Potential TDM Recommendations for the Vienna TOD: This document will include the following elements:

**Literature Search:**

- Review and summarize the state of TDM programs in Fairfax County. (County staff will provide the Consultant with copies of programs proffered throughout the County.)

- Identify barriers to TDM implementation in Fairfax County including a discussion of all relevant issues, pro and con, with appropriate responses to each. Include a description of the role education, outreach, and support can play in local TDM’s.

- Identify the state of TDM programs in neighboring jurisdictions, throughout the Country and those comparable or relevant international programs at similarly sized TODs. Include a discussion best practices, successes and failures, as well as relevant issues, pro and con. Provide empirical information on program performance.

**Benchmarking:**

- Identify quantifiable measurements to establish existing conditions and evaluate TDM program progress/success in communities surrounding and proximate to the Vienna-Fairfax-GMU Metro Station. Such measurements may include surveys, traffic counts, etc. The Consultant should identify those communities deemed relevant to the projects goals and objectives.

- Provide a review of benchmarking practices at other similarly sized and successful TOD’s either within the region or nationally.

- Recommend a sequence of events required for successful TDM program implementation through build out, including recommendations for implementation, timing and benchmarking progress.

- Summarize the results of the data collected.

**Recommendations:**

- Using information provided by accepted sources and/or Project Members, as well as other accepted sources, develop a set of TDM recommendations specific to the Vienna-Fairfax-GMU TOD, to include
strategies appropriate to the types and levels of development planned for the TOD, as well as interim and ultimate TDM goals.

- Identify how funding and/or technical assistance might be provided to establish the TDM program and identify the levels of effort/costs of implementing each step of the program throughout the Comprehensive Plan’s recommended stages.

The Consultant is free to present the TDM program document in a sequence and format of their choosing as long as each element is addressed.

**Project Review Meeting(s):** The Consultant will meet with the Project Members on a regular basis at key points during the project. The Consultant will incrementally present the results respectively of the literature survey, benchmarking and recommendation phase to the Project Members for review and comment. Draft documents will be distributed at least two weeks prior to any review meetings.

**Final TDM Program Document:** Following the final project review meeting, the Consultant shall present the final results of the survey and TDM recommendations to a meeting of the Project Members, and others.

The anticipated outcomes of the final document should include:

- A complete understanding of current peak hour travel patterns for the existing communities and developments proximate to the Transit Station Area.

- A summary of best practices locally, nationally and at comparable international locations along with empirical data supporting similar types of TODs.

- Assessment and recommendations of best TDM practices for the Vienna-Fairfax-GMU TOD.

- Identification, development, and quantification of specific empirical benchmarks to meet the Comprehensive Plan recommended SOV reduction goals.

- Identification of program elements and monitoring strategies.

- Cost estimates for implementing and sustaining on-going TDM efforts.
3. **STANDARDS AND DELIVERABLES**

All documents should be provided in both hard copy (paper) and digital format (MS Word). Data should be provided in MS compatible formats (Excel or Access).

All data, databases, reports and materials, in digital and hard copy format created under this project shall be transferred to FCDOT and Project Members upon completion of the project and remain the sole property of the Funding Entity with use by FCDOT permitted and approved in accordance with the contract to be executed with the Consultant.

The Consultant will provide ten (10) copies of the draft and twenty-five (25) copies of the final document. Interim reports must be submitted one to two weeks prior to meetings at which they will be discussed. In addition, one unbound copy of both the draft and final report will be provided to the Project Manager and Funding Entity. Original copies of the draft and final reports must be submitted to the FCDOT Project Manager for distribution to Project Members unless otherwise directed.

The Consultant will provide written bi-weekly progress reports to the Project Manager.

4. **PROPOSAL REQUIREMENTS**

Consultants will be evaluated on technical expertise and past performance. To assist with the evaluation please provide the following:

- A description of the Consultant’s qualifications, which should demonstrate:
  a. Expertise in the full range of TDM strategies and their evaluation.
  b. Experience in benchmarking TDM effectiveness, including development of surveys, statistical analyses, etc.
  c. An understanding of Transit Oriented Development.

- A description of how the team would accomplish the work outlined in the Scope of Work including an explanation of any proposed changes to the scope of work based on insights/expertise related to the topic.

- Include the names, titles and experience of key personnel, including day-to-day project manager.

- Describe the skills and services your firm offers
• Describe relevant experience of the firm and of personnel assigned to this task on similar types of TODs.

• Provide at least three relevant references and samples of completed work.

• Provide hourly and overtime rates for all classifications of personnel who may be utilized under this contract. These rates shall be presented and broken down by direct labor costs per class of labor and overhead cost.

• In order to be responsive to this RFP, each proposal shall conform to the following requirements. The Consultant shall:
  a. Submit ten (10) copies of the technical proposal in one sealed envelope. Number all pages consecutively.
  b. Submit one (1) copy of the cost proposal in a sealed envelope separate from the technical proposal.
  c. Provide a copy of the firm’s Standard Form 254.

• Clearly indicate the following on the outside of each of the sealed envelopes or packages containing the technical and cost proposals:
  a. Name and address of the Prime Consultant.
  b. Due date and time.
  c. Envelope contents (i.e., technical proposal, cost proposal.)
  d. Program Name - Vienna-Fairfax-GMU Station Area TDM Benchmarking & Strategies.

5. CONSULTANT EVALUATION AND SELECTION

The technical proposal will be evaluated by the Project Members and ranked first. The technical proposal evaluation criteria are the following:

• Qualifications of the firm and personnel to be assigned to the project and their experience working as a team to complete similarly relevant projects.

• Demonstration of overall project understanding, insights into local conditions and potential issues and knowledge of the project area and region.

• Clarity of proposal and creativity and thoughtfulness in addressing the scope of work.
• Completeness of submitted proposal with all elements required by the RFP.

The cost proposal will be reviewed for consistency with the technical proposal.

The Project Members reserve the right to seek clarification of any proposal submitted.

The Project Members reserve the right to engage in discussion with one or more Consultants, deemed fully qualified as a result of the review of the technical and cost proposals. Repetitive informal interviews shall be permitted. Consultants shall be encouraged to elaborate on their proposal and performance data, staff expertise, as well as alternative concepts. Proprietary information from Consultants shall not be disclosed to the public or competitors. At the conclusion of the interviews, and on the basis of the technical/cost proposals and interviews, the Project Members shall select one Consultant.

The Project Members reserve the right to reject any and all proposals received as a result of this solicitation, to negotiate with any qualified source, to waive any formality and any technicalities or to cancel in any part or in its entirety this RFP if it is in the best interests of the Project Members. This solicitation of proposals in no way obligates the Fairfax County DOT, Project Members, and/or the Funding Entity to award a contract.

6. ADDITIONAL INFORMATION

The contract shall be awarded to the most qualified bidder based on the quality of proposal response and Consultant interviews. This solicitation in no way obligates the Project Members to award a contract.

The Consultant will submit monthly invoices to the County’s Project Manager accompanied by brief, written progress reports.

Ten percent of the total contract cost will be withheld pending successful project completion.

All proposals become the property of the Project Members upon submission. The cost of preparing, submitting and presenting a proposal lies solely with the proposer.

Work must be completed and a final report submitted by the Consultant within 45 to 60 days after notice to proceed or as set forth in the contract.
Technical and cost proposals in two separate sealed envelopes should be submitted no later than 4:30 PM on Monday, February 14, 2005 to:

Angela K. Rodeheaver, Engineer IV  
Fairfax County Department of Transportation  
12055 Government Center Parkway  
Suite 1034  
Fairfax, Virginia  22035

Proposals submitted after the deadline will **not** be accepted. Questions regarding this RFP should be directed to Angela K. Rodeheaver at 703/324-1100.
Local Area Transportation Review and Transportation Policy Area Review Guidelines

Montgomery County Planning Department
M-NCPPC
MontgomeryPlanning.org
Abstract
The Local Area Transportation Review and Policy Area Mobility Review Guidelines were updated by the Planning Board on May 13, 2010, June 17, 2011, and February 9, 2012.

On November 13, 2012 the County Council adopted changes to the Subdivision Staging Policy eliminating the Policy Area Mobility Review as an area-wide test for transportation adequacy and replacing it with Transportation Policy Area Review. The Planning Board approved these revised guidelines to incorporate the Council’s action on January 24, 2013. This document reflects those changes.

These Guidelines are to be used for preparation and review of transportation impact studies for development in Montgomery County. This document should be used by transportation engineers, planners, public agency reviewers, and community members participating in the development review process.

Introduction

Section 50-35(k) of the County Code directs the Montgomery County Planning Board to find that public facilities will be adequate to serve proposed development. This Adequate Public Facilities (APF) finding requires forecasting traffic generated by proposed development and comparing it to the capacity of existing and programmed roads and transit. An applicant for proposed development must show that adequate transportation facilities will be in place within a specified period of time. Alternatively, the applicant must provide those facilities or make a Traffic Mitigation Payment toward area-wide transportation needs. These guidelines show the methodology for determining adequacy, specify mitigation for projected traffic generated by proposed development projects, and describe how Traffic Mitigation Payments are determined.

There are two tests for determining transportation adequacy—the Local Area Transportation Review (LATR) test and the policy area test called Transportation Policy Area Review (TPAR). These tests are required by the 2012-2016 Subdivision Staging Policy adopted by the County Council on November 13, 2012.

LATR determines the adequacy of local roads by measuring congestion at roadway intersections based on critical lane volume (CLV) and volume to capacity ratio (v/c). The estimated vehicle trips generated by a proposed development are compared to the applicable policy area standard to evaluate likely future congestion. The development’s trips that contribute to nearby intersections exceeding the standard must be mitigated in some fashion.

The TPAR test first considers whether a policy area is considered inadequate for transit or roadways (or both). If the area is inadequate, a development in the area must make a Traffic Mitigation Payment based on the number of dwelling units or square footage of nonresidential space, or make improvements that increase capacity in the policy area to address identified specific roadway and transit inadequacies.

These Guidelines explain the methodology for documenting and analyzing the likely impact of proposed development on intersection performance, that is, the LATR part of Subdivision Staging. The Guidelines focus on LATR because this aspect of the transportation adequacy test reflects the majority of the analysis conducted by applicants using these Guidelines. The TPAR test is updated every two years by the Planning staff and adequacy standards are established by the Planning Board. The current TPAR standards (2012-2014) are also presented in this document.

The criteria in these Guidelines determine whether a development can satisfy the requirements for transportation adequacy. Following the standards of the Subdivision Staging Policy, the Planning Board must not approve a development if unacceptable weekday peak-hour intersection congestion will result. The Planning Department staff’s review and the Planning Board’s decision is based on existing and programmed roads, available and programmed mass transportation, and physical improvements or trip mitigation measures to be provided by the applicant.

Together, the two transportation tests provide a picture of traffic impacts, and the necessary improvements to maintain congestion standards.

APPLICABILITY

LATR is applied to development projects that will generate more than 30 total weekday peak hour trips. TPAR is applied to projects that will generate three or more total weekday peak hour trips. Projects that generate fewer than 30 total weekday peak hour trips must prepare a traffic exemption statement describing the basis for any exemption from LATR and/or TPAR.

Both tests are applied by policy area (see Map 1). Detailed maps, with streets shown, can be found at: www.montgomeryplanning.org/research/growth_policy/subdivision_staging_policy/2012/documents/SSPappendix5.pdf. Each policy area has a particular congestion standard for intersections, which is applied to meet the LATR test. Each policy area also has a transportation adequacy determination for roadway and transit service applied in the TPAR test. These standards and mitigation requirements are adopted by the County Council and specified in these Guidelines, which are updated as needed to reflect industry standards, local traffic conditions, and Council action.
LATR and TPAR compliance is not required for developments in the White Flint Policy Area if applicants agree to participate in the White Flint Special Taxing District for transportation infrastructure improvements in lieu of satisfying the transportation APF tests for LATR and TPAR.

LATR and TPAR mitigation and/or payments are not required for public facility project mandatory referrals, in which the Planning Board’s comments are advisory. Mandatory referrals are often unique uses, such as schools or other public services, and their traffic review follows Mandatory Referral Guidelines, which requires a pedestrian and bicycle safety statement, pedestrian and vehicular circulation plan, and a traffic exemption statement or traffic study as applicable.

HOW TO USE THESE GUIDELINES

These Guidelines are to be used by applicants to prepare traffic studies for Planning Board approval and by staff when reviewing those studies. These Guidelines are also recognized as the standard for reports to the Board of Appeals and Hearing Examiner for special exception and zoning cases, respectively.

The following chart illustrates the steps needed to arrive at a recommendation for approval of the transportation test for the Adequate Public Facilities Ordinance. These Guidelines describe the information needed from the applicant to determine the answer at each step of the process and the considerations staff must evaluate when reviewing the document.

Figure 1: Montgomery County Transportation Review Process – LATR and TPAR

Project applications requiring LATR/TPAR studies:
- preliminary plan (as part of a subdivision application)
- site plans not requiring subdivision
- special exception and zoning cases before the Board of Appeals and County Council

These Guidelines may also apply to building permit review cases requiring an APF finding, though in some cases (less than 12 months vacancy, no increase in square footage, fewer than 30 new weekday peak hour trips) the APF test may be approved administratively by Planning Department staff.
When a proposed development is projected by the LATR test to generate an unacceptable level of peak hour congestion, the applicant should consult with Planning Department staff, the Montgomery County Department of Transportation (MCDOT), the Maryland State Highway Administration (SHA), and the municipalities of Rockville and Gaithersburg (when applicable) to develop recommendations for trip reduction, including specific intersection improvements or pedestrian, bicycle, and transit enhancements that can mitigate the project’s impact and thereby gain Planning Board approval.

The Guideline procedures outlined in this document are intended to provide a snapshot of estimated future traffic conditions for proposed development. These procedures are not intended to establish delay-free travel conditions.
Local Area Transportation Review

INTENT AND STANDARDS

The LATR test is undertaken in two steps to best measure congestion levels. The initial Critical Lane Volume (CLV) analysis is performed to screen out intersections with a CLV less than 1,600, the threshold between stable (but close to congested) and unstable (over-congested) road conditions.

For intersections with a CLV of 1,600 or greater, the more detailed Highway Capacity Manual (HCM) method is used to measure delay. In these cases, the applicant should use a traffic-flow model such as Synchro or CORSIM.

In the HCM method, intersection level of service is expressed as a volume/capacity (v/c) ratio and the standards are set at levels parallel with the current CLV standards in a policy area. For example, the 1,600 CLV standard, applicable in the Bethesda/Chevy Chase, Silver Spring/Takoma Park, Kensington/Wheaton, and Germantown Town Center policy areas (see Map 1) is expressed as a v/c ratio of 1.00. For Metro Station Policy Areas (MSPAs), the applicable 1,800 CLV standard is expressed as a v/c ratio of 1.13 (that is, 1,800/1,600).

APPLICANT’S PREPARATION OF AN LATR TRAFFIC STUDY

Applicants should use the following general criteria and analytical techniques to demonstrate the expected impact on public roadway intersections by the proposed development. The analysis should consider existing traffic, background traffic generated by developments approved and not yet built, and projected traffic generated by the applicant’s project. Planning Department staff may require that traffic from nearby pending applications is included in the traffic study if those applications are likely to be approved by the Planning Board before the subject application’s projected Planning Board hearing date. Otherwise, the traffic study would have to be updated to include the pending applications that were approved between the traffic study’s scoping and the Planning Board hearing date. Traffic studies should also reflect any traffic improvements that will be made by nearby projects.

Scope of an LATR Traffic Study

If the project is not exempt, the applicant must prepare a traffic study. Depending on the project size, uses, and location, the contents of a traffic study will vary. The applicant and Planning Department staff, in a meeting or through correspondence, will establish a scope for the study using the elements described below. (For zoning and special exception cases, Planning Department staff may consult with the Hearing Examiner, and initiate a meeting with the applicant and interested groups or individuals to establish the scope of the traffic analysis.)
A traffic study must consider the following elements:
1. CLV of intersections
2. Approved but unbuilt development
3. Existing intersection turning movement counts
4. Trip generation, directional distribution, and trip assignment
5. Mode split assumptions
6. CIP and CTP improvements
7. Circulation and Safety for High Traffic impact venues
8. Land use and size
9. Queuing/delay analysis (if applicable)
10. Pedestrian and bicycle impacts
11. Improvement and mitigation options
12. Traffic mitigation agreement (if needed)

1. Intersections
The number of intersections included will be based on the projected trips generated by the development under consideration (see page 17, Staff’s Evaluation of Traffic Study, for specific criteria regarding “land at one location”). As shown in Table 1, the number of signalized intersections and significant non-signalized intersections in each direction is based on the maximum number of total weekday peak hour trips generated by the proposed land uses, unless Planning Department staff in consultation with MCDOT, SHA, and municipalities if appropriate, finds that special circumstances warrant a more limited study.

</tbody>
</table>

The term “each direction” applies to every study intersection. For example, in a hypothetical grid, the first ring would include four intersections. The second ring would include not only the next four intersections along the streets serving the site, but also the four intersections with cross streets encountered in the first ring. As the number of intersections in each direction grows linearly from one to five, the number of total study area intersections grows at a greater rate.

Planning Department staff, in cooperation with the applicant, will use judgment and experience in deciding the significant intersections to be studied. For example, the ramps and termini of future interchanges will be treated as signalized intersections. The County’s central business districts (CBDs) and Metro Station Policy Areas (MSPAs) have more closely-spaced intersections. Accordingly, not every signalized intersection should be studied and as a result, the study may cover a larger area. Site access driveways are not included in the first ring of intersections.
When determining the intersections to be studied, Planning Department staff will also consider:

- geographic boundaries such as rivers, major streams, parks, interstate routes, railroads
- political boundaries, although intersections located within the Cities of Rockville and Gaithersburg, where the Planning Board does not have subdivision authority, will be included in the traffic study and the studies will be shared with nearby incorporated cities1
- contiguous land under common ownership
- the type of trip generated: existing, new, diverted, or pass-by
- the functional classification of roadways, for example six-lane major highway.

If a site’s number of peak hour vehicle trips is projected to increase the critical lane volume through an intersection by fewer than five trips and the applicant is required to improve another intersection for the same project and/or is participating in a traffic mitigation program, that intersection does not need to be analyzed in the traffic study, even if it would otherwise be identified as appropriate to study. Applicants may develop a trip distribution and assignment pattern before the study scoping process and work with Planning Department staff to determine which intersections don’t require full study. This process will be documented in the scoping correspondence.

**CLV Intersection Analysis Method**

An intersection’s ability to carry traffic is expressed as CLV, the level of congestion at critical locations with conflicting vehicle movements, usually an intersection. Current CLV standards for each policy area are based on achieving approximately equivalent combined transportation roadway and transit levels of service in all areas of the County (see Map 1). Greater vehicular traffic congestion is permitted in policy areas with greater transit accessibility and use.

For a traffic study, the existing, background, and site-generated traffic for identified intersections should be measured against intersection capacity using the critical lane volume method. The analysis should be carried out for the peak hour of both the weekday morning and evening peak periods and should use traffic data for non-holiday weekdays and other non-typical occurrences.

The CLV method is generally accepted by most Maryland public agencies including SHA, MCDOT, the Cities of Rockville, Gaithersburg, Takoma Park, and M-NCPPC Planning Department. The methodology will fit most intersection configurations and can be easily varied for special situations and unusual conditions.

While some assumptions, for example lane use factors (see Step 3 below), may vary between jurisdictions and agencies, the general CLV methodology is consistent. An excellent reference source is SHA’s web site: [http://marylandroads.com/Index.aspx?PagId=461](http://marylandroads.com/Index.aspx?PagId=461).

The CLV method can be used at signalized or unsignalized intersections. For unsignalized intersections, a two-phase operation should be assumed. The traffic volumes should be those approaching the intersection as determined in each step of the traffic study (existing, existing plus background, and existing plus background plus site).

---

1 In such cases, the coordination of any proposed intersection improvements shall be in accordance with the memorandum of understanding provided as Appendix 7.
Applicants should use the following steps to determine the congestion level of an intersection with a simple two-phase signal operation.

Step 1: Determine the signal phasing, number of lanes, and the total volume of entering turning movements on all intersection approaches and the traffic movements permitted in each lane.

Step 2: Subtract from the total approach volume any right-turn volume that operates continuously throughout the signal cycle (a free-flow right-turn bypass). Also, subtract the left-turn volume if it has an exclusive lane. An exclusive turning lane must be long enough to store all of the turning vehicles in a typical signal cycle without overflowing into the adjacent through lanes. Otherwise, none or only percentage of the turning volume may be subtracted from the total approach volume.

Step 3: Determine the maximum volume per lane for each approach by multiplying the volume calculated in Step 2 by the appropriate lane-use factor selected from Table 2. (Note: Do not count lanes established for exclusive use such as right- or left-turn storage lanes. The lane use factor for a single exclusive use lane is 1.00. Consult with Planning Department staff and MCDOT regarding any overlap signal phasing.)

<table>

<td>0.25</td>
</tr>
</tbody>
</table>

* Based on local observed data and the 2010 Edition of the Highway Capacity Manual

Step 4: Select the maximum volume per lane in one direction (e.g., northbound) and add it to the opposing (e.g., southbound) left turn volume.

Step 5: Repeat Step 4 by selecting the maximum volume per lane in the opposite direction (e.g., southbound) and the opposing (e.g., northbound) left-turn volume.

Step 6: The higher total of Step 4 or Step 5 is the critical volume for phase one (e.g., north-south).

Step 7: Repeat Steps 4 through 6 for phase two (e.g., east-west).

Step 8: Sum the critical lane volumes for the two phases to determine the CLV for the intersection. At some intersections, two opposing flows may move on separate phases. For these cases, each opposing phase becomes a part of the intersection’s CLV (see Table 3).

Step 9: Compare the resultant CLV for the intersection with the congestion standards in Map 1.
An example of a CLV calculation for a hypothetical intersection is provided in Table 3.

</table>

1 Approach volumes are the sum of through, right, and left turn movements in two lanes.
2 For a heavy right turn, evaluate worst of rights in one lane or through and rights in two lanes.
3 Approach volumes are the sum of through and right turn movements in two lanes.
4 Approach volumes are through only because of free right and separate left.
5 Intersection Critical Lane Volume = higher sum = 675 + 548 = 1,223.

The following conditions should be observed where applicable.

- Right turn overlaps can be assumed where an exclusive right turn lane exists, except in cases when an approach is signed for a “no turn on red” condition.
- The CLV for five-leg intersections should be addressed according to the individual signal phases identified in the field.
- In cases where pedestrian crossing time criteria are not met, applicants must inform MCDOT, request that they revise the signal timing, and include this in the pedestrian statement.
- Crossing distances are to be measured from the curb to the edge of the far travel lane (not curb to curb).
- “Desired times” are to be determined by dividing the crossing distance by 3.5 ft/sec and then subtracting the total clearance time for that associated phase, as per the Manual on Uniform Traffic Control Devices.
- The CLV calculation for roundabouts should calculate the sum of the approach flow and circulating flows, as defined by the Highway Capacity Manual, for each approach and comparing the highest sum to the LATR standards.

2. Approved but Unbuilt Development

As a general guideline, background traffic from approved but unbuilt developments will be in the same geographic area as the intersections to be studied, defined by a polygon connecting the intersections farthest from the site. If the background traffic is generated from a large, staged development, the traffic study and its review will also be staged. As noted above, background traffic data should also include effective trip mitigation programs or uncompleted physical improvements that have been required of nearby developments. In appropriate cases, Planning Department staff may require that traffic from nearby unapproved applications also be included in the traffic study as described on page 6.
3. Existing Intersection Turning Movement Counts

Generally, intersection turning movement counts less than one year old when the traffic study is submitted are acceptable. Traffic counts should not be conducted:

- on a Monday or Friday
- during summer months or when public schools are not in session
- on federal, state, or county holidays
- on the day before or after federal holidays
- during the last two weeks of December and the first week of January or when a major incident or event results in significantly different traffic volumes and patterns
- when weather or other conditions have disrupted normal daily traffic.

For special circumstances such as summer camps, non-summer or summer traffic counts, whichever is higher, will be used in the study.

4. Trip Generation, Directional Distribution, Directional Split, and Trip Assignment

Trip Generation

Trips projected to be generated by the proposed development and background traffic should be determined in accordance with the latest Trip Generation Guidelines (see Appendix 1). Developments that generate less than five peak hour background trips (i.e., subdivisions of four or fewer single-family detached houses) are not generally included unless located at a critical analyzed intersection, since tracking those trips is not pragmatic.

Trip generation equations and rates are shown in Appendix 1 for general office, retail, residential, fast food restaurants, child day care centers, private schools/educational institutions, senior/elderly housing, mini-warehouse, and automobile filling stations with or without ancillary uses. Equations for calculating trips from other land uses or zoning classifications can be obtained from the Institute of Transportation Engineer’s (ITE) latest edition of the Trip Generation Manual, as can guidance regarding pass-by, diverted, and internal trip capture rates.

Applicants should use Appendix 1 for trip generation rates and equations for typical land uses within Montgomery County. Planning Department staff can assist in calculating trips and using the trip generation tables in Appendix 2. Appendix 3 contains the trip generation rates for the Silver Spring, Bethesda, and Friendship Heights CBDs, which reflect higher transit use. Planning Department staff is authorized to make minor technical changes to Appendixes 1, 2, and 3 to reflect new information or to correct errors. Applicants should check with staff to ensure they are using the latest version of the Appendix.

Another special case is retail sites over 200,000 square feet of gross leasable area. Their trip generation rates will be set after discussion with staff and the applicant’s analysis of data for one or more similar-sized retail sites within the County. In lieu of data collection, a trip rate set at two times the rate in the latest edition of ITE’s Trip Generation Manual may be used.

In some cases, adjusting the trips from the trip generation rates and equations in the Appendix may be appropriate. For example, the effect of pass by and diverted trips for retail, including fast food restaurants, child day care centers, and automobile filling stations; and the total trips from mixed uses such as office and retail will be considered on a case-by-case basis, using the best available information. Deviations may also be appropriate for a particular site. Appropriate rates for these sites could be based on traffic counts of comparable facilities on vehicles both entering and leaving those sites, preferably in the County, and will be considered by staff.

Directional Distribution

Planning Department staff provides applicants with guidance pertaining to the directional distribution of background and site traffic generated by office and residential uses from the latest edition of the Trip Distribution and Traffic Assignment Guidelines (see Appendix 4). The distribution of trips entering and leaving the proposed development will be determined based on the relative location of other traffic generators, including background development, employment centers, commercial centers, regional or area shopping centers, transportation terminals, or other trip table information provided by staff. For land uses not covered in the Appendix, distribution should be developed in consultation with Planning Department staff.
Directional Split
The directional split is the percentage of the trips entering or leaving the site during the peak hour and the direction in which those trips are traveling. Appendix 1 contains the directional split for general land uses and Appendix 3 contains directional split assumptions for the Bethesda, Friendship Heights, and Silver Spring CBDs. For all other uses, refer to the latest edition of ITE’s Trip Generation Manual. If data are not available, staff and the applicant will determine an appropriate in-out directional split.

Trip Assignment
Trip assignment is an estimate of the impact of future traffic on the nearby road network. It tends to be less accurate farther from the origin or destination of travel. The assignment factors shall be determined in consultation with Planning Department staff and applied to the generated trips. The resulting volumes will be assigned to the nearby road network. Generated trips, background traffic, and existing traffic will be combined to determine the adequacy of transportation facilities. Trip assignment will be extended to the nearest major intersection, or intersections, in consultation with Planning Department staff (see Table 1).

Once an intersection assignment exceeds a CLV of 2,000, diverting estimated traffic to alternate routes may be considered. Diversions will be based on feasible alternatives and should create a balance that reflects the project’s traffic impacts on both primary and alternate routes, and without excessively burdening local residential streets. Impacts on primary and alternate intersections must be mitigated in accordance with the policy area congestion standards. Staff, in consultation with the applicant, SHA, and MCDOT, will resolve these cases individually before presentation to the Planning Board.

5. Mode Split Assumptions
Estimates of transit use should be included if the study is to include trip reduction generated using non-auto trip factors. For mixed-use developments, the trip-generation rates and formulas in ITE’s Trip Generation Manual include the impacts of transit users.

6. Capital Improvement Projects and Consolidated Transportation Program Improvements
Transportation projects fully funded for construction within six years in the latest version of the County’s Capital Improvement Program (CIP), the State’s Consolidated Transportation Program (CTP), or any relevant municipal capital improvements program should be included in the study, along with techniques for estimating traffic diversion to major new programmed facilities.

