appropriate adjustments in annual plan revisions. Like the Montgomery County and Arlington County programs, TMP District staff services would be offered to all employers to guide in the development of demand-management oriented commuter benefits.
A key improvement over the existing program would be that, each year, every TMP District participant would be required to implement an approved set of measures based on approved performance targets and previous-year performance.

**Alternative Consolidation Model – Transportation Management Associations**

The Potomac Yards TMA in Arlington County was established in lieu of the new development in Potomac Yards participating in the County’s official TMA – Arlington Transportation Partners. This option was intended to provide more autonomy to a large development, the developers of which had sought control over the spending of funds. The unique arrangement requires the independent Potomac Yards TMA to meet negotiated, annual performance measures specific to their area.

Under a similar arrangement in Alexandria, TMA’s could be established among individual TMP’s seeking more control or autonomy over their TMP investments. These independent TMA’s would:

- Negotiate locally-appropriate, TMA-wide performance measures with the appropriate TMP District;
- Operate in lieu of TMP District participation only so long as performance measures are achieved;
- Set and collect funding contributions from all participating employers; and
- Identify and fund demand-management and traffic mitigation strategies to achieve performance targets.

The TMA option should also be available for established residential developments choosing not to opt into the pay-only alternative, as well as new residential developments.

The City can set terms for each established TMA that define actions to be taken should performance targets not be achieved. For example, for each year that performance fails to meet or exceed targets, a TMA might be required to increase funding commitments by 15% for the subsequent year. Furthermore, should a TMA fail to meet performance measures within an established timeframe (five years for example), it could be dissolved. Optionally, failure to meet performance targets followed by a failure to meet increased funding obligations could result in immediate dissolution. Once dissolved, all residential participants would automatically shift to the pay-only model and all non-residential participants would automatically shift to the TMP District model.

Conversely, TMA’s that meet or exceed their targets are free to reduce funding commitment levels at their own discretion. This is a key aspect of their direct autonomy over their activities and investments, and a key incentive to attract traditional TMP’s into this alternative form of program consolidation.

**Optional vs. Mandatory Consolidation**

Due to differing regulations, mechanisms for consolidation must vary for new versus existing TMP’s. New TMP’s are at the discretion of the City and are therefore recommended to be brought into a consolidated TMP, as a participant in either a TMP
District or approved TMA. By contrast, an approved SUP can only be amended at the request of its holder; therefore, consolidation among existing TMP’s must be voluntary.

The City can offer increased autonomy to TMP’s that opt into TMP District or TMA participation by shifting the program’s emphasis to performance measures rather than funding and investment controls (see below). As long as a District’s performance targets are met (or substantially met) employers would be free to negotiate what TMP activities they will undertake each year, and on what they will expend their TMP investments.

The TMA option would provide even more autonomy compared to pay-only and TMP District options by allowing participants to select independent administrators of their choosing to collect funds, identify programs, and invest in strategies. This may be a popular solution for existing residential TMP’s that would like to participate in nearby employer-based shuttle services – providing the employer service with return-trip riders and increased service funding.

As long as this option is tied directly to meeting performance measures (with the clear understanding that failure to do so will result in absorption into the default model for each participant), the City can afford to offer this level of autonomy as means of attracting existing TMP’s into a more effective, consolidated program model. Stakeholders interviewed in Task 3 stated that such autonomy was highly desired among existing TMP participants. This benefit of consolidation is therefore anticipated to attract many existing TMP’s into a consolidated TMP option.

Figure 7 summarizes the track that any TMP can take through the proposed consolidation process – essentially there is no option to return to a traditional TMP once one opts into either a pay-only or TMA alternative. This is key to eventually attracting all TMP’s into either a TMP District or an approved TMA.

**Program Focus – Performance Measures vs. Funding and Investment Control**

Few changes to the existing program offer a greater chance to improve performance and generate participant and community buy-in than the City relinquishing direct control over funding levels and investments in return for setting quantifiable performance measures and targets. Two major advantages of such a trade off are:
• Accountability and Results – Each TMP participant is required to directly contribute to meeting overall program goals, as opposed to simply meeting funding and investment guidelines; and
• Improve TMP investment process – Both City staff and TMP participants have expressed frustration over the current implementation approvals process. A new focus on performance will:
  o Provide more flexibility to administrators:
  o Provide more autonomy to participants in identifying implementation options; and
  o Clarify what is expected of investments — that they directly impact measured performance.

Broad performance measures should be adopted that reflect stated program goals. Options include, but are not limited to:
  • Peak-period SOV-commute rates/Peak-period non-SOV-commute rates;
  • Transit commute rates (for transit-proximate sites or transit-rich areas); and/or
  • SOV-commute rate reductions.

Tracking these measures across the city will provide Alexandria with clear information on the impact of the program. This information will be invaluable for communicating the benefits of the program to participants and the general population.

In addition, individual performance targets should be set and annually revisited for each District and TMA, based on the constraints and opportunities of individual developments, sites, and/or district areas. Options include, but are not limited to:
  • Target SOV-, or non-SOV-, commute rates (as described in the Montgomery County TMD District approach in the Best Practices section above);
  • Transit-commute rate target;
  • SOV-commute rate reduction;
  • Meeting either SOV-commute, non-SOV-commute, or transit-commute target based on a set “base-performance” year. For example, matching non-SOV commute rates for a development’s census tract as measured by a census (Cambridge’s PTDMP sets their standard target based on the 1990 census; see Best Practices section above).

Whatever measures are chosen, and whatever targets are set, focusing on performance rather than process will provide a number of benefits for the program, as indicated above. In addition, such an approach will allow the City to offer increased autonomy to participants as a trade-off for opting into TMP Consolidation. In addition, focusing on performance and accountability, along with consolidation, will also provide important new tools for improving compliance among active TMP participants.

Non-Compliance Enforcement

Compliance enforcement was identified as an area in need of improvement during Task 3 interviews by participants in both the Developers and the City Attorney’s meetings. Specifically, identification of a series of non-compliance “triggers” and the resulting
consequences was suggested to clarify what the City expects of TMP participants as well as consequences for non-compliance. It was also suggested that a broader range of non-compliance response options would allow the City’s response options to better match various levels of non-compliance.

The review of compliance and enforcement issues during the Task 2 Review of Best Practices indicates that consolidating TMP’s and focusing on performance measures will greatly simplify these issues for Alexandria and provide the following enforcement improvements:

- Consolidation of compliance monitoring;
- Single-source of information for participants on both compliance requirements and non-compliance responses; and
- Focus on accountability in annual TMP plans, including measures responding to a lack of “good faith” compliance efforts.

**Consolidate Compliance Monitoring**

The current approach requires the City to enforce compliance in both the funding of TMP’s and the use of those funds to implement approved actions. This relies upon Transportation & Environmental Services staff to monitor compliance in terms of funding and completion of surveys and reports, while Planning & Zoning staff must identify implementation compliance – interpreting TMP funding proposals against SUP requirements. Monitoring all program activities through the TMP District staff, and a new focus on performance targets, would streamline this process.

The City's main compliance interest will be monitoring performance targets for each District and TMA. Within each District and TMA, reports, surveys, funding, and investments thus become tools for reaching and documenting these targets, rather than ends in themselves. Compliance with these obligations can be addressed at the level of annual TMP plan negotiations – increased obligations for poor performance, reduced obligations for high achievers. Should non-compliance rise to a level beyond such remediation, TMP District staff can initiate currently available non-compliance actions through the City Attorney’s office.

**Single Conduit for Compliance Information**

The TMP District can also be an effective conduit for providing information on the enforcement process – the same TMP District staff negotiating annual TMP plans with each employer will also be responsible for identifying consequences for poor- or non-compliance – ensuring that all participants are aware of the various levels of response to a lack of cooperation.

From the project interviews, it appears rare that the City currently has to do more than send out a letter from the City Attorney’s office in order to gain compliance from a non-participating or non-co-operative TMP. Should this fail, the issuance of a “zoning ticket” has proven to be effective in gaining compliance. The ability for a TMP District to inform members of the schedule of non-compliance responses, including details on the level of
non-compliance that will trigger them, can be expected to further prevent instances of non-compliance.

**Added Tools**
In addition to these broad, process-focused improvements in compliance monitoring, a number of specific compliance options are presented to focus on performance and accountability.

**The TMP District**
Consolidation into TMP Districts and TMA’s provides one critical new enforcement tool – performance accountability. Simply put, TMP District staff will be able to adjust annual TMP plans to reflect prior-year compliance levels. For instance, a TMP District can require an employer that failed to submit an acceptable volume of completed surveys to hire an outside firm to either complete surveys or conduct driveway counts in the following year’s TMP plan.

Should non-compliance continue, actions can be taken through the existing channels, such as involving the City Attorney’s office. In this way, options will be sufficiently flexible to match non-compliance levels with appropriate remediation actions. It is also worth reiterating here that the TMP District approach provides the capacity to reward standout compliance efforts through reduced obligations.

**The TMA**
The TMA option is essentially extended on credit. As long as the developments involved collectively meet performance targets, the autonomy and local control offered by this model are retained. The potential dissolution of any TMA becomes the main incentive to ensure compliance. TMA administrators will have the ability to address smaller levels of non-compliance as part of their efforts to meet their performance targets – providing them with flexibility to address various levels of non-compliance similar to TMP District staff.

**Pay-Only Option**
For residential TMP’s that remain with the traditional TMP model, non-compliance of a pre-determined level (i.e., two consecutive years of failing to provide surveys or invest funding) could result in the automatic conversion of that TMP to the pay-only model. This would likely require a City Council-approved change to the TMP ordinance.
SUMMARY OF RECOMMENDATIONS

Policy Goals
It is recommended that the City broaden its TMPSUP program goals and objectives to include reduced VMT and the many benefits tied to the current official goal of reducing VMT and peak congestion conditions, such as:

- Environmental benefits: improved air quality, reduced carbon emissions, reduced noise pollution;
- Improved roadway conditions: shorter travel times on local roads (for transit and private vehicles), fewer barriers to walking and biking, and reduced roadway wear and tear;
- Livability: improving the attractiveness of Alexandria as a Smart Growth community; and
- Social-Capital: community-building benefits of increased walking, biking, carpooling, and transit use.

This broadening of program goals and objectives would expand opportunities for quantifying program achievements, while underscoring the rationale for including residential developments in the program.

Program Structure and Implementation – Consolidation and Options
It is recommended that the City facilitate TMP consolidation by offering various TMP models and options to better fit the variety of affected developments. The recommended process can be summed up in three steps:

1. All new TMP’s are organized into TMP Districts (non-residential uses), or a pay-only model (residential uses) that directly supports consolidated TMP Districts.
2. Develop program options to better fit conditions of each existing TMP development – TMP District, TMA, or pay-only.
3. Attract existing TMP’s into a consolidated or a pay-only model.

Program Focus – Emphasize Results over Process
It is recommended that the City shift a focus on program processes (setting funding levels, ensuring compliance with surveying and investment requirements at each TMP) to mandating outcomes (setting broad performance targets on the District/ TMA level). To do so, the City should identify specific performance targets for each TMP District and TMA. Meeting these targets then becomes the primary compliance focus for the City.

TMP District staff and TMA administrators would then be freed to set funding, investment, survey, and reporting obligations for each participant as means for achieving performance targets – increasing obligations for under-performers and decreasing obligations for high-achievers. With such a change, participants will gain...
autonomy while the City gains accountability — as well as improved, goal-oriented program performance.

**Non-Compliance Enforcement**

Focusing on performance measures and targets, along with effective consolidation, will address many identified compliance enforcement issues and offer the following improvements for the City’s compliance efforts:

- Consolidation of compliance monitoring responsibilities via monitoring all program activities through the TMP District staff;
- Single-source of information for participants on both compliance requirements and non-compliance responses (TMP District staff or TMA); and
- Reduced compliance measures as the primary area of compliance becomes explicit targets.

Consolidation and accountability also add a number of new compliance tools, including:

- Performance accountability as TMP District staff will be able to adjust annual TMP plans to reflect prior-year compliance levels. For instance, a TMP District can require an employer that failed to submit an acceptable volume of completed surveys to hire an outside firm to either complete surveys or conduct driveway counts in the following year’s TMP plan.
- The TMA which would essentially be extended on credit. The potential dissolution of any TMA becomes the main incentive for participants' compliance.

TDM Site Plan Condition Checklist
### TABLE III: TDM Site Plan Condition Checklist

<table>
<thead>
<tr>
<th>Checklist completed by</th>
<th>on Date</th>
<th>Site Plan Required</th>
<th>Being Done</th>
<th>Not Done</th>
<th>Need Assistance</th>
</tr>
</thead>
</table>

**A. Program Participation**
- 1. Maintain an active membership in Arlington Transportation Partners (ATP).
- 2. Designate and train the Property Transportation Coordinator (PTC).
- 3. Facilitate development of Employee Transportation Coordinator (ETC).

**B. Facilities and Improvements**
- 4. Provide Transportation Kiosk or information display.
- 5. Provide for bus stops improvement.
- 6. Maintain existing bus stops during construction.
- 7. Maintain an on-site business center (residential use only).
- 8. Bicycle facilities: bike storage/parking facilities, guest parking and showers.

**C. Parking Management Plan**
- 10. Provide a Comprehensive Sign Plan for the property.
- 11. Design for paratransit access at main entrance to building.
- 12. Provide reserved spaces for carpoolers and vanpoolers (commercial use only)
- 13. Establish market-rate pricing for SOV parking (commercial use only).
- 14. Provide registered vanpools with free parking (commercial use only).
- 15. Provide carpoolers with ½ off the rate for SOV parking (commercial use only).
- 16. Depict area parking plan for the site and adjacent street frontage.
- 17. Prohibit on-street loading during peak periods.

**D. Promotions, Services, Policies**
- 18. Provide a sustainable commute benefit program.
- 19. Provide transit benefit for a six-month period (commercial use only).
- 20. Provide SmarTrip cards.
- 21. Provide website hotlinks to CommuterPage.com™
- 22. Distribute transit and ridesharing information:
  - a. Participating in ATP staff programs.
  - b. Provide New-resident or tenant commuter information package.
  - c. Distribute transit and ridesharing information periodically.
  - d. Participate in Ozone Action Days and similar activities.
  - e. Reference adjacent metro stations in promotional materials.
- 23. Encourage flexible work strategies to/from property.
- 24. Encourage telecommuting (commercial use only).

**E. Performance, Monitoring and Funding**
- 25. Implement TDM plan.
- 26. Submit an annual letter of performance to the County Manager.
- 27. Conduct a transportation performance study.
- 28. Provide annual Contributions to ACCS

Montgomery County –
Sample Traffic Mitigation Plan
**SAMPLE TRAFFIC MITIGATION PLAN**

Company/Organization: **Global Solutions, Inc.**

Address: 5555 County Drive, Silver Spring MD 20910

Number of Full-time Employees: **300** Part-time Employees **0**

Submitted by: Tom A. Jones

Title: President

Signature: __________________________________________ Date: May 1, 2003

Here’s our plan to reduce gridlock in Montgomery County by offering the selected transportation benefits to our employees. In the first column, we’ve placed an *E* next to the strategies that we already have in place, and *N* next to the strategies that we will implement with this year’s Traffic Mitigation Plan. In the last column, we’ve described our current or planned efforts.

**E** = Existing Strategy  **N** = New Strategy  ***** = Required Strategy

<table>
<thead>
<tr>
<th>Traffic Mitigation Strategy</th>
<th>Employer Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*E Contact person designated to receive and distribute information</td>
<td>Ellen Davis, Human Resources Director 301-555-5555; <a href="mailto:edavis@globalsolutions.com">edavis@globalsolutions.com</a> We will notify the TMD in writing of any changes in this information</td>
</tr>
<tr>
<td>*E Information on transit/pooling/other commute alternatives distributed/posted regularly (furnished by TMD)</td>
<td>Information on transportation services is posted in the employee break room.</td>
</tr>
<tr>
<td>*N Facilitate TMD staff presentations to employees and HR/Administrative staff on commute information/alternatives on periodic basis</td>
<td>We hold an annual benefits seminar in the fall. We would like TMD Staff to attend to display information and answer employee questions.</td>
</tr>
<tr>
<td>*N Guaranteed Ride Home Promotion (free regional program offering emergency rides)</td>
<td>We promote the Guaranteed Ride Home program to our employees. We provide brochures to employees with their monthly transit benefit.</td>
</tr>
<tr>
<td>*N Annual Commuter Survey distributed to employees (short survey of transportation– supplied by TMD)</td>
<td>[Please describe your approach to gaining 80 percent participation from your employees] We will distribute survey to our employees via e-mail from our company president. We will also send an e-mail reminder.</td>
</tr>
<tr>
<td>*N ADA information provided (transportation services for people with disabilities)</td>
<td>We will provide disabled employees with information on the regional Metro Access program and Montgomery County’s Same Day Access program.</td>
</tr>
<tr>
<td>*N Permanent display area for TMD-provided bus schedules and other transportation information</td>
<td>We plan to install a transit map and brochure racks in our employee break room.</td>
</tr>
<tr>
<td>*N Compile information on yearly TMP activities and submit Annual Report</td>
<td>We will maintain a file on the promotion and implementation of the strategies selected above and include in our Annual Report to DPWT.</td>
</tr>
<tr>
<td>N Attendance at free CSS-sponsored meetings/workshops permitted for designated contact person</td>
<td>Ms. Davis will be permitted to attend four such meetings per year.</td>
</tr>
<tr>
<td>Traffic Mitigation Strategy</td>
<td>Employer Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>----------------------</td>
</tr>
<tr>
<td><strong>E</strong> Information on commuting alternatives provided to new employees (TMD can provide materials and/or attend orientations)</td>
<td>We inform new employees of our transit subsidy program and provide Metro pocket guide and Ride On route maps to assist them in transit planning.</td>
</tr>
<tr>
<td>Free or reduced rate parking for car/vanpools offered to employees</td>
<td></td>
</tr>
<tr>
<td>Preferred location and/or reserved parking for car/vanpools offered to employees</td>
<td></td>
</tr>
<tr>
<td><strong>N</strong> Bike amenities at worksite, such as racks, lockers, and showers (TMD may be able to supply)</td>
<td>We will arrange to have bike racks installed in our garage.</td>
</tr>
<tr>
<td>Transit/pedestrian amenities at worksite, e.g. sidewalks, benches, etc.</td>
<td></td>
</tr>
<tr>
<td>Carpool matching for employees (as part of free region-wide matching program, or can be on-site only)</td>
<td></td>
</tr>
</tbody>
</table>
| **N** Alternative work schedules:  
  __ Flex Time    __ Jobsharing  
  X Compressed Work Week  
  X Telecommute/Teleworking | We allow teleworking for some employees in special circumstances. We would be interested in formalizing this program and making it available to more employees. |
| **E** Tax-free monthly transit subsidies provided to employees, including Super Fare Share, Fare Share and Metrochek. | We participate in the Super Fare Share program. We joined in September 2000. Fifty employees currently participate in the program. We inform new employees about the subsidy at orientation. |
| **N** Maryland State Commuter Tax Credit for employers | TMD Staff explained that we qualify for the State’s 50 percent tax credit on our contributions to employees commuting costs up to $30/month. We will apply for credit this tax year. |
| Pre-tax payroll deduction for transit costs offered to employees (Saves employer & employee money) | |
| Transit passes/tokens offered for purchase at worksite (at full or reduced price) | |
| Subsidize employee parking and transit equally (if employee parking is currently subsidized, offer equal subsidy for transit costs) | |
| Ozone Action Days participation (regional program to alert people to dangerous air quality days) | |
| Other : Please Indicate | |

Montgomery County –
Sample Annual Commuter Survey
ANNUAL COMMUTER SURVEY

Please return completed survey WITHIN 1 WEEK to the person who gave it to you, OR send to: MONTGOMERY COUNTY COMMUTER SERVICES, 8401 Colesville Road, Suite 150, Silver Spring, MD 20910

Say “Cheese!”

This survey is our yearly ‘Snapshot’ of Montgomery County Commuters.

Your employer is working with Montgomery County Commuter Services to improve our transportation system.

Your answers to this survey are very important!

Print Name & Phone Number for a chance to win a fabulous prize!

Print CLEARLY

Company/Organization: ____________________________________________ Date: ________________

1. Did you work at your usual place of employment yesterday? □ Yes □ No
   If no, please check one of the following, then skip to question 4.
   I was: □ Telecommuting □ On regular day off (non-compressed sch.) □ On leave (vacation, sick, maternity, etc.)
   □ On company business □ On compressed work week

2. What were your worksite arrival and departure times yesterday?
   Arrival: ____________________ □ am □ pm
   Departure: __________________ □ am □ pm

3. How did you travel to work yesterday? If more than one mode, check only the final mode you used to reach your worksite. Do not check “walked” if you walked to or from your car, bus, train station, etc.
   □ Walked (as my only method from home to work)
   □ Drove Alone (do not check if you drove a motorcycle/moped)
   □ Carpool Driver Including you, how many persons were in the carpool? __________________________
   □ Carpool Passenger
   □ Vanpool Driver Including you, how many persons were in the vanpool? __________________________
   □ Vanpool Passenger
   □ Casual Carpool or Slug Passenger
     (I rode with someone with whom I do not have a regular carpool arrangement)
   □ Bus, Metrorail, Amtrak, MARC and/or VRE
     (includes drive, walk, or shuttle to bus stop, station, or park-and-ride lot)
   □ Bicycle (as my only method of travel to and from the worksite)
   □ Motorcycle/Moped (as my only method of travel to and from the worksite)

4. How far do you live from your worksite (in miles)?
   □ 0 - 9.9 □ 10 - 19.9 □ 20 - 29.9 □ 30 - 39.9 □ 40 - 49.9 □ 50 or more

5. What is your home zipcode? ____________ ____________ ____________ ____________

6. If you drive alone to work, do YOU pay for some or all of your worksite parking? □ Yes □ No
   If YES, what is YOUR monthly cost for parking at your worksite?
   □ $1-$20 □ $21-$40 □ $41-$60 □ $61-$80 □ $81-$100 □ $100+

   Does your EMPLOYER pay for some or all of your worksite parking? □ Yes □ No
   If YES, what is your EMPLOYER’S monthly cost for your parking space at your worksite?
   □ $1-$20 □ $21-$40 □ $41-$60 □ $61-$80 □ $81-$100 □ $100+ □ Don’t Know

7. If you commute by any means other than driving alone, how much per month does your employer reimburse of your commuting expenses? (bus, Metrorail, carpool/vanpool, Amtrak, MARC, VRE, bicycle or walking)?
   □ $0-No Reimbursement □ $1-$20 □ $21-$40 □ $41-$60 □ $61-$80 □ $81-$100 □ $100 +

   8. If you usually drive alone to work, how likely would you be to switch to an alternative method (public transit, carpool, vanpool, bicycle) if you were offered the following? Select all that apply:
   a. A guaranteed ride home in an emergency □ Very Likely □ Somewhat Likely □ Not Very Likely □ Not At All Likely
   b. Flextime or compressed schedule □
   c. A monthly transit allowance □
   d. A monthly vanpool allowance □
   e. Free parking for carpool/vanpool □
   f. Free assistance to find a carpool or vanpool □
   g. Transit route and schedule information □
   h. Bicycle storage/shower facilities □

OVER PLEASE
Your responses help to improve transportation in Montgomery County!

- New county-wide transportation options, including Ride-On, Metrobus/Metrorail, MARC, MTA/Eyre Bus and free downtown shuttles
- Express Bus Service from Germantown and Gaithersburg to Bethesda
- One-Stop Commuter Express Store in Downtown Silver Spring
- FARE SHARE & SUPER FARE SHARE Transit Subsidy programs

### COMPLETE ONLY IF YOU WOULD LIKE TO RECEIVE FREE INFORMATION ON CARPOOLSING, VANPOOLSING, TRANSIT, THE GUARANTEED RIDE HOME (GRH) PROGRAM OR OTHER ALTERNATIVES TO DRIVING ALONE.

How Employers Implement TMPs

**BETHESDA**

“As a retail outlet with several shifts and employees who live all over the area, it’s difficult for us to coordinate carpools. We’ve found that the best way to inform employees about transit and other commuter services is through paycheck inserts, which they’re sure to see. The Transportation Management District has been tremendous — sending materials and helping us create our traffic mitigation plan. I would encourage any small business to call them for assistance in understanding the new law and meeting the requirements.”

— Stephen M. Smith, Comptroller, Strosniders Hardware

**NORTH BETHESDA**

“The North Bethesda Transportation Management District sent samples of traffic mitigation plans so we would know exactly how to create one. They also made gave us suggestions on how to make sure that all levels of the corporation were involved. Our employees have responded very positively. They like having the information available to them so they can research different options. The most popular is the tax-free transit subsidy, which saves them a lot of money.”

— Wendy L. Mock, Human Resources Manager, Social & Health Services, Ltd

**SILVER SPRING**

“Our employees are very excited about our transportation benefits program, and are eagerly anticipating the development of the new plan. We post all information on bulletin boards throughout the company, and invite comments and suggestions. The Silver Spring Transportation Management District (TMD) has been very helpful, providing us with advice and tips which would encourage our employees to consider alternate commute options, including more carpooling, telecommuting and bicycling. We are also promoting expansion of all the existing programs.”

— Alfreda Thomas, MayaTech Corporation

**FRIENDSHIP HEIGHTS**

“Our employees especially like Super Fare Share, and so does the company. It’s a nice savings for us. We also post information on commuting alternatives on our bulletin board and have a dispensing unit in our lunchroom with handouts from the Transportation Management District. We’re very happy with the program, and we’re doing all we can to reduce traffic in Montgomery County.”

— Jack Kilgallen, Facilities Management Manager, F-D-C Reports, Inc.
Appendix B:
Stakeholder Interviews Guidelines
Appendix: TMP Study Task 3 - Questions for Interviews per Group

Interview - Planning & Zoning and Transportation & Environmental Services

Questions

1. What is your interaction/responsibility with the TMP process? Please describe your last experience with the process.

2. Are the following TMP elements providing the information necessary to assess their potential effectiveness in containing traffic?
   a. Application
      i. Traffic Impact Statement
      ii. TMP
   b. Compliance - How effective are the following reporting tools in measuring the goals of the TMP program?
      i. Reports/Surveys
      ii. Fund Reports
      iii. Annual Reports

3. What are your general observations about the TMP process?
   a. Is there enough funding for the prescribed transportation activities?
   b. Is the TMP administration effective?

4. Enforcement -
   a. Please describe the Zoning Violation procedures.
   b. In your opinion, are there any other actions that could be taken to enforce the TMPs?

5. In your opinion, what aspect of the TMP program should be changed?

6. What are your suggestions for changing the TMP program?

Interview – City Attorney’s Office

Questions -

1. What is your interaction/responsibility with the TMP process?

2. What are your general observations about the TMP process? (both administrative and effectiveness)

3. What do you think about the following specific TMP elements:
   a. Application
      i. Traffic Impact Statement
ii. TMP

b. Compliance and
   i. Reports/Surveys
   ii. Fund
   iii. General Effects

c. Enforcement
   i. Zoning Violation

4. In view of the general response that residents and businesses give to the plan, how would you consider modifying the ordinance to achieve the reduction in traffic envisioned by the City through the TMPs?

5. Could a one-time TMP fee be assessed at the time of initial application for residential properties rather than a fee into perpetuity?

7. Have you considered modifying the ordinance by collecting the TMP funds not being spent as agreed and establishing a city-wide TMP fund?

7. In your opinion, what aspect of the TMP program should be changed?

8. What are your suggestions for changing the TMP program?

Interview – Developers and Developers’ Attorneys

Questions

1. Is the TMP program effective in controlling traffic from new development?

2. Could you share any other programs for traffic control of new development known to you?

3. What is your experience with the TMP process?

4. What are your general observations about the TMP process?
   a. Is there enough funding for the prescribed transportation activities?
   b. Would you favor a one-time payment for new traffic generated by a new project?

5. In your opinion, what aspect of the TMP program should be changed?

6. What are your suggestions for changing the TMP program?
Interview - Office Buildings and Retail

Questions

1. What is your interaction/responsibility with the TMP process? Please describe your last experience with the process.

2. From your end, how effective are the following reporting tools in measuring the goals of the TMP program?
   i. Reports/Surveys
   ii. Fund Reports
   iii. Annual Reports

3. What are your general observations about the TMP process?
   a. Is there enough funding for the prescribed transportation activities?
   b. Is the TMP administration effective?

4. Are you aware of the enforcement procedures for the TMPs?

5. In your opinion, what aspect of the TMP program should be changed?

6. What are your suggestions for changing the TMP program?

Interview - Residential Developments and Mixed Development

Questions

1. What is your interaction/responsibility with the TMP process?

2. What are your general observations about the TMP process?
   a. Is there enough funding for the prescribed transportation activities?
   b. Is the TMP administration effective?

3. Please describe your last experience with the process.

4. What transportation activities are in place in your site?

5. If there are no transportation activities, could you indicate the reason for that?

6. Please give your views with the reporting requirements (fund report, annual report and survey).

7. In your opinion, what aspect of the TMP program should be changed?

8. What are your suggestions for changing the TMP program?

Cambridge, MA

Memo

To: Robert W. Healy, City Manager
From: Stephanie Groll, PTDM Planning Officer
Cc: Brian Murphy, Asst. City Manager for Community Development
Date: April 9, 2012
Re: 2011 PTDM Monitoring

This memo provides an update, as required by the Parking and Transportation Demand Management (PTDM) Ordinance, on required monitoring of projects with approved Large Project PTDM Plans. Since November 1998, any non-residential project that has created new parking has been subject to the PTDM Ordinance. The ordinance requires that projects adding parking to its facility, whose total is twenty or more spaces, prepare a plan, which is approved by the City. Plans include a commitment for a numeric reduction in the percent of people accessing the project via single occupant vehicle (SOV). Monitoring and reporting to show whether the SOV mode split commitment has been achieved is a requirement of all plans. Monitoring begins approximately one year after the new facility is occupied. For Small Project PTDM Plans with a total of five to nineteen parking spaces, a commitment to implement three transportation demand management measures is required, but there is no SOV mode-split commitment or annual monitoring.

Thirty-seven projects with PTDM approvals completed monitoring in 2012. Eleven small projects did not have monitoring requirements.

Projects Monitored

A wide variety of projects are represented among those reporting this year. They include a hospital, a theatre and cultural arts facility, the retail and office portions of a mixed-used building, educational facilities, a city library, an R&D lab building and a large, multi-building office/R&D development. PTDM reports now cover the commuting activities of more than 26,594 employees and 8,540 graduate and primary school students. Fourteen of the 2010 Top 25 Cambridge Employers submitted PTDM monitoring reports. In 2011, the city monitored 16,728 parking spaces, which served 8,674,043 square feet of non-residential space.

Monitoring reliability

Response rates to 2011 employee mode split surveys were generally high. Of the thirty-seven projects conducting surveys, thirty-six had response rates of 60% or greater, with ten projects reporting response rates higher than 75%. This type of response, coupled with bi-annual driveway/parking utilization monitoring, gives us confidence that the results are reliable.
Mode Split Results

Sixty-two percent of the monitored projects (twenty-three) met their PTOM mode split commitments for 2011. Projects meeting their mode-split commitments all showed SOV driving rates of less than those projected. Compliant mode splits ranged from a low of 0% SOV to a high of 59%.

Several factors contributed to the challenges faced by the fourteen projects that did not meet their commitments. Eleven, or almost 80%, of the projects that failed to meet their mode split commitment are located more than 1/4 mile from rapid transit. Further, almost all of the ratios of employment to parking spaces at the sites, with current employment levels, are not conducive to meeting the mode split commitments set in the approved PTDM plans. Three of these sites have space that is either unleased or under-occupied due to reductions in staffing or slower than anticipated hiring. This has led to an imbalance in the employee-to-parking space ratios. This appears to confirm national research that over-supply of parking contributes to higher SOV rates.

Projects receive monitoring response letters noting whether a project is in compliance and offering technical assistance for non-compliant projects. In some cases when a property has implemented all of its plan required TDM elements and still does not achieve desired SOV levels, we work with them to develop additional reasonable TDM measures to promote non-SOV travel. This has been a mutually cooperative process, not yet necessitating the utilization of the enforcement provisions contained within the PTDM ordinance.

In addition, six projects with special permit requirements, but no PTDM requirements, submitted reports on the status of implementation of TDM measures and/or their mode splits. Five of these projects were required to complete mode split surveys and reported employee mode splits of between 32% and 83% SOV.

TDM Measures Implemented

A wide variety of measures have been implemented in order to meet these mode split goals. While all PTDM plans include measures to promote non-SOV travel, the ordinance allows property owners and employers some flexibility in determining which measures best fit their particular circumstances. Measures typically implemented include MBTA pass subsidies of varying levels, reserved parking for carpools, extensive bicycle parking, showers and changing facilities for walk/bike commuters, employee-paid parking, shuttles to the Red, Green, and Orange lines, as well as commuter rail. Some projects have also employed techniques such as providing financial incentives for walking and biking, combining summer picnics with transportation information fairs, offering alternative mode commuters the opportunity to park occasionally, and using car sharing to reduce the need for personal vehicles to run errands or see clients during the day.

If you have any questions, please feel free to contact me. Thank you very much.

---

* A project may have a special permit but no PTDM plan for one of three reasons: 1) It was permitted prior to November 1998; 2) It is residential or 3) It added no new parking.
Cambridge Parking and Transportation Demand Management Plan
Checklist

Please include the following elements in your PTDM Plan. These are general categories, so you will need to develop the detailed descriptions based on the site context and specific land use you are proposing.

☐ Project information
  o Project name
  o Project address
  o Owner
  o Contact person
  o Contact address, phone number, fax number, email
  o Project description
  o Summary table:
    ▪ Number of previously registered parking spaces
    ▪ Number of new parking spaces listed by parking type (categories listed in the Ordinance are: residential, commercial, non-commercial, customer, employee, patient, student, client, or guest)
    ▪ Square footage of building with breakdown of uses
    ▪ Number of vehicle trips expected to be generated by the R&D project (if project is required to complete traffic impact study)
    ▪ Estimated number of employees
    ▪ Census tract number

☐ Employee mode split
  o Each project subject to the Parking and Transportation Demand Management Ordinance is required to commit to a specific, numeric reduction in the percentage of trips made to the site by single-occupant vehicle (SOV). The employee mode split commitment is based on the 1990 Journey to Work data from the U.S. Census Bureau for your Census tract number—a 10% reduction from the 1990 mode split:

  1990 mode split % * 0.90 = mode-split commitment %

  o The final PTDM plan should state this number clearly as the mode split goal for the project, along with a commitment to make reasonable efforts to achieve this goal.

☐ Customer/Visitor/Other mode split
  SOV mode-split commitment for non-employee groups will be determined by other baseline measures.
□ Nearby transit services
  o List all buses and subway lines that serve the site, and their distance from the site.

□ Nearby bicycle and pedestrian links
  o Describe the network of nearby bike/ped facilities and the quality of the surrounding bike/ped environment (ex. broken sidewalks, good connection to Minuteman bike path, etc).

□ Sustainable-mode promotions and incentives
  o Describe what transportation demand management (TDM) measures the project owner will use to reduce the number of SOV trips and encourage people to walk, ride a bike, take transit, and car/vanpool.

□ Parking management and SOV disincentives

□ Marketing programs
  o Describe marketing and education programs that promote and publicize all of the TDM measures that are available.

□ Monitoring and reporting plan
  o Describe the program of surveys, car and bike parking counts, driveway counts, and other reporting documents that will be used to track, assess, and report on the implementation of the entire TDM program.

□ Office of Workforce Development
  o Include the required commitment that the applicant and tenants will work with the Cambridge Office of Workforce Development to encourage hiring Cambridge residents. Susan Walsh of OWD (617-349-6259) can discuss ways to accomplish this. Cambridge residents are more likely to use sustainable modes to travel to work.

□ Corporate Officer Certification

□ Maps/drawings showing:
  o Location of site
  o Location of transit
  o Parking layout (to be approved by TP&T). Show all parking spaces for bicycles and motor vehicles, following zoning requirements and the City of Cambridge Bicycle Parking Guide:

Elk Grove, CA

Introduction

The City of Elk Grove is submitting the start up Transportation Demand Management (TDM) Plan to the Sacramento Area Council of Governments (SACOG). This plan explains the programs that the City of Elk Grove will implement to promote and encourage the use of alternative transportation within the City, reduce single occupant trips to employers within the City and to promote SACOG’s 511 Sacramento Regional Traveler Information Program.

Since the City is seeking to start becoming a Transportation Demand Management Outreach Partner in the middle of the cycle for funding, the City is requesting $12,000 to help start up TDM activities within the City limits and portions of south Sacramento. The City will commit another $12,000 in its own funding to support TDM activities for this fiscal year.

This TDM program is in its infancy and staff will strive to implement the programs that are listed in this start up plan. Some programs may not get implemented until the next Federal Fiscal Year and the City will include those programs in its work plan as well.

The City will perform this voluntary service to its employers and residents. The City does not have any plans to assess any fees or require membership from employers and residents to participate in its TDM programs. The City is modeling its TDM program after the City of Roseville and transit agencies in Washington State. The City has plans to implement a TMA in the future and will strive towards the implementation of one, which would benefit the City and the south Sacramento area.

The TDM program will be managed in the City’s Development Services Department, Transit Services Division. Within this division, the City has employed one full time transit system manager, one full time assistant transit manager, three part time transit service aides and two part time transit surveyors.

Demographics

The City currently has 130,874 residents and is projected to increase at least 7% annually for the next five years. There are also approximately 969 employers employing 21,736 people. The City currently covers an area of 42 square miles, is located 11 miles south of Downtown Sacramento and 11 miles north of the City of Galt.

Background

Currently, the City of Elk Grove does not have a Transportation Management Association (TMA) or a TDM program to promote alternative transportation. The City has adopted the County of Sacramento’s Trip Reduction Ordinance to help promote alternative transportation within the City limits. An update Trip Reduction Ordinance will be developed in the next fiscal year. Elk Grove Promenade, a regional shopping mall is preparing to open in late 2007, early 2008 and as part of the Transportation Systems Management Plan and Environmental Impact Report, the mall in conjunction with the City must implement a TDM/trip reduction program.
Program Summary

Listed below are programs that the City will undertake in the implementation of its TDM Program for fiscal year 2006-2007. The City estimates that 1,200 hours will be spent on TDM activities.

Task # 1 – Hire Part Time Transit Service Aide to focus on TDM Activities

The City will hire a part time person to handle the implementation of the TDM plan. The City will strive to search for a local resident that is familiar with outreach, establishing relationships and is familiar with transportation issues. This person will perform employer outreach, continue to maintain and enhance the existing employer network, participate in TDM Task Force and subcommittee meetings monthly, promote SACOG 511 and regional rideshare program, prepare reports regarding the TDM program, manage the commuter club page, develop a new Citywide Park & Ride, Bike and Trails Map and participate in various alternative transportation related events.

The City is a current member of the Association of Commuter Transportation (ACT) and has been designated as a Best Workplaces for Commuters. The Transit Service Aide will participate in ACT events and continue to encourage alternative transportation options to the City employees and contractors to continue to maintain the Best Workplaces for Commuters designation.

Task # 2 – Implement Emergency Ride Home Program for residents and employees in the City of Elk Grove

Any resident or employee in the City of Elk Grove who uses alternative transportation methods to go to work or school (i.e. riding bus, walking, bicycling, carpooling and vanpooling) will be eligible for the Emergency Ride Home Program. The program will also be extended to e-tran riders that purchase a monthly pass. The City will enter into an agreement with a local taxi cab company and/or with a rental car company to provide the service. This program will only be available for the following emergencies:

- An immediate family member suffers and emergency and you can't wait for your normal ride home.
- A serious problem arises at your child's school or daycare center.
- Your home or property is damaged by burglary, fire, etc.
- You are sick and can't wait for your normal ride home.
- Your ridesharing partner has an emergency and you have no way to get home.
- Unscheduled, approved overtime.

A person would need to register for the program online at www.sacregioncommuterclub.com. Once approved, the registrant will receive a one voucher to use on the taxi and/or rental car. Once the voucher is used, the person would need to send in the pink copy of the voucher and answer the questions on the voucher to receive another one. Only six can be used per person, per calendar year.
Task 3 – Employer Outreach in the City of Elk Grove and South Sacramento Areas

The City will begin employer outreach to all employers in the City of Elk Grove and certain areas of south Sacramento. The outreach will include the following:

- Maintaining the Employer Transportation Network
- Conducting Transportation Fairs
- Distributing 511, Rideshare and Transit Information Citywide
- Developing and Maintaining “Transportation Kiosks” at employers
- Conducting Quarterly Meetings and Training Sessions with Employee Transportation Coordinators (ETC’s)
- Conducting various promotions with ETC’s and employers to encourage the use of alternative transportation
- Signing up employers onto www.sacregioncommuterclub.com
- Distribute the Regional Online Survey to Employers
- Promote the Sacramento Region Best Workplaces for Commuters Program

Task # 4 – Support SACOG Regional Programs

The City will support SACOG regional programs including participating in Bike Commute Month, distributing the 511 brochures (Bike Commuter Guide, Park and Ride Lot Guide, Travelers Information Guide and Rideshare Guide), promote the regional vanpool incentive program, promote the www.sacregion511.org website for ride matching and other travelers information, promote 511 for seeking additional travelers and ridesharing information, seek additional joint park and ride lots for the purposes of riding transit, carpooling and vanpooling, maintain and update www.sacregioncommuterclub.com for zip codes 95615, 95624, 95632, 95638, 95639, 95641, 95693, 95758, 95823, 95829, 95832, participate in the regional online survey and develop campaigns to reduce the use of single occupant vehicles driving along State Route 99 and Interstate 5 from Elk Grove and South Sacramento residents.

Task # 5 – Seek to Form a Transportation Management Association, Develop a New City Trip Reduction Ordinance and Enforcement of the Current Trip Reduction Ordinance

The City will work towards the establishment of a Transportation Management Association (TMA) which may encompass the south Sacramento area and the soon to be develop County Service Area -3 (CSA-3). CSA – 3 has some ongoing funding to develop and implement a trip reduction plan and services for that specific area. The City will work to establish a steering committee to help facilitate the development of a TMA.

In conjunction with developing a TMA, the City will also work to develop a new City Trip Reduction Ordinance that would replace the currently adopted County of Sacramento Trip Reduction Ordinance.

Transit Services staff will continue to work with the Planning Department in the interim to enforce the current trip reduction ordinance. The current trip reduction ordinance
developed by the County of Sacramento requires developers constructing projects that exceed 100,000 square feet to provide various Transportation System Management and Trip Reduction elements, such as hiring an employee transportation coordinator, having alternative transportation information readily available, install bicycle amenities and facilities and developing joint use park and ride lots or providing preferential parking for vanpools and carpools. Transit Services staff will also work with existing projects that had conditions imposed on them to ensure compliance with the current Trip Reduction Ordinance.

**TDM Budget – Fiscal Year 06/07 – Program will begin January 2, 2007- September 30, 2007**

September 14, 2006

STAFF REPORT

APPLICATION RZ/FDP 2004-PR-044

PROVIDENCE DISTRICT

APPLICANT: Tyson Corner Holdings LLC and Tysons Corner Property Holdings LLC

PRESENT ZONING: C-4 – 4.9 acres
C-7 – 73.75 acres
Total – 78.65 acres

REQUESTED ZONING: PDC

OVERLAY DISTRICTS: Highway Corridor (HC) and Sign Control (SC)

PARCELS: 29-4 ((1)) 35A & 35C
39-2 ((1)) 2, 4 & 5

ACREAGE: 78.65 acres

FLOOR AREA RATIO (FAR): 1.76 (Development with Rail Option)
1.10 (Pre-Rail Option without subsequent phases)

OPEN SPACE: 19.4 acres – 25 percent (Development with Rail Option)
15.6 acres – 20 percent (Pre-Rail Option)

PLAN MAP: Mixed Use
PROPOSAL:  

*Development with Rail Option* – Redevelop the Tysons Corner Center as a 6,013,035 sq. ft. Transit Oriented Mixed-use Development consisting of 2,474,135 sq. ft. in the existing Regional Mall; 1,389,438 sq. ft. Office Development in Four Buildings; 266,513 sq. ft. in a Hotel (up to 300 rooms); 1,685,275 sq. ft. Residential Development yielding 950 to 1345 Multi-family Dwelling Units in Four Buildings; and, 197,674 sq. ft. of new Retail-type Commercial phased to the Future Extension of Metrorail through the Tysons Corner Urban Center.

*Development Prior to Rail Option* – In addition to the existing Regional Mall, permit an additional 490,076 sq. ft. Office, 266,513 Hotel and 480,875 sq. ft. Residential (up to 340 Multi-family Dwelling Units) prior to the Future Extension of Metrorail should that project be delayed.

STAFF RECOMMENDATIONS:

Staff recommends approval of RZ 2004-PR-044 subject to the execution of proffers consistent with the draft proffers contained in Appendix 1 and approval of the Conceptual Development Plan.

Staff also recommends approval of the following requested waivers and modifications:

- Waiver of the service drive requirement along Leesburg Pike (Rt. 7) and Chain Bridge Road (Rt. 123)
- Modification of the minimum 8-foot planting width for trees per Sect. 12-0702(2) of the Public Facilities Manual (PFM) to allow the planting areas that are less than 8 feet wide
- Waiver of the barrier requirement along the eastern boundary (adjacent to the Capital Beltway)
- Modification of the transitional screening yard requirements along the eastern boundary (adjacent to the Capital Beltway)
- Modification of the peripheral parking lot landscaping requirement for the parking structures located adjacent to Chain Bridge Road
- Waiver of the transitional screening yard and barrier requirements internal to the project
- Waiver of the interior parking lot landscaping requirements for the existing parking structures identified as Parking Terrace B, Parking Terrace C and Parking Terrace E
- Waiver to allow the use of underground stormwater management facilities with residential development pursuant to Par. 6-0303.8 of the PFM (see the report prepared by the Site Review Division, DPWES in Appendix 7)
- Approval by the Board of Supervisors pursuant to Sect. 2-414 of the Zoning Ordinance to allow a commercial building within 75 feet of the right-of-way of an interstate highway (the Capital Beltway – I-495)
• Modification to allow the pedestrian pathways shown on the CDP/FDP (sidewalks, the 25 foot wide sidewalk within the bus plaza and an internal loop trail) to meet the requirement for a trail along Chain Bridge Road west of Tysons Boulevard (With Rail CDP/FDP only)
• Waiver of the trail requirement along Chain Bridge Road between the site entrance opposite Tysons Boulevard and the ramp for the Capital Beltway
• Modification of the trail along Leesburg Pike to allow combined sidewalk/trail that is consistent with the streetscape recommendations for the Tysons Corner Urban Center
• Waiver of the trail requirement within the right-of-way of the Beltway
• Modification of the recommended on-road bike trail on ShopsTysons Boulevard to allow a ten foot wide off-road bike trail
• Modification of the number of loading spaces required on site

Staff further recommends that the Final Development Plan be approved by the Planning Commission subject to the approval of the rezoning by the Board of Supervisors.

It should be noted that the main/trunk sewer lines serving this property may be inadequate. Should the Board approve this application, that approval does not guarantee that sewer capacity will be available to serve this site, at such time as the applicant elects to develop the property.

It should be noted that it is not the intent of staff to recommend that the Board, in adopting any conditions proffered by the owner, relieve the applicant/owner from compliance with the provisions of any applicable ordinances, regulations, or adopted standards.

It should be further noted that the content of this report reflects the analysis and recommendation of staff; it does not reflect the position of the Board of Supervisors.

For information, contact the Zoning Evaluation Division, Department of Planning and Zoning, 12055 Government Center Parkway, Suite 801, Fairfax, Virginia 22035-5505, (703) 324-1290.
DESCRIPTION OF THE APPLICATION

The applicant, the owner of the existing approximately 2.5 million sq. ft. super-regional mall, known as the Tysons Corner Center, is proposing to redevelop the mall property as a mixed-use development by adding new uses along the periphery of the existing mall building. The applicant has proposed a transit-oriented mixed use project in four phases that will add four office buildings, four high-rise residential buildings, a hotel and retail-type commercial uses to the property. The proposed development is oriented toward the planned future Metrorail station to be located at the intersection of Chain Bridge Road (Rt. 123) and Tysons Boulevard. The applicant has filed a rezoning application to rezone 78.65 acres currently zoned C-4 (4.9 acres) and C-7 (73.75 acres) to the PDC (Planned Development – Commercial) District. Portions of the application property are also located in the Highway Corridor (HC) and the Sign Control (SC) Overlay Districts.
The applicant has filed two alternative Conceptual/Final Development Plans. One, Development with Rail ("Rail CDP/FDP"), is phased to future rail service to Tysons Corner. The draft proffers state that the first phase of the Rail CDP/FDP could be implemented upon the finalization of a financing agreement for the proposed extension of Metrorail through the Tysons Corner Urban Center. Development of the subsequent phases, Phases 2 through 4, is tied to the actual construction and operation of the rail project.

The proposed development program for the Rail CDP/FDP is summarized in the following chart.

<table>
<thead>
<tr>
<th>TYSONS CORNER CENTER – WITH RAIL CDP/FDP</th>
<th>Gross Floor Area (GFA) In Square Feet</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Existing 2,474,135²</td>
</tr>
<tr>
<td></td>
<td>Main Mall Building 2,474,135³</td>
</tr>
<tr>
<td></td>
<td>Residential¹ 791,331³</td>
</tr>
<tr>
<td></td>
<td>Office 551,638</td>
</tr>
<tr>
<td></td>
<td>Hotel² 266,513</td>
</tr>
<tr>
<td></td>
<td>Retail Type Commercial 25,274</td>
</tr>
<tr>
<td></td>
<td>Total Phase in 1,342,700</td>
</tr>
<tr>
<td>Phase 1</td>
<td>499,275</td>
</tr>
<tr>
<td>Phase 2</td>
<td>518,000</td>
</tr>
<tr>
<td>Phase 3</td>
<td>298,000</td>
</tr>
<tr>
<td>Phase 4</td>
<td>320,000</td>
</tr>
<tr>
<td>Totals</td>
<td>2,474,135³</td>
</tr>
</tbody>
</table>

1) The total number of dwelling units is a range of 950 to 1345 dwelling units.
2) The hotel is to have a maximum of 300 rooms.
3) The GFA for the existing mall building includes a planned but un-built addition to the existing Macy’s building of up to 75,000 sq. ft. allowed under the current zoning envelope. It does not include the strip shopping center building (42,922 sq. ft.) near Chain Bridge Road that currently contains Circuit City, which is proposed to be demolished. Site Plan approval for 47,578 sq. ft. of the 75,000 sq. ft. addition to the Macy’s building noted above is pending.
4) Phase 2 also includes a 10,000 sq. ft. transit pavilion not included in this chart.
5) The Rail CDP/FDP includes an option to allocate an additional 50,000 sq. ft. within Phases 3 and/or 4. This additional gross floor area is included in the total residential GFA for residential and in the total GFA for the project.

The second, Development Prior to Rail ("Pre-rail CDP/FDP"), addresses the limited possibility that the planned extension of Metrorail service through Tysons Corner does not go forward, or does not do so on the current schedule. The Pre-rail CDP/FDP proposes three buildings, an office building, a high rise residential building and a hotel in the location of Phase 1 of the Rail CDP/FDP. After the Pre-rail CDP/FDP is developed, once a rail project is funded, constructed and in operation through Tysons Corner, the draft proffers would allow the phases 2, 3 and 4, respectively of the Rail CDP/FDP to proceed.

The Pre-rail CDP/FDP would allow the applicant to construct a mix of uses not allowed under the current C-4 and C-7 zoning, and also would limit the additional Gross Floor Area (GFA) to the amount of GFA allowed but un-constructed under by the current zoning. The Pre-rail CDP/FDP includes: the existing mall building – 2,474,135 sq. ft.,
residential – 480,875 sq. ft. (up to 340 multi-family dwelling units), office – 490,076 sq. ft., hotel – 266,513 sq. ft. (300 rooms) and 25,274 sq. ft. of retail-type commercial uses.

Pre-rail CDP/FDP

Waivers and Modifications

The following waivers and modifications are requested with both scenarios.

- Waiver of the service drive requirement along Leesburg Pike (Rt. 7) and Chain Bridge Road (Rt. 123)
- Modification of the minimum 8-foot planting width for trees per Sect. 12-0702(2) of the Public Facilities Manual (PFM) to allow the planting areas that are less than 8 feet wide
- Waiver of the barrier requirement along the eastern boundary (adjacent to the Capital Beltway)
- Modification of the transitional screening yard requirements along the eastern boundary (adjacent to the Capital Beltway)
- Modification of the peripheral parking lot landscaping requirement for the parking structures located adjacent to Chain Bridge Road
• Waiver of the transitional screening yard and barrier requirements internal to the project
• Waiver of the interior parking lot landscaping requirements for the existing parking structures identified as Parking Terrace B, Parking Terrace C and Parking Terrace E
• Waiver to allow the use of underground stormwater management facilities with residential development pursuant to Par. 6-0303.8 of the PFM (see the report prepared by the Site Review Division, DPWES in Appendix 7)
• Approval by the Board of Supervisors pursuant to Sect. 2-414 of the Zoning Ordinance to allow a commercial building within 75 feet of the right-of-way of an interstate highway (the Capital Beltway – I-495)
• Modification to allow the pedestrian pathways shown on the CDP/FDP (sidewalks, the 25 foot wide sidewalk within the bus depot and an internal loop trail) to meet the requirement for a trail along Chain Bridge Road west of Tysons Boulevard (with rail CDP/FDP only)
• Waiver of the trail requirement along Chain Bridge Road between the site entrance opposite Tysons Boulevard and the ramp for the Capital Beltway
• Modification of the trail along Leesburg Pike to allow combined sidewalk/trail that is consistent with the streetscape recommendations for the Tysons Corner Urban Center
• Modification of the recommended on-road bike trail on ShopsTysons Boulevard to allow a ten foot wide off-road bike trail
• Modification of the number of loading spaces required on site.
• Waiver of the trail requirement within the right-of-way of the Beltway

Reduced copies of the two proposed combined Conceptual/Final Development Plans are included in the front of this report. The Rail CDP/FDP is presented first and the Pre-rail CDP/FDP is second. The applicant’s draft proffers are included as Appendix 1. The applicant’s affidavit is Appendix 2 and the applicant’s statements regarding the application are included in Appendix 3.

An application for a Planned Development District, such as the PDC District is subject to the General Standards and the Design Standards found in Part 1 of Article 16, Development Plans. The most relevant standards are contained in Appendix 15: Selected Excerpts from the Zoning Ordinance.

LOCATION AND CHARACTER (See Graphic on page 6)

The 78.65 acre application property is the major portion of the 102-acre area bounded by the Capital Beltway (I-495) on the east, Chain Bridge Road (Rt. 123) on the north, International Drive (Rt. 6034) on the west and Leesburg Pike (Rt. 7) on the south. (This area is also identified in the Comprehensive Plan as Land Unit P of the Tysons Corner Urban Center). The properties located along Towers Crescent Drive and the office building at 8116 Leesburg Pike are also located within the area bounded by the above noted roads and are also within Land Unit P. The application property is currently developed with the approximately 2.5 million square foot Tysons Corner Center mall. Access to the property is
from Chain Bridge Road, International Drive and Leesburg Pike; I-495 is a limited access facility. The following chart addresses the surrounding area; additional description regarding the surrounding development is provided following the chart.

¹ Towers Crescent is also located east of the southern wing of the property that extend to Leesburg Pike.

**Metrorail Station:** The planned Tysons Central 123 Transit Station is to be located on the northern side of Chain Bridge Road. The current plans for the Metrorail extension through Tysons Corner show the rail line to be elevated at this station, although an underground alternative is under study. The pedestrian entrance to the station is to be located in the northwestern quadrant of the intersection of Tysons Boulevard and Chain Bridge Road. The plans for the Metrorail extension include a pedestrian bridge over Chain Bridge Road to the application property, and a bus transfer area on the application property.

Tysons II: Tysons II is a mixed use project that covers approximately 106 acres located north of Chain Bridge Road, across from the application property. Current development within Tysons II includes office buildings, the mall known as the Galleria/Tysons II, and a hotel. In 2003, pursuant to the approval of PCA 84-D-049-5, the development permitted within Tysons II was increased to reflect the rail-related intensities and land uses contained in the adopted Comprehensive Plan. The accepted proffers for Tysons II allow the rail related development to proceed only if the Full Funding Grant Agreement is finalized for the extension of rail.

Tysons II is divided into four land bays. The two land bays, Land Bay II and Land Bay IV, immediately across Chain Bridge Road from the application property, are undeveloped at this time. Approximately 1.6 million square feet of office space in four buildings up to 26 stories in height were approved in Land Bay II, with an option to convert
one of the buildings to a hotel. Approximately 725,000 square feet of high rise multi-family residential was approved in Land Bay IV.

Other Development to the North: There are two service stations located on the south side of Chain Bridge Road and east of its intersection with International Drive that are not part of the application property. These properties are accessed from Chain Bridge Road and from a service road located on the southern side of the service stations.

East

Capital Beltway: The eastern boundary is largely formed by the Capital Beltway (1-495) which is a ten-lane divided, limited access facility that is shown on the Transportation Plan to be widened to 12 lanes. High-occupancy vehicles lanes (HOV) are also included on the Plan, and there is a proposal under consideration by VDOT for the construction of high-occupancy toll (HOT) lanes. Two high rise multi-family residential projects, the Encore and the Regency, are located across the Capital Beltway from the application property.

South

Towers Crescent: The Towers Crescent development is located to the east and south of the application property where the property does not abut the Capital Beltway or Leesburg Pike. Towers Crescent is zoned C-4. It is approved pursuant to RZ 1998-PR-058 for development of seven office buildings, with a total of 1.33 million square feet of office, including retail uses on the lower levels, at 1.71 FAR. The Towers Crescent property is approximately 30 feet above the grade of the portion of the application property that is adjacent to it. Of the seven office buildings, three have been constructed. The office buildings adjacent to the mall property are either constructed or are to be constructed on top of a five level parking facility, increasing the difference in grade between the two properties.

In order to provide a pedestrian connection between these two main components of Land Unit P, the accepted proffers for RZ 1998-PR-058 include a commitment to create a plaza, with stairs and an elevator down to the level of Fashion Boulevard in the northwest corner of Towers Crescent, which is in the vicinity of the southeast corner of the Nordstrom's building in the Tysons Corner Center. This commitment is phased to occur with the construction of Building F within the Towers Crescent development. The proffers also include a commitment to cooperate with the owners of the Tysons Corner Center with regard to the construction of a pedestrian bridge across the mall ring road to connect to the mall's parking structure, identified as Parking Terrace C on the CDP/FDP submitted by this applicant. A proffered condition amendment has been submitted by the owner of Towers Crescent to convert the un-built area to multi-family residential buildings. The application has been accepted and is scheduled for a public hearing before the Planning Commission on ---.

Across Leesburg Pike: The area across Leesburg Pike from the application property includes Fairfax Square, a mixed use development that includes offices, with ground floor retail, and a movie theater. Some small retail properties are located to the west of Fairfax Square. Access to Fairfax Square is located at the traffic signal that also controls the
intersection of Fashion Boulevard and Leesburg Pike. The smaller retail properties include a service station, two fast food restaurants and a jewelry store. There is a service drive in front of this block, which is located between Aline Drive and Old Gallows Road.

West

The western boundary is formed by International Drive, a six-lane divided facility with turn lanes. There are two access points to the application property from International Drive. One is located opposite Fletcher Street and the second is opposite the entrance to the Crate and Barrel store located at the intersection of International Drive and Chain Bridge Road. The portion of the application property located adjacent to International Drive is developed with a parking garage, Parking Structure D. The site’s frontage on International Drive does not include a sidewalk. The area across International Drive from the mall is identified in the Comprehensive Plan as Land Unit O.

The initial zoning approval for a regional shopping center at this location occurred in 1962; the mall opened for business in the late 1960s. Subsequently, the mall was expanded several times, by converting the former truck tunnel under the mall to a second, lower level of shops, by adding anchor stores such as Nordstrom’s and Lord & Taylor’s, through the construction of parking garages around the perimeter of the mall building, and other small expansions to the mall building. The latest expansion of approximately 310,000 square feet replaced the former department store space on the easternmost end of the mall building and opened in 2005. The existing conditions on site are shown on Sheets 62 and 63 of the Rail CDP/FDP. A site plan, 006399-SP-015-2 is pending bonding approval to allow an expansion of the Macy’s building on the westernmost end of the mall building. The existing zoning allows an expansion to the Macy’s building of up to 75,000 sq. ft. Currently, there are no proffers that govern the Tysons Corner Center property.

Signage

In addition to signs that are otherwise permitted by Article 12, Signs, of the Zoning Ordinance, signs not otherwise allowed by the Zoning Ordinance have been approved for the site pursuant to the provisions of Par. 2 of Sect. 12-304. This paragraph allows the
Board of Zoning Appeals to grant a special permit to allow additional sign area, additional sign height, or a different arrangement of sign distribution for a regional or super-regional shopping center. With the approval of SPA 89-P-034 on May 18, 2005, two previous special permits addressing individual signs (SP 88-P-006 and SP 89-P-034) were consolidated into one approval affecting the whole shopping center, including the recent addition noted above. The approved special permit amendment included two sign plans. One addressed wayfinding signage that exceed the size normally permitted (2 sq. ft.) consisting of three types of signs – pole mounted signs that are 7.5 sq. ft. in size and two sizes of pylon signs, 23 sq. ft. and 39 sq. ft. The second addressed signs located on the shopping center building that exceed the 200 sq. ft. maximum area permitted for an individual sign area which identify Tysons Corner Center, the major anchor stores and the new multi-plex theater signs and any signs that are located on the façade of a parking garage that identify the shopping center and individual stores, which would not otherwise be permitted. The records regarding these applications are on file with the Department of Planning and Zoning.

The two existing free-standing signs at the main entrances to Tysons Corner Center, one located on Leesburg Pike and the other on Chain Bridge Road, exceed the current limitations on the size of free-standing signs (they are 569 sq. ft. in sign area each – 40 sq. ft. is permitted in a Sign Control Overlay District). These signs were installed pursuant to permits issued prior to the adoption of the current provisions related to signs contained in Article 12, Signs, and are grandfathered. However, some of the road improvements included in the draft proffers would require that these signs be relocated. The applicant has filed a comprehensive sign plan application to allow these signs to be relocated and to incorporate the signage approved pursuant the last special permit amendment. The application states that the proposed signs would be 556 sq. ft. in sign area and 34 feet tall. This application, CSP 2004-PR-044, is scheduled for a public hearing before the Planning Commission on January 18, 2007.

Parking Reduction

On July 21, 2003, the Board of Supervisors approved a parking reduction for the Tysons Corner Center. This approval was amended September 12, 2005, to allow a minimum of 10,300 parking spaces as the required parking for the Tysons Corner Center (see Appendix 4). The amended parking reduction was approved based on the parking accumulation pattern for the expanded mall building, including the new multi-plex movie theater and the existing 60,000 sq. ft. of office that is part of the mall building. The parking reduction included development conditions that allowed for the expansion of the Macy’s building and some changes of uses within the mall without requiring that the parking reduction be amended when “it is determined by the Director that those increases do not affect the parking accumulation associated with the parking reduction.”

Dulles Corridor Metrorail Expansion

The Dulles Corridor Metrorail project, an extension of the Metrorail system through Tysons Corner to the Dulles International Airport (IAD) and Loudoun County, is proposed currently to be constructed in two phases (see graphic below). Phase I will start from the
Orange Line between the East Falls Church Station and the West Falls Church Station and will generally follow the Dulles Airport Access Road (DAAR) to Chain Bridge Road (Rt. 123); from there, the extension will go through the Tysons Corner Urban Center, first along Rt. 123 and then along Rt. 7 before returning back to the DAAR. Four stations are proposed within Tysons Corner: two stations on Chain Bridge Road (Rt. 123): Tysons East Station and Tysons Central – Rt. 123 Station; and two stations along Leesburg Pike (Rt. 7): Tysons Central – Rt. 7 and Tysons West Station. A station at Wiehle Avenue and the DAAR will be the terminus for Phase I. Phase I construction is anticipated between 2007 and 2012, with revenue operations expected to commence in mid to late 2012. Fairfax Connector and Metrobus service is expected to be adjusted to serve the stations and 2,300 parking spaces will be available at the Wiehle Avenue station; commuter parking will not be provided within Tysons Corner.

Phase II of the Metrorail extension will include three additional stations along the DAAR within Fairfax County at Reston Parkway, Herndon/Monroe and Rt. 28. Another station will be located at the main terminal of Dulles International Airport and two stations will be located along the DAAR in Loudoun County. Phase II construction is anticipated to occur between 2008 and 2012. Phase II Metrorail service may begin operations in 2013.
The project has recently completed Preliminary Engineering for Phase I. An application has been submitted to the Federal Transit Administration (FTA) to commence Final Design for Phase I. The project anticipates submitting an application for a Full Funding Grant Agreement (FFGA) for Phase I to the FTA in early 2007, with execution of the FFGA in late spring of 2007. The execution of the FFGA will ensure that funding is available for construction. In addition, the Governor of Virginia and the Metropolitan Washington Airports Authority (MWAA) are finalizing an agreement for MWAA to takeover completion of the Metrorail Extension through the Dulles Corridor.

Tysons Corner Study

The current Comprehensive Plan provides a vision for substantial change in the Tysons Corner Urban Center so that it will become more pedestrian and transit oriented. The current Comprehensive Plan recommendations for the Tysons Corner Urban Center contain numerous objectives including to:

- Create an improved sense of place and function,
- Create centralized areas of relatively more intense development,
- Encourage development of additional housing, including affordable units,
- Encourage mixed-use development,
- Develop a cohesive pedestrian system, and
- Develop mass transit options as well as other transportation strategies.

On March 21, 2005, the Board of Supervisors established the Tysons Coordinating Committee to work with staff on a special study to evaluate and review the rail related land use recommendations of the current Comprehensive Plan for the Tysons Corner Urban Center. On May 23, 2005, the Tysons Coordinating Committee’s role was clarified and its membership was expanded by the Board of Supervisors. The Tysons Coordinating Committee’s mission is to formulate Plan revisions that will: promote mixed use, facilitate transit-oriented development, enhance pedestrian connections throughout Tysons, increase the residential component of the density mix, improve the functionality of the area, and provide for amenities and aesthetics such as public spaces, art and parks.

COMPREHENSIVE PLAN PROVISIONS (Appendix 5)

Plan Area: II
Planning District: Tysons Corner Urban Center
Land Unit: Land Unit P, Sub-unit P-1

The pending application for the redevelopment of the Tysons Corner Center from a regional mall to a mixed use transit-oriented development has been filed pursuant to the current Comprehensive Plan recommendations.

The Comprehensive Plan provides the following guidance on the land use and the intensity/density for the property. In the Fairfax County Comprehensive Plan, 2003 Edition,
Area II, Tysons Corner Urban Center, as amended through January 27, 2003, Land Unit Recommendations, Land Unit P, Sub-unit P1, pages 135-137 state:

“Land Unit P is comprised of about 107 acres, bounded by Route 123 on the north, the Capital Beltway on the east, Route 7 on the south and International Drive on the west. Existing development is predominantly retail and office use, including Tysons Corner Center, the region's first super-regional mall which draws thousands of shoppers from the metropolitan area and beyond. The land unit also contains a hotel and Tycon Tower, the largest office building in Tysons Corner.

Land Unit P comprises the majority of the Tysons I Activity Center in the Core, the largest activity center with about 130 acres. The land unit includes Tysons Corner Center (a super-regional mall), an office development, a hotel, and some community retail uses. Because properties in the area were developed individually over time, the existing uses function as separate entities. The vision for the entire Activity Center (including Land Units P and O) is to use redevelopment as an opportunity to interconnect all portions of the Activity Center with the dominant element, the shopping mall. The purpose is to create a mixed-use area that integrates all components: regional retail, office, hotel, community retail, as well as possible future convention facilities and housing. In the event rail is extended through Tysons Corner, a rail station might be planned in proximity to Land Unit P.

A major plaza should be provided within this Activity Center that is large enough for open-air activities such as musical performances by small groups before a lunchtime audience. A variety of benches, low walls and/or steps would provide abundant seating. Public art is encouraged to make the space appealing and attractive. Landscaping should be provided that is attractive in all seasons and shades the seating in the summer. Water features such as fountains and pools are encouraged because of their cooling effect in hot weather. When new development or redevelopment is considered in a development proposal within this land unit, the appropriateness of providing a major plaza should be evaluated as part of the development proposal's urban design analysis.

Circulation improvements for this land unit should occur only if development intensifies on the Tysons Corner Shopping Center site. Improvements to the private road that is part of the Tysons Corner Loop Road at the eastern edge of the property should be made, if feasible, including limiting access points from parking lots to the road.

Guidance for evaluating development proposals for this land unit is contained in the Area-wide Recommendations, the Land Unit Recommendations and the Development Review Guidelines Sections of the Plan. Specific Guidance for uses and intensities as envisioned in the Plan are provided in the sub-unit text below. Achieving planned intensity is predicated
upon successfully incorporating these recommendations and guidelines into development proposals. In addition, urban design and transportation guidelines are set forth in the Development Review Guidelines Section.

**SUB-UNIT P-1**

Sub-unit P-1 is planned for retail, office, hotel, support retail and service uses up to 0.8 FAR. Also encouraged are public/semi-public uses, a conference center and/or convention center, as well as flexibility to include recreational uses. The existing super-regional shopping center, Tysons Corner Center, is a significant component of Tysons Corner which should be encouraged to expand, modify and diversify its structures and uses as appropriate in order to remain a vital component of the metropolitan area’s retail sector.

![FIGURE 35](image)

**LAND UNIT P**

**TYSONS CORNER URBAN CENTER**

**Option Without Rail**

As an option, the sub-unit is appropriate to intensify as a mixed-use development with office, hotel, retail, support retail and service uses (such as daycare) up to 1.2 FAR (for all nonresidential uses). In any development proposal submitted under this option, planned nonresidential intensity can be
replaced by residential use as provided under the Alternative Land Use Guidelines in the Area-wide Recommendation section. Also encouraged are public/semi-public uses, a convention center and/or conference center, as well as flexibility to include recreational uses.

Under this option, this area offers significant opportunities to provide urban design amenities which could better integrate development in this land unit. Development proposals should show how new development will integrate with surrounding areas through the provision of pedestrian linkages and urban design amenities. The portion of the private road that is part of the Tysons Corner Loop Road in this sub-unit should be improved by limiting the number of access points from adjacent parking lots on the shopping center site, if feasible, when significant intensification occurs adjacent to this private road. (See Area-wide Recommendations, Transportation, for Collector Roads.)

Option with Rail

If a rapid rail station site is selected and programmed for design and construction in proximity to this sub-unit, mixed-use development with an intensity (for all nonresidential uses) up to 2.0 FAR is appropriate for the area within 1,000 feet of the station platform. Sites between 1,000 and 1,600 feet of the station platform are appropriate for mixed-use development with intensities (for all nonresidential uses) between 1.2 and 1.65 FAR. Compatible transitions of height, bulk and intensity to adjacent development should be considered within the 1,600 feet area. In any development proposal submitted under this option, planned nonresidential intensity can be replaced by residential use as provided under the Alternative Land Use Guidelines in the Area-wide Recommendations section.

Height Limit: Up to 270 feet located near Route 123, but not exceeding 150 feet adjacent to Land Unit O and along Route 7. On the east side of the mall, buildings facing across the Capital Beltway (I-495) to the Regency or Encore Apartments should be oriented so that the longest dimensions of the buildings do not parallel I-495. No building on the east side of the mall should exceed the height of the Tycon Towers office building (at 205 feet) or otherwise undermine the character of that building as a gateway to Tysons Corner. A variety of building heights should be provided with buildings adjacent to Route 123 at or near the greatest height in order to provide a major focal point for the core area. Building heights at or near the top of the limit can be achieved if the result is more usable open space, improved pedestrian circulation and urban design amenities. If a rapid rail station site is located in proximity to this Sub-unit, maximum building heights within 1,600 feet of the station platform may increase up to 30%. All transit related height increases should be consistent with the Building Height Guidelines and the resultant height should not adversely impact the character and development of adjacent and nearby lands or neighborhoods. (See the Building Heights Map, Figure 10, and Building Heights Guidelines)."
The Comprehensive Plan Map shows this property to be planned for Mixed Use. Plan Citations from the Area Wide Recommendations are included as part of Appendix 5 attached at the back of this report.

CONCEPTUAL/FINAL DEVELOPMENT PLANS (Reductions at front of staff report)

As noted above, the applicant has submitted a two part CDP/FDP one that is identified by this report as the Rail CDP/FDP; and, other as the Pre-rail CDP/FDP.

Description of the Rail CDP/FDP

Title of CDP/FDP: Tysons Corner Center (Development with Rail Option)
Prepared By: Patton Harris Rust & Associates
Original and Revision Dates: November 15, 2004 as revised through September 1, 2006

The following describes the Rail CDP/FDP in five parts: a general description followed by detailed descriptions of each of the four phases.

Description of Project

The redevelopment of the Tysons Corner Center from an automobile oriented regional shopping center to a mixed-use transit oriented development is based on the addition of several urban design and land use elements. These include: 1) adding new residential and office uses, that are in proportion to the existing retail uses; 2) focusing the development near the future rail station; 3) providing enhanced pedestrian connections to the future rail station, within and through the approximately 78.65 acre application property, and to adjacent properties; 4) integrating useable open space into the new development through plazas and park spaces; and, 5) adding retail-type commercial uses required by residents and office tenants to the site. These changes are proposed to occur while retaining the existing mall, allowing the mall to operate during the redevelopment of the property, and allowing it to continue to function as the successful major draw to the application property it is currently.

The proposed development will occur in four phases, located at various locations around the periphery of the mall building application property, as illustrated on page 1 of this report. The draft proffers commit that the phases would not be constructed until certain events associated with the implementation of the future rail project occur. Phase 1 can be constructed only after funding for the rail project is assured, and an agreement is executed between the rail project team and the applicant with regard to coordination of the two projects. Phase 2 may be constructed only after construction of the rail project has commenced. The third phase may be constructed when the rail project through Tysons Corner is in operation, and the fourth phase may be constructed when the rail project has been operating for two years. The third and fourth Phases may be reversed in their order of development.
The existing approximately 2.5 million square foot mall building and the general pattern of the private roads around the site will remain largely unchanged. The proposed development is concentrated near the future Metrorail Station, as demonstrated by the following chart, which shows that Phases 1 and 2 include over 70 percent of the proposed development.

</table>

**Rail Orientation:** As described above and illustrated in the plan view of the pedestrian elements of the Rail CDP/FDP on Page 17, the proposed development is oriented towards the proposed rail station at the intersection of Tysons Boulevard and Chain Bridge Road. Chain Bridge Road in this area is an eight-lane road, with dual left turn lanes and right-turn lanes, for a total of a fourteen lane section. Additionally, the ramps to and from the Capital Beltway end and/or begin near the intersection of Tysons Boulevard/Chain Bridge Road/Tysons Corner Center entrance. Given this circumstance, the pedestrian environment at the street level is adversely affected by the number of lanes, the number of turning movements, the volume of vehicles and the speeds the vehicles are traveling. Therefore, the plans for the rail project include a bridge over Chain Bridge Road to provide a safe crossing for pedestrians to move between the station and Tysons Corner Center. However, the rail project’s alignment of the bridge reflects the existing development at Tysons Corner Center; the Rail CDP/FDP proposes to relocate the on-site landing of the bridge closer to the entrance road. The relocated bridge would connect to the application property at a multi-level entrance pavilion to be constructed by the applicant in the northeastern corner of Phase 2. The realignment of the pedestrian bridge has been discussed with the project team and is to be addressed by the agreement with the rail project team that is referenced in the draft proffers.

**Pedestrian Access:** The upper level of the mall is above grade at the northern end of the site and essentially at grade at the southern end of the site. The Rail CDP/FDP provides a two tiered pedestrian circulation system to connect the various portions of the property; this consists of elevated connections primarily in the northern portions of the site, and a street level system. These two levels of pedestrian circulation are connected both visually and physically. The visual connections include the entrance pavilion, a water feature near the Chain Bridge Road entrance that consists of a waterfall cascading down steps from one of the new elevated plazas to the street level and a staircase in front of the office building in Phase 2. Physical connections
include the staircases, elevators that connect the pedestrian level to the parking under the buildings, and the elevator and escalators in the entrance pavilion.

The Rail CDP/FDP provides a continuous elevated pedestrian pathway from the rail station to the existing shopping center, as well as to Phases 1 and 2 of the proposed development. The pedestrian bridge that will connect to the rail station over Chain Bridge Road is at approximately the same elevation as the upper level of the mall. A second elevated walkway connects this bridge to Phase 1. This elevated system has been designed to physically separate pedestrians from the main vehicular travelways at the entrance to the site, so as to provide a safe and attractive means of walking to and around the site. In addition, an elevated connection will be provided between the site and the adjacent Towers Crescent development. Furthermore, the applicant has committed to keep the mall open to pedestrian traffic at least one hour before and after the operating hours of metro. As such, the mall itself becomes part of the site’s comprehensive pedestrian system. The second tier of the pedestrian network consists of the street level sidewalks, which occur internal to the site, as part of the larger streetscapes at the peripheries of the site, and as connections to off-site properties. The two levels of the pedestrian network merge at the southern end of the mall. Sheets 9 (illustrated below) and 10 of the CDP/FDP depict the pedestrian network.
The street level pedestrian network also includes the trail links through the site including the bike path along the eastern boundary and across the Westpark Drive bridge; the missing links along the site’s frontage on International Drive; trail connections to the future bus depot; and a loop trail to provide a continuous loop trail for the future residents and office tenants.

Integration with Adjacent Properties: The draft proffers and the Rail CDP/FDP include enhanced pedestrian connections to adjacent properties, as follows. The connection across Chain Bridge Road will be enhanced by the widening of the Westpark Drive Bridge to include sidewalks on both sides of the road, and an additional on-road bike lane, and by the pedestrian bridge to the rail station. Along International Drive, the proffers include a commitment to provide an interim sidewalk on the site’s frontage where there is no sidewalk currently, and to provide an urban streetscape, a pedestrian signal and an enhanced crosswalk at the Fletcher Street intersection with Phase 4, when that phase is constructed. As part of Phase 3, an urban streetscape is to be created along Leesburg Pike, with connections from that sidewalk into the site. As discussed previously, the applicant has also proffered to participate in the construction of an elevated pedestrian bridge between the mall property and the Towers Crescent property. The draft proffers also provide for the possibility of an alternative location for that connection provided that the two property owners agree on a mutual proposal to submit for review and approval by the County.

Parking: The redevelopment of this property to a mixed-use transit-oriented development will displace some of the existing parking. The displaced parking and the new parking required for the new uses will be provided within new parking structures constructed with Phases 1, 2 and 3, and with the expansion of the Parking Terrace A, located adjacent to International Drive, and parking underneath the residential building in Phase 4. The construction of new parking will be staged so as to ensure that adequate parking is provided for all uses prior to the demolition of existing parking spaces. This is illustrated by the parking tabs and other information on Sheet 3 of the CDP/FDP.

The two existing parking terraces located adjacent to the new wing of the mall building, Parking Terraces C and E, and Parking Terrace B, located adjacent to Leesburg Pike, will be retained. The parking for Phase 1 will be located under the new buildings and the elevated plaza level, with seven levels below grade and 2 above ShopTysons Boulevard. Prior to the demolition of Parking Terrace D (where Phase 2 is proposed), Parking Terrace A, located adjacent to International Drive, will be expanded by adding five levels on top of the existing four levels. Parking for Phase 2 will be located under the elevated plaza for that phase, with three levels generally above grade and six levels below grade. Six underground levels of parking are proposed under the portion of Phase 3 to be located adjacent to the mall building. Most of the parking for Phase 4 will have been constructed with the expansion of Parking Terrace A; however, two levels of underground parking will be constructed under the residential building to serve that use.

Plazas and Active Recreation Facilities: As noted above, one of the major benefits associated with the conversion of the site to a mixed use, transit oriented
development is the provision of useable outdoor spaces. Within each of the Phases, the Rail CDP/FDP includes plazas that will contain public amenities such as outdoor gathering and seating areas, fountains, public art, private and public recreation areas, and what are described as “animated façade areas”. The animated façade areas are illustrated on the CDP/FDP and further described in the draft proffers as areas along the new buildings and the existing mall building that are designed to provide visual interest to passing motorists and pedestrians by including entrances into an individual establishment and/or windows that provide views into the retail spaces. Animated façade areas are also located at the lower level of the residential buildings in Phases 3 and 4, along Leesburg Pike and along International Drive. Illustrations of animated façade areas are included with the illustrative graphics provided for Phases 1, 2 and 4 in the CDP/FDP.

The plazas and animated façade areas in Phases 1 and 2 are generally placed along the main elevated pedestrian pathways; the Phase 2 plaza is located one story above those pathways. The main plaza in Phase 3 is a “Community Green” located at street level that includes a water feature. Phase 4 contains a large public plaza, the Sky Terrace, to be constructed on top of the parking garage. The Sky Terrace is shown with a restaurant, an outdoor performance area, a children’s play area and gardens. A dog park is proposed at one of the entrances to the site from International Drive. The following illustrates the overall recreation facilities to be included in the Rail CDP/FDP.
Each of the proposed phases will contain a combination of public and semi-private active recreation facilities. The public recreation facilities include the ice skating rink, two children’s play areas, the dog park and other facilities that will be open to the public. Semi-private facilities include recreation facilities for the residents, including a swimming pool and other private open space adjacent to the each residential building. Basketball and tennis courts, open to all residents, are proposed within Phase 2 and on top of the parking garage in Phase 4 (the courts in Phase 4 will be installed with the construction of the expanded garage prior to the demolition of Parking Terrace D for Phase 2). Additionally, the draft proffers include a commitment to provide a limited service fitness center (equipment and facilities but not staffing) that is not less than 1,000 sq. ft. in size within each office and residential building.