Applicants should use the CIP and CTP to define a capital improvements project to be included in their traffic study. For an improvement to qualify for use, it must be fully funded for construction in the first six years of the applicable CIP or CTP as of the date of the traffic study’s submission.

If a capital project is not currently fully funded for construction within six years of the capital program, but such funding is reasonably anticipated to occur in the next capital program, Planning Department staff may recommend the Planning Board delay an APF decision until the County or State is ready to appropriate that funding. The Planning Board would then require the developer to consult with the County or State when building permit applications are filed. If the County or State agrees at that time in writing that the capital project will be constructed within six years, then the developer will contribute an amount equivalent to the cost of the LATR improvements that they would otherwise be required to make.

7. Circulation and Safety
The traffic study should provide peak hour turning movement projections (into and out of the site) for all driveways to commercial and multifamily residential developments, sites that share access through an easement agreement, and proposed intersections of any new public streets with existing public roads.

On sites with public or private facilities with 800 or more seats or that can otherwise accommodate 800 or more people during an event, which may have high traffic impacts, traffic studies should address concerns about site access and circulation.

8. Land Use and Size
The study should include the number and square footage of buildings on the site and whether they are commercial, residential, or some other use as described in Appendix 2 and in the latest version of the Highway Capacity Manual.
9. Queuing Analysis
The study should be based on data from the Highway Capacity Manual methodology, and reflect the different standards for CBDs and MSPAs (see Map 1). See page 18 for more detail.

10. Pedestrian and Bicycle Impact Statement
To ensure safe and efficient pedestrian and bicycle access and circulation to and within the site, the study should include:

- pedestrian and bicycle counts at each intersection: pedestrian counts will be recorded at each leg of the intersection; bicycle counts will be recorded as turn movements
- any capital or operating modifications required to maximize safe pedestrian and bicyclist access to the site and surrounding area
- inventory map of existing and proposed sidewalks, off-road shared-use paths, and bikeways near the site noting whether these facilities are generally consistent with the County’s Road Code design standards for sidewalk, path, landscape panel width, and street trees
- existing and proposed bus stops, shelters, and benches, including real time transit information
- pedestrian and bicycle accommodations at nearby intersections, including crosswalks, countdown pedestrian signals (CPS), push buttons, median refuges, and ADA-compliant ramps and accessible pedestrian signals (APS)
- information on bus route numbers, service frequency, and end destinations of bus routes
- in CBDs and MSPAs, recognition of peak pedestrian and bicycle activity periods
- inventory of existing streetlighting and additional lighting needs in the vicinity of the site.

11. Improvement and Mitigation Recommendations
The study should include a feasible range of traffic engineering improvements and/or trip mitigation measures associated with implementing the development.

12. Traffic Mitigation Agreement
If an applicant is proposing trip reduction measures, the study must include:

- a description of proposed Traffic Mitigation Agreement (TMAg) elements that will be entered into by the Planning Board, the Board of Appeals and MCDOT, and included in the opinions issued by the Board of Appeals. The description must include, at a minimum, the following elements:
  - the vehicle trip reduction goals, including the specific number of peak hour vehicles to be reduced in both the weekday morning and evening peak periods
  - the TMAg’s actions and a quantitative assessment of how they will achieve the required vehicle trip reduction goal
  - the required duration of the TMAg, whether the TMAg will be enforced based on the provision of specified actions (regardless of outcome), the measured outcome (regardless of actions provided), or a combination of both
  - the measures to be used in enforcement
  - the suggested method of monitoring
  - a security instrument to fund the continuation of the traffic mitigation program for its remaining term if the applicant defaults
  - the penalties if the vehicle trip reduction goals are not met.
- written statements from both MCDOT and Planning Department staffs concurring with the proposed approach to traffic mitigation.

Additional Guidance on Scope Elements
The project’s size and location will determine its traffic impact, as will the land uses in the proposed development. In calculating their impact, the applicant’s traffic study must consider the following factors.

Peak Hour
Traffic studies should be based on the one hour period with the highest trips during the typical weekday morning (6:30 a.m. to 9:30 a.m.) and/or evening (4:00 p.m. to 7:00 p.m.) peak period. This one-hour period shall be determined from the highest sum of the existing traffic entering all approaches to each intersection during four consecutive 15-minute intervals.
Traffic Data
Current existing traffic volume data may be available from the Planning Department’s intersection traffic count database, SHA, or MCDOT. New traffic counts should be conducted by the applicant if, in staff’s opinion, traffic volumes have increased due to some change in the traffic pattern, such as the completion of a nearby development or roadway project after the count was made. Applicants are responsible for collecting new traffic counts if turning movement data are more than one year old when the project application is considered complete by the Planning Department or if there are locations for which traffic count data are non existent.

Intersection traffic counts obtained from public agencies or conducted by the applicant must be manual turning movement counts of vehicles and pedestrian/bicycle crossing volumes in 15-minute intervals covering the typical weekday peak periods, 6:30 a.m. to 9:30 a.m. and 4:00 p.m. to 7:00 p.m., or some other agreed upon time period. The data must be collected in 15-minute intervals to allow selection of the peak hour within the nearest 15 minutes. All weekday peak-period turning movement data should be submitted as part of the applicant’s traffic study.

All new intersection traffic counts for vehicles, pedestrians, and bicycles must be submitted digitally to Planning Department staff to become part of the Planning Department’s Intersection Traffic Count database, which is available to developers, consultants, and others. Traffic counts affected by adverse weather or nearby traffic incidents will not be accepted (see page 11, Applicant’s Preparation of an LATR Traffic Study, Existing Intersection Turning Movement Counts).

Submitting an LATR Traffic Study
If an applicant is uncertain whether a traffic study is required, a traffic exemption statement must be filed as a part of an applicant’s development submittal. The traffic exemption statement must show:

• that the number of peak hour vehicle trips generated by the project’s proposed land use is fewer than 30 trips
• how the TPAR test is satisfied.

Planning Department staff will review the initial traffic exemption statement and determine if a traffic study is necessary.

If a traffic study is necessary, Planning Department staff has 15 working days to develop a study scope after receiving a written request and working with the applicant. As part of the scope, staff will supply the applicant with information on approved but unbuilt developments, relevant pending applications, nearby intersections to study, trip distribution and traffic assignment guidelines, and other information required to complete the study.

When determined to be complete and adequate, the applicant can return the study with the complete development application. Planning Department staff has 15 working days to let the applicant know if the study is complete and adequate.

TPAR and LATR are separate evaluation processes, but must be examined concurrently as part of a development application submission. Each applicant must satisfy both TPAR and LATR requirements. The requirements must be addressed in a single document, which may include a combination of traffic exemption statements and traffic studies.

Traffic Study Submittals
Two copies of the traffic study must be submitted with the development application. Once Planning Department staff confirms that the traffic study is complete and adequate, 13 copies must be submitted within five working days of notification, along with a PDF copy for inclusion in the application file and available for public view via the Planning Department website’s Development Activity Information Center (DAIC).

A complete and adequate traffic study must include:

• A site or area map showing:
  - existing roads serving the site and any CIP or CTP transportation improvements that are fully funded for construction within six years and that affect traffic at the critical intersections
  - nearby approved but unbuilt developments and associated improvements that would affect traffic at the critical intersections with their location shown on the area map. (This information is provided by staff and included as part of the traffic study.)
• Name and contact information of the licensed or certified professional submitting the traffic study. LATR traffic studies must be submitted by a registered Professional Engineer (PE), Certified Professional Traffic Operations Engineer (PTOE), Certified Professional Transportation Planner (PTP) or AICP Certified Transportation Planner (AICP CTP).

• Existing pedestrian and bicycle weekday morning and evening peak period traffic count summaries for the intersections analyzed in the traffic study. The summary should include any safety deficiencies or conditions that fail to comply with the Americans with Disabilities Act.

• For approved but unbuilt development:
  - weekday morning and evening peak hour trips expected to be generated by each nearby approved but unbuilt development, including the source of the generation rates and equations for each trip distribution patterns, as percentages, during the weekday morning and evening peak hours. The pattern of both distribution and assignment should be shown on an area map of the local roadway network.

• For the proposed development:
  - weekday morning and evening peak hour trips entering and leaving the site, including the site driveways
  - trip distribution patterns, as percentages, during the weekday morning and evening peak hours. The pattern of both distribution and assignment should be shown on an area map of the local roadway network.

• Maps that show separately and in combination:
  - existing weekday morning and evening peak hour traffic volumes using the affected highway system, including turning movements at analyzed intersections
  - projected weekday morning and evening peak hour trips assigned to the affected highway system and turning movements at analyzed intersections for all nearby approved developments, included as part of the background
  - traffic volumes derived by adding trips from approved development to existing traffic
  - if a roadway CIP/CTP or developer-sponsored project is considered as being in place, the resulting reassignment and redistribution of trip patterns
  - projected weekday morning and evening peak hour trips assigned to the affected highway system and turning movements at analyzed intersections for the proposed development
  - traffic volumes derived by adding site trips to the sum of existing plus background traffic assigned to the affected highway system and turning movements at the analyzed intersections.

• Any study performed to help determine how to assign recorded or proposed development trips, such as a license plate study or special turning movement counts.

• Copies of all critical lane volume analyses for each analyzed intersection, showing calculations for each approach.

• A list of all transportation improvements, if any, that the applicant agrees to provide and a scaled drawing of each improvement showing available or needed right-of-way, proposed roadway widening, and area available for sidewalks, bikeway, landscaping, as required. Coordination with MCDOT, SHA and, if impacted, the Cities of Rockville and Gaithersburg, should be shown.

Electronic copies of all vehicle, pedestrian, and bicycle traffic counts in approved digital format submitted to: www.montgomeryplanning.org/transportation/latr_guidelines/submission.pdf.

• Traffic counts affected by adverse weather, nearby traffic incidents, or other factors resulting in non-typical volumes will not be accepted.

Before a traffic study is accepted for review, the applicant must show proof that the MCDOT Development Review Fee (to review the traffic study) has been paid, in accordance with Executive Regulation No. 28-06 AM (Schedule of Fees for Transportation-related Reviews of Subdivision Plans and Documents).

Once a traffic study is determined to be complete and adequate (see Table 4), the date of Planning Department staff acceptance of that study becomes the completion date. Planning Department staff will inform the Planning Department’s Development Application and Regulatory Coordination division that the study is complete and adequate. As part of a development application, the traffic study will follow the standard notification process.
Planning Department staff is available to review the traffic study’s recommendations with community representatives. Traffic studies are available for public review as part of the application’s general file. Copies can be made or requested from the applicant, as needed. PDF copies are also available online at the Planning Department’s Development Activity Information Center.

After the traffic study is complete and adequate, Planning Department staff will distribute it to MCDOT, SHA, and incorporated cities, if applicable. Traffic studies should be distributed at or before the date when subdivision plans are distributed for review by the Development Review Committee. These agencies will have 30 days to review the traffic study and comment. Planning Department staff will determine if a traffic study’s recommendations are acceptable in consultation with the applicant, MCDOT, and SHA. Planning Department staff will work with the applicant to obtain comments from SHA and MCDOT five weeks prior to a scheduled Planning Board hearing.

It is the applicant’s responsibility to determine how to respond to written and/or oral communication by Planning Department staff regarding issues associated with and/or required modifications to the traffic study.

STAFF’S EVALUATION OF A TRAFFIC STUDY

Planning Department staff evaluates traffic studies considering the following elements, described here to ensure consistent review by staff and to provide applicants additional information about how their studies will be analyzed. The review includes variations for MSPAs, CBDs, and projects with multiple applicants.

Project Size and Location
To warrant an LATR traffic study, a proposed development must have a measurable traffic impact on a local area. Measurable traffic impact is defined as a development that generates 30 or more total (i.e., existing, new, pass-by, and diverted) weekday peak hour trips in the morning (6:30 a.m. to 9:30 a.m.) and/or evening (4:00 p.m. to 7:00 p.m.) peak periods. If the proposal generates less than 30 trips or is a renovation of an existing development and will generate no net increase in trips, a traffic exemption statement is required instead of a traffic study.

An LATR traffic study is not required for any expansion that generates five or fewer additional peak hour trips if use and occupancy permits for at least 75 percent of the originally approved development were issued more than 12 years before the LATR traffic study exemption request. If an LATR traffic study is required, the number of signalized intersections in the study will be based on the increased number of peak hour trips rather than the total number of peak hour trips.

To determine if a development will generate 30 or more weekday trips, Planning Department staff uses the following criteria:

- For office or residential development, all peak hour trips are counted even if, as part of the analysis, some of the trips will be considered as existing, pass by, or diverted trips to the site from existing traffic.
- For retail development, pass-by and diverted trips are included in establishing the 30-vehicle threshold for a traffic study and later, for designing site access and circulation. Pass-by and diverted trips are not added to site-generated trips because they are already on the network, but diverted turning movements are considered in evaluating CLV measurement.
- Planning Department staff shall exercise their professional judgment in consultation with the applicant in determining the appropriate land area to consider. Parcels that will be separated by unbuilt roadways remain “land at one location” but parcels separated by business district streets, arterial roadways, major highways, or freeways may cease to be “land at one location” even if still in common ownership.

In certain circumstances, Planning Department staff may, in consultation with the applicant, require analysis of traffic conditions during a different three-hour weekday peak period for example, 6:00 a.m. to 9:00 a.m. (versus the standard 6:30 a.m. to 9:30 a.m.) or 3:30 p.m. to 6:30 p.m. (versus the standard 4:00 p.m. to 7:00 p.m.), to reflect the site’s location or trip-generation characteristics, existing conditions, or background traffic. For example, a school where classes end before the start of the evening peak period may warrant analysis of an earlier peak period.

The applicant calculates the number of trips using the following sources:

- in the Silver Spring, Bethesda, and Friendship Heights CBD Policy Areas, use the trip generation rates in Appendix 3, Tables 3-1 or 3-2.
- in all other parts of the County:
  - for general office, general retail, residential, fast food restaurant, private school, child day-care center, automobile filling station, senior/elderly housing, or mini-warehouse, use the formulas provided in Appendix 1 and the tables provided in Appendix 2.
  - for other land uses, use the latest edition of the Trip Generation Manual published by the Institute of Transportation Engineers (ITE).

For some specialized land uses, trip-generation rates may not be available. In such cases, Planning Department staff may request that determining rates be a part of the traffic study, most likely by collecting existing driveway counts at similar land uses. If special rates are to be used, staff must approve them prior to submission of the traffic study.

An applicant shall not avoid the intent of this requirement by submitting piecemeal applications or approval requests. However, an applicant may submit a plan of subdivision for less than 30 peak hour trips if agreeing in writing that, upon filing future applications, the applicant will comply with the requirements of the LATR/TPAR Guidelines when the total number of site-generated peak hour vehicle trips at one location has reached 30 or more. Then, a traffic study will be required to evaluate the impact of the total number of site-generated trips in accordance with the Guidelines.
Planning Department staff may elect to waive the criteria described in this section if the development results in no net increase in weekday peak-hour trips.

**Congestion Standards**

The County Council establishes congestion standards throughout the County (stated in terms of CLV levels), which depend on the character of development and the availability of transit options. These standards are developed by policy area and adopted in the Subdivision Staging Policy (see Map 1). Planning Department staff maintains an inventory of intersection traffic data based on traffic counts collected by MCDOT, SHA, and private traffic consultants to provide applicants with a preliminary assessment of conditions in the vicinity of a proposed development.

**Reviewing Development in MSPAs and CBDs**

In reviewing MSPA and CBD applications, staff uses the following criteria.

**Adequacy of Traffic Flows**

- Any intersection with a CLV less than 1,600 will be considered acceptable with no further analysis required. The CLV will be calculated in accordance with the procedures defined in these Guidelines.
- If the CLV is 1,600 or higher, an HCM analysis shall be performed. Existing queues shall be measured by the applicant and total traffic (existing, background, and site) and planned roadway and circulation changes shall be taken into account. The HCM methodology shall be applied using simulation software such as SYNCHRO or CORSIM based on simulation parameters agreed upon by the applicant and Planning Department staff. The average queue length in the weekday peak hour should not extend more than 80 percent of the distance to an adjacent signalized intersection, provided the adjacent signalized intersections are greater than 300 feet apart. The 80 percent standard provides a margin of safety for peaking. If adjacent signalized intersections are closer together than 300 feet, the average queue length in the weekday peak hour should not extend more than 90 percent of the distance to the adjacent signalized intersection. The assumed signal timing analysis must be consistent with the crossing time required for pedestrians as described in the CLV Analysis Methods section (page 8).

**Site Access and Pedestrian/Bicycle Safety**

In addition to the traffic flow analysis, applicants must demonstrate that the following guidelines are not violated by their site development.

- Vehicle access points for parking and loading must be located so that they will not interfere with traffic flows on the adjacent streets or with access points to neighboring buildings or transit terminal areas. Access directly onto roads classified as arterials or above should be avoided, but if proposed it will be considered in the context of the application.
- In addition to the pedestrian and bicycle impact statement, pedestrian and bicycle safety shall be assessed based on the potential for conflicts between pedestrians, bicycles, and vehicles. Actions shall be taken to minimize conflicts and ensure pedestrian and bicycle safety on and adjacent to the site.

In MSPA cases where pedestrian crossing time criteria are not met, the applicant must inform MCDOT and request them to revise the signal timing. Any adjustments must be documented in the traffic study submitted as part of the development application. In the analysis, all pedestrian and bicycle movements are assumed to be made at the street level.

**Other Criteria**

- Total traffic is defined as the existing traffic, plus trips from approved but unbuilt development, plus the trips from the proposed development during the peak hour of the weekday morning and evening peak periods.
- Critical intersections are those within the CBD or MSPA, defined by Planning Department staff, generally adjacent to the site, or allowing site traffic to enter an arterial or major road. In some cases, where site volumes are large, additional intersections within or contiguous to the CBD or MSPA may be identified by staff for inclusion in the traffic study.
- Vehicles can be assigned to parking garages encountered on their trip into the CBD or MSPA. The capacity of parking garages must be accounted for based on guidance from Planning Department staff and consultation with MCDOT.
- Trip generation rates for background and site development traffic are contained in Appendixes 1, 2, and 3.

Multiple Applicants

Applicants can request that trip mitigation programs or intersection improvements be considered for more than one application. In those cases, the program or improvement must provide enough capacity to allow all participating applicants to satisfy LATR conditions.

An intersection improvement that is not yet complete may be used by two or more developments to meet LATR conditions. To be considered, the improvement must provide sufficient capacity to:
- result in a CLV that is less than the congestion standard for that policy area; and
- result in a CLV reduction equal to 150 percent of the CLV impact generated by the developments, that is, the intersection improvement must not only mitigate the impact of a proposed development, but improve conditions.

Any type of mitigation listed in this document or acceptable to MCDOT, SHA, and the Planning Board can be used to achieve this goal.

When development is conditioned on intersection and roadway improvements by more than one application, those improvements must be permitted and bonded, under construction, or under contract for construction prior to the issuance of building permits for any new development. Exceptions may be made if an applicant’s trip contribution to an intersection or roadway is less than 25 percent of the sum of total trips.

This requirement may be fulfilled by the creation of a road club or other mechanism approved by the Planning Board that:
- includes the terms, conditions, and responsibilities for funding 100 percent of the cost for design approval, right-of-way acquisition, and construction of the improvements as set forth in the individual project APF approvals; and ensures that all parties contribute in accordance with their respective shares to the total cost of the improvements
- ensures the improvements are either permitted and bonded or under contract for construction within three years of the first building permit issued for any of the developments dependent on the required improvements
- ensures the improvements are substantially complete and open within five years of the first building permit issued for any of the developments dependent on the required improvements.

If the second or third conditions above have not been met, no building permit that is conditioned on construction of the improvements may be issued to any other participant in the road club until all above conditions are met.

If a road club or other mechanism is formed, but not all parties responsible for the improvements join, the non-participating parties will not be permitted to proceed with platting or construction of their projects until they either join the road club or, if the improvements have been completed, reimburse the other road club participants for their share of the total costs. Non-participating parties include those with projects with preliminary plan or APF approvals, which are obligated to participate in the same improvements, whether the approval occurred before or after the road club formation.

Construction of an improvement by one applicant does not relieve other applicants of their responsibility to participate in the cost of that improvement. The final percentage of the construction cost contribution is determined by the participating applicants.

---

1 This condition is satisfied if the project is included in the first six years of the County’s Capital Improvement Program or the State’s Consolidated Transportation Program and the developer’s contribution is applied to that project.
2 Trip total is the sum of the total peak-hour trips generated by all developments required by the Planning Board to participate in the construction of the particular improvement.
3 In certain APF approvals, an applicant is not required to build an improvement until a certain number of building permits have already been released. Such a project would not be responsible for constructing those improvements until the specified number of building permits has been released.
If the Planning Board is asked to consider extending the time period to comply with APF requirements for an approved preliminary plan, Planning Department staff will determine if the traffic study needs to be updated based on the APF validity period.

**Participation in Transportation Improvements**
The Planning Board may require that applicants participate in some capital program transportation improvements. Participation will be proportional to the development’s impact on the improvement and will be determined by Transportation Planning staff, MCDOT, SHA, and other agencies that fund transportation-related improvements. If the traffic study identifies roadway changes or other transportation-related activities required to mitigate the proposed development’s on- or off-site impact, these changes will be the responsibility of the applicant as part of LATR.

**Traffic Mitigation Agreement**
Each applicant in a Transportation Management District (TMD) must have a proposed Traffic Mitigation Agreement (TMAg) outlining a participation plan for trip reduction measures and other strategies for participating in efforts to achieve the non-auto mode share goals for that policy area. This plan should be prepared in conjunction with the area’s TMD, MCDOT, and Planning Department staff. The TMAg for TMD participation may be structured to incorporate applicable LATR and TPAR requirements.

A TMAg may be required in areas where Transportation Demand Management is anticipated in the future, or in situations where the applicant has claimed credit for travel volume reductions by using transit without identifying specific measures to guarantee those reductions.

Proposed Traffic Mitigation Agreements should be:
- submitted as a draft, electronically and in writing, with subdivision plan submissions (the draft document should detail the project’s proposed the trip reduction program);
- executed and recorded before the issuance of the project’s first building permit.

**Information Provided by Staff**
The following information may be provided to the applicant by Planning Department and MCDOT staffs for use in the traffic study.
- Existing traffic counts at selected locations. (The applicant shall be required to update these data if the application is submitted more than one year after the applicant submits a completed development application to the Planning Department.)
- Trip generation rates or equations and their source.
- Initial directional distributions (see Appendix 4) to be refined based on the existing road network
- In CBDs, parking garage capacity information and locations of future public parking garages.
- A list of approved but unbuilt developments and their locations.
- Public and private transportation improvements in the study area, with funding assigned for construction within six years (see Appendix 6).

**Staff Findings**
In their report to the Planning Board, staff presents findings for each of the following categories and makes recommendations about the adequacy of transportation facilities. The Planning Board will use these findings and recommendations, along with comments and recommendations from the public, MCDOT, SHA, and incorporated cities and towns, to determine the adequacy of public facilities for the proposed development.

Staff determines adequacy by finding that:
- congestion conditions will not exceed policy area standards
- proposed intersections improvements are feasible and will improve congestion conditions
- the applicant will pay into a fund to make required improvements.

**Transportation Solutions**
If the applicant’s traffic study identifies a condition that exceeds the congestion standard for the policy area, Planning Department staff will notify the applicant, MCDOT and SHA so that feasible mitigation can be developed. The Planning Department staff may recommend and the Planning Board may approve traffic mitigation...
agreements, non-automobile transportation facilities, or physical road improvements, alone or in combination, as the required means to relieve local congestion. For LATR, priority will be given to non-physical improvements in MSPAs and CBDs. No transportation mitigation improvement or transportation mitigation payment is required under TPAR in MSPAs.

The Subdivision Staging Policy seeks to reduce congestion in areas where it may already be unacceptable. It stipulates that in policy areas where local area conditions exceed the congestion standard, development may only be approved if the applicant agrees to mitigate the LATR impact by either:

- making improvements that bring the local area condition to within the congestion standard, or
- reducing CLV by an amount to equal to 150 percent of the CLV impact generated by the development.

Whenever modifications to signalized intersections and other physical improvements are proposed to remedy congestion standard issues, the traffic study must provide preliminary information to establish the feasibility of implementing the proposed measures. In these instances, the traffic study should include:

- alternative intersection improvements that were considered but not recommended, plus the rationale for not proposing them
- existing and proposed pavement
- existing and proposed right-of-way
- the length and width of proposed modifications
- cross sections of existing and proposed improvements in the right-of-way
- modifications to receiving lanes (such as additional through or turn lanes) or right-turn lanes
- the adequacy of turn radii—particularly for opposing vehicle movements where additional turn lanes are proposed
- proposed changes to the operation of existing traffic signals (timing, phasing, etc.).

Once the applicant, Planning Department staff, and MCDOT and SHA have identified solutions that will create local transportation capacity, these solutions will be incorporated as conditions of approval in the Planning Department staff report. These solutions could include additional traffic engineering or operations changes beyond those currently programmed, or new transit or ridesharing activities.

For applicants participating in traffic mitigation or intersection improvements to satisfy LATR requirements, that participation also counts toward meeting LATR for intersections where site-generated trip volume is less than five critical lane movements.

Establishing Local Congestion Standards
The applicant’s traffic study must identify a development proposal’s impact and the degree of intersection congestion for the peak hour of the weekday morning and evening peak periods by comparing the calculated CLVs with the policy area congestion standards in Map 1. For intersections straddling policy area boundaries, the higher congestion standard shall be used.

The LATR congestion standards are based on an approximately equivalent level of service that balances transit availability with roadway congestion in all County policy areas. In areas of greater transit accessibility and use, greater traffic congestion is permitted (see Map 1).

If staff finds that congestion standards are exceeded under background conditions, an applicant is required to provide a traffic mitigation program consisting of either or both trip reduction or intersection improvements. The mitigation program should:

- bring the intersection to acceptable levels of congestion, or
- reduce CLV by an amount equal to 150 percent of the CLV impact generated by the development.

Unavoidable Congestion
In their analysis, Planning Department staff will identify alternate routes to serve associated trips that could mitigate congestion. If there are no appropriate alternate routes, then it must be assumed that trips from the proposed development will increase local area congestion. It is not appropriate to anticipate that the development’s associated trips associated would use local streets other than for site access unless those streets are classified as arterial, business district, or higher.
Transportation Demand Management Strategies

As part of the traffic study review and approval, staff, in coordination with MCDOT, will confirm the degree to which transit, ridesharing, or other TDM activities can mitigate vehicle trips generated by a development. This activity should occur before the traffic study scoping letter stage to aid in preparing and reviewing the report. If the proposed development or immediate area can be served with transit or ridesharing services, then priority will be given to developing a transit alternative or trip mitigation program using transit. If it is physically or fiscally ineffective for public agencies to provide transit or ridesharing services, then it must be assumed that trips from the proposed development will increase local area congestion. In most cases, TDM strategies will be included in TMAgs and monitored over time to ensure effectiveness.

Project-Related Traffic

Planning Department staff will identify the degree to which local traffic congestion is attributable to the proposed development by measuring traffic from three sources: existing traffic, background traffic generated by the total of all nearby approved but unbuilt development, and total trips generated by the proposed development. The more trips the proposed development contributes to local traffic congestion, the greater the local impact area.

Exceptions to LATR

There are several exceptions or additions to the LATR process and standards.

In the Potomac Policy Area the only developments subject to LATR are those with site-generated trips that will impact the following intersections:

- Montrose Road and Seven Locks Road
- Democracy Boulevard and Seven Locks Road
- Tuckerman Lane and Seven Locks Road
- Bradley Boulevard and Seven Locks Road
- Democracy Boulevard and Westlake Drive
- Westlake Drive and Westlake Terrace
- Westlake Drive and Tuckerman Lane
- River Road and Bradley Boulevard
- River Road and Piney Meetinghouse Road
- River Road and Seven Locks Road
- River Road and Falls Road
- Falls Road and Democracy Boulevard.

Alternative Review Procedure

The congestion standard for intersections in Metro Station Policy Areas is a CLV of 1,800 (see Map 1) and development within these areas is eligible for the Subdivision Staging Policy’s Alternative Review Procedure (ARP), which exempts projects from LATR and requires paying twice the TMD fees and reducing their trips by at least 50 percent.

For applicants using the Alternative Review Procedure (see Subdivision Staging Policy Section TA2), the solutions must be identified, agreed to, and made conditions of approval.

An applicant for a subdivision that will be built completely within an MSPA need not take any action under TPAR or LATR if they agree in a contract with the Planning Board and MCDOT to:

- submit an application containing all information, including a traffic study, that would normally be required for LATR
- meet trip reduction goals of no less than 50 percent set by the Planning Board as a condition of approving that subdivision, either by reducing trips from the subdivision itself or from other occupants of that policy area per an executed and recorded Traffic Mitigation Agreement, and provide a surety document to ensure that the reduction of trips in fact takes place
- participate in programs operated by, and take actions specified by, a TMO to be established for that policy area (or a group of policy areas) to meet the established mode share goals
- pay an on-going annual contribution or transportation development impact tax to fund the TMO’s operating expenses, including minor capital items such as buses, as established by County law
- pay 75 percent of the applicable General District Transportation Impact Tax without claiming any credits for transportation improvements.

To calculate mitigated trips for the Alternate Review Procedure, the applicant must explicitly document the conversion between person-trips and vehicle trips to account for transit use, vehicle occupancy, walk/bike use, internal site trip capture, and telecommute options. The estimates should document the effect of home-based work trips separately from all other trips. Special trip rates in Appendix 2, such as for office uses within 1,000 feet of Metrorail stations outside the Beltway, or rates for any uses within the Bethesda, Silver Spring, and Friendship Heights CBDs (Appendix 3), should not be used in either ARP or LATR-TPAR trip calculations. Countywide rates in Appendixes 1 and 2 are allowed, otherwise calculation rates and procedures recommended by the ITE or the TRB must be applied and referenced for Planning Department staff to consider the quantification of any trip reduction proposal.

Subdivision Staging Alternative Review Process

For commercial or residential developments, an applicant can meet LATR requirements by doing all of the following:

- paying 75 percent of the applicable development impact tax without claiming any credit for transportation improvements
- participating in and paying an on-going annual contribution to a Transportation Management Organization (TMO) if and when one exists
- mitigating 50 percent of their total weekday morning and evening peak hour vehicle trips per an executed and recorded TMAg
- submitting a traffic study to identify intersection improvements and trip mitigation measures that would have been required.
ALTERNATIVE SOLUTIONS AND MITIGATION APPROACHES

If an applicant’s LATR findings indicate an unacceptable intersection congestion level, their options to mitigate that impact include the physical or program improvements as outlined below.

In general, any mitigation measure or combination of mitigation measures must be scheduled for completion or be operating before or at the same time the proposed development is scheduled to be completed. The nature, design, and scale of any additional facility or program must receive approval from any government agency that would construct or maintain it and the applicant and public agency must execute an appropriate agreement before the Planning Board approves a record plat.

Both the subdivision plan and the necessary mitigation measures must be consistent with an adopted master plan or other relevant land use policy statement. For the Planning Board to accept a roadway improvement as a mitigation measure, the applicant must show that alternative non-auto mitigation measures are not feasible or desirable. In evaluating mitigation measures proposed by an applicant, the Board must place a high priority on design excellence to create a safe, comfortable, and attractive public realm for all users, with a particular focus on high-quality pedestrian and transit access to schools, libraries, recreation centers, and other neighborhood facilities.

If an approved subdivision already constructed or participated in the construction of off-site improvements to accommodate its peak hour trips (based upon the LATR requirements the Board imposed when it approved a development plan), and if the development later converts one or more approved uses or reduces its size so that the subdivision generates fewer or an equal number of peak hour trips than estimated when the Board imposed the LATR requirements, the trip mitigation agreement must reduce the development’s peak hour trip mitigation requirement by one trip for each peak hour trip that no longer would be generated by the development. If the conversion of all or part of the subdivision from one use to another would cause a different trip distribution or would place new or different burdens on one or more intersections, and if the subdivision is otherwise required to do so, the subdivision must construct or contribute to improvements specified by the Board to mitigate that result.

Applicants required to make intersection improvements to satisfy LATR may apply the capital cost of those improvements toward any TPAR mitigation obligation only if the conditions qualifying those improvements as being appropriate for TPAR mitigation are met.

LATR Mitigation Options

Traffic Mitigation Agreements

The applicant may be required to reduce or mitigate trips by entering into a legally-binding transportation mitigation agreement (TMAg). Each traffic mitigation program will be required to operate for at least 12 years, but not more than 15 years, once trip reduction requirements are initially achieved and after use and occupancy permits are drawn. Some elements are designed to continue in perpetuity.

TMAg measures could include:

- subsidizing transit fares to increase ridership
- constructing and maintaining a new park-and-ride facility or providing funds to increase use of an existing park-and-ride facility
- funding a private shuttle service, for example, between the site and a nearby Metrorail station or park-and-ride facility
- constructing queue-jumper lanes, providing traffic signal priority treatment for transit (after MCDOT and SHA have implemented this process) and other techniques to improve bus travel times (only results that improve travel times will be considered)
- parking management activities
- establishing live-near-work, flex-time, or telecommuting programs.

Other measures may be suggested by applicants, Planning Department staff, or MCDOT. Creative approaches to reducing traffic impacts are encouraged. The final trip reduction measures must be approved by the Planning Department and MCDOT staffs.
To ensure compliance with the contract conditions, TMAgs will be monitored at a minimum on a quarterly basis, at the applicant’s expense, by MCDOT staff or a consultant selected by the Planning Board. If the quarterly monitoring finds that the goals are not being met, the TMAg will be monitored on a monthly basis until the goals are met for three consecutive months. When the goals aren’t being met, staff and the applicant will work together to seek alternative or additional measures and monthly monitoring will take place until the trip reduction goals are met.

Non-Auto Transportation Facilities

To maintain an equivalent level of service for both auto and non-auto modes of travel, the Planning Board may permit an applicant to provide fewer roadway improvements or less traffic mitigation in exchange for providing non-auto transportation facilities that will enhance pedestrian safety or encourage non-auto mode choices.

Such facilities must be implemented to reduce the congestion levels at intersections that exceed the congestion standard and where an improvement need has been identified. Trip distribution and assignment assumptions in the LATR Traffic Study are key factors in determining local intersection impacts and the level of trip mitigation required.

Table 6 identifies trip reduction options. Any or all of these may be used for a given application. The maximum trip reduction per development is a function of the policy area congestion standard for the development site.

In determining the adequacy of improvements, the Planning Board must balance the environmental and community impacts of reducing congestion as well as the safe and efficient accommodation of pedestrians, bike riders, and bus patrons. Periodic monitoring may or may not be required of non-auto transportation facilities.

Non-auto facilities to mitigate congestion include sidewalks, bike paths, Super Shelters, bus shelters and benches, bike racks and lockers, and static or real time transit information signs, described in more detail below.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

Table 6 identifies trip reduction options. Any or all of these may be used for a given application. The maximum trip reduction per development is a function of the policy area congestion standard for the development site.

In determining the adequacy of improvements, the Planning Board must balance the environmental and community impacts of reducing congestion as well as the safe and efficient accommodation of pedestrians, bike riders, and bus patrons. Periodic monitoring may or may not be required of non-auto transportation facilities.

Non-auto facilities to mitigate congestion include sidewalks, bike paths, Super Shelters, bus shelters and benches, bike racks and lockers, and static or real time transit information signs, described in more detail below.

Sidewalks, Bike Paths, Pedestrian Refuge Islands, Accessible or Countdown Pedestrian Signals, and Curb Ramps

These features can be constructed off-site and should provide safe access from the proposed or existing development to any of the following uses:

- rail or bus transit stations or stops
- public facilities (school, library, park, post office, etc.)
- recreation centers
- retail centers that employ 20 or more persons at any time
- housing developments of 27 or more single-family detached units
- office centers that employ 100 or more persons
- existing sidewalks or bike paths
- adjacent private amenity space (sitting area, theater, community center).

Accessible pedestrian signals (for the visually-impaired), retrofitting existing traffic signals with countdown lights, and reconstructing existing substandard curb ramps (to current ADA guidelines) should be allowed as optional facilities.

These features must be within one-quarter mile of the edge of the proposed development. For transit stations or stops, the frequency of transit service must be at intervals of 20 minutes or less during the weekday morning and evening peak periods. Appropriate new bikeway segments can be found in the Countywide Bikeways Functional Master Plan, or in the applicable master or sector plan. The Plan prioritizes bikeways by activity center, for example Metro stations, CBDs, park trails, etc.
Super Shelters, Bus Shelters, and Benches
An applicant may propose to construct a Super Shelter, bus shelter, or bench, including a concrete pad. Encouraging bus use can reduce weekday peak hour vehicle trips by diverting some person-trips to buses. Two types of shelters can be provided: standard bus shelters and Super Shelters.

- The County has an agreement with Clear Channel Outdoor, Inc. (CCO) to provide a minimum of 500 standard bus shelters in the County. CCO has first choice of locations for these shelters, a number of which will carry advertising. Standard bus shelters provided under LATR must be located in areas where CCO chooses not to provide shelters. CCO must be offered right of first refusal for any new sites before shelter placement is accepted from the developer.
- Super Shelters include heating and lighting, have larger capacity, four walls (with openings to enter and exit), and a higher level of design than standard shelters. A Super Shelter is located on Rockville Pike near Marinelli Road (as part of an agreement with Target/Home Depot). They may be provided only where CCO has chosen not to provide shelters. If agreed to by MCDOT and the developer, Super Shelters should be incorporated as part of development planning and coordinated with existing and planned locations for standard shelters.

All shelters must be on a bus route, at an existing stop or a new stop approved by DTS, within one-quarter mile of the edge of the proposed development. The service frequency must be at 20 minute intervals or less during the weekday morning and evening peak periods.

Bike Racks and Lockers
An applicant may propose to reduce LATR impact by providing bike racks, lockers, or a secured bike area in a parking garage for a minimum of eight bikes, at an activity center located within a one-mile radius of the edge of the proposed development.

Transit Information Signs and Kiosks
An applicant may propose to reduce LATR impact by providing static or electronic signs and information kiosks at bus shelters, large office buildings, retail centers, transit centers, or residential complexes. The signs should communicate scheduled or real-time transit information, for example, the scheduled or estimated arrival of the next bus on a given route. The applicant must work with and obtain approval from WMATA for Metrobus routes or with the Montgomery County Division of Transit Services (DTS) for Ride On routes.

Static transit information signs may be provided only at locations other than CCO-provided standard bus shelters, since they include that information. The applicant will be required to provide for way to change static transit information as often as three times a year.

Other Non-Auto Facilities
An applicant may reduce LATR impact by providing other non-auto facilities, including but not limited to bus layover spaces, crosswalks or pedestrian bridges, on-road bicycle lanes, park-and-ride lots, park trails, transit stations, streetlights, transitways, and busways.

For these facilities, pedestrians and bicyclists should be able to safely cross any roadway to reach their destination. The applicant may provide improvements that Planning Department, MCDOT, and SHA staffs agree would increase the safety of the crossing.

Applying Trip Reduction Measures
Applicants may only apply a trip reduction measure after the total number of peak hour trips is determined using standard trip rates. Developments generating more than 30 total weekday peak hour trips will be required to complete a traffic study, which should include proposed trip reduction strategies. Applicants may be required to gather data on current bus patronage or pedestrian/bicycle activity within the local area to aid in evaluating the strategies.

Payment Instead of Construction
Where an applicant has made a good faith effort to implement an acceptable improvement and where the Board finds that a desirable improvement cannot feasibly be implemented by the applicant but that it can be implemented by a public agency within six years after the subdivision is approved, the County Council has authorized the Planning Board to accept payment to the County of a fee commensurate with the cost of the required improvement.
Transportation Policy Area Review

INTENT AND STANDARDS

Transportation Policy Area Review (TPAR) is a policy area-wide test of public transportation facilities. The test is separate from LATR in that it considers average transportation system performance for defined policy area boundaries. This process evaluates the adequacy of transit and roadways separately to allow more in-depth analysis and staging of improvements of these two types of transportation.

TPAR measures transit adequacy by evaluating neighborhood bus service using three measures of adequacy: coverage, peak headway, and span of service.

• Coverage is the percentage of the "transit-supportive area" of a policy area that is within ¼-mile of a bus stop or ½-mile of a transit station. This definition is consistent with the Transportation Research Board’s Transit Capacity and Quality of Service Manual (2nd edition, 2002) that describes a "transit-supportive area" as one with a household density of at least three units per gross acre or an employment density of at least four jobs per gross acre. Transit-supportive areas do not include land uses such as parks, farms, golf courses, bodies of water, major road rights-of-way, and low-density housing and employment zones.

• Peak headway is average time between buses traveling in the same direction during the weekday peak hour in the peak direction.

• Span of service is the average duration of weekday bus service for that subset of routes in each policy area that is scheduled to operate throughout most of the day without a split in service during the midday hours.
TPAR measures roadway adequacy, based on vehicle miles traveled (VMT) over a 10-year horizon (year 2022) by forecasting travel speed on arterial roads in peak travel directions (derived from the Planning Department’s regional travel demand model). This result is compared to uncongested, free flow speed. Roads with the most trips are weight-averaged to reflect their impact on the overall network.

The resulting ratio of forecasted speed to uncongested speed is consistent with analysis standards in the Highway Capacity Manual. It is then compared with Subdivision Staging Policy adequacy standards for Urban, Suburban, and Rural policy areas—40 percent (level of service D/E), 45 percent (mid-Level of Service D), and 50 percent (level of service C/D), respectively.

The results of the TPAR roadway adequacy analysis, by policy area, are depicted in Figure 2.

Three policy areas—Potomac, Fairland/White Oak, and Gaithersburg City—are forecast to be inadequate or approach inadequacy by 2022.
Table 7 summarizes the TPAR transportation adequacy status and transportation mitigation payment requirement for each policy area between January 1, 2013 and July 1, 2014.

</table>
EVALUATING A TPAR CONDITION

Staff will evaluate the following information submitted by the applicant, using the TPAR adequacy standards in the relevant policy area.

- The development’s policy area.
- The type of development as defined in the development impact legislation.

TPAR MITIGATION OPTIONS

If projected transportation capacity in a policy area is not adequate, the Planning Board may approve a subdivision in that area if the applicant commits to either:

- fully mitigate the incremental traffic impact of the subdivision by adding capacity or implementing a trip reduction program
- pay a Transportation Mitigation Payment as provided in County law.

The Transportation Mitigation Payment is charged to developments in policy areas determined as inadequate for transit or roadway conditions based on the analysis prepared every two years by Planning Department staff and approved by the Planning Board. It is calculated as an amount equal to a percentage of the General District Transportation Impact Tax based on the type and amount of development. Table 7 shows which Policy Areas are required to pay the Transportation Mitigation Payment. The General District Transportation Tax rate for different types of development is updated by County Council and can be found at:
http://permittingservices.montgomerycountymd.gov/DPS/fee/ImpactTaxes.aspx

The TPAR payment must be made prior to release of any building permit and may not be credited toward the applicable development impact tax. The funds are used to make transportation improvements that will bring a policy area into roadway and transit adequacy.

- No TPAR compliance is necessary if the Planning Board finds that the proposed development will generate three or fewer new peak hour trips, or if the proposed development is in a policy area adequate for both transit and roadways.
- Developments in MSPAs are exempt from Transportation Mitigation Payments.
- TPAR compliance is necessary in policy areas found inadequate. Payment rates for roadways and transit are to equal 25 percent of the General District Transportation Impact tax for the same project based on the type and amount of development. In areas inadequate for both roadways and transit, payment rates are set to equal 50 percent of the General District Transportation Impact Tax for the same project based on the type and amount of development.

It is possible to provide significant improvements to transit and/or roadway capacity instead of making the payment.

To fully mitigate the subdivision’s incremental traffic impact (by adding capacity or implementing a trip reduction program), added capacity must improve congestion in the affected policy area by addressing roadway inadequacies or transit inadequacies. Transit improvements can be used to address either roadway or transit inadequacies if they can be shown to improve roadway capacity. See Appendix 6 for preferred roadway improvements.

Roadway improvements must:

- Improve transportation capacity in the same policy area as the development project
- have logical end points and connect at least two signalized intersections
- be approved by MCDOT for operation and safety considerations.

Transit improvements to improve capacity under TPAR may only consist of the purchase of new Ride On buses to provide improved transit service in the relevant policy area if that policy area is inadequate for peak headway or coverage. The number of buses required to achieve mitigation will be determined in consultation with Planning Department and MCDOT staffs. If the relevant policy area is inadequate for span of service, the TPAR payment is the only option.
The cost of the transportation capacity improvement must be equal to or exceed the value of the TPAR payment and the expenditure is not creditable for future use under the transportation impact tax (that is, the TPAR payment and the impact tax are additive). In general, any mitigation measure or combination of mitigation measures must be scheduled for completion or be operating before or at the same time the proposed development is scheduled to be completed. The nature, design, and scale of any additional facility or program must receive approval from any government agency that would construct or maintain it and the applicant and public agency must execute an appropriate agreement before the Planning Board approves a record plat.

<tr>
<td>1) no other facilities</td>
<td>11.31</td>
</tr>
<tr>
<td>2) garage</td>
<td>11.00</td>
</tr>
<tr>
<td>3) convenience store(^3)</td>
<td>12.28</td>
</tr>
<tr>
<td>4) car wash and convenience store</td>
<td>17.33</td>
</tr>
</tbody>
</table>

\(^1\) A pumping station is defined as the area at which any one vehicle can stop and pump fuel at any one time. A pumping station could also be referred to as a fueling position in front of a single nozzle dispenser or a multi-produce dispenser.

\(^2\) Downcounty locations are considered the urbanized areas with a congestion standard of 1,500 or higher (see Table 1). All other locations are considered up-County.

\(^3\) Note: A convenience store as an accessory use to an automobile filling station must have less than 1,650 square feet of patron area. Otherwise, such land uses are considered to be a “convenience store with gasoline pumps” with trip-generation rates in the ITE Trip Generation Report under Land Use Code 853.

### Table 1-7: Senior/Elderly Housing

<table>
<thead>

### Equations Used

AM peak-hour trips = \(1.38(GFA/1000)\)
PM peak-hour trips = \(2.24(GFA/1000)\)

For buildings 25,000 sf and over:

AM peak-hour trips = \(1.70(GFA/1000) - 8\)
PM peak-hour trips = \(1.44(GFA/1000) + 20\)

#### Special Cases

If a building is within 1,000 feet of a Metrorail station and outside the Beltway, reduce weekday peak-hour trips from chart at left.

<table>
<thead>
<tr>

**Equations Used**

**50,000 to 200,000 sf**

- AM peak-hour trips = 0.25 \([7.43 \text{ (GLA/1000)} + 247]\)
- PM peak-hour trips = \([7.43 \text{ (GLA/1000)} + 247]\)

**Adjustment Factor for No Major Food Chain Store**

- \(P = 0.05 + 0.002 \left[200 - \left(\frac{\text{GLA}}{1000}\right)\right]\)

**Note:** Under 50,000 sf, no equations, since major food chain store is typically at least 50,000 sf

Equations Used

**SINGLE-FAMILY DETACHED**

**Under 75 Units**

AM peak-hour trips = 0.95(# of units)
PM peak-hour trips = 1.11(# of units)

**75 Units and Over**

AM peak-hour trips = 0.62(# of units) + 25
PM peak-hour trips = 0.82(# of units) + 21

**TOWNHOUSES OR SINGLE-FAMILY ATTACHED**

**Under 100 Units**

AM peak-hour trips = 0.48(# of units)
PM peak-hour trips = 0.83(# of units)

**100 Units and Over**

AM peak-hour trips = 0.53(# of units) - 5
PM peak-hour trips = 0.48(# of units) + 35

**GARDEN AND LOW-RISE APARTMENTS**

**Under 75 Units**

AM peak-hour trips = 0.44(# of units)
PM peak-hour trips = 0.48(# of units)

**75 Units and Over**

AM peak-hour trips = 0.40(# of units) + 3
PM peak-hour trips = 0.47(# of units) + 1

**HIGH-RISE APARTMENTS**

**Under 100 Units**

AM peak-hour trips = 0.40(# of units)
PM peak-hour trips = 0.46(# of units)

**100 Units and Over**

AM peak-hour trips = 0.29(# of units) + 11
PM peak-hour trips = 0.34(# of units) + 12

---

Note: For residential units in the Bethesda, Friendship Heights, and Silver Spring CBD Policy Areas, use Appendix 3. For residential units in all other Metro Station Policy Areas, the number of trips in Table 2-3 may be reduced by 18 percent.

APPENDIX 4 Trip Distribution and Traffic Assignment Guidelines

Introduction
This document provides trip distribution guidance to be used in all traffic studies prepared for development sites in Montgomery County. Vehicle trip distribution and trip assignment are described in Sections VII-D and VII-F of the Guidelines. For most development sites, the process is a combination of trip distribution and traffic assignment.

Definitions
Trip distribution specifies the location where trips that originate at a development site are destined to, and the origin of trips that are destined to a development site.

Traffic assignment specifies the individual local area intersections used to access (enter and leave) a development site.

Discussion
The tables in this appendix provide generalized assumptions for trip distribution for both background development(s) and the development site. For the purpose of reviewing trip distribution, Transportation Planning staff divided the region into 16 geographic areas, called super districts. Eleven of these super districts are in Montgomery County, as shown in Map 4-1. The remaining five super districts represent neighboring jurisdictions.

The trip distribution assumptions are contained in Tables 4-1 through 4-11 for developments within each of the eleven super districts in Montgomery County. For each super district, the assumed distribution of trips for general office development and for residential development is listed. For instance, 18.1 percent of trips generated by a general office development in Germantown (see Table 4-9) would be expected to travel to or from Frederick County. However, only two percent of trips generated by a residential development in Germantown would be expected to travel to or from Frederick County.

The trip distribution assumptions in these tables are based on 1990 census journey-to-work information, updated to reflect regional housing and employment totals as of 1998. The distribution for residential development in each super district is based on the reported workplace locations for 1990 census respondents who lived in that super district. Similarly, the distribution for office development for each super district is based on the distribution of all census households nationwide that reported a workplace in that super district. Trip distribution for other land uses will be decided based on consultation with staff and the applicant prior to submission of the traffic study.

The application of the trip distribution information in Tables 4-1 through 4-11 is straightforward in cases where a traffic study has a limited number of alternate routes. In other cases, judgment is required to convert the trip distribution information into traffic assignment information useful for conducting the Local Area Transportation Review.

Figure 4-2 provides an example of how the trip distribution information can be converted to traffic assignment information for a hypothetical case in the Rockville/North Bethesda super district with both office and residential components.

The leftmost column of data shows the trip distribution by super-district as found in Table 4-4 (used for development in the Rockville/North Bethesda super district). The information located in the center of the table (inside the boxes) describes the assumed route, or assignment, taken for trips between the site and each super-district. The data inside the boxes must be developed using judgment and confirmed by Transportation Planning staff. The rightmost portion of the table multiplies the percent of trips distributed to each super-district by the percent of trips from that super-district assigned to each route to calculate the percent of total site-generated trips using each combination of distribution and assignment. The assignment data is then summed to develop an aggregate trip assignment for the trips generated by the office and residential components of the site, respectively.

APPENDIX 5  Delegation Procedures for Certain APF Findings by Staff at Time of Building Permit

Procedures
For a building permit where a traffic exemption statement is submitted to demonstrate that TPAR is not applicable and an LATR traffic study are not needed, or when the LATR traffic study is conducted with a finding that no mitigation is required, Planning Department staff can make a finding that public facilities will be adequate to support the proposed development, set the validity period for the APF approval, and authorize release of the building permit.

For a building permit where the TPAR test requires mitigation less than five trips, Planning Department staff may authorize release of the building permit by letter if:

1. Planning Department staff finds that the public facilities will be adequate for the proposed development with the proposed trip mitigation and sets the validity period for the APF approval; and
2. MCDOT, the Superintendent of the Montgomery County Public School System, County Fire and Rescue Services, the Department of Police, and DPS have been notified of the method of mitigation, and have not explicitly objected; and
3. interested parties and the applicant have been given notice of the pending case, and have not objected to the proposed mitigation (see below, Noticing); and
4. a copy of a permit for construction within the right-of-way for the mitigation item has been received from DPS.

For cases requiring mitigation of five or more vehicle trips, the item will be scheduled for an APF finding at a public hearing before the Planning Board after 1, 2, and 4 above are met. If no objections are raised by any interested parties or any of the agencies listed in 2 above, the case may be scheduled as a consent item before the Planning Board.

If an Applicant requests a hearing before the Planning Board or if any interested party or agency listed in 2 or 3 above objects to the proposed mitigation, the item will be scheduled for an APF finding at a public hearing before the Planning Board.

Noticing
The applicant must notify all confronting and adjacent property owners, and community and homeowners associations (following the procedure in the Development Review Manual [link]) of the application for APF approval as well as any proposed mitigation measures. The notice must also state that anyone objecting to the proposal must do so in writing within 14 days to Transportation Planning and provide the appropriate contact information.

MEMORANDUM OF UNDERSTANDING BETWEEN

THE CITY OF GAITHERSBURG

AND

THE CITY OF ROCKVILLE

AND

THE MONTGOMERY COUNTY PLANNING BOARD OF
THE MARYLAND-NATIONAL CAPITAL PARK AND
PLANNING COMMISSION

FOR

THE COORDINATION OF TRAFFIC IMPACT STUDIES
FOR PROPOSED DEVELOPMENT PROJECTS

This Memorandum of Understanding (MOU) is entered into by and between Montgomery County Planning Department of The Maryland-National Capital Park and Planning Commission, the City of Gaithersburg, and the City of Rockville (collectively, the Parties)

WHEREAS, the purpose of this MOU is for the Parties to work cooperatively to better manage traffic conditions given the inter-jurisdictional impact of traffic generated by development in close proximity to nearby jurisdictions through the exchange of information regarding traffic reports (traffic impact study or applicable traffic statement) of proposed development and through the coordination and review of such reports; and

WHEREAS, the parties acknowledge that each has a different set of standards for traffic reports within their jurisdiction.

NOW, THEREFORE, the Parties agree to the following:

1. The methodology for determining the scope of traffic reports for proposed development projects, and also for analyzing the intersections included in such reports, will be determined in accordance with the standards set by the approving jurisdiction.

2. If a proposed development project has a signalized intersection within the scope’s study area and located in a neighboring jurisdiction (one of the other parties to this MOU), that such intersection will be analyzed as part of the required traffic reports in accordance with the standards set by the approving jurisdiction.
3. Each Party will notify their neighboring jurisdiction when a project is submitted for review that includes a signalized intersection within the scope's study area and located in that neighboring jurisdiction. This includes notification of pre-Development Review Committee/Development Review Team (DRC/DRT) meetings and regular DRC/DRT meetings for such project.

4. When a signalized intersection falls within a neighboring jurisdiction, the approving jurisdiction will provide the neighboring jurisdiction with a copy of the applicable traffic report scope between the applicant and the approving jurisdiction. The approving jurisdiction will also provide the accepted traffic report to the neighboring jurisdiction. The neighboring jurisdiction will then be allowed up to thirty (30) days to review and submit comments back to the approving jurisdiction regarding the proposed development's traffic report.

IN WITNESS WHEREOF, the undersigned being duly authorized by the respective agencies, has signed this MOU.

Local Area Transportation Review and Transportation Policy Area Review Guidelines

January 2013
The Office of Legislative Oversight’s review of transportation demand management in Montgomery County and other communities found that the County actively promotes transit and other alternative commuting modes, especially within urban centers. However, OLO also found that the County simultaneously implements parking policies that undercut efforts to encourage commuters to choose alternative travel modes.

OLO recommends the Council act to improve the consistency of the County’s transportation demand management policies and practices. As part of this, OLO recommends that the Council discuss how to establish a sustainable alternative commuting infrastructure. Practices of other places offer potential strategies for the County to consider.

WHAT IS TRANSPORTATION DEMAND MANAGEMENT?

“Transportation demand management” refers to a set of public policy strategies and programs aimed at providing convenient and affordable alternatives to the single-occupant vehicle to maximize use of a region’s alternative transportation resources.

When choosing how to travel to work, commuters weigh the relative cost, time, and convenience of alternative modes of travel against driving alone. Local governments control only some of the many factors that influence a commuter’s decision to drive alone or use an alternative travel mode.

Sufficient and reliable funding for transit and other alternative commuting modes is a necessary prerequisite for persuading a high percentage of commuters to use alternative modes. For example, suppose a jurisdiction successfully persuades a large number of commuters to use an alternative mode of travel by providing cost competitive, timely, and convenient alternatives to driving alone. This may generate a need for the jurisdiction to invest additional resources in its alternative transit infrastructure (e.g., buses or bikeways) so that commuters do not become frustrated by crowded transit or other inconveniences and return to driving alone.