**Transportation:** Notwithstanding that the rail station is planned adjacent to Tysons Corner Center, the impacts of the additional vehicular traffic generated by the proposed mixed use development on the road network in Tysons Corner were also addressed. Based on a traffic study prepared for the applicant, then further refined to address the comments of staff, the draft proffers address the impacts of the proposed development utilizing four different strategies.

The first strategy is expanding the transportation options available at Tysons Corner Center. The site currently contains a major bus depot for eight bus routes. The rail station will provide another transit option, as will the additional bus connections to be available at the new bus depot on Chain Bridge Road, and the bus routing changes resulting from the construction of rail. In addition, the draft proffers include a commitment to fund a study of the existing shuttle programs in Tysons Corner, and of the feasibility of creating a circulator system within Tysons Corner. Furthermore, the pedestrian improvements discussed above will better connect this site to the development north of Chain Bridge Road, across International Drive, and to Towers Crescent. Bicycle paths through the site will provide planned trail links through the site interconnecting the portion of Tysons Corner south of Leesburg Pike with the portion located north of Chain Bridge Road. As a result, Tysons Corner Center will become more readily accessible by many modes of transportation.

Second, because Tysons Corner Center will no longer be primarily just a single shopping center use, more activities will be available for residents, office workers and shoppers. Therefore, the proposed mixed use project will provide a synergistic combination of uses on site: work, play, entertainment, daily shopping needs, other types of shopping, and other services, which would typically be reached by driving but which will now be accessible by walking.

The third element is a proffered commitment to support a significant transportation demand management (TDM) program to reduce the number of vehicle trips on the nearby roadway network. While the first two items listed above are major components of a successful TDM program, a successful TDM program should also include strategies to further reduce reliance on single occupant vehicles. In addition, a TDM program must include the monetary resources and staff to provide marketing, information, transportation benefits or subsidies, branding, coordination among
various stakeholders, tele-work opportunities, coordination with regional efforts, among other items. In addition, it is critical for such a program to include specific trip reduction goals. The applicant’s program, as discussed in more detail in the transportation section of this report does all that and more. The TDM program also provides for resources to remedy any shortfalls in the proffered goal for the reduction in the number of trips, and for a penalty to be paid by the developer if goals are not met. Most importantly, the drafts proffers state that if the proffered trip reduction goals are not met, the third and fourth phases of development cannot be built until such time as the proffered goals are met. This is the first instance where an applicant has made a commitment to limit future development if the proffered TDM goals are not satisfied; and, in staff’s opinion, this sets an important precedent. The TDM plan will be subject to the review and approval of the County, includes monitoring to determine whether the goals are being met, requires periodic coordination, review and approval of revised plans by the County, and requires that any changes to the program to address shortfalls in meeting the trip reduction goals be approved by the County.

Finally, the draft proffers and the development plans include road improvements and on-site signalization to allow vehicles to move onto, off of and through Tysons Corner Center more easily. Proffered improvements to the roads immediately adjacent to the property include widening the Westpark Drive bridge to four lanes with on-road bicycle lanes, widening Chain Bridge Road and International Drive, widening on both sides of Leesburg Pike between International Drive and the interchange with the Beltway, and signal modifications associated with those improvements. The draft proffers include commitments to funding the design of the interchange at International Drive and Chain Bridge Road shown on the Comprehensive Plan and to review and, if approved by VDOT, re-time the signals along Leesburg Pike between Old Gallows Road and the DAAR.

Stormwater and BMPs: When the site was initially developed in 1968, detention was not required; the proposed redevelopment will not result in an increase in the amount of impervious area, so additional detention is not required. Nevertheless, the applicant has proffered to a thirty (30) percent reduction in the peak flows from the site with the development of the rail related development program. In addition, the draft proffers commit the applicant to reduce the phosphorous loading in water discharged from the site by fourteen (14) percent. To accomplish these proffered goals, the Rail CDP/FDP includes several locations for underground sand filters and Filterra devices. In a separate commitment, the draft proffers also commit to provide certain Low Impact Development (LID) techniques on the property; the detention and water quality treatment achieved by these features is to be in addition to the other proffered goals. The (LID) techniques include designing the Community Green in Phase 3 with the features of an intensive green roof; the installation of eight cisterns within the property, the use of porous pavement within a surface parking lot; the provision of an infiltration facility on the site; and, the use of plaza landscaping to reduce the heat island effect. The proposed locations of these features are shown on the sheet entitled “Preliminary Stormwater Management Plan”.
Phase 1

*General Description:* Phase 1 is to include three new high-rise buildings and a one story addition to the mall building at the plaza level, as summarized below:

1. a 351 foot tall, up to 26-story, residential building with up to 355 dwelling units and 13,116 sq. ft of retail-type commercial in a 499,275 sq. ft. gross floor area building, Building 1A;
2. a 320 foot tall, up to 18-story, office building (551,638 sq. ft.), Building 1B;
3. a 300 foot tall, up to 20-story hotel with a maximum of 300 rooms and 4,400 sq. ft. of retail-type commercial in a 266,513 sq. ft. building, Building 1C; and,
4. 7,756 sq. ft. of retail-type commercial added to the exterior of the mall building, Building 1D.

The northern boundary of Phase 1 is Chain Bridge Road and the ramp to the Capital Beltway. As discussed above, there is a grade change of up to approximately 45 feet between Chain Bridge Road and the plaza level for Buildings 1A and 1B. This grade differential is accommodated by an architectural block wall that is constructed in tiers.
that contain niches. The niches are planted with vines or other plant material that will form horizontal elements along the edge of each tier. Further, each tier is to be lit to provide night-time views of the breaks in the height of the wall. Finally, to soften the edge of the wall, ornamental trees are proposed to be planted along the fire lane at the top of the wall to screen the wall of the parking garage. A portion of the wall includes a sound attenuation wall.

Pedestrian Movements: The street level of Phase 1 is generally located at the elevation of ShopTysons Boulevard, elevation 434 (identified in the diagram as “Grade Level”). As discussed previously, the street level pedestrian pathways are not intended as the primary pathways; the main pedestrian movements occur at the elevated plaza level. Vertical circulation points are identified by circles on the diagram at the right.
The portion of the Loop Trail in this phase follows the fire lane. Where the fire lane ends, the loop trail is cantilevered from the retaining wall.

The loop trail connects to the pedestrian and bike paths proposed as part of the widening of the Westpark Drive bridge, and to the bike trail along the eastern boundary of the property. As part of the reconstruction of the Westpark Drive Bridge, pedestrian elements will be added to the signal and crosswalks will be installed where Westpark Drive and ShopTysons Boulevard intersect.

In addition, as part of this phase, the applicant has proffered to construct a pedestrian bridge from Parking Terrace C to Towers Crescent. The proffers and the CDP/FDP include two alternative alignments, one that reflects the location of the bridge connection proffered with Towers Crescent; the second is this applicant’s preferred alignment. The draft proffers state that the applicant will cooperate with Tower Crescent to choose the preferred alignment, subject to the County’s approval, and to jointly fund construction of the bridge.

**Vehicular Circulation:** All vehicular access to the parking garages, the common access/drop off area for Buildings 1A and 1B and the drop off area for the hotel, is from ShopTysons Boulevard, as shown on the diagram to the right. A traffic signal is proposed to be installed on ShopTysons Boulevard (identified as “Ring Road” to the right), just east of the portion of the mall building that currently is occupied by Lord & Taylor.

**Parking:** As noted above, parking for Phase 1 is located in two parking garages; one common 9-level garage located under the plaza platform for Buildings 1A (residential) and 1B (office). Six of the levels are underground and three are above the street level. A second six level parking garage is proposed under the hotel. The hotel parking includes three underground levels (below street level) and three partial levels above street level but below the elevated plaza that connects to the mall. Street level drop off areas for each building are also provided. There are two access points to the parking garages under Buildings 1A and 1B. The garage under the hotel is to be
accessed from an entrance under the plaza between the hotel and Lord & Taylor. There is no access into the parking garages for Phase 1 from Chain Bridge Road or from the entrance road into the site from Chain Bridge Road. There are to be a total 2,541 parking spaces provided in the two garages, approximately 242 spaces will be available for parking for the mall.

Plazas: There are four elevated plazas in Phase 1: 1) the plaza in front of Buildings 1A and 1B; 2) an open area behind Buildings 1A and 1B overlooking Chain Bridge Road; 3) a semi-private terrace for the residential building; and, 4) the main plaza located near the mall and adjacent to and west of the hotel building, as described below.

The bridge linking Phase 1 and Phase 2 across the main entrance road into Tysons Corner Center connects to Phase 1 at the plaza level and adjacent to the proposed residential building (Building 1A). This connection occurs at a 50 foot wide public plaza area, part of which is covered by an overhang of Building 1A, below the semi-private recreation area for that building. An animated façade area with retail-type commercial uses is included in Building 1A at the plaza level. An elevator with access to the public spaces and separate from the main core of the building is shown at the eastern end of this building, providing access to the parking garage below the buildings. The semi-private plaza with a swimming pool and outdoor seating areas is to be located one level above the plaza. The lobby for the office building is located at the southwestern corner of that building. On the north side of Buildings 1A and 1B, along Chain Bridge Road, is a thirty
foot wide area that will contain a fire lane and be planted with trees. This is illustrated above as part of the discussion of the northern edge of Phase 1.

The main plaza for Phase 1 extends from the plaza in front of Buildings 1A and 1B, across ShopTysons Boulevard to the mall. The area over the road is eighty (80) feet wide and is to be planted with trees. A special pavement treatment extending from between Buildings 1A and 1B to the mall entrance identifies the pathway. Between the hotel and the shopping center, this plaza widens to approximately 110 feet and includes a seasonal ice rink with a shade structure and art installations in front of the hotel. Approximately 4,400 sq. ft. of retail-type commercial uses are to be placed within the hotel building, along the exterior of the existing mall building. The plaza also includes an outdoor seating area.
Phase 2

General Description: Phase 2 is located to the west of the main entrance road to the site from Chain Bridge Road. It includes two high-rise buildings near Chain Bridge Road and two one-story commercial structures adjacent to the existing mall on either side of a new entrance to mall (near Macy's):

1. Building 2A is an 351 foot tall, up to 26-stories, multi-family residential building with 518,000 sq. ft. of GFA and a maximum of 408 dwelling units;
2. Building 2B is a 320 foot tall, up to 18-story office building, with 520,400 sq. ft. GFA. The lower two levels include 23,800 sq. ft. of retail-type commercial uses; and,
3. Buildings 2C and 2D contain a total of 24,700 sq. ft. of retail-type commercial uses and will be constructed on either side of a new entrance to the second level of the mall.

Phase 2 also includes the 10,000 sq. ft. entrance pavilion that is the terminus for both the pedestrian bridge that crosses Chain Bridge Road to the rail station and the pedestrian bridge to Phase 1. Both pedestrian bridges will be at level with the second level of the shopping mall or what is described in this report as the plaza level. A new bus depot is proposed at street level, along Chain Bridge Road.
Pedestrian Circulation: Pedestrian activities in Phase 2 occur at various elevations. The first is the street level which descends approximately 20 feet in grade along Chain Bridge Road from the western boundary of the site to the entrance road. The second is the main pedestrian level which is at the same level as the elevated plazas and includes a covered pedestrian path along the office building (Building 2B) between the entrance pavilion and the new entrance to the mall. The third is the plaza between Buildings 2A and 2B, which is one level above the plaza level.

The following section through the plaza between the two high rise buildings from the entrance pavilion to the mall illustrates the various levels where activities occur in Phase 2.

The following illustration shows the change in grade and the animated façade along the north/south façade of the Phase 2 office building. The lower level is the entrance road from Chain Bridge Road to the ring road. The elevated pedestrian pathway, the second level, connects the entrance pavilion on the right of the illustration and bridge over the ring road to the entrance to the mall on the left side of the illustration.
The following illustrates the entrance pavilion toward the bus depot as seen from Chain Bridge Road. The segment of the loop trail from the westernmost end of Phase 2 (the right hand side of the illustration) is shown connecting to the entrance pavilion. Below the cantilevered pedestrian walkway are canopies covering the bus depot. Left of the entrance pavilion are the bridge to the rail station and the elevated pedestrian path to the mall. The left side of the illustration includes the pedestrian bridge across the entrance road to Phase 1.

Vertical connections include steps along the entrance road, and steps and elevators at the southwest corner of the office building and within the entrance pavilion. In addition, the loop trail can be used to access International Drive and Phase 4. In addition, a trail connection westward along the ring road and up to the northernmost entrance to Tysons Corner Center from International Drive allows a pedestrian to climb the grade between the new bus depot and International Drive. From this point, a pedestrian can also access the plaza between the two buildings via the fire lane that meets the ring road adjacent to the lobby to the residential building.

_Vehicular Circulation:_ As part of the construction of Phase 2, the entrance to the site from Chain Bridge Road is to be reconfigured. The new layout was designed to simplify the decision making process for the driver entering the site and to allow more time for a decision, thus reducing the possibility of interference with through traffic on Chain Bridge Road. After entering the site, traffic will be directed to the area between Lord & Taylor and Phase 2, where a vehicle can either go to the west on the ring road or circle back to ShopTysons Boulevard to the east. In the alternative, traffic can continue to the ring road and travel westward...
between Phase 2 and Macy’s. Traffic on the ring road will also be able to access ShopTysons Boulevard at the western edge of Phase 1.

All access to the parking garage under Buildings 2A and 2B will be from the segment of the ring road between Phase 2 and the Macy’s building. The ring road in this area has a raised median and median breaks are provided at each of the proposed entrances to the garage. Each building includes a drop-off area outside of the main travel lanes. The drop off area for Building 2A, the residential building, is at the western end of that building; it is a loop driveway located at the lobby entrance to that building and provides access to the grasscrete fire lane behind the buildings. The drop off for Building 2B is located along the main entrance road approximately 120 feet from the intersection.

**New Bus Depot:** Access for transit vehicles to the new bus depot is directly from Chain Bridge Road; use by other vehicles will be precluded. The transit vehicles will enter the bus depot from the west and exit the bus depot at the eastern end onto the entrance road into Tysons Corner Center. From there, the transit vehicles will utilize the internal circulation to access the surrounding public street network. Direct egress onto Chain Bridge Road is not desirable because that would interfere with the intersection of the entrance road and Tysons Boulevard. A bus stop area sufficient for up to four buses is shown. Shrubs and a barrier are proposed in the median separating the bus lane from the main travel lanes of Chain Bridge Road to deter pedestrians from crossing this section of Chain Bridge Road.

As illustrated below, the bus depot will be adjacent to the northern wall of the Phase 2 parking deck. A twenty-five foot wide area between the bus stops and the wall will provide for pedestrian circulation and will be partially covered by canopies that are to be attached to the garage wall. The bus depot can be accessed at street level by pedestrians. The vertical circulation within the entrance pavilion will allow pedestrians coming from the mall, Phase 1 and the rail station to reach the bus depot.

**Parking:** Parking will be provided in a parking garage located under the main portion of Phase 2. Seven levels of parking are proposed to be underground and three levels above ground. To ensure that there is adequate parking on-site during the
construction of Phase 2, prior to the demolition of existing Parking Terrace D, five levels of parking will be added to Parking Terrace A. There are a total of 2,494 parking spaces shown in the Phase 2 garage; approximately 2,000 parking spaces are required to meet the Zoning Ordinance requirements for the office and residential buildings (the exact number is dependent on the types of uses located within the animated façade areas in the office building).

Plazas: There are two main plazas proposed with this phase, the plaza at the reconfigured entrance to the mall near Macy’s, and a plaza between the two high rise buildings.

The plaza at the new entrance to the mall will be located above the southern end of the entrance road. A cascading water feature that is to be a signature feature along the entry road from Chain Bridge Road starts at the plaza level and then descends to an island within the entrance road. This cascading water feature will also provide a visual connection between the elevated pedestrian level and the street level.

The first illustration that follows depicts the plaza at the new mall entrance and the water feature as seen from the pedestrian bridge across the main entrance in the distance and a portion of the plaza between the two Phase 2 buildings. The second illustration is a portion of the cover illustration that includes the water feature at the entrance road and a view of the plaza between the two buildings and illustrates the pedestrian connections to the rail station and to Phase 1.
The open space plaza between the two buildings will contain both public space and semi-private recreational space associated with the residential building. The public open space will consist of a grassy area between the two buildings with an approximately 25 foot wide area between the residential building and the edge of the parking deck. This will allow pedestrians to travel between the ring road at the western end of this phase and the entrance pavilion. A sound attenuation wall is proposed to screen this area from highway noise. The required fire lane will be surfaced with grasscrete or other similar treatment. The semi-private area will be segregated from the rest of the plaza by a “green screen divider” and will contain a swimming pool and half court basketball for the residents of that building, as illustrated in the following section.

Phase 3

General Description: Phase 3 is located on the west side of Fashion Boulevard, the access into Tysons Corner Center from Leesburg Pike and is split into two parts.

The first part, illustrated on the right, includes a 205 foot tall, sixteen story residential building (Building 3A) with up to 282 dwelling units (298,000 sq. ft.) and 25,800 sq. ft. of retail-type commercial uses on the first level. This building will be constructed south of Nordstrom’s and east of the wing of the mall containing LLBean and Bloomingdales. Another major feature of this portion of Phase 3 is the Community Green to be constructed concurrently with the residential building. It is located immediately south of Building 3A and on top of a six level parking structure.
The second part of Phase 3 is depicted in the illustration to the right. Building 3B fronts onto Leesburg Pike and is located between that road and Parking Terrace B, in the northwest quadrant of the intersection of Fashion Boulevard and Leesburg Pike. It includes a 65 foot tall, 2-story building with office (26,100 sq. ft) on the second floor and retail (30,000 sq. ft.) on the first floor.

Pedestrian Circulation: The pedestrian circulation for this Phase occurs at street level, which is at the same general elevation as the second level of the mall. A new mall entrance is proposed in the corner of the mall adjacent to the residential building. The new entrance will provide the most direct link between the Phase 3 residential building and the future rail station.

A sidewalk along Fashion Boulevard will connect the two parts of Phase 3 and improve pedestrian access from Leesburg Pike through the application property. A second connection from Leesburg Pike into the application property is shown west of Parking Terrace D. There is an existing stairway and sidewalk providing access from the existing office building at the intersection of Leesburg Pike and International Drive.

The loop trail also runs along this portion of Fashion Boulevard, on the side of it that is to be developed in Phase 3. The loop trail will include bike lanes and a separate pedestrian path along Fashion Boulevard.
**Vehicular Circulation:** The existing vehicle circulation along Fashion Boulevard and the road between Bloomingdale’s and Parking Terrace B will be generally unchanged, except for the addition of turn lanes, the addition of a traffic signal at the intersection of those two roads, and the widening of the outer lanes to fifteen feet wide to accommodate bicycles. Vehicular access to the parking deck under Building 3A and to the Community Green will be provided from an entrance off Fashion Boulevard; a second entrance is shown from the travel aisle between the mall building and the Community Green. Access to the existing loading area under the mall building will be retained under Building 3A. A drop off area for the residential building is shown on the north side of that building and opposite the Community Green.

There are no vehicular access points to Building 3B from Leesburg Pike; all access to that building will be from the rear and through Parking Terrace B. Loading access is shown from Fashion Boulevard and behind the building.

**Streetscape:** Along Leesburg Pike, the applicant is proposing a streetscape that complies with the current Comprehensive Plan streetscape recommendations along Leesburg Pike, including a double row of large deciduous trees and the inclusion of street activities, including outdoor dining, as shown below.

**Parking:** As noted above, parking for the residential building will be located under the building and the Community Green in a six level garage containing approximately 1,376 spaces. Of these, 452 spaces are required to meet the parking requirements for the residential building. The ground floor retail —type commercial uses in this building requires approximately 104 spaces, depending on the specific uses within that space. The remaining parking will be available for shoppers at the mall.
The required parking for Building 3B, will be located in the existing parking in Parking Terrace B, which contains 1,630 parking spaces. The parking requirement for Building 3B is 68 spaces for the office use and 120 spaces for the retail space.

Plazas: A semi-private terrace with a swimming pool, seating areas and a small active/passive activity area is proposed to provide recreational space for the residential building. This terrace will be located one level above the street level and will be accessible only through Building 3A.

The primary outdoor public space is the Community Green noted above. This space is approximately two-thirds of an acre in size and will resemble a town square. The draft proffers state that it is to include a “Central focal water element/interactive water feature” in the center. The site is to be ringed with sidewalks and street trees. Pathways are shown leading to the center from each corner. Shrubs are proposed to further screen the center area from the adjacent roadways. The lobby for the residential building is to be opposite the Community Green. The Community Green is illustrated on page 33 of this report.

Phase 4

General Description: Phase 4 is located adjacent to International Drive and includes existing Parking Terrace A. As noted above, Parking Terrace A is to be expanded to nine levels above grade prior to the construction of Phase 2. The following buildings are proposed to be constructed around the expanded Parking Terrace A in Phase 4:

1. a 195 foot tall, 15-story, 320,000 sq. ft. residential building (Building 4A) with up to 300 dwelling units on the south side of the parking terrace, with 17,500 square feet of retail-type commercial uses on the first floor;
2. a 160 foot tall, 7-story, 235,400 sq. ft. office building (Building 4C) with 23,000 sq. ft. of retail-type commercial uses on the first floor between the parking terrace and the northernmost entrance to Tysons Corner Center from International Drive; and,
3. a 4-story, 54,300 sq. ft. office (45,900 sq. ft) and retail (8,400 sq. ft.) building (Building 4B) between Buildings 4A and 4C.

As part of Phase 4, the upper level of Parking Terrace A will be converted to a Sky Terrace, a 2.66 acre open plaza for the use of the residents and the public. In addition to the semi-private recreational facilities (the tennis court and the basketball court) constructed with Phase 2, the public portion of the Sky Terrace will include walking paths, gardens, seating areas, a children’s play area and a seasonal performance area. A 9,600 square foot restaurant is proposed on the northern side of the Sky Terrace. It will be accessed via an elevator that connects to the ground level, where an additional 9,600 sq. ft. of retail-type commercial uses are proposed to be inset into the parking terrace, which are identified as Building 4D on the Rail CDP/FDP. The primary access to the Sky Terrace will be via an atrium area to be constructed in the center of office Building 4B, which faces onto International Drive. The Sky Terrace can be accessed from the mall via the existing pedestrian bridges connecting to the parking terrace. The following is a perspective drawing of Phase IV that shows the Sky Terrace and the restaurant.
The larger office building (Building 4C) is proposed at the northern end of Phase IV, in the southeast quadrant of the intersection of the mall entrance from International Drive. Building 4B is immediately south and is to be a four story office building with retail-type commercial building on its first floor facing onto International Drive. Building 4B will include an atrium that will provide a visual and a physical (stairs and elevators) connection to the Sky Terrace, which is approximately six parking levels above International Drive. The residential building is proposed to face onto the entrance road located opposite the intersection of Fletcher Street and International Drive. The following is the landscape plan for Phase 4.

**Pedestrian Circulation:** There are two types of pedestrian circulation in Phase 4 – the vertical circulation to the Sky Terrace, which is described above, and the street level pedestrian network. The street level network includes a streetscape in front of the residential building. The pedestrian path is also part of the loop trail and International Drive. The loop trail continues along the entrance road from International Drive past the dog park, connecting to the portion of the loop trail to the built Phase 2. The street level pedestrian network also includes the
sidewalks between Parking Terrace A and the existing mall buildings as illustrated below.

The streetscape along International Drive in front of Buildings 4A and 4C includes a double row of deciduous trees, with a 35 foot distance between the curb and the building, as illustrated below.

In front of Building 4B, the streetscape is constrained by the existing site conditions associated with adding a building along the face of the existing parking terrace. As such, the streetscape has been modified to include a single row of large deciduous trees, with smaller evergreen trees adjacent to the building; the distance between the curb and the building is twenty-two feet.
**Vehicular Circulation**: The existing vehicle circulation pattern will be generally unchanged; however, the existing travelway between Parking Terrace A and International Drive will be eliminated. The access points into Tysons Corner Center from International Drive will not be changed, except to improve turning movements and the pedestrian crossing at the southernmost entrance. International Drive is proposed to be widened by one lane along the site’s frontage, which will necessitate that the traffic signals be modified. Access to Parking Terrace A will be from the ring road between the parking structure and the mall building. A drop off/pick-up area will be provided for the residential building under the building and north of the parking structure. A similar drop off/pick-up area is proposed for the office building at the end of the ring road near the southwest corner of the Macy’s building.

**Parking**: Parking will be provided in the expanded Parking Terrace A, which will contain 3350 spaces. In addition, there are two levels of underground parking proposed under Buildings 4A and 4B. All access to this parking will be from the ring road.

**Plazas**: As described and illustrated above, one of the main features of Phase 4 is the proposed Sky Terrace to be located on top of Parking Terrace A. In addition, a semi-private plaza is to be included with the residential building. This semi-private plaza will be located on the southern side of the building and will be located approximately 20 feet above street level. This approximately 7,000 square foot semi-private space will include a pool, informal passive recreation space and seating and will be accessed through the residential building.

**Description of the Pre-rail CDP/FDP**

**Title of CDP/FDP**: Tysons Corner Center (Development with Rail Option)

**Prepared By**: Patton Harris Rust & Associates

**Original and Revision Dates**: November 15, 2004 as revised through September 1, 2006

**Description of the Pre – Rail CDP/FDP**

The Pre-rail CDP/FDP proposes to develop only the Phase 1 portion of the site with a development program that contains the same uses in the same basic layout as that proposed with Phase 1 in the Rail CDP/FDP; however, the amount of gross floor area is reduced to the amount that would be allowed under the existing C-4 and C-7
zoning. Pursuant to the draft proffers, the Pre-rail CDP/FDP would only be developed if a Full Funding Grant Agreement (FFGA) or similar funding mechanism for the first phase of the Dulles rail project is not executed at the time that the property owner is ready to proceed with the development of Phase 1. Under this proffered scenario, the later phases of the Rail CDP/FDP could be implemented in accordance with the proffered development with rail phasing schedule when funding for the extension of rail through Tysons Corner is secured.

The layout of the Pre-rail CDP/FDP is exactly the same as that proposed for Phase 1 under the Rail CDP/FDP, except for the size of the office and residential buildings. The footprints of the buildings are slightly smaller, which affects the amount of retail-type commercial to be located in the office building. The hotel building remains the same size – up to 300 rooms in a 260,200 sq. ft. building. The proposed plaza areas, animated façade areas and other amenities included in the Rail CDP/FDP are also included in the Pre-rail CDP/FDP. The following chart includes a comparison of the respective plans. There is an illustration of the Pre-rail CDP/FDP on Page 3 of this report.

**ANALYSIS**

The following analyses pertain to both the Rail CDP/FDP and the Pre-rail CDP/FDP; however, where a comparison or contrast is needed, it will be so labeled.

**Land Use Analysis** (Appendix 5)

The application property is Sub-unit P-1 of Land Unit P of the Tysons Corner Urban Center, which is one of the core areas identified within the Tysons Corner Urban Center. Sub-Unit P-1 comprises the majority of the Tysons One Activity Center in the Core. The Development with Rail Option is filed pursuant to the Comprehensive Plan’s Option with Rail, the most intensive of the three development options provided for Sub-Unit P-1 in the Tysons Corner Urban Center. The alternative development option submitted by the applicant, the Pre-rail Option, is also compatible with the Development with Rail Option. In addition to the site specific text regarding Sub-unit P-1, there are a number of planning elements applicable to the Tysons Corner Urban Center addressing land use, urban design, transportation, among other things, as discussed in the following sections of this report.
**Mix of Uses/Intensity of Development**

The Comprehensive Plan envisions the Tysons Corner Center as a mixed-use area with retail, office, hotel and residential uses, with or without rail. The Plan option with rail recommends that a “mixed-use development with an intensity (for all nonresidential uses) up to 2.0 FAR is appropriate for the area within 1,000 feet walking distance of the station platform; sites between 1,000 and 1,600 feet of the station platform are appropriate for mixed-use development with intensities (for all nonresidential uses) between 1.2 and 1.65 FAR. Compatible transitions of height, bulk and intensity to adjacent development should be considered within the 1,600 feet area. In any development proposal submitted under this option, planned nonresidential intensity can be replaced by residential use as provided under the Alternative Land Use Guidelines in the Area-wide Recommendations section.” The Alternative Land Use guidelines allow residential uses to replace nonresidential gross floor area at a ratio of 3 to 1, provided that the increase in intensity does not exceed 50 percent of the planned non-residential intensity.

The Plan’s intent is to create a mixed use area that integrates the existing shopping mall with office, residential, hotel and community retail uses. In this application, a mix of uses is proposed in each of the four proposed phases; all four phases include a mix of office, residential and retail uses. In addition, Phase 1 includes a hotel.

As recommended in the Comprehensive Plan, the area with the highest development intensity is nearest to the future rail station platform, and likewise, the lowest intensity is proposed in the area farthest from the station platform. The area located within 1,000 feet of the future rail station platform (Phases 1 and 2) has a proposed FAR of approximately 1.43 including the existing mall (residential is 44.08% of new GFA). Area 2, located within 1,000 and 1,600 feet of the station platform (Phase 4), has a proposed FAR of approximately 0.92 (residential is 47.80% of new GFA), and the area beyond 1,600 feet (Phase 3) has a proposed FAR of approximately 0.83 (residential is 78.44% of new GFA).

The proposed development meets the Plan regarding both the mix of uses and intensity. The Pre-rail option likewise conforms to Plan guidance.

**Phasing of Development with Future Rail**

As the applicant has chosen the development option which is predicated on the existence of rail, the proposed project must be phased in relation to the advent of rail. The proffers indicate that a Full Funding Grant Agreement or similar funding commitment to finance the Metrorail extension through Tysons Corner must be executed prior to any construction of the proposed Rail CDP/FDP. If a funding agreement has not been signed, the applicant may pursue development under the Pre-rail CDP/FDP. The draft proffers state that construction of Phase 1 cannot commence until a funding agreement has been executed and that Phase 2 cannot begin until the commencement of the construction of the Metrorail extension through Tysons Corner. The proffers also require that an agreement be reached between the applicant and the rail project regarding the installation and operation of an elevated...
pedestrian bridge connection between the subject property and the Tysons Central 123 Metro Station; the installation and operation of the entrance pavilion and the bus depot in the vicinity of Parking Terrace D; the dedication by the applicant of land area and the granting of easements along Route 123 for the depot; and, the maintenance of these facilities. Phase 3 can be developed when the rail station and the bus depot are open and in operation, and Phase 4 can occur once the metro has been operational for at least two years.

The proposed phasing plan complies with the Comprehensive Plan’s Option with Rail. The Pre-rail Option conforms to the Comprehensive Plan by limiting development to a 1.08 FAR. In addition, since this option consists of essentially the same uses and a similar footprint and intensity as Phase 1 of the Rail CDP/FDP, it will be compatible with Metrorail should it be funded through Tysons Corner at a later date. Staff has concluded that the issue has been addressed.

**Design Interface with Rail**

As discussed previously, the project has been designed to provide the appropriate coordination and interface with the various components of the rail project.

**Height Limits**

Within Sub-unit P-1, the Plan recommends that buildings along Chain Bridge Road not exceed 270 feet in height, and that buildings on the east side of the mall not exceed the height of the Towers Crescent office building or 205 feet. The plan further states that if a transit station is located near the Sub-unit, building heights may be increased by 30 percent within 1600 feet of the platform and that a variety of building heights be provided along Chain Bridge Road. All transit height increases should not adversely affect the character and development of adjacent and nearby lands or neighborhoods.

The Rail CDP/FDP depicts building heights consistent with the Comprehensive Plan. In Phases 1 and 2, the height of all five buildings is based on the 30 percent height bonus, with two buildings at the maximum recommended height of 351 feet (270-foot base height plus 81-feet additional height allowed near a transit station). The building heights in Phases 1 and 2 vary from 320 to 351 feet maximum and will serve to provide a major focal point at the transit station for the Tysons Corner core area. In Phase 3, the only high-rise building is located on the east side of the mall near the Towers Crescent office building and will be a maximum of 205 feet in height. The proposed building is the same as the Towers Crescent building; however, the building’s highest elevation above sea level is lower than the Towers Crescent building’s highest elevation because the Towers Crescent site is at a higher elevation than the mall property. Two of the three high-rise buildings located adjacent to Land Unit O in Phase 4 employ the height bonus for being within 1600 feet of a transit station. Building 4A, the residential building, is to be a maximum of 195 feet tall and Building 4C, an office building, is to be a maximum of 160 feet tall. This portion of the site is identified in the Comprehensive Plan for building heights of 150 feet, which can be increased to 200 feet when a building is located near a transit station.
The three buildings proposed in the Pre-rail Option will be a maximum height of 270 feet, the maximum height recommended along Chain Bridge Road without the existence of a rail station. Staff believes that the intent of the Plan regarding a variety of building heights along Chain Bridge Road is met, since the site is part of a larger context which includes the approved development plans for Tysons II located immediately north of Route 123, and the Towers Crescent development located to the south which include several buildings at variable heights.

The draft proffers include a limitation on the height of penthouses, which are treated by the Zoning Ordinance as a feature that can extend above the maximum height specified for the building (see Sect. 2-506). Penthouses are limited to 25 feet tall; however, an increase to thirty feet may be permitted as necessary to accommodate mechanical equipment for an elevator.

Staff has concluded that both development proposals are consistent with the height recommendations contained in the Plan for Land Unit P of the Tysons Corner Urban Center.

Plazas/Recreational Amenities

One of the important elements of converting the existing automobile oriented regional shopping center to a mixed use transit oriented development is to provide useable open space. Currently, all social activity occurs along the corridors internal to the mall. Under Open Space/Parks/Recreation, the Plan recommends that the core area include larger urban plazas as focal points for use during lunch and after work. The transformation of the Tysons Corner Urban Center into a more urban environment with amenities for persons who live, work, shop and play in Tysons Corner is a challenge. In both versions of the CDP/FDP, the proposed design successfully integrates such amenities by including plazas and other urban open spaces that provide a sense of place and contribute to creating a quality urban environment. These plazas and open space areas are integral to each phase and will provide significant active and passive recreation opportunities for both the general public and for the residents of the site. In addition to a proffered commitment to provide an indoor children’s play area(s) in the existing shopping mall, the proposal provides a variety of different urban type environments on a site that does not have useable outdoor spaces at this time. The plazas vary in size and functions from hardscape areas to formal pocket park areas and all include various features, such as fountains, play areas, seating, performance spaces, etcetera that help create the individual character of each space. Further, the plazas/recreational amenities are well distributed throughout the application property. The applicant has addressed fully this recommendation of the Plan.

Pedestrian Circulation

The proposed development has met the Plan language regarding the provision of a pedestrian circulation system linking open spaces and facilitating walking and biking. A cohesive pedestrian circulation system links open spaces, facilitates walking, and
reduces reliance on private automobiles. As discussed previously, the site as a whole, as well as each of the four phases, includes a pedestrian circulation system that serves to integrate the development both internally and externally, resulting in a transit- and pedestrian-friendly environment.

Landscaping and Streetscaping

One of the most basic elements of the Comprehensive Plan’s Urban Design Guidelines for Tysons Corner is its recommendations for appropriate landscaping and streetscaping. The Rail CDP/FDP includes a landscape plan for the proposed development consisting of an overall plan, detail sheets for each phase, and details regarding streetscapes, plazas and other features. Similar plans are provided for the Pre-rail CDP/FDP. The applicant proffers to provide streetscapes along all frontages of the application property that are in substantial accordance with the guidelines set forth in the Comprehensive Plan for the core area of the Tysons Corner Urban Center, with one exception. There is one area where the streetscape has been modified along a portion of the International Drive frontage of Phase 4 due to site constraints. Existing Parking Terrace A prevents a sufficient setback to meet the Plan recommendation for this portion of the International Drive streetscape. To address this issue, the applicant has provided an alternative streetscape that satisfies the Plan by providing evergreen trees on the building-side of the sidewalk rather than the recommended canopied street trees. Trees located within 15 feet of proposed buildings may be shifted to address the tenant program and avoid conflicts with such urban design elements as outdoor cafes, entry doors and facilities/structures, subject to approval from the Zoning Administrator.

The applicant has identified in both of the CDP/FDPs a number of animated façade areas throughout the new development and existing shopping mall which are also important elements of the pedestrian-friendly, urban environment. The applicant will require new tenants located in those areas to create an external streetscape presence through the use of transparent exterior storefront façades and entries, landscaping, seating areas, canopy and awning shade elements and other techniques.

Based on the foregoing, staff has concluded that the streetscapes, landscaping and animated façade areas not only address the Urban Design Guidelines contained in the Comprehensive Plan text for the Tysons Corner Urban Center, they set a new bar to which future development applications will be encouraged to emulate.

Due to the urban nature for the development, the applicant is requesting a modification of the minimum planting area requirements of the PFM to allow smaller planting areas in conjunction with the use of structural soils – soils that have been engineered to provide support of sidewalks and other similar features while also providing a growing media for landscaping, primarily trees associated with streetscaping where such landscaping is located in relatively urban situations. Details of the structural soil planting areas are contained on Sheets 55 – 56 of the Rail CDP/FDP, including locations where structural soil is likely to be employed. The draft proffers include appropriate commitments to provide an acceptable growing
medium for the plant material. As such, and given the move urban nature of the development and that the proposed structural soil will support healthy plants and trees, staff supports the requested modification.

**Lighting and Signage**

To minimize nighttime light pollution and glare, the proffers commit that all parking lot and building mounted security lighting shall utilize full cut-off fixtures. Wall-washer type lighting will be shielded such that the lamp surface is not directly visible. New parking garage lighting fixtures (located at the top levels of the new garages) will also use full cut-off exteriors. Full cut-off street lighting fixtures are required by the Zoning Ordinance for new fixtures. To address the impacts of lighting within the parking structures on adjacent or nearby residences, the draft proffers state that full cut-off, low-intensity or recessed lighting will be used along the perimeter of the parking structures. The proffers also require that, during construction, lighting will be shielded or otherwise attenuated, including dimming or extinguishing lighting outside the operating hours of the shopping center to limit the impacts on adjacent residences. It is recommended that the applicant’s make a similar commitment with regard to the interior lighting of the proposed office structures to ensure that those buildings are not fully lit at all hours.

With regard to signage, as discussed in the Background Section of this report, a sign program for the mall property was approved by the Board of Zoning Appeals pursuant to SPA 89-P-034 in 2005. That approval consists of two signage packages: one addressing signs that do not comply with the size and location requirements of Article 12, Signs, and one addressing wayfinding signs. In addition, the applicant has proffered to provide a wayfinding sign plan during site plan review for each phase of the proposed development to direct pedestrians, bicyclists and drivers around the development. The signage is also proffered to include signs identifying the loop trail around the project. The applicant has filed a comprehensive sign plan (CSP) to allow the two existing free-standing signs at the entrances to the mall to be relocated or reconstructed because these signs will be displaced by proffered road improvements. The public hearing on the CSP will be held by the Planning Commission subsequent to the Board’s action on the rezoning. It is currently scheduled for January, 2007.

Staff has concluded that the proffered commitments regarding signage and lighting will result in the installation of appropriate signage and lighting.

**Residential Unit Size**

Given the project’s proximity to transit and employment opportunities, staff recommended that a variety of unit sizes be provided to accommodate a diversity of income ranges. The Rail CDP/FDP proposes a total of 1,701,500 square feet of multifamily residential units to be spread among the four phases. The proffers provide for a minimum of 950 units and a maximum of 1,345 units. Therefore, the average unit size ranges from 1,265 to 1,791 gross square feet, with common areas included in the calculation of average unit size. The Pre-rail CDP/FDP proposes 459,700 square feet of residential units, with a minimum of 259 units and a maximum
of 340 units. The average unit size ranges from 1,352 to 1,775 gross square feet including common areas.

The draft proffers also include commitments that the average size and minimum size of affordably priced residential units will be a minimum 400 sq. ft., with a maximum of 900 sq. ft. and average size of 550 sq. ft.

**Parking**

The Plan states: “Parking should be located at the side, back or underneath the building. Parking in front of the building may, however, be appropriate in several circumstances: limited parking for visitors and ground-floor retail customers, possible parking needed for retail expansions at the regional malls, and other existing retail within the Core which is primarily along Route 7. New retail buildings and centers should be designed with limited parking in the front; where this is not feasible due to site constraints, landscaping and other appropriate techniques should be used to achieve, to the extent possible, the design objectives of the Tysons Corner Plan.”

In the Rail CDP/FDP, four new parking structures and the expansion of one existing parking structure are planned. Almost all parking will be provided in above ground and below ground parking structures. The proposed parking structures address the recommendations of the Plan with regard to the location of the parking for the additional transit related development proposed to be added to Tysons Corner Center. The draft proffers recognize that the existing parking reduction for the mall will have to be amended to reflect the changed conditions on the property. In addition, the proffers anticipate the future evaluation and request for parking reductions given the application property’s proximity to the future Tysons Central 123 Metro Station, current and future bus facilities on the property, the character of the proposed development as a mixed-use transit-oriented development, and the intended effects of the Transportation Demand Management (TDM) Plan. A stronger commitment to pursue a parking reduction would be desirable because parking reductions can be part of a stronger TDM program for the site.

**Trails Shown on the Comprehensive Plan**

**Chain Bridge Road Trail:** The Trails Plan includes a major trail (8 – 12 feet wide and paved of asphalt) along the site’s frontage on Chain Bridge Road and two on-road bicycle trails on either side of the road. The application includes a request for a modification of this requirement along the portion of the site located west of the site’s entrance from Chain Bridge Road and a waiver east of the entrance road. The modification is requested in favor of the trail provided along the ring road from International Drive to the bus depot. This ten foot wide asphalt trail will provide a trail link from International Drive to the future bus depot and to the rail station, substituting for the trail segment that is planned in front of the two gas stations that are not part of the application property. Along the bus platform area, a walking/bus waiting area that is twenty feet wide is shown in the plan views and the following section views of the bus depot. There is also a barrier between the bus depot and the road.
The segment of the Chain Bridge Road trail located to the east of the entrance road would lead a pedestrian directly to the ramp leading to the Capital Beltway, at which point there are no links providing a safe pedestrian pathway towards McLean. The draft proffers proposed to escrow the funds required to build this link so that those funds can be utilized to build the frontage trail in the future in the event a solution has been established and adopted by the County. Staff has concluded that the application addresses the trails issues on Chain Bridge Road and supports the requested modification and waiver.

Leesburg Pike: The streetscape conforms with the streetscape recommendations for Leesburg Pike contained in the Comprehensive Plan, which includes sidewalks that function also as a trail. The streetscape extends for approximately 20 feet from the face of curb to the building, which meets or exceeds the recommendations of the Trails Plan. Further, the draft proffers state that the streetscape may be altered if the Comprehensive Plan is amended to change the streetscapes in the Tysons Corner Urban Center. An illustration of this streetscape is provided in the description of Phase 3.

International Drive: The Trails Plan includes a major trail along International Drive. The Plan includes a streetscape design for streets in the Core area that functions as a trail. At this time, there is no sidewalk along the site's frontage on International Drive between the entrance opposite Fletcher Street and the entrance near Chain Bridge Road. The draft proffers state that a six foot wide sidewalk will be provided at the time of the construction of Phase 1 along this link of International Drive. This
sidewalk will be in place until such time as Phase 4 is constructed, when the sidewalk in this area will be replaced by the proposed streetscape. As described above, while the depth of the streetscape along International Drive varies, the walkway portion is a minimum 12 feet wide in all circumstances, which adequately provides for pedestrian movements. Illustrations of the International Drive streetscape are provided in the description of Phase 4.

**Fashion Boulevard and ShopTysons Boulevard:** In response to comments of the Trails Committee, the Rail CDP/FDP includes bicycle trails along these internal roadways, which are in addition to the trails contained on the Trails Plan. In accordance with the draft proffers, this link between Leesburg Pike and Chain Bridge Road through the application property will be constructed in two parts. The first portion, a ten foot wide off-road bike trail, is to be constructed along the link of ShopTysons Boulevard that parallels the Beltway and between Kidwell Drive and the Westpark Drive bridge concurrent with the development of Phase 1. In addition, the widening of Westpark Bridge will include bicycle lanes on both sides of the bridge linking to this trail. With the construction of Phase 3, Fashion Boulevard will be widened to include fifteen foot wide lanes along both sides of that roadway to provide room for bicycles.

**Capital Beltway Trail:** The Trails Plan includes a regional serving trail along the Capital Beltway that is shown on the Trails Plan within the right-of-way for the Capital Beltway. Constructing a regional trail along the alignment of the Beltway is not appropriately implemented in an incremental fashion; if this segment were to be constructed incrementally, it would not connect to other trail segments and would place recreational trail users unsafely within the limited access area associated with the interstate highway. Staff has concluded that the regional trail along the Beltway would be most appropriately constructed as part of the construction of a larger project to construct a trail along an interstate highway, such as part of a project to widen the Beltway or to include High Occupancy Toll (HOT) lanes on the Beltway. Where such an issue has been addressed along the Dulles Airport Access Road (DAAR), a waiver of this requirement has been granted typically, and staff supports a waiver in this instance.

**Residential Development Criteria (Appendix 16)**

Fairfax County expects new residential development to enhance the community by: fitting into the fabric of the neighborhood, respecting the environment, addressing transportation impacts, addressing impacts on other public facilities, being responsive to our historic heritage, contributing to the provision of affordable housing and, being responsive to the unique site specific considerations of the property. To that end, the Board of Supervisors adopted the Residential Development Criteria, which are contained in Appendix 9 of the Land Use Section in the Policy Plan to be used in evaluating zoning requests for new residential development.

In this instance, because the residential component is integrated within each phase and cannot be considered in isolation from that phase or from the development proposal as a whole, the criteria will be addressed for the project as a whole,
including the non-residential elements. Further, the development criteria provide an appropriate framework for the analysis of the application because the criteria address planning issues common to all land use applications as reflected in the following statement found in Appendix 9 under the heading, NON-RESIDENTIAL DEVELOPMENT CRITERIA:

“While the Comprehensive Plan has no direct equivalent to the residential density range in areas planned for non-residential or mixed uses, each rezoning application for such uses will be evaluated using pertinent development criteria, as found in the Residential Development Criteria, as a basis for such evaluation.”

Site Design & Neighborhood Context:

Development Criterion Number 1, entitled ‘Site Design,’ recommends that developments address the consolidation goals in the Comprehensive Plan, and further the integration of the proposed development with adjacent planned and existing development. Additional elements of this criterion applicable to this proposal to redevelop Tysons Corner Center as a mixed use development include: providing convenient access to transit facilities; providing open space that is usable, accessible and integrated with the proposed development; and, providing appropriate landscaping and amenities.

The following discussion also includes a discussion of the Criterion #2, Neighborhood Context, which recommends that all applications, regardless of the proposed density or intensity, be designed to fit into the community within which the development is to be located as evidenced by an evaluation of: transitions to abutting and adjacent uses; bulk and mass of the proposed development; setbacks; architectural elevations; connections to non-motorized transportation facilities; and, the existing topography and vegetative cover. It is noted in this criterion that it is not expected that developments will be identical to their neighbors and that the individual circumstances of the property will be considered.

Many of the elements of these two criteria have been discussed elsewhere in this report; others that have not are discussed below.

Lot Consolidation

The application property includes all of the property bounded by International Drive, Leesburg Pike, the Capital Beltway and Chain Bridge Road, with the exception of two small parcels, Parcels 29-4 (((1)) 17 and 18, which are developed with service stations, and the office building at 1861 International Drive. The office building is integrated with the shopping center by a pedestrian connection from its elevated plaza to the area adjacent to Parking Terrace B (near Bloomingdale’s) and access the parking garage under the office building is from the access road into the application property located opposite Fletcher Street. It would be desirable, but is not critical, for the two gas station properties to be consolidated with the application to
allow the southeastern quadrant of the intersection of International Drive and Chain Bridge Road to be integrated into Tysons Corner Center.

**Site Layout/Urban Design/Neighborhood Context**

Unlike other areas where mixed use redevelopment has been proposed as a redevelopment of a property, this property is the site of an existing highly successful shopping center that is a major economic asset to the County and to the property owners and that will be retained in its entirety. The redevelopment of the Tysons Corner Center is predicated at each phase upon retaining the functionality and viability of the existing mall. Accordingly, the proposed redevelopment of the site occurs around the periphery of the property on areas currently used for parking or as peripheral strip shopping center uses. However, rather than just adding buildings along the ring road, in a manner similar to Fair Oaks Mall, the new development is integrated with the mall building through the creation of a two level pedestrian network that works with the topography of the site, and by the construction of new plazas connecting to the mall in three of the four phases. In addition, the corridors in the mall will be open during the time period that rail transit is operating, resulting in the mall itself being connected to, and becoming an integral part of, the site’s pedestrian network as well as the large pedestrian network of this part of the Tysons Corner Urban Center. As a result covered pathways are provided for large portions of the overall pedestrian network in the mall, under building overhangs, the covered bridge across Chain Bridge Road and the pathway across the top of Parking Deck C. The pedestrian improvements at street level within the site and around its periphery enhance the site significantly. The new plazas are major amenities that will change the entire character of the site by providing pedestrian friendly spaces where parking lots now exist. Sheets 9 and 10 depict the overall pedestrian network, the detail sheets within each phase, and the interconnections with the mall building.

While the retention of the existing mall building precludes the creation of a grid pattern of streets, traffic through the site and to the various elements or phases of the project is collected internally on the ring road, rather than dispersed on the public street network. The system of elevated pedestrian pathways and plazas is a creative and appropriate solution to create a safe pedestrian-oriented environment that is separated from the main vehicular movements. At the southern end of the site, the street level pedestrian network allows for integrated pedestrian facilities with wide, urban style streetscapes and street level retail-type commercial uses.

The relationship of each of the new proposed phases to the adjacent development is also an important element of the site layout/neighborhood context:

- Phases 1 and 2, which include approximately 70 percent of the proposed additional development, are located appropriately near the future rail station and will be connected to the rail and to the Tysons II development via the pedestrian connections to the rail station and across the Westpark Drive bridge;
- A portion of Phase 3 is located near the intersection of Fashion Boulevard and the ring road, near the pedestrian bridge to the Towers Crescent project, and
the office building is located on Leesburg Pike creating a street edge along this portion of the road where there is currently a parking garage; and,

- Phase 4 proposes to create an activated streetscape along International Drive, where there is currently only a parking garage and no sidewalk.

The area adjacent to the Capital Beltway, where the mall building was recently expanded, is not proposed to be changed with this application, that roadway presents a major barrier to providing connections to the development on the other side of the road.

The overall result is the conversion of an inwardly oriented, automobile dependent development to one that provides a variety of land uses and, most importantly, types of environments. Further, this large portion of the core area of the Tysons Corner Urban Center will become part of the fabric of the area rather than an island unto itself. The edges along Leesburg Pike and International Drive will be transformed from edges that draw a strong, almost impenetrable, boundary to edges that are transitions and invite interactions, because a streetscape will be introduced that is pedestrian friendly and that provides street life that can reflect or transition to a street life across the road, especially along International Drive. An essential element of the streetscape contained in the Urban Design Element of the text for the Tysons Corner Center is having the buildings located near the street rather than away from the street with parking between the street and the building. Where the edge presents a strong gap to the adjacent property through topography, whether it is a change in grade such as with Towers Crescent or a roadway as with Chain Bridge Road, the project proposes to literally bridge itself to the adjacent properties.

The proposed building heights and relationship of the buildings to the street reflect the pattern recommended in the Urban Design element for the Tysons Corner Urban Center in the Plan. While the applicant has not provided specific architectural details at this point, the applicant has committed to use materials consistent with Class A office space. In addition, the draft proffers require that the architecture for each building be reviewed and approved by the Planning Commission prior to the issuance of the building permit.

Environment (Appendix 6)

Development Criterion 3 recommends that all rezoning applications respect the environment. The criterion enumerates several principals that should be addressed:

a) natural environmental resources should be preserved;

b) existing topographic conditions and soil characteristics should be considered;

c) off-site impacts on water quality should be minimized by commitments to state of the art best managements practices and low impact site design techniques;

d) the volume and velocity of stormwater runoff should be managed to avoid impacts on downstream properties;

e) future and current residents should be protected from the adverse impacts of transportation generated noise;

f) any exterior lighting fixtures should minimize neighborhood glare and impacts to the night sky; and,

g) site design techniques to achieve energy savings and to encourage and facilitate walking and bicycling should be employed.
Preservation of Natural Environmental Resources & Consideration of Existing Topographic Conditions

With the existing level of development on the site, there are no environmental resources to be preserved on the site. Similarly, the existing man-made topography reflects the previous development activity on the property.

Stormwater Management/Best Management Practices:

Sheets 57-61 of the Rail CDP/FDP address stormwater management and best management practices (SWM/BMPs) and the outfalls for the property. Similar information is provided in the Pre-rail CDP/FDP. The applicant has filed a request to include underground detention with residential development.

Stormwater Management: The existing site is largely paved and the proposed new development will occur on previously developed portions of the site. With the original development of the site, stormwater management and best management practices were not required to be provided and the majority of the site is impervious. Off-site stormwater from the Towers Crescent development and the adjacent roadways passes through the site. The natural water courses have been replaced by a closed conduit system; the stormwater is discharged into an existing outfall that crosses the Capital Beltway after it leaves the site. The draft proffers include a commitment to provide an overall stormwater management plan prior to the approval of the first site plan. The proffers further commit to reduce the amount of water currently discharged from the site by thirty (30) percent at the conclusion of building out all four phases, which is significantly in excess of the requirement specified in the Public Facilities Manual (PFM) for a redevelopment site, which requires detention for the increased amount of impervious surface only. The proffered reduction is accomplished by providing underground storage in each phase, thereby achieving part of the proffered reduction with each phase of development.

Best Management Practices/Low Impact Development: The applicant has proffered to treat the stormwater leaving the site to provide phosphorous removal of 14 percent; the analysis provided by the applicant indicates that 11.85 % phosphorous removal is required by the PFM. This level of removal will be achieved from two types of facilities currently included in the PFM, sand filters and Filterra devices. These best management practice facilities will be installed with each phase and ultimately meet the proffered goal with the completion of Phase 4.

In addition, the applicant has proffered to construct a number of low impact development techniques on-site. These proffered facilities are not currently recognized phosphorous removal techniques in the PFM; as such, they have not been assigned a phosphorous removal rate and will not be utilized to meet proffered 14% reduction. These facilities include: green roof areas, located mainly on the plazas above parking garages; stabilized turf areas on the fire lanes for Phases 1 and 2; pervious pavers in the limited amount of surface parking that will remain on-
site; and, an underground infiltration device at the dog park, provided that the soils test indicate that this is a suitable location for infiltration.

Outfall: The Tysons Corner Center property is located in the upper reaches of the Scotts Run watershed. The stormwater is collected in a closed conduit system that was constructed as part of the existing shopping center. This system discharges into an existing closed conduit system that crosses the Beltway to the east to connect to a tributary of Scotts Run. Scotts Run has been degraded by the impacts of the existing development in its watershed through undercutting, and the channel is incised. The applicant is addressing this by reducing the stormwater peak flow from the property to Scotts Run as discussed above.

Underground Detention Waiver (Appendix 7): In conjunction with the approval of a rezoning application, the Board of Supervisors may grant a waiver of Section 6-0303.8 of the PFM to permit underground stormwater management facilities in residential developments. The waiver may be granted by the Board after taking into consideration possible impacts on public safety, the environment and the burden placed on future homeowners for maintenance. If waived, the underground stormwater management facilities will be privately maintained pursuant to a private maintenance agreement in a form acceptable to the Director, DPWES, be disclosed to future owners in the chain of title, and not be located in a County storm drainage easement.

The Rail CDP/FDP includes six underground detention vaults, eight underground sand filters and eight underground cisterns, in addition to the low impact design features. The proposed underground facilities are located along travelways, and adjacent to buildings and parking structures, and will be equipped with double locked BILCO doors. Staff has concluded that the proposed underground detention is appropriate in this instance because the site is in an urban environment, the costs will be shared among all of the on-site uses and the proposed facilities provide detention beyond the minimal requirements of the PFM. Therefore, staff recommends that the Board grant the waiver subject to the proposed development conditions contained in Attachment A to Appendix 7. The proposed development conditions require (among other things) that:

- the underground stormwater facilities be maintained by all components of the proposed development, not just the residential component;
- a reserve fund be established for replacement of the facilities;
- the underground facilities be constructed of reinforced concrete products;
- liability insurance in the amount of $1,000,000 against claims associated with the underground facilities be provided and that the County be held harmless for any liability associated with the underground facilities; and,
- an annual maintenance budget be established.

Transportation Generated Noise:

The property abuts an interstate highway – the Capital Beltway (I-495); two major arterials – Leesburg Pike (Rt. 7) and Chain Bridge Road (Rt. 123) and International
Drive – a six-lane divided highway. Each of these sources produces highway noise that need to be addressed for the interior of the residential buildings and the hotel, and for exterior recreation spaces. The Policy Plan states that new residential development should not occur in areas with projected highway noise exposures above DNL 75 dBA based on traffic projections to 2026. The applicant has submitted a noise study (Appendix 3j) for review by County staff that demonstrates to staff’s satisfaction that this standard will be met. In addition, the draft proffers state that if subsequent proffered noise studies show noise levels above DNL 75 dBA, the residential building will not be constructed and a proffered condition amendment will be sought to locate other uses in the affected area.

The second element of the County’s noise policy is to ensure that noise levels between DNL 60 dBA and DNL 75 dBA are attenuated so that interior living spaces are at or below DNL 45 dBA and outdoor recreation areas are attenuated to DNL 65 dBA or less. The draft proffers include a commitment to provide noise attenuation measures to ensure that highway noise in the interiors of the residential units and the hotel rooms will be less that DNL 45 dBA. The proffer also requires that the affected buildings be identified on each site plan and that the affected units be identified on the building plans.

With regard to outdoor recreation areas, the noise study identifies areas where structural noise attenuation will be provided to shield areas identified for outdoor recreation spaces and includes copies of the sheets of the CDP/FDP that include noise attenuation structures. The noise attenuation structures are designed to be an integral part of the site design by adding additional height (approximately 4 feet) to the walls along Chain Bridge Road or by using the noise attenuation structure to segregate the semi-private open space for the residential building in Phase 2 from the more public elements of the upper plaza in that phase.

The application includes a request for a waiver of the requirement found in Sect. 2-414 that commercial buildings be located a minimum of 75 feet from the edge of an interstate highway right-of-way. In this instance, Building 1B is located adjacent to the ramp from northbound Chain Bridge Road (Rt. 123) to the outer loop of the Capital Beltway (I-495). Building 1B is located 40 feet from the edge of the right-of-way adjacent to the ramp, approximately 140 feet from the pavement for the ramp and approximately 575 feet from the main travel lanes. While Building 1B is located less than 75 feet from the right-of-way line adjacent to the ramp, it is well beyond 75 feet from the main line of the road. Staff has concluded that the draft proffer that requires that noise within the office building be attenuated to 50 dBA addresses the noise impact and furthers the intent of the Zoning Ordinance and the Comprehensive Plan policies regarding highway noise; and, therefore recommends that the Board approve the requested deviation from this requirement in accordance with the provisions of Par. 3 of Sect. 2-414.

Tree Preservation/Landscaping

Development Criterion 4 states that all residential development should be designed to take advantage of existing quality tree cover.
Given the existing development on this property, tree preservation is not an issue for this application. However, as discussed elsewhere in this report, the applicant proposes to dramatically increase the amount of landscaping on the site through additional plantings along new pedestrian pathways through the site, streetscaping along the public roads and within the application property, and within the various plazas.

**Transportation** (Appendix 8)

Development Criterion 5 states that, regardless of the proposed density, development should implement measures to address planned transportation improvements and should offset impacts to the transportation network. The criterion notes that not all principles contained in the criterion will be applicable in all instances. The following is an evaluation of those principles that are applicable in this instance.

The size and location of the application property in the Tysons Corner Urban Center presents unique and challenging transportation issues. The approximately 79 acre site occupies a significant amount of land area in the Urban Center. The site is surrounded on three sides by arterial and interstate roadways, with 2 interchanges from the interstate to the arterial roadways providing convenient vehicular access. It is further served by a number of WMATA and Fairfax Connector bus lines. In addition, as discussed, a metro rail is slated to be placed in operation opposite the site in the Route 123 corridor by approximately 2011. The future presence of heavy rail, the existing high level of transit service to the site, and the mixed-use nature of the proposed development create significant possibilities for an aggressive Transportation Demand Management (TDM) program. All these factors played important roles in the evaluation of the application.

**Internal Circulation**

The retention of the existing mall impacts the manner in which circulation through the site and connections to adjacent properties and the adjacent road network could occur, and how new traffic enters and exits the site. As a result of the retention of the mall, it was necessary to maximize opportunities for effective internal circulation into, through and out of the property for automobiles, trucks and transit vehicles. To address this, the draft proffers include the following:

- Increasing the capacity of the internal streets through widening them and adding turn lanes at critical intersections.

- Adding signalization to a number of internal intersections and committing to allow County and VDOT to review the signalization plans.

- Reconfiguring significantly the vehicular entry to the site from Route 123 to improve traffic movement internally within the site, as well as to counter possible degradation of Route 123 with spillover traffic.
Impacts on the Adjacent Network of Public Streets

The construction of an additional 3.5 million square feet of development in the Tysons Corner Urban Center could, if not mitigated, degrade levels-of-service on the public roads located throughout the Urban Center. During the weekday peak hours, and frequently on weekend mid-days, the surrounding road network exceeds its capacity under today’s conditions. A comprehensive program is needed to address the traffic impact of the proposed development both programmatically and through construction of infrastructure. A proffered three-prong approach addresses this issue through phasing the proposed development to the availability of rail, implementing an aggressive TDM program, and constructing roadway improvements, as discussed below.

Phasing to Rail/Transit: Extension of Metro construction of rail from the West Falls Church Metro station to Dulles Airport on an alignment through the middle of the Tysons Corner Urban Center is expected to significantly reduce the number of future vehicle trips in Tysons Corner as a whole. Under the selected Comprehensive Plan option, the proposed redevelopment of the Tysons Corner Center to a mixed use project is contingent on a direct connection to the planned rail service, including a convenient means for residents, employees and customers to maximize usage of this alternative to the automobile. This integration is a key component of transit-oriented development. As described previously in this report, the applicant has integrated the development with future rail service to maximize opportunities for its use as an alternative to private vehicles.

While the implementation of the Rail CDP/FDP is tied to the availability of rail, the applicant is seeking an option to construct 1.2 million additional square feet of mixed-use development prior to funding for the rail project, as shown on the Pre-rail CDP/FDP. Although funding agreement is not currently in place and is not expected to occur until 2007, design and engineering of the rail project has progressed significantly and, it is anticipated that the Phase 1 will likely be developed as shown on the Rail CDP/FDP. However, should that not occur, the level of development shown on the Pre-rail CDP/FDP can be accommodated with the improvements proffered to be constructed with that option, as discussed beginning on page 62 of this report.

With the Rail CDP/FDP, the applicant has proffered that all phases of the development will be tied to various phases of rail project to ensure that the appropriate relationship between development and rail occurs, as detailed below.

- Phase 1 of the rail-related development consisting of 1.3 million square feet cannot be initiated until a funding agreement for rail is in place.

- Phase 2 of the rail-related development is the most critical development stage because it is where the connection to the future rail station is to occur and because, when combined with Phase 1, over 1 million square feet of additional
development will be constructed. Under the proffers, Phase 2 cannot be initiated until each of the following is achieved:

i. Commencement of construction of the first phase of the rail line extension to Dulles Airport and,

ii. An agreement is completed between the applicant and the rail project on the issues of mutual concern including access to the rail line.

• Phase 3 of the rail-related development cannot be initiated until each of the following is achieved:

i. The Tysons 123 rail station in the vicinity of the site is operational and,

ii. A pedestrian bridge or tunnel connecting the site to the station is operational and,

iii. A bus depot adjoining the property is in operation.

• Phase 4 of the rail-related development cannot be initiated until the following is achieved:

i. The three elements described in Phase 3 have all been operational for 2 years.

To further foster transit-oriented development, the applicant is also proposing several measures to enhance access to rail and bus service at the site. In addition to the previously discussed pedestrian improvements designed to provide safe and efficient foot access to the rail station, the applicant’s commitments include:

• Construction of a pavilion that accommodates vertical circulation at the on-site terminus of the pedestrian bridge connecting the rail station, the ground-level bus depot, the mall, and the rest of the development.

• Dedication and construction of a bus depot adjoining the site on the Route 123 frontage.

• Continued access by public transit providers to the existing bus stops located on the site, including provision of a sidewalk along International Drive for access to that bus stop.

• Retention of the existing on-site bus stop and bus layover area near the Nordstrom store.

• Establishment of a new internal bus stop with shelter with Phase 1 of development.

• Provision of construction of bus shelters and funding of off-site bus shelters along the public roadways on the perimeter of the site.
• Agreement to fund a study to determine the parameters of implementing a bus circulator system within the Tysons Urban Core and if that system is implemented, fund start-up and operating costs to a total of $1.25 million dollars.

Transportation Demand Management (TDM): A major component of this transit-oriented development is the establishment by the applicant of a TDM program to reduce the impact of the proposed development on the transportation infrastructure of Tysons Corner. The basic premise of the TDM program is to reduce vehicle trips to and from the site through the use of alternatives to single-driver private vehicles for activities that have increasingly relied on that mode of transportation in the past. Use of rail is the most obvious TDM activity; however, any alternatives that substitute for the use of a single-occupant vehicle (SOV) are important elements of a TDM program. These include carpooling, telecommuting, using other forms of transit, bicycling, and walking, as well as the creation of a synergistic range of uses on the site. Typically the goal of a TDM program is to reduce AM and PM peak hour trips; however, given the urban location of the site, and the daily traffic demands associated with the Tysons Urban Center, a program that will reduce trips at all hours will be of notable benefit.

The proposed mix of uses is a major factor in the ability of any development or area to be able to reduce trips. Within a development that has an appropriate mix of uses in sufficient amounts, the need for people within the development to use their private vehicles to drive outside that area for services will be reduced, which effectively reduces the demands on the surrounding road network. In addition to the existing 2.5 million square feet of retail type uses in the mall, the applicant is proposing the construction of 1.4 million square feet of office use, 1.7 million square feet of residential use, a 260,000 square foot hotel and 182,000 square feet of new retail-type commercial uses located primarily on the lower floors of the new buildings. The resulting diversity of uses, particularly the nearly 50% split in residential and office development, will create a strong synergistic relationship. In addition to the retail, entertainment and recreational opportunities within the existing mall, the new retail uses in particular are designed primarily to provide services for people who live and work at the development; this is enhanced by the proffered commitment to provide a small grocery store and a child care center on site.

TDM programs in Fairfax County have grown through an evolutionary process, increasing in complexity and scope in recent years as more aggressive approaches to offsetting traffic generated by developments on an already saturated road network have been sought. The program proposed with this application, developed jointly by the applicant and the County, represents the most aggressive and comprehensive TDM program proffered to date, and includes benchmarks for achievement and significant precedential incentives/penalties related to achievement of those benchmarks. Important elements of the program include:

• A commitment to specific trip reduction goals for that are individually tied to the office, residential and hotel uses, and that are specific to both the am and pm peak periods. The goals are adjusted based on the limited possibility that the
Pre-rail CDP/FDP is constructed. The following chart, copied from the draft proffers, sets forth the goals for the Rail CDP/FDP after build-out of all four phases.

### Phases 1 through 4 After Rail is Operational

<table>

- A detailed strategic plan for implementation and administration of the program has been developed and is referenced in the proffers.

- Specific techniques to be used for implementation of the TDM program, include, but are not limited to: branding the program; meeting with stakeholders; development of a website, outreach and other forms of information dissemination including within the mall; transit benefits for workers; promotion of telework to tenants in the offices; provision of telework sites; car sharing programs, taxi stands, ride matching for vanpools and carpools; a parking management plan; van and/or shuttle drop-off points; pre-wiring residential units for internet access; sales and marketing of residential units to TDM oriented buyers; sales promotion of the residential component with other employers in Tysons Corner; use of promotions and discounts to encourage workers to remain at the site during the peak hours rather than travel.

- A TDM program designed specifically for mall employees that encourages the use of carpooling, van pooling and the use of mass transit, and that provides for subsidies to encourage the use of these and other non-SOV modes of transportation.

- A transportation coordinator will be retained to administer the TDM program.

- The applicant will be obligated to provide annual studies and reports to the County to verify compliance with the vehicle trip reduction goals and to demonstrate the TDM program’s viability and effectiveness.

- The TDM program and yearly budget will be subject to the review and approval of the County staff. An initial funding of $200,000 is required to be increased as necessary to implement the agreed upon program. The initial funding amount is based on the review of a projected budget by staff.

- The developer, not the successor condominium and/or other owners, will remain responsible for the funding, administration, remedies and applicable penalties of the TDM program through the “Developer Control Period” which is
defined as two years of successfully meeting the proffered goals after Phase 4 is “stabilized” as defined in the proffers as when RUPs and Non-RUPs have been issued for 100% of the proposed buildings. The responsibility for the TDM program will then be turned over to the unit owners’ association, which will include all uses on site.

- If the proffered vehicle trip reductions are not met, the applicant will be required to implement measures to remedy any shortfall in meeting the goals, including the infusion of additional monies to initiate these measures. The so called “remedy fund” is to be $400,000 (adjusted for inflation) initially and is to be replenished on an annual basis as necessary. The extent of the remedy fund ($400,000) is based on a preliminary budget for the TDM program reviewed and approved by staff.

- If the proffered vehicle trip reductions are not achieved, the developer will be required to pay a penalty for each additional trip generated by a specific use, even if other uses are meeting the proffered goals, with the penalties increasing as the extent of any failure increases. For example, if the proffered reduction goal is exceeded by up to 2%, the penalty amount is $4,000 per vehicle; between 2% and 5%, the penalty amount is $6,000 per vehicle; and if the failure exceeds 5%, the penalty amount will be $12,000 based on the number of vehicles that represent a 5% failure. A chart at the end of the proffers provides examples of the penalties that could result from a hypothesized failure. The penalty funds are to be used for transportation improvements in the area – not to assist in remediying the shortfalls of the TDM program. The penalty fund is to be secured with a letter of credit that escalates from $2,000,000 to $4,000,000 depending on the number of completed phases. The penalties will cease after the TDM program is turned over to the future unit owners’ association.

- Perhaps the most punitive aspect of the TDM program is the applicant’s commitment that if the proffered trip reductions for all uses within Phases 1 and 2 combined are not being met, the developer cannot proceed to Phase 3; a similar limitation is proffered for Phase 4, which is precedential.

This program provides very significant commitment to reduce traffic generated by the proposed development and a precedential means to address the possibility of a failure of that program to work, in case that was to occur.

Off-site Road Improvements: As previously stated, the surrounding road network is already saturated during the weekday peak hours and frequently on weekend driving midday. Therefore, implementation of road improvements to address the traffic impact of the development is a critical element in the applicant’s transportation program.

The applicant has proposed the following road improvements to be constructed in the various phases of development, which address all of staff’s requests.
The proffered commitments with the Rail CDP/FDP include:

- **Widening of Chain Bridge Road including:**
  
  i. dedication of the right-of-way for the proffered improvements (Phases 1 and 2)
  
  ii. construction of four through travel lanes along the property’s frontage, a dedicated right-turn lane, capacity for dual left turns into Tysons Boulevard opposite the Mall site, and signal modifications (Phase 1)
  
  iii. subject to provision of property acquisition and construction funds by the County, construction of off-site improvements to International Drive and Chain Bridge Road to provide an additional lane of traffic on each roadway, replacement of the signal at that intersection, and construction of pedestrian improvements (Phase 2).

- **Widening of Route 7 including:**
  
  i. dedication of the right-of-way for the proffered improvements (Phase 1)
  
  ii. provision of four through travel lanes along the property’s frontage resulting in four continuous westbound lanes from I-495 to International Drive. (Phase 1)
  
  iii. construction of a 4th eastbound lane from the Gallows Road/International Drive intersection to Old Gallows Road. (Phase 2)
  
  iv. contribution of an additional $70,000 for road improvements in the corridor. (Phase 3)

- **Widening of the Westpark Drive bridge to a 4-lane undivided cross-section including modifications to the intersection of Westpark Drive and ShopTysons Boulevard to enhance through traffic movement. The value of the bridge improvement (currently $8.2 million) is creditable against the Tysons Transportation Fund contribution. (Phase 1)**

- **Widening of International Drive along the property’s frontage to three through northbound travel lanes. (Phase 4)**

- **Designing of the planned interchange at Route 123 and International Drive. The value of this improvement (currently $1.2 million) is creditable against the Tysons Transportation Fund contribution. (Phase 2)**

- **After the stabilization of each phase, the draft proffers require that a corridor evaluation of the signals along Leesburg Pike or Chain Bridge Road (depending on which phase is completed) be undertaken to determine appropriate signal timing modifications. The signal timing plans will be subject to the review and approval of VDOT and will be implemented by the applicant.**

The proffered improvements with the Pre-rail CDP/FDP include the following:
• Widening of Chain Bridge Road to a four lane section across the site’s frontage (including a right-turn lane), including dedication of the required right-of-way.

• Widening of the Westpark Drive bridge to a 4-lane undivided cross-section including modifications to the intersection of Westpark Drive and ShopTysons Boulevard to enhance through traffic movement.

• Reconstructing the Chain Bridge Road/entrance road intersection to provide three lanes of storage within the property and adjust the existing signal as required.

• Installing traffic signals at three intersections along the ring road.

• Improving the existing signals to include pedestrian heads at intersections adjacent to the application property.

• Adding a westbound land along the property’s Leesburg Pike frontage to tie into the existing turn lane at International Drive.

• Conducting a corridor evaluation of the signals along Leesburg Pike to determine appropriate signal modifications subject to the review and approval of VDOT.

Service Drive Waiver

The application includes a request to waive the service drive requirements along the Leesburg Pike (Rt. 7) and Chain Bridge Road (Rt. 123) frontages of the application property. These locations do not include service drives at this time. The draft proffers include commitments to widen both of these facilities, including providing turn lanes into the entrances to the application property from these roadways. An urban streetscape is being provided along Leesburg Pike that is consistent with the urban boulevard treatment contained in the Comprehensive Plan. Along Chain Bridge Road, a bus depot that is associated with the planned extension of rail through Tysons Corner is being provided between the site’s entrance and International Drive; to the east on Chain Bridge Road is the ramp to the Capital Beltway. Given these factors, and the fact that a service drive is not necessary to manage circulation on these frontages, staff supports the requested waiver of the service drive requirement along the site’s frontages.

Public Facilities

Residential Development Criterion 6 states that development is expected to offset its public facility impact.

*Park Authority Analysis (Appendix 9)*
Impacts on Park Authority Facilities: The residents of this development will use outdoor recreational facilities. Typical recreational needs include open play areas, tennis and volleyball courts and athletic fields. Based on the Zoning Ordinance Sections 6-209 and 16-404, the applicant must provide $955 per non-ADU (affordable dwelling unit) residential unit for outdoor recreational facilities to serve the development population.

The recreational needs of the future residents are addressed in five ways in the proffers and on the CDP/FDP. (See appropriate portions of the section entitled “Description of the CDP/FDP” for a more detailed description of the individual recreation facilities and their locations). First, there are common recreation facilities open to the public; second, there are semi-private recreation facilities for the future residents; third, the draft proffers include a commitment to contribute to the County an additional $493 per dwelling unit (escalated) prior to site plan approval for the residential component of each phase to be used for the provision of off-site outdoor recreation facilities. (The Park Authority requested $265 per estimated resident; which at Park Authority’s estimate of 1.7 residents per multiple family dwelling unit, equates to $450.50 per unit; and fourth, a contribution of $500,000 will be made within 30 days of the final, un-appealable approval of the rezoning application to the Board of Supervisors for improvements to public athletic fields. The draft proffers also provide that if the $955 expenditure for recreation facilities required pursuant to Sect. 6-209 is increased by the Board in the future, the on-site expenditure for recreational facilities will equal the increased amount. If the proffered on-site recreational facilities do not meet fully the monetary requirements of Sect. 6-209, the draft proffers include a provision that the balance would be contributed to the Park Authority. In addition, the public plazas proposed with each phase will provide passive recreation opportunities. These include performance spaces in the public plaza and a performance lawn with stage to be provided as part of the Sky Terrace in Phase 4. The draft proffers require that bicycle racks be provided with each phase and that shower and locker facilities be provided in one of the office building in Phases 1 and 2, and in the office buildings in Phases 3 and 4. Thus, the recreation needs of the residents, workers and visitors to the site are well accommodated by the proffered commitments and the recreational and other amenities shown on the CDP/FDP.

Loop Trail: The Park Authority comments were based on a previous version of the CDP/FDP and state that the proposed loop trail should be designed to be accessible and the route easy to follow through the use of wayfinding signage, distinctive pavers or other marking, direction and distance markers. The comments also raised a concern that the loop trail could be built in segments and thus may never be completed if the later phases are not constructed.

The loop trail has been designed to address accessibility issues by shifting the trail from the elevated plaza in Phase 2, so that it will cantilevered from the parking garage wall adjacent to the bus depot and connect directly to the entrance pavilion, and, by designing a ramp system to address the change in grade at the eastern end of Phase 1, in combination with a more direct stairway. The draft proffers include a commitment to provide signage and mileage markers along the loop trail.
The issue of phasing of the loop trail has been addressed through a commitment to provide an interim trail link along International Drive currently with Phase 1. While this will not provide for a full loop until Phase 3 is constructed, existing sidewalks and internal roadways can temporarily substitute for the link between the ring road along the Capital Beltway and International Drive.

Staff has concluded that the applicant has adequately addressed the issues associated with the proposed loop trail.

**Dedication of a Park to the Park Authority:** Park Authority initially requested that approximately 1 acre of land be dedicated to it for an urban park that would include features such as an amphitheater, hardscape plaza areas, open green spaces, a water feature and an outdoor kiosk. The applicant’s proposed plazas include all of the above noted features thereby providing the appropriate outdoor areas and recreational amenities. However, the proposed plazas and other amenities are generally located on top of parking structures, which are located in portions of the site that were previously developed. The site does not contain a contiguous acre of relatively undeveloped property that could be appropriately dedicated in fee simple to the County for park purposes. With the open spaces generally located on top of structures, staff has concluded that it is most appropriate that the sites not be dedicated to the County.

**Schools Analysis (Appendix 10)**

The residential portion of the proposed mixed-use development is anticipated to generate:

- 85 elementary students who would attend Westbriar Elementary School, which is projected to operate within its capacity of 424 students through the school year 2010 – 2011;
- 15 intermediate students who would attend Kilmer Intermediate School, which is projected to exceed its capacity of 850 students through the school year 2010 – 2011;
- 38 high school students who would attend Marshall High School, which is projected to operate within its capacity of 1500 students through the school year 2010 – 2011.

Since the current zoning does not permit residential uses, an additional 138 students will be generated by the proposed development. While there is currently sufficient capacity projected for the high school level, Kilmer Middle School is currently experiencing a capacity deficit which is projected to remain through the 2010-2011. The anticipated student yield at the elementary school level could create a capacity deficit at the elementary school level, based on current projections. Special programs in the Marshall High School pyramid include a full day kindergarten at Westbriar Elementary, and Gifted and Talented and special education programs at Kilmer, all of which impact capacity at both schools. Marshall High School renovation planning funds were approved in the 2005 Bond Referendum.
Based on the guidelines for addressing school impacts, based on the students generated by the maximum number of dwelling units proposed by this application (1345 dwelling units), contribution of $1,035,000 for schools (138 students x $7,500 per student) was requested. The draft proffers commit to providing $7,500 for each student generated with the first building permit for each residential building. In addition, the draft proffers include a commitment to raise the amount of the schools contribution if a new guideline is adopted by the Board of Supervisors.

The proposed development provides for safe school bus drop off and pick up for students at each of the residential buildings by providing a drop-off and pick-up area with each residential building in each phase.

**Sanitary Sewer Analysis (Appendix 11)**

The property is located in the Scotts Run (E1) watershed and would be sewered into the Blue Plains Treatment Plant. At the request of the Wastewater Planning and Monitoring Division, the applicant performed a Preliminary Sanitary Sewer Capacity Analysis. Excerpts of that analysis are included in Appendix 3i. This analysis demonstrated that, while the existing development is adequately accommodated, prior to full build out of the proposed redevelopment, two pipes located off-site and in an easement will have to be upgraded from 12 inch pipes to 15 inch pipes to accommodate peak flows. The draft proffers include a commitment to upgrade the sanitary sewer system in accordance with the recommendations of the sanitary sewer study.

Should the Board approve this application, that approval does not guarantee that sewer capacity will be available to serve this site when the applicant seeks to develop the property.

**Fire and Rescue Department Analysis (Appendix 12)**

This property is serviced by Station 29, Tysons Corner. This service currently meets fire protection guidelines.

The applicant has coordinated with the Fire Marshal on several issues regarding this project including, but not limited to, the provision of fire lanes within Phases 1 and 2, fire equipment access in Phases 3 and 4 and the requirements to allow the proposed Sky Terrace, a public assembly use, to be located on top of a parking garage as part of Phase 4. Confirmations that these issues have been adequately resolved with that office was transmitted to the Department of Planning and Zoning by e-mail and are included in the files for this application in that office.

In addition, the draft proffers include a commitment to continue to provide a 1700 square foot community space within the mall for use by County public safety agencies including providing basic office furniture. The mall already includes such a facility.
Water Service Analysis (Appendices 13 & 14)

The property is located within the service area of the City of Falls Church, which notes that adequate domestic water service is available. The adequacy of water service will be re-evaluated at the time of site plan approval and, it may be determined at that time that the size of water mains may be required to be increased. See Appendix 13.