MONTGOMERY COUNTY’S SERVICES AND PROGRAMS

The County’s alternative transportation infrastructure includes bus and rail transit systems, bikeways, and pedestrian facilities. The County also provides services and programs to promote these and other alternative commuting modes. For example, the County requires developers and employers to implement traffic mitigation measures and provides funding to employers who offer transit subsidies to their employees. The table below summarizes County services and programs designed to promote alternative commuting modes.

<table>
<thead>
<tr>
<th>Service/Program</th>

</tr>
<tr>
<td></td>
<td>• Provides personalized rideshare matching for carpools and vanpools.</td>
</tr>
</tbody>
</table>
TRANSPORTATION MANAGEMENT DISTRICTS

The County focuses transportation demand management efforts on urban centers. Specifically, County law establishes transportation management districts in North Bethesda, downtown Bethesda, Friendship Heights, downtown Silver Spring, and Shady Grove. (The Shady Grove district, established in 2006, remains unfunded and inactive.) The County Department of Transportation (DOT) has also designated the Wheaton Central Business District as a “Transportation Planning and Policy Area.”

The County uses different approaches to manage and finance transportation demand management activities in North Bethesda, Bethesda, Friendship Heights, Silver Spring, and Wheaton. These differences reflect the uniqueness of each area, constituent interests, and management practices that existed when the transportation management district or transportation planning and policy area was established. For example, private organizations manage the transportation management districts in North Bethesda and Bethesda (under County contract), while the County’s Department of Transportation manages programs in Friendship Heights, Silver Spring, and Wheaton.

TRANSPORTATION DEMAND MANAGEMENT GOVERNANCE IN MONTGOMERY COUNTY

In Montgomery County, a decentralized structure of County and non-County entities shape the governance of transportation systems and transportation demand management programs. At times, this results in policies and programs that are not fully coordinated. This is common in most metropolitan areas, where governance entities may include state and local governments, regional organizations, transit systems, and parking authorities.

Some communities, notably universities with urban campuses, operate transportation demand management systems that offer a range of services that are consolidated under one centrally-managed program. In these places, a single entity promotes alternative commuting modes, offers transit incentives, operates local shuttle services, and sets parking pricing and supply policies.

IMPACT OF PARKING POLICIES ON TRANSPORTATION DEMAND MANAGEMENT

As currently implemented, County parking policies and transportation demand management objectives often work at cross purposes to one another, simultaneously promoting alternative commuting modes and providing single-occupant drivers easy access to plentiful, low-cost, conveniently-located parking. Such parking serves as an incentive to drive alone, which arguably undercuts County efforts to encourage alternative travel modes.

Under current zoning requirements, developments in urban centers must provide nearly the same amount of parking (for similar uses) as developments in less dense parts of the County. These requirements, adopted when the County was more suburban in nature, do not fully account for transit services and traffic congestion in urban centers today.

The County’s parking management practices also encourage commuters to drive alone. The County is a significant provider of parking in urban centers (see table below). Currently, most of the County-provided spaces in Bethesda, Silver Spring, and Wheaton are designated as long-term parking, which encourages commuters to drive alone. Except for a few County parking facilities which fill during peak hours, the overall supply of parking in each district exceeds demand. Further, the County’s parking rates are generally less expensive compared to private parking rates.

TRANSPORTATION DEMAND MANAGEMENT FUNDING IN MONTGOMERY COUNTY

Multiple County and non-County sources fund the County’s transportation infrastructure, which includes rail and bus systems, bikeways, and pedestrian facilities. The major funding sources for the County’s transit and transportation demand management services are two special funds:

- **The Maryland Transportation Trust Fund** supports State transportation programs, including operating MARC trains and MTA Commuter Buses and paying the County’s contributions to WMATA. State gas tax and motor vehicle taxes are the Fund’s largest revenue sources.

- **The County’s Mass Transit Fund** supports operation of the Ride On bus system, transportation demand management programs, and other activities of the DOT Division of Transit Services. Mass Transit Property Tax revenue contributes about two-thirds of all Mass Transit Fund resources.

Revenue from two special districts also supports County transportation demand management activities:

- **Transportation Management District** revenue funds transportation demand management activities through a special fee that the County charges certain property owners.

- **Parking Lot Districts (PLDs)** receive revenue from parking fees and fines and a special property tax. PLD revenue must first pay for parking facility operating and capital obligations; however, surplus revenue may be used to support a transportation management district.

The table below shows the different FY08 funding sources in the four Transportation Management Districts and one Transportation Planning and Policy Area (in Wheaton).

TRANSPORTATION DEMAND MANAGEMENT IN OTHER COMMUNITIES

Other communities implement a variety of transportation demand management strategies. Highlights from these strategies and observations about their applicability to Montgomery County are summarized below.

**Dedicated Funding for Transit**: Most large transit systems in the country are funded in part by revenue from a dedicated source. Examples of dedicated revenue are sales taxes, automobile fees, and toll revenue. Montgomery County would need State approval to establish any of these types of revenue as a dedicated funding source for transit.

Montgomery County is already authorized to implement other transit funding strategies used elsewhere. For example, the County could establish “transportation improvement districts” (a type of special taxing district) to raise revenue for transit system improvements. The County could also impose an excise tax on non-residential parking spaces, or it could raise public parking rates to support transit programs.

**Transportation Network Design**: Transportation network design may also promote efficient commuting practices. Examples include:

- Locating public parking facilities at the periphery of a central business district to intercept vehicles before they enter the congested district center.
- Installing traffic signaling systems that give precedence to transit vehicles at signal-controlled intersections.
- Building dedicated rights-of-way or roadway lanes used by frequent, high-capacity public commuter buses.
**Economic Incentives:** Economic incentives are a common tool to entice commuters to switch to transit or other alternative modes. Currently, the County reimburses some employer-provided transit subsidies. Other communities have developed different incentives to encourage commuting by alternative modes. For example:

- In Denver, Colorado, transit systems sell discounted passes for use by all workers in an organization. These programs offer those employees who do not need to drive every day an incentive to ride transit occasionally.
- The state of California requires many employers that provide parking subsidies to offer a cash allowance as an alternative to the parking subsidy.
- Redmond, Washington, has a pilot program that calculates an initial baseline number of commuter trips for a business, and then pays a business $300 annually for each trip it eliminates below the initial baseline.

**Driving Disincentives:** Several communities have adopted strategies to make driving alone less attractive than other commuting options. Examples of driving disincentive practices include:

- Reducing minimum parking requirements for urban areas served by transit. Alternatively, some communities set maximum limits – by site or by district - on the amount of parking permitted.
- Constraining the parking supply or raising parking rates.
- Adjusting transportation-related charges by time of day or by location (a practice known as “congestion pricing”). For example, London charges drivers a fee to enter the city center.

**OLO Recommendations**

OLO offers four recommendations for Council action to improve the consistency of the County’s policies and practices related to transportation demand management.

1. **Establish parking policies that are consistent with the County’s transportation demand management goals.**

   The Council should review and amend current parking policies to better align them with the County’s transportation demand management goals established in approved master plans and the Growth Policy. The Council should consider revising Zoning Ordinance parking requirements and establishing criteria for determining the supply and pricing of County-owned parking spaces.

2. **Ask the Executive and the Planning Board to report annually on commuting goals.**

   The Council is the sole entity with authority to align land use and transportation policies to achieve complementary objectives. The Council should ask the County Executive and the Planning Board to report annually on progress made toward achieving master plan commuting goals. Based on this input, the Council should determine what changes, if any, should be made to transportation or land use policies and programs.

3. **Ask the Executive to evaluate transportation demand management practices used in other communities.**

   The County has implemented a broad series of measures to promote alternative commuting modes; nonetheless, some practices from other jurisdictions merit further evaluation to assess their viability in Montgomery County. The Council should ask the County Executive to evaluate transportation demand management practices that could supplement the current array of County programs.

4. **Discuss approaches for creating and funding a sustainable alternative commuting infrastructure.**

   If the County's transportation demand management programs are successful, the increased demand created by a large scale shift in commuting practices could strain the County’s transit, bicycle, and pedestrian networks. The Council should discuss its long-term vision for building and funding additional capacity to accommodate workers who no longer commute by single-occupant vehicle. The Council should assess whether it expects to use existing revenue sources to build future improvements or whether it intends to pursue new funding resources for major new initiatives.

CHAPTER I: AUTHORITY, SCOPE, AND ORGANIZATION OF REPORT

A. Authority

B. Purpose and Scope of Report

Transportation demand management programs in urban centers are designed to change travel behavior by providing convenient and affordable alternatives to the single-occupant vehicle. The objectives of these programs are to reduce traffic congestion, decrease energy consumption, and improve air quality. Montgomery County offers a collection of transportation demand management programs that focus on urban center commuters.

The County Council directed OLO to prepare a report that describes the implementation, funding, and governance of transportation demand management strategies in Montgomery County and in other jurisdictions. Specifically, the Council asked OLO to:

- Describe transportation demand management practices in the County’s urban centers, including programs, governance structure, and financing;
- Provide case studies from other jurisdictions on alternative urban transportation demand management approaches; and
- Identify transportation demand management practices, governing structures, and financing techniques employed in other jurisdictions that could be considered for use in Montgomery County.

C. Organization of Report

Chapter II, Transportation Demand Management Concepts, describes concepts relating to transportation demand management.

Chapter III, Transportation Demand Management Governance and Implementation in Montgomery County, describes the County’s approach to transportation demand management.

Chapter IV, County Parking Policies and Commuter Choice, describes County policies and programs relating to parking in urban centers.

Chapter V, Transit and Transportation Demand Management Funding, presents information on the funding of transit and transportation demand management programs.

Chapter VI, Transportation Demand Management in Other Communities, identifies alternative transportation demand management practices employed in other communities and discusses the potential applicability of these practices to the County.

Chapter VII presents a summary of the Office of Legislative Oversight’s Findings.
Chapter VIII presents the Office of Legislative Oversight's Recommendations. Chapter IX presents Agency Comments received on a final draft of this report.

D. Methodology

Office of Legislative Oversight (OLO) staff members Aron Trombka and Jennifer Renkema conducted this study. OLO gathered information through document reviews, data analysis, and interviews with staff from the Department of Transportation (DOT) and the Department of Planning. OLO also met with managers of transportation management organizations and attended meetings of transportation management district advisory committees. OLO conducted internet research on transportation demand management programs around the country and abroad and made e-mail contact with program managers to learn more about specific initiatives. A primary source for much of the content of this report was the website of the Victoria Transport Policy Institute’s online Transportation Demand Management Encyclopedia (http://www.vtpi.org/tdm/index.php#incentives).

E. Acknowledgements

OLO received a high level of cooperation from everyone involved in this study. OLO appreciates the significant time commitment, the information shared, and the insights provided by all staff who participated. OLO thanks the following individuals who provided valuable input and information:

- Carolyn Biggins, DOT
- Sandra Brecher, DOT
- Dave Dabney, Bethesda Urban Partnership

CHAPTER II: TRANSPORTATION DEMAND MANAGEMENT CONCEPTS

This chapter introduces the reader to some of the basic concepts that influence the design and implementation of transportation demand management programs. This chapter includes two sections.

Section A, **Definition of Transportation Demand Management**, defines the concept and objectives of transportation demand management; and

Section B, **Factors that Influence Commuter Choices**, presents an overview of the different factors that influence commuter travel choices.

A. Definition of Transportation Demand Management

The phrase transportation demand management (TDM) refers to a set of strategies that increase the efficiency of a region’s transportation resources including roadways, transit lines, bikeways, pedestrian connections, and parking facilities. More specifically, TDM strategies seek to maximize the number of travelers that a transportation network can accommodate in a cost effective, timely, and convenient fashion. In jurisdictions such as Montgomery County, where communities are transitioning from suburban to urban densities, a central purpose of TDM is to change travel behavior by promoting viable alternatives to commuting by single-occupant automobile.

The Victoria Transport Policy Institute describes “transportation demand management” as follows:

“Transportation Demand Management refers to various strategies that change travel behavior (how, when and where people travel) in order to increase transport system efficiency and achieve specific planning objectives. TDM is increasingly used to address a variety of problems.

… Many factors affect people’s transport decisions including the relative convenience and safety of travel modes (such as whether streets have sidewalks and bikepaths, and the quality of transit services available), prices (transit fares and the price of parking at destinations); and land use factors (such as whether or not schools, parks and shops are located close to residential neighborhoods).

… Transportation Demand Management strategies influence these factors to encourage more efficient travel patterns, such as shifts from peak to off-peak periods, from automobile to alternative modes, and from dispersed to closer destinations.”

---

The Montgomery County Code, Chapter 42A, defines transportation demand management as:

“any method of reducing demand for road capacity during a peak period, including an alternative work hours program, carpools, vanpools, subsidized transit pass, preferential parking, improved bicycle and pedestrian access and safety, or peak period parking charge.”

Of the various TDM strategies that influence commuting decisions, this OLO report focuses on strategies relating to:

- The funding of transit and other alternative commuting modes;
- Incentives to encourage the use of alternative commuting modes;
- Disincentives to commuting in a single-occupant automobile; and
- Land use and transportation network designs that promote efficient commuting patterns.

B. Factors that Influence Commuter Choices

If the goal of TDM strategies is to change travel behavior, it is helpful to identify the factors that commuters take into account when they decide how to travel to work. To address this question, OLO interviewed transportation management professionals in Montgomery County and reviewed academic and professional literature. OLO’s literature review relied, in particular, on work published by the U.S. General Accountability Office and the Victoria Transport Policy Institute.

As detailed below, most of the factors that influence commuter choices affect one of the following three attributes:

- Cost – the relative expense of alternative commuting modes;
- Time – the time it takes to commute by one mode compared to another; and
- Convenience – the ease, comfort, and reliability of alternative commuting modes.

In its interviews with transportation demand management professionals and its review of the literature, OLO found recurring descriptions of these three factors as having the greatest impact on commuter choices. As an illustrative example, the Transportation Research Board of the National Research Council studied factors that influence individuals’ travel decisions. As part of the study, the researchers conducted a survey of residents in metropolitan areas with a rail transit system. Consistent with the input OLO received from its interviews, the Transportation Research Board study found that a sizable majority of survey respondents sought “reliable transportation at low cost, … didn’t want to spend any additional time commuting, nor … to be dependent on someone else for their transportation.”

---

2 MCC §42A-21.
3 Transportation Research Board, Understanding How Individuals Make Travel and Location Decisions: Implications for Public Transportation (TCRP REPORT 123), 2008
Examine these factors more closely, OLO found there are numerous conditions that impact the cost, time, and convenience of commuting. These conditions fall into three general categories: community conditions, individual circumstances, and external factors.

1. Community Conditions

The physical development of a community influences commuting choice. This section identifies five community factors that may contribute to an individual's decision to drive alone to work or to use an alternative mode of transportation.

**Land Use Patterns:** Land use patterns affect commuting options. The relative locations and density of jobs and housing influence whether alternatives to the single-occupant automobile are viable. Transit and carpooling become more feasible where geographically concentrated patterns of housing and/or jobs exist. This occurs because concentrating land uses enables the efficient operation of a fleet of shared vehicles to collect and transport commuters to their destinations. Moreover, in mixed-use urban centers, walking to work also becomes an option for some commuters.

**Transit Network:** To be a viable commuting option, a transit network must be capable of transporting a large number of people and must connect areas where people live with areas where they work. In addition, the frequency of service is an important factor in determining how many people use transit to commute to jobs. Moreover, for commuters to consider transit, the system must be reliable, convenient, and cost competitive.

**Roadway Network / Traffic Congestion:** The roadway network influences a commuter's travel behavior. A roadway network with excess capacity relative to demand easily accommodates all forms of automobile commuting, including single-occupant vehicles. In contrast, a roadway network with excess traffic congestion due to capacity constraints may prompt some commuters to consider alternative modes of transportation. Building roadway features such as dedicated bus lanes, high-occupancy vehicle lanes, and bicycle lanes support alternatives to driving alone.

**Parking Availability and Cost:** The availability and cost of parking plays a significant role in shaping commuting decisions. Plentiful low-cost parking serves as an incentive to drive alone; limited or high-cost parking provides an incentive to commute by alternative modes. Moreover, where parking is at a premium, the presence of reserved, preferred, or discounted spaces for carpools and vanpools may prompt some commuters to share the ride to work.

**Bicycle / Pedestrian Network:** The existence of bikeways connecting residential areas to urban employment centers offers a commuting alternative for some people. Within an urban center, an extensive and safe pedestrian network is necessary for people to feel comfortable walking from their transit stop to their place of employment. In mixed-use urban centers, pedestrian connections allow residents to walk to work.
Table 2-1 summarizes the community conditions that support either driving alone or alternative modes of commuting.

**Table 2-1: Summary of Community Conditions that Support Single-Occupant Auto and Alternative Commuting Modes**

</tr>
</tbody>
</table>

**2. Individual Circumstances**

Besides the community conditions described above, a commuter’s individual circumstances will affect travel mode decisions. The affects of these circumstances are different for each person.

*Commuting Costs:* The relative costs of commuting alternatives influence personal decisions about how to travel to work. For example, the cost of driving alone not only depends on fuel prices (see page 9), but is also a function of other factors such as the type of vehicle driven, the cost of parking, and the availability of transit subsidies. A commuter who drives a relatively fuel efficient car may have significantly lower commuting costs than someone who drives a gas guzzler. Whether a commuter’s employer offers free (or below market rate) parking also is a significant factor in the overall cost of driving. In addition, whether an employer offers transit subsidies also can affect the cost competitiveness of transit relative to driving alone.

*Commuting Time:* The length of time it takes to travel door to door influences commuting decisions. In addition to community factors such as the level of roadway congestion and the quality of the transit network, personal circumstances affect travel time, which in turn affects
commuting choices. For example, an employee who lives near his/her workplace or near a transit line has more ways to reach work in an acceptable amount of time than an employee who lives far away from work or transit. An employer that permits a flexible work schedule may reduce employee commuting during peak hours. In addition, an organization that allows telework reduces an employee’s commute time to zero on days when s/he works from home.

**Commuting Convenience:** Driving alone and transit offer different types of conveniences and inconveniences for commuters. For example, a driver has an automobile at his/her immediate disposal for running errands on the way to work, during lunch time, or on the way home. In contrast, a transit rider may be able to perform other tasks during his/her commute. At times, a driver must contend with unexpected traffic congestion, accidents, and construction. On the other hand, some transit riders regularly encounter crowded buses or trains. During inclement weather, a driver encounters more difficult driving conditions; whereas a transit rider encounters less comfortable waiting conditions. Different individuals will weigh the value of these conveniences and inconveniences differently.

**Personal Preferences / Limitations:** Personal preferences or individual limitations also influence commuting choices. Environmental concerns may motivate some people to choose alternative commuting modes. Others may choose biking or walking to combine exercise with their commute. In contrast, some people with mobility limitations may consider driving alone the only feasible commuting option.

Table 2-2 on the following page summarizes the individual circumstances that support either driving alone or alternative modes of commuting.

</tr>
</tbody>
</table>

3. External Factors

Several conditions beyond the direct control of the County Government or County residents influence commuting decisions. This section presents three examples of external influences that affect commuting choices.

*Fuel Costs:* Rising fuel prices make transit more cost competitive with driving alone and increase the attractiveness of alternative commuting means such as carpooling and bicycling.

*Housing Market Conditions:* When housing costs spiked sharply in recent years, many people who work in the County chose to live in distant communities with more affordable housing. These choices lengthened people’s commutes, put more traffic on the roadway network, and limited the feasibility of alternatives to driving alone.

*Employer Work Schedule Policies:* Employers that permit employees to work flexible schedules or to telework may help reduce the number of peak hour commuting trips.
CHAPTER III: TRANSPORTATION DEMAND MANAGEMENT GOVERNANCE AND IMPLEMENTATION IN MONTGOMERY COUNTY

This chapter describes Montgomery County’s approach to transportation demand management (TDM) and includes the following three sections:

Section A, Governance Structure, describes transportation demand management governance and organizational structures in Montgomery County;

Section B, Special TDM Areas in Montgomery County, describes how the County has focused TDM requirements and resources in urban centers; and

Section C, County Transportation Demand Management Policies and Programs, presents the County’s strategies for implementing transportation demand management.

A. Governance Structure

Responsibility for transportation demand management in Montgomery County is decentralized and shared among multiple County and non-County entities. As detailed below, the County Council, County Executive, Department of Transportation, and the Maryland-National Capital Park and Planning Commission each exercise authority that shapes the County’s transportation demand management strategies. In addition, Montgomery County is located in a metropolitan area where transit services such as bus and rail cross jurisdictional lines. The County must work with the States of Maryland and Virginia, District of Columbia, and the Washington Metropolitan Area Transit Authority (WMATA), and the Metropolitan Washington Council of Governments to affect County and regional transit goals. The County is also influenced by Federal policies that influence transportation demand management.

1. County Entities

a. County Council and County Executive

County Council: The County Council exercises the authority to establish County policies that impact transportation demand management, such as land use patterns; the transit, roadway and bicycle networks; and parking availability. Specifically, the Council:

- Approves the County’s annual operating budget and capital improvements program, which fund transportation demand management programs and transit operations and facilities (e.g., bus facilities, bikeways, and sidewalks);
- Has final approval authority for master plans and the biannual Growth Policy;
- Enacts County law including the chapters of the County Code that directly impact transportation demand management: Chapter 42A, Ridesharing and Transportation Management; Chapter 59, the County Zoning Ordinance, and Chapter 60 Parking Lot Districts; and
- Sets parking rates for County parking facilities by annual resolution.
Additionally, under the County Code, the Council has the authority to create transportation management districts (described beginning on page 13) and confirm members of the Friendship Heights and Silver Spring Transportation Management District Advisory Committees. The Council also advocates at the State level for transportation funding and coordinates with other local governments to set regional transportation goals.

**County Executive**: The County Executive prepares and recommends an annual operating budget and biannual capital improvements program, including funding for transportation services and facilities. The County Executive also has legal authority to establish “share-a-ride districts” (see page 28) and nominate members to the Friendship Heights and Silver Spring Transportation Management District Advisory Committee (see pages 16 and 17).

### b. Department of Transportation

Four DOT organizational units manage County transportation facilities and services that shape the County’s transportation demand management strategies: the Office of the Director, the Division of Transit Services, the Division of Parking Management, and the Division of Traffic Engineering and Operations. The roles of these units are briefly described here, and more details about the specific programs they administer are found later in this chapter and in Chapter IV.

**Office of the Director**: The Office of the DOT Director oversees the implementation of transportation policies for the County Government. The Director’s Office sets priorities for all DOT programs including transit, commuter services, and parking management activities, and is also responsible for providing general program oversight.

In addition, the Director’s Special Assistant for Metro Affairs serves as the liaison between the County Government and outside agencies including the Washington Metropolitan Area Transit Authority (WMATA), the Maryland Transit Administration (MTA), and other local jurisdictions. For example, the Special Assistant attends WMATA board meetings and meets regularly with representatives from other jurisdictions to review the WMATA budget, programs, and policies. The Special Assistant also advocates for State support of transit services.

**Division of Transit Services**: The mission of the Division of Transit Services is to “provide an effective mix of public transportation services in Montgomery County.” The Division operates the County’s Ride On bus system, coordinates special transit services for seniors and persons with disabilities; regulates taxi services; provides commuter services; and oversees transportation management districts. More specifically, the Commuter Services Section manages County programs and services to decrease single-occupancy vehicle trips during peak travel hours by encouraging commuters to use alternate modes of transportation. The County’s array of commuter services is described in detail beginning on page 32. The Division also develops the County’s Transit Strategic Plan.

**Division of Parking Management**: This Division maintains and operates County parking facilities in the parking lot districts and determines the mix of short- and long-term parking. The Division’s responsibilities are described in Chapter IV.

**Division of Traffic Engineering and Operations**: This Division maintains bikeways, sidewalks, crosswalks, and lighting and installs pedestrian count-down signals.
c. Maryland-National Capital Park and Planning Commission

Montgomery County Planning Board: The Planning Board develops and recommends master plans and a biannual Growth Policy to the County Council. These documents influence transportation demand, roadway network capacity, and traffic congestion by shaping the type, location, density, and sequencing of development. Based on master plan and Growth Policy guidelines adopted by the Council, the Planning Board may require developers to implement traffic mitigation measures to reduce development impact on traffic congestion and to reduce single-occupancy vehicle trips.

Montgomery County Department of Planning: The Planning Department prepares draft master plans and Growth Policies for the Planning Board. The Planning Department’s Division of Transportation Planning analyzes the impact of traffic generated by new development on the County’s transportation network. The Division works with State and County transportation agencies and with developers to design and implement transportation elements in the County's master plans. In addition, the Division participates in drafting and enforcing traffic mitigation measures required by the Planning Board as part of the development approval process.

2. Non-County Entities

State of Maryland: The State of Maryland influences transportation demand management in Montgomery County in several ways. Specifically the State:

- Operates and funds Maryland Transit Administration (MTA) Commuter Buses and the MARC train system. The County has only an indirect role in determining levels of service or long-term planning for MARC. County responsibility related to MARC service consists only of facility and parking maintenance at some stations.
- Provides funding for Metrobus and Metrorail service to Montgomery County.
- Provides financial aid to the County’s Ride On bus service. The amount of State aid for Ride On varies from year to year and is subject to appropriation by the State General Assembly.
- Provides annual financial assistance to County ride-sharing programs.
- Controls right-of-way use, lane configurations, traffic signal settings, and other factors that influence transportation demand management on State highways. This is relevant for this study since most major roadways in County urban centers are State highways.
- Limits the County’s revenue collection authority. For example, the State, and not the County, retains the authority to levy a sales tax on gasoline, impose roadway tolls, or collect fees on the licensing and registration of motor vehicles.

Federal Government: Several federal government policies and programs impact transportation demand management in Montgomery County. For example, the Federal Government provides some funding for WMATA services. In addition, Federal tax laws stipulate that employer-provided transit subsidies that exceed $115 per month are taxable income.¹

¹ The Internal Revenue Service will increase the non-taxable transit benefit limit to $120 per month in January 2009.
The Washington Metropolitan Area Transit Administration (WMATA): WMATA operates the regional Metrobus and Metrorail systems which serve Montgomery County. The WMATA board includes two voting representatives from each jurisdiction: Maryland, Virginia, and the District of Columbia. The governor appoints Maryland’s two voting members, one to represent Montgomery County and the other to represent Prince George’s County. Montgomery County also has an alternate member who is appointed by the County Executive. The alternate member votes in committee and may vote with the full board when the permanent member is unavailable. Funding decisions for Metro that impact Montgomery County are primarily made by the State.

Metropolitan Washington Council of Governments (COG): COG provides regional coordination for transportation demand management efforts. COG’s efforts include employer outreach, marketing, maintaining a ridesharing database for use by regional governments (including the County), and offering the Guaranteed Ride Home (described on page 33). COG also provides grant funding for the County’s employer outreach activities related to transportation demand management.

B. Special TDM Areas in Montgomery County

The County provides transportation demand management and commuter services throughout the County. However, County policies and practices focus commuter services resources on certain “urban centers.” For the purposes of this report, the term “urban centers” refers to areas of the County with high concentrations of employment that are well served by transit. Specifically, this report focuses on the four active transportation management districts and the one transportation planning and policy area in the County. As this report addresses TDM strategies implemented by the County Government, the report does not discuss Federal Government employment centers or urban centers located within municipalities.

1. Transportation Management Districts

   a. Legal Framework

County Code Chapter 42A, Ridesharing and Transportation Management, establishes the Council’s authority to establish Transportation Management Districts (TMDs) in certain areas of the County. Specifically, the law:

- Explains the purposes of transportation demand management;
- Stipulates what types of areas may be designated as TMDs;
- Describes the role of DOT and the Planning Board in managing TMDs;
- Requires developers and some businesses within TMDs to implement plans to reduce traffic;
- Requires DOT to monitor and report on transportation demand management outcomes in the TMD; and
- Authorizes a special TMD fee that may be charged to developers and property owners within the TMD.
**Purposes of Transportation Demand Management** The County Code describes the relationship between transportation demand management and County land use and development objectives. Specifically, the law states that the County desires to “focus new development in high transit-service areas” but that “limited transportation infrastructure, traffic congestion, pedestrian access, and safety issues impede the County’s land use and economic development objectives.”

The law identifies three purposes of transportation demand management. These are to:

- “Provide sufficient transportation capacity to achieve County land use objectives and permit further economic development;

- Reduce the demand for road capacity, and promote traffic safety and pedestrian access; and

- Help reduce vehicular emissions, energy consumption, and noise levels.”

According to the Code, transportation demand management will result in “improved traffic levels and air quality, and a reduction in ambient noise levels [that] will help create attractive and convenient places to live, work, visit, and conduct business.”

The Code also stipulates that transportation demand management measures should be conducted:

- In conjunction with transportation facility review, capital improvement projects, and parking and traffic control measures;

- With cooperation from government, developers, employers, property owners, and the public; and

- Consistent with commuting goals in the Growth Policy.

**Areas that may be Designated as Transportation Management Districts** The Code authorizes the Council to establish TMDs in:

- Metro station policy areas and adjacent areas served by the same transportation network; and

- An area where transportation review applies under the Growth Policy.

**Governance of TMDs** The Code authorizes both the Department of Transportation and the Planning Board to implement transportation demand management measures in TMDs, as shown in Table 3-1 on the next page. In addition, the Code allows the Executive and the Council to establish transportation management district advisory committees in each TMD. The law also allows DOT to enter into sole source contracts with a transportation management organization to carry out transportation demand management programs in a TMD.

Source: Montgomery County Code, Chapter §42A-23

**Outcome Monitoring**: The Code requires DOT to monitor and report on the results of traffic mitigation measures in TMDs through an annual commuter survey and a biennial report.

**Annual Commuter Survey.** DOT must conduct an annual commuter survey in TMDs to gather data on employee commuting patterns and monitor progress toward achieving Growth Policy commuting goals. The Code requires employers to make a “good faith effort” to achieve an 80 percent completion rate.\(^{11}\)

**Biennial Executive Report.** DOT must submit a biennial report to TMD Advisory Committees, the Planning Board, and the County Council on:

- Employee commuting patterns;
- Auto occupancy rates;
- Level of service measurements for each intersection in the policy area and selected critical intersections outside the area;
- Parking supply and demand;
- Status of road or intersection improvement, signal automation, improved bicycle and pedestrian access and safety, and other traffic modification in or near the policy area;
- Transit use and availability;
- Carpool and vanpool use; and
- The source and use of any funds received for the TMD.\(^{12}\)

---

\(^{11}\) MCC §42A-26.

\(^{12}\) MCC §42A-27.
**Funding TMDs:** The Code authorizes the Council to establish an annual fee to be charged to developers and owners of optional method projects in TMDs. Fee revenue must be used for TMD administration or program implementation in the district where it was collected. In addition, the County funds TMD activities with General Fund and Parking Lot District Fund revenue. (See Chapter V for a complete description of funding for TMDs.)

**b. Established Transportation Management Districts**

The Council has established five transportation management districts: North Bethesda, Downtown Bethesda, Friendship Heights, Downtown Silver Spring, and Shady Grove. Although the Council established the Shady Grove district in 2006,\textsuperscript{13} it remains unfunded and inactive.

**North Bethesda TMD:** The Council established the North Bethesda TMD in 1995.\textsuperscript{14} This TMD includes the Metro Station Policy Areas of Grosvenor, Twinbrook, and White Flint and the surrounding areas of Executive Boulevard, Rock Spring Park, and Montgomery Mall. (See map page 18.) DOT contracts with Transportation Action Partnership (TAP) to manage the North Bethesda TMD. The North Bethesda TMD has an advisory committee with 12-18 voting members and three non-voting members who are appointed by the TAP Board of Directors. The North Bethesda TMD receives funding from a TMD fee and parking fees from County-operated parking in the district.

**Bethesda TMD:** In 1998, the Council established a transportation management district within the Bethesda Central Business District.\textsuperscript{15} (See map page 19.) DOT contracts with the Bethesda Urban Partnership (BUP) to manage the TMD. The Bethesda TMD has an advisory committee with 11 voting members and five non-voting members appointed by the BUP Board of Directors. The Bethesda TMD receives funding from a TMD fee and revenue transferred from the Bethesda Parking Lot District Fund.

**Friendship Heights TMD:** The Council established a transportation management district in the Friendship Heights Sector Plan area in 1999.\textsuperscript{16} (See map page 20.) The DOT Division of Transit Services manages the TMD. The Friendship Heights TMD has an advisory committee with 14 voting members and eight non-voting members who are nominated by the County Executive and confirmed by the County Council. The Friendship Heights TMD receives funding from a TMD fee and the County’s Mass Transit Fund.

\textsuperscript{13} Resolution 15-1432  
\textsuperscript{14} Resolution 13-319  
\textsuperscript{15} Resolution 14-56  
\textsuperscript{16} Resolution 14-325
Silver Spring TMD: In 1987, the Council established a transportation management district in the Silver Spring Central Business District. This district was reauthorized in 2002 to update to reflect changes to County Code Chapter 42A, Ridesharing and Transportation Management. (See map page 21.) The DOT Division of Transit Services manages the TMD. The Downtown Silver Spring TMD has an advisory committee with 12 voting members and four non-voting members who are nominated by the County Executive and confirmed by the County Council. The TMD receives funding from the County’s Mass Transit Fund. Although authorized, no TMD fees have been collected in Silver Spring because no developments required to pay the fee have been completed. DOT expects that some fees will be collected in FY09. In FY09, the Silver Spring TMD is receiving a transfer of about $200,000 from the Silver Spring Parking Lot District Fund.

2. Wheaton Transportation Planning and Policy Area

DOT designated the Wheaton CBD as a transportation planning and policy area (TPPA) in 1993. (See map page 22). DOT considers the TPPA as a precursor to a potential TMD in the Wheaton CBD. Initiatives in the TPPA are similar to those in a TMD, but they are not mandated by law. Within the TPPA, the DOT Division of Transit Services:

- Provides technical and marketing support to employers;
- Markets transit subsidies and programs for employees;
- Encourages employers to voluntarily submit traffic mitigation plans;
- Consults with the Wheaton Urban District, the Mid-County Regional Services Center and Citizens Advisory Board, and Wheaton-Kensington Chamber of Commerce as advisory bodies for TPPA activities;
- Distributes, tabulates, and analyzes annual commuter surveys; and
- Produces periodic reports which include the status of transportation projects and services, parking supply and utilization, traffic counts at key intersections, and employee commute characteristics.

Transportation demand management activities in the Wheaton TPPA are funded with revenue from the County’s Mass Transit Fund and a transfer from the Wheaton Parking Lot District Fund.

C. County Transportation Demand Management Policies and Programs

This section describes the transportation demand management policies and programs put in place by the County.

1. Master Plans and Growth Policy

The County’s transportation demand management strategies in urban areas are guided by area master and sector plans and the Growth Policy. Master and sector plans establish County policy regarding the location and type of growth. These policy documents seek to manage travel demand by concentrating development in urban areas served well by transit. Growth policy transportation review standards (for both Policy Area Mobility Review and Local Area Transportation Review) allow greater levels of congestion in transit-served areas and the reduction of transportation impact tax rates in Metro Station Policy Areas.

Master and sector plans establish goals for “non-auto driver mode share,” or a percentage of commuters who travel by a method other than single-occupancy vehicles. These goals are carried over to the Growth Policy, which is revised on a biannual basis. The table below shows the mode share goals for each TMD. The 1989 Wheaton CBD Sector Plan does not include a mode share goal.

<table>

</tr>
</tbody>
</table>

Source: County Council Resolution 16-376, 2007-2009 Growth Policy

In Bethesda, mode share achievement levels control the staging of development approvals. For example, before moving from Stage One development to Stage Two development under the 1994 Bethesda CBD sector plan, downtown Bethesda had to achieve a mode share of 32 percent.

2. Transit Network

The County’s transit network consists of inter-related systems: MTA Commuter Buses, MARC Train, Metrorail, Metrobus, and Ride On Bus. The Maryland Transit Administration (MTA) operates MTA Commuter Buses and MARC and the Washington Metropolitan Area Transit Authority manages Metrobus and Metrorail. The County Department of Transportation operates the Ride On Bus system.
MTA Commuter Buses: The Maryland Transit Administration operates three commuter buses that serve Montgomery County. Two of the buses travel the Route 29 corridor with stops in Burtonsville and Silver Spring. The third bus travels the I-270 corridor with stops at Shady Grove Metro station and several stops in the Rock Springs Business Park in the North Bethesda TMD. Buses primarily travel southbound during the morning commute and northbound in the afternoon and evening.

MARC Train: The MARC train Brunswick Line serves Montgomery County with 11 stations, including a stop in Silver Spring. During the morning commute, nine trains run southbound to Washington, DC only. One afternoon train runs northbound only, and nine trains run northbound only in the evening. Trains do not run on weekends. Trains do not stop at all stations on each run.

Metrorail: The Metrorail red line serves Montgomery County at 12 stations along the MD 355 and MD 97 corridors, including stations in North Bethesda (Twinbrook, White Flint, and Grosvenor) and in the Bethesda, Friendship Heights, Silver Spring, and Wheaton Central Business Districts. During peak commute times (weekdays 5 a.m. - 9:30 a.m. and 3 - 7 p.m.) trains run between Shady Grove and Glenmont with five minute headways and between Silver Spring and Grosvenor with 2.5 minute headways.

DOT reports that on an average weekday, about 85,000 people board Metrorail in Montgomery County. Stations with the most boardings are Silver Spring and Shady Grove (about 15,000 each) followed by Bethesda and Friendship Heights (about 10,000 each).

Metrobus: WMATA operates 21 bus routes in Montgomery County. At least 20 of these routes serve the four TMDs and the Wheaton TPPA during peak hours. Headways on these routes vary from three to 30 minutes. WMATA reported a 2.4 percent ridership increase for Montgomery County routes in FY08.19

Ride On Bus: The County Department of Transportation operates the Ride On Bus system. Ride on operates 77 weekday routes, 42 Saturday routes, and 33 Sunday routes. Also, Ride On operates three Metrobus routes on the weekends. During peak periods, Ride On operates 77 routes with headways ranging from 30 minutes to less than 10 minutes. 37 of these routes serve TMDs or the Wheaton TPPA.

Ride On reports that for peak period bus service, 79 percent of the County's population lives within a ¼ mile from a Ride On bus route and 89 percent of employment in the County is within ¼ mile from a bus route.20

Over the last four years, Ride On reports that ridership has increased by 28 percent. In FY08, overall ridership increased by 5.1 percent from FY07. In comparing weekday trips in June 2007 and June 2008, Ride On found an increase of 6.2 percent. Ride On also reported a decrease in schedule adherence from FY07 to FY08, with 82.1 percent of trips running on time in FY07 compared to 79.3 percent in FY08.
Ride On routinely collects route-specific ridership data and gathers additional information when they receive reports of overcrowding or schedule adherence problems. Ride On reports that 12 - 15 routes currently reach capacity during peak hours on regular basis. As a result, many buses must pass bus stops without picking up passengers for lack of space. When possible, Ride On redistributes resources from underutilized routes to stronger performing routes.

Table 3-3 summarizes the level of rail and bus transit service available to County commuters.

### 3. Bicycle Facilities and Pedestrian Facilities

The presence of a well developed bicycle and pedestrian network assists some commuters’ travel to urban centers and provides mobility options within an urban center for employees who do not travel by automobile.

#### a. Bikeways

The County ‘s 2005 Countywide Bikeways Functional Master Plan includes bikeways throughout the County that connect “major activity centers: municipalities, central business districts, town centers, transit stations, major employment hubs, countywide park trails and regional parks.”

In all, the plan includes about 200 existing and proposed bikeways (about 500 miles). The table below provides a brief summary of the number of existing, partially completed, and proposed bikeways that connected directly to urban centers as of 2005. As shown in Table 3-4, the majority of planned urban center bikeways are unbuilt.

---

21 2005 Countywide Bikeways Functional Master Plan, p. 1
Bikeway planning, design, and construction may be funded by the County, State, Federal Government, or private developers.

**Montgomery County:** Bikeway construction may be included in capital improvement projects for road improvements, intersection improvements, the annual bikeway program, the annual sidewalk program, independent sidewalk projects, streetscape projects, and independent bikeway projects. The County’s FY09-FY14 Capital Improvements Program (CIP) includes an Annual Bikeway Program that “plans, designs, and constructs bikeways and trails throughout the County.” The CIP allocates about $3 million over six years to this project and specifies that facilities constructed under this project “will cost less than $300,000 each.” The current CIP also includes four independent bikeway projects, including one in the Silver Spring TMD.

**State of Maryland:** Bikeways on or alongside State highways may be constructed with funding from the State of Maryland’s consolidated Transportation Program. This program receives funding from vehicle titling and registration fees, gas taxes, corporate income taxes, and Federal funding.

**Federal Government:** The State receives annual Federal transportation funding that may be used for bikeway construction. For example, the State used Federal funding to support construction of the Capital Crescent Trail.

**Private Developers:** Developers may be required to construct or improve bikeways as a condition of development approval.22

In FY08, the Council approved a budget of $100,000 for bikeway maintenance. In FY09, this amount increased to $250,000.

### b. Bicycles and Transit

Metrobus, Metrorail, and Ride On Bus provide bicycle accommodations for people who combine bicycling and transit. MTA Commuter buses do not permit riders to bring bicycles. Specifically,

**Metrorail:** Metro provides bicycle storage facilities, including lockers and bike racks at Metro stations. Table 3-5 on the next page presents data on storage facilities in the four TMDs and in the Wheaton TPPA. Bicycles are not permitted on trains during peak hours.

**Metrobus:** All Metrobuses are equipped with bike racks that hold up to two bikes.

**Ride On Bus:** All Ride On buses are equipped with bike racks that hold up to two bikes.

Source: 2005 Countywide Bikeways Functional Master Plan

c. Pedestrian Facilities

The County does not have a Countywide functional master plan for pedestrian facilities. The master plans for North Bethesda and the Bethesda, Friendship Heights, and Silver Spring Central Business Districts recommend pedestrian-friendly features such as wider sidewalks on busier streets, streetscaping, mid-block signals for pedestrian crossings, and restrictions on allowing drivers to turn right on red.

DOT maintains sidewalks and makes upgrades such as installing pedestrian countdown signals at crosswalks. DOT also administers Countywide contracts for crosswalk and lighting maintenance. The County makes sidewalk improvements through the Capital Improvements Program. Projects with pedestrian improvements include road projects, independent sidewalk projects, and the Annual Sidewalk Program. The Annual Sidewalk Program primarily targets residential areas and the projects are smaller in scope than independent sidewalk projects. Additionally, the Planning Board may require developers to make pedestrian improvements as part of their development approval.

23 In downtown Bethesda, the Bethesda Urban Partnership maintains sidewalks within the Bethesda Urban District, which is part of the TMD.
4. Share-a-Ride Districts

County Code Chapter 42A establishes share-a-ride districts in the Silver Spring and Bethesda Central Business Districts. The purpose of share-a-ride districts is to encourage carpooling, vanpooling, and transit ridership. Within these districts, the Code requires the County Executive to establish ridesharing programs that include promoting carpooling/vanpooling and transit, providing personalized ride matching, and promoting incentives such as discounted transit passes.

The Code authorizes the County Executive to establish additional share-a-ride districts in employment areas with large concentrations of office space. The Executive also may establish share-a-ride outreach areas in areas with lower concentrations of office space. The County Executive has designated share-a-ride districts in North Bethesda and Friendship Heights. The Executive has not created any share-a-ride outreach districts.

Within a share-a-ride district, the Code also allows a development to obtain a reduction in its minimum parking requirements from the Planning Board if the developer agrees to participate in a County-operated share-a-ride program, provide ridesharing incentives, and pay an annual fee to the County ’s ridesharing account (part of the Mass Transit Facilities Fund). The County uses ridesharing account revenue to:

- Operate a program that promotes carpooling, vanpooling, and transit use;
- Provide personalized matching for applicants for carpools or vanpools; and
- Promote ridesharing incentives (e.g., preferential carpool parking or discounted transit passes).

Because all current share-a-ride districts are located in TMDs, DOT offers participation in the parking reduction provisions of share-a-ride districts as one tool for developers to use to meet traffic mitigation requirements (see Section 5, below). The Department of Planning reports that, at present, only nine developments participate in this option.

5. Developer and Employer Traffic Mitigation Measures

Developer Traffic Mitigation Agreements: Chapter 42A of the County Code requires all applicants for subdivision or optional method development within a TMD to complete a traffic mitigation agreement “to ensure that public transportation will be adequate to meet commuting goals set in the Annual Growth Policy.” The law also permits the County to require developers outside of a TMD to complete a traffic mitigation agreement. Agreements may include measures that limit parking, incentivize carpooling or vanpooling, or subsidize transit. Outside of TMDs, traffic mitigation agreements typically require developments to comply with trip generation limits. Within TMDs, measures included in traffic mitigation agreements must contribute to meeting the area mode share goal established in the Growth Policy.

24 MCC §42A-5.
25 MCC §42A-6.
26 MCC §42A-25.
DOT’s Division of Transit Services and M-NCPPC’s Department of Planning work with developers to draft traffic mitigation agreements. For the North Bethesda and Bethesda TMDs, the County contractors who operate the TMDs also comment on proposed traffic mitigation measures. Typically, agreements are submitted with the preliminary plan during the development approval process and finalized with the certified site plan.

The Department of Planning’s Division of Transportation Planning monitors traffic mitigation agreement implementation outside of TMDs. DOT monitors implementation within TMDs.

Table 3-6 shows traffic mitigation agreement measures that are either required or suggested by County Code, DOT, or the Planning Board. Appendix A provides a sample agreement.

*Required elements are sometimes adapted to allow for specific circumstances for developers and employers

**Required by law for traffic mitigation agreements outside of TMDs

Employer Traffic Mitigation Plans: County Code Chapter 42A also requires employers in a TMD who have 25 or more employees to submit a traffic mitigation plan to the Department of Transportation. In some cases, DOT may require the owner of a multi-family residential building to submit a plan. Employers submit annual reports on plan implementation to the DOT Division of Transit Services. The Division of Transit Services reports that it aims to make direct contact with employers two to three times per year to assist them with plan implementation.

Table 3-7 lists suggested and required measures that may be included in employer traffic mitigation plans. See Appendix B for a sample traffic mitigation plan.

**Other Traffic Mitigation Efforts:** Although the County does not have jurisdiction over Federal campuses in Montgomery County, the Planning Board and Planning Department provide advisory comments regarding traffic mitigation to the National Capital Planning Commission for specific Federal projects. In addition, DOT's Division of Transit services has worked with Federal agencies to provide employees with information on transportation alternatives. The Division of Transit Services also conducts an annual commuter survey at Federal agencies.

### 6. County Transit Subsidies

The County Government provides financial assistance to employers throughout the County who offer transit subsidies to their employees. Under Federal law, employers may offer up to $115 per month to employees as a tax free benefit. The County has two transit subsidy programs: Fare Share and Super Fare Share. Under these programs, the County pays a portion of employers’ costs for their employees’ transit subsidy.

Fare Share is a three-year subsidy offered to employers throughout the County, while Super Fare Share is a nine-year subsidy available only to employers in TMDs. For each program, the County’s share of the employer subsidy declines over time. At the end of the program term, employers are encouraged, but not required, to continue providing the subsidy. Table 3-9, on the next page, shows the County and employer subsidy contributions for each year of the programs.

Source: DOT, Division of Transit Services

In Wheaton, the County offers a hybrid program. For the first six months the County will pay up to $114 per employee with the employer paying $1 per month. After the first six months, the program follows the Fare Share schedule.

7. Promoting Alternate Modes of Transportation

The DOT Division of Transit Services Commuter Services Section promotes the use of alternative modes of transportation and implements transportation demand management programs. The responsibilities of the Commuter Services Section include:

- Marketing alternate transportation options to workers and residents in the County;
- Encouraging employers to promote alternate transportation options for their workers;
- Promoting and implementing programs such as Fare Share and Super Fare Share;
- Providing personalized rideshare matching for carpools and vanpools; and
- Overseeing the County’s transportation management districts.

The Commuter Services Section implements Countywide outreach and programs and directly manages the Silver Spring and Friendship Heights TMDs and the Wheaton TPPA. For the North Bethesda and downtown Bethesda TMDs, the Commuter Services Section manages contracts with private organizations that provide transportation demand management services.

DOT uses direct mail, advertising, the County website, and special events to reach employers and employees. While DOT offers transportation demand management services and programs to employers in all areas of the County, the Department dedicates the majority of commuter service resources to programs in the transportation management districts.
The table below describes programs and incentives provided or promoted by DOT to encourage commuters to use alternative modes of transportation.

CHAPTER IV: COUNTY PARKING POLICIES AND COMMUTER CHOICE

This chapter discusses how County policies on the supply and cost of parking in urban centers influences commuters’ choice of travel mode.

Section A, Zoning Ordinance Parking Requirements, describes the Zoning Ordinance requirements for providing parking for new developments;

Section B, Parking Lot Districts, describes the purpose of County parking lot districts and the supply and pricing of parking spaces in those districts; and

Section C, Other Publicly Managed Parking Spaces, discusses publicly provided parking outside of the parking lot districts.

A. Zoning Ordinance Parking Requirements

The County Zoning Ordinance establishes minimum parking requirements for different types of land uses. For the most part, these requirements are identical for similar uses throughout the County. However, two provisions lower the number of parking spaces required for office buildings in certain urban centers.

Metro Station Proximity Parking Reduction: The Zoning Ordinance allows for reduction of the minimum parking requirement for office buildings in close proximity to Metro stations. The reduction in office parking requirements varies by geographic area of the County. The urban centers studied in this report are located either in the “southern” or “south central” areas of the County as delineated in the Zoning Ordinance. An office building in one of these centers would qualify for a reduced parking requirement based on its proximity to a Metro station. Table 4-1 shows the minimum parking requirements for office buildings in the “southern” or “south central” areas of the County and the reductions allowed for developments located within 800 feet and 1,600 feet of a Metro station.

<table>
<thead>
<tr>

<td>2.4</td>
</tr>
<tr>
<td>More than 1600’</td>
<td>2.4</td>
<td>2.7</td>
</tr>
</tbody>
</table>

Table 4-1: Office Building Parking Requirements
(Parking Spaces per 1,000 Gross Square Feet)

The Zoning Ordinance does not grant a parking space reduction for office developments located more than 1,600 feet from a Metrorail station (about one-third of a mile) even if the building is on a route served by Metrobus or Ride On bus.¹ Instead, office buildings in urban centers that

¹ Unless the building is located in a share-a-ride district and the property owner enters into a share-a-ride agreement.
are served by bus transit but located more than a third of a mile from a Metrorail station must provide the same amount of parking as offices located in any other part of the County.

The parking space reductions for developments near Metro stations do not correspond with the commuting goals established in the Growth Policy for these areas. (Growth Policy commuting goals are the target percentage of non-driving workers that commute to an area of the County.) For example, a development in Silver Spring built immediately adjacent to Metro must provide 26 percent fewer parking spaces than a similar development located elsewhere in the County. However, this parking space reduction falls well below the 46 percent non-driver commuting goal for Silver Spring set in the Growth Policy. Table 4-2 compares parking reductions and commuting goals for Silver Spring and North Bethesda. In each case, the Metro proximity parking reduction is substantially less than the target commuting goal. County parking requirements assume that some commuters will travel by alternative means. Therefore, a parking reduction percentage need not be identical to the commuting goal percentage to achieve the same overall modal split.

### Table 4-2: Comparison of Metro Proximity Parking Reductions and Growth Policy Commuting Goals

<td>Maximum Metro Proximity Parking Reduction</td>
<td>26%</td>
<td>17%</td>
</tr>
<tr>
<td>Growth Policy Commuting Goal</td>
<td>46%</td>
<td>39%</td>
</tr>
</tbody>
</table>

**Share-A-Ride District Parking Reduction:** The Zoning Ordinance allows a parking reduction of 15 percent for office buildings in certain areas of the County that are designated as share-a-ride districts. Developers who receive the parking reduction pay an annual fee to the County’s ridesharing account, participate in a County-operated share-a-ride program, and provide ridesharing incentives. A development may not receive both the share-a-ride and the Metro proximity parking reduction.

### B. Parking Lot Districts

The County Government is a major supplier of parking spaces in urban centers. The DOT Division of Parking Management oversees County-operated parking facilities.

#### 1. Location and Purpose of Parking Lot Districts

Chapter 60 of the County Code establishes the following four parking lot districts in the County:

1. Bethesda Parking Lot District;
2. Silver Spring Parking Lot District;
3. Wheaton Parking Lot District; and

---

2 An office within 800 feet of a Metro must provide 1.9 parking spaces per 1,000 gross square feet (gsf) compared to the 2.4 space per 1,000 gsf required for offices more than 1,600 feet from the Metro. The difference of 0.5 parking spaces per 1,000 gsf is 26% lower than the base parking requirement of 2.4 spaces per 1,000 gsf.

3 MCC § 59-E-3.31
The Code defines the boundaries of each parking lot district (PLD). Since the Montgomery Hills area does not meet the criteria for an “urban center” as defined in Chapter III, this report focuses primarily on the Silver Spring, Bethesda, and Wheaton Parking Lot Districts.

The County created the parking lot districts in the late 1940s and early 1950s. The purpose of these districts is to give property owners an off-site alternative to satisfying the on-site parking requirements of the Zoning Ordinance. In lieu of providing parking on-site, non-residential property owners in a parking lot district (PLD) may opt to pay an annual ad valorem tax to fund the construction and maintenance of public parking facilities.

2. Parking Lot District Capacity and Occupancy Rates

As shown in Table 4-3, PLDs provide more than 20,000 parking spaces in Bethesda, Silver Spring, and Wheaton.

<table>

<td><strong>1,464</strong></td>
</tr>
</tbody>
</table>

Source: Department of Transportation

In each PLD, the County designates spaces for short-term or long-term use. Short-term parking (less than three hours) is primarily intended for customers and clients of area businesses. Long-term parking (three or more hours) is available for drivers who work in the area or who switch to transit to complete their commute.

DOT periodically adjusts the mix of short-term and long-term parking spaces based on parking space vacancy rate surveys and input from parkers and businesses. As shown in Table 4-4 on the following page, DOT allocates the majority of PLD parking spaces for long-term parkers; however, short-term visitors often will park in long-term spaces. Since current land use patterns in Silver Spring require more parking for full-day employees, the Silver Spring PLD has the largest percentage of long-term spaces (84%). By comparison, in Wheaton, where a higher percentage of parkers are customers of retail establishments, DOT has designated a relatively high percentage (37%) of PLD space for short-term parking.
Table 4-4: Mix of Short-Term and Long-Term Parking Spaces (June 2008)

<td>1,464</td>
</tr>
</tbody>
</table>

Source: Department of Transportation
* Long-term spaces include carpool and permit spaces.
** Other spaces consist of handicapped parking and spaces reserved for government vehicles.

Parking space peak hour occupancy rates also vary among the PLDs. DOT conducts monthly surveys of parking facility occupancy rates during peak usage hours (weekdays from 10 a.m. to 2 p.m.). As shown in Table 4-5, in FY08, about 84 percent of Bethesda PLD spaces were occupied during peak hours. Silver Spring and Wheaton occupancy rates were both near 60 percent. In all PLDs, occupancy rates were significantly higher for long-term spaces than for short-term spaces.

</tbody>
</table>

Source: Department of Transportation
* Long-term spaces include carpool and permit spaces.
2. Parking Lot District Rates

The Council establishes parking rates for each PLD by resolution. PLD parking rates include different rates for short-term parking (less than three hours), long-term parking (three or more hours), daily permits, and monthly permits. Table 4-6 shows the PLD parking rates approved by the Council to take effect on July 1, 2008.4

</tr>
</tbody>
</table>

Source: Department of Transportation

Short-Term versus Long-Term Parking Rates: As seen in Table 4-6, the short-term hourly rate is $0.25 higher than the long-term hourly rate in the Bethesda and Silver Spring PLDs. In the Wheaton PLD, the short-term and long-term hourly rates are the same.

Daily Parking Permit Rates: The Bethesda and Silver Spring PLDs offer daily parking permits. At $8.25 per day, the permit fee in Bethesda is 38 percent higher than the Silver Spring permit fee of $6.00 per day.

Monthly Permits: At $95 per month, the cost of a monthly parking permit is identical in the Bethesda, Silver Spring and Wheaton PLDs.

Carpool Discounts: In the Bethesda and Silver Spring PLDs, the County discounts the $95 monthly parking permit for carpools. In Bethesda, a monthly parking permit for a two-person carpool is $70 (a 26% discount) and a permit for a five-person carpool is $10 (an 89% discount). The carpool discounts in the Silver Spring PLD are even higher. The County does not offer discounted rates for carpools in the Wheaton PLD.