The property also contains a 24-foot wide Fairfax Water easement with a 42-inch water main (see Appendix 14). This easement will require that the water authority review any site plans for impacts to the easement and water main. The 10 foot wide trail proposed along ShopTysons Boulevard runs along this easement. The applicant has coordinated with the Fairfax Water, which has determined that the trail alignment within the easement is acceptable subject to certain conditions. The draft proffers state that if Water Authority does not grant permission to re-grade in the easement, the funds to construct the trail would be contributed to the Providence District Trail Fund. The Rail CDP/FDP includes an alternative design that would not affect the easement. This alternative is not the preferred outcome because it would shift the ring road further into the site and diminish the amount of green space between the ring road and Parking Terrace E.

Affordable Dwelling Units

Criterion 7 of the Development Criteria states that ensuring an adequate supply of housing for low and moderate income families, those with special accessibility requirements and those with other special needs is a goal of the County. The applicant can elect to fulfill this criterion by providing affordable units that are not otherwise required by the ADU Ordinance. As an alternative, land adequate and ready to be developed for an equal number of units may be provided to the Fairfax County Redevelopment and Housing Authority or to such other entity as may be approved by the Board. Satisfaction of this criterion may also be achieved by a contribution to the Housing Trust Fund or, as may be approved by the Board, a monetary and/or in-kind contribution to another entity whose mission is to provide affordable housing in Fairfax County, equal to 0.5% of the value of all of the units approved on the property except those that result in the provision of ADUs. This is also a recommendation contained in the Plan guidance for the Tysons Corner Urban Center.

Given the type of residential buildings that are to be constructed, Par. 1 of Sect. 2-803 of the Zoning Ordinance does not require that affordable dwelling units be provided.

To address this criterion and the Comprehensive Plan guidance for the Tysons Corner Urban Center which states that “for all development proposals with a residential component, affordable housing should be provided in accordance with the Affordable Dwelling Unit Ordinance and/or other Board-adopted policies regarding affordable housing,” the draft proffers state that 8 percent of the proposed residential units will be provided as what the proffer identifies as affordably priced rental housing
units (APRUs). APRUs would be provided under both development options with a minimum of 8 percent provided with each phase. These units will be provided for 30 years as rental units that are affordable to individual and families at 70 percent of the Washington D.C. Standard Metropolitan Statistical Area median household income. The proposed units will number a maximum of 108 APRUs and will be one bedroom, studio and efficiency units. The size of the units will range from 400 to 900 feet, with an average size of 550 feet. Up to 30 percent of APRUs can be provided off-site in Tysons Corner if approved by the Zoning Administrator. Staff believes that the aforementioned commitment is very responsive to the issue.

Heritage Resources

Criterion 9 of the Residential Development Criteria states that heritage resources are those sites or structures, including their landscape settings that exemplify the cultural, architectural, economic, social, political or historic heritage of the County or its communities.

The application property does not contain any identified heritage resources.

ZONING ORDINANCE PROVISIONS (Appendix 15)

Minimum District Size/Minimum Lot Size Requirements (Sect. 6-207):

This section contains minimum size parameters that a proposed PDC District must meet. The proposed PDC District exceeds the parameter established in Par. 1A, in that it exceeds 100,000 sq. ft. of GFA.

Par. 2 of Sect. 6-207 states that there is no minimum lot size for any building.

Bulk Requirements (Sect. 6-208):

Pars. 1 and 2 refer to the Design Standards contained in Part 1 of Article 16, Development Plans, with regard to the standards for maximum building height and minimum yard requirements. The design standards will be addressed below under Standards Applicable to all P-District.

Par. 3 addresses the maximum allowable floor area ratio (FAR) and sets a maximum FAR of 1.5. However, this paragraph also allows the Board to approve, at its discretion, up to a maximum of 2.5 FAR when the development meets one or more of the four standards outlined therein.

The proposed FAR of the Pre-rail option is 1.08. The FAR of the Rail option will be 1.77 with the completion of Phase 4. The proposed redevelopment of Tysons Corner Center includes all four of the features that must be included to qualify for the increase above 1.5 FAR:
1. open space in excess of the requirement – fifteen percent (15%) is required and twenty-three percent (23%) is provided;
2. “unique design features such as, but not limited to, terraces, sculpture, reflecting pools and fountains” are provided;
3. below surface parking spaces are provided; and,
4. structured above ground parking spaces are provided.

The Rail CDP/FDP meets these requirements; therefore, staff has concluded that the requested FAR above 1.5 is appropriate in this instance.

Transitional Screening Yards & Barriers

As described in the Description of the Surrounding Area section above, the property is bounded on four sides by divided roadways that are four or more lanes wide with turn lanes, and the Capital Beltway, an interstate highway. The uses across these roadways consist primarily of other commercial uses that are similar to those proposed on the site except for two existing high rise multi-family buildings located to the east across the Capital Beltway, and one planned high rise multi-family building to be constructed to the north across Chain Bridge Road that, pursuant to the matrix included in Article 13, Landscaping and Screening, should be buffered by transitional screening and barriers.

Where offices and retail establishments abut high-rise residential buildings, a transitional screening yard 1, twenty-five feet wide, and barriers D (a 42 to 48 inch tall chain link fence), E (a six foot tall brick or architectural block wall), or F (a six foot tall wooden fence) are required. Some of the allowed uses listed in the draft proffers would require transitional screening yard 2, which is thirty-five feet wide and the same barrier requirement.

The application includes a request to modify the transitional screening yard requirement along the northern and eastern boundaries pursuant to the provisions of Par. 3 of Sect. 13-304, which allows such modifications when the property has been designed to minimize adverse impacts. Given the application property is located in the Tysons Corner Urban Center which has specific streetscape provisions, which are being met, and given the more urban character of the area, staff concurs with the requested modification of the transitional screening yard requirement along the northern boundary. The width of the Capital Beltway obviates the effectiveness of screening, and staff concurs in the requested modification to the east. However, staff recommends that trees be planted along the trail to the extent that the existing Fairfax Water easement does not preclude such plantings, which are not currently shown on the Rail CDP/FDP. The application also includes a request to waive the barrier requirements along these boundaries. Par. 12 provides for a waiver of the barrier requirement when the topography between the affected lots is such that the barrier would be ineffective, such as, as is the case in this instance, a ten-lane divided road and an interstate highway. For this reason, staff also concurs with the request to waive the barrier requirement along the eastern and northern boundaries.
A modification of the transitional screening yard requirement and a waiver of the barrier requirement have also been requested with regard to the area between of the proposed high-rise multi-family buildings and the commercial structures proposed within Tysons Corner Center. Par. 1 of Sect. 13-304 provides for such modifications and waivers on a site that is to be developed under a common development plan within the PDC District when compatibility between uses has been addressed through a combination of the location and arrangement of buildings or through architectural or landscaping treatments. Based on the design proposed with the Rail CDP/FDP and the Pre-rail CDP/FDP, staff recommends that the requested modification of the transitional screening yard requirement and waiver of the barrier requirement within this project be approved.

**Interior Parking Lot Landscaping**

Sect. 13-201 requires that interior parking lot landscaping be provided such that five percent of the area of the parking lot is landscaped. The application includes a request to waive the interior parking lot landscaping requirements for the existing above ground parking garages, Parking Terraces B, C and E. Pursuant to the provisions of Par. 6 of Par. 13-201, in conjunction with the approval of a rezoning application, the Board may approve a waiver or modification of the interior parking lot landscaping requirement when such modification will not have a deleterious effect on the existing or planned development of adjacent properties.

Parking Terrace B is the existing parking garage at the end of the Bloomingdale’s wing of the mall building. The future development of the Building 3-B, the office building on Leesburg Pike, will buffer most of this structure from views from Leesburg Pike. The redevelopment of Tysons Corner Center will not change the circumstance for the properties located to the east or west of this arm of the application property. Parking Terrace E was constructed a part of the recent expansion of the mall at the end of the wing located closest to the Capital Beltway. Parking Terrace C is located between the eastern wing of the mall building and the Towers Crescent development and faces the parking deck associated with that development. The upper level of Parking Terrace C is visible only from the upper levels of the adjacent and planned office buildings in Towers Crescent.

Staff supports the requested waiver of the interior parking lot landscaping requirements for existing Parking Terraces B, C and E, because this represent the existing conditions, retrofitting the tops of decks is very difficult and since the site otherwise exceeds the amount of open space required. It should be noted that the tops of the new parking decks will include turf and other landscaping. The applicant has also proffered to construct the Community Green, located on top of the underground parking deck in Phase 3 and portions of the Sky Terrace in Phase 4 as “intensive green roofs.”

**Peripheral Parking Lot Landscaping**

Sect. 13-202 requires that peripheral parking lot landscaping be provided in a four-foot wide strip with one large deciduous tree every fifty feet where a property
abuts land not in the right-of-way of a street or in a ten-foot wide strip with at least
one tree for every forty feet where the property abuts right-of-way. The application
includes a request to modify this requirement along Chain Bridge Road, where the
parking garages for Phases 1 and 2 abut the roadway. The northern edge of Phase
1 has been redesigned so that the width of the planting strip between the parking
garage and the roadway is no less than eight feet. The modification is also required
for Phase 2 where the proposed bus depot is located. Pursuant to the provisions of
Par. 3 of Par. 13-202, in conjunction with the approval of a rezoning application, the
Board may approve a waiver or modification of the peripheral parking lot landscaping
requirement when such modification will not have a deleterious effect on the existing
or planned development of adjacent properties. In this instance, the frontage along
Chain Bridge Road has been designed to accommodate the bus depot and to
provide an appropriate edge to the site where the ramp to the Capital Beltway is
adjacent to Phase 1. Staff concurs with the requested modification.

Parking

On July 21, 2003, the Board of Supervisors approved a parking reduction for Tysons
Corner Center. This approval was amended September 12, 2005, to permit 10,300
parking spaces to be provided for the Tysons Corner Center, reflecting the recently
completed expansion of the mall building (see Appendix 4). The amended parking
reduction was approved based on the parking accumulation pattern for the expanded
mall building including the multi-plex movie theater and the existing 60,000 sq. ft. of
office space now part of the mall building. The parking reduction included
development conditions that allowed for the expansion of the Macy’s building and
some changes of uses within the mall without requiring that the parking reduction be
amended when “it is determined by the Director that those increases do not affect the
parking accumulation associated with the parking reduction.” The applicant has been
informed by DPWES staff that approval of a new parking reduction will be required
when each phase is developed if the currently approved parking reduction for the
mall is to be continued.

The draft proffers state that parking will be provided in accordance with the
requirements of the Zoning Ordinance, including any future reductions that may be
approved by the Board. The CDP/FDP includes a chart that details the existing
car parking and the parking to be provided with each phase in the “Building and Parking
Schedule” contained on Sheet 3. As noted previously, with the construction of each
phase some parking will be displaced, especially with Phase 2, when existing Parking
Terrace D will be razed. Furthermore, some of the parking located in the new
parking structures will include parking to support the mall. The parking schedule
identifies the parking to be built with each phase for each use within that phase and
identifies the number of spaces to be provided in each structure for mall parking. The
schedule demonstrates that the parking provided within each phase meets the
Zoning Ordinance requirement for the new uses proposed for each phase. Sheet 3
also includes a chart that illustrates the proportion of the number of parking spaces
on the site that will exceed Zoning Ordinance requirements, expressed as a
percentage of the required parking.
This proffer also states that the current parking reduction shall remain in effect with regard to the shopping center until such time as the County determines that it must be amended.

An additional consideration is the availability of parking for each building in close proximity to that building, as well as segregating the parking for each use to ensure that parking for one use does not supplant its availability for other uses. For example, mall parking should not result in a resident or an office tenant not being able to park in the parking structure adjacent to that building. This is addressed by the draft proffers that state that the parking for each use will be separate to ensure that each use will have sufficient parking and that retail parking will be excluded from spaces allocated to office and residential users. The proffer also states that signage will be provided to direct retail patrons to parking for that use. The parking schedule states that there is sufficient parking within each phase to accommodate the residential and office uses in that phase.

Staff requested that the applicant commit to reducing further the parking provided on site to less than the Zoning Ordinance requirement given the proximity of the future rail station and in support of the proffered TDM program. However, the applicant has declined to do so for business reasons, citing difficulties obtaining financing and leasing the property in the future. The applicant has also noted that the cost of providing structured parking is an incentive to seek a parking reduction.

Loading Spaces

The application includes a request to reduce the overall number of loading spaces on site from 62 spaces to 37 spaces. The mall will be provided with the required 17 spaces; however, the total number of loading spaces for the new development proposed to be reduced from 45 to 20 spaces. Two loading spaces are proposed to be provided with each building, i.e. six spaces are provided within Phase 1, four spaces within Phase 2, four spaces within Phase 3 and six spaces within Phase 3. Staff recommends that this request be approved.

Overlay District Requirements

Portions of the property are located in parts of two different overlay districts, the Highway Corridor Overlay District and the Sign Control Overlay District.

*Highway Corridor Overlay District:* This district addresses specific automobile oriented uses, car washes, drive-in banks, drive-through pharmacies, fast food restaurants, quick-service food stores, service stations and service stations/minis-marts. Of these uses, the list of proffered uses includes only fast food restaurants and quick-service food stores. These uses are not proposed to be free-standing; they will be incorporated into the existing and the proposed buildings in Tysons Corner Center. Given this and the character of the development, staff has concluded the proposed conform with the requirements of Sect. 9-505.
**Sign Control Overlay District (SCOD):** The SCOD applies to free-standing signs for commercial and industrial uses and specifically limits office parks and shopping centers to free-standing signs with a maximum of 40 sq. ft. of sign area. The CDP/FDP includes locations for proposed free-standing signs for this mixed use project. The applicant has submitted a Comprehensive Sign Plan that requests approval of 34 foot tall free-standing entrance signs that are similar in sign area to the existing non-conforming free-standing signs, which are 568 square feet in area and approximately 18 feet tall. The Comprehensive Sign Plan can only be acted upon after the site has been rezoned to the PDC District; the CSP is scheduled for public hearing in January of 2007. Until such time as the CSP is approved, all signs on the property must comply with the conditions associated with SPA 89-P-034.

**Use Limitations for the PDC District**

Sect. 6-206 includes several use limitations that are applicable to the PDC District as follows:

Par. 1: This paragraph refers to the standards contained in Part 1 of Article 16 (Sect. 16-100). The subsequent text addressing those standards notes that these standards are, in staff’s judgment, satisfied.

Par. 2: This paragraph notes that the performance standards contained in Article 14 are applicable to the uses within a PDC District. The proffers address the requirements for lighting contained in Part 9 of Article 14. Other performance standards including, air pollution, fire and hazardous materials, radiation hazards, electromagnetic radiation and interference, liquid and solid waste disposal, noise and earthborn vibrations associated with blasting reference the standards contained in other sections of the County Code that are part of construction and other business activities on a property.

Par. 3: This paragraph notes that that standards set forth in Article 8, Special Permits, and Article 9, Special Exceptions, are to be used as a guide in the evaluating all group or category uses noted on a development plan. The group and category uses permitted per the draft proffers will not be located in free-standing buildings but will be located within the office buildings, residential buildings and the existing mall building on the site. As evidenced by the analyses contained in this staff report, staff concludes that the proposed group and category uses conform with the standards for special permit uses and special exception uses.

Par. 4: This paragraph states that all uses shall be in substantial conformance with the approved final development plans as provided for in Sect. 16-403, which requires that site plans be in substantial conformance with the final development plan.

Par. 5: This paragraph addresses secondary uses by requiring: a) that secondary uses are permitted only in a PDC District that includes one or more principle uses; b) limits the amount of gross floor area devoted to dwellings as a secondary uses to fifty percent of the principle uses in the development unless modified by the Board; and,
c) limits the gross floor area of all other secondary uses to less than 25 percent of the gross floor area of the principal uses in the development.

The Rail CDP/FDP, the Pre-rail CDP/FDP and the proffers include the following principle uses: offices, eating establishments, retail sales establishments, hotel, the existing theater in the mall building, garment cleaning establishments, personal service establishments, business supply and service establishments, financial institutions, public uses and repair service establishments. While a gross floor area is not listed on either CDP/FDP for some of the uses listed above, the GFA to be devoted to office, hotel and retails is listed on each CDP/FDP. The Rail CDP/FDP includes approximately 1,389,438 sq. ft. office; 266,513 sq. ft. hotel and in excess of 2.4 million sq. ft. of retail sales, resulting in a total of approximately 4 million sq. ft. of principle uses. The Pre-rail CDP/FDP includes approximately 490,076 sq. ft. office, 266,513 sq. ft hotel and in excess of 2.4 million sq. ft. of retail sales, for a total of approximately 3.16 million square feet of principle uses. The amount of gross floor area devoted to residential use is 1,685,275 sq. ft. (approximately 41 percent of the principal uses) and 480,825 sq. ft. (approximately 15 percent of the principal uses) respectively. In conclusion, both CDP/FDPs include one or more principal uses; the amount of GFA devoted to residences does not exceed fifty percent of the principle uses on site; and, the secondary uses would not exceed 25 percent of the total GFA; as required by Par. 5.

Par. 6: This paragraph requires that the proposed secondary uses be designed to protect the character of adjacent properties and be conducted entirely within a building. As discussed elsewhere in this report, staff concluded that the proposed design more than adequately addresses the relationship between the proposed development and the surrounding properties and such uses are to be located within buildings devoted to principal uses and will not be located in separate free-standing buildings.

Par. 7: This paragraph addressed service stations, and service station/mini-marts and vehicle light service establishment and is not applicable in this instance.

Par. 8: This paragraph addresses the sign regulations which are discussed above in the section entitled Signage.

Par. 9: This paragraph addresses including elderly housing or independent living facilities in a project. The draft proffers state that this use could be added through the approval of a special exception.

Par. 10: Pursuant to Sub-paragraph A, fast food restaurants are permitted when the use is located in a building with at least one other principle use and when they are designed to cater primarily to occupants and/or employees of the building complex, accessible via a clearing designated pedestrian system and are not more than 15 percent of the structure. The possible locations for fast food restaurants in either the existing mall building or within the lower floors of the proposed office or residential buildings demonstrate that any fast food restaurants will meet these standards.
The remaining paragraphs address uses, kennels and veterinary hospitals (Par. 11), drive through pharmacies (Par. 12), vehicle transportation service establishments (Par. 13), and new vehicle storage (Par. 14), that are not proposed to be part of the development.

**Standards for all Planned Developments** (Sect. 16-100)

Sect. 16-101 contains six general standards that must be met by a planned development. Sect. 16-102 contains three design standards to which all Conceptual and Final Development Plans are subject.

**Sect. 16-101, General Standards**

The first general standard requires that the planned development conform with the Comprehensive Plan (Par. 1). As discussed in the Land Use Analysis section above, staff has determined that this standard has been satisfied.

The second General Standard addresses whether or not the planned development is of such a design that it achieves the purpose and intent of a planned development more than would be development under a conventional district (Par. 2). The purpose and intent of the Planned Development Commercial District as contained in Sect. 16-201 is to encourage innovative and creative design of commercial development and to insure high standards of layout design and construction of high density commercial development. Further, the district regulations are designed to accommodate preferred high density land uses that could produce detrimental effects on neighboring properties if not strictly controlled as to location and design. For the reasons discussed elsewhere in the staff report, staff has determined that this standard has been satisfied.

The third general standard addresses the efficient use of the available land and protection of scenic assets and natural features such as trees, streams and topographic features (Par. 3). As noted in the discussion regarding the environmental criterion, there are no natural features remaining on the site. However, the well integrated and well designed plazas, streetscape and landscaping will re-introduce scenic assets to Tysons Corner Center. Staff has concluded that this standard has been satisfied.

The fourth general standard states that the planned development should be designed to prevent substantial injury to the use and value of existing surrounding development and shall not hinder, deter or impede development of surrounding undeveloped properties (Par. 4). This issue is addressed primarily in the discussions regarding the Neighborhood Context Criterion. Staff has determined that this standard has been satisfied.

The fifth general standard addresses the adequacy of public facilities in the vicinity (Par. 5). As noted in the Public Facilities Analysis, the site is located in an area where public facilities and public utilities are or can be available to the property. As noted in the analysis of the sanitary sewer needs, improvements down stream will be
required to accommodate the proposed development; the proffers acknowledge this requirement. The proffers include contributions to schools in the vicinity in accordance with the guideline that has been adopted by the Board, and a commitment to any increased contributions based on the adoption of a new guideline by the Board of Supervisors. Contributions to address the impacts of the proposed development on Park Authority facilities are included in the draft proffers. The details of these contributions are addressed under the Public Facilities Analysis. Staff has determined that this standard has been met.

The sixth general standard addresses internal linkages between internal facilities and to external facilities at a scale appropriate to the development (Par. 6). The roadway and pedestrian networks have been described extensively in this staff report. Staff has concluded that this standard has been satisfied.

Sect. 16-102, Design Standards

The first design standard specifies that, the peripheral yards should generally conform with the setbacks for the most similar conventional district. The most similar conventional districts are the C-4 District for the office use and the R-30 District for residential use. The following yard requirements are specified for these two districts.

<table>
<thead>
<tr>
<th>Yard Requirements In The C-4 And R-30 Districts</th>
<th>C-4</th>
<th>R-30</th>
</tr>
</thead>
<tbody>
<tr>
<td>Front</td>
<td>$25^\circ \ ABP^1 \geq 40$ feet</td>
<td>$25^\circ \ ABP^1 \geq 20$ feet</td>
</tr>
<tr>

<td>No Requirement</td>
<td>$25^\circ \ ABP^1 \geq 10$ feet</td>
</tr>
<tr>
<td>Rear</td>
<td>$20^\circ \ ABP^1 \geq 25$ feet</td>
<td>$25^\circ \ ABP^1 \geq 25$ feet</td>
</tr>
</tbody>
</table>

1. ABP – Angle of Bulk Plane is the angle at ground level of a line drawn from the property line to the top of the building. The building must be located within this envelope while not exceeding the maximum height requirement specified in the applicable zoning district.

Therefore, the following yards would be required on the buildings located along the peripheral boundary for each of the phases. The chart also includes the actual setback proposed in this instance.

1. The required setbacks assume that the building face is vertical for the full height of the building along the lot line from which the setback is being measured.
2. Along Chain Bridge Road Building 2A abuts the area to be dedicated for the bus depot which is to be constructed on land to be dedicated by the applicant for that purpose.

As discussed in the Land Use Analysis section above, there are streetscape standards outlined under the Urban Design portion of the Tysons Corner Urban Center Plan text. An important element of an urban streetscape is the relationship of the building to the street. In this instance, the buildings reflect the recommendations of the Plan that the buildings be located relatively close to streets. As such, the appropriate determination in this instance is whether the proposed buildings are in the proper relationship to the street, whether they further the design guidance contained in the Comprehensive Plan and how the streetscape recommendations contained in the Plan text for the Tysons Corner Urban Center are met. As discussed in the Land Use Analysis section above, staff has concluded that the proposed buildings have an appropriate relationship to the street as evidenced by compliance with the streetscape guidelines contained in the Plan text.

Given that the proposed layout conforms with the streetscape recommendations for the Tysons Corner Urban Center, staff has concluded that Design Standard 1 has been satisfied.

The second design standard states that other applicable provisions of the Ordinance such as off-street parking, landscaping, signs, etc. are applicable to planned developments (Par. 2). This standard is addressed by the analysis regarding Zoning Ordinance provisions above, and has been satisfied.

Design Standard Number 3 specifies that the street systems conform with the applicable requirements and that a network of trails be provided to provide access to recreational amenities open space, public amenities, vehicular access routes and
mass transit facilities (Par. 3). Staff has concluded that this standard has been satisfied as addressed by discussions throughout this report.

CONCLUSIONS AND RECOMMENDATIONS

Staff Conclusions

As illustrated by this report, the planning and land use issues and their resolution by the applicant serve as a model for transforming the Tysons Corner Urban Center in response to the extension of rail transit to and through that part of Fairfax County. The following summarizes the major facets of the project—urban design elements, the relationship to the planned extension of rail transit to and through Tysons Corner, transportation impacts on the road network, and other issues—to illustrate how the application provides that model of the type of development that the County expects in response to the opportunity provided by the rail extension.

The proposed design addresses diverse urban design issues by:

- Providing an appropriate synergistic mix of uses in close proximity to the planned rail station that will, by their nature, reduce vehicular trips;
- Providing a well designed and visually interesting pedestrian system, including a direct connection between the currently planned elevated rail station to the mall and to the proposed additional development on the site;
- Creating a pedestrian friendly environment on a site that was previously designed to focus on the automobile, by creating a system of plazas, pathways, pedestrian oriented streetscapes, and animated building façades;
- Creating an elevated set of plazas and pedestrian walkways that separate the pedestrian from the major traffic movements;
- Locating buildings and plazas in appropriate relationship to one another and so that the plazas have appropriate solar access;
- Proffering to provide animated façade areas on the new buildings and to the mall itself;
- Providing a layout that includes high quality urban design; and,
- Proffering to provide the Planning Commission with architectural plans for review, comment and approval prior to approval of such plans by staff itself.

The conversion of the Tysons Corner Center to a first class mixed use project is tied to the extension of Metrorail through Tysons to Dulles Airport. However, as noted in the Background section, while the Rail Project is moving forward, a funding commitment has not been finalized. To address the limited contingency that the rail project may not proceed as currently contemplated and to ensure that the proposed mixed-use transit-oriented redevelopment of Tysons Corner Center will occur in concert with the implementation of this major transportation asset the draft proffers:

- state that a reduced Phase 1 could be built without the rail project being funded and imminently constructed; and state that if the rail project is implemented at a
later date than currently contemplated, the rail related development could be constructed;

• include commitments that phase the project to the funding, construction and operation of rail: Phase 1 of the Rail CDP/FDP is tied to the funding of rail; Phase 2 cannot be constructed until such time as rail is under construction; Phase 3 can be constructed upon the opening of rail; and, Phase 4 is triggered once rail through Tysons Corner has been in operation for at least two years;

• fund the difference to have the bridge that connects to the rail station widened to sixteen feet wide; and

• state that, if the option to have the portion of the rail extension through Tysons Corner constructed underground rather than above ground is chosen, the applicant will modify the pedestrian connection to accommodate that change.

The impacts of the additional vehicular traffic generated by the proposed mixed use development on the road network in Tysons Corner are also addressed fully. As a result, Tysons Corner Center will become more readily accessible by many modes of transportation as follows:

• The site contains and will continue to accommodate a major bus depot where eight bus routes intersect.

• Additional bus connections will be available at the new bus depot on Chain Bridge Road.

• The draft proffers include a commitment to fund a study of the various existing shuttle programs in Tysons Corner and the feasibility of creating a circulator system within Tysons Corner.

• New pedestrian facilities will better connect this site to the development north of Chain Bridge Road, across International Drive and to Towers Crescent.

• Bicycle paths through the site will provide planned trail links through the site interconnecting the portion of Tysons Corner south of Leesburg Pike with the portion located north of Chain Bridge Road.

• The applicant has proffered the strongest transportation demand management (TDM) program that the County has seen to date. The proffered TDM program includes trip reduction goals that must be met and provides for resources and methods to remedy any shortfalls in achieving the proffered reduction in the number of trips, as well as penalties to be paid by the developer for any shortfall. In addition, the drafts proffers state that, if the proffered trip reduction goals are not met, the third and fourth phases of development cannot be built until such time as the proffered goals are met. The TDM includes monitoring to determine whether the goals are being met, requires periodic coordination, review and approval of reports and plans by the County, and requires that any changes to the program to address shortfalls in meeting the trip reduction goals be approved by the County. The proffered TDM program also includes elements related to the existing mall. This set of commitments constitutes the most robust TDM program presented with a zoning application to date.

• The draft proffers include road improvement and signalization commitments within the site to allow vehicle to move onto, off of, and through Tysons Corner Center more easily. Proffered improvements to the roads immediately
adjacent to the property include widening the Westpark Drive bridge to four lanes with on-road bicycle lanes, widening Chain Bridge Road and International Drive, widening on both sides of Leesburg Pike between International Drive and the interchange with the Beltway, and signal modifications associated with those improvements.

- The draft proffers include funding the design of the interchange at International Drive and Chain Bridge Road shown on the Comprehensive Plan.
- The proffers include a commitment to review and, if approved by VDOT, re-time the signals along Leesburg Pike between Old Gallows Road and the DAAR.

Other planning issues where this application has set an example for the redevelopment of other portions of Tysons Corner and the County include:

- The draft proffers commit to a reduction of the stormwater flowing off the site by 30 percent by including the construction of on-site stormwater detention, where none is required.
- The draft proffers include a commitment to reduce the amount of phosphorous from the site by 14 percent, where the PFM would require an 11 percent reduction.
- The draft proffers include the implementation of various low-impact development techniques which will provide water quality benefits in addition to the commitment to reduce phosphorous discharges from the site noted above.
- The draft proffers state that if the amount required for on-site recreation facilities in the PDC District is raised above the current $955 per dwelling unit, the amount of recreation facilities will equal the greater amount. The applicant has proffered and additional $493 per unit for athletic facilities and fields in the vicinity, which is to be escalated. A one-time contribution of $500,000 for athletic fields to be made within 30 days of the approval of the zoning case being final. A commitment is made to increase the proffered contributions for off-site fields and other recreation facilities requested by the Park Authority.
- The draft proffers provide commitments to the schools and state that the proffered contribution for schools will also be escalated upon an adoption of new guidelines by the Board of Supervisors.
- The proposed residential buildings are, except from the requirement to provide ADUs. In lieu of the 0.5 percent of the value of the residential portion of the project that is recommended by the Residential Development Criteria, the draft proffers commit the applicant to provide eight percent of the dwelling units as units that are affordable to individuals and families that make 70 percent of the MSA median household income.

The CDP/FDP and the draft proffers are the result of a cooperative relationship between staff and the applicant to effect a major change to one of the core areas of Tysons Corner and to provide an example of the transit oriented future for Tysons Corner as envisioned in current recommendations of the Comprehensive Plan. Staff has concluded that the pending application will provide an example of how to implement that transit oriented vision.
Recommendations

Staff recommends approval of RZ 2004-PR-044 subject to the execution of the draft proffers contained in Appendix 1 and approval of the Conceptual Development Plan.

Staff recommends approval of the following requested waivers and modifications:

- Waiver of the service drive requirement along Leesburg Pike (Rt. 7) and Chain Bridge Road (Rt. 123)
- Modification of the minimum 8-foot planting width for trees per Sect. 12-0702(2) of the Public Facilities Manual (PFM)
- Waiver of the barrier requirement along the eastern boundary (adjacent to the Capital Beltway)
- Modification of the transitional screening yard requirements along the eastern boundary (adjacent to the Capital Beltway)
- Waiver of the transitional screening yard and barrier requirements internal to the project
- Modification of the peripheral parking lot landscaping requirement for the western parking structures located adjacent to Chain Bridge Road
- Waiver of the interior parking lot landscaping requirements for the existing parking structure identified as Parking Terrace B, C and E
- Waiver to allow the use of underground stormwater management facilities with residential development pursuant to Par. 6-0303.8 of the PFM subject to the conditions contained in Appendix 7
- Approval by the Board of Supervisors pursuant to Sect. 2-414 of the Zoning Ordinance to allow a commercial building within 75 feet of the right-of-way of an interstate highway (the Capital Beltway – I-495)
- Modification to allow the pedestrian pathways shown on the CDP/FDP (sidewalks, the 25 foot wide sidewalk within the bus depot and an internal loop trail) to meet the requirement for a trail along Chain Bridge Road west of Tysons Boulevard (with rail CDP/FDP only)
- Waiver of the trail requirement along Chain Bridge Road between the site entrance opposite Tysons Boulevard and the ramp for the Capital Beltway
- Modification of the trail along Leesburg Pike to allow combined sidewalk/trail that is consistent with the streetscape recommendations for the Tysons Corner Urban Center
- Modification of the recommended on-road bike trail on ShopTysons Boulevard to allow a ten foot wide off-road bike trail
- Modification of the number of loading spaces required on site
- Waiver of the trail shown on the Trails Plan within the right-of-way of the Capital Beltway

Staff further recommends that the Final Development Plan be approved by the Planning Commission.

It should be noted that the main/trunk sewer lines serving this property may be inadequate. Should the Board approve this application, that approval does not guarantee
that sewer capacity will be available to serve this site, at such time as the applicant elects to develop the property.

It should be noted that it is not the intent of staff to recommend that the Board, in adopting any conditions proffered by the owner, relieve the applicant/owner from compliance with the provisions of any applicable ordinances, regulations, or adopted standards.

It should be further noted that the content of this report reflects the analysis and recommendations of staff; it does not reflect the position of the Board of Supervisors.

Pursuant to Section 15.2-2303 (A), Code of Virginia (1950, as amended) and Sect. 18-204 of the Zoning Ordinance of Fairfax County (1978, as amended), the property owners and applicants for themselves and their successors and/or assigns (collectively referred to as the “Applicant”) in this Rezoning application (“RZ”) proffer that the development of the parcels under consideration and shown on the Fairfax County Tax Maps as Tax Map 29-4 ((1)) 35A and 35C and 39-2 ((1)) 2, 4 and 5 (the “Property”) shall be in accordance with the following conditions if, and only if, Rezoning application RZ 2004-PR-044 is granted. In the event that the Rezoning application is denied, these Proffers shall be immediately null and void and of no further force or effect. The proffered conditions are:

**GENERAL**

1. **Conceptual/Final Development Plan.** The Property shall be developed in substantial conformance with the Conceptual/Final Development Plan dated November 15, 2004, and revised through September 1, 2006, prepared by Patton, Harris, Rust & Associates and consisting of 63 sheets (the “Development With Rail CDP/FDP”), and/or the Conceptual/Final Development Plan dated March 31, 2006, and revised through September 1, 2006, prepared by Patton, Harris, Rust & Associates and consisting of 33 sheets (the “Development Prior to Rail CDP/FDP”), as further described below. Development of the Property under the Development With Rail CDP/FDP is sometimes referred to in these Proffers as the “Development With Rail,” and development of the Property under the Development Prior to Rail CDP/FDP is sometimes referred to in these Proffers as the “Development Prior to Rail.” The use of the term “CDP/FDP” in these Proffers shall mean the Development With Rail CDP/FDP or the Development Prior to Rail CDP/FDP or both, as applicable.

2. **Minor Modifications.** Minor modifications to the CDP/FDP may be permitted pursuant to Section 16-403(4) of the Zoning Ordinance when necessitated by sound engineering or when necessary as part of final site engineering. Building footprints may be decreased, and the number of units and square footage within each building may be adjusted, as long as the minimum open space tabulations provided in the CDP/FDP are not reduced, the minimum building setbacks from the property lines (as provided in accordance with the dimensions shown on the CDP/FDP) are maintained, and the range of residential units and building heights comply with the ranges indicated in the CDP/FDP and these Proffers.

3. **Future Applications.** Any portion of the Property may be the subject of a Proffered Condition Amendment, Rezoning, Special Exception, Special Permit, Variance or other zoning action without the joinder and/or consent of the owners of the other land areas, provided that such application complies with Section 18-204 paragraph 6 of the Zoning Ordinance. Previously approved proffered conditions or development conditions applicable to a particular portion of the Property which are not the subject of such an application shall remain in full force and effect.
PROPOSED DEVELOPMENT

4. **Development With Rail and Development Prior to Rail.** Development of the Property may occur as described in paragraphs A, B and C below.

   A. **Development With Rail.** Subject to the transition provision described in paragraph C, if a Full Funding Grant Agreement or a similar or equivalent funding mechanism (“FFGA”) to finance the Metrorail extension through Tysons Corner has been executed by the time the Applicant intends to begin construction of any part of the new development, such new development of the Property shall be pursued under the Development With Rail CDP/FDP except as otherwise indicated in paragraph C.

   B. **Development Prior to Rail.** If a FFGA to finance the Metrorail extension through Tysons Corner is not executed at the time that the Applicant intends to begin construction of any part of the new development, the Applicant may only pursue development under the Development Prior to Rail CDP/FDP. The Applicant may pursue development of the Property under the Development Prior to Rail CDP/FDP until such time as the FFGA is executed by the relevant parties, and the Applicant chooses to pursue construction of Phases 1, 2, 3 and 4 as described in Proffer #6.

   C. **Transitions in Applicable Development Plans.** If the Applicant has an approved site plan for the Development Prior to Rail CDP/FDP, but has not started construction at the time that a FFGA is executed, then the Applicant shall not be required to construct the Development With Rail, and may proceed with development under the Development Prior to Rail CDP/FDP. In addition, the Applicant reserves the right to begin construction under the Development Prior to Rail CDP/FDP and subsequently complete development of Phase 1 of the Development With Rail CDP/FDP if the FFGA is executed after the Applicant obtains an approved site plan for the Development Prior to Rail CDP/FDP. Alternatively, the Applicant may complete construction under the Development Prior to Rail CDP/FDP and subsequently proceed with Phases 2, 3 and/or 4 as further described in the Proffers.

5. **Development With Rail CDP/FDP.** The Property is approximately 78.65 acres in size and is currently developed with 2,517,057 square feet, which includes the existing Tysons Corner Center super-regional mall (the “Existing Shopping Center”) and an up to 75,000 square foot un-built expansion of the Existing Shopping Center. The additional development proposed with this Development With Rail will supplement the uses and square footage existing on the Property. As contemplated by the CDP/FDP, approximately 42,922 square feet of the Existing Shopping Center will be removed, leaving 2,474,135 square feet in the Existing Shopping Center, including the 75,000 square foot un-built expansion; a maximum of 3,538,900 square feet gross floor area of development may be added to the 2,474,135 square feet of development in four phases as indicated in the CDP/FDP and as follows:
Existing Shopping Center*  
2,474,135 SF

Development With Rail
- Office: 1,389,438 SF
- Multifamily Residential Units: 1,685,275 SF (minimum 950 units, maximum 1,345 units)
- Hotel: 266,513 SF (maximum 300 rooms)
- New Retail and Other Non-Residential/Retail/Commercial Non-Office Uses: 197,674 SF

*Including the 75,000 SF un-built expansion and removal of 42,922 SF of the Existing Shopping Center

6. Phasing of the Development With Rail. The Development With Rail (consisting of a total of 3,538,900 square feet of gross floor area in addition to the Existing Shopping Center) will take place in four phases, as indicated in the CDP/FDP and further described below:

A. Phase 1: Phase 1 consists of a maximum of 1,342,700 square feet of gross floor area. The Applicant may submit and process a site plan or building plans at any time; however, the Applicant shall not obtain approval of any plans or permits, including but not limited to, grading plans, site plans and/or building permits until such time as (1) a FFGA is executed as set forth Proffer #4 and (2) an agreement is executed between the Applicant and the Dulles Transit Partners, the Virginia Department of Rail and Public Transportation and/or their respective successors (jointly, the “Dulles Rail Project Entities”) in accordance with Proffer #51.

B. Phase 2: Phase 2 consists of a maximum of 1,096,900 square feet of gross floor area.

i. The Applicant may submit and process a site plan or building plans at any time; however, the Applicant shall not obtain approval of any plans or permits, including but not limited to, grading plans, site plans and/or building permits until such time as construction of the Metrorail extension through Tysons Corner has commenced.

ii. For the purposes of this proffer, commencement of construction of the Metrorail extension through Tysons Corner shall be deemed to have occurred upon the commencement of site work related to the construction of the track or stations for the Dulles Corridor Metrorail Project.

C. Phases 3 and 4: Phase 3, as shown on the Development With Rail CDP/FDP, is comprised of 379,900 square feet of gross floor area, and Phase 4, as shown on the Development With Rail CDP/FDP is comprised of 669,400 square feet of gross floor area. An additional 50,000 square feet residential development may be allocated to either Phase 3 or Phase 4 or shared between both of those phases as long as the maximum number of residential units does not exceed 1,345.

i. Order of Phases 3 and 4. At the Applicant’s discretion, Phases 3 and 4 of the Development With Rail may occur in either order, as long as the first of the two phases occurs after the conditions of Proffer 6.C.ii have been met, and the second of the two phases occurs after the conditions of Proffer 6.C.iii have been met.

ii. Third Phase Timing. The Applicant may submit and process a site plan or building plans at any time; however, the Applicant shall not obtain approval of any plans or permits for the third phase, including but not limited to grading plans, site plans and/or building permits until such time as (1) the Tysons Central 123 Metro Station is in operation, (2) an elevated pedestrian bridge connecting the Property to the Tysons Central 123 Metro Station is open for use, (3) a bus plaza located on the Property is in operation, and (4) the conditions of subparagraph iv below have also been met.
iii. **Fourth Phase Timing.** The Applicant may submit and process a site plan or building plans at any time; however, the Applicant shall not obtain approval of any plans or permits, including but not limited to grading plans, site plans, and/or building permits until such time as (1) the Tysons Central 123 Metro Station is in operation for not less than two years, (2) an elevated pedestrian bridge connecting the Property to the Tysons Central 123 Metro Station is open for use for not less than two years, (3) the bus plaza located on the Property is in operation for not less than two years, and (4) the conditions of subparagraph iv below have also been met.

iv. **TDM Threshold for Third and Fourth Phase Timing.** In addition to complying with subparagraphs ii and iii above for the third and fourth phases, the Applicant shall not obtain approval of any plans or permits, including but not limited to grading plans, site plans, and/or building permits if penalties related to the Transportation Demand Management Program are due or have been paid under Proffer #41.O, unless the sum of all AM and PM peak hour vehicle trips for all uses that have reached Stabilization at the time of the immediately preceding annual Trip Count was less than the combined totals for Maximum Trips After Reduction during both AM and PM peak hour trips for all such uses as contained in the applicable table in Proffer #41.A.ii. The terms Stabilization, Trip Counts and Maximum Trips after Reduction are defined in Proffer #41.

a. To illustrate the effect of this subparagraph iv, if development is occurring under the Development With Rail, notwithstanding that penalties may be due or have been paid under Proffer #41.O, the Applicant may proceed to the third phase if the aggregate number of AM and PM peak hour vehicle trips for all uses that have reached Stabilization in Phases 1 and 2 is less than 2,522. The Applicant may proceed to the fourth phase only if the aggregate number of AM and PM peak hour vehicle trips for all uses that have reached Stabilization for Phases 1, 2 and 3 is less than 2,817 in order to proceed to the fourth phase if the fourth phase is Phase 4, or 3,271 for Phases 1, 2 and 4 in order to proceed to the fourth phase if the fourth phase is Phase 3.

7. **Development Prior to Rail CDP/FDP.** In the Development Prior to Rail CDP/FDP, approximately 42,922 square feet of the Existing Shopping Center will be removed, leaving 2,442,057 square feet in the Existing Shopping Center, including an up to 75,000 square foot un-built expansion. The Applicant proposes to add an additional 1,262,738 square feet of gross floor area of development to the existing development under the Development Prior to Rail in the location where Phase 1 of the Development With Rail CDP/FDP is shown. The Applicant reserves the right to begin construction under the Development Prior to Rail and subsequently complete development of the Property under the Development With Rail CDP/FDP as set forth in Proffer #4.
If the Applicant begins development under the Development Prior to Rail, at such time as the FFGA is executed by all appropriate parties, the Applicant may proceed with development of Phases 1, 2, 3 and 4, as described in Proffers #4 and #6. In that event, at such time as the Applicant constructs Phase 2 under the Development With Rail, the Applicant shall complete the improvements indicated in Proffers 38.C.ix and #43.A.iii, if such improvements have not been completed.

The total square footage of the Development Prior to Rail is broken down as follows:

<table>

8. Owners’ Associations

A. Umbrella Owners’ Association. Prior to the issuance of the first RUP or first Non-RUP under either the Development With Rail or the Development Prior to Rail, the Applicant shall establish an Umbrella Owners’ Association (the “UOA”). Tysons Corner Holdings LLC and Tysons Corner Property Holdings LLC, or any successor entities that are the owners of the Existing Shopping Center, shall be members of the UOA.

B. Homeowner and Condominium Owners’ Associations. For each residential building in which units are held for sale, the Applicant shall cause either a homeowners’ association and/or a condominium owners’ association (“HOA/COA”) to be formed for that building. Each of these associations shall be members of the UOA.

C. Disclosures. UOA and HOA/COA documents (including budgets provided in any offering or sale materials) shall specify the proffer and maintenance conditions and obligations set forth in these Proffers. Purchasers shall be advised in writing of these proffer conditions and obligations prior to entering into a contract of sale.

D. UOA TDM Obligations. All residents, tenants, owners, employers and employees living, working, operating a business or owning property within the Property shall be advised of the TDM Plan described in Proffer #41. All UOA and HOA/COA members shall be informed of any funding obligations for the TDM program prior to entering into a contract of sale, and all such obligations shall be included in UOA and HOA/COA documents.

9. The Existing Shopping Center and the Proffers. These Proffers and the CDP/FDP include a number of road and other improvements that shall be implemented in conjunction with the development of the new buildings and facilities. A 75,000 square foot un-built expansion
may be added to the Existing Shopping Center building in the location identified on the CDP/FDP as Macy’s, and/or other exterior or interior renovations or other improvements to the Existing Shopping Center, but not the addition of any new square footage to the structure, beyond the 75,000 square feet referenced above, may be carried out without requiring the construction or implementation of the phased road and other improvements that are specifically proffered herein.

Many of these proffers include references to contributions or improvements that are required following the issuance of a specific Residential Use Permit (“RUP”) or Non-Residential Use Permit (“Non-RUP”). For the purpose of these proffers, when RUPs or Non-RUPs are referenced, the RUPs or Non-RUPs are not those associated with the Existing Shopping Center but are those associated with the proposed new office, residential, Retail/Commercial and/or hotel uses.

10. Mix of Uses. The Property shall consist of a mix of residential, office, retail, service and hotel uses and may include the following uses, subject to the limitation that the maximum square footage of the residential, office, new Retail/Commercial and hotel uses shall not exceed the square footages indicated in the CDP/FDP and the limitations of Proffer #6 and #7. In addition, the following uses are permitted on the Property.

- Eating establishments
- Theatres
- Bank teller machines
- Amusement arcades
- Fast food restaurants (without drive-through)
- Quick-service food stores
- Vehicle rental establishments permitted with no more than twenty-five (25) total vehicles on the Property at any one time and with no individual vehicle rental establishment to exceed more than 10 cars on the site at any one time; the location of the storage spaces for the rental vehicles shall be shown on the applicable site plan.
- Billiard and pool halls
- Bowling alleys
- Commercial swimming pools, tennis courts and similar courts
- Health clubs
- Financial Institution
- Indoor archery ranges, fencing and other similar indoor recreational uses
• Miniature golf courses
• Skating facilities
• Community clubs, centers, meeting halls, swimming pools, archery ranges
• Swimming clubs, and tennis clubs/courts
• Dwellings as indicated on the CDP/FDP
• Institutional uses
• Child care centers and nursery schools with approval of a Special Exception unless shown on the proffered CDP/FDP or in accordance with Proffer #16.
• Churches, chapels, temples, synagogues and other such places of worship with a child care center, nursery school or private school of general or special education with approval of a Special Exception
• Colleges and universities
• Cultural centers, museums and similar facilities
• Independent living facilities with the approval of a Special Exception
• Private clubs and public benefit associations
• Private schools of general education with approval of a Special Exception
• Private schools of special education with approval of a Special Exception
• Personal service establishments
• Business supply and service establishments
• Garment cleaning establishments (restricted to an establishment that provides drop-off/pick-up service only with no on-site processing/cleaning)
• Public uses
• Repair service establishments
• Retail sales establishments

11. **Community Space.** The Applicant shall provide, at no cost to the County, a centrally-located space of not less than 1,700 square feet in the Existing Shopping Center or elsewhere on the Property for use by Fairfax County to serve the Fairfax County Police, the Fairfax County Fire Department and/or other users as coordinated by the County and the Applicant. The
Applicant shall provide utilities, cleaning services and general maintenance for this space at no cost to the County. The Applicant shall also provide basic office furniture, including desks, chairs and tables.

12. **Incubators.** The Applicant shall provide opportunities for small and minority-owned businesses to obtain retail cart or kiosk space within the Existing Shopping Center and within other interior or exterior areas of the Property and will consider these businesses, if successful, as candidates for tenancy as in-line retail space becomes available in either the Existing Shopping Center or elsewhere on the Property. Upon request, the management of the Existing Shopping Center shall facilitate coordination between small and minority-owned businesses and third party organizations that may be able to provide assistance to these incubators.

13. **Metrorail Tax District Buyout for Certain Residential Uses.** At least sixty days prior to recording residential condominium documents for any portion of the Property located within the Phase I Dulles Rail Transportation Improvement District (the "Phase I District"), the Applicant shall provide a written notice to the Director of the Real Estate Division of the Fairfax County Department of Tax Administration advising that the Applicant intends to record condominium documents for that portion of the Property. Prior to recording the condominium documents, the Applicant shall pay to Fairfax County a sum equal to the then-present value of Phase I District taxes that will be lost as a result of recording the condominium documents, in accordance with a formula approved by the Fairfax County Board of Supervisors.

14. **Hours of Operation of the Existing Shopping Center Corridor and Elevated Pedestrian Bridges.** To permit convenient access to and through the Property to the Tysons Central 123 Metro Station, the interior mall corridors (other than service corridors) of the Existing Shopping Center and the interior pedestrian circulation routes as indicated on the CDP/FDP (including the bridges proposed to the neighboring Towers Crescent Property per Proffer #29) shall be open not less than between the hours of one hour before and one hour after the hours of operation of the Tysons Central Metro 123 Station. This proffer shall take effect at the time the Tysons Central 123 Metro Station becomes operational for general public use. This proffer shall not preclude the Applicant from (A) altering the alignment of the interior corridors of the Existing Shopping Center as long as mall corridors as a whole provide substantially equivalent connectivity, (B) from temporarily limiting portions of the corridors, as necessary, for cleaning, tenant construction and/or other Existing Shopping Center operations as long as mall corridors provide substantially equivalent connectivity and appropriate signage is provided, or (C) exercising such other reasonable controls over such corridors and bridges to prevent the general public from acquiring rights of access that are inconsistent with the status of the Property as private property, as long as mall corridors as a whole provide substantially equivalent connectivity.

15. **Grocery and Convenience Store.**

   A. **Grocery Store.** The Applicant shall provide a grocery store of at least 5,000 square feet and no more than 15,000 square feet on the Property no later than at the time of issuance of the 106th RUP for Phase 4 or the Non-RUPs for 140,650 square feet of office space for Phase 4 of the Development With Rail, unless by such time a grocery store of a similar or larger size has been opened for business within Land Units O or P as identified in the Tysons Corner Urban Center.
Comprehensive Plan, and except as further described below. This grocery store shall provide daily necessities and prepared foods to serve primarily the residents and tenants of the Property. As a neighborhood serving grocery store, it shall neither be a quick-service (convenience) food store nor a large-format destination supermarket. At the time of submission of site plans for Phase 2, the Applicant shall identify a location on the Property where the grocery store described above may be located (“Grocery Store Location”).

i. Notwithstanding the foregoing, if the Applicant has not begun construction of the third phase (either Phase 3 or 4) within five years after issuance of the final RUP or Non-RUP for Phase 2, the Applicant shall provide a grocery store as described in paragraph A on the Property.

ii. Notwithstanding the foregoing, if the Applicant has not begun construction of the fourth phase (either Phase 3 or 4) within five years issuance of the final RUP or Non-RUP for the third phase, the Applicant shall provide a grocery store as described in paragraph A on the Property.

B. Quick Service Food Store. The Applicant shall provide a quick service food store on the Property prior to issuance of the 129th RUP for Phase 1 or the Non-RUPs for 278,750 square feet of office space for Phase 1, whichever occurs first. The existing CVS convenience store located within the Existing Shopping Center shall not satisfy this requirement. At such time as the grocery store as required by paragraph A has opened, the quick service food store shall not be required.

16. Child Care Center. Prior to issuance of the 204th RUP for Phase 2 or the Non-RUP for 272,100 square feet of Phase 2 office space, whichever occurs first, the Applicant shall provide at least one child care center on the Property.

A. The child care center shall accommodate a maximum daily enrollment of no fewer than 100 children and no more than 150 children, which may be modified with approval of a Special Exception without requiring a Proffer Condition Amendment.

B. The child care center shall be marketed primarily to the employees, tenants and residents on the Property. The Applicant reserves the right to modify this requirement with approval of a Special Exception without requiring a Proffer Condition Amendment.

C. The child care center shall meet the child care standards in the Zoning Ordinance current at the time of submission of the building plans, including those standards governing outdoor recreation areas.
17. **Architecture.** Buildings shall be designed with high quality architecture and building materials. The exterior building materials used in the development of the new residential, office and hotel buildings shall consist of glass, steel, brick masonry, architectural pre-cast, stone masonry, architectural concrete and/or other materials of similar quality that are typically used on the exterior of Class A office buildings and residential and hotel buildings of a similar quality. No Exterior Insulation and Finish Systems (EIFS) shall be utilized on any of the new proposed residential, office or hotel buildings. At or prior to the time of submission of building plans to Fairfax County, the Applicant shall provide information on the building architecture and materials and the animated façade areas as specified in Proffer #19 to the Planning Commission for review and approval after consultation with the Providence District Supervisor; no such building plans shall be approved by the County until such approval is granted by the Planning Commission. In the course of its architectural review, the Planning Commission shall consider, among other things, whether the building heights, building articulation and other architectural design characteristics of the proposed buildings are in furtherance of the objectives of the County’s Comprehensive Plan in enhancing the Tysons Corner skyline.

18. **Maximum Building Heights.** The maximum heights of the proposed buildings shall not exceed the building heights indicated on the CDP/FDP. As indicated on the CDP/FDP, the Applicant is committed to maximum building heights and to a range of number of stories. This height limit does not include penthouses, elevators or mechanical equipment rooms covering less than 25% of the roof pursuant to Section 2-506 of the Zoning Ordinance. Penthouses shall be similar in material and color to the building, so the penthouse structure is consistent with the rest of the architecture of the building or is otherwise architecturally integrated with the building. No such penthouse structure shall exceed 25 feet in height, unless it can be demonstrated by the Applicant that such additional height is needed for the elevator the Applicant selects for that building; in which case, the maximum height of the penthouse structure shall not exceed 30 feet. The Applicant shall screen mechanical equipment located on the rooftops of the proposed buildings from ground level view, using parapet walls and other screening walls, materials or devices.

19. **Animated Façade Areas.** The Applicant shall provide animated façade areas throughout the Property as identified on the CDP/FDP and which shall be indicated on the architectural/building plans submitted per Proffer #17.

A. **External Streetscape Presence.** The Applicant shall require new tenants located in the areas identified in the CDP/FDP as “Animated Façade Areas” to create an external streetscape presence through the use of transparent exterior storefront facades (as outlined below in paragraph C) and entries, landscaping, seating areas, canopy and awning shade elements and other techniques that create a building façade that provides interest to pedestrians and vehicles. When negotiating new leases with existing tenants located in the Animated Façade Areas, the Applicant shall require existing tenants to also create such external streetscape presence using the foregoing techniques.
B. **Entry Elements.** The Animated Façade Areas shall include functioning entry doors into the applicable Retail/Commercial space. Such entry elements shall not be separated by a distance of more than 75-feet on-center, unless a greater separation is needed to accommodate larger tenant spaces or as permitted by the Zoning Administrator. Should the layout of a larger tenant not be able to accommodate multiple entries with a maximum spacing of 75 feet, such tenant shall be required to design the façade with glazed elements that are no more than 25-feet apart, and of a size no smaller in area than 48 square feet.

C. **Glazing Requirements and Transparency Levels.** Along the Animated Façade Areas, a minimum transparency level of 45% of the overall area of the façade (as measured across the entire length of the façade and to a height of 15-feet from the lowest finished floor elevation) shall be provided through glazed windows and doors that allow views into the tenant space. Up to 20% of the above described transparent windows or glazing can be met with display windows or glazing that have reduced visibility through sandblasting, glass blocks or other similar methods, that allow for light to enter the interior space without providing direct visibility from outdoors, with the remaining glazing remaining fully transparent.

20. **Buildings 1-A and 1-B Route 123 Retaining Wall and Parking Structure Façade.** As indicated in the CDP/FDP, the Applicant shall treat portions of the parking terrace façade associated with Buildings 1-A and 1-B along Route 123 to provide a high-quality, attractive façade of no greater than 34’ in height above grade at any point as shown on the CDP/FDP. The façade of the wall shall be composed of high-quality architectural block, stone, stone-like material, colored pre-cast concrete or a comparable material. At the time of submission of site plans to Fairfax County, the Applicant shall provide information on the building materials and elevations of this wall to the Planning Commission for review and approval after consultation with the Providence District Supervisor.

A. The Applicant shall provide lighting of the wall to provide a visually interesting façade along Route 123.

B. Along Route 123 in front of Buildings 1-A and 1-B, and as indicated on the CDP/FDP, the Applicant shall provide street trees to help screen the parking structure façade. The Applicant may provide London Plane trees; however, final determination of the tree species and specific planting locations (at least 4’ back from the top of curb) shall be coordinated with Urban Forest Management.

C. Landscaping, including vines and/or lower lying vegetation and planters, shall be provided intermittently within the face of the wall to create horizontal bands of plant materials that will break-up the mass of the wall and integrate the wall into the landscaping. Irrigation and drainage shall be provided on this wall feature to water the vegetation. At the time of site plan submission, the Applicant shall provide details of the wall landscaping (i.e. irrigation, soil information, size of the planting areas, depth of the planting areas, and other such information as Urban Forest Management may request) plans for review by Urban Forest Management. The Applicant shall maintain the landscaping on the wall to ensure the vegetation and the
wall look attractive and provide a plan for such maintenance for the review and approval of Urban Forest Management.

D. Irrespective of the landscaping provisions in paragraph C., at the time of site plan submission, the Applicant may pursue an architectural wall without the landscaping described in paragraph C if the Applicant in coordination with Urban Forest Management determines that vegetation on the wall may not survive or appear attractive. Per this Proffer, the Applicant shall submit information on the building materials and elevations of this alternative architectural wall to the Planning Commission for review and approval.

21. Telecommunications Equipment. Telecommunications equipment serving the Property may be placed on the proposed building(s) rooftop(s); however, any such facilities must (a) comply with the Zoning Ordinance; and (b) be screened, designed and/or setback sufficiently from the perimeter of the roof and penthouse such that they shall not be visible from the surrounding streets at street level. Screening measures may be used such as (i) including the facilities as part of the architecture of the building(s), (ii) utilizing consistent colors, (iii) employing telecommunication screening material, and (iv) flush-mounted antennas.

LIGHTING

22. Lighting. All on-site, outdoor and parking garage lighting shall meet or be less than that permitted under the Outdoor Lighting Standards of Section 14-900 of the Zoning Ordinance. All parking lot and building mounted security lighting shall utilize full cut-off fixtures. Wall-washer type lighting shall use fixtures with shielding such that the lamp surface is not directly visible. Lighting fixtures on the sky terrace on the future improved Parking Terrace A in Phase 4 shall utilize full cut-off fixtures and appropriate heights to mitigate the lighting impact on nearby residential units.

23. Parking Structure Lighting. The Applicant shall utilize full cut-off, low-intensity or recessed lighting directionally shielded to mitigate the impact on the adjacent residences for any lighting along the perimeter of a parking structure not constructed of solid walls. Such lighting shall meet the requirements of Article 14 of the Zoning Ordinance.

24. Construction Lighting. During construction, the Applicant shall attempt to reduce glare from OSHA, VOSHA, VUSBA and local ordinance required superstructure lighting to the extent possible without violating aforementioned laws, regulations or policies. Such measures as cut-off shields, lower intensity or lower number of light bulbs, dimming or extinguishing lighting after operating hours of the Existing Shopping Center will be presented to appropriate inspectors for their consideration.

NOISE ATTENUATION

25. Noise Attenuation. To meet the noise limitations described in paragraphs A through E below, the Applicant shall provide appropriate noise attenuation measures as identified on the CDP/FDP as a “Sound Attenuation Wall” and as determined necessary based on the noise studies required below and as approved by DPZ.
At the time of submission of each site plan, the Applicant shall submit a noise study addressing the buildings shown on that site plan (“Noise Study”) to the Department of Planning and Zoning (“DPZ”) and the Department of Public Works and Environmental Services (“DPWES”) for review and approval. The Noise Study shall indicate the traffic and transit-related noise anticipated from I-495 (including the southbound entrance ramp adjacent to the Property), Route 123 (including transit related noise due to the Tysons Central 123 Metro Station and the associated bus plaza adjacent to the Property), Route 7, International Drive and the Westpark Bridge. The Noise Study shall include projected noise levels in the residential units, hotel rooms, office space and outdoor recreation areas shown on the submitted site plan and will be based on final site topography and conditions shown on the site plan rather than existing topography/conditions. The methodology of the Noise Study, including any noise measurement locations that may be required, shall be subject to the approval of DPZ and DPWES. The following information shall be included in this noise study: the affected buildings, the affected outdoor recreation areas, and the affected residential units, hotel rooms and/or office spaces (occupied spaces) and the noise attenuation measures to ensure that the affected outdoor areas meet the standards outlined below.

A copy of the applicable approved Noise Study shall be included with the submission of the building plans for the construction of each building on the site. The building plan shall identify the affected occupied spaces and the noise attenuation measures, including materials, to be provided to ensure that each such affected occupied space meets the standards outlined below. Supporting information that documents that the proposed noise attenuation measures will be sufficient to attain the interior noise standards shall also be provided. The Applicant shall not obtain building permits until such time as the County has approved the noise attenuation measures for each building.

A. **Outdoor Recreation Areas.** The Applicant shall provide noise attenuation measures shown on the CDP/FDP as necessary to ensure that traffic-related noise in the outdoor recreation areas that are so identified in the CDP/FDP do not exceed 65 dBA Ldn. Adjustments to the noise attenuation measures indicated on the CDP/FDP may be permitted subject to the approval of DPZ to ensure that the noise attenuation measures provide the necessary noise attenuation.

B. **Noise Levels within Residential Units, Hotel Rooms and the Office Buildings.** The Applicant shall provide noise attenuation measures in order to reduce interior noise in all residential units and hotel rooms to approximately 45 dBA Ldn or less. The Applicant shall provide noise attenuation measures to reduce interior noise in the office buildings to approximately 50 dBA Ldn or less.

C. **Identification of Affected Buildings and Units.** The buildings in which noise attenuation measures are required for some or all of the residential units, hotel rooms or office space contained therein shall be identified on the site plans. The specific units or areas requiring such attenuation and the proposed measures to attenuate the noise shall be indicated on the appropriate building plans, as determined by DPWES. This information shall also be disclosed in the UOA documents.
D. **Residential Balconies.** No balconies shall be provided in any areas of the residential buildings projected to exceed 75 dBA Ldn. The Applicant shall disclose in sales contracts/rental agreements that some of the residential balconies may be located in areas where noise levels may exceed 65 dBA Ldn.

E. **Areas in Excess of 75 dBA Ldn.** If the noise study reveals that there are residential units located within an area that exceeds 75 dBA Ldn projected to 2026, then the residential units in that location shall not be built, and the Applicant shall (i) pursue a proffered condition amendment to change the location of the residential units or (ii) replace the residential units with non-residential or office uses as long as the non-residential or office square footage as indicated in Proffer #6 for the Development With Rail and Proffer #7 for the Development Prior to Rail is not exceeded.

**PARKING**

26. **Parking.**

A. **Parking Management.** The Applicant shall separate the parking associated with office, residential and Retail/Commercial uses (including the Existing Shopping Center) to ensure that each of these uses will have sufficient parking per the tabulations indicated in the CDP/FDP or any approved parking reduction. Parking provided for the office and residential uses shall be located in close proximity to the respective use. Spaces allocated for the residential uses shall not be accessible by patrons of the Existing Shopping Center or the new Retail/Commercial uses. Patrons of the Existing Shopping Center may utilize the parking spaces set aside for office use during hours other than normal business hours, as determined feasible by the Applicant and the office tenants. The Applicant shall designate parking for each use through on-site signage to direct drivers to the appropriate parking locations. The Applicant shall provide signage to direct visitors from the parking terraces to the Existing Shopping Center.

   i. Clearly marked pedestrian routes or paths from the parking spaces available to Retail/Commercial patrons in the proposed parking structures to the Existing Shopping Center shall be provided. These routes shall be open and accessible the same hours as the Existing Shopping Center. These routes shall not require patrons to walk through residential buildings.

B. **Parking and Phasing.** At the time that construction of any or all of the four phases is completed, the parking provided in that phase or on the Property (taken as a whole) shall not exceed the Zoning Ordinance parking requirements, except as provided in this paragraph B and except as indicated on the CDP/FDP. Notwithstanding the foregoing, the Applicant may provide more parking than required by the Zoning Ordinance (i) in any phase to the minimum extent necessary to avoid construction of partial floors of parking structures, and (ii) in Phases 1, 2 and 3 to the extent necessary to provide sufficient parking for future phases, subject to the qualification
that the number of spaces provided does not exceed 110% of the number of spaces required by the Zoning Ordinance. As indicated in the CDP/FDP, parking in excess of Zoning Ordinance requirements will be provided during construction of Phase 2 in order to accommodate the demolition of Parking Terrace D.

C. Existing Approved Parking Reduction for the Existing Shopping Center. The Applicant shall pursue a parking reduction for the Existing Shopping Center if Fairfax County determines that an amendment to the governing reduction (as approved by the Board of Supervisors on September 12, 2005 (6399-PKS-010-1)) is required. If such a study is required and the County fails to approve a new parking reduction for the Existing Shopping Center, the Applicant shall provide the parking required by the Ordinance for the Existing Shopping Center.

D. Future Parking Reductions. Given (i) the proximity to the future Tysons Central 123 Metro Station, (ii) the bus facilities already located or to be located on the Property, (iii) the character of the Development With Rail as a mixed-use transit-oriented development, and (iv) the intended effects of the Transportation Demand Management Plan provided in accordance with Proffer #41, the Applicant shall evaluate and pursue parking reduction(s) for the uses associated with the Development With Rail other than the Existing Shopping Center at appropriate times as may be permitted by Article 11, Parking, of the Fairfax County Zoning Ordinance.

SIGNAGE

27. Signage.

A. Advertising/Store Signage. The Applicant shall provide signage as permitted by Article 12 of the Zoning Ordinance and SPA 89-P-034 until and unless SPA 89-P-034 is replaced with an approved Comprehensive Sign Plan or similar approval.

B. Wayfinding Signage. The Applicant shall provide wayfinding signage as permitted by Article 12 of the Zoning Ordinance and SPA 89-P-034 until and unless SPA 89-P-034 is replaced with an approved Comprehensive Sign Plan or similar approval. The Applicant shall provide DPZ Staff and the Planning Commission with a wayfinding sign plan for administrative review and comment during review of each site plan. Such wayfinding sign plan shall depict the signs proposed within the area subject to the site plan and any modifications to signs outside the site plan area. The Applicant shall implement the wayfinding sign plan for each phase by installing all wayfinding signs for that phase prior to the issuance of the first RUP or Non-RUP for that phase. The wayfinding signage plan shall include provision of signage to direct those traveling on the Property to the parking locations associated with each of the uses on the Property.

C. Temporary Signs. No temporary signs (including “Popsicle” style paper or cardboard signs) which are prohibited by Article 12 of the Zoning Ordinance, and no signs prohibited by Chapter 7 of Title 33.1 or Chapter 8 of Title 46.2 of the Code of Virginia, shall be placed on or off-site to assist in the initial sale of residential units.
on the Property. Furthermore, agents and employees involved in the marketing and sale of the residential units on the Property shall be directed to adhere to this policy.

**OFF-SITE ELEVATED PEDESTRIAN CONNECTIONS**

28. **Elevated Connection Across International Drive.** Should the Applicant or others choose to provide an elevated pedestrian bridge across International Drive that would connect the Property and Land Unit O, as such is identified in the Comprehensive Plan, such a bridge may be provided as permitted by the Zoning Administrator. In addition, should an above-grade pedestrian connection across I-495 on the site frontage be funded for construction, the Applicant shall work with County to provide all necessary easements to permit construction of this facility and to provide pedestrian access to the on-site pedestrian network at no expense to the County or the Commonwealth of Virginia.

29. **Towers Crescent Pedestrian Connections.** The CDP/FDP depicts two pedestrian bridges labeled as “Towers Crescent Proffered Bridge” and “Alternative Bridge Alignment” to connect the Property and the property at Tax Map #39-2 ((20)) 1A1, 1E and 1F (the “Towers Crescent Property”); however, it is the Applicant’s intent to participate in the construction of only one bridge except as discussed in paragraph C below. The Applicant prefers to construct the Alternative Bridge Alignment, since this bridge more directly connects the Existing Shopping Center to the plaza on the Towers Crescent Property as indicated on the CDP/FDP. The Applicant shall be required to construct or contribute to the construction of the Towers Crescent Proffered Bridge as described in paragraph A below, unless an alternative bridge is provided as described in paragraph B below.

A. **Towers Crescent Proffered Bridge.** The CDP/FDP depicts a “Towers Crescent Proffered Bridge,” which would provide a pedestrian connection between the Towers Crescent Property and the westerly end of Parking Terrace C on the Property. This bridge connection is also indicated on the Generalized Development Plan associated with the Towers Crescent Property development (RZ 1998-PR-058). Proffer #24 of the proffers associated with RZ 1998-PR-058 (the “Towers Crescent Proffers”) describes the commitment of Tycon Tower I Investment Limited Partnership, Towers Crescent LLC and Towers Crescent Land LLC (and their successors or assigns) (collectively, the “Towers Crescent Owners”) to construct a pedestrian bridge connection between the Property and the Towers Crescent Property. The provision of this bridge connection is required by this Proffer if the proposed bridge receives necessary approvals from Fairfax County, and if the easements and funding as further described in this proffer are provided by the Applicant and the Towers Crescent Owners.

   i. The Applicant shall (a) provide easements as necessary for the construction of the Towers Crescent Proffered Bridge from the centerline of Fashion Boulevard to Parking Terrace C at such time as the Towers Crescent Owners submit a site plan for this pedestrian bridge, and (b) provide funds to the Towers Crescent Owners necessary for the construction of the pedestrian bridge from the centerline of Fashion Boulevard to Parking Terrace C in accordance with the Towers Crescent
Proffers, provided that the Towers Crescent Owners submit the design and final construction cost information for the pedestrian bridge to the Applicant for its reasonable review and approval. The Applicant shall provide funds for construction of the Towers Crescent Proffered Bridge as construction progress payments, such that funds shall be advanced to fund the construction of the bridge as it is completed.

ii. To permit convenient pedestrian access across the bridge and to and through the Property, the Towers Crescent Proffered Bridge shall remain open not less than the same hours as the mall corridor hours are open in the Existing Shopping Center. At such time as the hours of operation are extended in the mall corridors per Proffer #14, the hours of operation of the bridge shall be extended accordingly.

iii. If the Towers Crescent Owners have not begun construction of the Towers Crescent Proffered Bridge as of the time of the Applicant’s submission of a site plan for Phase 2, the Applicant shall thereafter construct the bridge at such time as the Towers Crescent Owners provide (i) the necessary easements (at no cost to the Applicant), (ii) funding for the design of the bridge and (iii) all of the costs of construction of the bridge other than those costs that are required to be paid by the Applicant under this Proffer. The Applicant shall diligently pursue the three aforementioned items from the Towers Crescent Owners. If the Towers Crescent Owners fail to provide the easements and design and construction funding described in this proffer, the Applicant shall provide the County with documentation of such easements and funding.

iv. If such funds and/or easements have not been provided by the Towers Crescent Owners prior to approval of a site plan for Phase 2, the Applicant shall not be required to design and/or construct this bridge connection. In such event, however, the Applicant shall be obligated to (A) escrow funds in an amount approved by Fairfax County DPWES equal to the cost of constructing the Towers Crescent Proffered Bridge from the centerline of Fashion Boulevard to Parking Terrace C (including a safe pedestrian connection into the Existing Shopping Center) as indicated in the CDP/FDP, and (B) provide the necessary construction and access easements to permit the construction of the bridge connection to any party ready, willing and able to complete the construction of the bridge connection (such as, but not limited to, Fairfax County). If six years after the Applicant provides the escrow to the County plans have not been submitted to the County to permit construction of the Towers Crescent Proffered Bridge, the escrow shall be returned to the Applicant.

B. Substitute Elevated Bridge Location. If, prior to the construction of the Towers Crescent Proffered Bridge as outlined in paragraph A above, the Applicant and the Towers Crescent Owners reach a written agreement that provides for a
substitute elevated pedestrian bridge connection between the Towers Crescent Property and the Property (such as, but not limited to, the Alternative Bridge Alignment indicated on the CDP/FDP), such that the alternate location shall be constructed instead of the Towers Crescent Proffered Bridge, provided that (1) the design, location and the schedule for the construction of the alternate elevated bridge are approved by the Zoning Administrator (including the pedestrian pathways across Parking Terrace C), and (2) such alternate elevated bridge is constructed in accordance with designs and plans and on a schedule as approved by the Zoning Administrator.

C. Additional Elevated Bridge Location. The Applicant reserves the right to construct another bridge in addition to the Towers Crescent Proffered Bridge (such as, but not limited to, the Alternative Bridge Alignment) so long as (1) the design and location of the alternate elevated bridge are approved by the Zoning Administrator (including the pedestrian pathways across Parking Terrace C), and (2) such alternate elevated bridge is constructed in accordance with designs and plans as approved by the Zoning Administrator.

LANDSCAPING

30. Landscape Plan. The CDP/FDP includes a conceptual landscape plan for the Property, consisting of an overall plan and details regarding streetscapes, plazas, the wall described in Proffer #20 and other features. As part of the site plan submission for each phase, the Applicant shall submit to Urban Forest Management of DPWES for review and approval a detailed Landscape Plan, which shall include, among other things, irrigation information, design details for tree wells and other similar planting areas above structures and along streets; the composition of the planting materials and/or structural soils used where plantings are to be located within or on top of structures and along streets and other methods to be used to ensure the viability of the proposed plantings; information demonstrating that the requirements of this Proffer have been met; and other information that may be requested by Urban Forest Management. Such Landscape Plan shall be consistent with the quality and quantity of plantings and materials shown on the CDP/FDP and Proffers 30-32. Adjustments to the type and location of vegetation and the design of the plazas, pocket parks and streetscaping shall be permitted subject to approval of the Zoning Administrator.

31. Streetscaping. Streetscaping shall be provided throughout the site as indicated in the CDP/FDP. The Applicant shall phase the planting of streetscaping as indicated in the CDP/FDP.

A. For trees within 15 feet of the proposed buildings, the Applicant may shift the location of said trees to address final tenant program and urban design with Zoning Administrator approval. In some instances, said trees may be relocated or shifted to avoid conflicts and facilitate urban design elements such as outdoor cafes, entry doors and facilities/structures related to the buildings. Those trees located in the row closest to the curb shall not be shifted as described in this paragraph; however, the Applicant may make other adjustments as necessary due to engineering reasons if approved by DPZ.
B. After the approval of this rezoning, if the applicable streetscaping guidelines in the Comprehensive Plan are revised, the streetscaping may be adjusted to incorporate adjustments to the streetscaping guidelines in the Comprehensive Plan. Such modification may be permitted subject to approval of the Zoning Administrator.

C. Brick pavers or tree grates shall be used for tree wells.

32. **Structural Soil.** For trees not planted within an 8-foot wide minimum planting area, or that do not meet the minimum planting area required by the Public Facilities Manual (“PFM”), the Applicant shall provide a minimum of 130 square feet and 90 square feet of surface area of structural soil for those trees identified as Category 4 and 3 shade trees, respectively, in the PFM. The structural soil shall have a minimum width of 8-feet and a minimum depth of 36-inches and shall be connected to the extent feasible, as determined by Urban Forest Management. Geotextile fabric shall be provided between the structural soil and a layer of organic material located on top of the structural soil. At the time of site plan submission, the Applicant shall provide written documentation, including information about the composition of the structural soil, to Urban Forest Management indicating that a qualified and appropriately licensed company provided the structural soil. The Applicant shall provide 72-hour notice to Urban Forest Management and the Providence Supervisor’s Office prior to installation of the soil to allow verification of the composition of the structural soil and verification that the structural soil is installed correctly. The Applicant shall provide written confirmation from a certified arborist and/or landscape architect demonstrating and verifying installation of structural soil.

**SANITARY SEWER AND STORMWATER MANAGEMENT**

33. **Sanitary Sewer Coordination.** In connection with the development of the new residential, office and hotel buildings on the Property under the Development With Rail or the Development Prior to Rail, the Applicant shall upgrade portions of the sanitary sewer system that serve the site in accordance with the recommendations in the Preliminary Sanitary Sewer Capacity Analysis prepared by Patton, Harris, Rust & Associates and dated May 16, 2006 and as may be determined necessary by DPWES. Upon request of DPWES, the Applicant shall provide capacity analyses at the time of site plan review.

34. **Stormwater Management Master Plan.** At the time of review of the first site plan, the Applicant shall prepare and obtain approval from DPWES of a Stormwater Management Master Plan (the “Stormwater Plan”) for the entire Property. This plan shall address water quality and quantity management and phasing of construction of the proposed stormwater mitigation measures in accordance with the CDP/FDP. This plan shall use computational methods acceptable to the County to demonstrate satisfaction of this proffer for the entire Property. The stormwater management described below is proposed for the Development With Rail and the Development Prior to Rail. The stormwater management requirements indicated below for the Development Prior to Rail are the same as for Phase 1 of the Development With Rail. At the time of site plan review for each subsequent site plan, if any, the Applicant shall update the Stormwater Plan as necessary as determined by DPWES. These updates shall include new computations supporting any modifications to the stormwater detention or stormwater quality treatment proposed since the County approval of the previous Stormwater Plan.
A. **Water Quantity Goals.** As of the date of these Proffers, there is no on-site detention of water on the Property. Using underground detention methods similar to those shown in the CDP/FDP, the Stormwater Plan shall demonstrate at full build-out of the Development With Rail a thirty percent (30%) reduction in the existing (at the time of rezoning) peak rate of stormwater discharge for the Property for the 10-year design storm, with phased reductions provided at each phase as indicated on the CDP/FDP. The Stormwater Plan shall demonstrate at full build-out of the Development Prior to Rail, a seven and one-half percent (7.5%) reduction in the existing (at the time of rezoning) peak rate of stormwater discharge for the Property for the 10-year design storm.

B. **Best Management Practices ("BMP").** Sand filters, Filterra devices, and/or other such other low impact development ("LID") methods as may be approved for water quality treatment credit by the County shall provide water quality treatment for the site. Using methods similar to those shown on the CDP/FDP, the Stormwater Plan shall demonstrate at full build-out of the Development With Rail a net fourteen percent (14%) reduction from the existing (at the time of rezoning) stormwater phosphorous loading for the discharge leaving the Property. The Stormwater Plan shall demonstrate at full build-out of the Development Prior to Rail a two and one-half percent (2.5%) reduction from the existing (at the time of rezoning) stormwater phosphorous loading for the discharge leaving the Property.

C. **Low Impact Development ("LID").** In addition to the Best Management Practices in Paragraph B. above, the Applicant shall incorporate the following LID strategies to mitigate environmental impacts of existing and proposed development on-site. The LID facilities shown on the CDP/FDP are for the purpose of illustrating the application of the proposed LID techniques. In the event that either the Applicant or County staff deems it necessary to substitute another LID strategy for one of those listed below, the Applicant shall identify an alternate strategy acceptable to both parties, and if necessary as determined by Fairfax County, will seek administrative approval from the Zoning Administrator pursuant to the provisions of Sect. 16-403 of the Zoning Ordinance.

   i. **Porous Pavement.** The Applicant shall install porous pavement in areas of pavement south of Parking Terrace C and near ShopTysons Boulevard, as shown in the CDP/FDP.

   ii. **Plaza Landscaping.** The Applicant shall install landscaping on each of the plaza areas as designated on the CDP/FDP. The intent of this landscaping is to: (1) reduce the heat island effect on the plaza areas and (2) provide a natural aesthetically-pleasing sense of place consistent with the programming for these spaces. Details of these areas shall be included in the Landscape Plan to be provided pursuant to Proffer #30.
iii. **Stabilized Turf.** The Applicant shall install stabilized turf in the fire lane areas as indicated in the CDP/FDP.

iv. **Intensive Green Roof.** Under the Development With Rail, the Applicant shall install and maintain two intensive green roof areas over the parking structures as shown on the CDP/FDP, one of which shall be in Phase 3 (Community Green) and one of which shall be in Phase 4 (landscaped portions of the Sky Terrace). These two roofs shall include landscape plantings in a natural soil matrix over an under-drain system. The intent of these intensive green roofs is (1) to incorporate into otherwise impervious areas of the site a soil matrix and plantings intended to provide stormwater pollutant removal; (2) to reduce the heat island effect on site; (3) to naturalize and add aesthetically pleasing elements to be used by citizens; and (4) to function in conjunction with the programmed uses in these areas. Details concerning these areas shall be included on the Landscape Plan that will be provided pursuant to Proffer #30.

v. **Cisterns.** The Applicant shall install cisterns as shown on the CDP/FDP. The cisterns shall detain water for reuse on-site for irrigation and other appropriate uses.

vi. **Infiltration.** The Applicant shall install an infiltration facility on the site in the area generally north of the existing International Drive entrance to the Property and as indicated on the CDP/FDP.

D. **Applicant Maintenance Responsibility.**

i. **Regular Maintenance.** The Applicant shall assume responsibility for the perpetual maintenance of all of the stormwater management structures associated with this proffer and shall execute an agreement with the County in a form satisfactory to the County to this effect at the time of its first site plan approval (the “SWM Agreement”) and subsequent site plans, as required. The Applicant shall be responsible for maintenance of the BMP and LID devices and underground detention devices. The Applicant shall be required to contract with one or more maintenance and management companies to perform regular routine maintenance of the stormwater management devices, and the Applicant shall provide a maintenance report annually to the Fairfax County Maintenance and Stormwater Management Division of DPWES. The UOA documents shall include the UOA’s maintenance responsibility for the stormwater management structures.

ii. **County Agreement.** The SWM Agreement for the underground detention facilities as indicated on the CDP/FDP shall address the following issues to the satisfaction of DPWES: (1) future replacement when warranted; (2) liability and insurance in an amount reasonably acceptable to Fairfax
County; and (3) allowance for County inspection to ensure that the facilities are maintained by the Applicant in good working order.

**TRANSPORTATION**

35. **High Occupancy Toll (“HOT”) Lanes Coordination.** The Applicant shall meet with representatives of any public or private entities that propose to design, construct and operate HOT lanes or similar transportation improvements to be located in the right-of-way of the Capital Beltway, and representatives or members of VDOT, FCDOT, DPZ, and the Board of Supervisors to discuss and evaluate the estimated impacts, benefits, connectivity, association and relation of the Property to such improvements, and if agreeable to the Applicant, allow a connection of the HOT lanes on or to the Property. The Applicant shall coordinate design and construction activities and schedules for the reconstruction of the Westpark Bridge as described in Proffer #37 with any public or private entities that propose to design, construct and operate HOT lanes or similar transportation improvements to the Capital Beltway, so as to ensure that the design and reconstruction of the Westpark Bridge will not conflict and is compatible with the location or schedule for construction of the HOT lanes improvements.

36. **Road Improvements – Acquisition of Right-of-Way and Easements**

   A. At the time of submission of a site plan, the Applicant shall attempt to acquire, and then if successful, shall dedicate such off-site right-of-way and easements as are necessary to complete the improvements described on the CDP/FDP and referenced in the Proffers for each phase of the Development With Rail or the Development Prior to Rail. The Applicant shall use its good faith efforts to obtain such rights-of-way and easements at fair market value.

   B. If, subsequent to the filing of each site plan, the Applicant is unable to bring about the dedication by others and the necessary rights-of-way and easements, or to acquire by purchase the rights-of-way or easements at fair market value, as determined by an MAI (Member of the Appraisal Institute) appraisal, then the Applicant shall request the Board of Supervisors condemn the necessary land and/or easements.

   C. It is understood that the Applicant’s request to the Board of Supervisors for condemnation will not be considered until it is forwarded in writing to the Division of Land Acquisition or other appropriate County official, accompanied by (1) plans, plats and profiles showing the necessary right-of-way or grading easements to be acquired, including all associated easements and details of the proposed transportation improvements to be located on said right-of-way property (2) an independent appraisal of the value of the right-of-way property to be acquired and of all damages to the residue of the affected property; (3) a sixty (60) year title search certificate of the right-of-way property to be acquired; and (4) a letter of credit in an amount equal to the appraised value of the property to be acquired and of all damages to the residue which can be drawn upon by the County. It is also understood that in the event the property owner of the land to be acquired is awarded with more than the appraised value
of the property because of the damages to the residue in a condemnation suit, the amount of the award in excess of the letter of credit amount shall be paid to the County by the Applicant within forty-five (45) days of said award. In addition, the Applicant agrees that all reasonable and documented sums expended by the County in acquiring the right-of-way and necessary easements shall be paid to the County by the Applicant within sixty (60) days of written demand. Notwithstanding the foregoing, with respect to any condemnation of property along the frontage of Route 123 that is pursued in furtherance of the improvements to be completed under Proffer 38.C.ii and 61, only the provisions of clauses (1) through (3) of this subparagraph shall apply.

D. Except as specifically provided to the contrary, in the event the necessary rights-of-way and/or easements cannot be acquired voluntarily, and the County chooses not to exercise its right of eminent domain, the Applicant is then released from performing any obligations under the Proffers that cannot be performed without such acquisition. The Applicant, however, shall complete the proffered improvements for which acquisition of right-of-way or easements is not necessary. The Applicant shall escrow funds for the unbuilt portion in an amount determined by DPWES as indicated in the proffers if condemnation does not occur. In the event the County elects to defer its exercise of eminent domain, then Applicant’s proffer requiring such acquisition shall likewise be deferred to the extent that such acquisition is necessary to perform the proffer.

37. Westpark Bridge.

A. Westpark Bridge Pedestrian and Vehicular Improvements. The Applicant shall widen the existing Westpark Bridge and its approaches to VDOT standards for acceptance into the VDOT maintenance system. Such widening shall result in a total of four lanes undivided with a six-foot sidewalk on the east side of the road and a six-foot on-road bike lane on each side of the road while maintaining the existing 7.8-foot sidewalk on the west side of the road, as indicated in the CDP/FDP. Prior to the submission of a site plan that includes the bridge, the Applicant shall coordinate the design and construction of this bridge with FCDOT to ensure compatibility with the Dulles Rail Project design.

i. ShopTysons Boulevard/Westpark Bridge Traffic Signal. The Applicant shall design and adjust the traffic signal at the ShopTysons Boulevard/Westpark Bridge intersection or install a new signal to accommodate the widened bridge and intersection modifications as determined by VDOT. With the installation of the new signal or modifications to the existing signal, the Applicant shall install pedestrian-activated chirping countdown signal heads or a reasonable substitute (if a substitute is requested by VDOT or FCDOT), to facilitate the movement of pedestrians through the intersection and the movement of pedestrians and bicyclists along the trail.
ii. **Westpark Bridge/Westpark Drive Traffic Signal.** The owners of Tax Map 29-4 ((10)) 4B have proffered to provide a traffic signal at the intersection of Westpark Drive and Galleria Drive. If the terms of that proffer are met during construction of the proffered Westpark Drive bridge improvements, the Applicant shall coordinate with the owners of Tax Map 29-4 ((10)) 4B to permit installation of that traffic signal by the owners of Tax Map 29-4 ((10)) 4B.

B. **Phasing of Bridge Design and Construction.** The Applicant shall design the new bridge and submit the appropriate plans and information to VDOT and DPWES no later than the time of submission of the first site plan for the Development With Rail or Development Prior to Rail. The Applicant shall construct and open the bridge for traffic and operate the ShopTysons Boulevard/Westpark Drive traffic signal prior to issuance of RUPs for 225 units or Non-RUPs for 400,000 square feet of the office space, whichever occurs first. Upon demonstration by the Applicant that, despite diligent efforts, due to the coordination required with other transportation improvements in the vicinity, the improvement has been or should be delayed, the Zoning Administrator may agree to a later date for completion of the improvement including the traffic signal. Following completion of the bridge construction, the Applicant shall provide FCDOT with a certified schedule of costs actually paid or incurred in the design and construction of the bridge for use in determining the applicable credit toward the contribution to the Tysons Corner Transportation Fund per Proffer #39.

i. **HOT Lanes.** If the entities proposing to construct the HOT lanes project complete or become obligated to complete the Westpark Bridge widening project as part of any proposed HOT lanes improvements to the Capital Beltway, the Applicant shall pay $8,200,000 to the Tysons Transportation Fund, with $820,000 to be contributed prior to the first site plan approval for the Development With Rail or the Development Prior to Rail and the remaining $7,380,000 to be contributed prior to issuance of the first RUP or Non-RUP, whichever should occur first. The amount of this contribution to be made shall be adjusted yearly, based on changes in the Construction Cost Index published by the Engineering News-Record (“CCI”), from the base year of 2007 to the actual date of payment.

a. If the Applicant makes the foregoing payment, and it is later determined that the entities constructing the HOT lanes project are not obligated to construct the bridge widening (or if the Applicant makes the foregoing payment and at the time of the County’s issuance of the building permit for the residential building 1-A, the entities proposing to construct the HOT lanes project have not started construction of the Westpark Bridge widening project, if directed to do so by the County, the Applicant shall construct this widening, provided the County refunds the $8,200,000, with escalator if any to the Applicant. In the event that the Applicant
takes over the completion of the widening of the Westpark Bridge under either of the foregoing circumstances, the Applicant will not be obligated to complete that project by the deadline set forth in paragraph B above, but by such later date that is mutually agreed upon by the Applicant and the County.

C. **Right-of-Way/Easements.** To complete this improvement, right-of-way and approval for temporary and permanent easements may be required from off-site property owners. The Applicant shall work diligently and in good faith to obtain any necessary right-of-way and/or easements at fair market value.

i. Should the Applicant not receive the requisite right-of-way, easements or other approvals from all necessary parties by the time its first site plan is otherwise ready for approval by DPWES, the Applicant shall request the County utilize the condemnation provisions as outlined in Proffer #36 to obtain the right-of-way and/or easements necessary to permit completion of this improvement.

a. If the County elects not to pursue condemnation, rather than making the improvements to the Westpark Bridge, the Applicant shall instead (1) provide to Fairfax County its completed design plans for this bridge, (2) receive a credit for the cost of this design incurred by the Applicant towards its Tysons Transportation Fund commitment contained within Proffer #39 (Tysons Transportation Fund) based on review of actual invoices for legitimate expenses, and (3) in lieu of constructing this bridge, contribute all required, remaining funds to the Tysons Transportation Fund, per Proffer #39 within 60 days of County notification that the County is not pursuing condemnation.

38. **Road Improvements.**

A. **Overview and Phasing.** The Applicant shall construct road improvements with the phasing of the development as reflected on the CDP/FDP and in these proffers. Except as specifically provided below, each set of phased improvements shall be constructed and open for traffic, or shall be operating, as the case may be, not later than the date of the issuance of that number of RUPs or Non-RUPs set forth below. Upon demonstration by the Applicant that, despite diligent efforts to complete the proffered improvement, the improvement(s) has been or should be delayed, the Zoning Administrator may agree to a later date for completion of the improvement(s).

Development Prior to Rail/Phase 1: 260,000 square feet of office space or 130 residential units, whichever occurs first

Phase 2: 260,200 square feet of office space or 139 residential units, whichever occurs first
Phase 3: 13,050 square feet of office space or 100 residential units, whichever occurs first

Phase 4: 140,650 square feet of office space or 107 residential units, whichever occurs first

The CDP/FDP and the Tysons Corner Center Intersection Improvement References graphic attached to these proffers as Exhibit A provides numeric references to the intersections specified below.

B. On-Site Traffic Signals. At the time of implementation of the below proffers that require installation of traffic signals on the Property or modification of existing signals, the Applicant shall provide VDOT with the requisite traffic signal plans for review and comment/approval. If the County, upon request of the Applicant or on its own initiative, determines that such signal installations as proffered below will be detrimental to traffic operation, the Zoning Administrator may (1) agree to a later date for completion of the traffic signal installation or (2) permit the Applicant to proceed without the signal installations.

C. Development Prior to Rail/Phase 1 (Unless otherwise noted, for the purpose of this Proffer, Phase 1 shall also refer to the Development Prior to Rail)

i. Take the following actions with respect to Route 123 Frontage Improvements. (See Sheets 47, 49 and 50 of the Development With Rail CDP/FDP or Sheets 21, 22 and 23 of the Development Prior to Rail CDP/FDP).

a. Prior to site plan approval for Phase 1, or upon written request by Fairfax County, whichever occurs first, the Applicant shall dedicate and convey in fee simple to the Board of Supervisors right-of-way along Route 123 for roadway frontage improvements and future improvements to the I-495 southbound ramp, as indicated on the CDP/FDP.

b. The Applicant shall construct improvements along the Route 123 Property frontage to provide the following:

- Four northbound through lanes of travel transitioning to three through lanes and two ramp lanes accessing I-495;
- A separate northbound right turn lane into the Property entrance;
- With Phase 1 of the Development With Rail, but not the Development Prior to Rail, the Applicant shall also provide three bus bays in the Bus Plaza for use in conjunction with the future Tysons Central 123 Metro Station (subject to the
agreement further described in Proffer #51) as indicated on Sheet 47 of the Development With Rail CDP/FDP.

c. All of the improvements described in subparagraph b. shall be limited to the south side of the existing Route 123 median and shall be designed to accommodate, but shall not include, improvements on Tysons Boulevard to accommodate dual left turns from Route 123 to Tysons Boulevard.

d. The Applicant shall provide VDOT with verification of adequate sight distance with any future elevated pedestrian bridge that is intended to connect the Property to the Tysons Central 123 Metro Station.

ii. Reconstruct the Route 123/Tysons Boulevard/Property driveway intersection (Intersection #2) on-site to add three lanes of stacking storage at the Route 123 egress and construct improvements to the existing Route 123 entrance to the Property as indicated on Sheet 47 of the Development with Rail CDP/FDP and Sheet 9 of the Development Prior to Rail CDP/FDP. To accommodate this new entrance configuration, and to better accommodate traffic volumes, the Applicant shall replace the existing traffic signal at the Route 123/Tysons Boulevard/Property driveway intersection (Intersection #2) with a new traffic signal with the signal poles and signal heads located as appropriate for the adjusted intersection. This improvement to the Route 123/Tysons Boulevard/Property driveway intersection (Intersection #2) is an interim improvement until such time as the ultimate improvements are provided with Phase 2 per Proffer #38.D.iv. If the Applicant should construct Phases 1 and 2 concurrently, this improvement would be superseded by the improvement discussed in Proffer #38.D.iv.

iii. Install a traffic signal, including pedestrian-activated chirping countdown signal heads (or reasonable alternative if requested by VDOT or FCDOT), at the Fashion Boulevard/Ring Road/Nordstrom intersection, southwest of Parking Terrace “C” (Intersection #9). This improvement is to be coordinated with the Towers Crescent Owners, as necessary regarding easements and/or letters of permission.

iv. Install a traffic signal, including pedestrian-activated chirping countdown signal heads (or reasonable alternative if requested by VDOT or FCDOT), at the Ring Road/Fashion Boulevard intersection located southeast of Parking Terrace “C” (Intersection #8).

v. Install a traffic signal on ShopTysons Boulevard east of the northeast corner of Lord & Taylor (Intersection #6).
vi. Add a southbound right-turn overlap phase to the signal at the Route 7/Property driveway intersection (Intersection #12) and add pedestrian-activated chirping countdown signal heads (or reasonable alternative if requested by VDOT or FCDOT) and painted crosswalks, subject to VDOT approval. If VDOT does not permit signal modifications in this location, the Applicant shall demonstrate to FCDOT that the Applicant diligently pursued such modifications. If the signal modifications are not permitted, the Applicant shall provide an escrow amount for this improvement, in an amount approved by the County, for future signal modifications or other improvements in the vicinity of the site.

vii. Design and construct pedestrian-activated chirping countdown signal heads (or reasonable alternative if requested by VDOT or FCDOT) and crosswalks at the intersection of International Drive and the Crate and Barrel entrance (Intersection #4) and at the intersection of International Drive/Fletcher Street (Intersection #10) to VDOT standards.

viii. As indicated on Sheets 52 and 53 of the Development with Rail CDP/FDP and Sheet 25 of the Development Prior to Rail CDP/FDP, construct an additional westbound lane along the Property’s Route 7 frontage connecting the existing right-turn lane from Route 7 into the Mall Property at Fashion Boulevard (Intersection #12) to the proposed westbound lane west of the entrance. This additional westbound lane will provide four through travel lanes, with the additional westbound lane tying into the existing right turn lane at International Drive in the vicinity of Intersection #11. The existing 4’ sidewalk will be replaced with a 5’ interim sidewalk until the sidewalk improvement per Proffer #43.A.vi is constructed as part of the development of Phase 3.

ix. Take the following actions with respect to Route 123 Offsite Frontage Improvements (only with the Development With Rail except as discussed in Proffer #7).

a. The Applicant shall design the roadway improvements to Route 123 along the frontage of Tax Map #29-4 ((1)) 16 and 17 to permit construction of an additional northbound through lane as indicated on Sheet 48 of the CDP/FDP as follows.

   • Widen northbound International Drive to accommodate a right turn lane from northbound International Drive onto northbound Route 123 (Intersection #1).

   • Adjust the Route 123 median to provide a 7’ wide pedestrian sanctuary for pedestrians crossing Route 123 at International Drive. To accomplish this pedestrian improvement, the Route 123 left turn lanes and right turn lane lanes shall be narrowed to 11’ in width, subject to approval of VDOT. If VDOT does
not approve lanes of 11’ in width, the Applicant shall coordinate with FCDOT to provide an alternative alignment. In addition, the Applicant shall stripe pedestrian crosswalks in conformance with this design.

- Adjust as necessary the traffic signal at the Route 123/International Drive intersection (Intersection #1) to accommodate the changes in the configuration of the intersection, including but not limited to shifts in the traffic signal poles and relocation of utility connections to the traffic signal. The Applicant shall install pedestrian-activated chirping countdown signal heads (or reasonable alternative if requested by VDOT or FCDOT) at the Route 123/International Drive intersection.

- Re-stripe the southbound International Drive right turn lane for shared through/right turn movements at the Route 123/International Drive intersection (Intersection #1). Irrespective of the reimbursement provisions in Proffer #38.C.ix.b, the Applicant shall not seek County reimbursement for the costs associated with the re-striping indicated in this paragraph.

b. The Applicant shall construct these improvements if Fairfax County agrees in writing to reimburse the Applicant for the cost of those improvements, including land acquisition at fair market value, except as noted above. The Applicant shall not enter into any agreement to acquire land for these purposes without Fairfax County’s prior written approval of the terms of acquisition. Except as may otherwise be agreed to between the County and the Applicant, reimbursement will be provided by the County in the form of monthly construction progress payments upon submission by the Applicant and approval by the County of all necessary documentation demonstrating the expenditures for the defined improvements that have been paid or incurred by the Applicant. The Applicant shall be entitled to obtain reimbursement for all of its third-party costs, such as engineering and design costs, except for any costs paid or incurred in connection with the acquisition of land or easements necessary for these improvements. The Applicant shall not be entitled to reimbursement for the Applicant’s own overhead costs or profit.

c. The Applicant shall exercise diligent efforts to try to acquire all necessary off-site right-of-way and easements necessary for construction of these improvements in accordance with the procedures described in Proffer #36. The Applicant shall provide DPWES with documentation of such diligent efforts to
d. If it is mutually determined by the Applicant and the County that the improvements cannot be constructed, the Applicant shall provide the County with the frontage improvement plans for use with future road widening.

x. Make At Grade Pedestrian Improvements (Only with the Development Prior to Rail) consisting of improvements to the at-grade pedestrian crossing at the Route 123/Tysons Boulevard/Property driveway (intersection #2) to include a painted crosswalk and pedestrian-activated chirping countdown signal heads (or reasonable alternative if requested by VDOT or FCDOT).

xi. Only with the Development Prior to Rail, relocate the Ring Road at the southeast corner of Parking Terrace D to permit improvements to the Route 123/Property entrance as indicated on Sheet 22 of the Development Prior to Rail CDP/FDP.

D. Phase 2.

i. Install a traffic signal, including pedestrian-activated chirping countdown signal heads (or reasonable alternative if requested by VDOT or FCDOT), at the Fashion Boulevard/Ring Road/Bloomingdale’s intersection (Intersection #13).

ii. Add northbound and southbound overlap phases and adjust signal timing at the Route 7/International Drive intersection (Intersection #11). If VDOT does not permit the installation of signal modifications at this location, the Applicant shall demonstrate to FCDOT that the Applicant diligently pursued such modifications. If the signal modifications are not permitted, the Applicant shall escrow funds with the County for future signal modifications or other improvements in the vicinity of the site. The amount of this escrow shall be determined by FCDOT and shall equal the cost of the signal modification.

iii. If required by the County, the Applicant shall design the Route 123/International Drive (Intersection #1) interchange, including both preliminary and detailed design plans for a proposed grade separated single point urban interchange in accordance with the timing described in Proffer 38.A.

a. The Applicant shall meet with the FCDOT and VDOT to identify design requirements and formatting (so as to be able to turn over designs to FCDOT in a form usable to FCDOT) and shall generate a preliminary design plan for the interchange to include typical sections, plan design concept, preliminary grades, traffic
information, preliminary hydraulic design, costs, and a concept for traffic maintenance.

b. Following a field inspection by VDOT, the Applicant shall update the preliminary design plans to provide detailed hydraulic, bridge design and traffic control information, as well as to identify initial right-of-way and easement needs for the project. The design of the Route 123/International Drive interchange will not include improvements to other nearby interchanges, including but not limited to the Route 7/Route 123 interchange, but shall include lane transitions as necessary. The Applicant will not be obligated to conduct any VDOT public hearings or related procedures. Design efforts will not include final bridge plans or utility relocation plans.

c. Prior to site plan approval for Phase 2, the Applicant shall request the County to determine whether the County will exercise its option to not require the Applicant to design this interchange. If the County notifies the Applicant prior to site plan approval for Phase 2 that it has elected to not require the Applicant to design this interchange, then the Applicant shall pay $1,200,000 to the Tysons Transportation Fund, with $120,000 due prior to site plan approval of Phase 2 and the remaining $1,080,000 due prior to issuance of the first RUP or Non-RUP in Phase 2, whichever should occur first. The amount of this contribution to be made shall be adjusted yearly, based on changes in the CCI, from the base year of 2007 to the actual date of payment.

iv. Construct improvements to the existing Route 123 entrance to the Property (Intersection #2) and realign the ring road as indicated on Sheets 24 and 26 of the CDP/FDP.

v. Complete frontage improvements along Route 123 to include a fourth bus bay in the Bus Plaza, as indicated on Sheet 49 of CDP/FDP.

vi. Subject to VDOT approval, at the Route 7 intersection with Fashion Boulevard (Intersection #12), construct an additional southbound lane on Fashion Boulevard to eastbound Route 7 to provide two exclusive left turn lanes, a shared left/through lane and an exclusive right-turn lane on Fashion Boulevard, as shown on Sheet 24 of the CDP/FDP. The Applicant shall make signal timing adjustments, as necessary.

vii. Subject to VDOT approval, construct improvements along Route 7 eastbound between International Drive/Gallow's Road and Old Gallows Road to provide one additional eastbound shared/right through lane to provide a total of four through eastbound travel lanes, as indicated on Sheets #52 and 53 of the CDP/FDP.
a. The Applicant shall exercise diligent efforts to try to acquire all necessary off-site right-of-way and easements necessary for construction of these improvements in accordance with the procedures described in Proffer #36.

b. Construction of these Route 7 offsite frontage improvements shall be completed prior to issuance of the first RUP/Non-RUP for Phase 2 of the Development With Rail. Upon demonstration by the Applicant that, despite diligent efforts, the improvement has been or should be delayed, the Zoning Administrator may agree to a later date for completion of the improvement.

c. If it is mutually determined by the Applicant and the County that the improvements cannot be constructed, the Applicant shall provide the County with the frontage improvement plans and contribute the amount estimated by FCDOT for the construction of this frontage improvement, subject to review and approval by FCDOT, to the Tysons Transportation Fund to permit future construction of this improvement or other improvements in the vicinity.

E. Phase 3.

i. Widen Fashion Boulevard to provide eastbound and westbound left-turn lanes at the Fashion Boulevard intersection with the internal Ring Road at Nordstrom (Intersection #9). With this improvement, the Applicant shall complete modifications as necessary to the traffic signal constructed at this intersection in Phase 1, including adjustments necessary to address construction of the above-grade pedestrian crossing in the immediate vicinity as shown on the CDP/FDP.

ii. Widen Fashion Boulevard to provide a second eastbound left-turn lane at the intersection with ShopTysons Boulevard (Intersection #8).

iii. Widen Fashion Boulevard to provide a northbound left-turn lane at the intersection with the internal Ring Road at Bloomingdale’s (Intersection #13).

iv. Widen the eastbound and westbound outside travel lanes of Fashion Boulevard to 15-feet (including gutter) from Route 7 (Intersection #12) to ShopTysons Boulevard (Intersection #8) to accommodate bikes and vehicles as shown on Sheets 32, 34 and 35 of the CDP/FDP.

v. The Applicant shall construct frontage improvements along the Property’s Route 7 frontage east of the Fashion Boulevard/Leesburg Pike intersection (Intersection #12) to provide an additional right-turn lane into the Property from westbound Route 7, as indicated on Sheet #53 of the CDP/FDP.
a. This roadway improvement may require off-site construction easements and public access easements from the adjacent properties to the east (identified on the Fairfax County Tax Map as 39-2 ((4)) 30 and 30A). Despite diligent and timely efforts on its part, should the Applicant not receive the requisite approvals and easements from all necessary parties by the time its Phase 3 site plan is otherwise ready for approval by DPWES, the Applicant shall request the County utilize the condemnation provisions as outlined in Proffer #36 to obtain the right-of-way and/or easements necessary to permit completion of this improvement. If the Applicant fails to obtain the off-site construction and/or public access easements, the Applicant shall demonstrate to FCDOT that the Applicant diligently pursued such modifications.

If the County elects not to pursue condemnation, rather than constructing the above described improvements to Route 7, the Applicant shall instead provide the County with the construction plans and escrow funds with the County, subject to FCDOT approval, in an amount sufficient to complete the construction or to be used for road or transit improvements elsewhere in Tysons Corner at the County’s discretion.

vi. Add a westbound right-turn overlap phase and adjust signal timings at the Route 7 intersection with Fashion Boulevard (Intersection #12). If VDOT does not permit the signal modifications in this location, the Applicant shall demonstrate to FCDOT that the Applicant diligently pursued such modifications. If the signal modifications are not permitted, the Applicant shall escrow funds with the County for future signal modifications or other improvements in the vicinity of the site. The amount of this escrow shall be determined by FCDOT and shall equal the cost of the signal modification.

F. Phase 4.

i. Prior to site plan approval for Phase 4 or upon demand by Fairfax County, whichever should occur first, the Applicant shall dedicate and convey in fee simple to the Board of Supervisors right-of-way along International Drive, as indicated on the CDP/FDP.

ii. Widen the International Drive median from 4-feet wide to 7-feet wide north of Fletcher Street to provide a pedestrian refuge for use by pedestrians crossing International Drive at the intersection (Intersection #10), as indicated on the CDP/FDP.

iii. Widen International Drive along the site frontage to provide three 11-foot northbound travel lanes, subject to VDOT approval. If VDOT fails to
approve these 11-foot lanes, the Applicant shall work with FCDOT to provide an alternative alignment.

iv. Contribute $70,000 to FCDOT to be used for future spot improvements in the Route 7 corridor of Tysons Corner. The contribution amount shall escalate on a yearly basis from the base year of 2007 and change effective each January 1 thereafter, based on changes in the CCI.

G. Phase 3 and 4 Improvements if Phase 4 Occurs Before Phase 3. If the Applicant elects to construct Phase 4 prior to Phase 3, the road improvements associated with Phases 3 and 4 per Proffer #38.E and 38.F shall be completed as indicated below.

i. Phase 4. The Applicant shall provide the road improvements associated with Phase 4, as indicated in Proffer #38.F, and the improvement in Proffer #38.E.v.

ii. Phase 3. If constructed as the last phase, at the time of construction of Phase 3, the Applicant shall provide the remaining road improvements as set forth in Proffer #38.E. but not included in paragraph 38.G.i. above.

H. Adjust Traffic Signal Timing. For the purpose of this proffer, data collection for the following corridor evaluations shall be conducted within four weeks of the first Trip Count date after Stabilization as defined in Proffer #41 (not including a week containing a federal holiday or when public schools are not in session). The Applicant shall submit the corridor evaluation to the County and VDOT within four months after the collection of data.

i. Following the Stabilization of either the Development Prior to Rail or Phase 1, the Applicant shall conduct, and submit to VDOT, a corridor evaluation of existing signal timings along Route 7 from Old Gallows Road to the Dulles Toll Road (11 intersections) during the AM and PM peak hours.

ii. Following the Stabilization of Phase 2, the Applicant shall conduct, and submit to VDOT, a corridor evaluation of existing signal timings along Route 123 from Anderson Road to Old Courthouse Road (seven intersections) during the AM and PM peak hours.

iii. Following the Stabilization of Phase 3, the Applicant shall conduct, and submit to VDOT, a corridor evaluation of existing signal timings along Route 123 from Anderson Road to Old Courthouse Road (seven intersections) during the PM peak hour, along International Drive from Fletcher Street to Crate & Barrel (two intersections) during the PM peak hour, and along Route 7 from Old Gallows Road to the Dulles Toll Road (11 intersections) during the AM and PM peak hours.
iv. Following the Stabilization of Phase 4, the Applicant shall conduct, and submit to VDOT, a corridor evaluation of existing signal timings along Route 123 from Anderson Road to Old Courthouse Road (seven intersections) during the AM peak hour and along Route 7 from Old Gallows Road to the Dulles Toll Road (11 intersections) during the AM and PM peak hours.

v. The purpose of each corridor evaluation, as indicated in subparagraphs i-iv above, is to determine appropriate signal timing modifications along each corridor. Such signal timing plans shall be subject to VDOT review and approval at each phase. Following each corridor analysis, the Applicant shall make such signal timing modifications as approved by VDOT based on the findings of the evaluation as soon as reasonably feasible.

39. Tysons Transportation Fund. The Applicant shall provide a contribution of $3.62 per new non-residential square foot and $804 for each new residential unit associated with the subject site plan to Fairfax County for the Tysons Transportation Fund. Prior to site plan approval, the Applicant shall contribute 10% of the aforementioned amount to the Tysons Transportation Fund, with the remainder of the contribution to be made prior to issuance of a RUP or Non-RUP for the subject building. The amount due at each phase shall be adjusted to ensure that credits for all creditable expenditures are granted as further described below. The square foot and per unit amount of the contribution to be made shall be adjusted, as approved by the Board of Supervisors, based on changes in the CCI from the base year of 2007 to the actual date of payment.

The Applicant shall receive credits against the contributions that would otherwise be due to the Tysons Transportation Fund for the following actual or estimated costs: (a) costs incurred or to be incurred (or payments made or to be made) with respect to the design and construction of improvements to the Westpark Bridge as described in Proffer #37, and (b) costs incurred or to be incurred (or payments made or to be made) in the design of the Route 123/International Drive interchange as described in Proffer #38.D.iii. To the extent that any creditable amount exceeds the amounts that are due to the Tysons Transportation Fund with any site plan, such excess shall be carried over and applied to amounts that may be due with any future site plan.

A. Westpark Bridge Design and Construction.

i. If the Applicant has performed the work specified in Proffers 37.A and 37.B, the amount of the Tysons Transportation Fund credit shall be determined by FCDOT based on documentation acceptable to FCDOT that describes in detail all design and construction costs actually paid or incurred by the Applicant.

ii. If the Applicant has not yet performed the work specified in Proffers 37.A and 37.B, but has confirmed in writing its legal and binding obligation to perform such work by the date prescribed by Proffers 37.A and 37.B, the amount of the credit shall be determined by FCDOT based on detailed estimates of the costs to design and construct the bridge project as
submitted by the Applicant, and shall be subject to final reconciliation and adjustment subsequent to completion and acceptance of the bridge project and submission of documentation acceptable to FCDOT that describes in detail all design and construction costs actually paid or incurred by the Applicant.

iii. If entities other than the Applicant have performed or will perform the work specified in Proffers 37.A and 37.B, the Applicant shall contribute the amount specified in Proffers 37.B.i. to the Tysons Transportation Fund, and the credit shall equal the amount paid.

B. Route 123/International Drive Interchange Design.

i. If the Applicant has performed the design work in accordance with Proffer 38.D.iii.a, then the amount of the credit shall be determined by FCDOT based on documentation acceptable to FCDOT that describes in detail all design costs actually paid or incurred by the Applicant.

ii. If the Applicant does not perform or has been released from performing the design work in accordance with Proffer 38.D.iii.a, but makes or has confirmed its binding commitment to make the payment described in Proffer 38.D.iii.c, then the credit will be the amount specified in Proffer 38.D.iii.c.

iii. If the Applicant has not yet performed the design work in accordance with Proffer 38.D.iii.a., but has confirmed in writing its legal and binding obligation to perform such work by the date prescribed by Proffer 38.D.iii.a, then the amount of the credit shall be determined by FCDOT based on detailed estimates of the costs to design the interchange in accordance with Proffer 38.D.iii.a. as submitted by the Applicant, and shall be subject to final reconciliation and adjustment subsequent to completion and acceptance of the interchange design and submission of documentation acceptable to FCDOT that describes in detail all design costs actually paid or incurred by the Applicant.

40. Congestion Management. The Applicant shall prepare and implement a construction congestion management plan during construction of each phase, as appropriate. The congestion management plan shall identify anticipated construction entrances, construction staging areas, construction vehicle routes and procedures for coordination with FCDOT and/or VDOT concerning construction material deliveries, lane closures, and/or other construction related activities that may adversely affect the surrounding road network. Such plans shall be prepared by a qualified professional and submitted for review and comment to the Providence District Supervisor and the Providence District Planning Commissioner, FCDOT and DPWES upon submission of the initial site plan for each phase. The Transportation Coordinator (as defined in Proffer #41) shall coordinate with the development/construction manager, VDOT, FCDOT and the Dulles Rail Project Entities throughout construction, to monitor the off-site transit and roadway improvements and ensure the congestion management plan adequately ensures safe
circulation at all times and efficient circulation on the Property and on the public roadways adjoining the Property. In addition, the TC shall coordinate any adjustments to the TDM Plan (as defined in Proffer #41) as necessary to address the congestion management plan.

TRANSPORTATION DEMAND MANAGEMENT

41. Transportation Demand Management. This Proffer sets forth the programmatic elements of a transportation demand management plan (the “TDM Plan”). Initially, the TDM Plan shall be implemented and maintained by Tysons Corner Holdings LLC and Tysons Corner Property Holdings LLC, or the entities that are their successors as the owners or developers of the Existing Shopping Center (jointly, the “Owner/Developer”). After the completion and Stabilization (as hereinafter defined) of the fourth phase and satisfaction of the proffered goals described below for a period of two years, the TDM Plan shall be maintained by the UOA. For the purposes of this proffer, under no circumstances shall the UOA be deemed to be the Owner/Developer, and the provisions of this Proffer applicable to the Owner/Developer shall not apply to the UOA, except as specifically noted. As used in this Proffer, the term “Development” shall be deemed to refer to both the Development With Rail and the Development Prior to Rail.

The purposes of the TDM Plan are to (a) limit the number of vehicle trips generated by certain of the new uses constructed as part of the Development, and (b) encourage the use of transit (Metrorail and bus), other high occupant vehicle commuting modes, walking, biking and teleworking by employees, customers and residents who work or live in the buildings located in the Development and the Existing Shopping Center. The TDM Plan will be based on the “Transit-Oriented Development Transportation Demand Management Study and Strategic Plan” prepared by Strategic Transportation Initiatives, Inc., dated September 1, 2006 (the “TDM Strategic Plan”), the terms of which are hereby incorporated by reference.

A. Vehicle Trip Objectives.

i. General. Implementation of the TDM Plan shall help to limit the number of vehicle trips generated by the Development through the use of mass transit, ride-sharing and other strategies. The Development shall be designed to create significant interactions among various uses on the Property such that fewer automobile trips will occur within the site and on the external road network through the creation of synergistic relationships within the Property. In addition, easy access to Metrorail and bus facilities and the capability for teleworking will provide commuting options other than the automobile to residents, employees and visitors to the Property.

ii. Maximum Trips After Reduction Limits. The objective of the TDM Plan shall be to limit the number of vehicle trips generated by the new on-site residential, office and hotel uses in the Development during weekday peak hours (as determined using methods based on ITE, 7th edition, Trip Generation rates and/or equations) (the “ITE Trip Generation Rate”). The number of vehicle trips generated by the proposed residential, office and hotel uses shall be separately measured so that appropriate remedial actions may be undertaken as required to address any excess of trips
associated with a specific type of use. The types of remedial actions that will be undertaken are described in the TDM Strategic Plan. The number of vehicle trips generated by the new on-site residential, office and hotel uses in the Development during weekday peak hours shall not exceed the maximum trip limits for each of the defined uses ("Maximum Trips After Reduction") set forth in the following tables.

After rail is operational at the Tysons Central 123 Metro Station, the effect of the Maximum Trips After Reduction limits will be to reduce vehicle trips generated by the on-site uses during the weekday Peak Hours (as defined below) as follows.

**Percentage Trip Reduction at Build-out of Each Phase After Rail is Operational**

<table>
<thead>
<tr>
<th>Use</th>
<th>AM Peak Hour</th>
<th>PM Peak Hour</th>
</tr>
</thead>
<tbody>
<tr>
<td>Office</td>
<td>27%</td>
<td>31%</td>
</tr>
<tr>
<td>Residential</td>
<td>51%</td>
<td>68%</td>
</tr>
<tr>
<td>Hotel</td>
<td>24%</td>
<td>50%</td>
</tr>
</tbody>
</table>

The Maximum Trips After Reduction indicated in the following tables is based on the percentage reduction of total trips that would otherwise be generated by the Development according to methods in the ITE Trip Generation Rate. In the event that the buildings actually constructed by the Applicant in any phase have less than the maximum number of dwelling units or hotel rooms and/or less than the maximum square footage of office gross floor area, then the Maximum Trips After Reduction set forth in the below charts shall still govern.

### Maximum Trips After Reduction for the Development if the Applicant Starts Development Under the Development Prior to Rail (Phase 1A for the purpose of this chart)

Because the Development Prior to Rail is an alternate development option that would be in place of Phase 1 under the Development With Rail, it is referred to as Phase 1A in the following tables.

#### Phase 1A (Before Rail is Operational)

<table>
<thead>
<tr>

*Trip Generation Before Reduction is based on the ITE Trip Generation Rates before the TDM and synergy reductions

### Definitions

i. **Transportation Coordinator.** The Owner/Developer and subsequently the UOA shall appoint a qualified transportation management professional to be the Transportation Coordinator (“TC”) for the project. The TC’s duties shall be to develop, implement and monitor the various components of the TDM Plan and revise the TDM Plan as appropriate. The TC shall oversee all elements of the TDM Plan and act as the liaison between the Owner/Developer and subsequently the UOA and FCDOT. The TC may be employed either directly by the Owner/Developer or by a property management company under a management contract with the Owner/Developer.

ii. **Stabilization.** The “Stabilization” of any phase of the Development, or of any building in a phase of the Development, shall be deemed to occur on the date when (a) initial RUPs have been issued for 100% of the units in a residential building in that phase, regardless of the physical occupancy in that phase, (b) initial Non-RUPs shall have been issued for 100% of the gross leaseable area in an office building in that phase, regardless of the physical occupancy, and (c) initial Non-RUPs shall have been issued for the hotel in that phase, regardless of the physical occupancy.

iii. **Peak Hour.** The relevant weekday AM or PM “peak hour” shall be that 60-minute period during which the highest volume of mainline through volumes occurs between 6:00 and 9:00 AM and 4:00 to 7:00 PM, respectively, as determined by mechanical and/or manual traffic counts conducted by a qualified traffic engineering firm conducted at select locations within a cordon defined by Route 7, International Drive, Route 123 and I-495 and as approved by FCDOT. To determine the peak hour, such counts shall be collected beginning on a Monday at 2400 hours and continuing to the following Thursday at 2400 hours during a week between April 1 and May 31 (but not including a week containing a federal holiday or when public schools are not in session). The methodology for determining the peak hour may be modified, in
agreement between the Owner/Developer (or the UOA after the end of the Owner/Developer Control Period) and FCDOT without requiring a PCA, in order to respond to technological and/or other improvements in trip counting.

iv. **Index**. The term “Index” shall mean the Consumer Price Index for all urban consumers (CPI-U) 1982-1984=100 (not seasonally adjusted). All fixed amounts specified in this Proffer as being due to the TDM Account, the TDM Remedy Fund and the TDM Incentive Fund shall be adjusted annually to reflect changes in the Index over a 2007 base year, unless another base year is specified. All amounts payable to the TDM Penalty Fund, and the then-stated amount of the Letter of Credit, shall be adjusted annually starting in 2022 to reflect changes in the Index over a 2021 base year.

v. **Owner/Developer Control Period**. The term “Owner/Developer Control Period” shall be defined as the period starting upon the approval of the Rezoning and ending on the date when two consecutive annual Trip Counts conducted after Stabilization of the last of Phases 3 or 4 to be constructed show that vehicle trips meet the trip reduction objectives, and are equal to or less than the applicable Maximum Trips After Reduction.

vi. **TDM Remedy Fund**. The purpose of the “TDM Remedy Fund,” as further described below, shall be to supplement the TDM Account in support of additional TDM strategies that may be determined to be necessary following any of the Trip Counts and for which sufficient funding is not immediately available through the then-existing TDM Account, including the TDM Budget Contingency (as hereinafter defined).

vii. **TDM Penalty Fund; Letter of Credit**. The TDM Penalty Fund is an account into which the Owner/Developer will deposit penalty payments as may be required to be paid pursuant to this Proffer (the “TDM Penalty Fund”). The County may withdraw funds from the TDM Penalty Fund for transportation improvements in the vicinity of the Property. To secure the Owner/Developer’s obligations to make payments into the TDM Penalty Fund, the Owner/Developer will provide the County with letter of credit as further described below.

Prior to the issuance of the first RUP or Non-RUP, whichever comes first, for Phase 1, the Owner/Developer (or its successor owner or developer, but not the UOA) shall (a) establish the TDM Penalty Fund and (b) deliver to the County a clean, irrevocable letter of credit in the stated amount of $2,000,000 issued by a banking institution approved by the County to secure the Owner/Developer’s obligations to make payments into the TDM Penalty Fund as described in paragraph O (the “Letter of Credit”). The stated amount of the Letter of Credit shall be increased to $3,000,000 prior to issuance of the first RUP or Non-RUP, whichever comes first, for
Phase 2, $3,500,000 prior to issuance of the first RUP or Non-RUP, whichever comes first, for Phase 3 and $4,000,000 prior to issuance of the first RUP or Non-RUP, whichever comes first for Phase 4. Alternatively, the Owner/Developer may provide substitute or additional Letters of Credit that achieve the same result.

The Letter of Credit will name the County as the beneficiary and will permit partial draws or a full draw.

The foregoing stated amount(s) of the Letter of Credit (1) shall be reduced by the sum of any and all previous draws under the Letter of Credit and payments by the Owner/Developer into the TDM Penalty Fund, and (2) starting in 2022, shall be increased annually to reflect changes in the Index over a 2021 base year.

If the results of any Trip Counts during the Owner/Developer Control Period show that, notwithstanding adjustments to the TDM Budget and TDM Plan over the time periods specified in paragraph M., the Maximum Trips After Reduction specified in Proffer #41.A.ii are being exceeded, then the penalty provisions of paragraph O shall apply. Thereafter, the Owner/Developer will make the payments required under paragraph O into the TDM Penalty Fund, and the County shall be authorized to withdraw the amounts on deposit in the TDM Penalty Fund. Penalty funds paid to the County shall be applied to transportation improvements in the vicinity of the Property at the County’s sole discretion.

At such time as the Owner/Developer is required to pay a penalty per paragraph O, if the Owner/Developer fails to make the required penalty payment to Fairfax County, within 30 days after written demand, the County shall have the ability to withdraw the penalty amount directly from the Letter of Credit.

C. Components of the TDM Plan. In order to meet the Maximum Trips After Reduction objectives, a TDM Plan shall be adopted and implemented by the Owner/Developer, subject to FCDOT approval. The minimum components of the TDM Plan are specified in paragraph C and may be subsequently adjusted by mutual agreement between the Owner/Developer (and subsequently the UOA) and FCDOT. All adjustments to the components of the TDM Plan contained in this paragraph C shall be approved by FCDOT and will not require a PCA. The TDM Plan shall include provisions in respect of the Development and the Existing Shopping Center as set forth in para. 41.C.i below and in Proffer #42. The minimum TDM Plan components are further described in the TDM Strategic Plan. In addition, the TDM Strategic Plan includes information about possible supplemental TDM Plan components. In addition to the timing, phasing and implementation information in this Proffer, more detail is provided in the TDM Strategic Plan.
i. **TDM Components Applicable to the Existing Shopping Center and the Development.** At a minimum, the TDM Plan shall contain the following elements as applicable to the Existing Shopping Center and the Development, including residential building occupants, office building tenants and employees and hotel employees and guests:

a. **TDM Network --** Establishment of a network of designated on-site TDM contacts among the Owner/Developer, the UOA, office building tenants, property managers and FCDOT through which to coordinate the implementation of the TDM Plan.

b. **Meetings with Stakeholders --** The TC shall attend meetings with other community groups and organizations that have a mutual interest in furthering the success of TDM programming and the effectiveness of mass transit and other non-SOV commuting (such as with TYTRAN and Dulles Corridor Rail Association).

c. **Website --** Develop and maintain a TDM project website that includes targeted information on a building-by-building basis, and that includes multi-modal transportation information, real-time travel and transit data, the possibility of online transit pass sales or value loading and connections to supporting links.

d. **Personal outreach --** In person outreach by the TC or the TC’s representatives to all new commercial tenants to explain the TDM program and transit options.

e. **Dissemination of information --** Dissemination of information in the TC’s on-site office as well as in prominent locations throughout the Property, including in the Existing Shopping Center. This dissemination of information shall include information relevant to patrons and customers of the Existing Shopping Center in addition to the Retail/Commercial, residential, office and hotel uses about transit benefits programs, maps and schedules offered by WMATA, Fairfax Connector and other transit providers, through the electronic information kiosks that are described below, and/or displays at its mall customer/concierge service booths.

f. **Transit benefits --** Encouragement of employers to offer employee benefit options including parking cash out, pre-tax/payroll subsidies for transit and vanpool fares, flex-time and alternative work schedule programs and live-near-work incentives.

g. **Telework programs and telework facility --** The Owner/Developer shall provide space for a telework facility for use by residents on the Property. The facility shall be located in the Development or
in the Existing Shopping Center. The telework facility shall consist of a minimum of 600 square feet of gross floor area and shall have computers, copier facilities, a fax machine and access to lap-top hook up stations with secure wireless internet access, private space for phone calls and access to a washroom.

h. Car sharing -- Car sharing program(s) subject to agreement with third-party vendor(s) (such as ZipCar/FlexCar).

i. Taxi stand -- A taxi stand shall be provided at the hotel in Phase 1.

j. Ridematching, carpoools, vanpools and guaranteed ride home -- Vanpool and carpool formation programs, including ride matching services, and coordination with established guaranteed ride home programs.

k. Commuter Club -- The TC shall establish a Commuter Club, which will provide discounts and special incentives to members, who may be comprised of residents, office and hotel workers and employees of retail tenants in the Existing Shopping Center.

l. Parking management plan -- A parking management plan, which shall include the “un-bundling” of parking spaces from residential unit sales/leases, dedication of parking spaces for carpoools/vanpools in the office parking areas and offering Commuter Club incentives/benefits to residential carpoolers.

m. Informational Kiosks -- The Owner/Developer shall provide space and a power supply within the Existing Shopping Center for electronic information kiosks that provide transit information if such kiosks should become available from WMATA, Fairfax County or other entities.

n. Vans and shuttles -- The Owner/Developer shall provide van and shuttle drop-off points or areas as shown on the CDP/FDP and shall allow and encourage employer, hotel and other shuttle services that are operating in the Tysons Corner area to stop at such points or areas to pick-up or drop off employees and patrons.

o. Rush hour pricing – The Owner/Developer shall provide incentives to residents, employees and visitors to remain on the Property during the PM peak by offering movie ticket and restaurant discounts during the afternoon/evening rush hour peak. These discounts shall be subsidized through the TDM budget and/or TDM Incentive Fund.
ii. **Additional TDM Components Applicable to Residential Buildings.** In addition to the TDM program components described in paragraph 41.C.i above, at a minimum, the TDM Plan shall also have the following components as applicable to residents:

a. **In-Unit Internet Access** -- All residential units shall be pre-wired to provide wireless Internet access (or other technology that may become available from time to time) to permit residents to access the Internet from home.

b. **Sales/leasing marketing program** -- A targeted marketing program for residential sales/leases that encourages and attracts TDM-oriented people such as one and no-car individuals and families to live in the Development as well as a targeted marketing program for office tenants to encourage on and off site office workers to live in the on-site residential buildings. The Owner/Developer shall actively support the TC and Existing Shopping Center management in the efforts to encourage office tenants to live in the residential units on the Property through discussions between executives and officers of the office tenants and executives and officers of the Owner/Developer.

c. **TDM incentives** – One time distribution of fare media or other incentives to all initial residents of driving age as well as on select occasions as an incentive.

d. **Transportation advising** -- “Personalized transportation advising” integrated into new unit walk-throughs, including appropriate training of sales/leasing agents.

iii. **Additional TDM Components Applicable to Office Buildings.** In addition to the TDM program components described in paragraph 41.C.i above, at a minimum, the TDM Plan shall also have the following components as applicable to the office building tenants and employees:

a. **Matching On-Site Office Employees to On-Site Residential Units** – Residential units shall be marketed to the on and off-site Tysons Corner Urban Center office employers and workers, including providing information in prospective tenant packages and possible discounts or financial incentives to those employees who live and work on the Property. The Owner/Developer shall actively support the TC and Existing Shopping Center management in the efforts to encourage office tenants to live in the residential units on the Property through discussions between executives and officers of the office tenants and executives and officers of the Owner/Developer.
b. Relocation program -- Coordination of a relocation program to bring new businesses to the Property, with the goal of the office tenants utilizing alternative commuting options.

c. Leasing Packages -- Integration of transportation information and education materials into office leasing packages.

D. **Shuttle Bus/Bus Circulator System.** In order to provide initial support for the development of a comprehensive Tysons Corner shuttle or circulator system, prior to approval of the first site plan, the Owner/Developer shall, at FCDOT’s option, (1) contribute $100,000 to Fairfax County to pay for the expenses of a feasibility study relating to the creation of a consolidated shuttle or circulator system in the Tysons Corner area, or (2) retain a qualified consultant at the Owner/Developer’s expense not to exceed $100,000 to perform such a study. If FCDOT chooses the second option, the scope of the study will be prepared by the Owner/Developer and will be subject to review and approval by FCDOT, and the selected consultant shall be approved by FCDOT. The purpose of the study will be to summarize and evaluate the various private shuttle services currently provided in the Tysons Corner area and make recommendations to the County about the possible ownership, organizational structure, routes, sources of revenue and start-up and on-going capital and operating budget requirements for a shuttle or bus circulator system that would be intended to consolidate and replace existing shuttle services.

i. In addition, upon receipt of a written request from Fairfax County indicating the County’s intent to create a Tysons Corner shuttle or bus circulator system, the Owner/Developer shall make a one-time payment of $250,000 to the County to pay start-up expenses relating to the operation of such a consolidated system if the County decides to and proceeds to organize such a service, and the Owner/Developer shall contribute $100,000 to the County during each of the initial ten years that the service is in operation in Tysons Corner.

ii. In addition, the TC shall coordinate with the employers, hotels and automobile dealerships that run existing shuttles in Tysons Corner to provide access for those shuttles to the Property.

iii. In the event that after the completion of the feasibility study, a consolidated shuttle or bus circulator system is not created, the Owner/Developer may elect to operate a consolidated shuttle/circulator service itself.

iv. In the event that after the completion of the feasibility study, the events described in paras. i and iii above do not occur, then starting on the tenth anniversary of the approval date for the Rezoning, the Owner/Developer shall pay $250,000 to the County for the purpose of operating or enhancing existing bus service to and in the vicinity of the Property and
shall pay $100,000 per year on the following ten annual anniversary dates
to further that service.

E. **Transportation Coordinator.** Within ninety (90) days after the approval of the
Rezoning, the Owner/Developer shall appoint a TC for the project. The
Owner/Developer shall provide written notice to FCDOT of the appointment of
the TC within ten (10) days of such appointment and shall furnish FCDOT with
evidence of such TC’s qualifications and thereafter shall do the same within ten
(10) days of any change in such appointment. Following the initial appointment
of the TC, the Owner/Developer or the UOA, as applicable, shall continuously
employ, or cause to be employed as specified above, a TC for the Development
and the Existing Shopping Center.

F. **TC Office.** The Owner/Developer and subsequently, the UOA, shall provide a
centrally-located office for the TC and space for TDM products, services and
program offerings available to new residents, businesses, customers and visitors
to the Property. The office may be located within the Existing Shopping Center
or elsewhere on the Property.

G. **TDM Plan and Budget.** Within thirty (30) days after the TC has been appointed
by the Owner/Developer, the Owner/Developer, through the TC, shall prepare and
submit an initial TDM Plan to FCDOT for review and comment, including (i) the
start-up components of the TDM Plan that will be put in place both before and
after the commencement of operations at the Tysons Central 123 Metro Station
and (ii) an initial budget sufficient to implement the TDM Plan for the remainder
of the year and for the next calendar year (the “TDM Budget”). The TDM Budget
shall include a contingency equal to a minimum of ten percent (10%) of the
amount of the annual TDM Budget (the “TDM Budget Contingency”). If
FCDOT has not responded with any comments to the Owner/Developer within
sixty (60) days of receipt of the TDM Plan and TDM Budget, the TDM Plan and
TDM Budget shall be deemed approved. The Owner/Developer shall provide
written documentation demonstrating the establishment of the TDM Budget to
FCDOT no later than thirty (30) days after FCDOT’s response to the proposed
TDM Budget and Plan or following the sixty (60) day period described above.

Thereafter, the TC shall re-establish the TDM Budget for each calendar year,
which shall cover the costs of implementation of the TDM Plan for such year
(including the TDM Budget Contingency). The TC shall furnish a copy of the
TDM Budget and TDM Plan for each year to the FCDOT for review and
comment not less than sixty (60) days before the beginning of each year. A line
item for the TDM Account shall be included in the UOA budget upon the
establishment of the UOA. The association documents that establish and control
the UOA shall provide that the TDM Account shall not be eliminated as a line
item in the UOA budget and that funds in the TDM Account shall not be utilized
for purposes other than to fund TDM strategies. The TDM Account shall be
funded solely by the Owner/Developer until such time as assessments of residents
and commercial owners are implemented as provided in the UOA documents.
H. **TDM Account.**

i. **Initial Funding.** Within thirty (30) days after the establishment of the initial TDM Budget, the Owner/Developer shall establish and fund an account (the “TDM Account”) in the initial amount of the annual budget for the TDM program for the then current year. The purpose of the TDM Account shall be to fund the TDM Budget, including the TDM Budget Contingency. The TDM Account shall be established as an interest bearing account with a banking or other financial institution qualified to do business in Virginia. All interest earned on the account principal shall remain in the TDM Account, and shall be used for TDM Plan purposes. The Owner/Developer shall provide written documentation demonstrating the establishment of the TDM Account to FCDOT within ten (10) days of its establishment. Funds in the TDM Account shall be utilized by the TC each year to implement the TDM Plan in accordance with the TDM Budget.

ii. **Excess Funds in TDM Account.** Any funds remaining in the TDM Account at the end of any given year shall be transferred to the TDM Remedy Fund, as further discussed in paragraph I, until such time as the TDM Remedy Fund has achieved a balance of $400,000 (this amount shall be adjusted annually based on changes in the Index from the base year of 2007). At such time as the TDM Remedy Fund achieves such a balance, any funds remaining in the TDM Account at the end of any given year shall be transferred to the TDM Account for use in transit incentives. In the event that the TDM Remedy Fund is drawn upon, then the TDM Remedy Fund shall be replenished during the next TDM Budget cycle (repeated for multiple budget cycles if necessary), as indicated above, until the TDM Remedy Fund achieves a balance of $400,000 (as such amount is or has been adjusted in accordance with the method described above).

iii. **Annual Funding.** The TDM Account shall be replenished annually following the establishment of each year’s TDM Budget and any transfer of funds to the TDM Remedy Fund. The TDM Account shall maintain a starting balance at the beginning of each year of not less than $200,000, or in such greater amount as may be required under the TDM Budget for such year.

iv. **Transfer to UOA.** The TDM Account shall be managed by the Owner/Developer (and not the UOA) until the Owner/Developer Control Period has expired. Thereafter, management of the TDM Account will become the responsibility of the UOA.

I. **TDM Remedy Fund.** At the same time that the Owner/Developer creates and funds the TDM Account, the Owner/Developer shall establish a separate interest bearing account referred to as the “TDM Remedy Fund.” All interest earned on the principal in this account shall be added to the principal in the TDM Remedy
Fund and shall be used for TDM Remedy Fund purposes. Prior to issuance of the first RUP or Non-RUP, the Owner/Developer shall contribute to the TDM Remedy Fund to the extent necessary for the TDM Remedy Fund to have a $400,000 balance (as such amount has been adjusted at that time based on changes in the Index from a base year of 2007). Funds from the TDM Remedy Fund shall be drawn on only for purposes of immediate need of TDM funding, and may be drawn upon prior to any TDM Budget adjustments that may be required under paragraph M. At the end of the Owner/Developer Control Period, the Owner/Developer shall contribute to the TDM Remedy Fund to the extent necessary for the TDM Remedy Fund to have a balance of $400,000, as such amount may have been adjusted annually based on changes in the Index from a base year of 2007. Following such payment into the TDM Remedy Fund, the Owner/Developer shall transfer the TDM Remedy Fund to the UOA. Thereafter, the UOA shall continue to replenish the TDM Remedy Fund per the requirements of paragraph 36.H.ii.

J. TDM Incentive Fund. Prior to issuance of the first RUP or Non-RUP for the first building constructed as part of the Development, the Owner/Developer shall make a one time contribution of $400,000 to a segregated sub-account in the TDM Account to fund a transit incentive program. Such program shall be prepared by the Owner/Developer, through the TC and in coordination with FCDOT and shall include consideration for fare media distribution and value loading, financing incentives, and alternative incentives (such as grocery delivery) tailored to residents and mall customers. The TDM Incentive Fund shall be established as an interest bearing account with a banking or other financial institution qualified to do business in Virginia. All interest earned on the account principal shall remain in the TDM Incentive Fund and shall be used for TDM incentive purposes.

K. Annual Surveys and Reports. Commencing in 2007, the Owner/Developer, or the UOA after the end of the Owner/Developer Control Period, shall cause the TC to prepare and submit to the County the annual surveys and reports on the TDM Plan described below.

i. Annual Survey. An annual survey (the “Annual Survey”) shall be completed in September of each year. The Annual Survey shall gather information on the effectiveness of the TDM Plan and shall be used by the TC to determine whether changes to the TDM Plan are needed to, among other things, achieve (or to continue to achieve) the objective that vehicle trips do not exceed the Maximum Trips After Reduction. If the Annual Survey reveals that changes to the TDM Plan are needed, the Owner/Developer (and subsequently the UOA, as applicable) through the TC shall coordinate such changes with FCDOT and implement and adjust the TDM Budget accordingly. The TC shall coordinate the preparation of Annual Survey materials and the methodology for validating survey results with FCDOT prior to doing each year’s Annual Survey, and shall collect and analyze the results. Such analysis shall include at a minimum:
a. A description of the TDM measures in effect for the survey period and a description of how such measures have been implemented;

b. The number of people surveyed and the number of people who responded in each building;

c. The results of any surveys taken during the survey period;

d. The number of residents, employees and/or others participating in the TDM programs, displayed by category of participants and by mode of use;

e. An evaluation of the effectiveness of the TDM Plan and its program elements, including its effectiveness in achieving vehicle trip reduction objectives for each of the residential, office and hotel buildings, and, if necessary, proposed modifications to the plan and program elements; and

f. A description of the uses constructed and occupied on the Property at the time the survey was conducted and levels of occupancy.

ii. Annual Report. The TC shall submit a written annual report on the TDM Plan to the FCDOT no later than sixty (60) days after the completion of the Annual Survey described in Proffer #41.K.i. (the “Annual Report”). The Annual Report shall include (a) a description of the TDM strategic efforts for the year, including, as applicable, sample marketing materials, (b) a financial statement that includes the TDM Budget for the year and a detailed summary of actual TDM Plan income and expense for such year, (c) a summary of the levels of occupancy in the buildings that have been completed in the Development, (d) an analysis of the results of the Annual Survey (e) a compilation and analysis of the results of any Trip Counts that were conducted during the year, (f) discussion of any changes proposed to the TDM Plan and (g) the amount of money then on deposit in the TDM Penalty, Incentive and Remedy Funds.

iii. Adjustments to Calendar and Due Dates. At the mutual agreement of the FCDOT and the Owner/Developer (and subsequently the UOA), the due dates for the delivery of the Annual Report may be altered if changes have occurred, or appear to have occurred, in trip characteristics resulting from events such as an additional phase reaching Stabilization.

iv. Meetings with FCDOT. The Owner/Developer or UOA (as applicable) shall meet with FCDOT annually to discuss the results of the Trip Counts, the Annual Survey, the Annual Report and the TDM Plan.
L. **Trip Counts.**

i. **Trip Count Measurement Dates.** For purposes of this Proffer, Trip Counts shall be measured on three consecutive days over a maximum two week period (but not including a week containing a federal holiday or when public schools are not in session); these dates are referred to as “Trip Count Measurement Dates.” Trip Counts shall be conducted between April 1 and May 31 after Stabilization (as previously defined in para. 41.B.ii) has occurred for the first phase of development and shall continue annually thereafter except as provided in paragraph 41.L. In accordance with Proffer #41.L.v and during the times below, the Owner/Developer shall conduct interim trip counts at the request of FCDOT. At least thirty (30) days prior to conducting the Trip Counts, the Owner/Developer shall meet with FCDOT to review and reach agreement on the dates that will be the Trip Count Measurement Dates, the methodology for the Trip Counts, and the analyses to be done after the Trip Counts are complete.

ii. **Trip Counts, Generally.** Starting when the Stabilization of the first phase of the Development has occurred, the Owner/Developer shall measure separately the actual vehicle trips that are generated from the office, residential and hotel uses for all phases that have reached Stabilization in the Development (the “Trip Counts”) on the Trip Count Measurement Dates to evaluate whether the vehicle trips are equal to or less than the applicable Maximum Trips After Reduction. Trip Counts provided to FCDOT shall include information about the occupancy levels for all surveyed uses at the time of the Trip Count Measurement Dates.

iii. **Methods.** Trip Counts shall include counts of vehicles entering and exiting the areas of the parking garages designated for residential, office and hotel parking, as well as those additional manual and mechanical counts as may be needed, as determined by FCDOT. Trip Counts shall be conducted at the garages so that the only trips generated by the separate office, residential and hotel uses are compared to the Maximum Trips After Reduction specified for each such use (that is, cut-through trips, Metro trips, retail trips, etc. are excluded).

iv. **Calculations.** For each residential, office and hotel use, the total number of peak hour vehicle trips shall be computed by summing the number of trips entering and exiting the parking garages for the individual uses (residential, office and hotel) on each of the three days that Trip Counts are taken during the AM and PM peak hours and dividing that sum by three. Values will be provided for each garage included in the Development, and a sum of vehicle trips generated by the residential, office and hotel uses separately will be calculated.
v. Frequency of Trip Counts. Following the Stabilization of the first phase of the Development, the Owner/Developer shall conduct Trip Counts annually until such time as two consecutive annual Trip Counts indicate that the trips generated in the AM and PM Peak Hours by all phases that have reached Stabilization are equal to or less than the applicable Maximum Trips After Reduction. At such time, the Owner/Developer shall conduct Trip Counts every two years, provided that at such time as the next phase reaches Stabilization, the Owner/Developer shall again conduct annual Trip Counts until such time as the provisions of this paragraph permit Trip Counts every two years. If the Owner/Developer is conducting Trip Counts every two years as permitted above, and if two consecutive biennial Trip Counts indicate that the trips generated in the AM and PM Peak Hours by all phases that have reached Stabilization are equal to or less than the applicable Maximum Trips After Reduction, then the Owner/Developer shall conduct additional Trip Counts at not greater than five (5) year intervals to determine whether the Maximum Trips After Reduction are continuing to be met, until such time as annual Trip Counts would otherwise be required due to the Stabilization of a subsequent phase. Notwithstanding the provisions of this paragraph, FCDOT may request counts be undertaken at any time to validate traffic data, but not more frequently than two times per calendar year. If such requests are made by FCDOT, the Owner/Developer shall conduct the requested counts.

vi. Evaluation of Trip Counts. The results of the Trip Counts shall be compared to the Maximum Trips After Reduction specified for each use to determine whether actual trips are equal to, less than or greater than the specified Maximum Trips After Reduction. In the event the trips generated by each of the uses in the phases that have reached Stabilization are equal to or less than the Maximum Trips After Reduction specified for each use, then the Owner/Developer and subsequently the UOA (as applicable) shall continue to administer the TDM Plan in the ordinary course, in accordance with the provisions of these Proffers. If the trips generated by each of the uses in the phases that have reached Stabilization are greater than the Maximum Trips After Reduction, the Owner/Developer and subsequently the UOA (as applicable) shall follow the provisions of paragraph M below.

M. Adjustments to TDM Plan and Budget. In the event that any of the Trip Counts are greater than the applicable Maximum Trips After Reduction, then the TC shall convene a meeting with FCDOT within thirty (30) days after the completion of the Trip Counts to review the results of that report and the TDM strategies then in place for the Development. Thereafter, the TC shall develop modifications to the TDM Plan and the TDM Budget to address the surplus of trips, including any surplus caused by or related to a particular use or uses. The Owner/Developer shall submit any revisions to the TDM Plan and TDM Budget to FCDOT within thirty (30) days following this meeting. If FCDOT has not provided comments to
the Owner/Developer within sixty (60) days after receipt of the revised TDM Plan and revised TDM Budget, the Owner/Developer’s revisions to the TDM Plan and TDM Budget shall be deemed approved. Following approval of the revised TDM Plan and TDM Budget, the Owner/Developer shall (1) draw down on the TDM Remedy Fund, if it is determined to be necessary to do so, (2) increase the TDM Account with TDM Remedy Fund monies if necessary in order to cover any additional costs to implement the revised TDM Budget, (3) implement the provisions of the revised TDM Plan as developed in consultation with FCDOT, and (4) continue to conduct Trip Counts annually. In the event that Maximum Trips After Reduction are still being exceeded after two annual revision cycles, then the penalties set forth in paragraph O shall apply.

N. Subsequent Reporting After the Owner/Developer Control Period.

i. Owner/Developer Control Period. The Owner/Developer shall remain obligated under this Proffer until the end of the Owner/Developer Control Period. At the end of the Owner/Developer Control Period, the Owner/Developer shall be released from any further obligation under this Proffer, and the UOA shall bear the sole responsibility for continuing compliance with these Proffers. At the end of the Owner/Developer Control Period, the Letter of Credit shall be returned to the Owner/Developer for cancellation.

a. Continuation of TDM Plan. In the event the trips generated are equal to or less than the applicable Maximum Trips After Reduction, then the UOA shall continue to administer the TDM Plan in the ordinary course, in accordance with the provisions of this Proffer, including the fact that through the TC, the UOA shall continue to submit the Annual Reports, including the results of the Annual Survey and any Trip Counts, to FCDOT, as prescribed in paragraph K.

b. Additional Trip Counts. If an Annual Report demonstrates that a change in commuting patterns has occurred that is significant enough to reasonably call into question whether the Maximum Trips After Reduction limits are continuing to be met, as determined by FCDOT, then FCDOT may require the UOA to conduct additional Trip Counts (pursuant to the methodology set forth in paragraph L) within 180 days to determine whether in fact such objectives are being met or are likely to be exceeded. If any such Trip Counts demonstrate that the Maximum Trips After Reduction are being exceeded, then the UOA shall meet with FCDOT to review the TDM strategies in place and to develop modifications to the TDM Plan to address the surplus of trips. Within sixty (60) days following such meeting, the UOA shall submit a revised TDM Plan and TDM Budget to FCDOT for its review and approval. If FCDOT provides no response within sixty
(60) days after receipt of the revised TDM Plan and TDM Budget, the UOA’s revised TDM Plan and TDM Budget shall be deemed approved.

O. **TDM Penalty Fund.** If the results of any Trip Counts during the Owner/Developer Control Period show that the actual vehicle trips continue to exceed the Maximum Trips After Reduction after two annual testing cycles, then the Owner/Developer shall pay to the TDM Penalty Fund the amounts specified below, and FCDOT may thereafter withdraw such funds from the TDM Penalty Fund. If the Owner/Developer fails to pay what is due to the TDM Penalty Fund, FCDOT may draw against the Letter of Credit in the amount that was due to be paid. FCDOT may apply funds withdrawn from the TDM Penalty Fund, or drawn under the Letter of Credit for transportation improvements in the vicinity of the Property.

As indicated in Proffer #6.C.iv, the Applicant shall not obtain approval of any plans or permits, including but not limited to grading plans, site plans, and/or building permits if penalties related to the Transportation Demand Management Program are due or have been paid under this Proffer, unless the sum of all AM and PM peak hour vehicle trips for all uses that have reached Stabilization at the time of the immediately preceding annual Trip Count was less than the combined totals for Maximum Trips After Reduction during both AM and PM peak hour trips for all such uses as contained in the applicable table in Proffer #41.A.ii.

The maximum aggregate amount of all penalties to be paid under this paragraph O is $4,000,000, and shall be $2,000,000 following Stabilization of first phase (that is, either Phase 1 of the Development With Rail or the Development Prior to Rail), $3,000,000 following Stabilization of Phase 2, $3,500,000 following Stabilization of Phase 3 and $4,000,000 following Stabilization of Phase 4, in each case (1) less the sum of any and all previous draws under the Letter of Credit and payments by the Owner/Developer to the TDM Penalty Fund, and (2) starting in 2022, increased annually to reflect changes in the Index over a 2021 base year.

To supplement the penalty information below, attached as Exhibit B to these Proffers are schedules that describe in detail these penalties. Illustrative examples demonstrating possible scenarios of the application of the TDM Penalty Fund provisions are depicted in Exhibit C.

i. If the volume of AM and/or PM peak hour vehicle trips generated by the (i) combined residential uses for all phases that have reached Stabilization, (ii) combined office uses for all phases that have reached Stabilization or (iii) hotel use after Stabilization exceeds the applicable Maximum Trips After Reduction limit for such use, the Owner/Developer shall make penalty payments as indicated below.

   a. **Failure up to 2%.** If there is a failure in the reduction of trips for each of the uses listed in subparagraph i above in either or both of
the AM and PM Peak Hours by up to 2%, the Owner/Developer shall pay to the TDM Penalty Fund $4,000 per vehicle trip for each trip by which such Maximum Trips After Reduction limit has been exceeded in the Peak Hour in which the limit has been exceeded, but in the event that the limits are exceeded in both the AM and PM Peak Hours, in whichever Peak Hour would result in a higher penalty amount.

b. Failure Greater than 2% but less than or equal to 5%. If there is a failure in the reduction of trips for each of the uses listed in subparagraph i above in either or both of the AM and PM Peak Hours by more than 2% but less than or equal to 5%, the Owner/Developer shall pay to the TDM Penalty Fund $6,000 per vehicle trip for each trip by which such Maximum Trips After Reduction limit has been exceeded in the Peak Hour in which the limit is exceeded, but in the event that the limits are exceeded in both the AM and PM Peak Hours, in whichever Peak Hour would result in a higher penalty amount.

c. Failure Greater than 5%. If there is a failure in the reduction of trips for each of the uses listed in subparagraph i above in either or both of the AM and PM Peak Hours by an amount greater than 5%, the Owner/Developer shall pay to the TDM Penalty Fund $12,000 per vehicle trip for the number of trips that would equate to a 5% failure in whichever Peak Hour would result in the higher penalty amount.

P. Enforcement. If the TC fails to timely submit any Annual Report or Trip Count evaluation report to FCDOT as required by this Proffer, Fairfax County may thereafter issue the TC a written notice providing the TC has sixty (60) days within which to cure such violation. If after such sixty (60) day period the TC still has not submitted the Annual Report or Trip Count evaluation report, then the Owner/Developer and/or UOA as applicable shall be subject to a penalty of $200 per day payable to Fairfax County to be used for transit or transportation related improvements in the vicinity of the Property until such time as the report is submitted to FCDOT.

42. Transportation Demand Management Program Specific to the Existing Shopping Center. As provided in Proffer #41.C.i, certain components of the TDM Plan are applicable to and will benefit the Existing Shopping Center. Also, the Owner/Developer shall provide an additional TDM program that is tailored to specifically serve the Existing Shopping Center (the “Mall TDM Program”). The Mall TDM Program shall also be administered by the TC for the Owner/Developer, which shall retain financial and legal responsibility of this program even though the UOA will assume responsibility for the TDM Plan at the end of the Owner/Developer Control Period as described in Proffer #41.N.
A. **Goals of the Mall TDM Program.** Because tenants of the Existing Shopping Center and their employees work hours that are atypical of the standard work day, these tenants and their employees do not necessarily travel to and from the Property during the Peak Hours. Given this, the Mall TDM Program shall encourage Existing Shopping Center tenants and their employees to utilize transit, carpools, walking, biking and other non-SOV modes of transportation to travel to and from the Property rather than focusing on the specific trip reductions during the AM or PM Peak Hours. The goal of the Mall TDM Program is for ___% of the Existing Shopping Center store tenants and their employees to use non-SOV modes of transportation to commute to and from the Existing Shopping Center on a regular basis. *THIS PERCENTAGE TO BE PROVIDED FOLLOWING THE MALL SURVEY CONDUCTED IN SEPTEMBER 2006.*

B. **Components of the Mall TDM Program.** The Mall TDM Program shall include, at a minimum, the components applicable to the Existing Shopping Center that are described in Proffer #41.C.i, and the additional components provided below. These additional components may be subsequently amended by mutual agreement between the Owner/Developer and FCDOT. All amendments to the components of the Mall TDM Program contained in this Proffer shall be approved by FCDOT and will not require a PCA. The Mall TDM Program components are further described in the TDM Strategic Plan.

i. **Employee/Tenant Meetings --** The TC shall hold regular TDM meetings with the Existing Shopping Center store tenants and their employees to review the available transit options, adequacy of bus schedules (including hours of service), changes in transit service and other relevant transit-related topics. The TC shall invite Fairfax County and/or WMATA representatives to these meetings from time to time to speak to the group(s) about these and related subjects. Based on these meetings, the TC shall work with Fairfax County or WMATA to consider changes to the relevant services, such as changes to bus schedules, if such changes would provide better service to Existing Shopping Center tenants and their employees.

ii. **Transit Incentives --** Utilizing the Mall TDM Incentive Fund (described in paragraph C below), the TC shall provide financial incentives to Existing Shopping Center store tenants and their employees that utilize transit. These incentives shall include contests with fare card rewards, mall gift certificates and the like (for example—an award could be offered to the transit riding employee of the month/year or the tenant with the highest percentage of employees utilizing non-SOV transport to commute to and from the Existing Shopping Center).

iii. **Regional TDM Incentive Programs --** The TC shall make information available to Existing Shopping Center store tenants and their employees about programs that promote alternative commuting options. This shall include information on vanpools, carpools, guaranteed ride home and
other programs offered by organizations in the Washington, D.C. Metropolitan Area.

iv. Ridesharing -- The TC shall assist Existing Shopping Center store tenants and their employees in forming carpools or vanpools and the provision of convenient parking spaces to carpools or vanpools.

C. Mall TDM Incentive Fund. The Owner/Developer shall establish a Mall TDM Incentive Fund for use exclusively by the Owner/Developer with Existing Shopping Center store tenants and their employees. The Owner/Developer shall contribute $25,000 per year to this fund for the provision of transit incentives, such as gift certificate awards, fare card contests and/or give-aways, transit fairs specific to the Existing Shopping Center store tenants and their employees and for similar inducements or incentive activities. This amount shall be adjusted annually based on changes in the Index from the base year of 2007. The Applicant shall start providing this funding at the time that the first TDM Budget is approved and funded per Proffer #41. At such time as a tenant elects to financially contribute to the Mall TDM Program, such contributions shall be utilized in addition to the Owner/Developer’s annual contributions (that is, the Owner/Developer’s annual contributions shall not be reduced or offset in any way).

D. Annual Surveys and Analysis. The TC shall monitor the success of the Mall TDM Program in reaching the goal set forth in paragraph A above through tenant and employee surveys completed in September of each year (“Mall Surveys”). The TC shall review and analyze the Mall Surveys, and submit an analysis of survey results (“Mall Survey Analysis”) to FCDOT as a supplement to the Annual Report required by Proffer #41.K.ii. The Mall Survey Analysis shall include the following information:

i. A description of the Mall TDM Program measures in effect for the survey period and a description of how such measures have been implemented;

ii. The number of tenants and/or employees surveyed and the number who responded;

iii. The results of the Mall Surveys taken during the survey period;

iv. The number of people participating in the Mall TDM Program, displayed by category of participants and by mode of use; and

v. An evaluation of the effectiveness of the Mall TDM Program in achieving the goal set forth in paragraph A, including the effectiveness of the components in place and, if necessary, proposed modifications.

E. Adjustment to the Mall TDM Program Goal. At such time as the Metrorail has been in operation at the Tysons Central 123 Metro Station for a period of five years, the TC and Existing Shopping Center management shall review the non-
SOV transportation goal stated above to determine if the goal should be adjusted to more accurately reflect the transit mode split for the employees in the Existing Shopping Center. The TC shall address this issue in the Mall Survey Analysis submitted with the next Annual Report. The Mall TDM Program goal shall be reviewed with FCDOT at the next annual TDM meeting. At the time of review, the Owner/Developer and FCDOT (in coordination with the Providence District Supervisor) shall determine by mutual agreement if the mode split goal should be adjusted.

F. Mall TDM Program Participation Outreach. The TC and Existing Shopping Center management shall endeavor in good faith to encourage participation by Existing Shopping Center store tenants in the Mall TDM Program, including the encouragement of a financial participation by such tenants through their direct offering of transit benefit programs and transit incentives to their employees. Actions taken by the TC and Existing Shopping Center management in furtherance of this objective shall include dissemination of information to, and solicitation of participation from, the tenant’s Existing Shopping Center in-store management and executives or officers at its headquarters offices, at appropriate intervals.

G. Increasing Existing Shopping Center Store Tenant Commitments. In conjunction with the TC, the Owner/Developer and the management company for the Existing Shopping Center shall develop a long-range plan and schedule covering a period of years for endeavoring to incorporate covenants in leases that would require Existing Shopping Center store tenants to participate in the Mall TDM Program. This plan and schedule shall be submitted to the County at such time as the TDM Plan is submitted per Proffer #41.G, and shall include the following information. The TC may revise this plan with mutual agreement by FCDOT and the Owner/Developer.

a. A schedule for the dissemination of information and outreach efforts to be made or provided to tenants and their respective corporate ownership about the quality of life, financial and employee retention benefits of participation in and encouragement of the Mall TDM Program. The target of this information exchange and outreach shall be the national level executives or officers of the Existing Shopping Center store tenants.

b. The Owner/Developer shall actively support the TC and Existing Shopping Center management in the efforts to encourage tenants and executives to support the Mall TDM Program. Such support shall include executives and officers of the Owner/Developer communicating with executives and officers with national tenants as necessary.

The TC shall provide a detailed report to the county with respect to the activities described in this paragraph G as a supplement to the Annual Report that is to be

61
filed with the county in accordance with Proffer #41. This report shall include detailed accounts of the outreach efforts and the feedback and response from the tenants. The report shall also include information on how the TC and the Owner/Developer will address any lack of interest in, opposition to, or other issues posed by Existing Shopping Center store tenants with the Mall TDM Program.

**PEDESTRIAN/BICYCLE IMPROVEMENTS**

43. **On-Site Trails.** The Applicant shall complete the trails described in paragraph A below and as indicated in the CDP/FDP, on a phase-by-phase basis, and in each phase, so the trails will be available for use on or before the date of issuance of that number of RUPs or Non-RUPs as meet the following thresholds:

- Development Prior to Rail or Phase 1 of the Development With Rail: 260,000 square feet of office space or 130 residential units, whichever occurs first
- Phase 2: 260,200 square feet of office space or 139 residential units, whichever occurs first
- Phase 3: 13,050 square feet of office space or 100 residential units, whichever occurs first
- Phase 4: 140,650 square feet of office space or 107 residential units, whichever occurs first

A. Due to the urban nature of the site, the Applicant may request modifications to the Public Facilities Manual design criteria for trails, such as shoulders or lane markings; such modifications shall be subject to approval by DPWES. For each phase, the Applicant shall provide appropriate pedestrian/bicycle signage and lane markings. Upon demonstration by the Applicant that despite diligent efforts, the improvement(s) has been delayed, the Zoning Administrator, may agree to a later date for completion of the improvement(s).

i. Development Prior to Rail and/or Phase 1 – a 10-foot wide trail along the eastern side of ShopTysons Boulevard with crosswalks as indicated on Sheet 22 of the Development With Rail CDP/FDP or Sheet 18 of the Development Prior to Rail CDP/FDP.

   a. This trail requires approval of Fairfax Water (“FW”) to adjust the grades over the water main and approval of VDOT to grade and construct a retaining wall. If VDOT fails to grant such permission, the Applicant shall provide this improvement via the “Phase One: Alternative Plan For Bike Trail” as indicated in the above noted pages of the CDP/FDP or pursue another reasonable alternative as approved by the Zoning Administrator and DPWES.

ii. Development Prior to Rail and/or Phase 1 – As indicated on Sheet 23 of the Development With Rail CDP/FDP (or Sheet 19 of the Development Prior to Rail CDP/FDP), the Applicant shall provide a 6-foot wide multipurpose trail adjacent to the Mall Ring road between Terrace A and
International Drive to connect to existing sidewalks at Fletcher Street and the Crate & Barrel/Mall entrance (Intersection #4). This sidewalk will subsequently be replaced with a 12-foot shared pedestrian/bicycle path to be provided in Phase 4 and as further described in Proffer #43.A.vii below.

iii. Phase 1 – As indicated on Sheet 23 of the CDP/FDP, the Applicant shall provide a 10-foot wide trail along International Drive north of the Crate & Barrel/Mall entrance (Intersection #4) along the Property’s frontage. This improvement is to be provided with Phase 1 of the Development With Rail only; however, if, as outlined in Proffers #4 and #6, after completing the Development Prior to Rail, the Applicant is permitted to proceed to Phase 2, this improvement shall be completed as part of Phase 2 in accordance with Proffer #7.

iv. Phase 2 – As indicated on Sheet 26 of the CDP/FDP, the Applicant shall provide a 10-foot wide trail from International Drive to the bus plaza on Route 123.

v. Phase 3 – As indicated on Sheet 35 of the CDP/FDP, the Applicant shall provide a 6-foot wide sidewalk on the south side of Fashion Boulevard adjacent to Towers Crescent if the Towers Crescent Owners provide necessary grading, construction and pedestrian access easements at reasonable cost to the Applicant. Prior to site plan approval for Phase 3, which includes roadway improvements to Fashion Boulevard in the vicinity, the Applicant shall diligently pursue the necessary easements and provide DPWES with documentation of the efforts to coordinate with the Towers Crescent Owners. If the Towers Crescent Owners should grant the necessary easements, the Applicant shall provide this trail widening improvement prior to issuance of the first RUP or Non-RUPs for Phase 3, whichever occurs first.