In many urban centers around the country, commercial entities control the majority of paid parking spaces. In communities such as these, the private sector sets parking prices based on market demand. Commercial parking facilities in urban centers must raise revenue to cover the cost of facility construction and operations. While the Council must set PLD rates to meet

As a result, PLD parking rates in some areas fall well below rates charged in privately-operated commercial facilities. For example, while the County charges $95 for a monthly PLD permit, a monthly pass in a commercial facility in the Bethesda Central Business District currently costs between $120 and $145 according to a recent DOT pricing survey.

C. Other Publicly Managed Parking Spaces

The five urban centers that are the focus of this report include two areas that do not have parking lot districts: North Bethesda and Friendship Heights. Even without a formal parking lot district, a supply of public parking exists in these two areas. In North Bethesda, the County manages over 1,000 parking spaces. On-street spaces are paid, while parking lot spaces are free. As shown in Table 4-7, a majority of these spaces are designated for short-term parking.

Source: Department of Transportation

In the Friendship Heights Transportation Management District, the Village of Friendship Heights manages 200 short-term on-street parking spaces.
CHAPTER V: TRANSIT AND TRANSPORTATION DEMAND MANAGEMENT FUNDING

Transportation infrastructure, including rail and bus systems, bikeways, and pedestrian facilities are funded through multiple County and non-County sources. This chapter describes the major sources of funding for County transit and transportation demand management programs in four sections:

Section A, **Transit System Funding**, identifies the funding sources for transit systems serving the County.

Section B, **County Transportation Demand Management Program Funding**, identifies the funding sources for County transportation demand management programs.

Section C, **State and County Transportation Funds**, describes two transportation funds that are major sources of transit and transportation demand management funding.

Section D, **County Special District Revenue**, presents information on the sources and uses of revenue collected in County transportation management and parking lot districts.

A. Transit System Funding

As detailed in Chapter III, multiple public transit systems serve Montgomery County. Each system receives funding from different sources.

1. WMATA Funding

The Washington Metropolitan Transit Authority (WMATA) operates the Metrorail and Metrobus systems. WMATA receives most of its operating revenue from passenger fares, parking and advertising fees, and payments from state and local governments. WMATA funds its capital program primarily through Federal grants and contributions from state and local governments. The State of Maryland uses revenue from the Maryland Transportation Trust Fund to pay Montgomery and Prince George’s Counties’ obligations to WMATA. (See page 42 for a discussion of the Maryland Transportation Trust Fund revenue sources.) In FY08, the Maryland contribution to WMATA for Montgomery County was $118.9 million.

2. Ride On Funding

The Department of Transportation operates the Ride On Bus system. Funding for the Ride On system comes from the County’s Mass Transit Fund. In FY08, the operating budget for Ride On was $94.9 million. (See page 42 for a discussion of the Mass Transit Fund revenue sources.)

3. MTA Commuter Bus and MARC Train Funding

The Maryland Transit Administration (MTA) manages commuter bus services and the MARC commuter rail service through contracts with private organizations. The Maryland Transportation Trust Fund is the funding source for MARC train service and MTA Commuter Buses.
B. County Transportation Demand Management Program Funding

Multiple revenue sources fund County transportation demand management programs.

1. Transportation Management District (TMD) Activities

The Department of Transportation manages the Friendship Heights and Silver Spring Transportation Management Districts and contracts with private organizations for the management of the Bethesda and North Bethesda Transportation Management Districts. As detailed in Chapter III, TMD personnel manage and promote a series of programs to encourage alternative commuting modes. TMD staffing and programs are funded from transportation management fee revenue (see pages 42-43) and from the County Mass Transit Fund. Some TMDs also receive a transfer of parking revenue collected in the district (see page 43). Table 5-1 summarizes the FY08 funding sources for each TMD.

<table>

<td>✓</td>
<td>✓</td>
<td>✓</td>
<td>**</td>
</tr>
<tr>
<td>Mass Transit Fund</td>
<td></td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
</tbody>
</table>

*Use of Silver Spring parking revenue is authorized in County Code, and in FY09 the budget assumes that PLD revenue will support the Super Fare Share program in Silver Spring.

**DOT expects to collect TMD fees in FY09.

Although there is no TMD in Wheaton, the County uses Parking Lot District Fund and Mass Transit Fund revenue to support transportation demand management activities in Wheaton.

2. Commuter Services

The Commuter Services Section of the DOT Division of Transit Services implements and promotes programs to encourage alternative commuting modes (see Chapter III). In FY08, the annual budget for the Commuter Services Section was $5,514,060. The Montgomery County Mass Transit Fund is the primary funding source for the Commuter Services Section. Commuter Services also receives funding from TMD fees, share-a-ride parking reduction fees, parking revenue, and grants from the Maryland Transit Administration and the Metropolitan Washington Council of Governments.

---

1 The FY08 Commuter Services Section budget included $671,840 for operation of the Bethesda Circulator shuttle bus. This item was transferred to the budget of the Bethesda Regional Services Center in FY09.
C. State and County Transportation Funds

As mentioned earlier in this chapter, two special transportation funds are major sources of transit and transportation demand management funding.

1. Maryland Transportation Trust Fund

The Maryland Transportation Trust Fund is a dedicated fund supporting the programs and activities of the Maryland Department of Transportation. The Transportation Trust Fund finances Department operating, capital, and debt service expenses, including the State’s contribution to WMATA and the operation of MARC trains and MTA Commuter Buses. The largest revenue sources for the Transportation Trust Fund are a State gas tax and motor vehicle taxes and fees. Although the Fund receives dedicated revenue, Fund resources are subject to appropriation by elected officials and are not earmarked for specific programs such as transit.

2. Montgomery County Mass Transit Fund

The County’s Mass Transit Fund finances the planning, development, and implementation of transit programs and facilities. More specifically, the Mass Transit Fund supports operation of the Ride On bus system, transportation demand management programs, and other activities of the DOT Division of Transit Services. As illustrated in Table 5-2, Mass Transit property tax revenue contributes about two-thirds of all Mass Transit Fund resources. Other large contributors to the Mass Transit Fund are State aid and Ride On fare revenue.

</tr>
</tbody>
</table>

Source: Office of Budget and Management

D. County Special District Revenue

The County’s transportation management districts (TMDs) and parking lot districts (PLDs) each collect revenue that support County transportation demand management activities.

1. Transportation Management District Revenue

The County Code authorizes the County to charge a fee in TMDs to fund transportation demand management activities, including TMD administration and implementation of traffic mitigation plans and agreements. Transportation management fee revenue must be used in the district in which the development or property subject to the fee is located.

2 MCC § 42A-29.
The current transportation management fee for all County TMDs is $0.10 per square foot of gross floor area in commercial properties. The fee applies only to commercial properties either occupied after June 2006 or subject to a TMD fee as a condition of subdivision or optional method approval in June 2006 or earlier. In FY08, the County collected a total of about $270,000 in transportation management district fee revenue from the Bethesda, North Bethesda, and Friendship Heights TMDs. In FY08, the County did not receive any TMD revenue from Silver Spring because no developments required to pay the fee had been completed. DOT expects to begin collecting TMD fees in Silver Spring in FY09.

2. Parking Lot District Revenue

As detailed in Chapter 4, the County constructs and maintains public parking in the Bethesda, Silver Spring, and Wheaton Parking Lot Districts. PLDs receive revenue from a special district tax, parking fees, and parking fines.

**Special District Tax**: The County Code established each PLD as a special taxing district. Within these districts, the Code authorizes the County to collect an annual ad valorem tax from non-residential property owners who opt not to provide on-site parking. The Code exempts property owners of buildings that meet their entire off-street parking requirement from paying the special district tax.

The Council sets PLD real property and personal property tax rates by resolution annually. The County Code limits the PLD special tax rate to no more than:

- $1.00 per $100 of assessed value for improved real property; and
- $1.00 per $100 of assessed value for personal property.

Table 5-3 shows the Council-approved PLD special tax rates for improved properties for FY08.

4 MCC § 60-1.
5 MCC § 60-3.
6 The exemption applies only to the building but not to the land on which it stands.
7 MCC § 60-3(a).
8 The rates for unimproved properties are one-half the rates for improved properties.
Other PLD Revenue: PLDs also receive revenue from parking fees, parking fines, and investment income. However, for each PLD, parking fees and special district taxes are the largest sources of revenue. Table 5-4, below, shows estimated FY08 PLD revenue by source.

Source: Approved FY09 Operating and Capital Budgets, Schedule C-3.

The County Code restricts spending taxes and fees collected in a PLD to uses within that PLD. The Code states that the primary use of PLD revenue is to acquire, build, restore, improve, maintain, and operate off-street parking facilities. In addition, the Code allows the Council to transfer parking fee revenue from a PLD for the following uses:

1. Funding an urban district;
2. Supporting the activities of a transportation management district;
3. Implementing transit and ridesharing incentive programs; and
4. Establishing public-private partnerships to increase ridesharing and transit usage.

No legal requirement exists to direct parking fine revenue to any special fund. Nonetheless, County practice is to allocate $25 of each fine to the Mass Transit Fund to support transportation demand management activities in the district where the parking violation occurred and to allocate the remaining fine revenue to the PLD fund where the parking violation occurred.

In recent years, the Council has approved a transfer of funds from the Bethesda, Silver Spring, and Wheaton PLDs to their respective urban districts. In addition, relatively small amounts of revenue from each PLD were transferred to the General Fund to cover parking district overhead costs.

In each year from FY04 – 08, the County transferred Bethesda PLD revenue to support the Bethesda TMD. During those same years, the Silver Spring PLD provided no funds to the Silver Spring TMD. As mentioned above, the County annually transfers funds from the Wheaton PLD to pay for transportation demand management activities in Wheaton.

---

9 MCC § 60-16.
10 In FY09, the budget assumes a transfer of about $200,000 for the Silver Spring PLD to support the Super Fare Share program in Silver Spring.

* The Wheaton PLD provides funds to the Mass Transit Fund to pay for transportation demand management activities in Wheaton. In FY08, the amount of this transfer was $195,260 and is included in the total transfer from the Wheaton PLD to the Mass Transit Fund in the table.

Although the County has not established a parking lot district in North Bethesda, as described in Chapter IV the County provides public parking lots and on-street parking within the North Bethesda TMD. In FY08, the County collected about $975,000 in North Bethesda parking fees and fines.
CHAPTER VI: TRANSPORTATION DEMAND MANAGEMENT IN OTHER COMMUNITIES

This chapter summarizes the current transportation demand management (TDM) practices in Montgomery County, identifies additional or alternative TDM practices, and discusses the potential applicability of these additional or alternative practices to the County. This chapter has five sections:

Section A, Dedicated Funding Sources for Transit, presents methods used in other jurisdictions to dedicate funding for transit.

Section B, Economic Incentives, describes incentive programs to encourage commuting by transit and other alternative modes.

Section C, Driving Disincentives, describes strategies used in other communities to make driving alone less attractive than other commuting options.

Section D, Location and Design of Transportation Network, discusses how some jurisdictions have altered transportation networks to promote efficient commuting practices.

Section E, Centrally Managed System Governance, describes transportation demand management systems that consolidate a wide range of services into one integrated, centrally-managed program.

A. Dedicated Funding Sources for Transit

Most major transit systems in the United States receive a substantial portion of their capital and/or operating resources from a dedicated revenue source. The Federal Government defines the three characteristics of a dedicated funding source for transit:

- Funding must come from a specific designated revenue source;
- Revenue from the designated source must be provided directly to a transit agency; and
- Designated revenue must not be subject to appropriation.\(^1\)

According to the United States General Accountability Office (GAO), 23 of the 25 largest transit agencies in the country receive funds from dedicated revenue sources.\(^2\) The Washington Metropolitan Area Transit Authority (WMATA) is one of the two largest systems that do not receive dedicated funding. While the County’s Mass Transit property tax is dedicated to funding transit programs, the tax rate has fluctuated significantly in recent years thereby reducing the stability of this revenue source.

WMATA receives most of its operating revenue from passenger fares, parking and advertising fees, and payments from state and local governments. WMATA funds its capital program primarily through Federal grants and contributions from state and local governments. The State of Maryland uses revenue from the Maryland Transportation Trust Fund to pay Montgomery and

---

\(^2\) Ibid.
Prince George’s Counties’ obligations to WMATA. Major revenue sources for the Maryland Transportation Trust Fund include the State’s gas tax, motor vehicle taxes, and Motor Vehicle Administration fees.

The County’s Mass Transit Fund supports operation of the County's Ride On bus system and other transit related activities. The three largest contributors to the Mass Transit Fund are property tax revenue, State aid, and Ride On fares.

The County Code authorizes the County to charge a fee in transportation management districts (TMDs) to fund transportation demand management activities including TMD activities and implementation of traffic mitigation plans and agreements.\(^3\) Revenue from transportation management district fees must be used in the district where the development or property subject to the fee is located. While this fee supports transportation demand management programs, it does not directly fund transit system operating or capital costs.

1. **Sales Taxes**

Sales tax revenue is the most common dedicated revenue source for transit systems in the country. According to the GAO, 15 of the 23 largest transit agencies with dedicated funding received a portion of their revenue from sales taxes.\(^4\) Table 6-1 lists examples of metropolitan transit systems that receive dedicated sales tax revenue.

<table>

</tbody>
</table>

---

\(^3\) MCC § 42A-29.  
**Applicability to Montgomery County:** Maryland law prohibits counties from imposing sales taxes. Legislation was introduced in the 2007 session of the Maryland General Assembly which would have dedicated a percentage of State sales tax revenue for transit operating and capital programs. The bill received an unfavorable report from the Senate Budget and Taxation Committee and was never acted upon by the full State Senate.

2. **Transportation Improvement Districts**

“Transportation improvement districts” (also known as “transportation development districts” or “community improvement districts”) are special taxing districts designed to raise revenue for transportation improvements in a specific area. Several states allow the creation of transportation improvement districts as separate governmental entities authorized to levy taxes and issue bonds.

The laws of some states require a majority of property owners within the proposed boundary of the district to vote in favor of creating a district. In addition, in some states, transportation improvement districts may cross municipal boundaries. However, the establishment of a transportation improvement district does not exempt developments from complying with municipal zoning requirements and transportation infrastructure plans.

Most transportation improvement districts levy a property tax assessment on commercial properties within the district. Some districts impose an additional charge on new development projects to cover all or a portion of the cost of transportation improvements needed to accommodate the new trips generated by that development (a type of “impact tax”). Transportation improvement district tax revenue most commonly supports roadway infrastructure improvements. However, in many districts, revenue also funds transit system capital or operating expenses.

---

5 Annotated Code of Maryland, Tax-General Article, § 11-102 (c).
6 SB 167.
Case Study: Transportation Improvement District Funding for Dulles Rail Transportation Improvement District, Virginia

In March 2001, the Virginia General Assembly passed legislation to establish the Dulles Rail Transportation Improvement District as a special taxing district within Fairfax County and the Town of Herndon. The purpose of the District is to provide funding for the construction of a 23-mile extension of the Metrorail system from the West Falls Church station through the Tysons Corner area to Dulles Airport. The Virginia law stipulated that the District would be created upon receipt of a petition from property owners of at least 51 percent of the assessed commercial and industrial properties in the District. In 2004, property owners representing 64 percent of assessed property values petitioned Fairfax County to establish the District. That same year, Fairfax County began to levy a charge of 22 cents per $100 of assessed value on commercial and industrial property owners in the District.

The Dulles Rail Transportation Improvement District is not the sole dedicated source of revenue for construction of the Metrorail extension. In 2005, the Commonwealth of Virginia Transportation Board approved a fee structure for the Dulles Toll Road that sets aside revenue for this transit project. The Transportation Board requires that no less than 85 percent of “existing surplus net revenue” must be dedicated to the Dulles Corridor rail project. (The term, “existing surplus net revenue” refers to revenue remaining after payment of toll road operating and debt service obligations.) Moreover, the Board committed to adjust toll rates in the future as necessary to raise sufficient revenue to fund the capital cost of the rail project.

Sources: Metropolitan Washington Airports Authority; Commonwealth of Virginia Transportation Board

Applicability to Montgomery County: The County could establish a type of transportation improvement district through creation of a special taxing district or an impact tax district. Maryland law permits the County to establish special taxing districts for the purpose of assessing a property tax to support any function allowed under its home rule authority. However, revenue from special taxing district property taxes would be subject to the Charter limit on property tax revenue. The State also permits the County to assess impact taxes on new development. Impact tax revenue would not be subject to the Charter limit. (In contrast to the case study from Fairfax, the County does not have authority to charge roadway tolls as detailed on page 50).

3. Other Dedicated Tax and Fee Revenue

While sales and property taxes are the most common dedicated revenue source for transit systems, some jurisdictions set aside revenue from other types of taxes and fees to support transit. Examples of these dedicated revenue sources include:

- As noted above, the State of Virginia has dedicated a portion of revenue from the Dulles Toll Road to support the construction of a transit line in the Tysons-Dulles corridor.
- The Metropolitan Transit Authority (New York) receives dedicated revenue from automobile registration fees.

8 State law as codified in MCC § 52-17.
Transportation Demand Management Implementation, Funding, and Governance

- The Southeast Pennsylvania Transit Authority (SEPTA) receives dedicated revenue from automobile leasing and rental fees.
- All revenue from the London, England, “congestion charging” program is required by law to be invested in improving Greater London bus operations (see page 62).
- The City of Redmond, Washington imposes a “Business Tax/Transportation Improvement” (BTTI) tax on employers to fund transportation improvements including transit programs (see case study below).

| Case Study: Per Employee Transportation Tax |
| Redmond, Washington |

The City of Redmond, Washington funds its transportation demand management program through revenue raised by a “Business Tax/Transportation Improvement (BTTI)” tax. Redmond levies the BTTI as a per employee tax on all employers in the City. The current BTTI rate is $55 per employee per year.

BTTI revenue funds a variety of transportation improvements including roadway capital projects and programs to encourage alternatives to the single-occupant automobile. About ten percent of BTTI revenue support commuting alternatives. For example, BTTI funds have been used to:

- Administer the city’s transportation demand management program;
- Fund transit and ridesharing incentives and rewards;
- Fund the operation of a shuttle bus service;
- Operate parking management programs; and
- Fund the construction of a “bike station” at a transit center.

The City first imposed the tax in 1997 as a temporary four-year measure. In 2001, with the support of the business community, Redmond established the BTTI as an on-going revenue stream. BTTI revenue is directed to a special fund dedicated exclusively for transportation related projects.

Source: City of Redmond, Washington

*Applicability to Montgomery County.* Maryland law prohibits the County from raising revenue from roadway tolls, automobile registration fees, or taxes on car rentals.9

The County Code allows the County to charge a “transportation management” fee on optional method developments in an established transportation management district (TMD).10 The County currently funds TMD activities and programs in part from revenue raised by the transportation management fee. The Code permits the County to use transportation

---

10 MCC § 42A-29.
management fee revenue for a variety of additional purposes including adopting traffic and parking control measures, providing transportation-related capital projects, and creating public-private programs to increase ridesharing and transit use.\textsuperscript{11}

4. Parking Space Tax

In Australia and Canada, several municipalities have implemented special taxes on non-residential parking spaces. The goal of this type of tax is to create an economic disincentive for driving alone and, in some cases, to raise revenue for transportation projects. This taxing strategy also encourages developers and property owners to reduce the number of parking spaces constructed or made available for use.

Communities levy parking space taxes based either on the number of parking spaces or the size of the parking area at a property. Some communities limit the imposition of this tax to free or subsidized parking spaces and facilities. Implementation of a tax on parking spaces requires the municipality to maintain an accurate inventory of surface and in-structure parking spaces in local land records.

<table>
<thead>
<tr>
<th>Case Study: Parking Space Taxes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sydney, Melbourne, and Perth, Australia</td>
</tr>
</tbody>
</table>

Three Australian cities tax non-residential parking in urban areas.

- Sydney charges a parking space levy for each privately owned non-residential off-street parking space. The annual levy is $800 Australian dollars (US$660) per space in the central business district and $400 (US$330) per space in other business districts. Revenue from the parking space levy is dedicated to fund transportation capital projects.

- Melbourne charges a “long stay car park levy” for long-term and leased parking spaces in commercial facilities in the central business district. This levy is intended to encourage parking facilities to convert long-term spaces used by commuters into short-term spaces used by shoppers and visitors. The annual levy is $800 (US$660) per space.

- Perth charges a “parking license fee” for commercial parking spaces in the central business district. The fee varies depending on the type of space (short- or long-term) and the number of days the space is actually used. The annual fee is $169 (US$140) for short-term parking and $195 (US$160) for long-term parking.

Source: Todd Litman, Parking Taxes: Evaluating Options and Impacts, Victoria Transport Policy Institute, 2006

\textsuperscript{11} MCC § 42A-29 and 42A-23(b).
Applicability to Montgomery County: In 1990, Senior Legislative Attorney Michael Faden wrote a memorandum concluding that the Council has the authority to enact an excise tax on parking spaces. That same year, the Council approved an excise tax on non-residential parking spaces. However, County Executive Kramer vetoed the legislation and the parking space tax never took effect.

In October 2007, the Working Group on Infrastructure Financing for County Government Facilities issued a report that, among other things, recommended that the County enact an excise tax on non-residential commuter parking spaces.

5. Revenue from Market Rate Public Parking

It is extremely uncommon for public parking revenue to support transit or transportation demand management. Montgomery County stands out as one of the few communities that use parking revenue to fund transportation demand management programs.

Most commonly, public parking prices are set at a uniform (and often below market) rates throughout a parking district. Surplus parking revenue in most communities feeds into the general fund or support the activities of a business improvement district (similar to an urban district in Montgomery County). Some communities (such as San Francisco and Pasadena, California) have implemented market rate pricing by charging higher hourly rates for parking spaces in the greatest demand and lower rates for less attractive spaces. However, even in communities with market rate parking fees, rates are set so as to maintain an adequate supply of available spaces throughout the day rather than to raise revenue for transit or to create a financial disincentive to drive.

One noteworthy exception in public parking rate setting and revenue policy has been put in place by the University of Washington at its Seattle campus. When it implemented a comprehensive transportation demand management program in 1991, the University raised single-occupant vehicle parking rates by 50 percent. Single-occupant vehicle drivers pay parking fees that are significantly higher than both transit fares and parking costs for carpool drivers. At present, full day parking for a single-occupancy vehicle at a University parking facility is $12.00.

Parking fee revenue supports a range of transit and transportation demand management activities known as the “U-Pass” program (see page 68). Parking revenue contributes about one-third of the operating costs of the U-Pass program.12

Applicability to Montgomery County: The County Code does not indicate any particular method or basis for setting parking rates. Rather, the Council sets public parking rates by resolution based on whatever criteria it sees fit. Under all pricing strategies, the County has an obligation to raise sufficient funds to cover PLD operating costs and to repay facility revenue bonds. Otherwise, the Council has the prerogative to keep rates low to minimize the cost to drivers or to set the rates high to serve as a disincentive to driving.

12 U-Pass 2007 Annual Report, University of Washington Office of Commuter Services
The County Code limits the use of Parking Lot District revenue to certain purposes; these include the construction, maintenance, and operation of parking facilities; funding urban districts and transportation management districts; and implementing transit and ridesharing incentive programs. An amendment to County law would be necessary to allow Parking Lot District revenue to directly fund transit system operating and capital costs.

B. Economic Incentives

As discussed in Chapter II, the relative cost of driving versus alternative transportation modes is an important factor in determining individual commuter choices. Economic incentives are a proven means of convincing some commuters to switch to transit or other alternative modes. As detailed in Chapter III, the County reimburses some employers for a portion of the cost of transit subsidies offered to employees.

1. Employer-Based Transit Benefits (“EcoPass” Programs)

The most common form of transit benefit is a direct contribution from an employer to individual employees who ride transit regularly (an “employee-based” benefit). In contrast, in an “employer-based” approach, a transit agency uses an employer as an intermediary to provide transit benefits to all employees of an organization as a group. Under an employer-based program, a transit agency sells an employer passes for all of its employees to ride public transit for free.

Traditional transit agency pricing for individual monthly and annual passes assumes that users will ride transit almost daily. Under employer-based programs, a transit agency can price passes at a highly discounted rate because an employer pays for all employees regardless of how often they ride transit. Table 6-2 shows a hypothetical example comparing the costs of transit benefit that is employee-based with a transit benefit that is employer-based. The example assumes an organization of 100 employees (consisting of 80 single-occupant vehicle commuters and 20 transit commuters).

<table>
<thead>
<tr>
<th>Assumptions:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Number of Employees: 100</td>
</tr>
<tr>
<td>Number of Regular Transit Commuters: 20</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th></th>
<th>Per Employee Benefit</th>
<th>Employer-Based Pass</th>
</tr>
</thead>
<tbody>
<tr>
<td>Annual per User Cost Paid by Employer</td>
<td>$300</td>
<td>$60</td>
</tr>
<tr>
<td>Number of Employees Receiving Benefit</td>
<td>20</td>
<td>100</td>
</tr>
<tr>
<td>Total Annual Cost to Employer</td>
<td>$300 x 20 = $6,000</td>
<td>$60 x 100 = $6,000</td>
</tr>
<tr>
<td>Total Revenue to Transit Agency</td>
<td>$6,000</td>
<td>$6,000</td>
</tr>
</tbody>
</table>
This example shows an employer-based transit pass pricing program can be cost neutral for the transit agency and the employer, and yield increased benefits for some employees. All regular transit commuters retain their full transit benefit under employer-based pricing. However, under this pricing model, employees who have the ability to take the bus or train on occasion can ride transit at no cost on days that they do not need to drive.

Transit systems in the Dallas, Denver/Boulder, Portland, Salt Lake City, San Jose, and Seattle areas offer employer-based transit passes. These programs, known as “EcoPass” programs, have increased transit usage by offering all employees — particularly commuters who do not need to drive every day — an incentive to ride transit on occasion. A study of EcoPass programs found that employer-based transit benefits reduce commuter parking demand by as much as 19 percent.13

<table>
<thead>
<tr>
<th>Case Study: Employer-Based Transit Benefits</th>
</tr>
</thead>
<tbody>
<tr>
<td>Regional Transportation District (Denver/Boulder)</td>
</tr>
</tbody>
</table>

The Regional Transportation District (RTD) serving the Denver and Boulder, Colorado area provides employer-based transit passes. RTD sells employers EcoPasses that enable all employees to ride transit for a year at no cost. In addition, employers who participate in the EcoPass program also make their employees eligible for a free guaranteed ride home in case of an emergency. The City of Boulder also arranges discounts at local merchants for EcoPass-eligible employees of businesses in the City.

RTD sets EcoPass prices based on two factors: the location of the employer and the number of employees. For 2008, the lowest annual EcoPass charge is $38 per employee for employers with 2000 or more employees located in outer suburbs with limited transit service. The highest annual EcoPass charge is $344 per employee for employers with 20 or fewer employees located near the airport. In contrast, purchasing monthly RTD passes would cost $1,584 per year.

Last year, almost 1.1 million employees received the RTD EcoPass benefit. These employees made about 9.8 million transit boardings during the year.

Source: Regional Transportation District

Applicability to Montgomery County: The County could incorporate employer-based transit passes as a component of Ride On system pricing. However, Ride On is only one element of the County’s transit network. Employer-based transit passes likely would be most successful if the passes were accepted by all transit providers. WMATA would have to approve this type of pricing for the Metro system while the State would have to approve it for MARC.

2. Parking Parity

Many employers offer free or below market-rate parking as an employee benefit. As described in Chapter II, free or low-cost parking serves as an incentive for commuters to drive to work alone. The term “parking parity” refers to efforts to offer other benefits as an alternative to free or low-cost parking. Parking parity seeks to establish equity between benefits provided drivers and benefits provided employees who choose alternative commuting modes. In the case study that follows, the State of California requires many employers that provide parking subsidies to their employees to concurrently offer a cash allowance as an alternative to the parking subsidy.

<table>
<thead>
<tr>
<th>Case Study: Parking Cash-Out Program</th>
</tr>
</thead>
<tbody>
<tr>
<td>State of California</td>
</tr>
</tbody>
</table>

In 1992, the California legislature created a “parking cash-out” program that requires some employers to offer employees the option to choose cash in lieu of a parking subsidy. For the purpose of the cash-out law, the term “parking subsidy” means the difference between the out-of-pocket amount paid by an employer to secure an employee parking space and the price, if any, charged to an employee for use of that space. Employees that commute by transit, carpool, or vanpool and telecommuters, walkers, and bikers are eligible for the parking cash-out if a subsidized parking space for a single-occupancy vehicle is available to them.