Should the Applicant not receive the requisite approvals and easements from the Towers Crescent Owners at the time its Phase 3 site plan is otherwise ready for approval by DPWES, the Applicant shall request the County utilize the condemnation provisions as outlined in Proffer #36 to obtain the easements necessary to permit completion of this improvement. The Applicant shall provide DPWES with documentation of such diligent efforts to demonstrate the Applicant’s failed attempts to obtain the necessary easements. If the County elects not to pursue condemnation, rather than constructing the above described trail widening, the Applicant shall escrow funds per the County of Fairfax Unit Price Schedule to permit the replacement of the 4-foot sidewalk sections with 6-foot sidewalk sections as determined by Fairfax County.

vi. Phase 3 – As indicated on Sheets 34 and 35 of the CDP/FDP, the Applicant shall provide a 15-foot wide shared vehicle/bicycle lane and
streetscaping on Fashion Boulevard and a 12-foot wide shared pedestrian/bicycle path and streetscaping along the Property’s Leesburg Pike frontage as indicated on Sheet 37 of the CDP/FDP.

vii. Phase 4 – As indicated on Sheet 44 and 45 of the CDP/FDP, the Applicant shall provide a 12-foot wide shared pedestrian/bicycle path and streetscaping along the Property’s International Drive frontage.

B. Trail Adjustment. The trails may be adjusted to incorporate changes to the bike trail guidelines in the Fairfax County Comprehensive Plan for the Tysons Corner Urban Center or the County’s Trails Plan (including locating the trails along Leesburg Pike and/or International Drive on-road), without obtaining a Proffer Condition Amendment or an amendment to the CDP/FDP if approved by the Zoning Administrator. If the County revises the Comprehensive Plan trail alignment along Leesburg Pike or International Drive to recommend trails be located on-road, the Applicant shall work with FCDOT, VDOT and DPZ to locate a 5 foot trail on the roadway(s) in lieu of the trail described above. To comply with the Comprehensive Plan or Trails Plan, such modification shall be subject to the approval of the Zoning Administrator in accordance with the provisions of Sect. 16-403, provided that the adjustments are in substantial conformance with the CDP/FDP and do not materially adversely affect other features shown on the CDP/FDP.

44. Loop Trail. With the Development with Rail, the Applicant shall provide a Loop Trail around the Property, as indicated in the Development With Rail CDP/FDP on Sheets 8, 9 and 10 (or an interim loop trail with the Development Prior to Rail or Phase 1 as indicated on Sheet 8 of the Development With Rail CDP/FDP). This trail facility shall be constructed in phases with the phases of the Development With Rail as indicated in the CDP/FDP and in Proffers #6 and #43. The Applicant shall provide signage and mileage markers to demarcate the loop trail around the Property.

45. Route 123 Sidewalk/Trail. In lieu of an 8’ paved trail along the Route 123 frontage east of the Route 123 entrance to the Property, the Applicant shall contribute funds to the Providence District Trails Fund as determined by DPWES at the time of the first site plan approval (as per the then current Fairfax County Unit Price Schedule) for use by the County or others in constructing this portion of the trail and sidewalk at such time as a safe passage across I-495 is constructed through the interchange or in another location as determined by the County.

46. Bicycle Racks. The Applicant shall provide bicycle racks convenient to the office, residential and Retail/Commercial uses, including, at a minimum, the below. To the extent possible, on-site bicycle racks shall be provided under cover. Specific locations of the bicycle racks are to be coordinated with FCDOT prior to site plan approval. The Applicant shall provide bicycle racks prior to the issuance of the first RUP or Non-RUP for each phase or building respectively.

A. The Applicant shall provide bicycle racks accommodating a minimum of 20 bicycles near the Elevated Plaza in Phase 1 as indicated on the CDP/FDP. In addition, with Phase 1 or the Development Prior to Rail, the Applicant shall
provide bicycle racks in convenient locations accessible to those traveling to the Existing Shopping Center from Route 123, Route 7 and International Drive, including a bicycle rack in a convenient location underneath the Phase 1/Development Prior to Rail Elevated Plaza.

B. The Applicant shall provide bicycle racks accommodating a minimum of 20 bicycles with each new parking garage and/or near each residential and office building in every phase prior to the issuance of the first RUP or Non-RUP.

C. With Phase 3, the Applicant shall provide bicycle racks accommodating a minimum of 20 bicycles near the Community Green.

D. If demand for the bicycle racks provided throughout the Property exceeds the bicycle parking spaces provided, the Applicant shall provide additional bicycle racks to ensure that the demand is met.

47. **On-Site Shower and Locker Facilities.** The Applicant shall provide shower and locker facilities to facilitate employees that bike to the Property. At a minimum, a shower and locker facility for each gender shall be provided in each of the following buildings: (1) either Office Building 1-B or 2-B, (2) Office Building 3-B, and (3) either Office Building 4-B or 4-C.

**PUBLIC TRANSPORTATION**

48. **Bus Shelters.** The Applicant shall provide bus shelters in the following locations. Unless otherwise noted, should FCDOT determine that a bus shelter in any of these locations is not warranted, the Applicant shall escrow $20,000 for construction of each such bus shelter to permit construction of a shelter in the vicinity of the Property. The contribution amount shall escalate on a yearly basis from the base year of 2007 based on changes in the CCI. The Applicant shall provide general maintenance of the bus shelter areas, including trash removal.

A. Prior to issuance of the first RUP or Non-RUP, the Applicant shall install bus shelters in the following locations.

   i. On ShopTysons Boulevard in the vicinity of Buildings 1-A and 1-B in a location to be coordinated with and subject to the approval of FCDOT.

   ii. On the Property’s International Drive frontage in a location to be coordinated with and subject to the approval of FCDOT.

B. Prior to issuance of the first RUP or Non-RUP for Phase 3, the Applicant shall install a bus shelter along the Property’s Route 7 frontage in a location to be coordinated with and subject to the approval of FCDOT.

49. **Bus Shelter Contributions.** The Applicant shall make contributions to Fairfax County for bus shelters as further described below. The contribution amount shall escalate on a yearly basis from the base year of 2007 based on changes in the CCI.
A. The Applicant shall contribute $20,000 prior to site plan approval for Phase 3 to be used for the installation of a bus shelter on the west side of International Drive or in the vicinity of the Property.

B. The Applicant shall contribute $20,000 prior to site plan approval for Phase 4 to be used for the installation of a bus shelter on the south side of Route 7 or in the vicinity of the Property.

50. Mall Bus Circulation Access. As may be determined necessary by the County, the Applicant shall work cooperatively with WMATA and Fairfax County toward reaching a written agreement among the parties that will assure continued access to the ring road located on the Property to buses owned and operated by WMATA, the County, and other governmentally-sponsored mass transit service providers. This agreement shall address matters such as the number of buses, the routes, stops and other relevant information and any impact of the buses, routes and stops on the circulation throughout the Property. Once this agreement is signed, the number of buses, circulation patterns and locations of bus stops may be altered by the mutual agreement of the Applicant, WMATA and the County. The agreement shall provide that WMATA, the County and such other governmentally-sponsored mass transit service providers shall maintain at all times customary public liability and property damage insurance (or adequate self insurance reserves), which names the Applicant as an additional named insured, and which covers personal injury or property damage caused by the acts or omissions of the respective parties.

51. Metrorail Station-Related Facilities. THIS PROFFER TO BE REVISED TO REFLECT THE AGREEMENTS CURRENTLY BEING COORDINATED WITH FCDOT, DRPT AND WMATA. As further described in Proffer #4, the Applicant shall not obtain approval of any plans or permits related to the Development With Rail until an agreement is established between the Applicant and the Dulles Rail Project Entities, and/or the Washington Metropolitan Area Transit Authority (“WMATA”). The Applicant shall provide these agreements to FCDOT for review prior to execution. Those agreements shall provide for: (i) the installation and operation of an elevated pedestrian bridge that is 16’ wide at the base (with respect to this, the Applicant shall provide the funds necessary to increase the width of the pedestrian bridge from 12’ wide to 16’ wide as measured at the base of the interior to provide a 16’ wide area of clearance for pedestrian use); (ii) the construction and operation of an entrance pavilion on the Property on the south side of Route 123 in the vicinity of Parking Terrace D to accommodate the elevated pedestrian bridge; (iii) the construction and operation of a bus transfer plaza on the Property on the south side of Route 123 in the vicinity of Parking Terrace D; (iv) the dedication by the Applicant of land area along Route 123 for the bus transfer plaza (without compensation therefore to be due to the Applicant); (v) the grant of easements as may be needed to accommodate the exiting of buses from the bus transfer plaza through the Property to the surrounding public street network (without compensation, therefore, to be due to the Applicant); (vi) the granting of reciprocal construction, access, utility and air rights easements pertaining to the foregoing facilities; (vii) conformity with WMATA connection policies for private development (except that the Applicant shall not be required to compensate WMATA for any connections); and (viii) maintenance of the foregoing facilities by the appropriate parties. The CDP/FDP depicts the Applicant’s preferred locations for the foregoing improvements. The Applicant shall cooperate with the Dulles Rail Project Entities to coordinate the final locations of
such improvements and shall obtain approval from the Zoning Administrator for any changes in locations from those depicted on the CDP/FDP.

The agreement with the Dulles Rail Project Entities shall also address the contingency that the extension of Metrorail could occur after the Applicant has constructed improvements under the Development Prior to Rail or where the Applicant has constructed Phase 1 under the Development With Rail but has elected to delay or not to construct Phase 2. Subject to the completion of definitive terms and conditions of the separate agreement, Sheet 21 of the Development Prior to Rail CDP/FDP or Sheet 47 of the Development With Rail CDP/FDP show certain Metrorail-related improvements or conveyances that the Applicant shall construct or make prior to the operation of the Metrorail at the Tysons Central 123 Metro Station, including (1) land dedication areas (without compensation, therefore, to be due to the Applicant), (2) relocation of the Mall ring road adjacent to Parking Terrace D to permit the frontage improvements to accommodate the Metrorail bus area on Route 123, (3) construction of a pedestrian bridge from the Metrorail south entrance pavilion on the Property to the Development Prior to Rail or to Phase 1, (4) the widening of the Property’s Route 123 frontage to accommodate the ultimate Route 123 northbound improvements, and (5) construction of a bus plaza area on the south side of Route 123.

RECREATIONAL FACILITIES

52. On-Site Recreational Facilities Contributions.

A. Pursuant to Paragraph 2 of Section 6-110 and Paragraph 2 of Section 16-404 of the Zoning Ordinance regarding developed recreational facilities, the Applicant shall expend a minimum of $955 per market residential unit on on-site recreation facilities. In order to satisfy this obligation, the Applicant shall provide the on-site recreational facilities shown on the CDP/FDP. If the Applicant does not expend the prescribed amount in any phase of the development, and any such shortfall is not expended for these purposes in a subsequent phase, then any remaining balance shall be contributed as of the completion of the fourth phase to the County Park Authority for the provision of recreation facilities located in the vicinity of the Property.

B. Prior to site plan approval for a residential building in any phase, if the County increases the standard contribution of $955 per market-rate unit, the Applicant shall increase the contribution to the County for that phase of development as indicated in paragraph A.

53. Public Amenities and Facilities. These facilities are proposed to serve or be used by members of the general public, subject to usual and customary rules and regulations governing their use. The Applicant shall complete the facilities as described in paragraphs A-F below, and as indicated in the CDP/FDP, on a phase-by-phase basis, on or before the date of issuance of that number of RUPs or Non-RUPs as set forth below for each phase.

- Development Prior to Rail/Phase 1: 260,000 square feet of office space or 130 residential units, whichever occurs first
- **Phase 2:** 260,200 square feet of office space or 130 residential units, whichever occurs first
- **Phase 3:** 13,050 square feet of office space or 100 residential units, whichever occurs first
- **Phase 4:** 140,650 square feet of office space or 107 residential units, whichever occurs first

A. **Changes to the Layout and Mix.** The layout or mix of facilities indicated below may be altered provided the proposed alterations substantially conform with and provide substantially equivalent recreation opportunities as that shown on the CDP/FDP as determined by the Zoning Administrator. The Applicant reserves the right to add public art to the site in areas not currently identified with public art on the CDP/FDP.

B. **Children’s Play Area.** The Applicant shall provide one or more indoor children’s play areas totaling not less than 1,700 SF within the Existing Shopping Center.

C. **Phase 1 or the Development Prior to Rail.** The Applicant shall provide the following facilities or equivalent as part of the Phase 1 development or the Development Prior to Rail (these facilities may be adjusted seasonally, and not all facilities are specifically indicated on the CDP/FDP):

   - i. Seasonal ice skating rink/interactive water feature
   - ii. Performance space
   - iii. Seating area adjacent to the ice rink and Retail/Commercial uses
   - iv. Public art in locations as generally depicted on the CDP/FDP with flexibility in the locations permitted with administrative approval from the Zoning Administrator
   - v. Children’s activity area
   - vi. Children’s passive area (to include a reading area or space for children’s entertainment)
   - vii. Shade structure(s) and/or shaded area(s)

D. **Phase 2.** The Applicant shall provide the following facilities as part of the Phase 2 development:

   - i. Entry water feature
   - ii. Seating adjacent to the proposed Retail/Commercial
   - iii. Dog exercise area/park, as identified on the CDP/FDP as “Dog Exercise Area”
iv. Shade structure(s) and/or shaded area(s)

E. **Phase 3.** The Applicant shall provide a community green as part of the Phase 3 development as shown on the CDP/FDP. This community green shall include the below facilities or amenities:

i. Central focal water element/interactive water feature

ii. Walking paths with seating

iii. Open events lawn/play area for special events

iv. Shade structure(s) and/or shaded area(s)

F. **Phase 4.** The Applicant shall construct the Sky Terrace on top of Parking Terrace A as part of the Phase 4 development. The Sky Terrace shall include the below facilities or amenities:

i. Walking paths with seating

ii. Gardens

iii. Children’s active play area

iv. Performance lawn with seasonal stage

v. Shade structure/pavilion

vi. Small active/passive recreational area (e.g. bocce court, putting green, sculpture lawn)

54. **Semi-Private Amenities and Recreation Facilities.** Except where indicated otherwise, these facilities are proposed to serve or be used by residents and office workers living and/or working in the residential and office buildings, subject to usual and customary rules and regulations governing their use. The Applicant shall complete the facilities as described in paragraphs A-F below, and as indicated in the CDP/FDP on a phase-by-phase basis. Except as otherwise noted, these facilities shall be completed on or before the date of issuance of that number of RUPs or Non-RUPs as set forth below for each phase.

A. **Changes to the Layout and Mix.** The layout or mix of facilities indicated below may be altered provided the proposed alterations substantially conform with and provide substantially equivalent recreation opportunities as that shown on the CDP/FDP as determined by the Zoning Administrator. Such alterations to the layout or mix of facilities may occur at any time, including after the facility has been constructed. The Applicant reserves the right to add public art to the site in areas not currently identified with public art on the CDP/FDP.
B. Health Club or Fitness Center. Each residential and office building in each phase shall have a limited service health or fitness center (providing equipment and facilities but not necessarily staffing) for use by the residents and employees, respectively, living or working in those buildings, and having an appropriate size but in all cases not less than 1,000 square feet per building. When located in an office building, the health club/fitness center shall be open for use prior to issuance of Non-RUPs as indicated below:

- Development Prior to Rail/Phase 1: 260,000 square feet of office space or 130 residential units, whichever occurs first
- Phase 2: 260,200 square feet of office space or 130 residential units, whichever occurs first
- Phase 3: 13,050 square feet of office space or 100 residential units, whichever occurs first
- Phase 4: 140,650 square feet of office space or 107 residential units, whichever occurs first

C. Phase 1 or the Development Prior to Rail. The Applicant shall provide the following semi-private facilities as part of Phase 1 or the Development Prior to Rail prior to the issuance of RUPs for the 130th residential unit.

i. Swimming pool for the residential building
ii. Seating that consists of either a seating element built into the development or actual chairs/benches, with a minimum number of seats that is not less than 5% of the number of residential units
iii. Shade structure(s) and/or shaded area(s)

D. Phase 2. The Applicant shall provide the following semi-private facilities as part of Phase 2 prior to the issuance of RUPs for the 130th residential unit. As indicated on the CDP/FDP, a structural barrier shall provide a visual separation between the below indicated semi-private amenities/facilities and the public amenities/facilities described above.

i. Semi-private terrace located between residential tower 2-A and office tower 2-B
ii. At least two court activities (with some combination of basketball, tennis or multi-use sport court) on the top level of the improved Parking Terrace A.
iii. Temporary sport court practice wall on the top level of the improved Parking Terrace A. This temporary practice wall will be removed at the time of construction of the Sky Terrace.
iv. 1,700 square foot Multipurpose Sport Court on the plaza between buildings 2-A and 2-B for use by residents in the on-site residential buildings and office workers. This court may be used as a half-court basketball court or for other court activities.

v. Swimming pool for the residential building.

vi. Seating that consists of either a seating element built into the development or actual chairs/benches with a minimum number of seats that is not less than 5% of the number of residential units within Phase 2 and an additional minimum of 12 seats to serve the office tenants in addition to the residents.

vii. Shade structure(s) and/or shaded area(s).

E. Phase 3. The Applicant shall provide the following semi-private facilities as part of Phase 3 prior to issuance of the 100th RUP for Phase 3.

i. Semi-private terrace located at residential tower 3-A

ii. Swimming pool for the residential building

iii. Seating that consists of either a seating element built into the development or actual chairs/benches with a minimum number of seats that is not less than 5% of the number of residential units within Phase 3

iv. Small active/passive recreational area (e.g. bocce court, putting green, sculpture lawn)

v. Shade structure(s) and/or shaded area(s)

F. Phase 4. The Applicant shall provide the following semi-private facilities as part of the semi-private terrace at residential building 4-A prior to the issuance of the 107th RUP for Phase 4.

i. Swimming pool for the residential building

ii. Seating that consists of either a seating element built into the development or actual chairs/benches, with a minimum number of seats that is not less than 5% of the number of residential units within Phase 4

iii. Shade structure(s) and/or shaded area(s)

55. Off-Site Recreational Facilities Contributions.

A. Contribution for Off-Site Recreation Facilities. In addition to the recreation facilities and/or contribution required by Proffer #53, the Applicant shall provide a contribution of $493 per residential unit to the Fairfax County Board of
Supervisors at the time of site plan approval for each phase. These funds are to be used for athletic facilities and fields in the vicinity of the Property.

B. **Potential Escalated Contribution.** The contribution amount shall escalate on a yearly basis from the base year of 2007 and change effective each January 1 thereafter, based on changes in the Consumer Price Index for all urban consumers (CPI-U) 1982-1984=100 (not seasonally adjusted) (“CPI”).

56. **One-Time Field Contribution.** The Applicant shall make a one-time contribution of $500,000 to the Fairfax County Board of Supervisors for athletic field improvements. The field(s) to be improved, and the scope of the improvements, shall be determined by the Providence District Supervisor in consultation with the Providence District Athletic Fields Task Force. Such contribution shall be made within 30 days of final, unappealable approval of this Application.

**PUBLIC SCHOOLS CONTRIBUTION**

57. **Public Schools Contribution.**

A. **Contribution.** Per the Residential Development Criteria Implementation Motion adopted by the Board of Supervisors on September 9, 2002, effective January 7, 2003, at the time of issuance of the first building permit for each residential building, the Applicant shall contribute $7,500 per student generated by that building (based on an assumed rate of .102 students per multifamily high-rise unit in that phase) to DPWES for transfer to the Fairfax County School Board to be utilized for capital improvements and capacity enhancements to schools in the Tysons Corner area that may serve the development.

B. **Escalation in Contribution.** Prior to site plan approval for each phase, if Fairfax County should increase the accepted ratio of students per high-rise multifamily unit or the amount of the contribution per student, the Applicant shall increase the amount of the contribution for that phase of development to reflect the current ratio and/or contribution. If the County should decrease the ratio or contribution amount, the Applicant shall provide the greater of the two amounts.

**AFFORDABLE HOUSING**

58. **Affordably Priced Rental Units.** This proffer sets forth the elements of a program that is intended to provide affordably priced rental housing units (“APRUs”), which will be affordable to future residents who have a median household income of 70% of the Washington D.C. Standard Metropolitan Statistical Area median household income (“MHI”), in order to preserve and expand the housing options available in the County to residents that have a moderate income.

A. Eight percent (8%) of the dwelling units actually constructed shall be APRUs. The APRUs shall be subject to the rental and other covenants and restrictions of these proffered conditions, and except as specifically set forth in this Proffer, shall not be subject to the rental and other restrictions applicable to Affordable
Dwelling Units ("ADUs") as defined by Article 2 of the Zoning Ordinance. The Applicant shall provide all of these units as either two (2) bedroom, one (1) bedroom, efficiency and/or studio units with one bathroom and a minimum size of 400 square feet per unit, a maximum size of 900 square feet and an average size of 550 square feet. The Applicant shall phase the provision of APRUs with each phase in order to provide a minimum of 8% APRUs within each phase of development.

B. The Applicant shall provide these APRUs as rental units within the Applicant's proposed residential buildings. The Applicant specifically reserves the right to provide APRUs as rental units within a rental building or within a condominium building (that is, the Applicant may either retain ownership of the building and rent all of the dwelling units, or the Applicant may create a condominium in order to sell market-rate units and nevertheless rent APRUs).

i. Notwithstanding the foregoing, the Applicant may provide up to 30% of the APRUs in each phase off-site in the Tysons Corner Urban Center Planning District, in one or more locations approved by the Zoning Administrator, provided that the Zoning Administrator determines that such substitute units are substantially equivalent to on-site units.

ii. Not less than ten percent (10%) of the APRUs provided in any phase (rounded to the nearest whole number) shall be designed and constructed as fully handicapped accessible units. In the event that APRUs are authorized off-site, no more than five of the handicapped accessible units may be provided off-site.

iii. All of the semi-private facilities and amenities that are available to market rate units shall also be available to APRUs on an equal access basis.

iv. Within any residential building, APRUs shall be dispersed among the market rate units.

v. In accordance with Section 2-812.6 of the Zoning Ordinance, the Applicant shall record a covenant running with the land in favor of the Fairfax County Redevelopment and Housing Authority that provides that for thirty years from the date of issuance of the first RUP for the APRUs, no such unit may be rented for an amount that exceeds the rental rates for ADUs as set by the County.

C. It is intended that the APRUs shall be administered in a manner that is similar to certain of the administrative procedures established for ADUs in Section 2-800 of the Zoning Ordinance in effect at the time of the execution of these proffers. The following specific provisions of the Zoning Ordinance shall apply to administration of the APRUs, except where such provisions directly conflict with this Proffer: (1) Section 2-811.2, (2) Section 2-811.3, (3) Section 2-812.1.D, (4) Section 2-812.6, (5) Section 2-812.7, (6) Section 2-813 and (7) Section 2-817.
When this Proffer conflicts with the administrative sections of the Zoning Ordinance, this Proffer shall control.

MISCELLANEOUS PROFFERS APPLICABLE TO DEVELOPMENT WITH RAIL AND DEVELOPMENT PRIOR TO RAIL

59. **Advance Density Credit.** The Applicant reserves density credit as may be permitted by the provisions of Paragraph 4 of Section 2-308 of the Ordinance for all eligible dedications described herein.

60. **Severability.** Any of the phases and/or buildings may be the subject of a proffered condition amendment (“PCA”), Special Exception (“SE”), Special Permit (“SP”), or Final Development Plan Amendment (“FDPA”) without joinder and/or consent of the owners of the other phases or buildings, provided that such PCA, SE, SP or FDPA does not materially adversely affect the other phases or buildings. Previously approved zoning applications applicable to a particular land bay that is not the subject of such a PCA, SE, SP or FDPA shall otherwise remain in full force and effect.

61. **Successors and Assigns.** These proffers will bind and inure to the benefit of the Applicant and his successors and assigns. Each reference to “Applicant” in this proffer statement shall include within its meaning and shall be binding upon Applicant’s successor(s) in interest and/or developer(s) of the site or any portion of the site.

62. **Counterparts.** These proffers may be executed in one or more counterparts, each of which when so executed and delivered shall be deemed an original, and all of which taken together shall constitute but one and the same instrument.

Strategic Transportation Initiatives Inc. Proposed Plan Transportation Demand Management MetroWest.
Submitted on behalf of Pulte Homes.
PROPOSED PLAN
TRANSPORTATION DEMAND MANAGEMENT

MetroWest

SUBMITTED ON BEHALF OF
Pulte Homes

BY Strategic Transportation Initiatives Inc.
The MetroWest Transportation Demand Management (TDM) Strategic Plan has been reformatted for presentation purposes, only, and is the same document submitted to Fairfax County as part of the Proffer requirement.

Pulte Homes has designed a new transit-oriented, mixed-use community adjacent to the Vienna-Fairfax-GMU Metrorail Station south side facilities. The community will incorporate a variety of residential, office, retail, service, institutional, governmental and other uses. MetroWest will create a new and greatly enhanced pedestrian-friendly interface with the Vienna-Fairfax-GMU Metrorail Station, a town center plaza combining retail and public outdoor activity space, pedestrian connections to and through East Blake Lane Park and adjacent existing neighborhoods, as well as provide a new public recreation/community center.

The project provides many transportation (motorized and non-motorized) improvements and/or enhancements in the immediate and surrounding area. Most notable is the construction of a critical long-anticipated, four-lane, median-divided boulevard to connect Lee Highway with Saintbury Drive. This new link to the Vaden Drive Bridge will enhance circulation in and around the Vienna-Fairfax-GMU Metrorail Station area, and provide a relief for north-south traffic in the Lee Highway corridor. The project also provides for the redesign and reconstruction of Saintbury Drive as a public street east of Vaden Drive to Nutley Street. Improvements to both the pedestrian interface with the Metrorail Station and vehicular circulation and access to the various uses in and around the station are also proposed. Significant improvements to south side station facilities will also be provided and include ramp widenings, new traffic signals, crosswalks, modifications to existing signals and improved bus and kiss-and-ride facilities.

The project also includes a pedestrian bridge crossing of Hatmark Branch and a realignment of the City of Fairfax Connector Trail to improve pedestrian connections to both the Metrorail Station and the project from communities west of the park and east of the proposed new community.

MetroWest implements the Policy Plan of Fairfax County by concentrating development next to an existing Metrorail Station. Additionally, it furthers the Smart Growth Principles of the Metropolitan Washington Council of Governments (MWCOG). The MetroWest plan is the result of a multi-year collaborative effort among surrounding neighborhood associations, a citizens’ working group, the Fairfax County Departments of Planning & Zoning and Transportation, the Washington Metropolitan Area Transit Authority (WMATA) and the Virginia Department of Transportation (VDOT). One of the features of the MetroWest plan is the inclusion of provisions for Transportation Demand Management (TDM), which will help ensure the pedestrian orientation of the project for the future and decrease the project’s reliance on single occupant vehicle (SOV) trips.

A strategic plan for TDM at MetroWest, developed by Strategic Transportation Initiatives, Inc., a Virginia-based TDM consulting firm, is presented in the pages that follow.
This document presents the Strategic TDM Plan for the MetroWest transit-oriented development (TOD) proposed by Pulte Homes. The properties comprising the proposed new development are generally located on the south side of I-66, north of Lee Highway, west of the existing Hunters Branch community and east of East Blake Lane Park in Fairfax County, Virginia. The applicant proposes to rezone and subsequently develop the site with the following mix of land uses:

- Up to 300,000 Gross Square Feet (GSF) of office space
- Up to 2,248 residential dwelling units
- A minimum of 100,000 GSF of combined retail, service, institutional and governmental uses

TDM is a general term for strategies that result in more efficient use of transportation resources. In an effort to decrease reliance on the personal automobile and encourage the use of transit, ridesharing, telecommuting, bicycling, and walking, the Fairfax County Comprehensive Plan provides that the applicant implement a TDM Plan. Many different TDM strategies, with a variety of impacts, can be used in a TDM plan. Some reduce the need for physical travel through mobility substitutes or more efficient land use. Some improve the transportation options available to consumers, while others provide an incentive to choose more efficient travel patterns. TDM strategies can change travel timing, route, destination, or mode.

The Comprehensive Plan specifies that the TDM Plan for MetroWest be “...evaluated initially in at least three stages during the development process; first at the time of rezoning, second before and during construction and third after project completion or “build-out.” The Plan further provides that at the time of rezoning, the applicant should demonstrate the feasibility of the peak-hour trip reductions established for the community (47% for residential uses and 25% for office uses.) To that end, the Fairfax County Department of Transportation, through Pulte Homes (as the applicant), solicited proposals from qualified applicants and/or firms to develop TDM program recommendations for the new community, as well as to evaluate the feasibility of the potential peak-hour trip reductions for the project.
UrbanTrans Consultants were selected by the County to conduct the work and a final report was issued in July 2005. The final report concluded that the “...trip reduction targets for the proposed project (peak-hour vehicle trip reductions of 47% for the residential uses and 25% reductions for the office uses) can be achieved through a combination of physical design characteristics of the site, as proposed, and the full application of the TDM programs and strategies” as they recommended. This TDM Plan provides a methodology and protocol for implementing, funding and monitoring the recommended MetroWest TDM strategies.

Initially, Pulte Homes will be responsible for the start-up and the operation of the TDM program. Eventually, the program will be handed over to the management of a building management firm or other agent of the Umbrella Owner’s Association.

The MetroWest TDM Plan will be a community-wide effort. All future owners, tenants and homeowner’s associations within the MetroWest community will be made aware of the TDM program and its ongoing activities. Every resident and employer/employee will be a part of the TDM strategy for MetroWest. All residents, employers and employees will directly benefit from the TDM program and will directly or indirectly fund its implementation. Part of the TDM strategy for MetroWest is to align the interests of project residents, employers and employees so that all work to ensure the success of the program and the continued achievement of the TDM objectives.
In its final report, UrbanTrans summarized the process used and the results generated from research and analyses they conducted. The process involved five research and analysis tasks:

1. Forecasting peak-period vehicle trip generation for the proposed development using established ITE and Fairfax County trip generation rates as appropriate.

2. Assessing existing commuting and travel patterns, along with transportation-related attitudes and preferences, within the existing Vienna-Fairfax-GMU Metrorail Station Area (the area generally defined by the Fairfax County Comprehensive Plan as within the 1/2-mile radius from the station.) Methods utilized included:
   
   a. RESIDENT & EMPLOYER SURVEYS:
      Surveying residents and employees within the study area, and, proximate to other existing stations, to assess attitudes and preferences about travel choices, and to understand current travel behavior and demographics.

   b. TRAFFIC COUNTS:
      Conducting peak-hour vehicle counts of entering/exiting traffic at communities proximate to the Vienna-Fairfax-GMU transit station, and observing vehicle occupancy during peak periods.

   c. CENSUS ANALYSIS:
      Utilizing 2000 Census and Journey to Work data, along with supplemental 2005 demographic data, to understand demographic and household information and commute patterns within the 1/2-mile radius of the Vienna-Fairfax-GMU Metrorail Station Area.

3. Investigating TDM “best practices” and lessons-learned throughout the region and across the country.

4. Understanding current TDM programs offered within Fairfax County as a whole, and identifying opportunities and barriers to successful TDM implementation at the MetroWest site.

5. Meeting with, responding to, and receiving input and suggestions from neighborhood groups and residents within and proximate to the study area.

The results of these tasks yielded specific TDM program recommendations for MetroWest, and forecasted that peak period vehicle trip reductions could be reasonably achieved given the combination of uses proposed, the transit oriented design of the development, and the recommended TDM program elements.
This MetroWest TDM Strategic Plan is the next step and is intended to build on the UrbanTrans recommendations to develop programmatic details and specifications for the implementation of TDM at MetroWest. Its intended purpose is to transform all of the recommended strategies into a coordinated program of TDM operations during and after construction of the project. This TDM Strategic Plan is organized around the following areas:

- Site & Physical Amenities/Improvements
- TDM Products, Programs and Services, including branding and targeted marketing
- TDM Program Strategies
- TDM Program Management
- Parking Management
- TDM Implementation and Funding
- Monitoring and Evaluation
Transportation Demand Management (TDM), as stated earlier, refers to strategies employed to reduce vehicle demand. TDM strategies consider how people’s choices of travel mode are affected by land use, development design, parking (availability and cost), and convenience and availability of alternative modes. One of the most important components of a TDM plan at a transit-oriented development (TOD) is the design of the site and supporting facilities. By designing the site to provide for its safe and convenient use by pedestrians, bicyclists, and transit users, the effects of the programmatic elements of the TDM plan are enhanced.

One of the most influential long-term factors in trip choice is the physical environment. In the TOD, how comfortable does it feel to walk to/from the transit station, bus facilities and on-site amenities; for adults, persons alone, people with mobility challenges, and children? How far is it to a mix of services? Is the site designed for people or vehicles? Are there major barriers that impede access to the station and community?

The conceptual plan for MetroWest reflects the collaborative efforts of the development team, public agency staff and surrounding community representatives in creating a true transit-oriented community. The plan reflects a mix of density, diversity and design elements.

**Density**

The highest densities within the community are located closest to the transit station and transition down to the south, east and west. Locating higher residential densities proximate to the Vienna-Fairfax-GMU Metrorail Station serves to support the peak hour headways currently provided and planned by WMATA. The location of the office buildings close to the south side station platform bolsters the marketability of the office uses on-site and would encourage employees and/or visitors to utilize the station, increasing off-peak, off-directional usage. Transitioning residential density down towards the east, west and south conforms to the Comprehensive Plan’s goal and objective of integrating TOD’s with existing stable communities.
Diversity of Uses
A diverse mix of residential unit types, sizes and price points, as well as commercial and on-site personal service uses, serves to enhance the ability of the community to provide opportunities for mode choice and to reduce the need for off-site trips. The following mix and type of uses are proposed as part of the new community:

- Low, mid and high-rise multi-family rental and/or condominium units;
- Age-restricted residential dwelling units;
- Single family attached dwelling units;
- Potential for Live/Work units;
- Onsite transit store that will be located in one of the core area buildings;
- Grocery store;
- Personal service retail uses (i.e., dry cleaners, coffee shop, deli, restaurants, day care center, etc.);
- A +/- 29,700 gross square footage (GSF) community center; and
- 300,000 GSF of office uses.

Site Design
The following design elements will be included throughout the MetroWest community:

- Sidewalks that are safe, attractive, well-lit and that connect main entrances of buildings/residences to the street or activity area without barriers.
- Building entrances that are oriented to the streets or activity areas and are not separated by vast parking areas or fences.
- On-street, short-term carpool/vanpool drop-off and off-peak delivery parking spaces at convenient locations situated close to out-of-weather waiting or retail areas.
- Structured parking for mid- and high-rise buildings.
- Safe bicycle access to area services.
- Showers in commercial office buildings.
- Bicycle lockers and designated spaces/racks throughout the community.
- Pedestrian connections to/from adjacent communities and streets to facilitate broader community access.
- A raised pedestrian table at the northern boundary of the site to facilitate access to/from the south side station facilities.
- Provision of south side station enhancements including bus canopies, improvements to the kiss-and-ride lot, bus bays, ramp improvements, etc.
- Pedestrian crossing improvements along Saintsbury Drive to include count down pedestrian heads at signalized intersections, crosswalks, and improvements for visually-challenged residents where permitted by VDOT.
- Roadway improvements including new traffic signals and designated pedestrian pathways.
- Street furnishings for pedestrians.
- Informational kiosks in one or more onsite buildings.
- Bus shelters, trash receptacles, etc.
- Wiring for Internet access in residential and commercial buildings and availability of high-speed wireless to facilitate telework.
- Onsite residential business center for use by project residents, including meeting space, computer stations, facsimile machine and copy machine to facilitate telework.
The MetroWest community will have a substantial choice of transportation products to choose from, some that are unique to MetroWest and others that are offered as part of living in Fairfax County, and the Metropolitan Washington DC region.

TRANSPORTATION PRODUCTS/SERVICES DEVELOPED SPECIFICALLY FOR METROWEST WILL INCLUDE:

- A designated onsite, full-time Transportation Coordinator (TC) responsible for the implementation, monitoring and management of the MetroWest TDM program. The TC will be located within the MetroWest mixed-use development. Only that portion of the TC’s time that is spent on TDM will be charged to the TDM budget, such portion of the TDM budget to increase as the project builds-out.

- A branded transportation management program that will have an identity that represents the MetroWest community and the developer. The program branding will be developed through a series of focus groups directed to commuters in the region who fit the profile for residents or employees living and working at MetroWest.

- Customized materials marketing the branded program that will be targeted to likely transit users and that will give the community a sense of ownership, as a stakeholder in the MetroWest transportation program. These materials will be included in any materials marketing the sale or lease of space at MetroWest.

- An on-site retail transit store that will have TDM products, services and program offerings available to residents, businesses, customers and visitors to MetroWest, as well as a staff person that will operate the store and assist customers with their travel planning. The space will be approximately 350-400 s.f. and provided by the developer. Hours of operation for all TDM facilities will be readily available in printed materials and online, and the space will be open during convenient times for commuters.

PRODUCTS AND SERVICES THAT ARE OFFERED REGION-WIDE INCLUDE:

- Commuter Connections, the region-wide TDM program administered by the Metropolitan Washington Council of Governments (MWCOG), www.commuterconnections.org.
The Commuter Connections (CC) program provides several important services to commuters throughout the Washington, DC region that will greatly assist in supporting the MetroWest TDM Plan implementation. The most widely used program is the ridematching service which links commuters to one another to form carpools and vanpools by filling out an application (online or printed) and sending it to the CC staff. Information on the application is downloaded into the region-wide computer database and applicants are matched to potential pooling partners through their home and work locations. The commuter is sent a “match list” and given the names and contact information for their potential pooling partners. This service is free of charge. The service database can be customized for MetroWest residents, exclusively, and made available to the TC at any given time.

The TC will assist interested commuters in applying to the program and setting up carpools and vanpools among residents at MetroWest. The TC will also schedule pooling partner meetings throughout the year to encourage participation in the Commuter Connections ridematching program.

- NuRide, an on-time, state-of-the-art matching service for casual carpooling and vanpooling. [www.nuride.com](http://www.nuride.com).

The matching service that NuRide offers is similar to airline travel ... the difference is that the commuters travel by car. Each commuter plans his/her commuting trips online and earns reward points every time they travel with other people. Similar to the Commuter Connections ridematching service, NuRide customers register and sign onto the NuRide website and plan their trip by specifying a date and time, where they want to go, and related travel criteria. Just like with frequent flyer miles, the commuter earns NuRide Miles, an exclusive reward points program wherein points can be redeemed at a list of retail stores, such as Starbucks, Old Navy, etc. Participation as a NuRide customer will help to mitigate the impact of traffic in and through the MetroWest residential community.

The TC will provide information on NuRide to all residents and employees working at MetroWest. Information will also be available at the MetroWest Transit Store.
Guaranteed Ride Home, or GRH, the ridesharing insurance program provided by MWCOG, is marketed by the Fairfax County, Ridesources customer service representatives. 1-800-745-RIDE.

Participation guidelines require that Commuters must call Commuter Connections and receive authorization from Commuter Connections prior to using the GRH service. MWCOG Commuter Connections staff will issue authorization number(s) to participating commuters and/or the MetroWest TC to certify a GRH trip. Commuters will not be reimbursed for trips not authorized by Commuter Connections. Depending on the commuter’s employment site, an Employee Transportation Coordinator (ETC) may have to be contacted first in order to make the appropriate arrangements for this service.

Commuters must be officially registered with Commuter Connections before using the GRH service. Registered commuters are those who have received an official registration letter and a GRH ID card from Commuter Connections. Commuters who have not been officially registered may use the GRH service one time, providing they meet all other eligibility criteria. This is referred to as a “one-time exception.” Any commuter granted a one-time exception must be officially registered before additional GRH trips are granted. Registered and one-time exception commuters must be carpooling, vanpooling, taking transit, bicycling, or walking to their site of employment at least two (2) days per week and on the day they use the GRH service.

Registered commuters may use the GRH program up to four (4) times annually from their official registration date. Commuters who received a one-time exception, then officially register with Commuter Connections may use the GRH service three (3) more times within 12 months from the date of their one-time exception GRH trip.

Commuters must re-register annually to maintain their GRH registration. Commuters must contact Commuter Connections to re-register and update their registration information.

The GRH program may only be used in cases of unexpected personal or family emergency, unexpected illness, or unscheduled overtime. Cases in which the GRH program cannot be used include, but are not limited to, the following: previously scheduled medical appointments, trips to the hospital or emergency room by a commuter that needs medical attention, personal errands, transit service disruptions and/or delays, business related travel and working late without a supervisor’s request, weather emergencies, any type of building closings or evacuations, and natural acts of God.
Requests to use the GRH program because of unscheduled overtime must be made *before* the commuter’s registered work end time, and a supervisor’s verification will be required at the time of the request.

GRH service is available between 6:00 a.m. and 10:00 p.m., Monday through Friday, except holidays and unplanned Federal Government office closings. *GRH TRIPS MUST BE TAKEN BEFORE 10:00 P.M.* Holidays include: New Year’s Eve, New Year’s Day, Martin Luther King’s Birthday, Washington’s Birthday, Memorial Day, Independence Day, Labor Day, Columbus Day, Veteran’s Day, Thanksgiving Day, Day after Thanksgiving, Christmas Eve, and Christmas Day.

In order to be eligible, a commuter must be physically working in the Washington, D.C. Metropolitan Statistical Area (MSA) as defined by the United States Office of Management and Budget. The MSA includes the District of Columbia, the Maryland counties of Calvert, Charles, Frederick, Montgomery and Prince George’s, the City of Alexandria and the Virginia counties of Arlington, Fairfax, Loudoun, Prince William and Stafford, and all cites within the aforementioned counties.

Eligible commuters can live anywhere inside the MSA or in any of the following areas: Allegany, Anne Arundel, Baltimore, Calvert, Carroll, Cecil, Charles, Harford, Howard, Queen Anne’s, St. Mary’s, or Washington counties, the City of Baltimore, and any point along the Upper Eastern Shore in Maryland; and Caroline, Clarke, Culpeper, Fauquier, Frederick, King George, Lancaster, Northumberland, Orange, Page, Rappahannock, Richmond, Shenandoah, Stafford, Spotsylvania, Warren, or Westmoreland counties, the City of Fredericksburg, or the City of Winchester in Virginia; and Jefferson County in West Virginia; and Adams, or York counties in Pennsylvania. Any other destination points outside of the above-mentioned areas will be considered on a case-by-case basis.

All GRH trips must originate from the commuter’s office location. Depending on the nature of the emergency, and home and work locations, a commuter using the GRH service may be required to use a taxi, car rental, transit, or any combination of these services to reach their destination point. MWCOG’s Commuter Connections staff and/or their designees will determine the type of service used and will issue a valid GRH authorization number at that time.

Commuter Connections will pay for one vendor service and/or one transit service per request. If the GRH trip is made by a taxi, MWCOG’s Commuter Connections program will pay for all charges, excluding gratuity, to the destination. The commuter is responsible only for tipping the taxi driver. Cancellation on the part of the commuter of a GRH trip may count as one of the four annual trips.
If a transit option is used for the GRH, the participant will be mailed a transit reimbursement voucher. The transit reimbursement voucher must be submitted back to MWCOCG within thirty days of transit use in order for payment to be made. Please allow 45 days for reimbursement.

If the GRH trip is made by rental car, the commuter is responsible for signing a standard rental agreement, showing a valid driver’s license, proof of insurance, providing a credit card number for collateral, returning the rental car within a 24-hour period, and the following charges: gasoline refueling charges, taxes, purchase of insurance (if necessary), additional rental charges if auto is not returned within a 24-hour period (unless Commuter Connections has given prior approval for additional rental time.) The commuter will be responsible for any loss or damage to the rental car.

GRH is a free service provided by the Metropolitan Washington Council of Governments (MWCOCG.) MWCOCG will use its best efforts to provide the Guaranteed Ride Home in accordance with the guidelines shown above. By requesting assistance from the Guaranteed Ride Home program, the participant in the program explicitly acknowledges that MWCOCG assumes no liability for the timeliness of the GRH participating vendor(s) or any accidents that may occur on the conveyance. The MetroWest TC will track the usage of each of the GRH participant who lives in the development and keep records on-hand at the TDM office.

- Participation in the region-wide Air Quality Action Days program.

Air Quality Action Days are called when air quality in the Baltimore/Washington region is expected to reach unhealthy levels. These days occur during the summer months when hot, humid, and stagnant weather conditions contribute to the formation of air pollution. Poor air quality affects children, individuals with respiratory and heart ailments, and older adults. Even healthy people can experience problems associated with high levels of air pollution.

When an Air Quality Action Day is forecasted, all participants are either emailed or faxed an unhealthy air alert. The media is also notified. On unhealthy days, individuals and organizations area asked to take action to protect their health and also to reduce air pollution.

Public and private sector Air Quality Action Days participants have agreed to develop voluntary Air Quality Action Day plans. These plans range from notifying employees and customers of an Air Quality Action Day to rescheduling operational activities. Air Quality Action Days empower government agencies, businesses, and residents in the Baltimore/
Washington region to do their share for cleaner air. During Air Quality Action Days, all sectors of the community will be called on to take voluntary actions to reduce air pollution.

The MetroWest TC will promote participation in the region-wide program to employers and provide information regarding alerts to residents of the community through the website. There will be a consideration to fly the Air Quality Action Days flag with permission of the Clean Air Partners program. The flag, flown on days when the air quality is unhealthful, will be visible to commuters in the MetroWest community, as well as those traveling along I-66 and the Metrorail Orange line.

- Telework Resource Center (TRC), administered by the MWCOG, provides information and assistance to employers on how to set up a work-site telework program. TRC staff will work with employers to help them create telework policy for their businesses, as well as select and train qualified employees on the benefits of teleworking and how to work remotely in an effective and productive manner. Information from this program should be made available to residents and used to assist in the set-up of the telework center onsite.

The MetroWest TC will work with the TRC to secure information on teleworking for the residents of the development. The TC will also be available to assist residents in choosing the best telework location option for them, which will be either at home or in a telework center.

- SmarTrip and SmartCard technology provided by the Washington Metropolitan Area Transit Authority (WMATA) to purchase and fulfill media fare card value.

SmarTrip is a permanent, rechargeable farecard. It’s plastic—like a credit card—and is embedded with a special computer chip that keeps track of the value of the card.

Each new resident of MetroWest will be given the option of receiving a SmartCard at
the signing of their lease or purchase agreement. The TC will be responsible for the purchase of the SmartCards from WMATA, distributing the cards to the residents, and tracking the use of the card through a registration process and annual survey of each resident.

SERVICES OFFERED BY FAIRFAX COUNTY GOVERNMENT INCLUDE:

RideSources customer service representatives will assist with the following TDM services in support of the MetroWest residential and business communities:

- Employer outreach
- Residential community-based TDM program
- Event planning for transportation fairs, etc.
- Ridematching service
- Design of mode split surveys and appropriate methodology
- Assists in the formation of vanpools
- Provides ongoing marketing and technical support

OTHER TDM SERVICES THAT WILL BE PROVIDED INCLUDE:

- Vanpool formation by the Transportation Coordinator and third party vanpool companies.

  The TC will work with the residents and employees located at MetroWest to form vanpools using the services of a third-party vendor who will own the vehicle and assume liability for the poolers who travel in the vehicle each day to work. This will be accomplished by holding vanpool formation meetings for residents and employees interested in participating in vanpools. The date and location of these meetings will be posted on the MetroWest website and flyers will be sent to the residents and businesses announcing the event. The meetings will be attended by recommended third party vendors who will explain the details on how to form a vanpool using their services. The TC will have information available at the MetroWest Transit Store on the benefits of vanpooling and a list of the available vendors.

- Coordination with shuttle bus services by others that currently provide service to/from the Vienna Metrorail Station.

  The TC will research all existing shuttle bus services that operate to and from the Vienna Metrorail station. Information will be provided to the residents and employees at MetroWest
on the service schedules, costs and criteria for use. The TC will also coordinate any TDM programs at MetroWest with approved transportation service vendors. Information will be available at the MetroWest Transit Store and on the website.

- Bus service that currently operates to and from the Vienna Metrorail Station, including the Fairfax Connector bus services that operate to and from the Vienna Metrorail Station.

As is the case with shuttle bus services, the TC will provide information on all bus services that currently serve the Vienna Metrorail Station. Information will be available at the MetroWest Transit Store and on the website.

- Car-sharing program agreements with the developer and, eventually, the homeowner’s association.

The TC will be responsible for meeting with car-sharing program vendors to establish a program at the Vienna Metrorail station for residents and employees working at the development. The TC will work directly with the vendor to set up the program criteria. Information on the car-sharing service will be available at the MetroWest Transit Store and on the website.

RESOURCES AND TECHNICAL ASSISTANCE FOR THE FOLLOWING TDM PROGRAM OFFERINGS WILL BE AVAILABLE:

- Parking cash-out programs.

An incentive program to encourage commuters to give up their parking spaces in trade for the purchase of fare media for transit has been a very positive initiative in achieving prescribed traffic mitigation requirements such as the trip reduction goals required for MetroWest.

The TC will develop the criteria for the program and present it at the MetroWest individual employee transportation coordinator meetings, discussing how to implement the program at each business site. The TC will provide the sale of transit fare media through the MetroWest Transit Store with information on the website.

- Pre-tax benefit programs for transit, bus and vanpools.
The current pre-tax benefit program, which is offered through the Internal Revenue Service Regulation Section 132, allows employers to offer employees up to $105 per month for the purchase of transit fare media (bus & rail) and vanpooling. This program benefit is only available through a commuter’s employer.

The MetroWest TC will conduct an annual seminar for businesses operating at the development on the pre-tax benefit and how to implement the program at their work-sites. Information will be available on the IRS regulation and program implementation at the MetroWest Transit Store and on the website.

- Alternative workplace and compressed and flexible work hour programs to assist in diverting traffic from peak-hour periods.

The TC will also offer a seminar each year on alternative, compressed and flexible work hour programs. Flexible work hour programs allow commuters to travel to and from the worksite during off-peak periods. Compressed work hours and teleworking allow the commuting employee to avoid traveling to work one or two days a week, helping to achieve the trip reduction goals.

- Ridematching software for ridesharing arrangements for carpooling and vanpooling.

As discussed, the TC will use the MWCOG rideshare matching service to assist commuters arriving at the work-site and residents living at MetroWest to become carpoolers and vanpoolers.

- Senior discount program.

The TC will research all senior discount programs that are available in the MetroWest area and also region-wide, such as the WMATA senior pass program that allows seniors 65 years of age or older to receive discounts on travel by bus or rail in the region. Seniors will be able to obtain a senior pass discount card (ID) and information regarding all available senior discount programs at the MetroWest Transit Store.
A commuter and telework club that will provide incentives for residents and employees who work at the MetroWest to use transit alternatives.

The TC will organize two clubs, or membership organizations, that will provide incentives for residents and employees to use commute alternatives – commuter and telework clubs. The commuter club will provide discounts at local retail to encourage the use of alternatives. Carpoolers and vanpoolers may receive free gasoline, an oil change or carwash. Transit users may receive free fare media cards. The criteria may be longest distance for daily commute, frequency in using the alternatives, or the number of miles logged. The TC will also prepare a plan for implementing both programs. Annual recognition meetings will be held at the Transit Store at MetroWest.

Vanpool program designed for members of the commuter club and residents of MetroWest.

The members of the residential vanpool club will meet at least once during the year and will be recognized by the TC for their participation in vanpooling and also rewarded with incentives for their efforts. The meetings will be advertised through the MetroWest residential newsletter and on the website.

Special promotional activities, with various incentive awards, to sustain awareness of, and interest in, the TDM program.

The TC will organize an annual sponsored event promoting TDM activities in the residential communities. The event will be attended by all vendors who offer their services in the community and they will be encouraged to provide promotional materials for distribution to the residents.

All of the TDM products, services and program information will be available through the transit store which will be located within close proximity to the Vienna Metrorail Station.
Residential

The success of TDM program implementation will be in the marketing and sales of the recommended TDM products and services which will include transit (rail & bus), vanpooling, carpooling and teleworking.

Target marketing

A variety of target marketing strategies will be used to encourage commuters to take advantage of their residential location – next to one of the best regional rail systems in the nation – by using the Washington Area Metropolitan Area Transportation Authority’s Metrorail system. Residential targets will include current transit riders, people working along the rail line that services MetroWest (Orange and Blue) without transfer trips, and full-time teleworkers who either work at home or at a telework center.

Marketing materials will include information on all of the available transit service and transportation offerings at MetroWest, including membership to the commuter and telework clubs. The materials will be designed to interest all residents at the development, including those in the senior high-rise community.

Target market strategies to encourage the use of transit for special audiences – such as the senior population – may include a coupon-based incentive program, the senior transit pass offered by WMATA, etc. Specific materials will also be developed for the school pool program and teleworking.

Sales kits

Materials will be prepared by the TC, or its organization, on all of the TDM products and services that are available to the target market with information included that is relevant to the particular market.

One-on-one marketing

One-on-one marketing, also known as point-of-sales, will be conducted when sales representatives are discussing lease or ownership of the residential and/or commercial office units with customers who are visiting the sales offices of the project, or discussing the project with customers over the phone.

Transit, transportation, and related incentive programs

Initial residents will be provided with incentives for transit (bus & rail), teleworking and/or
other agreed-upon TDM strategies to encourage their participation in alternative commute options as part of their new resident welcome package. In order to receive the incentive(s), the new resident must participate in a transportation information meeting. Those incentives may be in the form of transit fare media, SmarTrip cards, or any other form or instrument that may be redeemed for use as an alternative commute option. Other related incentives may include grocery delivery, pick-up and drop-off of cleaning and laundry, etc. The incentives are available one-time for those residents who are 18 or older and work full time.

Residential programs
A residential-based vanpool program will be developed using the Commuter Connections ridematching services and RideSources staff to help coordinate and organize MetroWest vanpools. The TC will work with the County to ensure that all vanpool participants are receiving all subsidies that are available to them. The program will include opportunities for preferred vanpool parking and awards for vanpools.

The residential community will have a customized page on the MetroWest website that provides information on all of the available and specialized services. This may include a ridesharing board or classified ad section for carpool opportunities.

Office/Commercial

Parking cash-out
Parking cash-out programs will be encouraged to reduce vehicle commute trips and emissions by offering employees the option of “cashing-out” their subsidized parking space and taking transit, biking, carpooling to their place of employment. “Parking cash-out program” means an employer-funded program under which an employer offers to provide a cash allowance to an employee equivalent to the parking subsidy that the employer would otherwise pay to provide the employee with a parking space. If an employer pays $160 per month for a parking space for their employee and offers a parking cash-out program, they agree to offer their employee a cash allowance of that amount to use for the purchase of fare media for transit (bus/rail) or ridesharing (carpooling and vanpooling), or bike modes of travel.

Pre-tax, transit benefit, Federal IRS regulation
Federal regulation allows employers to give employees up to $105 per month as a pre-tax payroll deduction or a tax-free employee benefit. Any expenses associated with the program are also fully deductible by employers. Detailed information on how the program is implemented can be found on several websites including www.TransitCenter.com and www.CommuterCheck.com and http://www.irs.gov/irb/2004-29_IRB/ar10.html. Such programs will be encouraged for all office owner/tenants. These programs are implemented through a payroll deduction, better known as a cafeteria plan, for each individual business. Details on the program’s criteria can be found on the IRS website, under Section 132f,
**Alternative work-hour programs**

Flextime, staggered work hours and alternative work schedules are effective ways in which to further trip reduction goals by altering the daily work schedules of employees and taking trips out of the AM peak period. Flexible work-hour programs provide employees with the option of starting their work day during an AM period – for example between the hours of 6 AM to 10 AM - and working a full work shift thereafter. This option spreads the AM peak period. Staggered work hour programs are generally applied to an entire business operation that begins its business hours after 10 AM each day, working a full shift thereafter. Again, the result is to mitigate the impact of traffic during peak periods. Alternative work schedule programs include compressed work weeks – working four (4), 10-hour work days or three (3), 12-hour work days each week, and 9/80 work hour programs, allowing employees to work four (4), 10-hour work days one week and five (5), 8-hour work days the next week. All tenants will be required to participate in a briefing or orientation on the MetroWest transportation program and encouraged to provide such options to their employees. It is important to note that the TDM aspects of alternative schedules work to shift trips to off hours and are secondary to those that eliminate trips.

**Rideshare matching and associated programs**

The Metropolitan Washington Council of Government’s, Commuter Connections ridematching service is used for the formation of carpools and vanpools, as well as disseminating information on available transportation programs and services offered throughout the region, specifically through Fairfax County’s RideSources program. Residents may learn about the rideshare matching program through the TC or [www.commuterconnections.org](http://www.commuterconnections.org) website. Application for the service may be completed online.

**The Guaranteed Ride Home (GRH) program**

GRH is administered by MWCOG through Commuter Connections, the regional TDM program. GRH provides commuters who regularly (twice a week) carpool, vanpool, bike, walk or take transit to work with a free and reliable ride home when one of life’s unexpected emergencies arise. Commuters may take advantage of GRH up to four times per year to get home for unexpected emergencies such as a personal illness or a sick child. GRH can also be used for unscheduled overtime when an employer mandates that they must stay late. GRH was designed to rescue commuters who are worried about how they’ll get home when an emergency arises. Knowing there’s a guaranteed ride home allows one to use commuting options like transit and carpools with peace of mind and confidence. Residents may learn about the guaranteed ride home program through the TC or [www.commuterconnections.org](http://www.commuterconnections.org) website. Application for the service may be completed online.
General

A safe routes to school, or school pool program, will be developed and coordinated with the RicEd@sources program employer outreach staff. A school pool is a group of parents who take turns carpooling and dropping off their children at the same school.

A car-sharing program will be implemented subject to agreement with a third-party vendor(s) such as FlexCar/ZipCar. This program provides an available vehicle that is parked within the community and is used by the residents of the community for quick trips, such as errands, etc. Implementation for the car-sharing program can be found on Page 19.
Program management for the implementation of the TDM plan will be directed by a designated transportation coordinator (TC).

The most important role of the person, or organization, assigned as the TC for MetroWest, will be to ensure that all of the TDM programs and services are operating in an efficient and productive manner, with the goal being twofold:

1. To reach the prescribed trip reduction goals; and,
2. To make the MetroWest TDM program an integral part and stakeholder in the community, identifying itself as a community organization whose mission is to act as mobility manager for MetroWest, focusing on the needs of its residential and business communities.

The TC’s first task will be to review the TDM Plan and develop an operational manual that addresses the day-to-day tasks that need to be completed to implement and maintain the branded MetroWest program after total build-out.

The TC will be involved in the branding of the TDM program for MetroWest by participating in the focus group study. The outcome of the study will be the creation of marketing materials for the program to be coordinated by the TC. These materials will be used by the TC to promote the programs and services and also by the Pulte sales staff to sell and lease property at MetroWest.

The TC will be located in a central space onsite and will work with each new resident and business that locates to MetroWest to introduce them to the TDM product, service and program offerings and seek individuals who will assume the role of TDM contacts for each commercial and residential building. The exception to this will be if the commercial or residential building is managed by the same property management company. In this case, the company would assign a single TDM contact for all of their properties.

The TC will also oversee the implementation of the TDM strategies and any and all tasks required by Fairfax County, Department of Transportation (FCDOT) such as conducting annual transportation mode split surveys. They will be tasked to report the outcome of the survey each year and provide an annual report of TDM activities within MetroWest to FCDOT. A by-product of the survey results will be a strategic plan that will propose TDM activities for the following year, including marketing strategies and budget.
The TC will provide FCDOT with an annual report as provided in the proffers, tracking the level of development, number of residents/employees living and working at MetroWest, participation level and use of each of the implemented TDM programs, number of preferential parking spaces, budget allocated for TDM program operation, and any other pertinent information.

They will also track the success of each of the employed TDM strategies by following the monitoring and evaluation techniques developed for the TDM plan. This may include parking management activities such as checking to make sure the carpool spaces are filled with vehicles that are registered carpools. The TC will also track the sale of transit fare media that will be sold at the transit store. They will also make sure that the bike facilities are kept safe, secure and clean. They will negotiate contracts with any third-party vendors who may provide services for MetroWest, such as car-sharing and shuttle bus providers.

With the assistance of Ridesources staff, the TC will schedule transportation events at MetroWest, at least once a year, to provide information to residents, employees, customers and visitors about available transportation programs and services. These events are known as transportation fairs.

The TC will represent the TDM concerns of the residents and employers of MetroWest at various transportation-related meetings, such as those hosted by FCDOT or MWCOG. The TC will also be involved in outreach activities for surrounding communities regarding the implementation and availability of TDM programs and services.
Parking management, simply stated, is how parking spaces are managed by use and space allocation in order to further the TDM objectives. By providing incentives (financial or otherwise) for commuters to travel to and from work each day in either carpools or vanpools, single occupant trips can be reduced. Parking management plans generally consist of three broad-based strategies; preferential parking, parking pricing and transportation allowances. A combination of two or more of these broad-based strategies comprises the MetroWest Parking Management Plan.

**Residential**

*For condominium units*
A maximum of one parking space will be bundled (or included) with the sale of the individual unit. Additional requested/required spaces may be purchased in addition to the sales price of the unit.

*For rental units*
One parking space will be designated for each unit at a flat fee to be determined based on a review of market conditions at the time the lease is signed. Additional spaces will be available based on a first-come/first-served basis at an additional flat fee per space. Availability of car rental services is an added service for residents of the mixed-used development and further helps to encourage one- or no-car individuals or families.

**Office/Commercial**

Parking spaces will not be bundled or included in the base square foot rental rates for office/commercial space at MetroWest. Parking pricing will be a separate charge for tenants and/or owners in the commercial office space dependent and based upon market conditions at the time of lease.

Designated areas for loading and unloading carpool and vanpool commuters will be included as part of the site plan design. Commuters will be dropped off or picked up either within the parking structure or at a dedicated stop close/adjacent to the office/commercial space.

Preferential parking spaces will be designated on the site plan and provided for those commuting employees registered as carpools or vanpools with the MetroWest TC. These spaces will be located closest to the elevators and/or core areas of the facility as is feasible and practical. Preferential parking for vanpools will be provided free of charge. Spaces will be set aside for vanpools in commercial parking facilities.
The carpool or vanpool recognized as “pool of the month” will be given the premiere preferential parking space in a garage. This distinction is given to a pool that has logged the most hours, has the longest pooling history, or travels the furthest to and from work each day.

A parking fee structure will be developed, providing an incentive for those commuting employees that participate in carpools and vanpools. A discount rate will be offered to car/vanpoolers and market rate charges will be applied for single occupant vehicle travelers.

A comprehensive parking management strategic plan will be developed that creates policy for MetroWest employee commuters, including the aforementioned parking arrangements. This will ensure that residents of the development not use WMATA parking facilities, that all on-street parking spaces will be managed by time and price, and that the parking meter revenues are allocated to the TDM program with enforcement being an objective of the monitoring and evaluation TDM plan for the project.

Spaces will be designated on the site plan and provided for taxi stands, shared-car services and delivery services on-site at select locations. These areas will be well-signed, lit and located throughout the development. Within each on-site garage, a minimum of 5% of the parking spaces shall have access with sufficient clearance for vanpools.

Carpooling and vanpooling spaces will be well-signed and monitored by the TC. Additionally, a covered area, such as an awning, building lobby, etc., will be set aside for pick-up of vanpoolers, carpoolers and any shuttle services that are implemented at MetroWest.

Spaces will be available, subject to the owner(s) of the parking garages in the commercial space, for use after-hours and on weekends by the residential community for special events, weddings, etc.
Phase I  Post-Rezoning
The first phase of the plan will begin following rezoning approval with the appointment of a TC – either an individual or a TDM specialist – who will provide oversight to the initial tasks that will be performed to implement the TDM program. The role of the TC is detailed in the section of this document entitled TDM Program Management.

The most important component of the TDM plan will be to create an operations manual to finalize the framework for a solid TDM program at MetroWest based on this TDM Strategic Plan that will provide resources and assistance to residents, businesses, customers and visitors to the mixed-use community.

THE OPERATIONS MANUAL WILL CONSIDER THE FOLLOWING TDM COMPONENTS FOR EACH TDM STRATEGY:

- **Targeted TDM program participants**
  The TC will target the use of specific TDM programs for specific groups of residents and employees. An example would be that those commuters who are most likely to use commuter alternatives, such as carpoolers and vanpoolers, are more apt to work for companies that have set schedules or have jobs that have static work hours.

- **Recommended person trips assigned for each transportation mode**
  Likewise, as mentioned above in targeting TDM participants, the strategic plan for each year may project the number of persons at MetroWest who will be using various transportation modes, knowing who the residents are and commercial businesses by industry.

- **Detailed TDM initiatives**
  Each TDM strategy will be described in detail as to service provided, how it is measured, who the target user is, what the cost is to provide or operate, etc. This type of information will be included in the TDM Operations Manual.

- **How the particular TDM strategy will be marketed**
  It will be important for the TC to work closely with the leasing agent to assist in marketing TDM to prospective owners and tenants. The TC will develop a presentation that will be given at the sales office to each person who contracts to live or lease space at MetroWest. The TC will be available to meet, one-on-one, with the new resident to describe the MetroWest TDM plan – and its brand – and how effective the program is in providing ease of mobility for them and their families or employees. The TC will also be available to participate in relocation meetings for employers moving to MetroWest.
What the TDM incentives will be for each strategy

The TDM incentives will be determined when each of the buildings is delivered. Some incentives have been mentioned in the TDM plan, however, some of these incentives may be changed and others may no longer be offered. The TC will research the best transit or transportation programs available at the time to determine what the most effective incentives will be to offer residents and tenants of MetroWest.

Recommended schedule or timeline

The schedule for the rollout of the TDM program to total build-out is illustrated in the TDM Program Implementation Chart. The first phase will include program branding, the hiring of the TC and upfront research. TDM activities before and during construction include programmatic items for the development and implementation of TDM strategies.

Associated budget for each TDM strategy

Each detailed TDM strategy description will include an associated budget for each phase of the project and maintenance.

Phase II  Before and During Construction

Phase II involves setting the framework for the implementation of the TDM Plan and implementing the TDM strategies in the early stages of development. This includes:

- Branding the MetroWest program to create an identity for the transportation program. This brand will be marketed to the existing development as well as future developments.

- Create a commuter and telework club to provide incentives for residents, employees, customers, and visitors to use alternative mobility modes such as ridesharing, transit and vanpooling or work at home or at a telework center. Incentives for both may include discounts from MetroWest retail or value-added on SmarTrip cards, or a discount on office services and supplies for teleworkers. Club members for both commuters and teleworkers will need to qualify by meeting a set of criteria established for membership.

- Develop collateral materials for the branded program and commuter and telework club. These may include brochures, posters, newsletters, etc.

- Develop a website dedicated to the TDM program with links to other transportation resources.
Create and implement a monitoring and evaluation plan to assist the TC in tracking the success of the TDM program.

Finalize the parking management program that will be used as an incentive for residents and employees to become carpoolers and vanpoolers.

Open a transit store as a retail outlet for the sale of transit fare media, provision of route information and scheduling, and other information related to mobility in and through the MetroWest area.

Set up bicycle facilities in the designated common areas.

Establish informational kiosks to provide real-time information for transit services and ridematching.

Participate in, or implement a new, ridematching service exclusive to MetroWest and those communities within the transit station area for carpooling and vanpooling.

Phase III Total Build-Out or Program Maintenance

Phase III of the TDM Plan will focus on monitoring and evaluating the TDM strategies and provide day-to-day assistance to residents, employees, customers and visitors to MetroWest on the available transportation products, programs and services. The TDM program will be considered at maintenance level when the trip reduction analyses demonstrate that the reductions are being met as provided in the proffers. Program maintenance will then occur following the post build-out trip generations.

THE METHODOLOGY USED TO MAINTAIN THE INTEGRITY OF THE STRATEGIC PLAN FOR THE TDM PROGRAM WILL INCLUDE:

- Identifying and analyzing trends in travel/commute patterns;
- Responding to trend analysis, emerging technology and evolving County services in both marketing and program elements; and
- Responding to trip generation analyses as provided in the proffer.

Additionally, the TC will need to keep apprised of any modifications in evolving County requirements and services.

The TDM Program Implementation Chart will be reviewed on an on-going basis with the TC through the survey analysis and will be altered, as necessary, in consultation with the County.
Monitoring and evaluation for the TDM plan will be as provided in the proffers.

**Monitoring TDM Programs and Services**

Monitoring and evaluation of TDM program and services will help make them more effective in reaching the prescribed trip reduction goals. For example it can:

- Document program successes and benefits generating future management interest and support for the program.

- Show which services work well and which do not, enabling the TC to direct future resources to successful services.

- Define why individual services do or do not work well, helping to improve their effectiveness.

- Identify who is using, or not using, a service, to target information and marketing where it’s most needed.

**SOME OF THE ACTIVITIES THAT WILL BE MONITORED AT METROWEST WILL INCLUDE:**

- Resident/employee awareness
- Use of program services by both residents and employees
- Employee/resident commute patterns
- Employee/resident attitudes and interests
- Supervisor/management attitudes
- Satisfaction of service users
- Program cost and savings
- Benefits to the organization

**SOME OF THE MONITORING TOOLS THAT WILL BE USED FOR BOTH RESIDENTIAL AND COMMERCIAL INCLUDE:**

- Registration forms and sign-up sheets
- Service log use
Tools for Tracking & Monitoring

As stated above, the information you need to collect, and the services and programs you wish to monitor, require a selected set of monitoring tools. The following chart presents examples of monitoring tools that can be used to evaluate some of the MetroWest TDM program and their offerings.

**Evaluation Process**

The purpose of monitoring and evaluation is to learn more about the TDM program and to measure its success. In the evaluation process, we identify the commute alternatives and services that residents, employers and commuters are using, any changes in their commute behavior, the reasons for the changes, how they heard about the program, and what they like and don’t like about it.

**USE INFORMATION COLLECTED TO ANSWER THE FOLLOWING QUESTIONS:**

- Did the program achieve the trip reduction goals?
- What commute alternatives are employers and commuters using now and how often do they use them?
- Did employee and commuter modes and patterns change? If so, how did they change?
- What were the reasons for the changes? (program services, personal factors such as a move to a new home, or external factors such as an increase in gas prices or construction projects.)
- Why did employees and commuters who continue to drive alone not shift to a commute alternative?
- How aware are employees and commuters of the commute program? How did they hear about the program? (information channels)
- Which incentives and services did employees and commuters use most? Why?
- Which did employee or commuter use least or not at all? Why?
- What did the program cost and what was the cost per benefit? (trips reduced, reduced absenteeism, increase in productivity)
- Which services were most effective and cost-effective? Which were least effective and cost-effective?
- Did the program cause any positive or negative change in internal company operations?

Tysons Land Use Task Force: Transportation Demand Management (TDM) Subcommittee. Fairfax County.
The Tysons Land Use Task Force has been charged by the Board of Supervisors with soliciting community input and making recommendations to update the 1994 Tysons Corner Comprehensive Plan to incorporate the four planned Metro Stations into the Plan. The Tysons Land Use Task Force’s mission is to formulate Plan revisions that will:

- Promote mixed use
- Better facilitate transit-oriented development (TOD)
- Enhance pedestrian connections throughout Tysons
- Increase the residential component
- Improve the functionality of Tysons
- Provide for amenities and aesthetics, such as public space, public art, and parks.

To support the Task Force’s efforts, Fairfax County has recently engaged PB Placemaking, a preeminent urban design/planning firm, to develop alternative scenarios for how Tysons should look in the future with the planned Metro Rail Stations. A major consideration for PB Placemaking and Cambridge Systematics will be the transportation impact of the design alternatives and the potential to mitigate negative effects through strategies often referred to as Transportation Demand Management (TDM). PB Placemaking’s alternative design scenarios and TDM assumptions will be provided to the County’s transportation consultant, Cambridge Systematics, for use with the transportation model to evaluate traffic conditions in a fully developed Tysons Corner.

The Task Force believes that TDM should be a component of the final Comprehensive Plan recommendations. Even major VDOT capital projects in Northern Virginia, which appear unlikely in the immediate future, would not be sufficient to mitigate the traffic to be generated by the redevelopment of the Tysons Corner Urban Center. Therefore, the Task Force believes that it is important to have a TDM plan which first closely examines the demand side of transportation and then creates a meaningful Tysons Corner Urban Center area-wide TDM plan that focuses on reducing peak-hour trip generation, vehicle miles traveled and overall single occupancy trips reduction.

PB Placemaking needs to ensure that all of the TDM programs and related efforts that are currently underway are coordinated in such a fashion as to ensure that they strengthen, not hinder, the ultimate TDM Comprehensive Plan recommendation that they deliver to the Task Force. This will require PB Placemaking to immediately review TDM planning and support programs, available TDM services, the project specific TDM efforts, the proffered TDM programs, the County efforts (TDM Consultant Project, TDM Coordinator position, TOD Committee) as well as the regional congestion management plan (CMP) and the CMP’s for the Dulles Metro Rail project and the HOT Lanes project. The success of the TDM plan for the Tysons Corner Urban Center will be dependent upon the coordination of all of these efforts.
Another key to the success of the Tysons Corner Urban Center TDM plan is to develop the right mix of TDM programs and strategies that not only fit the currently built Tysons Corner environment, but also have the ability to adapt to the changing environment as Tysons Corner is redeveloped over time. PB Placemaking must recommend a plan, which is not a “cookie-cutter” approach, but rather a TDM plan that is unique to the Tysons Corner Urban Center. While individual TDM efforts can be effective, most TDM strategies are most effective when used in combination with certain other TDM strategies. PB Placemaking must recommend the right mix of TDM strategies for the Tysons Corner Urban Center.

Although PB Placemaking has TDM experts on their team, the Task Force felt that it would accelerate their evaluation if the Task Force could provide information on current Regional, State, County and Tysons Corner TDM efforts and an initial assessment of the various TDM techniques that might be most applicable at Tysons Corner. With that in mind, The Task Force created a TDM Subcommittee to prepare this assessment.

WHAT IS TRANSPORTATION DEMAND MANAGEMENT (TDM)?

Transportation Demand Management (TDM) is a term applied to a broad range of strategies to shape the design and use of a transportation system. It has a particular focus on reducing the demand for travel by single occupant vehicles, as increasing the supply (more roads and parking) is not always an effective solution to increased traffic, and is usually more costly than other transportation alternatives.

TDM focuses on offering a variety of transportation alternatives (rail, bus, bike, walking, car pools, etc.), as well as other incentives and disincentives, that will modify travel behavior. While TDM will not eliminate all increased traffic generated from the redevelopment of Tysons Corner, it will reduce travel by single occupant vehicles and change the time of day that trips are made (reducing the impact of “peak hour” travel). It will also encourage energy conservation and improve air quality. TDM strategies are inherently flexible and adaptable, but their ultimate success depends upon providing real alternatives to automobile travel in order to affect the decisions of individuals who use the transportation system. Providing these alternatives requires the active and continuing cooperation of the private sector.

WHAT ARE THE CURRENT TDM EFFORTS?

Currently there are TDM efforts underway at the state, regional, and county level. There are also TDM programs in place that specifically cover the Tysons Corner Urban Center as a result of individual proffers or efforts by local TMAs or businesses. The TDM Subcommittee has attempted to compile a comprehensive list of the TDM programs currently underway that could affect the Tysons Corner Urban Center. These efforts, which are catalogued in Attachment A, include:

- TDM Planning and Support Programs
- Available TDM Services
- Project Specific TDM Efforts
- The regional congestion management plan (CMP) as well as the Dulles Rail and HOT lanes CMPs
- Proffered TDM Programs (i.e. Metro West and Macerich)
• Fairfax County efforts (TDM Consultant Project, TDM Coordinator position, TOD Committee)

PB Placemaking needs to review and understand all of the TDM efforts underway at the state, regional, county and Tysons Corner specific level so that they can develop an area wide TDM plan that not only coordinates all of these efforts but leverages the TDM funding of these efforts as well. PB Placemaking will also have to evaluate each of these efforts as to their effectiveness as well.

**SPECIFIC TDM STRATEGIES**

The TDM Subcommittee has also reviewed numerous TDM strategies. These strategies, which have been grouped into the following six categories, and are discussed in detail in Attachment B, include:

• Alternative Mode Support Strategies: These strategies encourage the use of alternatives to single occupancy vehicles. One method is through public education and various promotions. Modes include ridematching services, public transportation, vanpools, custom transit services, and non-motorized transportation. Offsite facilities such as HOV lanes and park and ride lots are supported. Car sharing services are also supported. In order for these modes to be promoted, proper facilities are needed to make them attractive and easy to use. Examples include a pedestrian and bicycle infrastructure that must be in place, and there must be public and private commitment for financial support of construction of these facilities.

• Worksite-Based Strategies: These strategies are private sector programs and services that encourage employees to change commuting patterns on a worksite by worksite basis by providing incentives that make publicly-provided modes more attractive, disincentives to single occupant travel, and employer management policies that provide employees with flexibility in mode choices.

• Land Use Strategies: These strategies include changing density, land use, urban design and land use mix to impact travel needs and patterns. Land use strategies are potentially the most effective over time.

• Programmatic and Policy Support Strategies: These strategies introduce restrictions and regulations to automobile use and provide political/program support and guidance to new institutional relationships.

• Telecommunications Strategies: These strategies utilize modern communications technologies, principally the Internet, to reduce the need for vehicle trips. While the primary impact is on commuting trips, they also have the potential to reduce non-commuting trips.

• Pricing Strategies: Pricing strategies use financial incentives and disincentives, such as parking or gasoline taxes, to influence transportation decisions.

While PB Placemakings TDM experts are most likely familiar with all of the TDM strategies reviewed in Attachment B, the TDM Subcommittee reviewed the strategies with the Tysons
Corner already-built environment in mind and made recommendations as what strategies might therefore be the most effective.

PB Placemaking needs to review and evaluate Attachment B and develop a program of TDM strategies for the Tysons Corner Urban Center taking into consideration the currently built Tysons environment as well as the ultimate preferred design scenario.

**SUBCOMMITTEE RECOMMENDATIONS**

**Coordination of the TDM Efforts** - If TDM is to have any chance of being successful in the Tysons Corner Urban Center, it is of critical importance that all of the TDM efforts are well coordinated. While there are currently many significant TDM efforts underway, there needs to be significant improvement in the coordination of the efforts between state, regional and county and private TDM programs and services. In addition, the marketing efforts to boost company and employee participation – a key to TDM success – need to be improved.

PB Placemaking also needs to be aware of all of the County efforts as well as other projects that may have an impact on an effective TDM program for the Tysons Corner Urban Center. In particular, PB Placemaking needs to understand the TDM planning and support programs, available TDM services, the project specific TDM efforts, the proffered TDM programs, the County efforts (TDM Consultant Project, TDM Coordinator position, TOD Committee (see Attachment C)) as well as the regional congestion management plan (CMP) and the CMP’s for the Dulles Metro Rail project and the HOT Lanes project. Coordination of these efforts is critical to the success of the Tysons Corner Urban Center TDM Plan.

An active TMA for the Tysons Corner Area is essential for TDM efforts to be effective. PB Placemaking needs to evaluate the efforts of local TMA’s, in particular TYTRAN, and recommend how they can best be utilized to improve the effectiveness of the Tysons Corner area-wide TDM program.

PB Placemaking also needs to review and evaluate current County efforts and their staffing of these efforts to determine whether they are coordinated and adequate. This is important because County staff will need to have the capability to oversee and validate area, site or project performance measures.

PB Placemaking should also recommend whether there needs to be any regulations or ordinances to assist in the implementation of an effective area-wide TDM program in the Tysons Corner Urban Center. PB Placemaking has a unique opportunity to make such suggestions since the Task Force is expected to recommend new Comprehensive Plan language along with recommendations for changes to existing regulations, or for new regulations or ordinances that support the recommended Comprehensive Plan changes.

**Recommended TDM Strategies for Consideration** - The Subcommittee reviewed the available TDM strategies and programs within the context of the Tysons Corner Urban Center to identify those that should be more closely reviewed and considered by PB Placemaking. While the list below provides the views of the Land Use Task Force TDM Subcommittee, it is not intended to replace the expertise of PB Placemaking in identifying additional or more effective approaches.
PB Placemaking must recommend the right mix of TDM strategies for the Tysons Corner Urban Center.

- **Alternative Mode Support Strategies** – PB Placemaking should focus on public education and promotion of alternative modes, ridematching services, additional forms of transit beyond Metro Rail, vanpools and shuttles, non-motorized support and HOV/HOT facilities. PB Placemaking must also recommend a Tysons Corner Urban Center internal circulator system that not only serves the urban center but also allows the surrounding neighborhoods access to the transit stations along with being better connected to the opportunities and amenities of a redeveloped Tysons Corner Urban Center.

With the advent of Metro service in Tysons, transit becomes the most attractive alternate mode. Local feeder buses, both public and private, will be needed to supplement Metro. With no parking planned at the four Metro stations, non-motorized modes can play a large role in moving people from the stations. Bicycle parking facilities, bike lanes throughout the Tysons Corner area, a complete, convenient, attractive pedestrian network are all needed for this mode to succeed.

There exist a number of services such as ridematching, vanpools, and custom transit services that need to be more heavily promoted.

Currently free parking in Tysons Corner is a major reason for employees and retail customers to use single passenger vehicles. If this is to change in the future, alternative modes must be promoted at the same time that parking management strategies are implemented.

- **Worksite-based Strategies** – PB Placemaking should focus on creating worksite-based strategies that can be implemented by both the County and a TMA like TYTRAN. The recommendation should include monetary incentive and disincentives, alternative work schedules, parking management and facility amenities.

- **Land Use Strategies** - PB Placemaking should focus on density levels, land use, urban design and land use mix. Their recommendation should include suggestions for compact residential development, compact employment and activity center, an affective mix of land uses, connectivity, transit and pedestrian oriented design, the jobs/housing balance and affordable housing. PB Placemaking will also have to design an improved grid of streets to support many of the TDM land use strategies.

- **Program and Policy Support Strategies** – PB Placemaking should evaluate potential strategies such as adoption of a trip reduction ordinance, establishment of a parking district or parking authority, and creation of a transportation management district. The evaluations should assess the operating costs and the anticipated effectiveness of each strategy.

- **Telecommunication Strategies** – Although the benefits of telecommuting/telework may be limited compared to other alternatives, it is a relatively low cost option and should be considered. The issue of infrastructure (wiring and telework centers) should be addressed. The U.S. General Services Administration and other organizations should be consulted about regional telecommuting programs and opportunities.
• Pricing Strategies – As previously noted, many of these are controversial and some would require new authorities, making implementation difficult and perhaps problematic. However, parking pricing should be considered as part of the review of parking management, including the review of County minimums and maximums for parking.

Use of Complementary TDM Techniques - The literature reviewed shows that in creating an effective TDM plan it is essential to include a mix of complementary techniques and strategies. While most TDM strategies are complementary, many are most effective when used in combination with certain other TDM strategies. The synergistic benefits from using the best mix of strategies needs to be considered at both the parcel and Tysons-wide level. At the Tysons-wide level, there is also the consideration that some strategies, such as shared parking, may not be fully effective – or even feasible – without participation by multiple developers and owners.

• PB PlaceMaking should develop a strategy for emphasizing complementary TDM techniques at both the parcel and Tysons-wide level, while still providing developers flexibility in their TDM plans.
• PB PlaceMaking should specifically evaluate the feasibility and value of requiring specific TDM techniques in parcel level and Tysons-wide TDM plans.
• PB PlaceMaking should include design elements that support TDM efforts, such as parks, that reduce the need for personal travel to other locations.
• PB PlaceMaking should evaluate the feasibility and strategy for including TDM requirements in all office and commercial leases for Tysons Corner.

Monitoring, Evaluation and Enforcement - TDM efforts need to feature monitoring and evaluation components to obtain and interpret feedback on program operations. The feedback is provided to program management to enable verification of satisfactory operation or to detect gaps between desired and actual program results. Management can act on results gaps to achieve or to regain program success.

TDM programs feature monitoring and evaluation components, designed to obtain and interpret feedback on program operations. The feedback is provided to program management to enable verification of satisfactory operation or to detect gaps between desired and actual program results. Management can act on results gaps to achieve, to maintain, or to regain program success.

Monitoring is done in two ways: (1), by physical counts of vehicles at predetermined points on or at the edges of development sites, and (2), through sample surveys of people who live on, work at, or in some cases visit a site. Representative physical counts allow direct comparisons of actual observations against desired values, e.g. PM peak hour actual against program PM peak goal. Sample survey results give indications of trends, e.g. increasing/decreasing use of carpools or shuttles, and also give information on such items as preferences, e.g. which of several possible incentives might be best for persuading people to ride the bus rather than drive.

Currently, TDM programs at development sites make use of both these forms of measurement to produce reports of past performance (for example on an annual or quarterly basis) and form the basis of plans for future program operations (for example, introduction of a new incentive package or tactic). The current programs have so far evolved site by site.
The Tysons Corner Urban Center will be made up of a number of individual development sites of various sizes. The ground maps of these sites may or may not correspond with any given division of the Tysons Corner Urban Center according to convenience of access to the circulator, or to transit, or for purposes of carpooling, or for bicycling and walking. Yet people will live and work at individual buildings on these development sites. If a broader view than the site level is to be taken, it must still be possible to make measurements that can be used to diagnose TDM problems and permit the development of solutions, in other words to make measurements of the road use behavior of specific people at specific places in the Tysons Corner Urban Center.

However, that level of monitoring and evaluation should be only a part of a larger view of transportation management in the Tysons Corner Urban Center. What is now referred to as TDM should become an integrated component of an overall Tysons Corner Urban Center transportation management system which embraces all modes of movement and all purposes of travel, including but going beyond vehicle counts and daily commute trips at individual sites. The larger system should address all aspects of the transportation infrastructure, beginning with the attributes of the built environment that affect transportation and extending to all methods of transportation management, using all cost-effective measurement technologies and evaluation methods.

When monitoring and evaluation indicate a failure of TDM techniques, enforcement of penalties must be part of any TDM program. TDM programs should be developed in such a way that it is in the best interest of developers to ensure their success. However, without enforcement, travel trip reduction goals are meaningless.

The Subcommittee recommends that PB Placemaking develop a Tysons Corner area-wide and site-specific monitoring and evaluation system to support their recommended TDM plan. Recognizing that the interests of the developers and the citizens need to be protected, PB Placemaking should also suggest ways to construct proffer agreements that can be more flexible to future revisions and updates as TDM evolves. “Phasing” should be used in developer TDM proffers to allow the opportunity to measure performance in meeting TDM targets.

*Note: The chart above does not contain all of the regional, state, county, Tysons area or business TDM efforts listed on the following pages.

---

¹ The contact is Barbara Reese at VDOT. Currently there is a draft regional CMP concept paper.
² Programs include: Guaranteed Ride Home; Ridematching; Transit Information; Smart Trip Cards; Transit Voucher Programs; Teleworking Assistance; Parking Management Programs; Marketing Transportation Options; Incentive Programs
³ CMP would manage or mitigate congestion during construction (2007 to 2011) of the Dulles Corridor Metrorail Project extension to Wiehle Avenue. The CMP would cover emergency response, communication, transit, and TDM. The CMP will provide cost-effective transportation options to commuters, shoppers, and residents of the corridor so that they can move safely and efficiently through the construction zones.
⁴ Provides technical assistance, speakers, training for setting up telework programs through MWCOG in cooperation with local TDM agencies (FFXCO Ridesources).
⁵ Provides sales person resources to assist local TDM agency efforts with public sector agencies for above services.
⁶ Operated through MWCOG. (www.mwcog.org/commuter/Bdy-Grh.html)
⁷ Ridematching database housed at MWCOG. Network members (local TDM agencies) offer commuter and employer assistance using this database. It is currently being revamped and will offer direct on-line matching in the future.
Regional

Metropolitan Washington Council of Governments (COG) Commuter Connections Program: COMMUTER CONNECTIONS is a regional network of transportation organizations coordinated by the Metropolitan Washington Council of Governments (COG), a non-profit. Commuter Connections offers free services to those who work in the Metropolitan Washington area. Among many services, it offers ridematching for carpools and vanpools and administers the Guaranteed Ride Home program. Commuter Connections also helps employers establish commuting benefits and assistance programs, including telework/telecommute programs, for their employees.

Commuter Connections website http://www.mwcog.org/commuter/ccindex.html

Commuter Connections FY 2007 work program http://www.mwcog.org/commuter/Work%20Program%20FY07.pdf

State

Telework!VA: The Telework!Va Program provides incentives for Virginia businesses to establish or expand telework programs for employees. The program goal is to provide more opportunity for participation in teleworking.

It is a program administered by the Commonwealth of Virginia Department of Rail and Public Transportation (DRPT) through the Metropolitan Washington Council of Governments (MWCOG) for northern Virginia companies.

The Telework!Va Program is limited to reimbursement of lease costs and consultant/technical assistance expenses. It reimburses a variable percentage of the lease expense for equipment; telework center space; technical assistance for setting up programs and installing equipment; and provides training for teleworkers and supervisors.

Telework!VA website http://www.teleworkva.org/overview.htm

Virginia’s 511 Traffic and Travel Information: Provides real-time reports of accidents and incidents on highways. http://www.511virginia.org/

Congestion Management Plans (CMP): CMPs are implemented during major construction projects and include TDM measures. A few recent examples of construction projects with significant CMPs are I-66, the Woodrow Wilson Bridge and the Springfield Interchange. In the near future, the CMPs for the Dulles Rail construction and the potential Capital Beltway HOT lane construction are critical to the Tysons area. Due to the overlapping area of these construction projects, the state is initiating a regional CMP effort.

Fairfax County

Employer Services Program (ESP): The ESP provides information and assistance regarding commuting alternatives to employers with 100 or more employees. http://www.fairfaxcounty.gov/fcdot/employer.htm
The RideSources Program: The RideSources Program provides Fairfax County citizens with free information and ridematching services. This is a cooperative program with COG Commuter Connections. [http://www.fairfaxcounty.gov/fcdot/sources.htm](http://www.fairfaxcounty.gov/fcdot/sources.htm)

Community Residential Program (CRP): This program builds partnerships with residential developments to promote use of alternative modes of transportation. [http://www.fairfaxcounty.gov/fcdot/crp.htm](http://www.fairfaxcounty.gov/fcdot/crp.htm)

TDM Consultant Project (Travel Demand Management and Associated Parking Requirements for Transit Oriented Developments and Transportation Management Districts): In 2007 Fairfax County DOT will engage a consultant to examine how to incorporate Travel Demand Management (TDM) as an integral part of the land use and development process in the County. A key aspect of this project is to determine TDM trip reductions and associated parking requirements for Transit Oriented Developments (TOD) and Transportation Management Districts (TMD). The completion of this project will assist the County and DOT staff in optimizing TDM proffers and associated parking requirements for developments including Metro station area developments.

TDM Coordinator: In the FY 2007 budget, the County Board established a TDM coordinator position within the Department of Transportation. The purpose of this position is to focus on TDM proffer development and implementation. This position was filled in October 2006.

Proffers – Proffers are voluntary commitments that a developer makes to offset the impacts of a proposed development. Due to the lack of state enabling legislation for the County to enact an adequate public facilities ordinance, or similar requirements for a new development, the proffer system, which is voluntary, is the primary mechanism by which such contributions are made. Proffers often include monetary contributions toward capital facilities such as schools, parks, roads and other public facilities. To mitigate the transportation impact of a development, proffers increasingly include a TDM plan.

The County is currently using a performance-based approach to TDM plans proffered by developers. That is, a TDM plan may include a range of techniques that may be employed, but the developer has the ability to “mix and match” which ones to use as long as he meets the agreed upon performance goals.

Existing Proffers - The following chart summarizes all Tysons Corner proffers that have a TDM component.

Applicant to provide incentives generally to meet target of "20% mode split goal for SOV": Rideshare program; guaranteed ride home / MetroCheck; preferential car/vanpool parking; reduced rate parking for HOV3; free parking for vanpool; bicycle storage; showers & lockers; and annual surveys to update program based on results.

Applicant must appoint TDM coordinator 60 days after site plan approval.

Provided a special taxing district is created, applicant will provide priority parking for car/van pools.

Provide priority parking for car/van pools; coordinate with County

Establish Shuttle from site to Dunn Loring - shuttle can be discontinued if public transportation service is provided from METRO to location adjacent to property is initiated.

Actions initiated by applicant must include: guaranteed ride home; preferential van/car pool parking with SOV charged market rate and HOV3+ charged half; and shuttle bus to Metro during weekday peak periods unless service to Dunn Loring provided by WAMATA or equivalent.

If applicant or land area is included in Fairfax Square agreements, applicant will provide car/van pool coordination & preferential parking.

A TDM program to meet a 20% reduction target vis-à-vis ITE 6th edition. This includes a TDM coordinator, lit drop, rideshare database and bulletin board coordinated with TYTRAN & DOT, involvement in Guaranteed Ride Home, & premium spaces for car/van pools. Other items include quarterly & annual reports and a possible shuttle bus. Program to be supported by $0.08 per square foot per year.

Penalty payment if 20% reduction not met: $0.035 per sq ft, $50,000 bond to insure payment.

Provide for office lease / purchasers a formal ride-share program with coordinator to encourage such; also distribute public transit information. May coordinate, establish, or participate with other employers in the Tyson's area.

Provision of shuttle bus service, at least hourly for eight hours each weekday; free taxi service or participation in comparable bus service by others may be substituted. Expires if five years have passed from first RUP and 2/3 of unit owners agree to abolish.

Must maintain shuttle bus service 8 trips per day min, or prepaid taxi, or participate in existing service by others. Applicant must create deed covenants for support of shuttle or alternative transit with a requirement of 2/3 majority vote to abolish.

Program to have a 20% reduction target; includes TDM coordinator; bike storage; telecommuting center; two 'level 3' activities per proffer document and annual survey.

Applies when reduction target not met: $40.00 per occupied unit per year. Expires 15 year after last RUP issued.

Applicant to encourage employee participation in TDM.

Applies under development option one only - various TDM programs including shuttle bus.

Applies under development option one only - shuttle bus service will be ended if metro stop constructed adjacent to site.

A literature drop TDM only; low priority.

New Proffers - PB Placemaking should review both of these TDM proffer documents.

MetroWest – See [http://www.restondigital.com/tysons/tdmlinks.html](http://www.restondigital.com/tysons/tdmlinks.html) (see attachment D)

Tysons Area – The Tysons Transportation Association (TYTRAN) is a non-profit membership transportation management association that seeks to achieve an effective and coordinated transportation system within the Tysons Corner Urban Center that supports the community’s economic prosperity and quality of life. TYTRAN accomplishes this through advocacy for transportation improvements and appropriate development policies, implementation of transportation demand and system management strategies and coordination of like-minded public and private organizations. TYTRAN’s programs include, but are not limited to, the TYTRAN commuter program, area-wide and employer TDM programs and services, meetings and forums, and a legislative program.

SPECIFIC TDM STRATEGIES

The TDM Subcommittee has also reviewed numerous TDM strategies. These strategies have been grouped into the following six categories:

Alternative Mode Support Strategies
Worksite-Based Strategies
Land Use Strategies
Programmatic and Policy Support Strategies
Telecommunications Strategies
Pricing Strategies

Alternative Mode Support Strategies
Many of the above activities should be coordinated by the Transportation Coordinator for Tysons. A well-funded, proactive transportation management group like TYTRAN would be the logical umbrella organization. Many examples of transportation demand management organizations exist in the region, including LINK of Reston and DATA (Dulles Area Transportation Association). PB Placemaking should determine when these organizations have been effective, and when not effective, determine why not.

Public Education and Promotion - Marketing plays an important role in dissemination of information about options for travel. Commuter Connections, a regional network of transportation organizations coordinated by the Metropolitan Washington Council of Governments, conducts public education and promotion campaigns in the Metro DC area.

These efforts can be used to encourage those people who don’t normally think to use alternate modes to use them for some of their trips. Effective publicity stresses the importance of using alternate modes and tries to reduce the stigma sometimes associated with using public transit, walking, and biking. Promotional materials should be widely available and provided to all employers.

Ridematching Services – TYTRAN currently uses the Commuter Connections car and van pool matching service. There is also a Commuter Connections ridesharing bulletin board. A more effective service would allow interactive origin/destination address entry showing prospective, screened applicants. Informal slug lines exist in the area and should be supported and encouraged. Employers should be encouraged to map employee residences (while ensuring privacy) to understand their employee commute regions and to help implement effective ridesharing services. Financial incentives are available to employers and employees. Residents should be encouraged to consider using ridematching services for non-commute trips such as team sports, school carpools, shopping trips for the elderly, and others. Carpooling has developed a negative connotation that needs to be overcome.

Transit Services – Tysons is served by many bus routes. Metro bus routes 28A, 28B, and 3T and Fairfax Connector bus routes 574, 401, and 404 all stop at the Tysons Corner Mall, which is one of the busiest bus stops in the region. TYTRAN provides basic links to Metro bus and Fairfax Connector information.
Dissemination of schedule information (Web, paper, wireless, email alerts) is important, and active encouragement of the use of transit should be part of any program. Access to transit stations needs to be improved (sidewalks, crosswalks, bike routes), as many stations are located on major arterials without sidewalks, bike routes, or proper crosswalks. We need to improve the facilities at bus stops (bus shelters, trash containers and pickup, secure, covered bike parking). More comfortable buses (less noise and pollution, smaller size) and more efficient routes would lead to additional ridership. Bike racks should be placed on buses to help integrate both modes of travel.

A Tysons Transit Pass would allow Tysons residents and employees to travel cheaply using all transit services. Hotel guests could be issued passes upon arrival.

There is also a great need for station centered circulation shuttles as well as shuttle service to Tysons Corner from adjacent communities such as Vienna, McLean and Pimmit Hills.

**Vanpool Services** – TYTRAN provides a link to the Commuter Connections ridesharing service. There are Federal tax and other subsidies available. These subsidies should be publicized by employers. The Commuter Connections Guaranteed Ride Home program can help alleviate concerns that parents and others have about not being able to quickly travel in case of emergencies.

**Custom Transit Services** – There are many existing shuttle buses from hotels/businesses/shopping malls to/from Metro stations and other major destinations. The Holiday Inn provides a shuttle to the Dunn Loring Metro station. The Comfort Inn Tysons provides a free shuttle to Dulles Airport. The Tysons shuttle provides service to the West Falls Church Metro station. The Marriot and the Embassy Suites Hotel Tysons Corner provide a free shuttle to a 3-mile radius of the hotel. Tysons Corner Doubletree provides a free shuttle to Metro.

These services will need to be expanded and coordinated when Metro comes to Tysons. The shuttles need to be frequent and direct. Residents and employees should be surveyed to determine what trips could be taken by shuttle that would otherwise taken by personal vehicles.

**Non-Motorized Support** – Despite the fact that Tysons is surrounded by the Dulles Toll Road, I-495, Route 123 and Route 7, there exist a number of ways to bicycle to and through Tysons from surrounding areas, mostly using existing roads. These routes should be mapped and publicized. Bicycle advocacy groups such as Washington Area Bicyclist Association and Fairfax Advocates for Better Bicycling are available for providing information about routes and resources.

For pedestrians, while there are a number of sidewalks in Tysons, many are not connected and those that exist often do not provide a direct route to destinations. Pedestrian crossings of the major roads are dangerous or non-existent. Most office buildings were developed with only motorized access in mind. Pedestrian and bicycle connections to the street are usually via these motorized access routes, not the more direct routes. These direct ped/bike routes to the street are sometimes prevented due to landscaping or fencing.

Safe routes to Metro stations and other locations throughout Tysons are needed. This includes trails, sidewalks, marked bike lanes, and signed bike routes. The built environment should...
include interesting sights and locations along pedestrian routes that encourage walking. The street network should consist of “Complete Streets” which routinely accommodate travel by all modes. Bicyclists and pedestrians need not compete for offroad space on sidewalks and trails if bicyclists are comfortable riding on the road, which is usually the safest and most direct method of bicycle travel.

Covered, secure bicycle parking, safe crossings of major roads, including new bridges over I-495 and Dulles Toll Road, and access through surrounding neighborhoods are needed. Bike rental or loans could be provided, including very short-term rentals to facilitate trips to/from Metro from nearby locations. Bikes could be rented using a credit card or special bike rental card. Rental rates would be low, possibly subsidized by the county and developers. See the Community Bicycle Program link on TDM link page for more information and examples of such programs.

Bike stations should be available for maintenance and storage of bikes during the day, with showers, lockers and changing rooms. Due to the hilly nature of the center of Tysons, some bikes may need to be supplemented with small electric motors.

Secure, covered bike parking, shower and locker facilities and other amenities for cyclists must be provided by employers. Bike to Work Day events can be held to encourage ridership and provide resources for cyclists. Events and campaigns are useful in spreading the word that it’s OK to bike and walk. Bicycle safety and education programs can be coordinated with the bicycle advocacy groups.

Bicycles can be provided by employers to reduce mid-day auto trips. An example is the National Wildlife Federation in Reston which has a fleet of bicycles for employee use.

A multi-modal access guide should be published to inform citizens about how and why to bike and walk to and through Tysons. Maps of access routes, street crossings, public restrooms, bike parking facilities, etc. can be provided. Walking and biking times to/from various destinations can be provided. The guide can be funded by state or federal grants.

The importance of bicycling as a way to quickly evacuate an area when the road network is clogged could be stressed

**HOV/HOT Facilities** – HOV lanes are located on the Dulles Toll Road. There are two studies underway at VDOT for constructing HOT lanes on I-495 and I-66. See TDM link page. These lanes need better enforcement and if congested, the requirements for entry could be increased. High Occupancy Toll lanes are being considered as well.

**Park & Ride Lots** – The TYTRAN, COG and County web sites contain maps of regional park and ride lots.

**Car Sharing** – Flexcar has current locations in East Falls Church, West Falls Church, and Vienna metro stations. The closest Zipcar location is currently along the Ballston corridor. Discussions with these and other firms should be held to investigate innovative uses of their services.

**Worksite-Based Strategies**
On an individual site basis, TDM programs have been found to result in significant HOV use where there is a strong employer commitment to the program. TDM programs could induce a significant shift in travel behavior in the Tysons Corner Urban Center when individual employer TDM programs are coordinated with an area-wide TDM Program.

Work-site based strategies may be provided by developers or employers. All of the work-site based strategies are designed to make forms of public transportation more attractive, provide flexibility in the choice in the mode of transportation and disincentives to driving alone.

The programs can have a direct impact on the number of commuting trips generated by an individual employer, could be implemented with the assistance of a Tysons Corner Urban Center Transportation Management Association and could be monitored effectively at the individual worksite basis as well as area-wide.

**Monetary Incentives** – Monetary incentives generally take three forms, direct subsidies, transportation allowances, and parking cash outs.

Under current IRS rules an employer can provide parking with a market value of up to $165 per month, tax free to the employee. Employers can only provide a transit/vanpool subsidy of up to $65 per month tax free. Any financial incentives given by an employer to commuters who carpool, bicycle, or walk, however, are taxed in full.

Employers can also provide direct subsidies for transit passes. All of these mechanisms give employees a financial incentive to take transit, carpool, vanpool or bike/walk to work. Transit subsidies are only effective in areas with good transit service. While Tysons Corner has good bus service, the Metro will not be available until 2012. A transit subsidy program will not be able to be truly effective until the Metro is operational through Tysons Corner.

However, financial incentives are among the most effective TDM measures and can have a dramatic effect on a company’s single occupant vehicle rate. “COMSIS has estimated that a reduction in trips of between 8% and 18% can be expected at individual employment sites, although this is heavily dependent upon the availability of alternative commute options at those sites. A study of Los Angeles commuters estimates that parking cash-out programs could reduce SOV trips by as much as 24% and a parking cash out program modeled by the Puget Sound Regional Council estimated a 1% to 3% reduction in regional daily work trips.”

**Alternative Work Schedules** – Alternate work schedules include flexible work hours, compressed work weeks and multiple work shifts for certain operation. All employers should be encouraged to implement alternative work schedule options for their employers.

“According to estimates by COMSIS, compressed work weeks reduce not just work trips, but total trips – on the order of 15%. The PRSC, however, estimates that alternative works schedules can only achieve up to a 1% reduction in region-wide VMT and vehicle trip reduction.”

**Guaranteed Ride Home** - Guaranteed ride home is a strategy offered to complement other TDM strategies. Employers “guarantee” some form of transportation to their employees in the event of personal/family emergencies or unscheduled overtime, to ensure that the employees can get home.
Currently there are at least two guaranteed ride home programs available in the Tysons Corner Urban Center. One is operated by the Metropolitan Washington Council of Governments (MWCOG) COMMUTER CONNECTIONS. (www.mwcog.org/commuter/Bdy-Grh.html).

Parking Management - Parking management strategies are designed to impact the availability, cost and location of parking. Parking, although provided free of charge for many commuters in the Tysons Corner Urban Center, does have a cost. Transferring this cost to employees – while giving them the ability to avoid it by using an alternative mode – is among the most effective ways to reduce the use of SOV’s for commute trips.

The County, working with a Tysons Corner Urban Center Transportation Management Association, should review parking requirements in the Zoning Ordinance to consider the full range of parking management strategies and other transportation demand management strategies. Parking management measures include the following:

- Preferential parking for HOVs/vanpools
- Parking cash out programs
- Limiting parking supply
- Parking pricing

“Aggressive parking management programs are possibly the most effective TDM measure an employer can take to reduce SOV travel. Limiting its supply is almost as effective.”

Facility Amenities – Facility amenities include the physical changes that can be made to an employment center to encourage the use of non-SOV modes by employees. Trip generating amenities like daycare, post offices, banks, gyms, restaurants, etc.) should be situated on-site to reduce the need for these trips.

In addition there are also other types of facility amenities that can reduce the need for employees to run errands like using the Internet for dry-cleaning, groceries, and allowing employees to send mail using the Company mail services. Amenities for cyclists like bike racks, showers and lockers are also effective in encouraging bike commuting.

Other facility amenities include: On-site transportation coordinators, preferred HOV parking locations, company vanpools and remote Post Office automated stations to eliminate post office trips.

Transportation Management Associations (TMAs) – Both individual TDM measures, as administered through commitments that are made as a part of the zoning process, as well as an area-wide TDM program, are needed in the Tysons Corner Urban Center as components of a successful public transportation improvement program. A Transportation Management Association (TMA) such as TYTRAN should administer a comprehensive area-wide program and coordinate the TDM actions of individual employers. Because of the public benefit that can be realized through these programs, the County should consider providing public funding to support such efforts.

The implementation of a successful comprehensive area-wide TDM program may require adoption of an ordinance governing such actions so that all property owners will be required to participate, not just properties committing to participation through the zoning progress.
Ordinance requirements may include paid parking, transit subsidies, rideshare matching services, preferential treatment of carpool/vanpools, shuttle bus services to nearby transit transfer stations, guaranteed ride home programs, marketing of commuter assistance programs, and other related measures designed to lessen use of single-occupant vehicles and boost HOV usage during peak commuting periods.

**Land Use Strategies** - Land use strategies are critical to the success of an area-wide TDM strategy for the Tysons Corner Urban Center. The use of a combination of land use strategies coupled with other TDM efforts can have a significant impact on travel need and patterns.

In the Rosslyn-Ballston Corridor of Arlington County, land use strategies have been a major factor in the overall success of its TDM strategy. Its success can be demonstrated through the following facts:

1) Since 1980, employment has increased 2x from 40k to 80k, residential units have increased 2.3x from 12k to 28k, office space has increased 3.5x from 6.5msf to 22.5msf.

2) The Corridor produces 32.8% of the County’s real estate taxes from 7.7% of its land – allowing Arlington to have the lowest property tax of any major jurisdiction in Northern Virginia. There has been an 81% increase in the assessed value of the land.

3) 73.3% of patrons walk to transit, over 61,000 trips daily, 38% of residents near stations take transit to work. 12% of Arlington County households don’t own cars, the regional average is 4%.

4) The traffic counts at five major intersections have increased only 16% from 1980 to 2000 while an 80% increase was projected.

5) Almost 30msf of development has occurred on two square miles of urban land. This development would require 14 square miles of green field land if constructed in a typical suburban location.

**Compact Residential Development** – After increasing or improving the level of transit service, an area’s housing density is the strongest predictor of alternative mode use. Also, research has suggested that increasing a community’s density may even drive the addition of mixed-use development and pedestrian friendly streetscapes, two other land use changes which can further reduce SOV use. Actions include allowing zero-lot line construction.

The time frame for this change to occur can vary as it is mostly influenced by the economy and the real estate market. The proper developer incentives should target key parcels or areas. Density bonuses, provision of upgraded infrastructure and accelerated permitting processes can all be effective incentives.

Increasing transit services is essential to see the benefits from increasing residential density.

“Pushkarev and Zupan state that when density levels approach 30 du/acre, transit demand triples, and at density levels over 60 du/acre, over half of all trips are made using public transportation.”

**Compact Employment and Activity Centers** –

“According to the 1994 study of Puget Sound travel behavior by Frank and Pivo, change from SOV to other modes becomes significant at densities of greater than 50 employees per gross
Acre. At densities greater than 125 employees per gross acre a majority of trips are made using modes other than SOVs.”

**Mixed Land Uses** – A mix of land uses including, but not limited to, commercial, residential, mixed use centers, civic uses and amenities is critical to the success of an urban center TDM plan.

**Connectivity** – Connectivity refers to the network of streets, sidewalks and trails that make it more efficient for a person to travel from one place to another. Improved connectivity can be accomplished by the following; a grid of streets for walking, bicycling and driving which provides numerous route choices, more connections to the regional network, improved connections to transit, improved connections between developments, pedestrian-friendly sidewalks as well as separate non-motorized paths and trails, and onroad bicycle routes

Improving the connectivity of road networks can improve congestion and shorten trips, but is unlikely to actually decrease auto trips. Improving sidewalk connectivity and trails can have a real impact on increasing pedestrian travel and decrease vehicle miles traveled.

**Transit and Pedestrian Oriented Design** – Numerous studies have demonstrated that factors such as safety, accessibility, amenities and aesthetics can all have a significant influence on transportation mode choice. Transit and pedestrian oriented design actions include: prominent crosswalks and complete sidewalk networks, traffic calming measures, landscaping techniques, parking, narrower streets, outward building orientation and zero lot-line frontage

Use incentives such as density bonuses accelerating permit approval for pedestrian friendly design.

**Parking Management** – Parking management refers to actions that affect the supply, location, cost and demand for parking. Strategies include the following: adjust off-street parking requirements, allowing flexible requirements, allowing shared parking, providing joint use spaces for park and ride lots, on-street parking, charging for parking costs, parking lot placement, residential parking permit zones.

**Jobs/Housing Balance** – There are approximately 15,000 residents and 120,000 workers in the Tysons Corner Urban Center. Efforts must be made to correct that imbalance as one of the keys to a successful urban center is a critical mass of residents. Placing housing close to work center is an extremely effective TDM land use strategy.

**Affordable Housing** – Housing must be available at all price points in the Tysons Corner Urban Center.

Please refer to the report from the Tysons Land Use Task Force Affordable Housing Committee.

**Programmatic and Policy Support Strategies**

**Trip Reduction Ordinances (TROs) and Programs** - Some states and localities have TROs. They can apply just to employers or be broader in coverage. The County is negotiating trip reductions, such as with Macerich and MetroWest, but it is done on a proffer basis and thus
applies only to those coming before the Fairfax County Planning Commission and the Board of Supervisors on a plan amendment or zoning change.

If there were a desire to have a TRO for Tysons, the following determinations and decisions would have to be made:

what state enabling legislation would be required;
who would be covered;
what would be the requirements;
what enforcement or penalties would there be;
what role would the County play in facilitating the implementation.

**Access Priority/Restriction** - These are carrot and stick approaches to get people to change behavior. These include things such as lanes or parking spots for HOV or van pools and limiting the number of parking spaces not for HOV or van pools. Much of this would apply to broader geographic areas and not be Tysons specific. Some of those are being implemented, such as the HOT lanes on the Beltway.

One thing that could be considered for Tysons is limiting parking spaces to encourage use of travel options other than SOVs. Something such as a parking district or parking authority could be considered for Tysons. Because of differences in history, use, and proximity to the rail stations, significant effort would be required to fashion something that would be effective and also be saleable.

**Support of New Institutional Relationships** - Transportation Management Associations (TMAs) are addressed in Employment Site Based Strategies. A Transportation Management District (TMD) could be created for Tysons. It could have responsibility for a variety of things from parking to shuttles to some of the things TYTRAN does or could do. Enabling legislation could be required to establish a TMD.

**Establish a Transportation Management District** – Tysons, or part of Tysons, could be designated as a transportation management district (TMD). Within the transportation management district, there could be both controls, such as limitations on parking spaces or use of parking space, and programs, such as operation of shuttles. Determinations would have to be made about what the limitations and responsibilities would be, who would operate the TMD, and how the costs of operation would be covered.

**Restrictions on SOV parking spaces within parts of Tysons Corner** – Limitations could be placed on the number and use of parking spaces within designated parts of Tysons Corner. These restrictions could be governed simply by ordinance, by a parking authority that would have responsibility for parking but not for other things, or by an entity operating a transportation management district. There are cost to operate either a parking authority or a transportation management district but such structures also provide greater flexibility, can be more responsive, and can provide an opportunity for those controlled to be directly involved in operations.

**Telecommunications Strategies**

These strategies utilize modern communications technologies, principally the Internet, to reduce the need for vehicle trips. While the primary impact is on commuting trips, they also have the
potential to reduce non-commuting trips. Except for telecommuting/telework, there is limited documentation on the effectiveness and implementation of telecommunications strategies.

Telecommuting/telework - Networked computers allow employees to work at home or another site, such as a telework center, rather than regular place of work. Vehicle trips can be significantly reduced for both residents of Tysons Corner and employees of businesses located in Tysons who can utilize this strategy. Telecommuting is particularly attractive to workers with longer distance commutes, so reductions in vehicle miles traveled is relatively high.

There will be, however, limitations to the use and benefits of telecommuting at Tysons. The vision of Tysons as a location where individuals both live and work reduces the need and opportunity for telecommuting. In addition, some categories of employees, such as service workers are required to be on-site, and will not be able to participate. Some employers may resist a telecommuting program due to concerns about potential loss of managerial control. Significantly, telecommuting will not have any impact on non-commuting trips, e.g., trip generation from business clients and retail and entertainment clientele or personal trips by residents. Non-commuting trips can represent 70 percent or more of total vehicle trips.

Although the application of telecommuting/telework will have some limitations, consideration should be given to providing the necessary infrastructure so they can be used where appropriate. For example, both residential and commercial development could be wired for Internet and other telecommunications services during construction. In addition, the feasibility of telework centers in Tysons could be explored with the U.S. General Services Administration and other organizations.

Other Strategies - Other telecommunications-based strategies focus on trip reduction thru Internet shopping, service transactions (e.g., Tele-shopping, Tele-banking, Electronic Government), and distance learning. Limited research has been done on the impact of Internet commerce. Given the lack of information, along with the fact that most of these services are market based and beyond control of developers or the County, these strategies may not be significant factors in a Tysons TDM Plan. Nevertheless, they might be included in the Public Education Program under “Alternative Mode Support Strategies.” In addition, the County may consider investigating expanded opportunities for residents to conduct business over the Internet.

Pricing Strategies
Pricing strategies use financial incentives and disincentives to influence transportation decisions. Many of these are controversial; some would require new authorities.

Parking Pricing - In certain situations a fee, such as a tax on parking spaces or a charge for parking, can be imposed on all parking spaces as part of a TDM strategy. Parking fees are also a revenue producer, although as much or more revenue could potentially be lost from decreased economic activity. While meters for street parking and paid parking at public or commercial parking garages may be feasible at Tysons, fees or taxes on shopping center surface parking and employee parking would be difficult to implement. Such fees would be controversial and likely opposed by property owners and developers, as well as shoppers, employees, and residents. Potential spill-over parking will be an issue with adjoining residential neighborhoods. Implementation of a fee would require [a special tax district?].
Parking Pricing is just one potential technique of a total Parking Management Program that discourages excessive parking supply and demand, and makes more efficient use of existing parking. Parking Management also includes such techniques as shared parking, parking “cash out,” more accurate and flexible parking minimums and maximums, and car sharing programs that allow members to reserve and drive a car whenever they want, eliminating the need for owning a car and an associated parking space. Parking Management efforts should be coordinated with County staff currently working on parking minimums and maximums.

**Gasoline Tax Increase** - Fuel is the largest and most visible auto operating expense. A gas tax (or applying the general sales tax to fuel) would make other transportation modes more competitive with automobile travel, as well as providing additional revenue to the County. Reduction in fuel usage would also reduce dependence on imported oil and reduce pollution. However, a significant tax would be needed to impact travel behavior. Even then, the desired traffic reduction may not be achieved, as drivers may switch to more fuel-efficient cars rather than drive less, or purchase fuel in neighboring jurisdictions. Implementation of a fuel tax would require [what authority would County need or what action would it have to take?].

**Road/Congestion Pricing** - Road pricing imposes a fee for traveling on a specific road. The most common road pricing application is a toll road, which can include HOT lanes (HOV lanes available to low occupancy vehicles if a toll is paid). Tolls can also be charged for driving in a particular area, usually a city center. Some area tolls only apply during peak periods. Congestion pricing is a variation on the toll theme, using variable pricing (higher prices under congested conditions and lower prices at less congested times and locations). As the name suggests, congested pricing is intended to reduce peak-period vehicle trips.

A Vehicle Miles Traveled (VMT) tax would, as the name suggests, charge drivers based on miles driven. In locations where it has been used it usually replaces registration and fuel taxes. Implementation would be costly, as GPS equipment for each car would be required to track mileage. Privacy issues would be raised by tracking the use of vehicles.

Like gasoline tax increases, road/congestion pricing and a VMT tax may be more suitable as County-wide or regional TDM approaches.

There are also traffic control systems in place in London, Rome and Stockholm. Stockholm and London use similar “congestion pricing” systems where drivers are charged different amount depending upon the time of day and their location. The project is essentially a ginat behavior-control experiment designed to distribute traffic more efficiently throughout the day and to spur more people to take public transportation.
The TDM Subcommittees report relied on the review of numerous sources, many of which are listed below. Much of what is contained in the report is not original thought and is taken directly from these sources.

Report Assesses Transportation Demand Management at Fairlee/MetroWest Development

A report by UrbanTrans Consultants assessing Transportation Demand Management, or TDM, for the Fairlee/MetroWest development, which is within the Vienna Metrorail Station area, was released today by the Fairfax County Department of Transportation. The study was to determine if the reductions in peak hour traffic as outlined in the Fairfax County Comprehensive Plan for the Fairlee/MetroWest development were achievable.

According to the report: “The research and analysis elements of the Fairlee/MetroWest TDM Development Program conclude that the trip reduction targets for the proposed project (peak-hour vehicle trip reductions of 47 percent for the residential uses and 25 percent reduction for the office uses) can be achieved through a combination of the physical design characteristics of the site, as proposed, and the full application of the TDM programs and strategies recommended in this document.”

UrbanTrans Consultants further stated: “The trip reductions, however, remain aggressive targets. The development of the TDM program recommendations and the trip reduction analysis conducted for this effort considered the project as a whole, with the full level of development planned; the mix and quantity of residential, office and retail uses proposed; and the pedestrian-friendly design of the site as planned. All of the design elements of the proposed project, along with the recommended TDM strategies (programs and budget levels), must work collectively to achieve the trip reduction targets. With all elements in place, however, trip reductions should prove sustainable.”

In December 2004, the Fairfax County Board of Supervisors approved a change to the county’s Comprehensive Plan for certain land units within the Vienna Metrorail Station area known as Fairlee/MetroWest. One element of the revised Comprehensive Plan language pertains to TDM, or strategies aimed at reducing traffic from the development site. TDM includes alternatives to driving alone, such as ridesharing, public transit, walking and biking, as well as the supporting strategies that encourage the use of transportation modes other than the single occupancy vehicle.
Report Assesses Transportation Demand Management at Fairlee/MetroWest Development (cont.)

“In general,” states the Comprehensive Plan, “at build out, it is expected that, for the residential portion of the development, a reduction in peak hour trips of 47 percent should be achieved through the use of transit and other means; for the office portion of the development, a peak hour reduction of 25 percent is expected to be achieved through the use of transit and other means.”

It is expected that the Fairlee/MetroWest development applicants will use the information from this report to prepare a draft proffer package and TDM program for the county to review that addresses the need for transportation alternatives and trip reductions for the site.

An advisory team with representatives from the community, county government and the development applicant provided background information and feedback during the development of the report.

The full report is available at www.fairleemetrowest-tdm.com. For further information regarding the report, contact Kevin Luten or Justin Schor with UrbanTrans Consultants at 202-248-1790 or Angela Rodeheaver with the Fairfax County Department of Transportation at 703-324-1100, TTY 711.

Project Background

In December 2004, the Fairfax County, VA, Board of Supervisors approved a change to the County’s Comprehensive Plan for certain land units within the Vienna Transit Station Area. The plan change was made in order to provide the opportunity for mixed-use transit-oriented development (TOD) at the Vienna-Fairfax-GMU Metro Station.

The December 6, 2004, Board Motion notes:

“TDM measures employed during the initial and subsequent development phases will have an objective of reducing vehicular trips in the peak hours by a specified amount, with the exact number to be negotiated between the County and the applicant based upon the number and types of units and uses being developed. In general, at build out, it is expected that, for the residential portion of the development, a reduction in peak hour trips of 47% should be achieved through the use of transit and other means; for the office portion of the development, a peak hour trip reduction of 25% is expected to be achieved through the use of transit and other means.

“The TDM program will be evaluated initially in at least three stages during the development process; first at the time of rezoning, second before and during construction and third after project completion or ‘build out.’ In the first stage of evaluation, at the time of rezoning, a development application should demonstrate that TDM [measures] will be provided to achieve the peak hour trip reduction goals stated above.”

Following the December 6, 2004, action by the Board of Supervisors, the Fairfax County Department of Transportation, through Pulte Home Corporation, solicited Requests for Proposal from qualified applicants and/or firms to develop TDM program recommendations for the proposed Fairlee/MetroWest project, and to evaluate the peak period vehicle trip reduction potential of the proposed project (with the inclusion of the TDM program recommendations). The project was not intended as a comprehensive traffic impact study addressing broader traffic or transportation issues beyond the proposed development site.

After reviewing submitted proposals, and following interviews with a number of firms, UrbanTrans Consultants (along with subcontractor LDA Consulting) were selected.

Fairfax County assembled a TDM Program Advisory Team to guide the effort in partnership with the UrbanTrans team. Members of the Advisory Team are indicated at the beginning of this document.
Project Overview

This Final TDM Development Program document summarizes the process used, as well as the results generated, from nearly three months of research and analysis. The research process involved conducting five research and analysis tasks:

1) Forecasting peak-period vehicle trip generation for the proposed development using established ITE and Fairfax County trip generation rates.

2) Assessing existing commuting / travel patterns, along with transportation-related attitudes and preferences, within the existing Vienna Transit Station Area (the area defined by the Fairfax County Comprehensive Plan as an approximately ½-mile radius from the transit station). Methods utilized included:
   a. Resident & Employer Surveys: Surveying residents and employees in the study area to assess their attitudes and preferences about travel choices and to understanding current travel behavior and demographic information.
   b. Traffic Counts: Counting vehicles entering/exiting existing subdivisions, and observing vehicle occupancy during the peak periods.
   c. Census Analysis: Utilized 2000 Census and Journey to Work data, along with supplemental 2005 demographic data, to understand demographic and household information and commute patterns, for the ½-mile radius Vienna Transit Station Area.

3) Investigating TOD “best practices” and lessons-learned throughout the region and across the country.

4) Understanding current TDM programs offered within Fairfax County as a whole, and identifying opportunities and barriers to successful TDM implementation at the Fairlee/MetroWest site.

5) Meeting with, responding to, and receiving input/suggestions from neighborhood groups and residents within the study area. The project team held six meetings in two months with neighborhood members, including a community open house held on June 1.

The Advisory Team used the information gathered from these research tasks to develop specific TDM program recommendations for Fairlee/MetroWest, and to forecast peak period vehicle trip reduction resulting from the combination of the proposed mixed-use, transit-oriented development, and the recommended TDM program for the development.

Lastly, the team developed an on-going monitoring and evaluation program, along with supplemental TDM strategies for future implementation should monitoring systems find trip generation in excess of target levels (utilizing target ranges and strategies tied to project phasing). Detail on the research and analysis is included in the pages that follow. Back-up information is included in referenced Appendices.
Baseline Trip Generation

UrbanTrans forecasted peak-period vehicle trip generation for the project site using established ITE and Fairfax County trip generation rates. Fairfax County provided detail regarding quantity and type of land uses proposed for the Fairlee/MetroWest project (including delineation of ownership versus rental units, number of buildings, and number of floors per residential building). For all trip generation analysis conducted in Fairfax County, Fairfax County directs the use of generation rates developed by Fairfax County for townhouse residential uses, and the use of ITE rates for all other residential land uses. This county-wide policy was followed in this baseline assessment.

The table below displays weekday, AM and PM peak-hour, vehicle trip generation calculations for the residential and office components of the proposed Fairlee / Metro West development. This represents the baseline trip generation calculation, and does not factor in potential vehicle trip reduction associated with the site’s transit proximity, mixed-use, or transportation demand management elements.

Current Travel Patterns & Preferences
The team used multiple methods to better understand current travel patterns and traveler attitudes and preferences with the Vienna Transit Station Area.

- Resident & Employer Surveys: Surveying residents and employees in the study area to assess their attitudes and preferences about travel choices and to understanding current travel behavior and demographic information.
- Traffic Counts: Counting vehicles entering/exiting existing subdivisions, and observing vehicle occupancy during the peak periods, and comparison of traffic counts to ITE/Fairfax County trip generation forecasts.
- Census Analysis: Utilized 2000 Census and Journey to Work data, along with a 2005 demographic assessment (Claritas, Inc. SiteReports, June 2005), to understand demographic and household information and commute patterns, for the Transit Station Area and surrounding areas.

Resident & Employee Surveys
To better understand dynamics within the existing Transit Station Area, the team conducted two surveys. One survey was conducted with residents living near the Fairfax/Vienna Metro station. A second survey was conducted with employees who worked near a Metrorail station. The surveys were performed for two primary purposes:

1. To present a “snapshot” of current commute travel patterns in the Fairfax/Vienna Metro Station area.
2. To identify transportation-related attitudes and preferences, as well as station area household and demographic data, to help inform the development of TDM strategies and trip reduction analyses.

The first step involved discussing and finalizing the travel survey process with the Advisory Team, and assembling a Travel Survey Group consisting of citizen representatives from the area to be surveyed. After receiving the approval of the survey process, the Advisory Team drafted survey instruments for employee and resident surveys. The survey instrument (questions and layout) were discussed with Advisory Team and the Travel Survey Group and revised per suggestions made by both groups.

Upon receiving approval from the Advisory Team, the design of both hard copy and web-based surveys was completed. The online travel surveys included both employee and resident surveys which were tested and revised before being posted to the project website. Hard copy resident surveys were designed, printed and distributed to 3,700 households. This involved printing 7,400 hard copy resident surveys, each with an individual identification number, as well as sorting mailing addresses for the transit station area (approximately ½-mile radius from the station), affixing postage to the surveys, preparing a pre-paid return postage identifier and system, and sorting and delivering hard copy surveys to the US Postal Service for delivery. Due to the nature of
the survey mailing area (defined around USPS Zip+4 boundaries), 14% of survey respondent live outside of a ½-mile radius from the transit station.

The Advisory Team took additional measures to ensure the hard copy surveys were effectively distributed and completed. This involved following up with area Home Owner’s Association (HOA) groups to confirm deliveries, hand-delivering surveys to two locations where surveys were not initially received, and cross-referencing mailing addresses for consistency. It also involved coordinating with HOAs to distribute prepared emails and flyers for use in communicating with their members about the survey. Additional communication with HOAs was done in coordination with the Supervisor’s office to ensure maximum survey completion rates.

For the employee survey, three employers within ½-mile of a suburban Metrorail Station were identified and asked to assist in distributing information about the travel survey to their employees. Within ½-mile of the Vienna Metro Station, ICF Consulting (photo, left) is the only employer who was surveyed. In order to provide comparable results to that of ICF Consulting, employees from Serco and L3 Communications were selected to be surveyed due to their proximity to the Dunn-Loring/Merrifield Metro Station, which is also on the Orange Line and suburban in nature. The employee survey was conducted entirely online, with no hard copy surveys distributed.

**Survey Findings**

For the resident survey, the exact number of qualified respondents within these households is not known. However, the 2005 demographic data for the ½ mile radius Transit Station Area indicates that approximately 20% of the households within this area have only one person, while the remaining households consist of two or more. Assuming that most of the two-plus-resident households consist of two adults, the consulting team estimated the number of qualified respondents at approximately 6,600. The response rate for the resident survey was approximately 7%, with 482 residents responding. The response rate for the employee survey was 10%, with 148 employees responding.

Because these samples did not constitute random samples (nor were they intended to, as part of the survey design), it was not possible to compute precise confidence levels for the survey results. However, for the resident survey, the analysis of survey results compared demographic and travel pattern results against data from the 2005 Demographic Data (Claritas, 2005) and other published statistics as were available to
validate the responses from the survey. Demographic distributions for the survey sample very closely tracked the distributions for these other sources, suggesting the respondents were similar in primary characteristics to what would have been expected for the entire sample frame. Additionally, residents within the survey area are relatively homogenous in key demographic characteristics. With the survey respondent demographic profile consistent with the known 2005 demographic data, and the homogenous nature of the survey population, the survey results provided a high-level of value in understanding the travel patterns and attitudes/preferences.

Key findings of the **Resident Survey** included:

- Table 3 presents mode shares as a percentage of weekly commute to work trips. This table includes both the traditional types of transportation: drive alone, Metrorail/train, carpool/vanpool, bus, and bicycle/walk, and two additional categories – compressed work schedule day off and teleworking. These are not actually travel modes but are included to show the percentage of weekly work trips that were eliminated through use of these work schedule options.

- The mode distribution shown above is for all employed respondents. But the mode distribution was different for respondents who worked in different states. As shown in Table 4, 80% of respondents who worked in Virginia and 68% of respondents who worked in Maryland drove alone to work. By contrast, only nine percent of respondents who worked in the District of Columbia drove to work; 77% of these respondents chose Metrorail. About 1/3 of all respondents worked in Washington, DC.

- 40% work a flexible schedule – that is, they can choose their start and end times as long as they work a required number of hours in a day or week. TOD research has shown availability of a flexible work schedule as a key determinant of transit ridership (Lund, 2004).
- Of respondent who use Metrorail to go to work, a large majority (88%) walk to the station. Only about seven percent of respondents drive alone and park.
- Respondents traveled on average 13.1 miles and 35 minutes to work. The distance was less than the regional average of 16.5 miles one way, but the time was about the same as the 34 minute average for the region in 2004.
- Respondents generally have good access to transit at their work location: 52% work within 10 minutes walk of a Metrorail station and 60% work within 10 minutes of a bus stop.
- More than half (56%) have free parking at work. The remaining 44% pay a fee to park.
- About four in ten (44%) respondents said their employers offer discount transit passes or will reimburse part of their commute cost.
- Respondents who said they drive alone were most likely to have free parking at their worksites:
  - 84% of these respondents said they did not have to pay to park.
  - 13% of respondents who primarily use Metrorail to get to work had free parking available at their work location.
- About two-thirds of respondents who primarily used Metrorail said their employers offered financial incentives, other than for parking. But only about one-quarter (27%) of respondents who drove alone could receive a financial incentive.
- 78% of all respondents made one or more non-work trips in the two workdays preceding the survey. Most (67%) of these trips were made by driving alone. About 27% were made by driving or riding with someone (carpool).
- Demographics:
  - About half (48%) of the respondents said two people live in their household. About a third (36%) said they have three or more people in the household. The remaining 16% said they live alone.
  - Most (62%) of the respondents said they do not have any children under 16 in the household.
Fairfax County
Fairlee-MetroWest TDM Development Program

- About one-third (34%) of the respondents said they have one vehicle (car, truck, SUV, van, motorcycle) in their household. Most (64%) said they have two or more vehicles. Only two percent said they do not have any vehicles.
- About half (47%) of the respondents were between the ages of 25 and 44. About a third (38%) were between 45 and 64. One in ten (12%) was 65 or older.

Key findings of the **Employee Survey** included:

- Driving alone is the most popular commute transportation among respondents, with over more than three-fourths (76%) of respondents using this as the primary mode. The second most popular mode was Metrorail. About one in five (17%) respondents primarily used Metrorail to travel to work.
- Driving alone accounts for about 73% of weekly commute trips for these respondents and Metrorail accounts for about one in five (18%) weekly trips.
- A large proportion (76%) of respondents said they live in Virginia: 48% in Fairfax County and 28% in another Virginia County. About one in ten (10%) lived in the District of Columbia. The remaining 14% lived in Maryland.
- Respondents traveled on average 15.3 miles and 39 minutes to work.
- Nearly all (95%) respondents park on-site when they drive to work.
- About one-third (31%) said they park for free. The remaining 69% said they pay a fee to park, with an average fee of $13.00 per month.
- Most (88%) respondents said their employers offer discount transit passes or offer to reimburse part of their commuting expense. About two-thirds of these respondents (64%) said the employer offers between $31 and $60 per month. Another quarter (23%) said they can receive less than $31.

A complete summary of survey methodology, the survey instruments, and complete survey results are available in Appendix 1: Resident & Employee Survey Summary.

**Census Analysis**
The following information summarizes findings regarding commute mode choice and demographic data for the Vienna Transit Station Area, alongside data for Fairfax County as a whole. Commute mode split information is also included for the area within a 3-mile radius of the Vienna Metro station. All data is from the 2000 Census, including data from the Census Transportation Planning Package (CTPP), which includes 2000 Census Journey to Work data. All data pertains only to residents living within the defined geographies.

Key findings from the 2000 Census data analysis include:

- Transit mode share approximately three times higher within the Transit Station Area than the County as a whole. See summary chart below (Figure 1).
Higher individual income levels, across all modes, with the Transit Station Area. Particularly high income representation among Transit Station Area carpoolers. High-income representation for transit users:
  - 56.7% of Transit Station Area transit riders earn >$50,000 (47.8% County-wide).

Greater representation of residents aged 25-44 within the Transit Station Area, tracking across modes.

Race/ethnicity distribution distinct for carpooling only, in the Transit Station Area and County-wide. No significant race/ethnicity distinctions between the Transit Station Area and the County.

Greater male representation in the Transit Station Area than County-wide across all modes except transit riders.

Lower levels of vehicle ownership within the Transit Station Area, with the largest number of households owning 1 or fewer vehicles being transit riders (39.5% of transit riders with the Transit Station Area own <1 vehicle in their HH).

Residents with the Transit Station Area (65.4%) and specifically transit riders within the Transit Station Area (75.3%) live in households with no children under age 18.
The team also utilized 2000 Census data to assess origin-destination patterns for residents living within a one-mile radius of the Vienna Transit Station Area. The map below displays the density of work locations (the darker the shaded area, the more people that work in these locations). This mapping reveals an existing high concentration of people working in proximity to the existing Metrorail lines, with higher concentrations in Arlington County and Downtown D.C. Additional employment locations include other activity centers within Fairfax County, as well as others along the Metrorail lines into Maryland (such as Bethesda and Silver Spring). This data is consistent with the resident travel survey finding, where 52% of residents reported having access to Metrorail within 10 minutes walk from their work location (Appendix 1, Table 13).

**Figure 2: Work Locations for Transit Station Area Residents, 2000 Census**
Traffic Counts
The team completed manual and machine traffic counts to capture information about existing travel patterns and average vehicle occupancies within the Vienna Metro Station Area.

The Advisory Team identified 13 locations in the study area for machine and manual traffic counts and defined traffic count processes. These locations were reviewed with the Travel Survey Group, who also commented on the processes and helped obtain permission from HOAs for placement of machine counters.

Upon receiving permission from all affected HOAs, the team conducted field visits to finalize exact count positions. Machine counters were then placed at 13 locations for a 72-hour period at each location (Tuesday-Thursday). The raw data collected from the traffic count machines was then used to calculate hourly and daily average traffic volumes for each location.

In addition to collecting vehicle volumes with traffic counter machines, the team conducted manual/visual traffic counts at 13 locations during two, three-hour period for each location (AM and PM peaks). The raw data gathered from manual traffic counts (volumes, occupancy, turning movements) was used to calculate summaries and average vehicle occupancies (AVO).

The team obtained base maps to develop a map of all count locations as well as each specific location. The maps were then used as part of graphic summaries that visually displayed manual and machine counts, vehicle volumes, directions, and AVO for each of 13 locations. Full traffic count summaries are included in Appendix 2: Traffic Counts.

Preliminary data summaries and maps were presented to and reviewed by the Advisory Team, Travel Survey Group, and Open House attendees.

Comparing Traffic Counts to Trip Generation Forecasts
Utilizing the machine traffic count data collected throughout the Vienna Transit Station Area in late April 2005, UrbanTrans attempted to complete a comparison of trip generation forecasts for four station area subdivisions (using ITE/Fairfax County trip generation rates, along with tallies of the number of dwelling units and types of land uses in each existing subdivision) and the machine traffic counts for each of the subdivisions. (The counts for the Hunter's Branch area were not incorporated, since vehicle counts included trips generated from both the residential units and the adjacent office uses at the ICF building.) Sites assessed included:
Vienna Station  
Marquis / Acadia  
Virginia Center/Country Creek Townhouses  
Circle Woods

A direct, accurate comparison of the machine traffic counts and the ITE/Fairfax trip generation forecasts is not possible. This is because the machine traffic counters tallied vehicles at the entry/exit point of a development (referred to as measuring the vehicle trips of a “generator”), and the ITE/Fairfax trip generation rates refer to the vehicle trips forecast for the “adjacent street.” This distinction between “generator” and “adjacent street” numbers does not allow for direct, accurate one-to-one comparisons.

However, there are still several points of note which can be gleaned from this comparison. A closer look at subdivision locations (relative to the transit station), traffic directional flow data, and vehicle occupancy data reveals the following:

- **Off-peak, off-direction (i.e., entering a development in the AM peak period) travel appears to be notably higher that forecasts would suggest.** During the AM and PM peak hours, the traffic count volumes exhibit a relatively high degree of off-peak, off-direction travel, which is indicative of non-commute-to-work travel (travel to schools, retail/shopping travel, etc.). This finding suggests a correlation to the lower (relative to surrounding neighborhoods) commute to work SOV rates found through the resident travel survey (51% of all weekly commute trips by single-occupant vehicle) and the census analysis (66% of daily commutes by single-occupant vehicle). These findings suggest higher levels of alternative mode use for commute to work trips, and lower levels of alternative mode use (thus, higher trip generation) for non-commute to work trips. In fact, the resident survey found that two-thirds (67%) of the non-commute trips made between 6 am and 9 am were made by driving alone (see Appendix 1, Table 15). Taken together, these findings suggest that existing transit-adjacent subdivisions within the ½ mile transit station area are seeing high levels of transit use for commute trips, and high levels of automobile use for other trip purposes.

- **Subdivisions with closer proximity to the transit station produced relatively fewer trips than sites further from the transit station.**

- **Sites with better/safer pedestrian connectivity to the site produced fewer trips than sites with poor/less safe pedestrian connections.**

- **Some, yet not a large number, of vehicle trips may be attributed to residents driving to the Vienna Metro park-n-ride.** In a November 2004 Fairfax County analysis of the home location of cars parking at the Vienna/Fairfax-GMU park-n-rides, the County identified vehicles from both the Virginia Center/Country Creek Townhouses and Circle Woods subdivisions, indicating that some vehicle trip generation from these areas could be attributed to transit riders driving to Vienna Transit Station (though this cannot be confirmed utilizing the data available).
At the Circle Woods count location, an unusually high number of high-occupancy vehicles were observed traveling in the off-peak, off-directions (into the development in the AM peak, out of the development in the PM peak). 35% of vehicles entering the area between 6-9 a.m. had 2 or more passengers, equaling an average vehicle occupancy (AVO) of 1.71 people per car. The AVO at all other count locations in the Transit Station Area fell roughly between 1.1 and 1.3. This suggests a degree of non-typical trip generation may have occurred within this subdivision during the traffic count days.

Current TDM Programs

Identifying opportunities and barriers to successful TDM strategy implementation involved researching and summarizing current TDM programs offered by state, regional, and county TDM providers. The service providers identified include:

- Metropolitan Washington TDM Services
- Fairfax County TDM Employer, Commuter and Residential Outreach
- Fairfax County HOV Lanes
- Fairfax County Current Transit Services
- Fairfax County Park & Rides
- Fairfax County Vanpool Providers
- Fairfax County TDM Organizations
- Virginia Commonwealth-Wide TDM Services

These services were identified as the foundation of TDM programs upon which the MetroWest TDM program would build.

With this foundation laid, the team could proceed with a TDM Opportunities and Barriers Assessment. The assessment considered opportunities and barriers that are part of existing conditions within the Vienna Transit Station Area. Opportunities are best understood as elements which aid and facilitate successful TDM application and barriers can be considered as hurdles to the potential success of TDM measures, if not sufficiently addressed or mitigated with other strategies or recommendations.

The assessment identified six opportunities:

- Existing Mass Transit Network
- HOV Lanes on I-66
- Neighborhood Retail
- Existing Bicycle and Pedestrian Trail Networks & Infrastructure
• FlexCar Fleet at Vienna-Fairfax Metro Station

The assessment also identified four barriers:
• Infrequent headways and limited neighborhood penetration on local bus services
• HOV lanes on I-66 nearing capacity
• Metrorail Orange Line faces capacity limitations during peak periods
• Poor pedestrian/bicycle connectivity between Vienna Transit Station Area and surrounding neighborhoods and neighborhood retail.

The complete summary of existing TDM programs and services, as well the complete analysis of TDM opportunities and barriers is included in Appendix 4: Current TDM Programs, Opportunities, and Barriers.

**TOD Peer Review**

Analyzing what TDM strategies are successfully implemented at TOD sites included investigating “best practices” and lessons learned throughout the region and across the country. The team obtained and reviewed existing TDM and TOD literature sources and prepared a listing of relevant TDM and TOD resources for the project website. UrbanTrans complemented this research with site visits to TOD sites in Oregon, Seattle, and Minneapolis, and used the opportunity to talk with TOD planners at these sites.

The results of the research were a comparison of four national examples of communities and TODs, an examination of their level of transit service, TOD characteristics, mobility programs, and results:
• Pleasant Hill, Contra Costa County, CA (San Francisco)
• Redmond Ridge PUD, King County, WA
• Lloyd District, Portland, OR
• Metropolitan Place, Renton WA

The sites were selected based on multiple criteria:
• Location outside of traditional downtowns.
• Representation of a cross section of TOD attributes of success (see below), where not every peer example exhibited all of the attributes.
• Availability of data on travel patterns and reductions.
The peer comparison looked at both traditional TOD physical attributes of success, as well as TDM attributes of success. The literature review and the case studies reveal a cross-section of TOD “attributes of success” which formed a framework for understanding different TOD characteristics and their relationship to travel demand and trip reduction. The attributes of success framework outlined the following three primary areas of importance:

1. **High-Capacity Transit Service**: Essentially, the existence of strong transit service, typically through light rail or heavy rail transit, with connections to a large number of regional activity centers.

2. **Physical Attributes of Success**: These are the more traditional attributes used in assessing TODs (often called the “Three Ds”), covering the key physical design features of a TOD, including:
   - **Intensity of Uses**. This attribute refers to location of uses within walking distance of the station (typically within ¼ - ½ mile). “At higher densities, use of alternative modes — particularly transit and pedestrian travel — is higher. Per-capita passenger vehicle trips and VMT are lower” (Kuzmyak, 2003). One point of note from the research is that density is often closely related to other factors, such as diversity of uses (as more people can support more retail at a particular location), pedestrian-friendly design, and lower levels of vehicle ownership per household. Figure 3 below illustrates the relationship between daily person trips and density.

![Figure 3: Average daily person trips per person in the United States by mode and density, 1990 NPTS survey](image)

- **Diversity of Uses / Mix of Uses**. This attribute refers to the inclusion of an integrated mix of land uses, such as residential, retail, and employment uses. Diversity of uses is often connected to the intensity of uses, as
noted above, and the impact of mixed-use developments on trip reduction is also linked to pedestrian-friendly design factors. Providing a mix of uses can impact primary mode choice decisions, and can also facilitate bike/walk access to transit (at the origin and/or destination). In one research example, analysis of over 15,000 households in 11 metropolitan areas found that “both land use mix and residential densities are linked with mode choice decisions... The analysis revealed that close proximity of retail uses and residents was associated with non-automotive commuting in two ways — more walking and cycling for short trips and marginally greater transit travel” (Parsons Brinkerhoff, 1996, from Kuzmyak, 2003).

- **Site Design.** This attribute refers to the “pedestrian-friendly” or “transit-supportive” nature of the site design. Design is also linked to both intensity of use and mix of use, as it pertains to how these uses are linked together, and the degree to which design features - such as safe / appealing walking environments (i.e., sidewalks, crosswalks), short block lengths, and direct linkages between walkways and building entrances - support walking and bicycling. Research on the individual impact of these factors, sometimes referred to as pedestrian environmental factors (or PEFs), faces challenges isolating the direct relationship between individual design attributes and travel behavior. A study of two San Francisco East Bay neighborhoods found that transit and pedestrian friendly design features were linked to an increased likelihood of using a non-auto mode for non-work trips of about 10 percentage points (Parsons Brinkerhoff, et al, 1996, as presented in Kuzmyak, 2003). In another effort, the impact of PEFs on travel behavior were modeled for the Portland, OR, region. “These tests suggested that substituting a very pedestrian-friendly neighborhood for one with an average pedestrian environment should result in 10 percent less VMT per individual in an average household, holding everything else constant” (Kuzmyak, 2003).

3. **TDM Attributes of Success:** In addition to the physical attributes, additional programmatic and policy-related factors were added to the analysis of TOD success. These TDM attributes - the “Five Ps”™ - are too often overlooked in traditional assessments of TOD performance. They include the programs and services that can significantly impact travel behavior and vehicle trip generation:

- **Promotion and Marketing** (including individual travel planning). Refers to programs that market available transportation options, as well as educate users on how different options work. Individualized marketing programs (which provide one-on-one travel assistance) have been implemented in Australia, Europe, and the U.S., with SOV trip reductions in targeted communities of between 8 and 14 percent (FTA Press Release, April 2004).

- **Pricing / Incentives.** Pricing and incentives refer to the use of financial incentives and disincentives for different travel options, including subsidies for transit and vanpool fares, reward-based incentive programs, and variable pricing (e.g., pricing which varies by time of day, to encourage
non-peak utilization). A 2001 survey of employees nationwide found that employees who have commuter assistance programs (such as discounted transit passes) were nearly eight times more likely to use public transportation that those employees that did not have such assistance (15 percent versus 2 percent), (Zylo, 2001, from ACT, 2004).

- Parking Management. Parking management refers to the management of parking through supply, pricing, and/or time-based measures. Parking management can also include provision of parking incentives, such as reserved, preferential parking spaces for carpools and vanpools.

- Policies. Policies refer to the existence of an overarching policy framework supporting development and implementation of TDM measures. Such policy frameworks can range in scale from an individual employer (where policies such as flexible work hours or parking cash out programs can support the use of non-SOV travel options), or may relate to an entire region or state (such as the commute trip reduction law in the state of Washington). Figure 4, below, illustrates the impact of employer policies on the percentage of California TOD residents using transit.

![Figure 4: Influence of Employer Policies on Transit Commuting Among Station Area Residents](Lund, 2004)

- Program Management. Unlike the physical attributes, TDM programs require continual implementation. As such, “having someone in charge,” is an essential attribute of success. This can mean a dedicated program coordinator and/or an area transportation management association

Table 5 below demonstrates the degree to which each of the TOD Peer Review sites examined exhibit the various attributes of success, and the available results from each project.

○ = Exhibits high level of success factor
● = Exhibits some elements of success factor
○ = Exhibits few or no elements of success factor
While the table outlines the degree to which the case examples exhibit each of the attributes of success, it also, by implication, highlights the degree to which a majority of TOD examples nationwide fail to integrate both the physical attributes and the TDM attributes. This is a clear shortcoming of many TOD projects, highlighting that good design alone is not enough to achieve the highest possible levels of trip reduction. “If You Build It They Will Come” is not the formula for TOD projects delivering on their full potential for reducing vehicle trips.

Conversely, TDM programs nationally have experienced a wide range of implementation success and failure. More often that not, where TDM programs can fall short of expectations, one or more of the following types of elements are missing: available alternatives to the automobile, sustainable program funding, active program management (by a dedicated program manager or organization), or lack of programmatic support by key implementing institutions (i.e., employers).

The team also looked at 2000 Census Data, a publication on travel characteristics of TODs in California (Lund, 2004), and other sources to compare information on Gender, Age, Race/Ethnicity, Income, Vehicles per Household, Ratio of Drivers to Vehicles, and Primary Commute Mode of four different stations and their corresponding County or City census data. Those comparisons included:

- Vienna Transit Station Area (Metrorail) vs. Fairfax County
- Rosslyn-Ballston Corridor (Metrorail) vs. Arlington County
- San Francisco: Pleasant Hill (BART) vs. City of Walnut Creek
- San Francisco: South Alameda County (4 BART Stations) vs. the South Alameda Counties of Hayward, Union City, and Fremont

The summary of this comparison is in Table 6 on the following page.

All of the TOD peer research and comparison data is included in Appendix 5: TOD Peer Research.

Community Involvement

An integral part of the research and analysis processes was making sure that the community was involved every step up of the way. The Advisory Team ensured this occurred by meeting with and receiving input from a number of neighborhood groups in the study area. Those meetings were as follows:

Advisory Team Meetings: April 7, April 21, May 12, May 24, June 9, June 15, June 29
Travel Survey Group Meetings: April 18, May 25
Fairfax County Land Use Seminar: May 2, June 21
Collective HOA meeting: May 12
Town of Vienna Mayor & Council and Staff Meeting: May 19
Community Open House: June 1

The Advisory Team meetings were attended by residents of the neighborhoods affected by the proposed development, Fairfax County staff, Pulte employees, Fairfax County Elected Officials, and staff of the Coalition for Smarter Growth. The Advisory Team was an integral part of the decision making made about the direction of Fairlee-Metro West TDM project.

The Travel Survey Group consisted of members of several HOAs who are impacted by the proposed TOD project. In the first meeting with the Travel Survey Group they provided feedback on resident survey design and gave permission to complete traffic counts in their developments. In the second meeting with the group they provided feedback on the data collected from the resident survey and traffic counts. This group also helped promote the resident survey and Open House meeting to their HOA members by distributing emails and hard copies of a flyer designed by The Advisory Team.

The Fairfax County Land use seminar was a forum for residents to learn about how county land use decisions are made. One of the topics at the May 2 Seminar was the Fairlee Metro West TDM Development project process. The seminar, which had over 100 residents in attendance, had two breakout sessions where attendees could ask more specific questions about the TDM development project. The team presented a second time, as part of the land use seminar series, on June 21.

The Collective HOA meeting was an opportunity for several of the HOAs impacted by the proposed Vienna Metro TOD to learn about the TDM assessment process and make recommendations. The citizen groups in attendance included representatives from Blake Manor, Blake View, Country Creek, Vienna Station, Country Creek-Section 7, Circle Woods, Hunters Branch-Condos, L&M/Popular Terrace, Villa D'Este, Southwest Vienna Citizens Association, Dunn Loring Gardens, Hunter Mill Defense League, and Sierra Club.
A member of the Advisory Team met with the Town of Vienna Mayor, Council and Staff to explain the TDM assessment process and listen to their recommendations for the process.

The Fairlee-Metro West TDM Development Project Open House was held June 1, 2004 from 7:00 to 9:00 p.m. The meeting was held at the Marshall Road Elementary School located at 730 Marshall Road, Fairfax. Thirty one meeting participants signed in, not including staff or consultants. A sign in table was set up at the entrance to the open house and each meeting attendee was provided with a project overview handout and a general comment form.

Three stations, described below, were set up around the room:

- Station 1: Existing Conditions
- Station 2: Existing TDM Programs
- Station 3: TDM Opportunities & Barriers

In addition to comments received from the general comment forms, attendees were given the opportunity to post their concerns on the displays at the stations listed above.

The community was also encouraged to provide their input on the TDM Project, through Advisory Team’s project website (www.fairleemetrowest-tdm.com). The website had links to the survey and an online open house area for suggestions and comments. It included links for meetings and resources.

A full summary of all materials, meetings, and comments is included in Appendix 6: Community Involvement.
TDM Program Recommendations – “MetroWest Connections”

The following TDM program recommendations are for the proposed Fairlee / MetroWest project site. The recommendations are based on (1) the findings of the research and analysis conducted through this project and summarized in the previous sections (including surveys, traffic counts, Census analysis, TDM opportunities and barriers assessment, TOD peer research); (2) national research on travel behavior, TDM programs and program effectiveness, and national TOD experience; and (3) the direct professional experience of the project team in planning, implementing, and evaluating TDM programs nationally.

Recommended TDM strategies are organized around the following areas:

- Parking Management
- Physical Facilities
- TDM Programs & Services
- TDM Program Management
- TDM Funding Mechanisms (as noted, complete budgets pending)

Parking Management

1. For Apartment / Condo Residential Buildings:
   - Limit condo units to one parking space as a bundled asset sold with the purchase of each condo unit. For additional spaces, explore graduated market-rate pricing scale for purchase and/or leasing arrangements for access to spaces in excess of one per unit.
   - For rental apartment units, develop a graduated monthly parking fee scale for all dedicated parking spaces.
   - Provide dedicated, free preferential parking spaces in convenient locations (covered, near entry/exit locations, and close to elevators) for vanpools.

2. For Office Buildings:
   - “Unbundle” leasing and pricing for office space from leasing and pricing for parking spaces.
   - Provide for loading/unloading of carpools and vanpools.
   - Provide dedicated, preferential parking spaces in convenient locations (covered, near entry/exit locations, and close to elevators) for carpools and vanpools.
   - Develop parking rate agreements charging single-occupant vehicles market rate pricing, along with graduated parking discounts:
     - One-half market rate for carpools.
     - No parking charge for vanpools.
     - Develop carpool/vanpool verification and monitoring system linked to identification of employment with a tenant employer.

3. In General:
   - Develop a comprehensive parking management plan that documents the integration of parking management strategies across all site uses, coordinate
with Metro to assess need for measures to discourage use of Metro parking garages by MetroWest users, management of permitted uses in all locations, utilization of market rate pricing for all non-residential spaces, and disbursement of on-street parking meter revenues to the TDM program (additional detail provided in the Funding Mechanism section).

- Provide permanently designated, on-street parking spaces in central locations for:
  - Shared-car vehicles
  - Taxi vehicles
  - Loading / unloading of vanpools. Locate proximate to service-oriented retail locations.
- For all on-site garages (residential and office), ensure that 5% of all spaces provide sufficient clearance for vanpool vehicles (minimum 7’2” clearance).
- Provide parking management by time and price for all on-street spaces.

**Physical Facilities**

1. **Off-Site Pedestrian & Bicycle Connectivity.** Assessment, identification, and upgrades to off-site pedestrian and bicycle crosswalks at two locations (i.e., Blake Lane/Saintsbury Drive, Nutley Street/Lee Highway) to facilitate safe walking/biking between the Vienna Transit Station / MetroWest and surrounding communities, retail locations, and schools. Location and upgrade specifications (i.e., pavement treatments, pedestrian islands) developed under guidance from Virginia DOT.

2. **Retail Mix.** Developer/retail leasing team strongly encouraged to pursue the following retail uses on-site, and to prioritize the location of these uses in initial phasing of residential building construction:
   - Specialty, Small Grocer (e.g., Trader Joes)
   - Child Care (prioritize development of proposed childcare in early development phase)
   - Copy / Shipping Store (e.g., FedEx Kinkos, UPS Store)
   - Dry Cleaning
   - Banking / ATM Services
   - Café / Coffee Shop, Restaurants
   Market the availability of retail services, and the arrival of upcoming new retail tenants, to area residents and employees.

3. **On-Site Wireless Access.** Establish broadband wireless connectivity through the non-townhouse portion of the site.

4. **Bicycle Racks.** Provide sufficient, secure bicycle storage facilities for each condo/apartment building, and at retail locations. Locate racks in prominent locations. Utilize industry standard bike rack designs.

5. **Bike Station.** Integrate bike station into MetroWest Connections store (see Program Management recommendations below). The facility should provide indoor, valet-service parking for bicycles, bicycle support sales and maintenance, and should explore provision of free loaner bikes for project residents. Dedicate free retail
space for this use. Explore opportunities to bid out management of the bike station to interested retailers, using national best practices/experience.

6. **Shower Facilities.** Integrate shower and changing / locker room facilities into office uses.

**Programs & Services**

1. **For Residential Buildings:**
   - Develop target marketing program for new residential sales and apartment rental (programs and methods at developer discretion):
     - Integrate transportation benefit messaging into overall residential product messaging, including “one less car” messaging and education providing details on the benefits of households using TOD amenities and transit services to reduce the need for one household vehicle.
     - Integrate transportation choice information into sales kits.
     - Specifically target marketing of the residential units to (1) existing transit riders, (2) people working along Metrorail lines, particularly along the Orange/Blue lines (not transfer trips), and (3) to full-time teleworkers.
   - Integrate transportation information and education materials, specifically tailored to the site, into residential sales kits and new resident welcome kits.
   - Integrate “personalized transportation advising” into new unit walk-throughs as new residents (ownership and rental) move into new units. This concept involves one-on-discussions with new residents about utilizing transportation options for various trip types - tailored to this specific location. Transition responsibilities from residential sales teams to TDM program manager as project build-out approaches.
   - Distribute SmarTrip cards to all new residents (regardless of age).
   - Provide initial SmarTrip value loading to all residents 16 years or older. To be eligible, residents must participate in a one-on-one transportation advising session and/or visit the MetroWest Connections Store. Explore bundled shared-car membership linkages as part of this process.
   - Pursue on-going SmarTrip value loading as part of specific marketing and reward campaigns.
   - Develop marketing and incentive programs that encourage off-peak vehicle travel, specifically for non-commute trip types (which are often more discretionary). Tailor programs for the age-restricted units encouraging non-peak travel.
   - Develop residential-based vanpool program. Explore use of minivans. Provide vanpool subsidies to make minivan vanpool cost-competitive with full-sized vans offered regionally.

2. **For Office Buildings:**
   - During the leasing phase, and after occupancy, strongly encourage employers to offer the following employee benefits options:
Parking cash out (giving employees the option to choose between the value of a dedicated parking space, tax-free transit or vanpool fares, or taxable cash).

Pre-tax and/or payroll subsidy for transit and vanpool fares (up to the maximum amount allowed under federal law, currently $105/month).

Flex-time and alternative work schedule programs.

Live-near-work incentives.

- Conduct carpool and vanpool formation programs and information programs on site, including providing ridematching services. Coordinate with Fairfax County TDM program managers.
- Communicate and facilitate availability of guaranteed ride home program (offered by the regional Commuter Connections program).

3. In General:

- Safe Routes to Schools. Develop programs to encourage carpooling, walking, and biking to schools, including:
  - “SchoolPool” programs which connect parents with children attending the same schools and assist in coordination of SchoolPool scheduling.
  - Promotion of carpooling, biking, and walking among high school students attending Oakton High School, including education and reward incentives.
  - “Walking School Bus” programs which coordinate parent/child meetings at a central location (on-site retail location, for example), with two parents leading groups of children by bike/walk to school locations (targeted to elementary age students attending Mosby Woods or Marshall Road schools). Coordination of daily/weekly parent responsibility.
  - See “Physical Facilities” for additional recommendations on school routes.

- Shared-Car Programs. Integrate information and marketing materials on shared-car availability and pricing. Work with shared-car providers (e.g., FlexCar, ZipCar) to provide discounted shared-car memberships to interested residents linked to provision of Metro SmarTrip cards. Incorporate shared-car rewards (free hours) into overall rewards program.

4. MetroWest Connections Online. Develop site-specific project website replicating the MetroWest Connections storefront online (either a stand-alone site or as a direct link off of a larger project webpage for residents/employees). Integrate:

- Multimodal transportation information.
- Real-time travel and transit data (i.e., Metrorail train arrival info).
- Explore online transit pass sales and/or SmarTrip value loading (consider options utilizing existing software tools/vendors, e.g., WageWorks, CommuterDirect).
- Provide specific links and resources supporting telework.
Program Management

1. **MetroWest Connections Store.** Provide on-site retail storefront site for TDM program manager. Co-locate with residential sales office during construction phases. Provide information, promotional materials, and one-on-one consultation to all on-site users, for all trip types.

2. **Program Manager.** Designate TDM program manager as central point of contact and lead manager of all on-site programs.

3. **Program Oversight & Coordination.** Establish an Advisory Board to guide the TDM program and activities of the TDM Program Manager. Assemble the Advisory Board as needed (likely quarterly). Participants for the Advisory Board, and for overall program coordination, should include the following designated contacts:
   - Office tenant contacts and/or office property manager contacts.
   - Individual and umbrella HOA “transportation” contacts (invite each HOA to designate a transportation liaison).
   - Fairfax County TDM Program Representative. Ensure maximum coordination and economies of scale by partnering closely with Fairfax County TDM program managers, while maintaining the site-specific, tailored nature of MetroWest information and materials.
   - Others as appropriate.

4. **Residential Sales Team / Rental Leasing Agents.** Provide sufficient training for sales and leasing teams to serve as extensions of the TDM program management staff. Integrate transportation and commute considerations into sales messages and establish up-front linkages and relationships for future transportation assistance and resources.

Funding Mechanisms

1. **From Residential Buildings:**
   - Utilize Condo/Townhouse HOA fees to provide on-going, sustainable funding for the MetroWest Mobility Program. “Unbundle” monthly unit-based condo association fees from monthly parking space user fees. Graduate parking space user fees based on number of spaces linked to a unit.
   - Develop comparable per-space fees for rental apartment units. Incorporate per-space fees into rental leasing agreements.

2. **From Office Buildings:**
   - Utilize Common Area Maintenance (CAM) fees to fund the TDM program. CAM fees dedicated to providing monthly transit subsidies for all registered tenant employees, and to providing on-going, sustainable funding for the MetroWest Mobility Program.

3. **From On-Street Parking.** Dedicate on-street parking meter revenues to fund the TDM program. Maintain parking meter pricing and revenue dedication in perpetuity.
Trip Reduction Analysis
In an effort to assess the trip reduction potential of the proposed MetroWest project, with the addition of the recommended TDM strategies outlined in the previous section, UrbanTrans conducted extensive research on trip generation modification methodology. This research led us to a 5-step analysis and validation process:

1. Establish trip generation rates.
2. Identify if any trips are inter or intra-related to the site’s land uses.
3. Identify TOD and TDM attributes and programs and their forecast changes to residential land use trip generation.
4. Identify TOD and TDM attributes and programs and their forecast changes to office land use trip generation.
5. Validate against a modeling tool (possible only for office uses)

The following information summarizes the results of the trip reduction analysis. Appendix 7 includes the detailed trip reduction calculations. The sections below directly reference the tables in Appendix 7.