The California “Parking Cash-Out Program” only applies to employers with 50 or more employees in designated air quality non-attainment areas. The law does not apply to employer-owned parking spaces.

A study reviewing the effects of the California cash-out requirement found that the program reduced the number of commuters who drove alone by 17 percent; increased carpooling by 64 percent; and increased transit ridership by 50 percent. All told, the shift in commuter choices resulting from the cash-out program reduced total vehicle miles traveled by employees by 12 percent.14

Source: California Environmental Protection Agency Air Resources Board

**Applicability to Montgomery County:** The County encourages employers to voluntarily provide alternative benefits to commuters who decline a free or reduced price parking space. The County could mandate a cash-out program similar to the one in California under its general police powers authority. However, as the County does not have a large supply of private commercial parking facilities, a cash-out mandate that applied solely to commercial parking benefits likely would have limited impact on trip generation.

---

3. Employer/Commuter Rewards Programs

Economic incentives may be used to entice employers to promote and support alternative commuting modes. Through the Fare Share and Super Fare Share programs, Montgomery County covers a portion of employer transit subsidy costs for up to nine years. Other communities offer employers performance-based incentives for trip reduction. For example, the City of Redmond, Washington, has piloted a program to provide businesses a $300 per year reward for each commuter trip reduced below an initial baseline level.

In some jurisdictions, community organizations provide direct monetary incentives to commuters who choose not to drive alone. These programs offer rewards for first switching to— as well as for continuing to use — an alternative commuting mode. These rewards are separate from transit subsidies and other benefits offered by an employer.

### Case Study: Commuter Rewards

**Cumberland Community Improvement District (Suburban Atlanta)**

The Cumberland Community Improvement District (CID) is a public-private partnership charged with improving transportation access to a commercial area northwest of Atlanta known as Cumberland Galleria. In addition to working to finance roadway and infrastructure improvements, the District also manages the Cumberland “Commuter Club” that provides support and assistance to promote transit use, carpooling, vanpooling, and telework.

Among other services, the Commuter Club offers a commuter rewards program. The rewards program offers several incentives for commuters to give up driving alone in favor of transit, ridesharing, and telework. New program participants earn $3 per day for three months for taking an alternative transportation mode. Carpoolers receive free monthly gas cards ($40 per month for three person carpools and $60 per month for four-person carpools). All Commuter Club participants are eligible for drawings for gift cards of $25 or more. Funding for the rewards comes from a commercial property tax that pays for all activities of the Cumberland CID.

Source: Cumberland Community Improvement District

**Applicability to Montgomery County**: The County already provides funding to offset some employer transit subsidy costs. Commuter or employer reward programs are another way to incentivize alternatives to driving alone. Of course, the success of these programs is dependent on the availability of resources to fund rewards that are large enough to affect commuter and business behavior.

4. Enhancement of Federal and State Incentive Programs

Many County employers offer transit subsidies to their employees. For 2008, the Internal Revenue Service allows employers to provide workers with up to $115 per month in tax-free transit and vanpool benefits. Any transit subsidy above $115 per month is considered taxable income under Federal law. Assuming 20 work days per month, the maximum tax-free subsidy of $115 per month equates to $5.75 per day benefit. As shown in Table 6-3, this subsidy amount covers only a portion of daily transit commuting costs for some County residents.

---

15 The U.S. Internal Revenue Service announced that it will increase the limit on non-taxable transit benefits to $120 per month in January 2009.

Source: WMATA

The financial “bailout” bill approved by Congress and signed by the President in October included a new Federal benefit for bicycle commuters. Beginning in January 2009, employees who use a bicycle as their primary commuting vehicle will be eligible for a $20-a-month, tax-free reimbursement from their employers for bicycle-related expenses. Employers will be able to deduct the reimbursement expense from their Federal taxes.

The State of Maryland offers an income tax credit to employers who provide benefits that support alternative modes of commuting. Employers are eligible to receive a tax credit for 50 percent of the cost of providing transit and vanpooling subsidies, guaranteed ride home programs, and cash benefits in lieu of parking. The maximum tax credit is $50 per participating employee per month. DOT reports that many eligible employers do not take advantage of this tax credit.

**Applicability to Montgomery County:** The County could team with transit advocacy groups and other local and state governments to persuade Congress to raise the maximum tax-free transit benefit amount. Similarly, the County could work with other Maryland counties to push for expansion of the State tax credit.

C. Driving Disincentives

Many commuters find that traveling alone in their car has a cost, time, and convenience advantage over transit and other alternative modes. Several communities have adopted strategies to make driving alone less attractive than other commuting options. Limiting the supply of parking in urban centers is a commonly used measure to discourage driving.

The County Code authorizes DOT to regulate or limit public parking as a means of managing transportation demand within TMDs. 16  In practice, however, the County has not used its authority to limit public parking. Moreover, County Zoning Ordinance requires private developers to provide significant amounts of parking in urban centers.

---

16 MCC § 42A-23(b)(a).
1. **Zoning Code Parking Requirements**

The most common type of parking standard in local zoning codes is the establishment of minimum parking requirements for different land uses. Zoning codes mandate a minimum number of parking spaces that must be provided for each specific land use type based on a measure of the intensity of use (gross floor area, number of bedrooms, number of employees, seating capacity, etc.). Typically, communities base minimum parking requirements on parking generation studies that estimate peak parking occupancy rates for different types of land use. Montgomery County has adopted this minimum parking requirement approach in its Zoning Ordinance.

In recent years, some urban planners have begun to question the soundness of demanding minimum parking requirements, particularly in urbanized areas served by transit. Most notably, these critics contend that transportation engineers and planners do not consider the price of parking and the availability of transit as variables in estimating parking generation rates. Several jurisdictions have adopted separate parking requirements designed specifically for urban areas with relatively high levels of transit service and traffic congestion.

**Variable Minimum Parking Requirements:** Many communities adjust minimum parking requirements for certain geographic areas. Communities that have adopted variable minimum parking requirements take into account factors such as traffic congestion, transit availability, and parking supply in setting specific parking requirements. Most commonly, these communities establish lower minimum parking requirements in urban centers that are served well by transit.

The Montgomery County Zoning Ordinance allows for reduction of the minimum parking requirement for office buildings in close proximity to Metro stations. In addition, the Ordinance allows for a parking reduction of 15 percent for office buildings in certain areas of the County that pay into the County’s share-a-ride account to support ridesharing programs.

**Maximum Parking Limits:** As an alternative to minimum parking requirements, some communities have established upper limits on parking supply. In these communities, the zoning code specifies the maximum amount of parking permitted at a specific site or within a specific district. Jurisdictions have applied maximum parking limits for both residential and non-residential development in high density areas served well by transit. Some communities set both minimum and maximum parking requirements, effectively establishing a range of parking spaces required in a development. In addition, some zoning code parking space limitations offer exemptions such as for short-term, shared, or paid parking spaces.

Portland, Oregon has created a system of transferable parking entitlements. Under this system, developers receive the right to build a maximum number of parking spaces at a property. A developer either may build the maximum allotment of spaces or may sell the entitlement for unbuilt spaces within a defined district.

Some urban planners see a downside to the strategy of setting upper limits on parking. Once a building is built, it is often very difficult to add parking if needed, particularly in an urban environment. Critics of mandated parking limits also cite concerns that these restrictions negatively impact the marketability of a project and could jeopardize the developer's ability to secure financing.

**Applicability to Montgomery County:** The Council has the authority to amend parking requirements in the Zoning Ordinance. On November 25, 2008, the Council approved an amendment to the Transit Mixed Use (TMX) zone that reduced minimum parking requirements. The Council’s Planning, Housing, and Economic Development (PHED) Committee has indicated that it plans to consider reducing minimum parking requirement or establishing maximum parking requirements in other high density zones.

The County has implemented a parking supply limit for one urban center. The approved Growth Policy sets a limit of 17,500 public and private long-term parking spaces that may be built in the Silver Spring CBD.

²³ Seattle Municipal Code, 23.74.010 A.1.b.
2. Control of Public Parking Supply and Pricing

Some communities have created disincentives to driving alone through control of parking supply and pricing. The following four strategies use parking policy as a tool to change commuting practices:

**Limiting Parking Supply:** A community may constrain parking supply in areas well served by transit to compel a certain percentage of commuters to travel by means other than single occupant vehicle. Under this strategy, parking could be constrained by limiting the total number of available spaces or by converting long-term general use spaces to short-term or carpool spaces. As an example, Portland, Oregon, has placed a cap on the total number of parking spaces allowed in certain commercial areas (see pages 58-59).

**Raising Parking Prices:** A community may raise the cost of driving alone by charging higher parking rates. As mentioned above, the University of Washington raised parking prices by 50 percent at its Seattle campus when it implemented a comprehensive transportation demand management program in 1991.

**Differentiated Parking Pricing — Time of Day:** As discussed on the next page, the strategy known as “congestion pricing” charges an additional cost for commuting during peak traffic hours. For example, this approach could involve charging a premium for parking during certain hours or for entering or exiting a parking facility during peak congestion hours.

**Differentiated Parking Pricing — Location:** Some communities charge a premium for high demand parking spaces (such as those located closest to major employment or commercial centers). For example, Pasadena, California set lower hourly parking rates at the periphery of the commercial district than in the center of the district in order to deter price sensitive drivers from the highest demand locations.

**Applicability to Montgomery County:** As discussed in Chapter IV, the County established parking lot districts in Bethesda, Silver Spring, and Wheaton to provide property owners an alternative to meeting the on-site parking requirements of the Zoning Ordinance. In addition the County manages on- and off-street parking meters in North Bethesda. Altogether, the County controls more than 21,000 parking spaces in urban centers.

By controlling a large number of parking spaces in urban centers, the County plays an important role in influencing commuter choices. County policies regarding parking supply and pricing affect the relative cost and convenience of driving alone compared to alternative modes. Currently, the County provides ample, relatively low cost parking in major urban centers.

---

24 The County also has established a parking lot district in the Montgomery Hills area. This report does not address Montgomery Hills as the area does not meet the criteria as an “urban center” as defined in Chapter III.
As detailed in Chapter IV:

- More than three-quarters of parking lot district spaces are available for long-term parkers;
- PLD-wide long-term parking vacancy rates range from 14 percent (in Bethesda) to 39 percent (in Silver Spring);
- Single-occupant vehicle parking rates are uniform in all PLD garages and lots;
- The hourly rate for long-term parking in PLDs ($0.50/hour) is 33 percent lower than the hourly rate for short-term parking ($0.75/hour); and
- In the Bethesda and Silver Spring PLDs, carpoolers receive a substantial parking discount.

The County could leverage its control of parking in urban centers to discourage commuters from driving alone. To achieve this end, the County could reduce the supply of long-term (non-carpool) parking, increase general rates for long-term parking, charge a premium for entering or exiting a parking facility during peak hours, and/or increase the rates for the highest demand parking spaces.

3. Limiting Commercial Parking Facilities

An urban area with constrained parking supply cannot accommodate predominantly single-occupant vehicle commuters. As mentioned in Chapter IV, the County Zoning Ordinance allows commercial parking facilities as a permitted use for optional method developments in central business district zones. The County could limit the supply of commercial parking facilities in urban centers through zoning restrictions.

Applicability to Montgomery County: The Council could amend the Zoning Ordinance to limit the zones in which commercial parking facilities are permitted.

4. Congestion Pricing

The term “congestion pricing” refers to a practice of adjusting transportation related charges (such as road tolls or parking fees) by time of day or by location. Congestion pricing creates an economic disincentive against adding traffic in the most congested areas of a city and/or the most congested periods of the day. Pricing models include:

- Imposing a new fee for use of a type of public facility that is free of charge in other locations or at other times of day; and,
- Charging a higher fee for use of a public facility than is charged in other locations or at other times of day.
Alternative methods exist for collecting congestion pricing fees. Drivers may pay a one-time entry fee at a toll booth or may purchase weekly, monthly, or annual passes. In addition, congestion fees may be assessed by means of a vehicle-mounted transponder that electronically charges a pre-existing account (similar to the “E-Z Pass” system). A municipality may charge congestion pricing fees at the entrance to different types of facilities, including:

- Major transportation facilities with a single point of entry (such as a bridge or tunnel toll station);
- Segments of the roadway network with multiple points of entry (such as entrances to a limited access highway);
- All roadways crossing a cordon surrounding a geographic area (such as a central business district or transportation corridor); and,
- Entrances or exits of public parking facilities.

Congestion pricing has been implemented in several cities outside the United States including London, Stockholm, and Singapore. Last year, the Federal Highway Administration awarded a grant to the City of San Francisco to study the feasibility of charging motorists a user fee to access specific areas of the City during peak periods of congestion. In contrast, earlier this year, the New York State Legislature defeated a proposal to impose an $8 charge on private automobiles entering Manhattan (south of 60th Street) during peak hours.

**Case Study: Congestion Pricing**

**London, England**

London introduced a “congestion charging” program in the central city in 2003. Drivers of vehicles that cross into the “charging zone” must pay an eight pound (US$12) charge. Taxis, emergency services vehicles, motorcycles, bicycles, and alternative energy vehicles are exempt from the charge. Residents of the central city pay a discounted fee for driving within or re-entering the charging zone.

Drivers may purchase daily, weekly, monthly, or annual passes. The congestion charge is in effect weekdays from 7:00 am through 6:00 pm. London enforces the fee by means of street cameras that read vehicle license plates and feed that information into a database of paid users.

Last fiscal year, the London congestion charging program raised 137 million pounds (US$205 million). By law, all revenue from the congestion fees is directed to support bus operations in Greater London.

Source: Transport for London

The creation of high-occupancy toll (HOT) lanes is another form of congestion pricing. In HOT lanes, carpools, vanpools, and buses travel for free, while drivers of single-occupant vehicles pay a toll. Several states currently have HOT lanes, including California, Colorado, Minnesota, and Texas.
5. Road Space Rationing

Several large cities in other countries control peak period vehicle trips through a measure known as “road space rationing.” Large cities including Athens, Mexico City, and São Paulo limit the total number of vehicles permitted to enter the center city each day. Road space rationing is implemented by various methods. One method involves the distribution of a finite supply of daily entry passes to residents who can either use a daily pass or sell it to other commuters. Other road space rationing methods include limiting entry to the central city based on vehicle license plate number and the day of the week.

Applicability to Montgomery County: Road space rationing is an extreme measure used primarily in urban centers with significantly worse traffic congestion and air quality conditions than exist in Montgomery County. As County urban centers are all served by State highways, the County would require State approval to enforce road space rationing.

D. Location and Design of Transportation Network

As mentioned in Chapter II, the physical layout of transportation facilities in an urban area may influence commuting choices. The design of transportation systems affect how people get to work. Some jurisdictions have altered their transportation networks to promote efficient commuting practices.

1. Remote Parking

Remote parking is a land use strategy that locates parking on relatively inexpensive land at the periphery of a major destination such as a central business district. Remote parking intercepts drivers before they enter the more congested area at the center of the district, thereby reducing traffic where density is the greatest. Commuters are attracted to the remote parking either by low-priced parking rates or by limited supply of long-term parking in the district’s center. Frequent shuttle bus service transports parkers to their job site or other final destination.

Remote parking is a common strategy found at U.S. airports. At many airports, relatively low cost, long-term parking is located on the periphery of the airport property (or off-site) but is easily accessed via major transportation routes. Users of these parking facilities rely on frequent and reliable shuttle buses to complete their trip to the airport terminal.

Applicability to Montgomery County: The County could adopt a remote parking strategy where land for new parking facilities is available. As the availability and cost of land is an important consideration, remote parking may be better suited to newly emerging urban centers than it would be as a “retrofit” to developed urban centers. In addition, to make remote parking a viable option for commuters, the County would need to set aside sufficient funding for frequent shuttle bus service between the parking facilities and the urban center.

2. Bus Rapid Transit

The term “bus rapid transit” refers to a transit system that includes dedicated rights-of-way or roadway lanes used by frequent, high-capacity public commuter buses. In contrast to rail transit, bus rapid transit routing may be adjusted to respond to changes in land use patterns including shifts in employment and housing.

Bus rapid transit may run in:

- A dedicated right-of-way;
- A dedicated lane of an existing roadway;
- The median of an existing roadway; or
- A non-road right-of-way (such as a railroad right-of-way).

In some instances, bus rapid transit systems share rights-of-way or lanes with private buses, vanpools, carpools, and other high-occupancy vehicles.

Advanced bus rapid transit systems include features similar to rail transit systems including pre-paid fare collection, enclosed stations, and integrated fare systems that permit transfers between routes and modes. A report by the U.S. General Accountability Office notes that bus rapid transit systems often must deliver high levels of service and amenities similar to rail systems in order to overcome the poor public image of commuting by bus.26

To implement a bus rapid transit system, the transit provider will need to make significant investments in right-of-way acquisition or conversion, purchase and maintenance of vehicles, and construction and up-keep of facilities. Nonetheless, bus rapid transit often is more affordable to construct than light rail transit systems.27 Construction and operation of bus rapid transit systems require the cooperative efforts of local planning agencies and transit service providers. As noted by the Victoria Transport Policy Institute, successful bus rapid transit requires that bus transit be given increased priority in transportation planning and budgeting, roadway management, and land use decision-making.28

Several metropolitan transit authorities have built bus rapid transit lines. Table 6-5, on the next page, shows information on bus rapid transit lines constructed in Boston, Cleveland, Las Vegas, Los Angeles, and Pittsburgh.

</tr>
</tbody>
</table>

**Applicability to Montgomery County**: County master plans and other planning documents identify possible bus rapid transit rights-of-way including the Corridor Cities Transitway, the Purple Line, in the Georgia Avenue corridor, and along Veirs Mill Road. Construction and operation of bus rapid transit would require the County to identify significant new funding sources. As a point of reference, the seven-mile bus rapid transit line in Cleveland which is being built primarily in existing rights-of-way is estimated to cost about $168 million to construct. The County also would require State approval if it chose to use State owned rights-of-way for bus rapid transit.

3. **Transit Signal Priority / High Occupancy Vehicle Lanes**

Transit signal priority refers to a traffic management strategy that gives precedence to transit vehicles at signal controlled intersections. Transit signal priority allows public buses (as well as street-cars and light rail lines) to avoid many intersection delays, thereby increasing the reliability of transit schedules. By improving the reliability and reducing the time of travel by transit, signal prioritization makes transit a more competitive alternative to the single-occupant automobile. A traffic management system may also offer signal priority to certain non-transit vehicles such as vanpools, carpools, and emergency response vehicles.
A common method of transit signal prioritization is the installation of “queue jump” lanes. A queue jump lane is a short bus lane leading to a signalized intersection. When a transit bus approaches an intersection, a signal priority system provides an early green light to the bus that permits the vehicle to by-pass the intersection queue.

As detailed in a 2005 study funded by the U.S. Department of Transportation, a transit signal priority system requires four technological components:

- A detection system that identifies the location of transit vehicles;
- A priority request generator that alerts the traffic control system that a transit vehicle would like to receive priority;
- Software that processes the request and decides whether and how to grant priority based on priority control strategies; and
- Software that manages the system, collects data, and generates reports. 29

Several communities have installed signal prioritization on dedicated transit or high-occupancy vehicle (HOV) lanes to maximize the efficiency of the roadway network. HOV lanes give priority to transit buses, vanpools, and carpools. In some communities, motorcycles and alternative fuel vehicles also are allowed access to HOV lanes. HOV lanes may be created at the construction of a new roadway or may be retrofitted into existing facilities by converting regular travel lanes to HOV lanes.

Multiple communities have instituted the use of transit signal prioritization including Chicago, Illinois; Fairfax County, Virginia; King County, Washington; Los Angeles, California; Portland, Oregon; and Tacoma, Washington. Evaluations of transit signal prioritization systems found that their effectiveness in reducing transit travel times varies depending on the level of congestion, the frequency of bus service, and the degree of prioritization the system gives both in intersections and on travel lanes. For example, signal prioritization in Tacoma, Washington resulted in a 40 percent reduction in transit vehicle intersection delays. In contrast, a study of transit signal prioritization in Fairfax County, Virginia found only minimal improvements in transit vehicle intersection delays during peak congestion periods (see case study on the next page).

---

Case Study: Transit Signal Priority
Fairfax, Virginia

Fairfax County has installed a transit signal priority system covering 25 intersections of Richmond Highway (Route 1). Buses travel the Richmond Highway corridor on lanes shared with other vehicles. Working with the Virginia Department of Transportation and WMATA, Fairfax installed a signalization system that extends a green light when a bus approaches an intersection during the last 10 seconds of the green phase. At present, the highway does not include any bus lanes or queue jump lanes.

The cost for procuring and installing prioritization technology at 25 intersections and 12 buses was approximately $220,000. Fairfax originally installed the signal prioritization system to accommodate emergency vehicles. With financial assistance from the Metropolitan Washington Council of Governments, Fairfax expanded the signal prioritization system to include commuter buses including express buses traveling from Fort Belvoir to the Huntington and King Street Metrorail stations.

The Virginia Department of Transportation commissioned Virginia Tech to evaluate the impact of the transit prioritization system on transit travel times. The Virginia Tech study found the benefits of the program were highly dependent on the level of congestion. During periods of low to moderate levels of congestion, the system reduced intersection delays for transit vehicles by as much as 23 percent. However, during the most congested peak hours, the study found only a marginal improvement (about 2.5 percent) in transit travel times.

Applicability to Montgomery County: The Department of Transportation operates the County’s Advanced Transportation Management System (ATMS). ATMS is a computer system designed to monitor and control traffic signals in real-time to reduce traffic congestion, travel time, and accidents. Several years ago, DOT conducted a limited demonstration of transit signal prioritization for Ride On buses. DOT found transit signal prioritization generally feasible but refrained from implementing the system pending completion of the current multi-year replacement of major ATMS technology. Transit signal prioritization is in the long-term scope of ATMS and could be accommodated by the next generation of ATMS technology. As State roads serve as the major commuting corridors to County urban centers, the County would require State approval to adjust signals and change lane configurations. WMATA approval would also be necessary to equip Metrobuses with signal prioritization technology.

The State of Maryland has dedicated certain lanes on I-270 for high occupancy vehicles during weekday rush hours.

E. Centrally Managed System Governance

In most metropolitan areas, a combination of entities governs transportation demand management programs. State and local governments, regional organizations, transit systems, and parking authorities often provide different transportation demand services. In many cases, these services are loosely connected and not comprehensively managed.
Some communities in the country, most notably universities, have developed transportation demand systems that consolidate a wide range of services into one centrally-managed program. In these consolidated programs, a single entity promotes alternative commuting modes, offers transit incentives, operates local shuttle services, and sets parking pricing and supply policies. For example, the University of Washington “U-Pass” program provides a package of transportation services for faculty, staff, and students that includes free transit, a free campus shuttle, and discounts for vanpooling, carpooling, bicycling, and car-sharing (see case study below).

| Case Study: U-Pass Program  
University of Washington |
|---------------------------|

The University of Washington U-Pass program is a consolidated transportation demand system that offers a wide range of services. Commuters pay a quarterly user fee to join the U-Pass program. For $70 per quarter ($50 for students), U-Pass members receive a range of benefits including:

- Unlimited free rides on public bus and train systems in the Seattle region;
- Discounted vanpool fares;
- Discounted carpool parking;
- Discounted parking for commuters who drive two days per week or less;
- Free nighttime van service serving the campus and nearby neighborhoods;
- Ridesharing matching programs;
- Free guaranteed emergency ride home;
- Discounted car sharing (“Zipcar”) services;
- Discounts on the purchase of bicycle helmets, lights, parts, and accessories; and
- Discounts on general purchases at over 40 local and national merchants.

Program users and single-occupant drivers furnish nearly all of U-Pass operating resources. The University sets parking prices at a rate high enough to create an incentive for some commuters to convert to alternative modes but low enough to attract sufficient customers to generate desired revenue. As mentioned above, parking fees and fines supplied 33 percent of program operating costs in 2007. Membership fees contributed about 59 percent of the operating revenue for the U-Pass program. Other University sources provided the remaining 8 percent of operating resources.\(^{30}\)

In the 18 years since the inception of the U-Pass program, the employee and student population in the University District of Seattle has grown by 24 percent. During the same period, the number of peak hour trips to the area decreased by more than 10 percent. Currently, more than three-quarters of the campus population commutes by a method other than driving alone.

Source: University of Washington

---

\(^{30}\) U-Pass 2007 Annual Report, University of Washington Office of Commuter Services
Applicability to Montgomery County. Governance of transportation demand management in Montgomery County is decentralized and shared among multiple County and non-County entities. The County could establish a new transportation demand management governance structure that oversees policies relating to transit financing, commuting incentive programs, infrastructure development and maintenance, zoning and land use requirements, parking policy, and other County policies, programs, and factors that influence commuting patterns.

The County has entered into an agreement with Montgomery College to provide a transit benefit to students enrolled in the College. Under the County’s “U-Pass” program, Montgomery College students ride for free on Ride On buses by showing a current student identification card. The College pays the County $550,000 annually for this benefit.
CHAPTER VII: FINDINGS

The report responds to the Council’s request for the Office of Legislative Oversight (OLO) to study transportation demand management in Montgomery County and other communities. “Transportation demand management” refers to a set of public policy strategies and programs aimed at increasing the efficiency of a region’s transportation resources by providing convenient and affordable alternatives to the single-occupant vehicle.

This chapter summarizes OLO’s findings about the implementation, funding, and governance of transportation demand management strategies in three subject areas:

A. General Findings about Transportation Demand Management
B. Montgomery County’s Approach to Transportation Demand Management
C. Funding for Transit and Transportation Demand Management
D. Transportation Demand Management Strategies in Other Communities

A. GENERAL FINDINGS ABOUT TRANSPORTATION DEMAND MANAGEMENT

Transportation demand management programs are designed to change individuals’ travel behavior by providing convenient and affordable alternatives to the single-occupant vehicle. Findings #1 through #3 discuss factors that influence a commuter’s travel choices. These transportation demand management concepts apply in Montgomery County as well as in other urban communities.

Finding #1: In choosing how to travel, commuters weigh the relative cost, time, and convenience of driving alone against alternative modes of travel.

Commuters to urban centers can choose to drive alone or take an alternative transportation mode (e.g., bus, rail, or carpool). Interviews with transportation demand management professionals and a review of the literature indicate that three dominant factors influence an individual’s commuting choices:

- **Cost** – the relative expense of commuting by alternative modes;
- **Time** – the time needed to commute by one mode compared to another; and
- **Convenience** – the ease, comfort, and reliability of commuting by alternative modes.

Finding #2: A range of conditions influence the cost, time, and convenience of commuting. Only some of these conditions fall within the County’s influence or control.

County land use decisions, transit programs, parking policies, and other actions affect the relative cost, time, and convenience of commuting patterns. For example:

- The County’s Zoning Ordinance establishes minimum parking requirements that determine the supply of parking in new developments.
The County’s Ride On Bus system operates 77 peak hour routes; this network includes 37 routes that serve the Bethesda, Friendship Heights, North Bethesda, Silver Spring, and Wheaton urban centers.

The County controls much of the parking supply in Bethesda, Silver Spring, and Wheaton. The County establishes the pricing structure for this supply and determines the mix of parking space uses (such as the number of spaces designated for short-term, long-term, and carpool use).

Several factors that affect a commuter’s travel choice are beyond the direct control of either County Government or County residents. External factors such as energy costs, housing market conditions, and workplace policies affect commuter decisions. Specifically:

- Rising fuel prices make transit, carpooling, and bicycling more cost competitive with driving alone.
- When housing costs spiked earlier this decade, many people who work in the County decided to live in distant communities, resulting in longer commutes and fewer options for alternative modes of travel.
- Employers that permit employees to work flexible schedules or to telework affect a reduction in peak hour commuting trips.

Finding #3: Successfully increasing the percentage of commuters using alternative modes of travel generates a need for additional investment in transit, bikeway, and pedestrian infrastructure.

Sufficient and reliable funding for transit and other alternative commuting modes is a necessary prerequisite to sustaining high mode shares (i.e., a high percentage of commuters using alternative modes of transportation). If transportation demand management techniques successfully persuade a large number of commuters to abandon driving alone, then cost competitive, timely, and convenient alternatives must be available to serve these commuters.

Transit systems in Montgomery County have experienced increased ridership in recent years. Recent data from Ride On demonstrates that buses during peak hours are regularly at capacity and have had to pass bus stops without picking up passengers due to lack of space. If ridership continues to increase, transit systems will not be able to accommodate this growth without adding new capacity.