Step 1 confirmed the following Trip Generation Baseline and Target Trip Reductions (from Table 1: Trip Generation Baseline Summary, page 3):

<table>
<thead>
<tr>
<th>Land Use</th>

</tr>
<tr>
<td>Office</td>
<td>300,000 sq. ft.</td>
<td>452</td>
<td>113</td>
<td>339</td>
</tr>
</tbody>
</table>

Step 2 identified factors that would result in fewer trips as a result primarily of the physical design of the site (the TOD Physical Attributes of Success). This planning concept is further supported by the Institute of Transportation Engineers (ITE) in their recommendations regarding mixed-use developments and pass-by trips, diverted linked trips and as internal capture rate. These ITE-identified trip reduction opportunities included as part of the physical design of the site included:

- Age-Restricted Units. Different use of residential units types that will be regulated by agreement: 368 units of 55+ age-restricted condo residences. The use of ITE trip generation rates for this land use type (which is lower than for the standard condo residences included in the baseline calculations) led to a reduction of 4.4% of trips from the residential baseline. See Appendix 7, Table 2.1.
- Internal Capture Rate. Internal capture rate refers to trips “captured” entirely within the development itself (e.g., traveling from a condo to the on-site grocery,
and back home again, all within the site). With the provision of the proper mix of retail uses (as recommended in the TDM recommendations), ITE guidance suggests that as many as one in four daily trips can be associated with internal capture, due to the mixed-use nature of the site and the pedestrian-friendly design elements. Quantifying the peak-hour trip reduction associated with this factor, specific percent reductions were used for residential and office uses, leading to a reduction of 2% of trips from the office baseline and a 10.3% reduction in trips from the residential baseline, due to the availability of resources such as grocer, restaurant, convenience retail/service, banking, recreation/exercise, mail/copy services. Specific rates were developed through research results (Cervero 2004; Edwards 2003; Hedges 2005; ITE 2004; Nelson, Niles 2000; USDOT nd) and blended with professional judgment per accepted ITE practice. See Appendix 7, Table 2.2.

- External Linked Trips. External linked trips are part of what is often described as “trip-chaining,” or linking multiple trip purposes in one journey (e.g., traveling from a condo to the onsite day care facility, dropping off a child, and then continuing onto to work at an offsite location). Where one portion of the total linked trip is completed within the boundaries of the project site, a trip that would have otherwise left the site is therefore reduced. ITE guidance distinguishes these trips from simple internal capture rates. The analysis looked at both trips linked from the residential / office uses onsite to external destinations, and at trips linked from external destinations to the onsite residential / office uses, and different trip reduction factors were used for each. These factors led to vehicle trip reductions of 3.5% of trips from the office baseline and a 9.4% reduction in trips from the residential baseline. Specific rates were developed through research results (Cervero 2004; Edwards 2003; Hedges 2005; ITE 2004; Nelson, Niles 2000; USDOT nd) and blended with professional judgment per accepted ITE practice. See Appendix 7, Table 2.3.

In each element of the trip reduction analysis related to the physical characteristics of the site, the analysis approach utilized percent reductions at the conservative end of the ranges established in the research on the impact of these factors. It is important to note that internal capture and external linked trips are both directly supported by the intensity of uses proposed within close proximity of the retail, the mix of uses onsite (retail, services), as well as the TDM programs (such as parking management). Furthermore, these factors are also influenced by the number of vehicles owned per household, where lower average vehicle ownership levels are associated with higher internal capture rates and external linked trips. As the 2000 Census analysis of the Vienna Transit Station Area (supplemented by the research of residents of TODs in California) suggests, and the proposed TDM program supports, residents of the site are projected to own fewer vehicles per household.

Lastly, it is important to note that the relationship between all of these factors is wholly inclusive of the development. This means that to achieve the full trip generation
reductions, the site must be developed with all of its components and characteristics, from the mix of uses and pedestrian-oriented design to the TDM program.

**Steps 3 and 4** in the process were to identify the trip reductions related to further specifics of the TOD, such as availability of transit and, moreover, reductions affiliated with the TDM attributes of success. While the specific program details and delivery have minor differences between residential and office application, the general categories produce results that have some comparative relationships.

Using national research, supplemented by the research conducted for this project, suggested ranges of reductions even greater than identified below. In all cases, however, the analysis opted for the most conservative approach in order to not overstate planned trip reductions and to factor out the potential for interrelationships between these factors (avoiding double counting of trip reductions). Furthermore, potential trips by carpool were identified and minimized by an occupancy of 2.25 people per vehicle (not providing for a 1 reduced trip to 1 person ratio).

The trip reduction factors analyzed for the residential (Step 3) and office (Step 4) uses included (see Appendix 7, Tables 3.1 and 4.1):

1. Transit Proximity/Accessibility: Associated with the availability of high-capacity transit service, the orientation of uses with within walking distance of transit, and existence of pedestrian-friendly design characteristics. These factors led to vehicle trip reductions of 10% of trips from the office baseline and a 10.1% reduction in trips from the residential baseline. The transit proximity/accessibility represents trip reductions tied to transit use above and beyond the reductions partly associated with transit use described below (onsite TDM programs and active parking management), which also lead to enhanced transit ridership. The range of reductions was developed by combining and interpreting research (Cervero et al 2004; Chrisholm 2002; ITE 2004; Kuzmyak et al 2003) followed by a use of professional judgment to identify specific factors.

2. On-Site Transportation Programs: On-site TDM programs and services summarized in the TDM program recommendations. These factors led to vehicle trip reductions of 4% of trips from the office baseline and a 3.9% reduction in trips from the residential baseline. The range of reductions was developed by combining and interpreting research (Cervero et al 2004; Chrisholm 2002; Kuzmyak et al 2003; US DOT nd) with professional experience followed by a use of professional judgment to identify specific factors.

3. Active Parking Management: Parking pricing and time management for residential, office, and on-street uses. These factors led to vehicle trip reductions of 8.4% of trips from the office baseline and an 8.5% reduction in trips from the residential baseline. The range of reductions was developed by combining and interpreting research (Kuzmyak et al 2003; US DOT nd; Vaca et al
2003) with professional experience followed by a use of professional judgment to identify specific factors.

4. **Residence-to-Office:** Commute to work trips captured within the site by people working and living on site. Assessing this factor required taking a look at the likely demographics and household characteristics for the project (see Appendix 7, Table 3.2 and 3.3). 5% of population is assumed to both live and work on site. This population is likely to emerge primarily from office employees working onsite and then deciding to live onsite as well. The natural turnover of both rental and ownership units onsite will allow for this element to emerge over time. The 5% of people both living and working onsite equates to vehicle trip reductions of 6% of trips from the office baseline and a 4.1% reduction in trips from the residential baseline. The range of reductions was developed by combining and interpreting research (Cervero et al 2004; Chrisholm 2002; Kuzmyak et al 2003; US DOT nd; Vaca et al 2003) followed by a use of professional judgment to identify specific factors.

What is significant about these findings, which were substantiated by various Transportation Research Board (TRB) documents and studies, was that with the planned, focused attention to these TDM Attributes of Success, more than 240 residential and 128 office trips, as shown on the Trip Generation Adjustment Summary Table (Table 7 below), can be re-distributed via other travel modes, to other travel times of the day, or eliminated altogether (as with telework).

In **Step 5**, one of the few models that exists relative to travel choice programs was loaded with site data to assess before and after situations related to programmatic elements, and to test and validate the overall methodology used in this trip reduction analysis. The intent was to determine if the methodology used in this effort could be validated by use of a wholly separate model. This model, developed by the Center for Urban Transportation Research (CUTR), is focused on work trips and modeling the impacts of workplace programs designed to reduce trips. This model is a neural network model based on approximately 7,000 real-world programs, and has been field tested by the developers with a higher success rate than previous regression models.

After site data is loaded and potential programmatic elements are input, the number of trips per 100 employees is calculated. See Appendix 7, Tables 5.1 and 5.2.

Through this validation process, the office trip reduction forecast from the methodology used for this effort and the modeled trip reduction from the CUTR model were within 3%. Based on this model validation process, 3% of trips were added back into the calculations for the office uses. This comparison served as a useful validation that the trip reduction analysis used for this effort was accurately reflecting likely travel behavior changes, and not reflecting double counting of reductions or other potential concerns.

Table 7 below summarizes all elements of the trip reduction analysis.

Monitoring and Evaluation

As identified by the Board of Supervisors in the December 2004 Board Motion, “The TDM program will be evaluated initially in at least three stages during the development process; first at the time of rezoning, second before and during construction and third after project completion or ‘build out.’”

Rigorous monitoring and evaluation are absolutely critical to this proposed TDM development program. To ensure credibility and performance, the monitoring and evaluation program must assess whether the development and implemented TDM measures are, in fact, meeting the forecast peak-period vehicle trip reduction targets.

The process below is recommended for implementation during the final two phases identified by the Board Motion.

1. During the construction period
2. One year after project completion or “build out”

The peak-period vehicle trip reduction targets are the baseline of this measurement process, and as such, the following methodology outlines a vehicle-based measurement system. The vehicle-based measurement system should be supplemented by onsite, online surveys of residents and employees, with a goal only to continue to refine and improve TDM program and service offerings.

**Phase 1 – During Construction**
Phase one monitoring and evaluation should be implemented at such time as buildings representing 55% of total planned residential dwelling units are certified for occupancy. The following phase one monitoring plan assumes that a proportionate amount of planned retail uses have also be constructed and occupied, but assumes offices uses have not been constructed.

Monitoring systems could include:

- **Cordon machine traffic counts.** Conduct machine traffic counts at the adjacent streets to all vehicle entry/exit locations providing access to/from the site as a whole at the time of measurement. Calibrate the cordon machines to pick up vehicle size in order to take into account construction vehicles entering and exiting the site. Conduct counts over a one-week period, collecting vehicle count data at 15-minute intervals for the entire week and supplement that data with peak hour turning counts.

- **Residential machine counts.** Conduct machine traffic counts at all completed condo/apartment building parking garage entry/exit location during the same period as the cordon counts.

- **Manual retail and residential counters.** Position individuals at retail parking locations, during three weekday AM and PM peak periods (Tuesday-Thursday) to
identify vehicles accessing retail service locations that are not MetroWest residents or employees. Depending on parking management systems in place, a method for identifying MetroWest residents and employees is needed (i.e., vehicle parking permit stickers). Alternatively, at garage entrances providing retail parking, visual or verbal assessments of residency can be conducted. This system should be used to determine the percentage of all non-resident vehicles accessing the site for retail purposes.

In order to assess peak-period vehicle trip generation for the project at this phase, cordon machine traffic counts should be averaged for weekday and weekend trips, and a single peak hour identified. The peak-hour identified should represent the four consecutive 15-minute increments which, when totaled, represent the highest volume of vehicles. The percentage of trips associated with non-resident travel should be subtracted from this total to isolate the total trip generation of all collected residential uses on site.

**Phase 1A - During Construction**

If Phase One monitoring indicates that trip reduction performance is not on track, then an additional phase of monitoring and evaluation is recommended. Determination that Phase 1A is needed should occur within 30 days of the final assessment (from Phase 1) that trip reduction is not on track. This additional phase requires a preliminary assessment of TDM measures already in place and evaluation of what is working (based on phase one survey results and traffic count / travel pattern analysis).

Assessment and evaluation systems should include:

- **Residential Travel Survey Analysis.** Identify which current TDM Measures are best received and utilized by residents of the development and explore which measures that have not been implemented have the greatest potential to be used.
- **Strategy Development.** Focus more attention on aggressively implementing the TDM measures that will be most effective and yield the best results.
- **Implement Additional/More Aggressive TDM Measures.** Timely implementation (within 90 days of phase one determination) is critical to ensure that TDM measures can take effect and yield behavior change before time of subsequent monitoring and evaluation.

Upon completion of the preliminary assessment of existing TDM measures, strategic planning for what additional measures need to be taken, and implementation of those additional measures, conduct a supplemental monitoring and evaluation phase to again assess performance between the initial monitoring phase and full build out. Phase 1A monitoring and evaluation should be implemented at such time as buildings representing 75% of total planned residential dwelling units are certified for occupancy.
Implement the same monitoring program outlined for phase one. However, supplement the monitoring program with delineations to enable specific assessment of travel behavior changes for the new residential buildings constructed following phase one. Compare survey results for residents that moved to the site following the phase one monitoring.

**Phase 2 - One Year After Build Out**

Phase two monitoring and evaluation should be implemented one year after all planned residential and office buildings are certified for occupancy. The following monitoring plan assumes that all planned retail uses have also be constructed and occupied.

Monitoring systems should include:
- All elements included in phase one.
- Machine counts at office uses. Mirror the cordon machine count process (in terms of count times and increments) by locating vehicle count devices at all entry/exit locations for garages serving office buildings.

In order to assess peak-period vehicle trip generation for the residential portion of the project at this phase, cordon machine traffic counts should be averaged for weekday and weekend trips, and a single peak hour identified. The peak-hour identified should represent the four consecutive 15-minute increments which, when totaled, represent the highest volume of vehicles. The percentage of trips associated with non-resident retail travel should be subtracted from this total. Additionally, the counts from the office locations should be subtracted from the total to isolate the total trip generation of all collected residential uses on site.

In order to assess peak-period vehicle trip generation for the office portion of the project at this phase, office entry/exit machine traffic counts should be averaged for weekday and weekend trips, and a single peak hour identified. The peak-hour identified should represent the four consecutive 15-minute increments which, when totaled, represent the highest volume of vehicles.

**Additional Evaluation**

Supplementing the vehicle-based monitoring of vehicle trip generation at each of the monitoring phases, an online survey of residents and employees (when relevant) should be conducted. The purpose of the survey should not be connected to the measurement of vehicle trip generation relative to the established baseline. The purpose of the survey should be to better understand:
- Transportation attitudes and preferences.
- Interest in, effectiveness of, and potential improvements to existing TDM programs and services on site.
- Travel and trip-making patterns, for the purpose of targeting future TDM programs.
- Demographics and household characteristics of residents and employees.
Oversight and Responsibilities
Fairfax County Department of Transportation should lead the monitoring and evaluation processes at each of the two phases, utilizing outside contractors as needed. Funding for these activities should be provided by the project developer, utilizing a separate escrow account to fund outside contractors managed by Fairfax County, as appropriate. Monitoring and evaluation efforts should be closely coordinated with the MetroWest TDM Program Coordinator.

Results of each monitoring and evaluation phase should be reported to the Board of Supervisors and be available publicly.

Phase One Trip Reduction Targets
The vehicle trip reduction analysis summarized in a previous section identifies forecast trip reductions upon full build out of all elements of the proposed development. In order to assess progress toward the ultimate build-out trip reduction targets, the Phase One monitoring and evaluation process should determine if the site is “on track” midway through the phased development process.

The table below summarizes potential phasing of the project, in two phases, utilizing initial phasing concepts provided by the project developer (actual phasing will be dependent on market conditions and absorption). The table utilizes the same trip generation rates used in the baseline computations.

Based on the peak-period vehicle trip generation summarized above, each of the trip reduction factors discussed in the prior Trip Reduction Analysis section, UrbanTrans assessed each of the TOD and TDM attributes (i.e., inclusion of age-restricted units, internal capture rate, etc.) in light of the amount of development planned in an initial phase (where phase one is selected as representing about 55% of the residential dwelling units – just past the half-way point in the development of the full project). For
each of the attributes, the team determined a forecast “percent of the total trip reduction” impact that could be expected given that the full project was not yet complete at the end of Phase 1. These forecasts are based on professional judgment of the interaction of each attribute with the presence/absence of different land uses and site design characteristics. As such, the forecasts for Phase 1 are expressed as ranges.

Phase 1 assumes approximately 55% of residential units are certified for occupancy, that no office uses have been completed, and that approximately 50% of planned retail square footage is available. For Phase 1, the forecast target range for measured peak-period vehicle trip reduction is between 22-29% for residential uses (compared the build-out target of 47% reduction, and measured against the trip generation baseline for Phase 1 of 570 peak-period vehicles). This is associated with the incomplete development of all retail space, the lack of office uses on site, and the incomplete nature of the development generally. Details of the assumptions regarding each attribute is shown in the table below.

The ranges presented are linked to the following concepts relating to the sensitivity of various trip-reduction areas to build out levels:

- **Age-Restricted:** Based on straight linkages to percent of units built.
- **Internal Capture and Linked Trips:** Reductions particularly sensitive to the availability of retail, as well as the diversity of retail available. The less retail on site, the more trips that will need to go external to the site, or not link to site uses.
- **Transit Proximity:** Sensitive primarily to the availability of pedestrian connections, and the quality of experience associated with the pedestrian link.
- **On Site Transportation Programs:** Programs are targeted directly to individuals, and thus have independent results. However, some programs may not come on line or be as fully developed prior to build-out (e.g., bike station).
- **Active Parking Management:** The majority of programs are targeted to individuals, though small scale impacts could be associated with more vehicles competing for on-street parking spaces at full build-out.
- **Residence to Office:** Direct connection to presence of office uses.
In general, this analysis again highlights the importance of the mixed-use nature of the project. As noted previously, the Trip Reduction Analysis assumes all elements of the proposed project are completed as planned, and that all elements of the TDM program are implemented.

Supplemental TDM Program Concepts
Following the monitoring and evaluation process conducted in Phase 1, if measured peak-period vehicle trips are not within the forecast 22-29% reduction range, or are at the low end of this range (measured against the baseline peak-period vehicle trips forecast for this initial phase), supplemental TDM programs must be implemented to ensure improved performance of the project through the remaining phases of construction and, notably, by the next Phase 1A monitoring and evaluation phase.

The supplemental TDM concepts provided below introduce sample additional demand management measures, as well as dedication of additional funding to strategies highlighted in the previous section on TDM Program Recommendations. Importantly, the resident survey conducted in Phase 1 should be utilized to inform development of supplemental TDM programs, in order to better tailor programs to fit stated preferences within the survey and build on what is working.

Supplemental TDM programs concepts include:

1. **Additional funding for transit pass subsidies.** Core strategies included initial addition of value to resident SmarTrip cards to establish transit use patterns initially following occupancy, and on-going addition of value to cards as part of marketing and promotion campaigns. This step would transition transit subsidies onto a more permanent schedule (addition of a transit card value on a monthly or quarterly basis, for registered residents visiting the Connections Store).

2. **Enhanced telework target marketing and home office subsidy program.** Utilize more aggressive target marking for residential sales/rental to full-time and part-time teleworkers by offering home office set-up incentives (i.e., computers, telecommunications equipment, and broadband internet access) and free telework support and training upon move-in.

3. **Off-peak travel incentives.** Fund reward-based incentive programs (prizes, SmarTrip value) encouraging off-peak travel for non-commute trips. Explore implementation options to reward residents for shifting discretionary travel off-peak. Focus on incentives targeted to 55+ residential condos.

4. **On-site concierge and courier services.** Fund free/discounted concierge and courier services, staffed out of the Connections Store, to eliminate off-site retail/service trips.

5. **MetroWest fleet vehicles.** Work with shared-car companies to establish a “fleet car” system for project residents. This idea builds on the shared-car recommendations by ensuring availability of a dedicated number of shared-car vehicles on-site, and providing a specified number of free shared-car hours for all
residents. Market this amenity to potential residents, linked to previously recommend “one less car” marketing.

6. Additional part-time TDM Program staff. Dedicate .5 FTE additional TDM Program staff member through one-year following project build out. Focus staff member resources on “personalized transportation advising” to expand availability of this service. Dedicate additional funding to provide incentives for residents to meet with program staff members.

**Long-Term Program Monitoring & Enforcement**

The TDM program is intended to be a core component of the development site in perpetuity. As a result, the following long-term monitoring and enforcement structures should be considered:

- **Long-term Monitoring.** In the period following the Phase 2 monitoring and measurement program, the MetroWest Connections TDM Program Manager should submit biennial reports to the Fairfax County DOT and TDM Program Manager. Reports could include:
  - Results of an online survey of residents and employees assessing travel patterns, mode splits, and attitudes and preferences regarding current and potential TDM programs.
  - Budget summaries of TDM program revenues and expenditures.
  - A TDM Program Workplan, with budgets, for the upcoming two year period.
  - Traffic counts.
  - Certification that all elements of the development agreement related to the TDM program remain in place.

- **Long-term enforcement.** Following project build-out, as described in the funding mechanisms portion of the TDM strategy recommendations, residential HOAs fees and office CAM fees will provide the sustainable, long-term funding required to maintain the MetroWest Connections TDM program activities and staffing. Upon submittal of the biennial report, Fairfax County DOT should determine continued compliance with the core elements of the TDM related proffers (including TDM funding mechanisms and program staffing). A finding of non-compliance would render the area in violation of the site’s zoning code (to be determined through the rezoning process), subject to standard County zoning enforcement processes.
TDM Program Staffing & Budget
At the point of full project build-out, a full-time TDM Program Manager is recommended for implementation of the TDM Program. National experience suggests a TDM program coordinator spend a minimum of one hour per week for every 200 people (employees or residents). Using employee per square foot and residential occupancy estimates equates to approximately 5,100 driving-age residents and employees, which translates into about 25 hours per week for a TDM Program Manager. Given the aggressive nature of the proposed TDM plan and the importance of achieving the project's trip reduction targets, a full-time staff person (40 hours per week) is recommended at full build-out.

During the initial phases of project marketing and sales, an employee (likely a member of the project sales staff) should be designated at .25 FTE as the TDM Program Manager. During this phase, the TDM Program Manager will work to refine TDM programs, develop initial marketing approaches and materials, and detail a multi-year TDM Business Plan. Upon issuance of the first residential certificate of occupancy, the TDM Program Manager should shift to .5 FTE hour commitment.

By the completion of Phase 1, as outlined in previous sections, the TDM Program Coordinator should shift to .75 FTE hour commitment.

By project build-out, the TDM Program Coordinator should be at 1 FTE.

Budget
Annual budgets for the recommended TDM program, in the four phases referenced above relative to staffing levels, are provided in the table below. Forecast expenses and revenue streams are detailed on an annual basis. The following concepts and assumptions are part of the proposed budget:

- Expenses for physical facility recommendations are assumed to be covered as part of overall development costs, and are not reflected in this budget.
- Assessments between residential and office uses are determined based on the percentage of overall project trips reduced by the proposed TDM program (75% of trips reduced are from residential uses, 25% from office uses).
- Program revenues from residential uses, outside of initial developer contributions, are derived from parking space user fees. User fees tied to TDM program funding should be assessed on a per-space basis, with each additional spaces (if any) assessed higher rates on a graduated scale. Individual HOAs should be responsible for a pro-rata share of TDM program funding and given flexibility, as needed, to manage HOA revenues and expenses as needed.
- Revenues from on-street parking meters are not included in this budget, but should also be dedicated to the TDM program to fund additional TDM programs and services (i.e., higher levels of incentives and subsidies).
- Retail space rent for the storefront / bike station is not assumed in the overhead calculations below.
- “Incentives / Subsidies” expenses are intended to cover a broad array of programs, from transit pass and shared-car incentives to vanpool subsidies.

Conclusions
The research and analysis elements of the Fairlee/MetroWest TDM Development Program indicate that the trip reduction targets for the proposed project (peak-hour vehicle trip reductions of 47% for the residential uses and 25% reductions for the office uses) can be achieved through a combination of the physical design characteristics of the site, as proposed, and the full application of the TDM programs and strategies recommended in this document.

The trip reductions, however, remain aggressive targets. The development of the TDM program recommendations and the trip reduction analysis conducted for this effort considered the project as a whole, with the full level of development planned; the mix and quantity of residential, office, and retail uses proposed; and the pedestrian-friendly design of the site as planned. All of the design elements of the proposed project, along with the recommended TDM strategies (programs and budget levels), must work collectively to achieve the trip reduction targets. With all elements in place, however, trip reductions should prove sustainable.

Glossary
The following terms and definitions are provided for reference:

Access - The ability to enter or approach a facility or to make use of a facility.

Accessibility - Measure of the ability or ease of individuals to travel among all origins and destinations in an area.

Access Mode - Mode or type of transportation used to reach the major mode of transportation used to reach a destination. Walking, bicycling, or driving to a park-and-ride lot are all examples of access modes.

Advanced Traveler Information Systems (ATIS) - A categorization of intelligent transportation systems (ITS) and other advanced technologies to provide real-time traffic, transit, weather, and other information to commuters, commercial operators, and travelers. Technologies and approaches include in-vehicle systems, changeable message signs, and computers in the home and office.

Alignment - The horizontal and vertical ground plan of a roadway, HOV lane, transit route, rail system or other transportation facility as it appears in plan and profile.

Alternative Transportation - Modes of transportation other than the single-passenger motor vehicle, including but not limited to carpools, vanpools, buspools, public transit, walking, and bicycling.

Alternative Work Schedule - Work policies and programs such as flexible and staggered work hours, variable work hours, flextime, and compressed work weeks that allow employees to avoid commuting during the most congested or peak travel periods in the morning and afternoon.

Arterial Street or Roadway - A major thoroughfare serving higher speed through trips, with limited access to adjacent property.

Average Daily Traffic (ADT) - The average number of vehicle trips generated during a 24-hour period from a specific site or area. This term also applies to traffic volumes on a roadway over a 24-hour period.

Average Vehicle Occupancy (AVO) - The total number of persons in all vehicles divided by the number of vehicles traveling past a selected point during a predetermined time period. AVO is usually expressed to two or three significant decimal places, such as 1.2 or 1.26.

Average Vehicle Ridership (AVR) - The average number of employees who report to a work site divided by the average number of vehicles driven by these employees, calculated for an established time period. This calculation recognizes vehicle trip reductions from telecommuting, compressed work weeks, and non-motorized transportation.
Barrier-Separated HOV Facility - An HOV lane that is physically separated from the adjoining general-purpose lanes by some type of barrier. A concrete barrier is the most commonly used approach, but wide buffers, movable barriers, and pylons may be used. A barrier-separated HOV lane may be a one direction/reversible facility or a two lane bi-directional facility.

Bicycle Lane or Bike Lane - A portion of a roadway reserved for preferential or exclusive use by bicycles through striping, signing, and pavement markings.

Bicycle Path or Bike Path - A path or trail reserved for exclusive use by bicycles and physically separated from motorized vehicle traffic by an open space or barrier. A bicycle path may be in a separate right-of-way, such as the use of an abandoned railroad line, or in a roadway right-of-way. Bicycle paths or trails may also be open to other user groups such as walkers, joggers, or in-line skaters.

Bicycle Facilities - Shelters, racks, storage facilities, and other elements for bicycles.

Bus - A self-propelled, rubber-tired vehicle designed to carry a substantial number of passengers.

Bus, Express - A bus that operates a portion of the route without stops or with a limited number of stops.

Bus, Feeder - A bus service that picks up and delivers passengers to a rapid transit station or express bus stop or terminal.

Capacity - The maximum number of vehicles (vehicular capacity) or persons (person capacity) that can pass over a given section of roadway in one or both directions during a given period of time under a prevailing management strategy that assures an acceptable level of free-flow service, usually expressed as vehicles per hour or persons per hour.

Capital Cost - The costs associated with the purchase, development or construction of fixed assets such as land, roadways, guideways, stations, buildings, and vehicles.

Carpool or Carpooling - Any automobile or private vehicle containing two or more occupants including the driver.

Carpool Lane - Another term used to describe an HOV lane, especially in areas with lower levels of bus service and high numbers of carpools.

Casual Carpool - Term used to describe the formation of a carpool on a periodic basis, with no formal arrangement for regular riders, or where drivers pick up random passengers at predetermined locations. Often used interchangeably with informal and instant carpooling.

Central Business District (CBD) - The major concentration of business activity in a downtown area. Formally defined by the Census Bureau.

Collector (Distributor Street) - A road generally parallel to an expressway which collects and distributes traffic at access points to the expressway involving through lanes.
Commute Trips - Trips that are made on a daily or regular basis to work, including those with intermediate stops to and from a work site.

Commute Alternatives - Alternatives to driving alone such as carpooling, vanpooling, transit, bicycling, and walking, or alternative work schedules that shift, commute trip to less congested periods, or remove work trips from the system altogether.

Commuter - A person who travels regularly between home and work or school.

Commuter Assistance Programs - Programs which provide services to help commuters identify and use alternative modes, such as ridesharing and transit, and provide support facilities and services.

Commuter Rail and Commuter Rail Transit - Passenger rail service which is often operated on existing railroad rights-of-way or on trackage shared with freight railroads. Commuter rail is characterized by long distance trips, faster operating speeds, and limited service, with longer distances between stops.

Compressed Work Week - One alternative work schedule technique that consists of condensing the standard 5-day work week into a fewer number of longer workdays. Common schedules include 4-10 hour days with one day off a week, and 9-9 hour days, with one day off every two weeks.

Congestion Pricing - The concept of charging for the use of a transportation facility, such as a roadway, based on the level of traffic congestion. The greater the level of congestion, which usually occurs during the morning and afternoon peak-periods, the higher the cost to use the facility.

Corridor - A geographical area usually defined by a freeway, roadway, or other physical element and its immediate surrounding area, including collector routes, that has similar characteristics.

Delay - The increased travel time experienced by a person or a vehicle due to circumstances that impede the desirable movement of traffic. Delay is measured as the time difference between the experienced travel time and the travel time during free-flow conditions.

Demand - The quantity of a good or service, such as transportation, desired. The desire for a good or service may be different based on different costs or benefits.

Demand-Responsive Transit Services - A bus, van, or other vehicle that is dispatched and operated only in response to a specific request for a passenger.

Destination - The point, area, or zone in which a trip terminates.

Directional Split - The distribution of traffic flows on a two-way facility, usually expressed as a percentage of the total two-way traffic.
**Disincentive** - Programs, policies, and techniques aimed at discouraging a specific type of behavior, such as driving alone.

**Employee Transportation Coordinator (ETC)** - An individual designated by a company or a group of companies to develop, implement, and administer an employee transportation demand management program. Duties may include coordinating vanpool and carpool programs, providing information on commute options, promoting the use of public transit, monitoring employee participation, and other related activities.

**Estimated Trip Reduction** - The estimated percentage of vehicle trips to be reduced through implementation of various commute alternative strategies, usually at one worksite or a small area.

**Fare** - The payment required to ride public transit. A variety of payment methods or media may be used including cash, tokens, tickets, passes, and other techniques.

**Flexible Work Hours and Flextime** - One alternative work schedule technique that gives employees the option of varying their starting and stopping times each workday. The intent is to allow employees more flexibility to adjust their work hours to individual needs and to avoid congested travel periods. Most policies specify a core period in the middle of the workday, such as 10:00 A.M. to 3:00 P.M., when all employees are required to be present.

**Forecasting** - The planning process of estimating future conditions, such as population and employment levels, demographic characteristics, and demand for roadway and transit facilities.

**Frequency of Service** - The number of vehicles on a route traveling in the same direction often expressed as the number of vehicles that will pass a certain point in the route within an hour period.

**General-Purpose Lanes** - The travel lanes on a freeway or roadway that are open to all motor vehicles.

**Grade Separation** - The vertical separation of an intersecting transportation facility to prevent conflicts.

**Guaranteed Ride Home Program** - Programs that provide commuters who rideshare, take transit, or use other alternative modes with a way to get home or to another location in the case of an emergency. A Guaranteed Ride Home program may be offered by an employer, a group of employers, a transit agency, or other groups, and a variety of techniques may be used to provide the service.

**Headway** - The time interval between buses operating on a route or out of a transit facility.

**High-Occupancy Toll (HOT) Lane** - Concept of using congestion or priority pricing on a toll or HOV facility. An example would be charging variable toll rates depending on the number of people in a vehicle and the time of day.
High-Occupancy Vehicle (HOV) - Motor vehicles with at least two or more persons, including carpools, vanpools, and buses. Individual HOV facilities may require different vehicle occupancy levels, which are usually expressed as either two or more (2+), three or more (3+), or four or more (4+) passengers per vehicle.

Home-Based Trip - A trip where either the origin or the destination is the traveler's home.

Home-Based Work Trip - A trip to or from the home for the purpose of one's employment.

Inbound - A trip toward a downtown, CBD, or major activity center.

Incentive - Programs, policies, and techniques aimed at a specific type of behavior, such as taking the bus or carpooling.

Informal Carpool - The composition of the carpool passengers varies from one day to another and there is no formal arrangement for regular riders. Often used interchangeably with casual and instant carpooling.

Infrastructure - All fixed components of a transportation system including roadways and bridges, park-and-ride lots, fixed transit components, and other elements.

Intelligent Transportation Systems (ITS) - The application of a wide range of advanced technologies to enhance the operation and management of the surface transportation system.

Intermodal - The integration of multiple modes in a corridor or area.

Jitney - A privately owned vehicle operated on a fixed or semi-fixed schedule for a fare.

Joint Development - Projects that involve the joint use or improvement of a piece of property. Joint developments usually involve the public and private sectors working together on a project, but they may also include public/public partnerships.

Kiss-and-Ride Lot or Facility - Short term parking spaces and pick up/drop off areas for commuters who are driven to a transit station or park-and-ride lot and are then picked up on the return trip.

Land Use - Refers to the manner in which portions of land or the structures on them are used, i.e., commercial, residential, retail, etc.

Level of Service (LOS) - A qualitative measure that describes the operational conditions or a road or intersection, as defined by the Highway Capacity Manual. The various service levels are defined by a range from A to F, with A representing freeflow traffic conditions and F representing stop-and-go traffic.

Light Rail Transit (LRT) - A mode of transit that operates on steel rails and obtains its power from overhead electrical wires. LRT may operate in single or multiple cars on separate rights-of-way or in mixed traffic.
**Linked/Unlinked Trip** - An unlinked trip is a passenger trip made on a single vehicle, such as a single automobile or bus ride. A linked trip is a person’s entire trip between an origin and destination, which may involve transferring between vehicles (e.g., Park & Ride or bus and rail transit), or multiple stops, such as stopping at a daycare center or store along a commute trip.

**Local Bus Service or Local Routes** - Bus routes and services characterized by frequent stops and relatively slow operating speeds that usually link neighborhood areas and downtowns or major activity centers using the local street system.

**Marketing** - A comprehensive approach to identifying the need of various user groups, matching services to meet those needs, and promoting the use of specific services.

**Market Research** - Broad term used to describe a general approach to identifying markets and their characteristics and the marketing services to those markets. May include a variety of techniques and approaches.

**Mass Transit and Mass Transportation** - Transportation provided by public or private operators by bus, rail, ferry, or other mode that operates on a regular basis, and serves large numbers of riders.

**Mixed-Use Development** - Defined by the Urban Land Institute as developments with the following criteria: (1) three or more revenue-producing uses that in well-planned projects are mutually supporting, (2) significant physical and functional integration of project components, including uninterrupted pedestrian connections, and (3) development in conformance with a coherent plan.

**Mobility** - The ability to move or be moved from place to place.

**Mode** - A particular form of travel conveyances, including buses, automobiles, carpools, vanpools, single occupant vehicles, walking, bicycling, rail, air, and water-borne vessels.

**Mode Shift** - The act of changing from one mode, such as driving alone, to another mode, such as taking the bus.

**Mode Split** - The proportion of total person-trips using the various modes of travel.

**Multimodal** - More than one mode operating in a corridor or area.

**Network** - A system that comprises all transportation elements.

**Non-Commute Trips** - Vehicle-trips made for purposes other than work-related reasons. Examples of non-commute trip purposes include shopping, personal business, medical, school, day care, and recreation.

**Off-Peak Direction of Travel** - The direction of travel in a corridor experiencing lower demand during a peak commuting period. In a radial corridor, the off-peak direction has traditionally been away from the central business district in the morning and toward the central business district in the evening. This situation is no longer the case in many metropolitan areas and in suburban areas; circumferential freeways often experience congestion in both directions.
Off-Peak Period - The period of time outside the peak commuting period, usually the midday, evening, night, and early morning.

Origin - The point or zone where a trip starts.

Paratransit - Transit services that are operated on demand, rather than on a fixed route and fixed schedule. Examples include dial-a-ride, jitney services, and shared-ride taxis.

Paratransit Vehicle - Usually smaller vehicles than conventional buses used on fixed route services. Examples include taxis, jitneys, vans, mini-vans, and small buses.

Park-and-Pool Lot and Park-and-Pool Facility - A facility where individuals can park their private vehicle and join a carpool or vanpool. The facility is not normally served by public transportation.

Park-and-Ride Lot and Park-and-Ride Facility - A facility where individuals can park their private vehicle for the day and access public transportation or rideshare for the major portion of their trip. Park-and-ride lots are found with HOV facilities, LRT, heavy rail, commuter rail systems, and ferry services.

Parking Cash Out - A strategy that employers can utilize to encourage employees to use alternative modes of commuting by giving up their tax-free parking and using the cash value to pay for expenses associated with other modes like carpooling or to receive a tax-free subsidy for their transit or vanpools.

Parking Management - Policies and programs aimed at managing both the supply of and the demand for parking at employment sites and major activity centers. May include strategies focusing on pricing, space availability and location, and priority treatments for carpools and vanpools. Measures that favor carpools and vanpools, including parking charges for drive-alone commuter parking, preferential parking for pool vehicles, and the elimination of free, low-cost, or on-street parking in employment areas.

Parking Pricing - Using pricing mechanisms to control the demand for parking and to encourage carpooling and vanpooling. Approaches include charging higher rates for driving alone, reducing or eliminating fees for carpools and vanpools, parking cash-out programs, and other approaches.

Peak Direction and Peak Direction of Travel - The direction of higher travel demand during a peak commuting period. In a radial corridor, the peak direction has traditionally been toward the central business district in the morning and away from the central business district in the evening. This situation is no longer the case in many metropolitan areas and in suburban areas; circumferential freeways often experience congestion in both directions.

Peak Hour - The hour in the morning and in the afternoon when the maximum demand occurs on a given transportation facility or corridor.
Peak Period - The time period in the morning and in the afternoon when the heaviest demand occurs on a given transportation facility or corridor. Usually two or more hours.

Person Throughput - Term used to describe the number of persons, not vehicles, being carried on a facility. Usually measured at a specific point on the roadway facility for a predetermined period of time.

Preferential Parking - Parking lots, spaces, or other areas reserved for carpools and vanpools. Preferential parking is usually located closer to the destination, in a parking garage, or in some other area which is more desirable.

Preferential Treatment - Providing special privileges to a specific mode or modes of transportation, such as bus lanes or signal priority for buses at intersections.

Priority Lane - Lane providing preferential treatment to buses, carpools, and vanpools.

Proximate Commute – Working at the employer worksite closest to the employee’s home can be implemented by multi-site employers such as banks, retail, etc.

Public Transit and Public Transportation - Passenger transportation service to the public on a regular basis using vehicles that transport more than one person for compensation, usually but not exclusively over a set route or routes from one fixed point to another. Routes or schedules of this service may be predetermined by the operator or may be determined through a cooperative arrangement.

Qualified Transportation Fringe Benefit - This represents a transportation fringe benefit that is tax-free for the employee. This benefit can be in the form of a mass transit subsidy, vanpool subsidy, and employer-provided parking. Carpool subsidy does not qualify.

Rail Transit - General term used for all types of rail transit systems including light rail transit (LRT), heavy rail, and commuter rail.

Reverse Commute - Regular travel between home and work or school in the opposite direction of the peak direction of traffic. Travel from a central city area to a suburb is one example of a reverse commute trip.

Ride Matching - The process of creating carpools and vanpools through finding people whose travel characteristics (origin and destination and time of travel) closely match.

Ridesharing - The function of sharing a ride with other passengers in a common vehicle. The term is usually applied to carpools and vanpools.

Right-of-Way - The area or property reserved for a specific transportation function such as a roadway or transit guideway.

Schedule - A listing of trips and time points for buses or other transit vehicles for a given route.
Service Frequency - The number of buses or other transit vehicles on a given route, passing a specific point within a given time period.

Shared Ride - A trip other than by public transit where more than one person occupies the same vehicle.

Shuttle - A public or private vehicle that travels back and forth over a particular route, especially a short route or one that provide connections between transportation systems, employment centers, etc.

Single Occupant Vehicle (SOV) - A motor vehicle occupied by only one person.

Staggered Work Hours - One alternative work scheduling technique that allows employees to begin and end work at times different than the normal 8:00 A.M. to 5:00 P.M. schedule. Work hours are usually staggered over a range from 15 minutes to two hours. Most staggered work hour programs require that employees maintain a set schedule, such as 7:30 A.M. to 4:30 P.M., on a regular basis.

Support Program - Policies, programs, and services that enhance the public acceptance or usage of an HOV facility, including ridesharing programs, employer-sponsored incentives, public information, and marketing activities.

Taxi and Taxicab - A vehicle to be operated by a professional and licensed driver for hire for a fee.

Telecommunications - The conveyance of information by electronic means. Examples include the telephone, interactive cable facilities, computer networks, and video conference centers.

Telecommuting - A work arrangement program whereby employees work at a location other than the conventional office or central headquarters, usually from home or an office close to home. Telecommuting can remove commute trips from the roadway system or reduce the length of commute trips.

Traffic Mitigation - The use of transportation management techniques to reduce the traffic impact of new development.

Traffic Volume - The number of vehicles on a freeway, roadway, HOV lane, or other transportation facility.

Transfer - The act of changing from one vehicle or route to another. Also, the paper provided to a passenger by a transit operator upon paying a fare that allows the individual to board the second vehicle without paying another fare.

Transit - General term referring to all vehicles and systems that move more than one individual includes carpools, vanpools, minibuses, buses, coaches, LRT, heavy rail, and commuter rail.
Transit Center or Transit Station - A facility serving transit buses and other modes such as automobiles and pedestrians. Centers and stations provide locations for individuals to access transit services and to transfer between buses or between buses and other modes.

Transit Dependent - An individual or group of individuals that are dependent on public transit to meet their private mobility needs because they are unable to drive, do not own a car, are not licensed to drive, or choose not to drive. Groups often considered transit dependents include the elderly, the young, low income individuals, and households without an automobile available.

Transportation Demand Management and Travel Demand Management (TDM) - A variety of strategies and techniques aimed at increasing the use of buses, carpools, vanpools, and other alternative commute modes, reducing single-occupant vehicles, and spreading travel to less congested time periods. Strategies may include both incentives, such as employer subsidized bus passes, and disincentives, such as higher parking rates for single-occupant vehicles.

Transportation Management Association/Organization (TMA/TMO) - Organizations comprised of some combination of employers, developers, building owners, and local government representatives formed to help address local transportation problems and to encourage greater use of high-occupancy vehicles and other strategies.

Transportation System Management (TSM) - Improvements focused on enhancing the management of the transportation system, including various elements of the transportation system. Examples of TSM projects include ramp metering, HOV ramp meter bypasses, and signal improvements.

Travel Time - The length of time it takes to travel between two points.

Travel Time Reliability - Term referring to the lack of variability in travel time that can be expected using different facilities.

Travel Time Savings - The time saved by use of an HOV facility rather than driving alone. Calculated by the difference in travel times between two points using the HOV facility and the general-purpose lane.

Trip Generation Rates - The number of vehicular trips to and from a development, cited per unit of measure such as square foot, thousand square feet, housing unit, or acre. The trip rates published by the Institute of Transportation Engineers (ITE) or developed by local jurisdictions are used to identify the potential impacts of new projects and to develop approaches to mitigate negative impacts.

Trip Reduction Ordinances - Laws or policies enacted by local governments that require developers, property owners, and employers to manage the number of vehicle-trips from a work site or development and to assist in financing necessary for transportation improvements.

Unlinked Trip - Trip that goes directly from origin to destination and does not include any intermediate stops or waiting or walking time.
Vanpool - A prearranged ridesharing function in which a number of people travel together on a regular basis in a van, usually designed to carry six or more persons.

Variable Work Hours - One alternative work schedule technique that allows employees to select work starting and ending times different than the normal 8:00 A.M. to 5:00 P.M. schedules. Most variable work hour programs require that employees maintain a set schedule, such as 7:30 A.M. to 4:30 P.M., on a regular basis.

Vehicle - Any motorcycle, car, truck, van, bus, or rail car designed to carry passengers or goods.

Vehicle Miles of Travel (VMT) - The total distance traveled in miles by all motor vehicles of a specific group in a given area at a given time.

Vehicle Occupancy - The number of people in a car, truck, bus, or other vehicle.

Violation of HOV Facility Requirements - An infraction of the rules and regulations for use of an HOV facility or other transportation system. On an HOV facility, not having the required number of people in a vehicle is a violation.

Volume to Capacity Ratio - The ratio of demand flow rate to capacity for a given type of transportation facility. The flow rate is typically given in terms of the number of vehicles passing a point for a given unit of time and the capacity is given in terms of vehicles for the same period of time.

Zoning - Land use regulations that divide a community into districts which have different allowable uses, development requirements, and regulations.

SECTION 1  INTRODUCTION

PURPOSE OF THE SURVEY

This report presents results of two surveys undertaken for the Fairfax/Vienna Metro TDM project. These surveys comprised one of several data collection efforts in the project. One survey was conducted with residents living near the Fairfax/Vienna Metro station. A second survey was conducted with employees who worked near a Metrorail station. The surveys were performed for two primary purposes:

1) Present a “snapshot” of current commute travel patterns in the Fairfax/Vienna Metro Station area
2) Identify the need and potential demand for various TDM services in the station area

The report is divided into three sections following this introduction:

- Section 2 – Survey methodology
- Section 3 – Resident Survey Results
- Section 4 – Employee Survey Results

Following these sections are four appendices:

- Appendix A – Resident Survey Questionnaire
- Appendix B – Employee Survey Questionnaire
- Appendix C – Resident Survey Frequency Tabulations
- Appendix D – Employee Survey Frequency Tabulations
SECTION 2  SURVEY METHODOLOGY

Described below are the following components of the survey methodology for each of the two surveys, resident and employee:

- Survey sample
- Questionnaire design
- Survey administration
- Survey analysis

SURVEY SAMPLE

Resident Survey

The sample frame for the resident survey included all residents 18 years or older, living within zip+four zip codes within a ½ mile radius of the station. The consulting team obtained address lists for all households within this area. Because the zip code area boundaries did not coincide exactly with the station area boundary, a small percentage of the households included in the sample were outside the ½ mile station area limit.

Approximately 3,800 households were included in the address list. The exact number of qualified respondents within these households is not known, but the 2000 Census data indicate that approximately 21% of the households within this area have only one person, while the remaining households consist of two or more. Assuming that most of the two+ resident households consist of two adults, the consulting team estimated the number of qualified respondents at approximately 6,600.

Employee Survey

The original sample frame for the employee survey included all employees working within ½ mile of the Fairfax/Vienna station. But this included only one employer, thus the consulting team also surveyed employees of two employers located within walking distance of the Dunn Loring Metro station. The Dunn Loring station area was chosen because it was considered similar to the area around the Fairfax/Vienna station and because, being the closest station to Fairfax/Vienna, it was expected to draw employees from similar home areas. The combined employee population at the three sites was approximately 1,500.

QUESTIONNAIRE DESIGN

The two surveys were developed by the consulting team, with review and input from two groups: 1) the project Advisory Team and 2) a Survey Area Group, consisting of citizen and homeowners representatives living in the study area. Prior to developing a draft questionnaire, the consulting team discussed the survey purpose with the Advisory Team members and described the types of questions likely to be included.

For the resident survey, these included:

- Current commuting patterns, work location, and work schedule
- Availability of TDM services at work/through employer
• Interest in/motivating value of TDM services for non-drive alone commuting
• Non-commute travel from home
• Demographic characteristics

For the employee survey, these topics included:
• Current commuting patterns, home location, and work schedule
• Availability of TDM services at work/through employer
• Interest in/motivating value of TDM services for non-drive alone commuting
• Non-commute trips made around the work location during the work day
• Demographic characteristics

The consulting team prepared draft questionnaires for each of the two surveys and distributed them to the Advisory Team for initial review. Concurrently, the consultants presented the draft questionnaires to the Survey Area Group members to solicit their comments and suggestions. This evening meeting was held on April 18. On April 21st, the consultants met with the Advisory Team to present the comments received from the Survey Area Group and to obtain other comments and suggestions from the Advisory Team members.

Following these two meetings, the consultants prepared revised draft surveys and distributed them once more to the Advisory Team for final review. A few additional minor changes were made to both drafts and they were finalized.

For the resident survey, both paper/mail or fax back and internet versions were then prepared. The employee survey was distributed only as an internet version. Links to the internet versions of the surveys were tested by the consultants and were provided to the Advisory Team members for their testing as well.

Due to the very short time available to develop and administer the survey, the survey was not formally pre-tested. However, the review performed by the Survey Area Group and the Advisory Team provided valuable suggestions on local terminology that the consultants believe enhanced the accuracy of the responses.

SURVEY ADMINISTRATION

Resident Survey
The resident survey was distributed by mail to each household in the zip+four area previously defined. As noted above, the resident survey respondents were given the option of completing the survey by mail or on-line. Thus the letter accompanying the questionnaire informed respondents that they could respond online and provided the website address for the on-line survey.

To simplify respondents’ access to the questionnaire, two copies of the questionnaire were mailed to each household. Respondents who had more than two adults in the household were told they could obtain additional questionnaires from their homeowners association or from the consulting team. To minimize the possibility of respondents submitting multiple questionnaires, each questionnaire was coded with a unique
number that was used for survey tracking purposes. Respondents who preferred to respond on-line were asked to enter this number as part of the on-line submittal.

A mail distribution firm prepared the questionnaire packets for mailing. The packet included the questionnaire, a cover letter stating the purpose of the survey and instructions on completing and submitting the questionnaires, and a flyer announcing that respondents would be entered into a prize drawing. The questionnaire packets were mailed by first-class mail. Respondents were given until June 19th, approximately 7-10 days, to complete and return the survey. Due to a two-day delay in the mail distribution of the questionnaires, the deadline for returning the questionnaires was extended by several days and questionnaires were accepted for 10 days after the original postmark date.

To enhance response rate, the consultants entered respondents who were willing to provide their names and phone numbers into the drawing for a $400 American Express gift card. Approximately 90% of the respondents participated in the drawing. Homeowners association (HOA) representatives also were asked to alert their residents that the survey would be conducted and to encourage residents to participate. Most of the HOAs did assist the consultants with this alert. Several of the HOA representatives also sent follow-up reminders to residents as the survey deadline approached.

**Employee Survey**

As noted earlier, the employee survey was conducted only by internet at three worksites. As part of the sample selection process, the consulting team contacted each of the three firms selected to request their participation and assistance in conducting the survey.

When the survey had been finalized and tested on-line, the consulting team provided a sample email, with a link to the internet survey site, to the survey coordinator at each of the employment sites. These representatives then distributed the email and link to employees at their worksites. Employees were asked to complete the questionnaire by June 19th. No extensions were needed for this survey, because the survey was distributed on schedule.

As with the resident survey, consultants entered respondents who were willing to provide their names and phone numbers into the drawing for a $400 American Express gift card. Approximately 90% of the respondents participated in the drawing.

**Survey Analysis**

When all questionnaires were returned, a datafile of responses was prepared. Resident questionnaires that had been completed in paper form were added to the file of responses entered directly from the internet. No paper questionnaires were collected for the employee survey. Next, the data were reviewed for response inconsistencies, out-of-range values, and other errors and were cleaned as needed. Three duplicate records were eliminated.

The response rate for the resident survey was 7.3%, with 482 residents responding. The response rate for the employee survey was 10%, with 148 employees responding. Because these samples did not constitute random samples, it was not possible to compute confidence levels for the surveys. However, for the resident survey, the consultants compared demographic and travel pattern results against data from the 2000
Census and other published statistics as were available to validate the responses from the survey. Distributions for the survey sample appeared to track distributions for these other sources, suggesting the respondents were similar in key characteristics to what would have been expected for the entire sample frame.

Then the following analysis activities were undertaken for the resident survey:

- Prepared frequency tabulations for each question
- Computed averages and ranges for numeric values where appropriate
- Computed or created additional variables, such as: primary travel mode, commute mode split, work location area, distance from home to Fairfax/Vienna Metro station, non-commute mode split, and other variables that would be used in the analysis
- Prepared cross-tabulations for some combinations of questions, particularly examining responses for commuters who primarily drive alone to work and those who use Metrorail for commuting

The employee survey was more limited in its questions, thus the analysis was limited to the following:

- Prepared frequency tabulations for each question
- Computed averages and ranges for numeric values where appropriate
- Computed or created additional variables, such as: primary travel mode, commute mode split, work location area, distance from home to a bus or train station, non-commute mode split, and other variables that would be used in the analysis

Preliminary results were presented to both the Advisory Team and the Survey Area Group. Both groups proposed questions that encouraged the consultants to conduct additional analysis. The Survey Area Group additionally was asked to provide assistance in grouping neighborhoods into logical groupings for distance analysis.
SECTION 3  RESIDENT SURVEY RESULTS

This section of the report presents the key findings of the resident survey. The tables show both the percentages of respondents who answered each question as well as the number of respondents who answered the question. These numbers are shown as “n=____.” Where relevant, survey results are compared for sub-groups of respondents, for example, respondents who drove alone to work compared with respondents who used Metrorail.

The results in this section are presented in the following sub-sections.

- Characteristics of the sample
- Commute patterns
- Commuting services available at work
- Non-commuting trips

CHARACTERISTICS OF THE SAMPLE

At the end of the survey, respondents were asked a series of questions about themselves and their households, including: age, number of persons in the household, number of children under 16 years old in the household, the number of motor vehicles owned or leased by household members, and neighborhood location. These results are presented first, to define characteristics of the sample. When comparable data were available from a 2005 demographic report for a ½ mile radius around the Vienna Transit Station, these comparisons are shown (Claritas, Inc. SiteReport. June 22, 2005).

Age

As shown in Table 1, about half (47%) of the respondents were between the ages of 25 and 44 and 38% were between 45 and 65. One in ten (12%) was 65 years or older. The last column of the table shows the age distribution from the 2005 demographic report. This comparison suggests that the survey sample might slightly over-represent respondents 45 year or older (50% for survey vs 46% for 2005 Demographics) and under-represent respondents under 25 (3% for survey and 7% for 2005 Demographics).

<table>

<td>26%</td>
</tr>
<tr>
<td>45-54</td>
<td>19%</td>
<td>21%</td>
</tr>
<tr>
<td>55-64</td>
<td>19%</td>
<td>16%</td>
</tr>
<tr>
<td>65 or older</td>
<td>12%</td>
<td>8%</td>
</tr>
</tbody>
</table>
Household Size and Composition

Tables 2 present results on household size and composition. Table 2 shows that 48% of the respondents said two persons lived in their household. About a third (36%) said they had three or more person in the household. The remaining 16% said they live alone. As shown in the last column, the survey sample might slightly over-represent two-person households (48% for survey vs 37% for the 2005 Demographic Report).

<table>
<thead>
<tr>

<tr>
<td>5 to 6</td>
<td>6%</td>
<td>7%</td>
</tr>
<tr>
<td>7 or more</td>
<td>0%</td>
<td>1%</td>
</tr>
</tbody>
</table>

As seen in Tables 3, the majority of households (68%) had no children under the age of 16. These children comprise about 19% of the total household members. This is quite close to the 2005 Demographic Report calculation of 20% of household members under 16 years of age.

Respondents were asked how many motor vehicles (cars, trucks, SUVs, or motorcycles) were owned or leased by members of their household. These results are presented in Table 4.

### Table 4
**Motor Vehicles Owned or Leased by Household Members**

<td>1%</td>
<td>1%</td>
</tr>
</tbody>
</table>

About a third (34%) said they had one motor vehicle. Nearly two-thirds (63%) said they had between two and four motor vehicles. One percent said they had five or more. Just two percent said they did not own any vehicles.

### Neighborhood Location

Finally, respondents were asked to indicate the “neighborhood” where they lived. More than 30 neighborhoods were cited, many noting the name of the condominium or townhouse complex in which they lived or naming a specific street. Details of the named neighborhood distribution are presented in Appendix 3 (Resident survey frequency tabulations). The locations were grouped into categories representing their approximate distances to the Fairfax/Vienna Metro station. These results are shown in Table 5 below. About 24% of the respondents lived within ¼ mile of the station. The majority (62%) lived between ¼ mile and ½ mile and 14% lived more than ½ mile from the station.

</tbody>
</table>
COMMUTING PATTERNS

The majority (80%) of survey respondents said they regularly traveled to a work or school location outside their home, one or more days per week. A second section of the survey questioned these respondents about their weekly commute patterns, including:

- Type of work schedule
- Time arriving at work
- Work location
- Commute mode(s) used and the frequency of use
- Length of commute

Work Schedule

Days Worked Per Week – As presented in Figure 1, a large majority (76%) of respondents who were employed said they work a full-time, “standard” work schedule; that is five days per week for a total of 35 or more hours. About one in eight (13%) said they work part-time and one in ten (10%) said they work a form of compressed work schedule, in which they work a full-time work week in fewer than five days per week.

Work Schedule Flexibility – Nearly half (40%) of respondents also said they have some flexibility in setting their work hours. They can choose their starting and ending work times, as long as they work a required number of hours in a day or week. Such flexibility would allow these respondents to choose their work hours to avoid traveling during congested times.
**Work Arrival Time**

Respondents were asked what time they arrive at work. The analysis also examined the time that respondents left their homes for work. This question was not asked directly, but was computed from the work arrival time and the length of time it took to travel to work. Results for both of these variables are shown in Table 6.

**Table 6**

*Work Arrival Time and Leave Home for Work Time*

</tbody>
</table>

About half (46%) arrive at work between 7:30 am and 8:59 am. The remaining respondents were equally divided between those who arrive before 7:30 am (17%) and arrive at or after 9 am (18%). About half (50%) also said leave home to go to work between 7:30 am and 8:59 am. But more than a third (36%) leave for work before 7:30 am. About one in eight (14%) leave home at 9 am or later.

**Work Location**

Table 7 displays the distribution of respondents’ work locations. As shown, well over half (59%) of the respondents worked in Virginia; 41% in Fairfax County and 18% in another Virginia County. About a third (35%) worked in the District of Columbia. A small percentage (6%) worked in Maryland.

Types of Transportation Used for Travel to Work

Respondents were asked what types of transportation they used to travel to work each weekday (Monday-Friday) during the previous week. If they were sick, on holiday or vacation, or otherwise absent from work one or more days, they indicated one or more “absent” days. Figure 2 and Table 7 present several different views of the use of various types of transportation type.

“Primary” Commute Mode – Figure 2 presents the distribution of respondents by their “primary” mode; that is, the type of transportation they used most days during the week. The largest percentage (53%) of respondents said they usually drove alone to work. More than a third (36%) said they usually rode Metrorail. Smaller percentages said they usually carpooled or vanpooled (7%), rode a bus (3%), or bicycled or walked (1%). About one percent said they primarily teleworked or worked from their homes.
Percentage of Weekly Trips by Mode – Table 8 presents the mode shares as a percentage of weekly commute trips. This table includes both the traditional types of transportation: drive alone, Metrorail/train, carpool/vanpool, bus, and bicycle/walk, and two additional categories – compressed work schedule day off and teleworking. These are not actually travel modes but are included to show the percentage of weekly work trips that were eliminated through use of these work schedule options.

Table 8
Weekly Trips by Mode
(n=380)

<table>
<thead>
<tr>
<th>Transportation Type</th>
<th>Percentage of Weekly Trips</th>

<td>Compressed work schedule day off</td>
<td>1%</td>
<td>1.1</td>
</tr>
<tr>
<td>Telework/work at home</td>
<td>2%</td>
<td>1.5</td>
</tr>
</tbody>
</table>

Driving alone accounted for just over half (51%) of weekly commute trips. About a third (36%) of weekly trips were made by Metrorail/train and seven percent were made by carpool or vanpool. Three percent of trips were made by bus and one percent were made by bicycling or walking. About three percent of “trips” were eliminated by use of teleworking or compressed work schedule.

Average Days Using Each Mode – Table 8 also provides the average number of days respondents used each type of transportation. Respondents generally were consistent in their choice of commute mode. All of the traditional commute modes, excluding bicycling/walking, were used at least three days per week on average. This is consistent with other results in the survey, which show that about 75% used the same type of transportation every day they commuted to work.

Respondents who drove alone or used Metrorail, used these modes on average four or more days per week. Respondents who carpooled/vanpooleed or rode a bus used these modes slightly less often, about 3.2 to 3.4 days per week. Bicycling/walking, and telworking were used 2.5 days and 1.5 days per week on average.

Travel Mode by Work Location – The mode distribution shown above is for all employed respondents. But the mode distribution was different for respondents who worked in different states. As shown in Table 9, 80% of respondents who worked in Virginia and 68% of respondents who worked in Maryland
drove alone to work. By contrast, only nine percent of respondents who worked in the District of Columbia drove to work; 77% of these respondents chose Metrorail.

</tr>
</tbody>
</table>

Length of Commute

Number of Miles – Commuters in the sample had a wide range of commute distances, ranging from less than one mile to 50 miles. Table 10 presents the distribution of distance. The average one-way commute distance was 13.1 miles, somewhat less than the 16.5 mile average calculated for the Washington region in the 2004 regional State of the Commute Survey conducted by the Council of Governments.

Table 10
Commute Distance (miles)
(n=373)

<table>
<thead>

</tr>
<tr>
<td>Average/mean</td>
<td>13.1 miles</td>
<td></td>
</tr>
</tbody>
</table>

About one-third (30%) of the respondents commuted fewer than 10 miles one-way. About half (52%) said they traveled between 10 and 19.9 miles. About one in five (18%) had commute distances of 30 miles or greater.
**Commute Travel Time** – Survey respondents commuted, on average, about 35 minutes one way, approximately the same as the 34 minute regional average as measured in the 2004 State of the Commute Survey. As shown in Table 11, about a third (37%) of respondents commuted less than 30 minutes and 53% commuted between 30 and 59 minutes. The remaining 11% traveled more than an hour.

Access to Metrorail Station

As noted earlier, about a third of the employed respondents said they use Metrorail for their commute. As displayed in Figure 3, nearly all (88%) of these respondents said they walk to the station. About seven percent said they drive themselves to the station and park. Two percent said they are dropped off, such as by a family member. The remaining three percent mentioned another access method, such as “bus,” “carpool,” or “bicycle.”

Figure 3

Access to Metrorail Station

(n=161)
COMMUTING SERVICES AVAILABLE AT WORK

Respondents who were employed were asked a third set of questions about commute assistance services that were available to them at their work. They also were asked if various commute assistance services would encourage them to use carpool, vanpool, transit, or bicycling/walking for their commute. The intent of this section was to examine both the currently available services and the motivating value of other commuting services that could be offered to residents. Results to these questions are provided below.

Parking and Commute Financial Incentives Available at Worksite

Over half (56%) of the respondents said they have free parking at their worksite. The remaining 44% said they have to pay a fee to park if they drive to work. About four in ten (44%) respondents said their employer offers free or discounted transit passes, such as Metrochek, or offers to pay or reimburse a portion of the respondents commuting expenses, other than for parking. The remaining 56% said they did not have access to this financial incentive or they did not know if their employer offered it.

But as shown in Table 12, the availability of free parking and financial incentives for commute modes other than driving alone were not uniformly distributed across respondents.

</tr>
</tbody>
</table>

Parking and Incentives by Commute Mode – Respondents who said they drive alone were most likely to have free parking at their worksites; 84% of these respondents said they did not have to pay to park.
About 60% of carpoolers/vanpoolers said they had free parking. But among respondents who primarily use Metrorail to get to work, only 13% had free parking available at their work location.

The third column of the table shows a different distribution for financial incentives. About two-thirds of respondents who primarily used either Metrorail (63%) or carpool/vanpool (68%) said their employers offered financial incentives, other than for parking. Only about one-quarter (27%) of respondents who drove alone could receive a financial incentive.

**Parking and Incentives by Work Location** – These results suggest that availability of free parking encourages driving alone and availability of financial incentives encourages use of train and ridesharing. Research in many areas of the U.S. supports these conclusions. However, the bottom section of Table 12 shows that free parking is primarily available to respondents who work in either Virginia or Maryland and is largely not available to respondents who work in the District of Columbia. Only 14% of respondents who worked in DC said they had free parking.

And financial incentives also are primarily available to DC workers. Two-thirds (64%) of respondents who worked in DC had access to financial incentives, compared to about one-third (35%) of respondents who worked in Maryland and one-quarter (26%) of respondents who worked in Virginia.

But respondents who worked in the District would be faced with greater impediments to driving alone, such as congestion, longer commute distances, greater availability and frequency of transit service than would be experienced by workers outside the District. And workers in downtown areas generally have greater access to shopping and convenience services at the work location, which would make it possible to conduct personal business near work without a car. These factors also could influence respondents’ commute mode choices.

**Distance from Work Location to Transit**

Respondents were asked how far they would have to walk to reach the nearest Metrorail station and the nearest bus stop. Respondents generally had good access to transit at work. Results for these questions are presented in Table 12.

**Table 13**

<table>
<thead>
<tr>
<th>Time to Walk from Work Location to Bus Stop and Rail Station</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Walk Time</strong></td>
</tr>
<tr>
<td>----------------</td>
</tr>
<tr>
<td>Less than 5 minutes</td>
</tr>
<tr>
<td>5 to 10 minutes</td>
</tr>
<tr>
<td>11 to 20 minutes</td>
</tr>
<tr>
<td>More than 20 minutes</td>
</tr>
<tr>
<td>Don’t know</td>
</tr>
</tbody>
</table>
Distance to Bus Stop – As illustrated, about 60% of respondents said they would have to walk no more than 10 minutes to the nearest bus stop. Another eight percent said they would have to walk 11 or more minutes. It is important to note that a third (33%) of respondents did not know the location of the nearest bus stop. It is likely that many of these respondents answered “don’t know” because they are not aware of any bus service in their work area. This suggests that the actual walk time would be more than 20 minutes away for a large portion of the “don’t know” respondents.

Distance to Metrorail Station – About half (52%) of the respondents said the nearest Metrorail station was within 10 minutes walk of their work location and 39% said the nearest station was 11 or more minutes away. It is worth noting that the percentage of “don’t know” responses was much less for rail stations than for bus stops. This is likely because the Metrorail stations are in permanent and more visible locations than are bus stops, thus respondents are more aware of where the stations are in relation to their work locations.

Distance to Transit by Primary Commute Mode – As was the case for other commute characteristics, the walk to transit time was different for respondents who drove alone to work and those who used Metrorail. The overwhelming majority (85%) of respondents who used Metrorail to travel to work said their work location was within 10 minutes of a rail station. But among respondents who drove alone to work, only one third (34%) could walk to a Metrorail station in 10 minutes or less. About 16% said the walk time would be between 11 and 20 minutes, while half (49%) said they would have to walk 20 or more minutes to reach a Metrorail station.

Interest in Other Commute Assistance Services

Respondents were asked if various commute assistance services would encourage them to use non-drive alone types of transportation for their work trips. Some of the services, such as “$100 subsidy for vanpool,” were targeted to a specific non-drive alone mode. Others, such as “Guaranteed Ride Home in case of emergency,” could be used for any non-drive alone mode. Respondents were asked to specify if each service: “would encourage,” “might encourage,” or “would not encourage” them to use transit, ridesharing, or bicycle/walk, as appropriate. Respondents who used the targeted modes now were asked to check “use this mode now.”

Table 14 presents the results of this series of questions. The 12 services presented to respondents are grouped into three categories: financial incentives, access to transit, and information/convenience services. The second column, with the heading of “n=___”, shows the number of respondents who were not currently using the targeted mode who answered the question.

Services Perceived as Most Valuable – As the table indicates, 30% or more respondents cited eight services, those shaded in the table, as services that either “would encourage” or “might encourage” them to use the targeted types of transportation. Four of the services that appear to be influential were in the “Access to Transit” category. These included: safe walking path to Metrorail station, bus/train stop within 10 min walk of work, shuttle to Metrorail station, and more Metrorail station parking. These services were noted by 44%, 42%, 35%, and 30% of respondents, respectively, as having some motivational impact.
Two services were noted in the “Financial Incentive” category. About 36% of respondents said “$100 subsidy for bus/train,” would or might encourage them to use transit and 30% said “$100 subsidy for vanpool” would or might encourage them to use vanpooling.

Two services in the “Information/Convenience Services” category also had support by more than 30% of respondents. These included: “Guaranteed Ride Home in case of emergency, cited by 38% as potentially influential, and “Convenience shopping at Metro station,” which was noted by 31%.

</tbody>
</table>

The importance of access to transit is notable, particularly when compared to the functions of other services that were tested in this question. While the specific factors influencing mode choice vary from one commuter to another, most commuters choose their modes based on four factors: availability, cost, time, and convenience of the modes. Since most respondents have a vehicle available for commuting, driving alone is an available option, but transit might be unavailable or difficult to access. The four services included in the “Access to Transit” category are designed to make it easier to reach transit on either the home or work end of the commute trip.
Information and convenience services, with the exception of “Guaranteed Ride Home” and “convenience shopping at Metrorail station,” were generally perceived as less valuable to respondents. It is worth noting that the lower rankings of the two bicycle support services could be due in part to other constraints on bicycling to work, such as long commuting distance or the need to drop a child at school or day care on the way to work.
NON-COMMUTE TRIPS MADE DURING WEEKDAYS

The preceding sections have described results about commuting behavior of the resident respondents who were employed or who regularly traveled to a school location on weekdays. Respondents who were not commuting to a work or school location skipped these commute questions. But all respondents were asked several questions about trips they made from their homes on weekdays for purposes other than for commuting. These questions thus were answered by respondents who are retired or otherwise not working.

Respondents were first asked if they had made any trips in the past two weekdays from their home to another location, for a purpose other than travel to work or school. As shown in Figure 4, about one quarter (22%) of respondents said they did not make any non-commute trips in the past two weekdays. The remaining 78% said they made one or more trips. One third (33%) made one or two trips, a quarter (26%) made three to five trips, and 19% made six or more trips over the two day period. On average respondents made 3.2 trips per person over the two day period or about eight trips per week per respondent.

Figure 4
Number of Non-Commute Trips Made in Past Two Weekdays
(n=476)

Non-Commute Trips Made During the Peak Morning Period

Respondents who said they had made trips for purposes other than commuting were asked how many of these trips were made between 6 am and 9 am. Only about one in five respondents said they made non-commute trips during these morning hours. On average, respondents made 0.8 trips over the two day period or about two trips per week during the morning peak period. Thus, the majority of non-commute trips made from the home location were made in the mid-day or evening hours, rather than during the early morning hours.
Types of Transportation Used for Peak Period Non-Commute Trips

As shown in Table 15, two-thirds (67%) of the non-commute trips made between 6 am and 9 am were made by driving alone. About a quarter (27%) of the trips were made by driving or riding with someone. A large portion of these trips likely were made to pick-up or drop-off someone at another location.

SUMMARY OF RESULTS

The two primary purposes of the Resident Survey were to examine current commute behavior and explore residents’ access to and interest in commute assistance services at their work locations. Following is a summary of the key results:

Work Schedule

- 80% of all respondents surveyed said they regularly travel to a work or school location. The remaining 20% were not currently working.
- 76% of employed respondents work full time (35 or more hours per week). Another 13% said they work part-time. About 10% said they work a “compressed work schedule.”
- 40% work a flexible schedule – that is, they can choose their start and end times as long as they work a required number of hours in a day or week.
- About a third (36%) of respondents said they leave for work before 7:30 am. Another 50% said they leave between 7:30 am and 8:59 am.

Commute Patterns

- Driving alone is the most popular commute mode among respondents, with over half (52%) of respondents using this as the primary mode. But Metrorail accounts for more than a third of weekly commute trips for respondents.
Respondents generally were consistent in their choice of type of transportation. About 75% said they used the same type of transportation every day they commuted to work.

A large majority (88%) of respondents who use Metrorail to go to work walk to the station. Only about seven percent of respondents drive alone and park.

More than half of the employed respondents (59%) said they work in Virginia: 41% in Fairfax County and 18% in another Virginia county. A third (35%) work in the District of Columbia.

Respondents traveled on average 13.1 miles and 35 minutes to work. The distance was less than the regional average of 16.5 miles one way, but the time was about the same as the 34 minute average for the region in 2004.

**Commuter Assistance Services at the Work Location**

- Respondents generally have good access to transit at their work location: 52% work within 10 minutes walk of a Metrorail station and 60% work within 10 minutes of a bus stop.
- More than half (56%) have free parking at work. The remaining 44% pay a fee to park.
- About four in ten (44%) respondents said their employers offer discount transit passes or will reimburse part of their commute cost.
- Respondents who said they drive alone were most likely to have free parking at their worksites; 84% of these respondents said they did not have to pay to park. But only 13% of respondents who primarily use Metrorail to get to work had free parking available at their work location.
- About two-thirds of respondents who primarily used Metrorail said their employers offered financial incentives, other than for parking. But only about one-quarter (27%) of respondents who drove alone could receive a financial incentive.
- Respondents who drive alone to work said some commute services would or might encourage them to use transit or other non-drive alone transportation to get to work. Valuable services included:

**Non-Commuting Trips – All Survey Respondents**

- 78% of all respondents made one or more non-work trips in the two workdays preceding the survey.
• 20% made 1 or more non-work trips between 6 am and 9 am. Respondents made an average of two non-work trips per week during the early morning hours.

• Most (67%) of these trips were made by driving alone. About 27% were made by driving or riding with someone (carpool).

**Demographic Characteristics – All Survey Respondents**

• About a quarter (24%) of the respondents live within ¼ mile of the Vienna Metro station. Most (62%) live between ¼ mile and ½ mile from the station.

• About half (48%) of the respondents said two people live in their household. About a third (36%) said they have three or more people in the household. The remaining 16% said they live alone.

• Most (62%) of the respondents said they do not have any children under 16 in the household.

• About one-third (34%) of the respondents said they have one vehicle (car, truck, SUV, van, motorcycle) in their household. Most (64%) said they have two or more vehicles. Only two percent said they do not have any vehicles.

• About half (47%) of the respondents were between the ages of 25 and 44. About a third (38%) were between 45 and 64. One in ten (12%) was 65 or older.
SECTION 3  EMPLOYEE SURVEY RESULTS

This section of the report presents the key findings of the employee survey. The tables show both the percentages of respondents who answered each question as well as the number of respondents who answered the question. These numbers are shown as “n= ____.” Where relevant, survey results are compared for sub-groups of respondents, for example, respondents who drove alone to work compared with respondents who used Metrorail.

The results in this section are presented in the following sub-sections.

• Characteristics of the sample
• Commute patterns
• Non-commuting trips made during the work day
• Commuting services available at work

CHARACTERISTICS OF THE SAMPLE

At the end of the survey, respondents were asked a series of questions about themselves and their households, including: age, number of motor vehicles owned or leased by household members, racial/ethnic background and occupation. These results are presented first, to define characteristics of the sample.

Age

As shown in Table 16, about half (54%) of the respondents were between the ages of 25 and 44 and 32% were between 45 and 65. One in ten (13%) was between 18 and 24.

<table>

<td>18%</td>
</tr>
<tr>
<td>55-64</td>
<td>14%</td>
</tr>
<tr>
<td>65 or older</td>
<td>2%</td>
</tr>
</tbody>
</table>
Motor Vehicles in the Household

Respondents were asked how many motor vehicles (cars, trucks, SUVs, or motorcycles) were owned or leased by members of their household. These results are presented in Table 17. About a third (34%) said they had one motor vehicle. Another third (37%) said they had two motor vehicles. About one in four (22%) said they had three or more. Eight percent said they did not own any vehicles.

Racial/Ethnic Background

A significant majority (83%) of respondents said they were of White/non-Hispanic ethnic/racial heritage. As shown in Table 18, small percentages of respondents said they were African-American (6%), Asian (5%), Hispanic (3%), or Other (3%) ethnic/racial background.

<td>3%</td>
</tr>
</tbody>
</table>
**Occupation**

Finally, respondents were asked to indicate their occupation from choices provided in the list shown in Table 19. The overwhelming majority (72%) of respondents said their jobs were “professional.” An additional 17% said they were in “executive/managerial” positions. Because the survey was conducted at only employers, all of which are consulting or professional service employers, this large percentage of white-collar occupations is not surprising. About six percent of the respondents said they worked in “administrative support or clerical” positions. A small number of respondents said they had another occupation.

</table>

**COMMUTING PATTERNS**

A second section of the survey questioned respondents about their weekly commute patterns, including:

- Type of work schedule
- Time arriving at work
- Home location
- Commute mode(s) used and the frequency of use
- Length of commute
Work Schedule

Days Worked Per Week – As presented in Figure 5, nearly all (93%) of respondents said they worked a full-time, “standard” work schedule; that is five days per week for a total of 35 or more hours. About one in twenty (5%) said they work part-time and a very small number (2%) said they work a form of compressed work schedule, in which they work a full-time work week in fewer than five days per week.

![Figure 5: Work Schedule Type](n=147)

Full-time, 5-day week, 93%

Part-time, 5%

CWS, 2%

Work Schedule Flexibility – Almost three-quarters (71%) of respondents said they have some flexibility in setting their work hours. They can choose their starting and ending work times, as long as they work a required number of hours in a day or week. Such flexibility would allow these respondents to choose their work hours to avoid traveling during congested times.

Work Arrival and Departure Times

Respondents were asked what time they arrived at work and what time they usually left work to go home. Results for the arrival time are shown in Table 20. Results for departure time are presented in Table 21.

Arrival Time – About half (54%) of the respondents said they arrive at work between 6 am and 8:59 am. About a quarter (23%) arrive just at the end of the peak period, between 9 am and 9:29 am. The remaining 23% of respondents arrived at or after 9:30 am.
### Table 20

<td>15%</td>
<td>12 midnight - 5:59 am</td>
<td>0%</td>
</tr>
</tbody>
</table>

**Departure Time** – Departure times were more concentrated than were arrival times. As shown in Table 21, 80% of respondents said they leave work during the peak period hours of 4 pm to 6:59 pm. Two-thirds (65%) leave work between 5 pm and 6:59 pm and 15% leave between 4 pm and 4:59 pm. Only about seven percent leave earlier than 4 pm and only 13% leave at 7 pm or later.

**Types of Transportation Used for Travel to Work**

Respondents were asked what types of transportation they used to travel to work each weekday (Monday-Friday) during the previous week. If they were sick, on holiday or vacation, or otherwise absent from
work one or more days, they indicated one or more “absent” days. Figure 6 and Table 22 present two different views of the use of various types of transportation type.

“Primary” Commute Mode – Figure 7 presents the distribution of respondents by their “primary” mode; that is, the type of transportation they used most days during the week. The largest percentage (76%) of respondents said they usually drove alone to work. About one in five (17%) said they usually rode Metrorail. Smaller percentages said they usually carpooled or vanpooled (1%), rode a bus (1%), or bicycled or walked (2%). About four percent said they primarily teleworked or worked from their homes.

**Figure 6**
Primary Commute Mode

(n=145)

**Percentage of Weekly Trips by Mode** – Table 22 presents the mode shares as a percentage of weekly commute trips. This table includes both the traditional types of transportation: drive alone, Metrorail/train, carpool/vanpool, bus, and bicycle/walk, and two additional categories – compressed work schedule day off and teleworking. These are not actually travel modes but are included to show the percentage of weekly work trips that were eliminated through use of these work schedule options.

**Table 22**
Weekly Trips by Mode

(n=145)

<table>
<thead>
<tr>
<th>Transportation Type</th>
<th>Percentage of Weekly Trips</th>
<th>Average Days Used per Week</th>

</tr>
<tr>
<td>Carpool/vanpool</td>
<td>1%</td>
<td>1.8</td>
</tr>
<tr>
<td>Bus</td>
<td>1%</td>
<td>2.0</td>
</tr>
</tbody>
</table>
Driving alone accounted for nearly three-quarters (73%) of weekly commute trips. About one in five (18%) weekly trips was made by Metrorail/train and two percent were made by walking or bicycling. A small number (1%) were made by carpool/vanpool and one percent were made by bus. Teleworking accounted for about five percent of “trips,” but these were actually trips eliminated when the respondent did not travel to the work location on those work days.

### Average Days Using Each Mode

Table 22 also provides the average number of days respondents used each type of transportation. Respondents generally were consistent in their choice of commute mode, with most traditional commute modes, excluding bus and carpool/vanpool, were used at least three days per week on average. This is consistent with other results in the survey, which show that about 72% used the same type of transportation every day they commuted to work.

Respondents who drove alone used this mode on average 4.2 days per week. Respondents who used Metrorail or bicycle/walking also were regular users of these modes, using them on average 3.7 and 3.2 days per week, respectively. Carpoolers/vanpoolers and bus riders were less consistent users of these modes, using them on average two or fewer days per week. Respondents who teleworked used this work schedule option an average of 1.7 days per week.

### Home Location

Table 23 displays the distribution of respondents’ home locations. Over three-quarters (76%) lived in Virginia; 48% in Fairfax County, 15% in Arlington County, and 13% in another Virginia County. About one in ten (10%) lived in the District of Columbia. The remaining 14% lived in Maryland.

</table>
Length of Commute

Number of Miles – Commuters in the sample had a wide range of commute distances, ranging from less than one mile to 60 miles. Table 24 presents the distribution of distance. The average one-way commute distance was 15.3 miles, about equal to the 16.5 mile regional average, as calculated for the Washington region in the 2004 regional State of the Commute Survey conducted by the Council of Governments.

Table 24
Commute Distance (miles)
(n=147)

</tr>
<tr>
<td><strong>Average/mean</strong></td>
<td><strong>15.3 miles</strong></td>
<td></td>
</tr>
</tbody>
</table>

About one-third (31%) commuted fewer than 10 miles one-way. About four in ten (43%) said they traveled between 10 and 19.9 miles. About one-quarter (26%) had commute distances of 30 miles or greater.

Commute Travel Time – Survey respondents commuted, on average, about 39 minutes one way, slightly higher than the 34 minute regional average as measured in the 2004 State of the Commute Survey. As shown in Table 25, about four in ten (40%) of respondents commuted less than 30 minutes and 53% commuted between 30 and 59 minutes. The remaining 19% traveled an hour or more.

NON-COMMUTE TRIPS MADE DURING THE WORK DAY

The preceding sections have described results about commuting behavior. Respondents also were asked several questions about trips they made during their work day for purposes other than for commuting. These results are shown in Figure 7 and Table 26.

About half (49%) of respondents said they did not make any non-commute trips during their work day in the past two weekdays. The remaining 51% said they made one or more trips. One third (35%) made one or two trips, 14% made three to five trips, and two percent made six or more trips over the two day period. On average, respondents made 1.2 trips over the two day period or about three trips per week.

Two-thirds (69%) of the non-commute trips were made by driving alone. About 17% were made by train or bus and one in ten (9%) trips was made by driving or riding with someone.

Table 26
Types of Transportation Used for Non-Commute Trips
(n=75)
Respondents were asked a third set of questions about commute assistance services that were available to them at their work. They also were asked if various commute assistance services would encourage them to use carpool, vanpool, transit, or bicycling/walking for their commute. The intent of this section was to examine both the currently available services and the motivating value of other commuting services that could be offered to employees. Results to these questions are provided below.

**Parking and Commute Financial Incentives Available at Worksite**

**Parking Location and Fees** – Respondents were asked where they parked if they drove to work and if they had to pay to park. Nearly all (95%) of the respondents said they parked “on-site” when they drove. The remaining five percent said they parked “off-site,” “on the street,” or in “another location.”

Table 27 shows the distribution of parking fees paid by employees. About three in ten (31%) said they have free parking at their work location. The majority (69%) said they have to pay a fee to park if they drive to work. Respondents paid between $5 per month and $115 per month to park, with an average fee of $13 per month. Sixty-five percent paid between $1 and $24 per month.

**Table 27
Amount of Parking Fee at Work**

</tr>
<tr>
<td>$75 to $99 per month</td>
<td>0%</td>
</tr>
<tr>
<td>$100 or more per month</td>
<td>2%</td>
</tr>
</tbody>
</table>
Financial Incentives for Non-Drive Alone – Nearly all (88%) of respondents said their employer offers free or discounted transit passes, such as Metrochek, or offers to pay or reimburse a portion of the respondents commuting expenses, other than for parking. The remaining 12% said they did not have access to this financial incentive or they did not know if their employer offered it.

Table 28 presents the distribution of respondents by the amount of incentive payment or reimbursement the employer provides. As shown, about two-thirds of respondents who said they had access to a financial incentive for non-drive alone commuting could receive between $31 and $60 per month. About a quarter said the incentive was less than $31 per month and 13% said they could receive more than $60 per month.

</tr>
</tbody>
</table>

Interest in Other Commute Assistance Services

Respondents were asked if various commute assistance services would encourage them to use non-drive alone types of transportation for their work trips. Some of the services, such as “$100 subsidy for vanpool,” were targeted to a specific non-drive alone mode. Others, such as “Guaranteed Ride Home in case of emergency,” could be used for any non-drive alone mode. Respondents were asked to specify if each service: “would encourage,” “might encourage,” or “would not encourage” them to use transit, ridesharing, or bicycle/walk, as appropriate. Respondents who used the targeted modes now were asked to check “use this mode now.”

Table 29 presents the results of this series of questions. The 11 services presented to respondents are grouped into three categories: financial incentives, access to transit, and information/convenience services. The second column, with the heading of “n=___”, shows the number of respondents who were not currently using the targeted mode who answered the question.

Services Perceived as Most Valuable – As the table indicates, 30% or more respondents cited six services, those shaded in the table, as services that either “would encourage” or “might encourage” them to use the targeted types of transportation. Two of the services that appear to be influential were in the “Access to Transit” category. These included: shuttle to Metrorail station, and more Metrorail station
parking. These services were noted by 39%, and 33% of respondents, respectively, as having some motivational impact.

Two services were noted in the “Financial Incentive” category. About 44% of respondents said “$100 subsidy for bus/train,” would or might encourage them to use transit and 34% said “$100 subsidy for vanpool” would or might encourage them to use vanpooling.

Two services in the “Information/Convenience Services” category also had support by more than 30% of respondents. These included: “Guaranteed Ride Home in case of emergency, cited by 44% as potentially influential, and “Convenience shopping at Metro station,” which was noted by 33%.

</tbody>
</table>

The importance of access to transit is notable, particularly when compared to the functions of other services that were tested in this question. While the specific factors influencing mode choice vary from one commuter to another, most commuters choose their modes based on four factors: availability, cost, time, and convenience of the modes. Since most respondents have a vehicle available for commuting, driving alone is an available option, but transit might be unavailable or difficult to access. The four services included in the “Access to Transit” category are designed to make it easier to reach transit on either the home or work end of the commute trip.

Information and convenience services, with the exception of “Guaranteed Ride Home” and “convenience shopping at Metrorail station,” were generally perceived as less valuable to respondents. It is worth noting that the lower rankings of the two bicycle support services could be due in part to other constraints on bicycling to work, such as long commuting distance or the need to drop a child at school or day care on the way to work.
SUMMARY OF RESULTS – EMPLOYEE SURVEY

The two primary purposes of the Employee Survey were to examine current commute behavior and explore residents’ access to and interest in commute assistance services at their work locations. Following is a summary of the key results:

Work Schedule

- 93% of employed respondents worked full time (35 or more hours per week). About 2% said they work a “compressed work schedule.”
- 71% worked a flexible schedule – that is, they can choose their start and end times as long as they work a required number of hours in a day or week.
- About a quarter (24%) arrived at work before 8 am. About half (53%) arrived between 8 am and 9:29 am. The remaining quarter arrived at 9:30 am or later.
- Work departure times were more concentrated than were arrival times. About two-thirds (65%) leave between 5 pm and 6:59 pm. Another 15% said they leave work between 4 pm and 4:59 pm.

Commute Patterns

- Driving alone is the most popular commute transportation among respondents, with over more than three-fourths (76%) of respondents using this as the primary mode. The second most popular mode was Metrorail. About one in five (17%) respondents primarily used Metrorail to travel to work.
- Driving alone accounts for about 73% of weekly commute trips for these respondents and Metrorail accounts for about one in five (18%) weekly trips.
- Respondents generally were consistent in their choice of type of transportation. About 72% said they used the same type of transportation every day they commuted to work.
- A large proportion (76%) of respondents said they live in Virginia: 48% in Fairfax County and 28% in another Virginia County. About one in ten (10%) lived in the District of Columbia. The remaining 14% lived in Maryland.
- Respondents traveled on average 15.3 miles and 39 minutes to work.

Non-Commute Trips During the Work Day

- About half (51%) of respondents made one or more non-commute trips during their workday in the over a two day period. Respondents made an average of 3 trips per week during their workday.
- About two-thirds (69%) of these trips were made by driving alone. About 17% were made by transit and 10% were made by driving or riding with someone. Five percent were made by walking or bicycling.

Commuter Assistance Services at the Work Location

- Nearly all (95%) respondents park on-site when they drive to work.
• About one-third (31%) said they park for free. The remaining 69% said they pay a fee to park, with an average fee of $13.00 per month.

• Most (88%) respondents said their employers offer discount transit passes or offer to reimburse part of their commuting expense. About two-thirds of these respondents (64%) said the employer offers between $31 and $60 per month. Another quarter (23%) said they can receive less than $31.

• Respondents who drive alone now said some commute services would or might encourage them to use transit or other non-drive alone transportation to get to work. Valuable services included:

**Demographics**

• About two-thirds (69%) of respondents said they had one or two motor vehicles owned or leased by members of their household.

• About half (54%) of the respondents were between the ages of 25 and 44. About a third (34%) were 45 of age or older.

• Nearly three-quarters (72%) of the respondents said they worked in “professional” occupations. Another 17% worked in “executive/managerial” jobs.

• About three-quarters (76%) of respondents were of White/non-Hispanic racial background. Five percent were of Asian background, five percent were African-American, and three percent were Hispanic.

Fairfax County Resident Transportation Survey

The Fairfax County Department of Transportation is conducting this survey to find ways to improve transportation services around the Vienna-Fairfax-GMU Metrorail Station. Your participation is valuable and your answers will be confidential. Please ask each member of your household 18 years or older to complete this survey and postmark it by May 13, 2005 to: Vienna Metro Survey, c/o UrbanTrans Consultants, 318 Aspen Street, NW, Washington, DC 20012

ENTER TO WIN A PRIZE – Residents who complete the survey will be entered into a drawing for an American Express gift card worth $400. To participate, provide your name and phone number at the end of the survey.

THANK YOU – WE VALUE YOUR INPUT AND COMMENTS!

1. Do you regularly travel to a work or school location outside your home, one or more days per week?
   - No (Skip to question 11, on the other side)
   - Yes (Continue to question 2)

2. Which of the following best describes your assigned work or school schedule? (Check only one box)
   - I work or am at school less than 35 hours per week
   - I work or am at school 5 days per week, 35 or more hours per week
   - I work a 9/80 compressed (alternative) schedule (9 days every two weeks, 80 hours)
   - I work a 4/40 compressed (alternative) schedule (4 10-hour days per week, 40 hours)
   - I work a 3/36 compressed (alternative) schedule (3 12-hour days per week, 36 hours)
   - Other _______________________________________________

3. Do you work a flexible schedule or flex-time, in which you choose the times you start and stop work, as long as you work a required number of hours in a day or week?
   - No
   - Yes

4. In the table below, indicate the number of WEEKDAYS (Mon-Fri) you used each of the types of transportation shown to get to work or school LAST WEEK. If you used more than one type on any day, e.g., walked to a bus stop then rode the bus, count ONLY the type you used for the longest distance part of the trip.
   If you were NOT at your regular work or school location one or more weekdays, indicate if you worked at home all day (telecommute) or if you were absent for another reason (e.g., regular day off, sick, business trip, etc.).

<table>
<thead>
<tr>
<th>Type of Transportation (longest distance part of trip)</th>
<th>Number of Weekdays Used LAST WEEK</th>
<th>Example</th>
</tr>

<td></td>
<td></td>
</tr>
<tr>
<td>Worked at home all day (telecommuted)</td>
<td>1</td>
<td></td>
</tr>
<tr>
<td>Absent from work for other reason</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

5. If you take a bus or train from the Vienna Metrorail station to go to work or school, how do you get to the station?
   - I don’t ever take a bus or train to work/school
   - I drive myself and park
   - I walk
   - I take a bus
   - I bicycle
   - I catch the bus or train at a location other than the Vienna station
   - I carpool and we park
   - I’m dropped off (kiss & ride)

---

Example: I worked five days: I drove alone 3 days, took Metrorail 1 day, and worked at home (telecommute) 1 day
6. About how many miles is it from your home to your usual work/school location? _______ miles
   How many minutes does it typically take you to travel from home to this location? _______ minutes
   At what time do you usually arrive at work/school? ____________ a.m. / p.m. (please circle one)
   What is the zip code of your work/school location? ______________

7. Is FREE parking available to you at or near your work/school? (Please answer, even if you never drive to work)
   q Yes  q No  q Don’t know

   PLEASE TURN OVER AND COMPLETE THE QUESTIONS ON THE OTHER SIDE OF THIS SHEET

8. Does your employer/school offer you free or discounted transit passes (e.g., Metrochek) or offer to pay or reimburse part of your commute expenses, other than for parking?
   q Yes  q No  q Don’t know

9. Listed below are services that could help you travel by carpool, vanpool, bus, train, or bicycle. For each service, check if the service would encourage you to use the type of transportation underlined for your trip to work or school. For example, check “Yes,” for “safe walking route/path to Metrorail station for train, bus riders,” if that service would encourage you to take the train or bus. If you already use the type of transportation noted, check the box “Use Now.”

10. How long does it (or would it) take you to walk from your work or school to the nearest...

   Metrorail station? q less than 5 min.  q 5-10 min.  q 11-20 min.  q More than 20 min.  q Don’t know
   Bus stop? q less than 5 min.  q 5-10 min.  q 11-20 min.  q More than 20 min.  q Don’t know

11. In the PAST TWO WEEKDAYS (Mon-Fri), about how many trips did you make from your home to another location for a purpose OTHER THAN travel to work or school (e.g., shopping, personal appointment, pick-up a child)?
   q No non-work trips (skip to question 13) ______________ non-work trips

12. Did you make any of these non-work trips between the hours of 6 am and 9 am?
   q No (skip to question 13)  q Yes

   12a. How many did you make by each of the following types of transportation?
   _______ Drove alone  _______ Drove or rode with others
   _______ Rode bus or Metrorail  _______ Walked or bicycled
Please also answer questions 13-16. This information will be confidential and used ONLY for classification purposes.

13. In what neighborhood do you live (e.g., Circle Woods, Country Creek)?

14. How many persons live in your home? Please count yourself, family, and anyone who may be unrelated to you such as live-in housekeepers or boarders. How many of these household members are under the age of 16?

Total persons in the household _______________

Number of household members under 16 _______________

15. How many motor vehicles (cars, trucks, SUVs, motorcycles) are owned or leased by members of your household?

☐ 0 ☐ 1 ☐ 2 ☐ 3 - 4 ☐ 5 or more

16. Which of the following categories includes your age?

☐ 18 - 24 ☐ 25 - 34 ☐ 35 - 44 ☐ 45 - 54 ☐ 55 - 64 ☐ 65 or older

THANK YOU FOR COMPLETING THE SURVEY!

If you would like to be entered into the prize drawing for the $400 gift card, provide your name and phone number below.

Name ____________________________________________________ Phone: _______________________________

Please check the submit button below. (Paper version will say: Please return the survey to____)
APPENDIX 2 – EMPLOYEE SURVEY QUESTIONNAIRE
(Paper version, but survey was conducted on-line)

Employee Transportation Survey

The Fairfax County Department of Transportation is conducting this survey to find ways to improve transportation services around the Vienna-Fairfax-GMU Metrorail Station. Your participation is valuable and your answers will be confidential. Please complete this survey and postmark it by May 13, 2005 to: Employee Travel Survey, c/o UrbanTrans Consultants, 318 Aspen Street, NW, Washington, DC 20012

ENTER TO WIN A PRIZE – Employees who complete the survey will be entered into a drawing for an American Express gift card worth $400. To participate, provide your name and phone number at the end of the survey.

THANK YOU – WE VALUE YOUR INPUT AND COMMENTS!

1. Which of the following best describes your assigned work schedule? (Check only one box)
   - I work less than 35 hours per week
   - I work 5 days per week, 35 or more hours per week
   - I work a 9/80 compressed (alternative) schedule (9 days every two weeks, 80 hours)
   - I work a 4/40 compressed (alternative) schedule (4 10-hour days per week, 40 hours)
   - I work a 3/36 compressed (alternative) schedule (3 12-hour days per week, 36 hours)
   - Other _______________________________________________

2. Do you work a flexible schedule or flex-time, in which you choose the times you start and stop work, as long as you work a required number of hours in a day or week?
   - No
   - Yes

3. At what time do you usually arrive at work? _______ a.m. p.m. (please circle one)
   At what time do you usually leave work? _______ a.m. p.m. (please circle one)

4. About how many miles is it from your home to your usual work location? _______ miles
   How many minutes does it typically take you to travel from home to this location? _______ minutes

5. In the table below, indicate the number of days (Mon-Fri) you used each of the types of transportation shown to get to your regular work location LAST WEEK. If you used more than one type on any day, e.g., walked to a bus stop then rode the bus, count ONLY the type you used for the longest distance part of the trip.

   If you DID NOT work at your regular work location any day, Monday-Friday, please indicate it you worked at home all day (telecommute) or if you were absent for another reason (e.g., regular day off, sick, business trip, etc.).

<table>
<thead>
<tr>
<th>Type of Transportation (longest distance part of trip)</th>
<th>Number of Weekdays Used LAST WEEK</th>
</tr>
</thead>
<tbody>
<tr>
<td>Drove alone in a car, truck, SUV, or motorcycle</td>
<td>3</td>
</tr>
<tr>
<td>Rode in a taxi</td>
<td></td>
</tr>
<tr>
<td>Drove or rode with others (carpool or vanpool)</td>
<td></td>
</tr>
<tr>
<td>Took Metrorail, MARC, Amtrak, or VRE train</td>
<td>1</td>
</tr>
<tr>
<td>Took Metrobus, Fairfax Connector, CUE, or other bus</td>
<td></td>
</tr>
<tr>
<td>Walked or bicycled (entire trip from home to work)</td>
<td></td>
</tr>
<tr>
<td>Other</td>
<td></td>
</tr>
<tr>
<td>Worked at home all day (telecommuted)</td>
<td>1</td>
</tr>
<tr>
<td>Absent from work for other reason</td>
<td></td>
</tr>
</tbody>
</table>

Example:
I worked five days: I drove alone 3 days, took Metrorail 1 day, and worked at home (telecommute) 1 day
6. In the PAST TWO WORK DAYS (Mon-Fri), about how many trips did you make during your work day for purposes OTHER THAN travel to work (e.g., shopping, personal appointment, pick-up a family member, etc.)?

- No non-work trips (skip to question 7)
- _______ non-work trips

6a. How many of these trips did you make by each of the following types of transportation?

- _______ Drive alone
- _______ Drive/ride with others
- _______ Bus or Metrorail
- _______ Walk or bicycle

7. On days that you drive to work, even if you only drive occasionally, where do you park?

- I never drive to work (skip to question 8)

I park:
- in a lot/garage at my work location
- in a public lot/garage off-site
- on the street
- other ______________________

7a. How much do you pay to park?

- _______ No charge, I park for free
- _______ _______ per: day / month (circle one)

8. Does your employer offer you free or discounted transit passes (e.g., Metrocheck) or offer to pay or reimburse part of your commute expenses, other than for parking?

- No, don’t know (skip to question 9)
- Yes

8a. How much does your employer offer to pay per month?

- $1–30
- $31–60
- $61–99
- $100+
- Don’t know

9. Listed below are services that could help you travel by carpool, vanpool, bus, train, or bicycle. For each service, please check if the service would encourage you to use the type of transportation underlined for your trip to work. For example, check “Yes,” for “safe route/path to walk from Metrorail station for train riders,” if that service would encourage you to take the train. If you already use the type of transportation noted, check the box “Use Now.”

<table>
<thead>
<tr>
<th>Commuting Service</th>
<th>Would the service encourage you to use carpool, vanpool, bus, train, or bicycle to get to work?</th>
</tr>
</thead>
<tbody>

<tr>
<td>Shuttle bus to bus stop or train station</td>
<td></td>
</tr>
</tbody>
</table>

Please also answer questions 10-14. This information will be confidential and used ONLY for classification purposes.

10. What is your zip code at home? ______________________

11. How many motor vehicles (cars, trucks, SUVs, motorcycles) are owned or leased by members of your household?

- 0
- 1
- 2
- 3-4
- 5 or more

12. Which of the following categories includes your age?
13. **Which of the following categories best describes your occupation?**

- Sales
- Technician
- Executive/managerial
- Administrative support, clerical
- Laborer
- Professional
- Machine operator, assembler
- Maintenance, facilities service
- Military
- Precision craft
- Retail, hospitality service
- Other ______________________

14. **What is your MAIN racial or ethnic heritage?**

- White, non-Hispanic
- Hispanic/Latino
- Asian
- African-American
- Other

</table>

The Average Vehicle Occupancy (AVO) is the average number of passengers in vehicles leaving and entering this access point to this development during the entire AM and PM peak travel periods.

**Vehicle Occupancy**

Vehicle Occupancy counts were gathered manually during one mid-week day in May 2005. The counts represent AM and PM peak travel periods. AM peak travel period falls between 6:00 AM and 9:00 AM and PM peak travel period falls between 4:00 PM and 7:00 PM. What is displayed here is the number of passengers in vehicles leaving and entering this access point to this development during AM and PM peak travel periods.

**Vehicle Volumes by Period and Direction**

Vehicle Volumes were gathered from machine counts over a three-day, mid-week period during the month of May 2005. What is displayed here is an average of the vehicle counts captured at this intersection over a three day period.
This is the intersection of Regents Tower Street and Lee Highway.

The Average Vehicle Occupancy (AVO) is the average number of passengers in vehicles leaving and entering this access point to this development during the entire AM and PM peak travel periods.

#### Vehicle Occupancy

Vehicle Occupancy counts were gathered manually during one mid-week day in May 2005. The counts represent AM and PM peak travel periods. AM peak travel period falls between 6:00 AM and 9:00 AM and PM peak travel period falls between 4:00 PM and 7:00 PM. What is displayed here is the number of passengers in vehicles leaving and entering this access point to this development during AM and PM peak travel periods.

Appendix 3

2000 Census Analysis
The following charts outline commute mode choice and demographic data for the Vienna Transit Station Area (approximately \( \frac{1}{2} \)-mile radius from the Vienna Metro Station, as defined by the Fairfax County Comprehensive Plan) alongside data for Fairfax County as a whole. Commute mode split information is also included for the area within a 3-mile radius of the Vienna Metro station. All data is from the 2000 Census, including data from the Census Transportation Planning Package (CTPP), which includes 2000 Census Journey to Work data. All data pertains only to residents living within the defined geographies.

All demographic charts provide data summaries regardless of commute mode (depicted as “all trips”), as well as the demographic breakdown specifically for each of three commute to work modes: single-occupant vehicle (SOV), 2 or more person carpools, and transit (which includes all transit modes – rail, bus, shuttle).

Key findings from the 2000 Census data analysis include:
- Transit mode share approximately three times higher within the Transit Station Area than the County as a whole.
- Higher individual income levels, across all modes, with the Transit Station Area. Particularly high income representation among Transit Station Area carpoolers. High-income representation for transit users:
  - 56.7% of Transit Station Area transit riders earn >$50,000 (47.8% County-wide).
- Greater representation of residents aged 25-44 within the Transit Station Area, tracking across modes.
- Race/ethnicity distribution distinct for carpooling only, in the Transit Station Area and County-wide. No significant race/ethnicity distinctions between the Transit Station Area and the County.
- Greater male representation in the Transit Station Area than County-wide across all modes except transit riders.
- Lower levels of vehicle ownership within the Transit Station Area, with the largest number of households owning 1 or fewer vehicles being transit riders (39.5% of transit riders with the Transit Station Area own <1 vehicle in their HH).
- Residents with the Transit Station Area (65.4%) and specifically transit riders within the Transit Station Area (75.3%) live in households with no children under age 18.

Appendix 4

Current TDM Programs, Opportunities, and Barriers
The following summary is intended to provide an overview of current transportation
demand management (TDM) programs currently offered by state, regional, and county
TDM providers. The services represent the foundation of TDM programs offered from
which the Fairlee / MetroWest TDM program recommendations will build upon.

**Metropolitan Washington TDM Services**

Commuter Connections was originally created in 1974 as the Commuter Club, providing
one of the first computerized carpool matching systems in the nation. The Commuter
Club network consisted of the Metropolitan Washington Council of Governments (COG),
General Services Administration (GSA), and the Greater Washington Board of Trade.
COG provided the direct ridematching services to the public. This service was and still
is provided free to anyone who requests ridematching information. In the 1980’s, the
local government agencies of City of Alexandria, Fairfax County, Montgomery County,
Prince William County, and the Northern Virginia Transportation Commission joined the
network. The Commuter Club network members used COG's ridematching software
and shared one regional database for ridematching. It was in the mid-1980’s that the
network changed its name to the RideFinders Network.

By 1994 the network had grown in membership to include all Washington D.C. area
local governments, a few federal agencies, several Transportation Management
Associations, and government agencies from the Baltimore area, southern Maryland,
and northern Virginia.

In 1996 and 1997, the services provided by the RideFinders Network had grown beyond
just carpool/vanpool matching to include transit route and schedule information, a
regional Guaranteed Ride Home program, bicycle to work information, park-and-ride lot
and HOV lane information, telecommute/telework program assistance, InfoExpress
commuter information kiosks, commuter information services through our Internet site,
and employer services. It was in 1996 that the network changed its name to Commuter
Connections.
Funding for Commuter Connections is provided to the Metropolitan Washington Council of Governments by the U.S. Department of Transportation, District of Columbia Department of Transportation, Maryland Department of Transportation, and Virginia Department of Transportation. Many of the local Commuter Connections members receive grant funding directly from their respective state government.

**Fairfax County TDM Services**

**Employer Outreach**
Fairfax County has an **Employer Services Program** that helps businesses and employees find transportation solutions. The program exists not only to make their company more successful, but to improve the economic vitality and quality of life for the entire region. They have an Employer Services Specialist who works on-site with employers to help them realize bottom-line benefits of commute alternatives.

The **Employer Services Program** provides the following services to employers **free of charge**:

- Development of tax-free commute benefit programs ([Metrochek](http://www.commuterconnections.com/metrochek.htm), [Metrochek Match](http://www.commuterconnections.com/metrochekmatch.htm))
- On-site transportation assessments
- Confidential employee commute surveys
- Mapping of employee residence patterns
- Computerized [ridematching](http://www.commuterconnections.com/ridematching.htm)
- Corporate relocation assistance
- On-site rideshare promotions and displays
- Assistance in implementing alternative commute programs and incentives
- Coordination with nearby companies to establish commuter programs
- Training an on-site Employee Transportation Coordinator (ETC)
- Development of incentive programs
- Program follow-up and evaluation
- Transit schedules, route maps and [park-and-ride](http://www.commuterconnections.com/parkandride.htm)
- New employee commute options information
- Assessment of parking options
- Development of a [telework](http://www.commuterconnections.com/telework.htm) program

Offering these services at the County level, the Fairfax County TDM program mirrors the regional Commuter Connections’ TDM programs. However, Commuter Connections does offer some regional services that are not offered at County level (as these are implemented more efficiently at the regional level):
• Guaranteed Ride Home (GRH)
• Ozone Action Days
• Bike to Work Day

Guaranteed Ride Home provides commuters who regularly carpool, vanpool, bike, walk or take transit to work with a reliable ride home when one of life’s unexpected emergencies arises. Commuters are able to use GRH to get home for unexpected personal emergencies and unscheduled overtime up to FOUR times per year. The GRH ride home by taxi, rental car, bus or train is free!

Commuter Connections will reimburse costs associated with the use of transit during an authorized GRH trip. They send a GRH Transit Reimbursement Voucher in the mail shortly after a GRH trip. The commuter completes and returns the Voucher to Commuter Connections within thirty days to receive their reimbursement.

The Fairfax County Employer Services Program provides employers with personal assistance with the following:

• Surveying employees to determine transit needs and preferences
• Helping with carpool and vanpool formations
• Providing up-to-date information on local bus schedules
• Helping implement Metrochek program

Fairfax County markets the typical employer benefits of promoting commute alternatives to their employees including:

• Improved employee productivity
• Improved morale
• Easier recruitment and retention
• Reduced parking and office space needs and costs
• Easier access and traffic flow at work site
• Reduced absenteeism and late arrivals
• Public recognition as a good corporate citizen

Commuter Outreach

The RideSources Program is operated by the Fairfax County Department of Transportation. The RideSources program provides commuters with free ridesharing information, including ridematching assistance to form or join carpools or vanpools. Commuters can call or mail in a RideSources application, and will be entered into a regional database which will match them with neighbors who share similar work schedules and travel patterns. This regional database is the Commuter Connections’ system.
Fairfax County markets the typical employee benefits of promoting commute alternatives to their employees including:

- Reduced commuting time and expenses/Access to HOV lanes
- Reduced wear-and-tear on personal vehicles
- Less stress
- More productive time while riding to and from work
- Flexible work schedules

They also try to appeal to the people who want to be good citizens and promote the Community Benefits of commute alternatives including:

- Easier travel on streets and highways
- Increased economic vitality
- Economic development benefits
- Cleaner air
- Improved overall quality of life

Fairfax County also offers a reduced personal-property tax rate for 12-15 passenger vans.

Residential Outreach

The Fairfax County Community Residential Program (CRP) partners with residential developments, multi-family complexes and associations to promote use of alternative modes of transportation including public transit. CRP is dedicated to encouraging people who live, work or commute through Fairfax County to use mass transit, carpools, vanpools, walking, biking or teleworking instead of driving alone.

Community Residential Services staff works with developers, property managers, and association leaders to create simple and effective Community Transportation Programs. Currently there are over 600 area residential communities and businesses in the partnership. The following services are provided to CRP members free of charge:

- **Assessment** – During the initial meeting staff completes a needs assessment to determine which transportation programs will be most beneficial to their community and establishes a Community Residential Transportation Coordinator (CRTC).
- **Residential Transportation Survey** – CRP staff survey residents’ to assess their transportation patterns and needs.
- **Plan & Implementation** – Staff works with the CRTC to design and facilitate the implementation of a Community Transportation Program.
• **Information Dissemination** – Staff serve as a regional transportation information resource by providing and distributing information to multi-family complexes and associations that request materials.

• **On-Going Support** – Staff offers on-going support by providing follow-up surveys, marketing, and technical support to Commuter Transportation Programs.

CRP compliments Fairfax County’s employer and commuter outreach efforts by reaching commuters where they live and increasing their knowledge of transit and transportation options available in their community.

Community Residential Transportation Coordinators are asked to assist with the residential program by doing the following:

• Serving as a liaison to CRP staff and disseminates transportation information to residents.

• Conducting at least one promotional effort that encourages commuter programs.

• Developing an incentive for residents to use different transportation methods.

Fairfax County and CRP recognize partners that implement a Community Transportation Program with either Bronze, Silver, Gold or Platinum levels depending on the level of assistance they provide their residents. Incentives are available for Platinum Level participants.

**Fairfax County HOV Lanes**
HOV, or High Occupancy Vehicle lanes are available to ridesharers on Interstate 66 and on Interstates 95 and 395 in Fairfax County. Vehicles must have a minimum number of occupants to travel on these lanes during peak commuting hours.

**Fairfax County Current Transit Services**
MetroRail (Orange Line and Blue Line) and Metrobus
Fairfax Connector Bus – Intra County Transit Service
CUE – City of Fairfax Transit
VRE – Regional Rail Service (Alexandria, Burke, Lorton, and Springfield)
FASTRAN – Para-Transit Services
TAGS Bus Service - The TAGS bus is a shuttle service, operated by Metro, that circulates in Springfield's business district.
Fairfax County Park and Rides

Rideshares may choose to use one of the Park & Ride lots listed in this brochure to meet carpools and vanpools, or you may choose to meet fellow ride-sharers at home or other locations.

Register for the Guaranteed Ride Home (GRH) Program by calling 1-800-745-RIDE, and we'll pay for your taxi ride home if an emergency arises on a day that you ride-share.
Fairfax County Vanpool Providers

Fairfax County Department of Transportation RideSources works in tandem with Commuter Connections to help commuters find riders with whom they can vanpool. In addition to many private individuals operating vanpools in Fairfax County and the Metropolitan Washington Region there are several third-party vanpool providers which include:

- VPSI Commuter Vanpools
- ABS Vans-Metro
- Access Transportation Services

Fairfax County TDM Organizations

DATA
The Dulles Area Transportation Association (DATA) is a Transportation Management Association (TMA) that identifies transportation needs; advocates steps to meet those needs; and provides a forum for members and other concerned parties to be informed of opportunities and participate in timely actions that will bring about a more effective transportation system.

DATA's Area of Operations encompasses an approximately 150-square mile area bounded by the Potomac River on the north, Hunter Mill Rd. on the east, by the Route 15 corridor on the west, and the Rt. 66 corridor on the south.

LINK
LINK provides information on alternative transportation methods you may use to get to and from Reston and Herndon.

TAGS
The Transportation Association of Greater Springfield (TAGS) is a non-profit, public-private transportation management association that plays a key role in the transportation improvement plan for the rapidly growing Greater Springfield area.

TYTRAN
The TYTRAN Commuter Program is a voluntary program that provides opportunities for member employees to participate in a variety of ridesharing activities designed to increase employee awareness of transit and transportation options into and around the Tysons Corner area.

Current Commuter program elements include carpool and vanpool matchlist generation; provision of transit schedules and itineraries; general alternative transportation
Virginia Commonwealth Wide TDM Services
There are a number of Virginia funded TDM programs operated through Commuter Connections including:

- TeleworkVA
- The Virginia Vanpool Assistance Program

Telework!VA
Telework!Va offers employers up to $35,000.00 to start or expand a formal telework program.

Telework!Va is a public / private partnership serving Northern Virginia businesses. Companies can receive as much as $3,500 per employee (for up to ten employees) to establish a telecommuting link, lease home office equipment or pay for office space at a convenient telework center.

It is a pilot program administered by the Commonwealth of Virginia Department of Rail and Public Transportation (DRPT) through the Metropolitan Washington Council of Governments (MWCOG).

The Telework!Va Program is limited to reimbursement of lease costs and consultant/technical assistance expenses. It reimburses a variable percentage of the lease expense for equipment; telework center space; technical assistance for setting up programs and installing equipment; and provides training for teleworkers and supervisors. No purchases are eligible for reimbursement.

Business applications to participate in the Telework!Va pilot program are now being accepted for review by DRPT and MWCOG. Applicants must demonstrate their willingness to start a long-term program, invest in the planning and staff resources required to sustain a program and commit to an implementation schedule with appropriate milestones of two (2) years or less. Priority is given to new program starts although existing program expansion requests may be considered on a case-by-case basis. Employers are required to sign a contract with the Metropolitan Washington Council of Governments (MWCOG) on behalf of the Virginia Department of Rail and Public Transportation.

The Virginia Vanpool Assistance Program
The Virginia Vanpool Assistance Program, sponsored by the Virginia Department of Rail and Public Transportation, provides temporary funding for vanpools having trouble filling all of their seats. There are two different programs: the VanStart Program, which funds empty seats during the critical start up phase of new vanpools; and the VanSave
Program, which is for existing vanpools that are experiencing problems in their passenger levels due to the loss of riders.

Anyone operating a vanpool that serves residents of the Commonwealth of Virginia can apply for assistance. The vanpool must be a non-profit organization and have a seating capacity of no less than six and no more than fourteen (excluding the driver.) The vanpool operator must certify that the van has PV plates and is appropriately insured under a Commercial Auto Policy or Vanpool Policy and registered with the local jurisdiction’s rideshare agency.

The VanStart Program and the VanSave Program have some differences in their eligibility requirements.

Under the VanStart Program, the owner/operator must register the vanpool and apply for assistance within the first three months of operation with the local jurisdiction’s rideshare agency. At least 50% of the passenger capacity must be full.

Under the VanSave Program, the vanpool must have been in operation for a minimum of six months and may not have received any state assistance funds in the past 12 months. At least 25% of the paying passenger capacity must have been empty for more than 30 days at time of application.

The amount of funding is based on the average cost per seat of the vanpool and the average cost per seat of similar vanpools traveling the same distance.
Fairlee / MetroWest – TDM Opportunities & Barriers Assessment

The following section highlights opportunities and barriers to successful TDM program implementation at Fairlee / MetroWest. The analysis considers opportunities and barriers that are part of existing conditions within the Vienna Transit Station Area. Opportunities are best understood as elements which aid and facilitate successful TDM applications (things to build upon for success), and barriers can be considered as hurdles to the potential success of TDM measures, if not sufficiently addressed or mitigated with other strategies or recommendations.

Opportunities

Opportunity #1: Existing Mass Transit Network
The Vienna-Fairfax-GMU Metro station offers rail and/or bus transit services to just many of the major activity centers within the Washington region. In addition to Metro’s Orange line to Downtown DC, the CUE Gold and Green lines provide bus service to major destination in the City of Fairfax, the Fairfax Connector provides bus service to the rest of Fairfax County, including the targeted location of Tysons Corner, and OmniRide provides express bus service on the HOV lanes of I-66.

Due to the extremely high frequency of service, Metro Rail timetables for peak hours (weekdays 5-9:30 a.m. and 3-7 p.m.) are not available or needed. Headways on the MetroRail Orange line are 12 minutes for midday service (9:30 am – 2:30 pm). These headways provide convenient service without the need for a schedule.

The Vienna Metro Station is at the western end of the Orange Line. This location provides residents of this area with access to the all other station locations within region. The Orange Line connects with the Blue Line in Rosslyn to go to the Pentagon, Airport and Alexandria. It connects with the Red Line at Metro Center to go to points as far northwest as Rockville and Shady Grove and points as far Northeast as Wheaton and Glenmont as well as to critical connections to Amtrak at Union Station. The Orange Line also has a connection with Yellow and Green Lines at Gallery Place–Chinatown to go to points as far northeast as Greenbelt and as far southeast as Branch Ave in Prince Georges County as well as south as far as Huntington in Fairfax County.

According to analysis of 2000 US Census Journey to Work data, the highest density of trip destinations (work locations) for people living within a 3-mile radius of the Vienna Fairfax Metro Station are all in close proximity to the Orange Line Stations, with notable concentrations of employment locations along Metro Rail station locations in Arlington County and in Downtown DC. These work destinations can all be access with a no-transfer trip from the Vienna Fairfax Metro Station. A map of employment locations for residents living within a 3-mile radius of the Vienna station is shown below. The darker the area, the higher the concentration of employment locations.
Opportunity #2: HOV Lanes on I-66
There are High Occupancy Vehicle (HOV) Lanes on I-66 for two or more people from Route 234 in Manassas past the Capital Beltway (I-495) to the Theodore Roosevelt Bridge. Outside of the Beltway one lane (the far-left lane) is reserved Monday through Friday for HOV eastbound in the morning (5:30 am to 9:30 am) and westbound in the afternoon (3:00 pm to 7:00 pm). Inside the Beltway, both lanes are reserved Monday through Friday for HOV eastbound in the morning (6:30 a.m. to 9:00 a.m.) and westbound in the afternoon (4:00 p.m. to 6:30 p.m.).

“The I-66 HOV lanes carried a total of 20,940 people in 9,825 vehicles in 2002 between 6:30 and 9:30 a.m. from Virginia to the core areas. Comparably, the Orange line of the MetroRail carried 24,600 people from Virginia to the core areas of Arlington and DC and beyond.” Avoiding congestion and saving time are two top incentives for using the HOV lanes. Users of the Northern Virginia HOV lanes save a substantial amount of time over the same trip in the conventional lanes. Travel times from the fall of 2003 along I-66 from Route 234 to 23rd & Constitution were 63 minutes in HOV lanes versus 94 minutes.
in non-HOV lanes. (“Second Report of the High-Occupancy Vehicle Enforcement Task Force” by Dennis Morrison VDOT and Captain Mike Counts Virginia Department of State Police, January 4, 2005.)

Opportunity #3: Neighborhood Retail
The Pan Am Shopping Center is just over ½ mile from the Vienna Metro Station, however, much of the proposed development site that is closer to Lee Highway is less than ½ mile from this shopping center, where there is currently a grocery store, café, fast food, and other neighborhood retail. This is a reasonable and realistic walking distance for people to run many of their quick and short daily errands that are normally completed by car in areas where land uses are more segregated and further apart.

Opportunity #4: Existing Bicycle and Pedestrian Trail Networks & Infrastructure
The bike and pedestrian trails surrounding the Vienna Transit Station Area already provide the potential for residents to connect with other destinations in the area by bicycle or walking. Connecting the Vienna Transit Station Area with trails in neighboring East Blake Lane Park opens up bike and pedestrian connections to area destinations that include: Downtown and Historic Old Town Fairfax and George Mason University, as well as a number of area parks including Lake Accotink, Thaiss Memorial, Draper, Kutner, Daniels Run, Van Dyck, and Providence Parks.

Additionally, there are currently bike racks and bike lockers at the Vienna Fairfax Station that enable biking to transit.

Opportunity #6: FlexCar Fleet at Vienna-Fairfax Metro Station
Currently there are a number of FlexCar shared cars available for use at the Vienna Metro Station. A personal Flexcar membership costs only $40 a year. Rates are $7-$10 per hour and $35 - $90 per day. These rates include full insurance, gas, maintenance, cleaning, parking and 24-hour emergency service. FlexCar and ZipCar are the two major shared cars companies operating in the U.S., and Washington, DC, is currently the only market served by both companies. The fact that these companies already operate in the area offered an opportunity for building on current shared car experience and market awareness.

Barriers

Barrier #1: Infrequent Headways on Local Bus Services
Although there is bus service from Vienna Metro Station connecting to most major destinations in Fairfax County, service frequencies are relatively low, reducing user convenience and increasing total travel times. Examples include:

- Local Metro bus service on routes 2B & 2G have hourly headways during off-peak and only 30 minute headways during peak.
• Local Fairfax County Connector bus service on routes 402 & 403 is not available during off-peak hours and only available at 35 minute headways during peak hours.
• Local CUE bus service on Green & Gold routes have only 30-35 minute headways all day long on weekdays.

The nature of the local bus service reduces the viability of transit use for larger market segments traveling between the Vienna Transit Station Area and points not along the Metro Rail system. As the 2000 Census map on page 11 illustrates, a moderate number of residents within the 3-mile radius of the transit station area travel to work at points north within Fairfax County, such as Tysons Corner, Reston, and Herndon.

Barrier #2: HOV Lanes on I-66 nearing capacity
Several factors contribute to I-66 HOV lanes nearing capacity levels during peak periods, including an increase in ridesharing, an increase in usage by low-emission vehicles, and lane violations by ineligible users. This combination of non-HOV use of the HOV lanes during peak hours has increased demand on those lanes and impacted the time savings realized by use of these Lanes on I-66.

Barrier #3: MetroRail Orange Line faces capacity limitations during peak periods
MetroRail transit users currently experience challenges with railcar crowding during peak periods, in particular related to boarding Orange Line trains from Downtown DC in the peak of the afternoon peak hour to return to the Vienna station. Peak hour train crowding challenges can degrade the transit user experience, and increase overall travel times. The Metro Capacity Improvement Plan (CIP) is designed to address capacity issues and meet customer demand throughout the system. Enhancements primarily include an increase in the number of 8-car trains by FY 2006, as well as additional enhancements in future years.

Barrier #4: Poor pedestrian / bicycle connectivity between Vienna Transit Station Area and surrounding neighborhoods and neighborhood retail
Many of the neighborhoods that surround the Vienna Transit Station Area are within walking distance of the Metro Station but do not have safe pedestrian access to it. Some examples are those neighborhoods east of Nutley Road that need to cross several lanes of traffic to get to the station. Other examples are those neighborhoods east of Blake Road who do not have pedestrian access from the side of their development closest to the Metro Station. If they were to enjoy a safe walk on a sidewalk or path to the Metro Station they would have a circuitous walk that was much further than ½ mile.

The Pan Am Shopping Center (At the southeast corner of Nutley Road and Lee Highway) has a grocery store, café, fast food, and other neighborhood retail and is within walking distance of most of the proposed development site, but is not friendly to pedestrians. Employees at ICF Consulting that are less than ¼ mile from the
restaurants in Pan Am Shopping Center often drive because they don’t feel safe crossing Lee Highway.

The extensive network of regional bike trails is not currently well connected to the Vienna Metro Station. The current network of bicycle routes will go underutilized if they cannot be accessed by travelers looking to connect to the Transit Station Area.
Appendix 5

TOD Peer Research

This appendix includes TOD / Development Case Studies, including:

- Pleasant Hill, Contra Costa County, CA (San Francisco)
- Redmond Ridge PUD, King County, WA
- Lloyd District, Portland, OR
- Metropolitan Place, Renton WA

Also included is a summary table highlighting demographic and commute to work mode share percentages for four areas:

- Vienna Transit Station Area (MetroRail) vs. Fairfax County
- Roslyn-Ballston Corridor (MetroRail) vs. Arlington County
- San Francisco: Pleasant Hill (BART) vs. City of Walnut Creek
- San Francisco: South Alameda County (4 BART Stations) vs. the South Alameda Counties of Hayward, Union City, and Fremont
Pleasant Hill  
Contra Costa County, CA (S.Fran.)

Transit: Heavy Rail & Bus  
7 regular-service & 3 express bus routes

TOD Characteristics  
The Pleasant Hill station area currently consists of four residential buildings and one retail site. The residential site ranges from high-intensity market rate condos to affordable apartment housing. Each site is located within ¼ mile of the transit station, with pedestrian connectivity considered fair to good. Parking ratios range from 1 space per unit to 1.9 spaces per unit among the four sites. Densities in the surrounding areas are relatively low (about 9 residents and about 5 employees per acre). The area today has significant surface park-n-ride parking capacity. The area is currently undergoing a second phase of planning and development, which promises to improve the station's connections to the surrounding community by structuring park-and-ride facilities to make room for a walkable mixed-use development. Depending on market conditions and public approvals, the pending development will add between 290,000-456,000 square feet of office space and either 274 or 446 apartments and for-sale townhouses to the station area. It will also add a child care facility and about 42,000 square feet of ground floor retail and restaurants. At completion, the additional redevelopment is expected to cost approximately $235 million, including $40 million of public money. (CA Department of Transportation, 2005)

Mobility Programs  
Pleasant Hill is not served by a site-specific TDM program. TDM services for the area are provided by Contra Costa County and by the regional metropolitan planning organization (MTC). A recent survey of residents found that about 60% of residents worked for employers that allowed them flexible arrival / departure times, and 20% provided some form of transit subsidy assistance.

Results  
Data from recent surveys of residents at all four residential locations found that nearly 45% of residents utilize transit for the commute to work, and about 49% drive alone to work. For non-work trips, surveys show about 71% of trips completed by single-occupant vehicle, yet higher levels of “trip chaining” for these trips (25% of non-work trips were linked to other trip purposes, versus only 15% of work trips linked to other trip purposes). Higher levels of SOV use for non-work trips are likely associated with poor availability of nearby retail services.

**Redmond Ridge PUD**
**King County, WA**

**Transit: Bus** (minimal service, 1 route / 4 trips)

Redmond Ridge is a Planned Urban Development in the unincorporated area of King County, WA, outside of the region’s Urban Growth Boundary (UGB). At full build out, it will include approximately 8,200 residents, 450 retail jobs and 3,700 office employees, in a predominantly rural environment.

**Transit Oriented Development Characteristics**
The site is designed with walking trails, community centers, retail, schools, recreation, et al. The concept is a self-contained island of suburban life within a rural setting. With the challenges of a tight UGB and only limited housing coming on line in the region, this community is functioning as a bedroom community to Cities west including Redmond, Bellevue and Seattle.

Access to the site is via local roads with very limited capacity. The majority of the trip connecting the site with the surrounding jurisdictions is via 2 lane roadways. The overall site contains multiple Park and Pool facilities to encourage carpooling. During design, communications infrastructure (telephone and cable television) were sized to include broadband internet access and allow for wireless connectivity. Homes within the site are wired with internal network connections in most rooms to provide for ease of internet accessibility.

**Mobility Programs**
The site is subject to a County-administered Transportation Management Plan (TMP), which requires the implementation of various travel choice programs and services. The community has elected to join a local Transportation Management Association (TMA) to assist with implementation and monitoring of their TMP. Some of their programs and services include, incorporating transportation into new resident orientations and owner’s association meetings, providing trained transportation coordinators via telephone or email, conducting promotional events and campaigns to increase awareness of travel choices, subsidizing first month transit, coordinating and promoting new program demonstrations and a transit feeder shuttle service.

**Results**
The Redmond Ridge project, even with virtually no transit service available, has achieved a drive alone rate of 70% for peak hour travel (Greater Redmond TMA, 2004). This has been made possible by a spreading of travel times, increases in both carpool and vanpool travel, as well as a growing number of home-based workers. Furthermore, transportation has been inserted as an element of the community’s evolving culture.

GRTMA (July, 2004), Transportation Management Program and Transit Service Plan 2004 Annual Program Review
Lloyd District
Portland, Oregon

Transit: LRT and Bus

Portland’s Lloyd District is bounded by NE Broadway Boulevard on the north, NE 15th Avenue on the east, I-84 on the south and I-5 on the west. Lloyd District is across the Willamette River from the Portland Central Business District, and is home to the Oregon Convention Center and adjacent to the Portland Trailblazers Rose Garden arena.

TOD Characteristics
The Lloyd District is comprised of approximately 650 businesses and 17,000 employees with 2020 employment growth forecasts of 34,000 employees. Residential is evolving with condominium towers throughout the district, though is at a lesser rate than employment. The district has evolved from a retail mall and commercial district with average transit service to a TOD through the inclusion of fixed guideway transit, pedestrian supportive infrastructure, and parking policies, coupled with aggressive planning and partnership programs.

Mobility Programs
The District has a Partnership Plan, which specifically highlights the need for travel choice programs in concert with parking management. Due in large part to the economic drivers of the district and the pre-TOD existence of the Lloyd District Transportation Management Association (LDTMA), this TOD and district has more focused TDM programs and policies than other Portland-area TODs.

Parking availability is limited at growth and actively managed by LDTMA in exchange for managing other travel choice outreach programs. All commercial and commuter parking is fee-based, with residents participating in a residential parking program. Many employers in the district participate in regional transit subsidy program.

Results
According to LDTMA’s Annual Report 2005, driving alone represents only 41.1% of all commute trips, bus/light rail representing an equally strong 40.8% of commute trips, and Carpool, Bike, Walk, Telecommute and Compressed Work Week making up the remaining 18.1%.

Metropolitan Place
Renton, WA

Transit: Bus (10 bus bays / local and regional service)

The Renton TOD, Metropolitan Place, is located across the street from the Renton Transit Center in the downtown of Renton, WA within a suburban community south of Seattle, WA.

TOD Characteristics
Metropolitan Place, includes 4,000 square feet of ground-level retail space and 90 apartments above a two-story garage with 240 parking stalls. 150 of the stalls are dedicated to Park & Ride uses during the day, with the remaining available for shared parking amongst the commercial and residential uses. Residential parking was built at 1 stall per unit. Parking around the site is fee based with nominal charges (maximum of $6.00 per day).

King County Metro, the local transit agency, collaterally invested in pedestrian amenities and gathering places at the newly expanded transit center across the street. These investments included a plaza, fountain and other street furniture. Coffee/espresso service and bike lockers are supplemental features adding to the pedestrian and bicycle environment.

Mobility Programs
No site-specific TDM programs were initiated beyond the TDM programs provided regional by King County Metro. When the project opened, FlexCar provided shared-car vehicles on site.

Results
Residential occupancy is high, and one third of residents use transit, which local staff notes is approximately three times the transit mode share of similar, suburban multi-family residential projects in the area (FHWA, 2004). Site managers have measured residential parking stall usage at .6 stalls per apartment unit, suggesting a degree of self-selection to reside at a TOD location and reduce auto ownership requirements. The FlexCar program no longer operates at the site, due to low usage levels. Areas experts note that shared-car programs regionally have been less successful when connected to bus transit station areas (as opposed to rail transit station areas).

Appendix 6

Community Involvement

This appendix includes the following Community Involvement summaries:

- Providence District Land Use Seminar Overview
- Vienna Township Meeting Overview
- Online Open House Overview
- Open House Overview
Providence District Land Use Seminar Overview

Providence District Land Use Seminar #1 was held May 2, 2005 from 7:30 to 9:00 p.m. The meeting was held at the Fairhill Elementary School located at 3001 Chichester Lane, Fairfax. Over 100 residents were in attendance, not including staff or consultants.

Meeting Notification and Format
This Fairfax County sponsored event was coordinated and promoted through the offices of Providence District Supervisor Smyth’s office to give Providence District residents the opportunity to learn more about land use issues. The Fairlee-Metro West TDM Development project process was one of four topics that were presented at the seminar. The format of these presentations was part informational and part discussion, with time available for questions on each topic. More than half the attendees used one of the two break-out sessions to ask as more specific questions about and provide suggestions for the TDM Development project process.

Land Use Seminar Comment Summary
Meeting participants provided comments verbally and were recorded by the consultant team. The following is a summary of all comments received.

Existing Conditions Comments

- The intersection of Nutley Road and Lee Highway is dangerous for pedestrians.
- Can Metro handle the new riders that will be generated by this project?
- Why doesn’t this project take into consideration off peak travel generated by the proposed TOD?
- Are a 47% reduction in peak period residential trips and 25% reduction in peak period employee trips achievable?
- Will you be able to provide empirical data with very precise strategies for achieving trip reduction goals?
- Sidewalks/pedestrian access in and around the Metro Site is inadequate.
Vienna Township Meeting Overview

The consultant team met with the Vienna Township Mayor, Council Members and staff on May 19, 2005 from 4:00 to 5:00 p.m. The meeting was held at the Vienna Town Hall at 127 Center Street South, Vienna.

Meeting Notification and Format

This meeting was called at the request of Town Council Member Laurie Genevro Cole, who had met the consulting team at the Providence District Land Use Seminar #1. The meeting was intended to provide Vienna Township elected officials and staff with an overview of the TDM Development project process as well as allow them to ask more specific questions about and provide suggestions for the TDM Development project process.

Vienna Township Comment Summary

Meeting participants provided comments verbally and were recorded by the consultant team. The following is a summary of all comments received.

**Existing Conditions Comments**

- Weekend trips are equal to that of peak hour rush.
- Many Metro riders park on Vienna Township residential streets and walk to the Metro station. Vienna Township issued street parking permits and followed up with ticketing to enforce it. This may be something Fairfax County wishes to do too.
- Other than during peak hours, there is no bus service to/from Vienna to the Metro Station.
- There needs to be better coordination between bus and MetroRail schedules.
- The biggest issue is capacity of the Orange Line back to Fairfax in the evening.
- Is the county travel survey being coordinated with the Fairlee-Metro West TDM Development project survey?
- Will there be household counts as part of the study?
- Can we get a list of areas surveyed, organized by HOA?
- Can we get a copy of the survey and survey results?
Online Open House Overview

The consultant team provided an ongoing opportunity for residents in the community to provide their input on the TDM project through the project website at [www.fairleemetrowest-tdm.com](http://www.fairleemetrowest-tdm.com). Comments were accepted on the website from May 6th through June 3rd.

Online Open House Notification and Format

The project web address ([www.fairleemetrowest-tdm.com](http://www.fairleemetrowest-tdm.com)) was promoted on every flyer distributed to HOAs to promote the resident survey as well as the open house. The web address was also promoted on over 7,400 surveys that the consultant team distributed to households in the survey area. The Online Open House was intended to provide a private and open ended forum with no timeframes to ask more specific questions about and provide suggestions for the TDM Development project process.

Online Open House Comment Summary

Online Open House participants provided written comments on the web page which were downloaded into a database and recorded by the consultant team. Each comment submitted was asked to record their zip code for reference purposes. The following is a summary of all comments received.

**Online Open House Comments**

<table>
<thead>
<tr>
<th>Comment</th>
<th>Home Zipcode Of Person Entering Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>• There's already too much development -- and congestion -- around the metro in the form of outsized townhomes, condo complexes etc, and some single family luxury housing. Leave it alone now!</td>
<td>22031</td>
</tr>
<tr>
<td>• 1) Eliminate stop sign for pedestrian walkway South of Vienna Metro - this stop sign backs up car traffic significantly!!! I would estimate, on an average morning, removing this sign would cut 10 minutes off my and thousands of other commuters!</td>
<td>20120</td>
</tr>
<tr>
<td>• 2) Re-open the cut thru access to apartments / condos / ICF consulting to residents / workers. There used to be a card activated gate there. This would speed up the time that the ICF shuttle bus needs to shuttle workers to / from metro.</td>
<td></td>
</tr>
<tr>
<td>• Your survey fails to inquire about day care, or to/from work travel west of the Vienna Metro Stop. Taking the bus is much too time consuming to &amp; from, you have to wait in the rain or snow without cover, and you must cross streets with fast-approaching cars to get even get to the bus stop.</td>
<td>22033</td>
</tr>
</tbody>
</table>
| • 1) Bicycle access across I-66 and through the Town of Vienna can be improved.  
  • 2) At present, Nutley St. is too dangerous to ride over I-66...traffic entering and exiting I-66 is heedless of other vehicles, much less bicycles. It would be helpful if a separate bicycle lane could be developed on Virginia Center Drive, Vaden Rd. and Saintsbury Rd, | 22182                                   |
which would permit bicyclists to get over I-66 at lower risk. And if Vaden is going to be accepting heavier traffic as a result of Fairlee, a dedicated bicycle lane will be essential if you want people to get out of their cars and bike instead.

- 3) Similarly, the Fairfax Connector Trail should be completed from Fairfax City to the W&OD, which will offer additional transportation capacity on top of car, bus, and rail. My understanding is that the Town of Vienna blocked signage of the trail through the town because residents were concerned about bicycle traffic. Now that the same people are tearing their hair out over the potential for massively increased car traffic due to Fairlee, maybe they’ll look more kindly on bicycles as an alternative to some of those cars? Or is the Town’s strategy to build a wall around itself?

- 4) What will happen to the Trail in Nottaway Park as a result of the recently-announced expansion of Park facilities?”

| Add a beltway/loop metro line and/or bus. | 20817 |
| Online survey says answers would be confidential AND that one is enrolled for chance at $400 gift card. But the only way to get latter is to make former impossible because you have to give your name to get the gift chance. What's up? | n/a |
| Any new development should have its own exit to/from I-66 to discourage new traffic in the residential areas. | 22180 |
| I work there occasionally and think this new development is great. I would love to see a more walkable area - right now it combines residential, business, and shopping but it’s very car-oriented. Some people from our office actually drive across the street to have lunch. I would like to see an area more conducive to walking and maybe some stores useful to commuters (coffee shops, dry cleaning) near the Metro station. Also, everybody should get Metrochek. | 20008 |
| More development would cause more traffic congestion. Already too much congestion around Nutley Street/Lee Highway/Vienna Metro area. | 20850 |
| 1) It takes 5 minutes to walk from my front door to the platform of the Vienna Metro Station. Yet I never take metro to work because of the inconvenience. I freelance and my two main clients are in Silver Spring and McLean. It would take about an hour to take metro to Silver Spring, when it takes about 45 minutes to drive. Also, I can park for $30/ month, which is much less than the approx. $7/ day metro fare. (Has anyone ever considered a metro line connecting Fairfax to Montgomery without taking us into DC? I would take it in a heartbeat! It certainly would alleviate traffic on the beltway.) 2) There is no metro station in McLean, so I have to drive - nine miles takes 30 minutes. Public transportation just doesn’t work for me. 3) Until recently, my roommate worked downtown. For years he took metro, but it became too crowded so he started to drive. Between 6:30 and 9:30 AM during the work week, EVERY SEAT is taken | 22031 |
before the train leaves Vienna - the beginning of the line. The trains quickly become overcrowded, which slows them down. There is NO WAY the metro system can accommodate all of the people the planned MetroWest community is going to bring in. It is already overcrowded.

- 4) And you are naive to think that everyone who moves into MetroWest is going to take the metro instead of drive simply because you wish it to be. Even though there is a grocery store within walking distance, you can't walk there because the traffic is too bad. Crossing the Nutley/Lee Highway intersection is dangerous. The cars don't stop at the light. (And the police never ticket them, even when it happens right in front of them). They speed up when a pedestrian is in the crosswalk. It is scary. If you add more pedestrians to the equation, people are going to start getting killed. This is never going to be a pedestrian friendly community because the surrounding roads are just too big.

- 5) Please don't force your plan on us because it is nice in theory. It honestly won't work.

---

**Safer cross walks in the immediate area of the Vienna metro station.**

**Hi, I took your survey and the part that interested me the most was the section on what would most likely make me use the metro. A subsidy would be great but the biggest draw for me would be to have a free covered bicycle port where I board the metro for work. I don't want it to rain on my bike while I'm at work, so I don't bike to the metro. I'll pay retail metro rides if I can get a free sheltered place to put my bike. Improved bicycle infrastructure isn't an option in your survey.**

**1) Take the Metro Train out to the Fairfax Government Center or better yet to the Gainesville area. People will move to the places the trains are easy to get to.**

**2) Or put a "Rush Hour only" exit off of 66 to the Prosperity Ave. This four lane road is under used in the mornings. This would allow for people riding the Dunn Loring metro easier access AND those people wishing to get to 29 and 50 a better exit then the Vienna Exit, which is over loaded with cars which are not even going to the Vienna metro. "**

**Please bring metro from Vienna out to Dulles corridor!**

**Never a set schedule. You need schedule @ train stops. You never know when train is arriving or leaving. You need to better monitor single drives of HOV**

**Justin, I told you I would not be able to answer how many miles it was to my work location and you said you would reword that question. I answered 1000 miles because I could not submit the survey with a blank field. I'm irked. Julia Hutchins**

**This only deals with rush hour/work travel, but the traffic is at least as**
congested at the weekends, does this not need to be taken into account to get an accurate picture???

- I’m 100% in favor of Metro West.
- I do use the Metro when its going where I’m going like the theatre, ball games, etc in DC
- Wish metro went cross-county

Open House Overview

The Fairlee-Metro West TDM Development Project Open House was held June 1, 2005 from 7:00 to 9:00 p.m. The meeting was held at the Marshall Road Elementary School located at 730 Marshall Road, Fairfax. Thirty one meeting participants signed in, not including staff or consultants.

Meeting Notification
Fairfax County staff for Providence District Supervisor Smyth provided the consultant team with list of more than 70 contacts at Homeowners Association and Civic Organizations with an interest in the Vienna Metro Study area. A meeting flyer was developed and distributed via email to approximately 50 HOA contacts in the study area with an email address. It was also placed on the project website. The consultant team followed up by phone with as many of them as possible to make sure they received the email. Follow up phone calls were also placed to approximately 15 HOA contacts that did not have email addresses.

Meeting Format
Meeting attendees were encouraged to arrive anytime between 7:00 and 9:00 p.m. An introduction to the meeting was held at approximately 7:30 by Kevin Luten, UrbanTrans Consultants. Mr. Luten also provided concluding comments at 8:45 and
answered remaining questions.

A sign in table was set up at the entrance to the open house and each meeting attendee was provided with a project overview handout (see below) and a general comment form. Three stations, described below, were set up around the room. Members of the Advisory Team were present at each station to answer questions about the project.

---

**Fairlee-Metro West**

**Transportation Demand Management (TDM) Development Project**

**Project Overview Handout**

**Study Process**

The goal of the project is to reduce traffic congestion throughout the Vienna Metro Station Area using Transportation Demand Management (TDM) measures. TDM can best be described as policies and strategies that maximize the use of the supply of transportation infrastructure.

To accomplish this, four primary tasks are being conducted:

1) Determining the existing peak hour commuting/travel patterns and how many people drive alone or do not drive alone within the Vienna Metro Station Area. The study process included:
   a. Predicting traffic volumes generated by the proposed development through the Institute for Transportation Engineers (ITE) and Fairfax County Trip Generation Models
   b. Sampling how many vehicles come in and out of neighborhoods surrounding the Vienna Metro Station and how many people are in those vehicles.
   c. Surveying residents and employees in the study area to assess their attitudes and opinions about travel choices and compare them to trends observed through travel behavior in census analysis.
2) Investigating “best practices” throughout the region and across the country
3) Identifying opportunities and barriers to successful TDM strategy implementation.
4) Meeting with and receiving input from a number of neighborhood groups in the study area.

Upon completion of the study, specific TDM, including TDM friendly site design and parking strategies will be developed to help achieve peak hour drive alone trip reductions for both the residential and office portions of the Vienna Station Area. The study will also include ongoing TDM evaluation strategies to ensure that the success of the aforementioned strategies can be measured.

**Timeline**

The study began in April 2005 and will be completed by the end of June 2005.

**Next Steps**

We will take your comments and incorporate them into a final report that will be presented to the Project Advisory Committee in mid-June. Information presented tonight and the draft report will be available at www.fairleemetrowest-tdm.com.
Station 1: Existing Conditions
The first station included numerous display boards and project team members answered questions and wrote down comments. The display boards included:
- Map with Traffic Count Locations
- Traffic Count Results
- Key Employer and Residential Survey Results
- Census Information

Station 2: Existing TDM Programs
Fairfax County staffed the second station and provided information on regional and local TDM programs.

Station 3: TDM Opportunities and Barriers
The third station included a general map of the station area and information on TDM opportunities and barriers. Project team members provided attendees with post it notes in two colors: one color representing opportunities and the other representing barriers. Meeting attendees were asked to identify 1) specific locations of TDM opportunities and barriers on the map and 2) general TDM opportunities and barriers, regardless of location.

Display boards included:
- General TDM Overview
- TOD and TDM Success Factors
- Map of Station Area
- Example TDM Opportunities and Barriers

Open House Comment Summary
Meeting participants provided comments both directly at the stations and on comment forms. The following is a summary of all comments received.

Existing Conditions Comments
- Vienna line/border includes Marshall Road School (comment was provided on traffic count map).
- Are there site specific TOD/TDM programs in Fairfax County?
- Need to show potential benefit of TDM. What can TDM do to reduce trips? How much is possible/reasonable?
- Pedestrian safety at Virginia Center Boulevard.
- The junction of I-66 and the Beltway is a major bottleneck. The traffic on I-66 East is often backed up at all hours and even weekends.
- Vienna Metro is not well connected by bus to other destinations. How will this be improved?
- Lack of sidewalks.
- Unsafe pedestrian crossing at Metro (Virginia Center Boulevard).
• Orange Line is crowded. Trains stops constantly to wait for train ahead.
• Bus Service: Inadequate coverage (geographic and time), buses always late.
• Lack of bicycle trail connections.
• Surprised by amount of information disseminated at this preliminary meeting.

**Current TDM Program Comments**

• Hard to tell from the display boards how programs are working in residential areas, and how they would work here.

**Opportunities and Barriers Comments**

**Opportunities:**

• Enhance bike connection between station and the town of Vienna and the W & OD path.
  o Can use Virginia Center Boulevard for bike path to southwest Vienna then use residential streets to reach town commercial area and trail.
• Direct traffic on Vaden/Country Creek that is looking for Nutley through appropriate directional signage. Discourage traffic from searching for Nutley through Vaden north of Country Creek/UCB.
• Vienna Station may not always be a terminus. Extension of line will reduce traffic.
• Demographics in Fairfax County lend support for this type of housing. There is a shortage.
• Current residents will gain opportunities to walk and bike to a pleasant area and services.
• Improve bike and pedestrian connections to Pan Am. A pedestrian crossing at Vaden Extension at Lee Highway and new sidewalk on south side of Lee would help.
• Need left turn phase for eastbound Country Creek at Vaden. Poor sight distance.

**Barriers:**

• Employment places not on transit line.
• I-66 at/above capacity in both directions.
• Poor bus service to local areas from station. Not just frequency, but very limited routes. Can’t get to Town of Vienna commercial area.
• New road (Vaden Drive extended) and the widening of Saintsbury Drive will greatly impede the access for Circle Woods and all the neighborhoods south and west of the metro station to the station.
• Poor pedestrian connectivity at Virginia Center.
• Poor connectivity along Vaden Drive from pedestrians coming from the north.
• Vehicular traffic on Virginia Center is moving too fast to allow safe pedestrian crossing.
• Sidewalk gap on north side of Virginia Center Boulevard between north east Metro lot entrance and Barrenhurst.
• Parking at Sweeny surface lot is removed.
• Please consider that:
  o Vienna Metro Station is at the end of the line.
  o Highway I-66 is just as close as the Metro so the proximity of I-66 makes it more attractive to use.
  o Developer may not require homeowners to continue TDMs.
What is the tolerance of Metro users for crowding? At what point are current (or potential) Metro users driven away by crowding? A recent speaker on the proposed Silver Line stated that the number of trains serving the Orange Line will be cut by more than half (from 20 to 8 or 9, in a given time period) to create tunnel capacity for Silver Line trains into DC. How will this affect Metro use by Metro West and other Orange Line users?

**Meeting Comments**
- Informative as to what TDM is and what options area, not informative about the impacts of TDM. Would be helpful to give a realistic assessment of what TDM would do under the best of circumstances. Start from existing mode shares and revise upward or downward depending on TDM measures. The meeting was not informative in terms of potential impact on the neighborhoods, positive or negative.
- Too much presentation and too little time to see the materials. Where can we get copies?

**Additional Comments**
- At station 1, it is unfortunate that only a.m. non-work trips were identified. Staff said numbers for p.m. were available, and they were much higher than in a.m.
- Need to measure non rush hour traffic and weekends. Need community meeting to present final report. Need to measure pedestrian traffic and improve safety/connectivity.
- Need to have a community meeting following dissemination of final report.
Appendix 7

MetroWest Vehicle Trip Reduction Analysis
Using the Institute of Transportation Engineers (ITE) Trip Generation Manual, 7th version, Land Use categories and rates, base trip generation for the site were established.

Based on these calculations, the AM Peak Hour was determined to be the largest peak for the Office land use, and the PM Peak Hour was determined to be the peak for the Residential land uses.
### Base Trips

<table>
<thead>
<tr>
<th>Trips-</th>
<th>Residential Peak (PM) Trips-</th>
</tr>

<tbody>
<tr>
<td>In</td>
<td>Out</td>
</tr>
<tr>
<td>398</td>
<td>54</td>
</tr>
<tr>
<td>565</td>
<td>339</td>
</tr>
</tbody>
</table>

Peak Hour trips carried forward from ITE Trip Generation

Original ITE Calculations assumed general High Rise Condominiums for the majority of land uses within the Residential Categories. In fact, as a demand management measure, 368 of these units will be developed as Age-Restricted residences (55 years old and older). To account for this change in use, ITE rates were re-calculated for one segment of the Residential land Uses.

### TABLE 2.1

</tbody>
</table>

### Trip Generation Modification -25 -15

Calculated by splitting out the age restricted units and then subtracting the new trip generation from the base trip generation. 200-(113+62)=25 less trips in and 122-(69+38)=15 less trips out

Our research, including Transportation Research Board work and ITE, point to the fact that mixed-use developments have trips that will be taken that are internal to the site. In fact, ITE suggests that these trips could be as much as 24% of all trips. Using the research (Cervero et al 2004; Edwards 2003; Hedges 2005; ITE 2004; Nelson et al 2000; US DOT nd), our understanding of potential internal synergies, and a very conservative approach, we calculated the number of trips that will be taken with both internal origins and destinations. Furthermore, our modification Factors are varied by In's and Out's based on Residential and Office origins only. Specific rates were developed through research results (cited above) and blended with professional judgment per accepted ITE practice.

### TABLE 2.2

| Origin Destination Factor Trips Factor Trips Factor Trips Factor Trips |
|----------------------|----------------|----------------|----------------|----------------|
| Residence Retail 1.0% 4 10.0% 5 |
| Office Retail       1.0% 4 10.0% 5 |

Availability of resources (grocer, restaurant, convenience retail/service, banking, recreation/exercise, mail/copy services) within the site.

565 trips x 7.5% = 42 fewer trips in and 339 trips out x 15% = 51 fewer trips

398 trips x 1% = 4 fewer trips in and 54 trips out x 10% = 5 fewer trips

565 trips x 4% = 23 fewer trips in and 339 trips out x 10% = 34 fewer trips

398 trips x 1% = 4 fewer trips in and 54 trips out x 5% = 3 fewer trips

565 trips x 2% = 11 fewer trips in and 339 trips out x 5% = 17 fewer trips

398 trips x 1% = 4 fewer trips in and 54 trips out x 10% = 5 fewer trips

### TABLE 2.3

<td>904</td>
</tr>
</tbody>
</table>

The next step in the process was to identify the trip reductions related to further specifics of the TOD such availability of transit and moreover reductions affiliated with Travel Choice programs and services (TDM). Using national research (Cervero et al 2004; Chisholm 2002; ITE 2004; Kuzmyak et al 2005; USDOT nd; Vaca et al 2003) and local survey results (Claritas 2005; LDA 2005), produced ranges of reductions even greater than identified below (Cervero found that TOD’s relative proximity to transit with good pedestrian amenities can increase transit usage by up to 30% and local survey results found that 35% of residents within 1/2 mile use transit for commuting). In all cases, we opted for the most conservative approach in order to not overstate planned trip reductions. Furthermore, potential trips by carpool were identified and minimize by an occupancy of 2.25 people per vehicle (not providing for a 1 reduced trip to 1 person ratio). In all cases, trips are not eliminated, just taken in modes other than pure auto trips.

### Residential Single Occupancy Vehicle Modifications for TOD Characteristics

</tr>
</tbody>
</table>

Note: These trips were NOT accounted for in Step 4 Trip Generation Modifiers

3652 Residents 16+ x 5% (live/work within site (non-telecommute)) X 20% who would travel in the PM Peak Hour distributed 87% In / 13% out

* Transit Proximity is mix of factors. Most important are the pedestrian environment and amenities combined with the close distance from Residences/Offices to Transist (almost all are contained within a 1/4 mile radius). As found in all research references these factors are attributable to TOD’s, though somewhat difficult to isolate to just one singular factor. Furthermore, the Onsite Transportation programs are more effective because of the physical characteristics (you can market and educate with better results because of the higher quality facilities).

Overall Trip Reductions affiliated with transit travel mode are 18.5% (10% Transit Proximity + 3% Onsite Programs + 7% Active Parking Management less 1.5% for Telework and Bike/Pedestrian Trip Reductions).

</table>
Establishing the Number of Commute Trips

Initially, the projected population needs to be established for the site's Residential land uses. This was established through a series of steps based on US Census, current Demographics, and national studies of Transit Oriented Developments.

US Census - Correlates to ITE National Standards

ITE trip generation is based on a combination of real world experiences throughout the country. These experiences are combined to produce expected results at a national level. As such these ITE calculations can readily be correlated with US Census data, which takes individual data and identifies local through national demographic detail.

After assuming 5% of the townhouse units will not be owner occupied, the total number of occupied units is calculated to be:

2,323 Units
2005 Demographic data was obtained from Claritas, Inc., a market research corporation. Using the current occupants per household data for all residences within the transit station area (1/2 mile radius), the projected number of residents was established. Furthermore, the Claritas data also provided an number of residents that are sixteen years old or older, which correlates to potential drivers and workforce. This number versus the total population established a rate of 79.75% of all residents will fall within the category of sixteen years old or older.

</tbody>
</table>

Using these general data, it is calculated that 4,768 residents will be in the category of sixteen years old or older.

**Using national and local research to calibrate household size for specifics of TOD's**

Using both the national research and the survey conducted of local residents, is established that TOD’s tend to have a household size that is smaller and has fewer children. To ensure the most conservative approach, however, we chose to use the higher percentage of residents that are sixteen or older rather than the range of 53%-62% that found in our research. This conservative approach will translate into a higher potential number of trips for calculation purposes.

</table>

Ultimately, these calculations found that our number of occupied households will translate into 3,652 residents sixteen or older.
After identifying the residential trip reductions related to further specifics of the TOD (and identified with Step 4), these factors then needed to be applied to the Office land uses. Our research suggested that these programs could 25% to 100% more effective than residential based programs due to similar commute patterns and employee culture issues. This is further validated by our own experiences throughout the country managing these types of programs. Even with these facts, we opted for the more conservative factors applied to the Residential land uses. All other logic and formula remained the same as in Step 3.

3652 Residents 16+ x 5% (live/work within site (non-telecommute)) X 15% who would travel in the AM Peak Hour distributed 97% In / 3% out

* Transit Proximity is mix of factors. Most important are the pedestrian environment and amenities combined with the close distance from Residences/Offices to Tranist (almost all are contained within a 1/4 mile radius). As found in all research references these factors are attributable to TOD's, though somewhat difficult to isolate to just one singular factor. Furthermore, the Onsite Transportation programs are more effective because of the physical characteristics (you can market and educate with better results because of the higher quality facilities). When factored with Onsite Transportation Programs and Active Parking Managament, contributions from TOD / TDM Characteristics total approximately 18.5%.
Number Of employees 1500 (5 employees per 1,000 sq ft for 300,000 sq ft)

</tbody>
</table>

Using the Area Employee Survey data (collected with the project) and the trip reductions calculated in Step 4, only 760 Auto Trips would be generated by 1500 employees at the site.

As we moved to validate trip generation through an established model, we chose to use the higher trip generation numbers of the Claritas data to balance against the greatest potential trip generation situation.

Using an Average Vehicle Ridership Model produced by the Center for Urban Transportation Research, we found that at a normal site, with the inclusion of a subsidy, nominal parking charges, a guaranteed ride home, access to a marketed ridematching system, and knowledge of compressed work weeks, the number of vehicles calculated is comparable to our conservative calculations

<table>
<thead>
<tr>
<th>Vehicles per 100 Ee’s</th>
<th>Auto Trips</th>
</tr>
</thead>
<tbody>
<tr>
<td>Without Programs</td>
<td>83.7</td>
</tr>
<tr>
<td>With Programs</td>
<td>56.3</td>
</tr>
</tbody>
</table>

We also found that this difference of 44.5 trips equated to 3% of our employee population. As such we added back trips related to this model.

It is important to note that this model DOES NOT account for any of the benefits related to TOD, and as such is an overly conservative modeling estimate. Even with this note, we felt it important to continue with our conservative approach to programmatic trip reductions.

APPENDIX 9:
TDM PROGRAM DEVELOPMENT RFP
1. BACKGROUND

THE COUNTY OF FAIRFAX, VIRGINIA, Department of Transportation, through Pulte Home Corporation, is soliciting Requests for Proposals from qualified applicants and/or firms to develop a program to benchmark mode splits and travel patterns in the vicinity of the Vienna-Fairfax-GMU Metro Station, in addition to providing a menu of transportation demand management strategies to be employed in the immediate area.

“Transportation Demand Management (TDM) is a general term for strategies that result in more efficient use of transportation resources. There are many different TDM strategies with a variety of impacts. Some improve the transportation options available to consumers, while others provide an incentive to choose more efficient travel patterns. Some reduce the need for physical travel through mobility substitutes or more efficient land use. TDM strategies can change travel timing, route, destination, or mode.”

According to the Northern Virginia 2020 Transportation Plan, by the year 2020 congestion in the vicinity of the Vienna-Fairfax-GMU Station, specifically along I-66, will worsen significantly with stop-n-go conditions throughout the peak period, making the need for these improvement strategies even more critical. Accordingly a variety of transportation strategies are needed to meet these challenges now and in the future. Some of the major issues confronting us are:

- Funding needed to meet system improvement demands;
- Increased construction costs for new roadway and transit facilities;
- Increased need to improve operational efficiency;
- Changes in travel patterns;
- Lower densities making traditional transit an inefficient option in many areas; and
- Need to reduce transportation related air pollution.

As recommended by Fairfax County’s Comprehensive Plan, transportation management strategies have been, and will continue to be, critical to addressing these issues. To that end, the Board of Supervisors established a Countywide goal of balancing land use with supporting transportation infrastructure, including the regional network. Regional and local efforts to achieve a balanced transportation system through the development of rapid rail, commuter rail, expanded bus service and the reduction of excessive reliance upon the automobile should be the keystone policy for future planning and facilities. To that end, the Board established 14 Countywide objectives and policies, including but not limited to the following:

---

1 On-Line TDM Encyclopedia from the Victoria Policy Institute
• Provide for a multi-modal transportation system that places the primary emphasis on alternatives to the single occupant vehicle
• Increase the number of commuters using non-motorized and public transportation so that by the year 2000, 60% of County trips to the metropolitan core (D.C), 20% of the commuters to Tysons, 15% of the commuters to the suburban or transit station areas and 5% of all other commuting work trips will be made by public transportation.
• Provide a road system that provides adequate local access and capacity for through movements.
• Provide complementary land use and transportation policies.

In furtherance of the goals and objectives stated above, the Board of Supervisors recently approved a change to the County’s Comprehensive Plan for certain land units within the Vienna Transit Station Area; specifically land units C and I. The proposed plan change was necessary in order to facilitate the development of a true “Transit Oriented Community” at the Vienna-Fairfax-GMU Metro station. A copy of the adopted Plan text is provided as Exhibit A.

The Metro-oriented mixed-use option for the station area represents “a highly integrated vision, whose synergy lessens the impacts of development on this site by creating conditions that minimize the need for automobile use. This density/intensity will be successful only if several core components – retail, commercial, and transportation demand management – succeed individually and collectively, and are also designed to serve the needs of the surrounding neighborhoods.”

To that end, the Plan recommends that a TDM program be provided in conjunction with any development approvals for the Metro-oriented mixed-use option in order to encourage the use of transit (Metrorail and bus) and high occupant vehicle commuting modes thereby reducing the demand for single occupant vehicle (“SOV”) trips.

In general, at build out, it is expected that for the residential portion of the project, a reduction in peak hour SOV trips of 47% should be achieved through the use of transit and other means; for the office portion of the development, a peak hour SOV trip reduction of 25% is expected to be achieved through similar means. The TDM program will be evaluated at three milestones; first at the time of rezoning, second before and during construction and third after build out. During the first stage, at rezoning, an application for rezoning should demonstrate that TDMs would be provided to achieve the peak hour SOV trip reduction goals stated above. Throughout the process, periodic surveys, traffic counts and reports based on empirical measurements will be conducted under the County’s auspices to document the success of the program in reaching the target reductions.

---

2 OTPA S02-II-V2, Board Motion, December 6, 2004, Page 6 of 20
The purpose of this RFP is to first determine the current state of peak hour commuting/travel patterns and mode splits within the Vienna-Fairfax-GMU Metro Station Area; second to investigate “best practices” throughout the region, across the country and/or comparable international programs; and third to develop a menu of successful TDM strategies and benchmarking opportunities to be considered for implementation at any transit-oriented mixed-use development planned for the Vienna-Fairfax-GMU Station Area (“Vienna TOD”). This effort will result in the compilation of empirical and quantitative measurements of mode splits and transit and HOV usage in the areas proximate to the transit station. During the review of the recently approved changes to the Comprehensive Plan extensive research and data collection had been completed by the Fairfax County Department of Transportation (“FCDOT”) and others. At this time, FCDOT now seeks a Consultant to build on prior work and complete a comprehensive and independent evaluation of existing mode splits, transit and HOV usage and travel patterns in the vicinity of the station, as well as strategies for increasing future mode splits.

Representatives of FCDOT and others will participate in the project as “Project Members”. Day-to-day oversight of this project will be provided by Angela Rodeheaver, Engineer IV, Fairfax County Department of Transportation (the “Project Manager”).

2. SCOPE OF WORK

The following activities and deliverables are expected from this project:

Project Kickoff Meeting(s): The selected Consultant will meet with Project Members to develop a clear understanding of the project’s goals, objectives and concerns. The Consultant should provide Project Members with suggested TDM programs/measures within the region and across the country that may be included for evaluation within the draft program, as well as how best to benchmark program performance.

Develop a Project Timeline: Based on the results of the kickoff meeting(s), the Consultant shall develop a timeline, defining in detail the steps necessary to complete the survey of existing conditions and make recommendations for TDM elements that may be appropriate for the Vienna-Fairfax-GMU TOD. The project must be completed within 45 to 60 days after notice to proceed.