Similarly, if a change in travel behavior leads to large increases in the number of people traveling to and within urban centers by bicycle or by foot, bikeway and pedestrian improvements may be needed. This would generate demand for more capital investment. A failure to fund capacity increases that keep pace with demand for alternative transportation modes could result in frustrated commuters choosing to return to driving alone.
B. MONTGOMERY COUNTY’S APPROACH TO TRANSPORTATION DEMAND MANAGEMENT

The County has chosen to focus transportation demand management efforts on “urban centers,” defined in this report as areas with high concentrations of employment that are well served by transit. 1 Specifically, OLO studied North Bethesda and the Central Business Districts of Bethesda, Friendship Heights, Silver Spring, and Wheaton. Findings #4 through #11 address Montgomery County’s approach to transportation demand management governance and implementation in these urban centers and in the County as a whole.

Finding #4: Governance of transportation demand management in Montgomery County is decentralized and shaped by multiple County and non-County entities.

Governance of transportation demand management in Montgomery County is decentralized and shared among multiple County and non-County entities. Within the County, the County Council, County Executive, Department of Transportation, and the Maryland-National Capital Park and Planning Commission (M-NCPPC) each have transportation demand management roles. For example:

- The County Council approves the operating and capital budgets that fund the County’s transportation demand management programs and transit operations and facilities. The Council also enacts laws, approves land use policies, and sets parking rates that affect transportation demand management.
- The County Executive sets transportation demand management policies and priorities in preparing and recommending an annual operating budget and biannual capital improvements program.
- The Department of Transportation implements County transportation policies, including operating Ride On, providing commuter services, and operating County parking facilities.
- M-NCPCC develops and recommends master plans and the Growth Policy. In addition, the Planning Department participates in drafting and enforcing traffic mitigation measures required by the Planning Board as part of the development approval process.

Since Montgomery County is part of a metropolitan region where transit services cross jurisdictional lines, the County must also work closely with the State of Maryland, District of Columbia, State of Virginia, the Washington Metropolitan Area Transit Authority (WMATA), Metropolitan Washington Council of Governments, and the Federal government to achieve County and regional transit goals.

1 As this report addresses TDM strategies implemented by the County Government, the report does not discuss Federal Government employment centers or urban centers located within municipalities.
Finding #5: In addition to the roadway network, Montgomery County’s current transportation infrastructure includes rail and bus transit systems, bikeways, and pedestrian facilities.

The County’s current alternative transportation infrastructure includes:

- The Metrorail, Metrobus, Ride On, MARC Train, and MTA Commuter Bus transit systems;
- A limited network of bikeways; and
- Pedestrian facilities (e.g., sidewalks and crosswalks) that improve mobility within urban centers.

Much of this infrastructure is focused on the County’s urban centers, specifically North Bethesda, and the Bethesda, Friendship Heights, Silver Spring, and Wheaton Central Business Districts.

Transit Systems: Table 7-1 lists the number of rail stations Countywide and in urban centers, and the parallel number of bus routes that provide service during peak commuting hours.

Bikeways: Currently, three of the five urban centers (Bethesda, North Bethesda, and Silver Spring) are served by eight bikeways. The County’s Master Plan of Bikeways calls for a significant expansion of the current bikeway system. The plan includes a total of about 200 bikeways (500 miles) throughout the County, including 62 bikeways that serve urban centers. Since many of the planned bikeways are in State highway rights-of-way, the County would require State cooperation to build these facilities.

Pedestrian Facilities: The County’s pedestrian facilities include sidewalks, crosswalks, countdown crosswalk signals, and lighting. The County’s Department of Transportation maintains these facilities and installs upgrades. The master plans for North Bethesda and the Bethesda, Friendship Heights, and Silver Spring Central Business Districts also recommend pedestrian-friendly features such as wider sidewalks on busier streets, streetscaping, mid-block signals for pedestrian crossings, and restrictions on allowing drivers to turn right on red.
Finding #6: The County actively promotes transit and other alternative commuting modes.

The County’s strategies for promoting transit and other alternative commuting modes include: requiring developers and employers to decrease commuter trips; providing County funding for transit subsidies; and offering general transit promotion programs.

**Developer and Employer Traffic Mitigation Measures:** County Code (Chapter 42A, Ridesharing and Transportation Management), requires certain developers and employers to implement traffic mitigation measures, such as limited parking, carpooling or vanpooling incentives, or transit subsidies.

**County Transit Subsidies:** The County’s Fare Share program (offered Countywide) and Super Fare Share Program (offered in the County’s transportation management districts) provide financial assistance to employers who offer transit subsidies to their employees.

**DOT Outreach and Programs:** The Commuter Services Section in the Department of Transportation’s Division of Transit Services implements Countywide outreach and programs, including:

- Marketing alternate transportation options to workers and residents in the County, with a focus on transportation management districts;
- Encouraging employers to promote alternate transportation options for their workers;
- Promoting and implementing programs such as Fare Share and Super Fare Share;
- Providing personalized rideshare matching for carpools and vanpools; and
- Overseeing the County’s transportation management districts.

**Share-a-Ride Districts:** In a share-a-ride district, an office development may obtain a reduction in its minimum parking requirements if the property owner participates in a County-operated share-a-ride program, provides ridesharing incentives, and pays an annual fee to the County’s ridesharing account (part of the Mass Transit Fund) to support transportation demand management activities.

---

2 See Chapter 3 for a complete description of transportation management districts.
Finding #7: The County Government focuses transportation demand management programs and resources on urban centers.

The Department of Transportation engages in transportation demand management activities throughout the County. However, County policies and practices focus transportation demand management programs and resources on certain urban centers.

County Code Chapter 42A, Ridesharing and Transportation Management, states that the County desires to “focus new development in high transit-service areas” but that “limited transportation infrastructure, traffic congestion, pedestrian access, and safety issues impede the County’s land use and economic development objectives.” As such, the Code authorizes the Council to establish transportation management districts to:

- “Provide sufficient transportation capacity to achieve County land use objectives and permit further economic development;
- Reduce the demand for road capacity, and promote traffic safety and pedestrian access; and
- Help reduce vehicular emissions, energy consumption, and noise levels.”

The Council has established transportation management districts (TMDs) in North Bethesda, downtown Bethesda, Friendship Heights, Silver Spring, and Shady Grove. The Shady Grove TMD, although established in 2006, remains unfunded and inactive.

In addition to the transportation management districts, DOT has designated the Wheaton CBD as a “Transportation Planning and Policy Area” and dedicates additional resources to this area for transportation demand management activities.

---

3 MCC §42A-22 (a) and (b).
4 MCC §42A-22 (c).
Finding #8: The County's approach to managing and financing transportation demand management activities varies among urban centers.

Table 7-2 shows how the County manages and funds transportation demand management differently in each of the five urban centers. Differences among the urban centers reflect the uniqueness of each area, diverse constituent interests, and different practices that existed when the transportation management district or transportation planning and policy area was established.

*While no Silver Spring parking revenue was transferred to the Silver Spring TMD in FY08, the FY09 budget assumes a transfer of about $200,000 to support the Super Fare Share program in Silver Spring.

**Fees are authorized but no developments required to pay have been completed. DOT expects to collect fees in FY09.
Finding #9:  The supply of spaces in County parking lot districts exceeds the current parking demand of single-occupant commuters.

In the 1940s and 1950s, the County established parking lot districts (PLDs) in some urban centers to give property owners an alternative way to comply with the Zoning Ordinance's parking requirements. Today, County-managed PLDs provide more than 21,000 parking spaces located in the Bethesda, Silver Spring, and Wheaton Parking Lot Districts; more than three-quarters of these spaces are available to long-term, non-carpool parkers.

At present, although a few parking facilities fill during peak hours, the overall supply of parking in each district exceeds demand. Long-term parking vacancy rates, which vary by district, range from 39 percent (in Silver Spring) to 14 percent (in Bethesda).

Finding #10: County parking policies work at cross purposes to County transportation demand management objectives.

The County promotes alternative commuting modes while it simultaneously implements policies that provide single-occupant drivers easy access to parking. The presence of plentiful, low-cost, conveniently located parking, which serves as a strong incentive to driving alone, undercuts efforts to encourage commuters to choose alternative travel modes.

The following parking-related policies and practices promote single-occupant vehicle driving into the County’s urban centers:

- Under current zoning regulations, the County requires developers in urban centers to provide nearly the same amount of parking (for similar uses) as is required in less densely built parts of the County that lack transit service. These minimum parking requirements were established when the County was more suburban in character and do not fully account for more urban conditions, such as the availability of transit and traffic congestion.

- The County’s parking lot districts provide large supplies of long-term parking in three of the five urban centers. As explained in Finding #9, at present, although a few parking facilities fill during peak hours, the overall supply of parking in each district exceeds demand.

- Parking rates for public parking spaces in County facilities are relatively inexpensive, particularly compared to private parking rates. According to a recent DOT pricing survey, in Bethesda, a monthly parking pass at a County-owned facility costs $95; the cost of a comparable pass at a commercial facility ranges between $115 and $165.
Finding #11: Since the County controls a large share of urban center parking spaces, the County has an opportunity to use parking availability and pricing to influence commuters’ travel choices.

Since the County manages a large share of the parking supply in three urban centers, it plays an important role in influencing commuter travel choices. County policies regarding parking supply and pricing affect the relative cost and convenience of driving alone compared to alternative modes.

As reviewed earlier, the County currently provides ample, relatively low-cost, long-term parking in urban centers. However, the County could use its control of parking in urban centers to influence commuter choices. Examples of changes that can discourage commuters from driving alone include: reducing the supply of long-term parking; increasing general rates for long-term parking; charging a premium for entering or exiting a parking facility during peak hours; and/or increasing the rates for the highest demand parking spaces.

C. FUNDING FOR TRANSIT AND TRANSPORTATION DEMAND MANAGEMENT

Transportation infrastructure, including rail and bus systems, bikeways, and pedestrian facilities are funded through multiple County and non-County sources. Findings #12 and #13 describe major sources of transit and transportation demand management funding in Montgomery County.

Finding #12: The State’s Transportation Trust Fund and the County’s Mass Transit Fund support transit and transportation demand management services.

Two special transportation funds are major sources of funding for transit and transportation demand management services in Montgomery County.

*Maryland Transportation Trust Fund*: The Maryland Transportation Trust Fund supports the programs and activities of the Maryland Department of Transportation. The Fund finances Department operating, capital, and debt service expenses, including the State’s contribution to WMATA and the operation of MTA Commuter Buses and MARC trains. State gas tax and motor vehicle taxes are the Fund’s largest revenue sources. Although the Fund receives dedicated revenue, its resources are subject to annual budget appropriations and are not earmarked for specific programs such as transit.

*Montgomery County Mass Transit Fund*: The County’s Mass Transit Fund supports operation of the Ride On bus system, transportation demand management programs, and other activities of the DOT Division of Transit Services. Mass Transit Property Tax revenue contributes about two-thirds of all Mass Transit Fund resources. Other large contributors to the Mass Transit Fund are State aid and Ride On fare revenue.
Finding #13: Revenue from two special taxing districts supports County transportation demand management activities.

The County’s transportation management districts and parking lot districts each collect revenue that supports County transportation demand management activities.

*Transportation Management District Fee*: The County Code authorizes the County to charge a fee to certain property owners in transportation management districts (TMDs) to fund transportation demand management activities. The Code requires transportation management fee revenue to be used in the district in which the property subject to the fee is located. In FY08, the County collected $1.3 million in transportation management district fee revenue.

*Parking Lot District Revenue*: The County Code establishes parking lot districts (PLDs) as special taxing districts. Within these districts, the County collects an annual ad valorem property tax from non-residential property owners who opt not to provide on-site parking. PLDs also receive revenue from parking fees, parking fines, and investment income. As shown in the Table 7-3, for each PLD, parking fees and special district taxes are the largest sources of revenue.

Source: Approved FY09 Operating and Capital Budgets, Schedule C-3.

By law, PLD revenue must be spent within that PLD. The Code states that the primary purpose of PLD revenue is to acquire, build, restore, improve, maintain, and operate off-street parking facilities; the Code also authorizes the use of PLD revenue for:

1. Funding an urban district in the same PLD;
2. Supporting the activities of a transportation management district;
3. Implementing transit and ridesharing incentive programs; and
4. Establishing public-private partnerships to increase ridesharing and transit usage.
OLO researched transportation demand management funding, policies, programs, and governance strategies used in other communities. Findings #14 through #18 discuss these strategies and their potential applicability to Montgomery County.

Finding #14: Most large transit systems in the country are funded in part by revenue from a dedicated funding source. State law limits the County’s options for funding transit with a dedicated funding source.

Most major transit systems in the United States receive a substantial portion of their capital and/or operating resources from a dedicated revenue source. Montgomery County would need to seek State approval to implement the most common strategies for dedicating a revenue source to fund transit services.  

*Sales Tax:* Sales tax revenue is the most common dedicated revenue source for transit systems in the country. Maryland law prohibits counties from imposing sales taxes. Legislation failed during the 2007 General Assembly session that would have dedicated a percent of State sales tax revenue for transit programs.

*Automobile Taxes and Fees:* Some jurisdictions dedicate revenue from gas taxes and automobile registration and licensing fees for transit programs. Maryland law prohibits counties from raising revenue from gas taxes or automobile fees. While the Maryland Transportation Trust Fund receives revenue from State gas taxes and automobile fees, transit must compete with other transportation programs through the annual appropriations process for these resources.

*Tolls:* Some jurisdictions dedicate roadway toll revenue for transit. Maryland law prohibits counties from raising toll revenue.

However, the County currently does have the authority to implement some of the transit funding strategies used in other communities.

*Transportation Improvement Districts:* “Transportation improvement districts” are special taxing districts designed to raise revenue for transportation improvements in a specific area. Property tax revenue in the Dulles Rail Transportation Improvement District helps fund the construction of the extension of Metrorail from West Falls Church to Dulles Airport.

Montgomery County has the authority to create a special taxing district to raise property tax revenue to support transit.

---

5 While the County’s Mass Transit property tax is dedicated to funding transit programs, the tax rate has fluctuated significantly in recent years thereby reducing the stability of this revenue source.
**Per Employee Tax**: The City of Redmond, Washington charges employers a “Business Tax/Transportation Improvement” (BTTI) tax of $55 per employee to fund transportation improvements including transit programs. The County has the authority to charge a similar fee.

**Parking Space Tax**: In Australia and Canada, several municipalities have implemented special taxes on non-residential parking spaces. These communities levy the tax based either on the number of parking spaces or the size of the parking area at a property.

Montgomery County has the authority to charge an excise tax on parking spaces. In 1990, the Council approved an excise tax on non-residential parking spaces; however, the County Executive vetoed the legislation. Last year, the Working Group on Infrastructure Financing for County Government Facilities issued a report that, among other things, recommended that the County enact an excise tax on non-residential commuter parking spaces.

**Market Rate Public Parking**: Some communities, most notably urban university campuses, set parking rates based on market demand and use the revenue to support a variety of transit-related programs.

As part of the annual budget process, the Executive recommends and the Council approves parking lot district (PLD) rates. PLD rates in some areas fall well below rates charged in privately-operated commercial facilities. Given the limits the Code places on use of PLD revenue, a Code amendment would be necessary to allow the use of this revenue for transit system operating and capital costs.

**Finding #15**: The County could offer additional or alternative types of economic incentives to encourage commuters to switch to transit or other alternative modes.

Economic incentives are a common tool to convince commuters to switch to transit or other alternative modes. The County’s Fare Share and Super Fare Share programs reimburse employers for a portion of the cost of providing employee transit subsidies. Elsewhere in the country, communities have developed additional types of alternative commuting economic incentives.

**Employer-Based Transit Benefits**: Transit systems in Dallas, Denver/Boulder, Portland, San Jose, and elsewhere offer employer-based transit passes. In these programs, the transit agency sells discounted transit passes for use by all workers in the organization. These programs offer all employees – particularly commuters who do not need to drive every day – an incentive to ride transit occasionally.

Montgomery County could incorporate employer-based transit passes as a component of Ride On system pricing but would need approval from WMATA and the State to extend the program to the Metro and MARC systems, respectively.
Parking Parity: “Parking parity” laws require an employer to offer cash benefits as an alternative to free or low-cost parking. California requires many employers that provide parking subsidies to concurrently offer a cash allowance as an alternative to the parking subsidy. The County encourages employers to voluntarily provide alternative benefits to commuters who decline a free or reduced price parking space.

Montgomery County could mandate a cash out program similar to the one in California under its general police powers authority.

Employer/Commuter Rewards Programs: Economic incentives may be used to entice employers to promote and support alternative commuting modes. Redmond, Washington, has piloted a program to provide businesses a $300 per year reward for each commuter trip reduced below an initial baseline level. In other jurisdictions, community organizations provide direct monetary incentives to commuters who choose not to drive alone.

Montgomery County could supplement its existing transit subsidy reimbursement programs by providing financial rewards to employers who reach trip reduction goals or to commuters who use alternative modes.

Finding #16: Some communities have put policies and programs in place to create a disincentive to driving alone.

Many commuters find that traveling alone in their car has a cost, time, and convenience advantage over transit and other alternative modes. Several communities have adopted strategies to make driving alone less attractive than other commuting options.

Zoning Code Parking Requirements: Local zoning codes commonly set minimum parking requirements for different land uses. In recent years, some urban planners have critiqued minimum parking requirements because they frequently are based on studies that do not factor in the price of parking and the availability of transit. Some jurisdictions have adopted separate parking requirements designed specifically for urban areas with relatively high levels of transit service and traffic congestion. Alternatively, some communities set maximum limits on the amount of parking permitted at a specific site or within a specific district.

The County Council has the authority to amend parking requirements in the County’s Zoning Ordinance.

Control of Public Parking Supply and Pricing: Communities may create disincentives to driving alone through control of parking supply and pricing. A community may constrain parking supply to compel some commuters to travel by alternative modes. In addition, local governments may increase parking rates to raise the cost of driving alone.

Montgomery County has the authority to use public parking pricing to discourage commuters from driving alone.

Congestion Pricing: The term “congestion pricing” refers to a practice of adjusting transportation related charges (such as road tolls or parking fees) by time of day or by location.
Congestion pricing creates an economic disincentive for driving to the most congested areas of a city and/or during the most congested periods of the day. Congestion pricing has been implemented in several cities outside the United States including London, Stockholm, and Singapore. The creation of high-occupancy toll (HOT) lanes is another form of congestion pricing. In HOT lanes, carpools, vanpools, and buses travel for free, while drivers of single-occupant vehicles pay a toll.

Congestion pricing on roadways is a form of toll payment. State law prohibits Montgomery County from imposing roadway tolls. Nonetheless, the County could impose a surcharge for drivers that enter or exit County operated parking facilities during peak hours.

**Finding #17: Some communities employ land use and transportation network design to promote alternative commuting modes.**

The physical layout of an urban area may influence commuting choices. Land use patterns and the design of transportation networks affect how people get to work. Some jurisdictions have altered their land use patterns and transportation networks to promote efficient commuting practices.

**Remote Parking:** Remote parking is a land use strategy that locates parking at the periphery of a central business district to intercept drivers before they enter congested areas. Commuters are attracted to the remote parking either by low-priced parking rates or by limited supply of long-term parking in the district’s center. Frequent shuttle bus service transports parkers to their job site or other final destination.

Montgomery County could adopt a remote parking strategy where land for new parking facilities is available. As the availability and cost of land is an important consideration, remote parking may be better suited to newly emerging urban centers than it would be as a “retrofit” to developed urban centers.

**Bus Rapid Transit:** The term “bus rapid transit” refers to a transit system that includes dedicated rights-of-way or roadway lanes used by frequent, high-capacity public commuter buses. Advanced systems (such as those built in Boston, Cleveland, and Las Vegas) include features similar to rail transit systems, such as pre-paid fare collection, enclosed stations, and integrated fare systems that permit transfers between routes and modes.

Montgomery County would require significant additional funding to construct and operate a bus rapid transit line(s) and would need State approval to use State rights-of-way.
Transportation Demand Management Implementation, Funding, and Governance

Transit Signal Priority: Transit signal priority refers to a traffic management strategy used by several jurisdictions that gives precedence to transit vehicles at signal controlled intersections. Transit signal priority allows public buses to avoid many intersection delays, thereby increasing the reliability of transit schedules. For example, upon approach of a transit bus to the intersection, a signal priority system provides an early green light to the bus permitting the vehicle to by-pass the intersection queue.

As State roads serve as the major commuting corridors to County urban centers, Montgomery County would require State approval to adjust signals and change lane configurations. WMATA approval would also be necessary to equip Metrobuses with signal prioritization technology.

Finding #18: University campuses offer models of centralized administration of commuter services, transit incentives, shuttle bus operation, and parking supply and pricing policies.

In most metropolitan areas, a combination of entities governs transportation demand programs. State and local governments, regional organizations, transit systems, and parking authorities often provide different transportation demand services. In many cases, these services are loosely connected and not comprehensively managed.

Some communities in the country, most notably universities, have developed transportation demand management systems that consolidate a wide range of services into one integrated, centrally-managed program. In these consolidated programs, a single entity promotes alternative commuting modes, offers transit incentives, operates local shuttle services, and sets parking pricing and supply policies.

Montgomery County could establish a new transportation demand management governance structure that oversees policies relating to transit financing, commuting incentive programs, infrastructure development and maintenance, zoning and land use requirements, parking policy, and other policies and programs that influence commuting patterns.
CHAPTER VIII: RECOMMENDATIONS

Transportation demand management programs in urban centers are designed to change travel behavior by providing convenient and affordable alternatives to the single-occupant vehicle. As reviewed in the previous chapter, while the County actively promotes transit and other alternative commuting modes, some County policies work at cross purposes to these goals. This chapter offers four recommendations for Council action to improve the consistency and coherence of the County’s transportation demand management policies and practices.

Recommendation #1: Establish parking policies that are consistent with the County's transportation demand management goals.

County parking policies work at cross purposes to County transportation demand management objectives. Although the County actively promotes alternative commuting modes, it simultaneously offers single-occupant drivers easy access to parking in urban centers. OLO recommends the Council review and revise current parking policies to better align them with the transportation demand management goals established in approved master plans and the Growth Policy. The Council should examine two aspects of County parking policy.

1.a. Establish a policy governing urban center parking requirements.

The County Zoning Ordinance regulates the minimum number of parking spaces required for specific land uses. Current requirements only partially account for the availability of transit and traffic congestion in the County’s urban centers. As a result, the County requires nearly the same amount of parking (for similar uses) in these urban centers as it requires in less densely developed areas that lack transit service.

In consultation with the Planning Board, the County Council should assess whether current Zoning Ordinance parking requirements are appropriate for urban centers served by transit. The Council should consider the following questions:

- Do the current Zoning Ordinance minimum parking reductions for proximity to Metrorail and share-a-ride participation adequately take into account current conditions in County urban centers?
- Should the Council amend the Zoning Ordinance to make parking reductions for developments served by Metrorail available to developments served by Metrobus and Ride On?
- Should the Council amend the Zoning Ordinance to replace minimum parking requirements with maximum parking requirements in urban centers served by transit?
- What should be the relationship between Zoning Ordinance parking requirements and master plan commuting goals?
1.b. Establish a policy on public parking supply and pricing.

The availability and cost of parking impacts the County’s ability to achieve both transportation and economic development policy objectives in urban areas. On the one hand, plentiful, low-cost parking serves as an incentive for commuters to drive alone, while limited or high-cost parking provides an incentive to commute by alternative modes. On the other hand, businesses perceive limited or high-cost parking as detrimental to County economic and business development objectives.

In consultation with the Executive Branch, the County Council should adopt a policy resolution that establishes criteria for determining the supply and pricing of County-owned parking spaces. The policy should address the following questions:

- In parking lot districts, what formula should be used to determine how many parking spaces the County should build to accommodate current and future development? Should the County set a cap on the total number of parking spaces in a parking lot district?
- Should the County manipulate the mix of short-term, long-term, and carpool parking spaces in parking lot districts to encourage use of alternative commuting modes?
- Should the County raise long-term parking rates to encourage use of alternative commuting modes?
- Should the County impose a surcharge for drivers that enter or exit County-operated parking facilities during peak hours?
- Should the County charge a premium for high demand parking locations?

Recommendation #2: Ask the Executive and the Planning Board to report annually on progress made toward achieving master plan commuting goals.

Council-approved master plans establish County goals for the percentage of commuters who travel by a method other than single-occupancy vehicles. Master plans for many areas of the County (including most urban centers) include commuting goals. Realizing these goals requires an implementation plan that coordinates multiple County policies and programs including:

- Land use decisions;
- Transit services and policies;
- Transit promotion and subsidy programs;
- Zoning Ordinance parking requirements;
- Parking supply and pricing policies; and,
- Bicycle and pedestrian facility planning and implementation.
The Council is the sole entity with the authority to align all of these policies and programs. To properly oversee the County’s progress in achieving its commuting goals, the Council requires periodic updates from the County Government and the Planning Board on current modal split levels and the effectiveness of existing strategies designed to increase modal splits.

OLO recommends that the Council ask the Executive and the Planning Board to report annually on progress made toward achieving master plan commuting goals. In the report to the Council, the Executive and the Planning Board should identify whether new measures to achieve the commuting goals (such as increasing transit capacity or raising parking prices) are warranted. Based on the input from the Executive and Planning Board, the Council would determine whether any changes should be made to County transportation or land use policies and programs that affect commuting decisions.

**Recommendation #3: Ask the Executive to evaluate transportation demand management practices used in other jurisdictions and to report to the Council on their potential applicability in Montgomery County.**

While the County has implemented a broad series of measures to promote alternative commuting modes, some practices from other jurisdictions merit further evaluation to assess their potential viability in Montgomery County. The Council should ask the Executive to evaluate transportation demand management practices that could supplement the current array of County programs.

Specific items that OLO believes merit Executive review include:

- The feasibility of implementing an “EcoPass” or similar employer-based transit benefit program in the County or in all areas served by WMATA (see page 53);
- The implementation steps and funding needed to pilot transit signal prioritization for Ride On and Metrobuses on State and County roads (see page 65); and
- The effectiveness of employer and commuter reward programs in adjusting commuting behavior (see page 56).

The Council should ask for a written response from the Executive by the summer of 2009.

**Recommendation #4: Discuss the Council's long-term vision for creating an efficient and sustainable alternative commuting infrastructure and the funding sources needed to realize the vision.**

The County seeks to persuade a large number of workers to commute by alternative modes. A large scale shift in commuting practices would generate new demand for facilities and services to accommodate workers who no longer commute by single-occupant vehicle. To sustain high mode splits, the County will need to identify funding for transit, bicycle, and pedestrian network capacity increases to keep pace with increases in demand.
OLO recommends that the Council discuss its long-term vision for building transportation infrastructure and for securing the funding needed to realize that vision. For example, the viability of developing major new transit capacity, such as a new bus rapid transit line, depends on the availability of sufficient funding to bring the initiative to fruition.

As it contemplates what the County’s transportation network will look like in 10 or 20 years, the Council should assess whether it expects future improvements to be built using existing revenue sources or whether new resources could be secured for major new initiatives. Any ambitious plan to greatly expand transit (and other alternative mode) capacity should also incorporate a long-term strategy to pursue Federal aid, State aid, and possibly new County- or State-authorized dedicated funding sources to help make the vision happen.
CHAPTER IX: AGENCY COMMENTS

The Office of Legislative Oversight circulated a final draft of this report to the Chief Administrative Officer for Montgomery County and to the Montgomery County Planning Board. OLO appreciates the time taken by agency representatives to review the draft report and provide feedback. OLO’s final report incorporates technical comments and corrections provided by County Government and Planning Department staff.

Written comments from the Chief Administrative Officer on the final draft report begin on the next page. Written comments from the Planning Director on the final draft report begin on page 95.
MEMORANDUM

December 04, 2008

TO: Aron Trombka, Senior Legislative Analyst
Office of Legislative Oversight

Jennifer Renkema, Research Associate
Office of Legislative Oversight

FROM: Timothy L. Firestone, Chief Administrative Officer

SUBJECT: Draft OLO Report 2009-6, Transportation Demand Management Implementation, Funding, and Governance

Thank you for the opportunity to comment on Draft OLO Report 2009-6 regarding Transportation Demand Management Implementation, Funding, and Governance. The report was compiled in response to the County Council’s request for an examination of the County’s Transportation Demand Management (TDM) strategies and a comparison with approaches used in other communities.

The report is a very comprehensive and well-organized review of existing TDM efforts and related policies and programs in the County’s urban centers. It highlights the many successful strategies the County is pursuing to reduce single occupant vehicle use in order to control traffic congestion, decrease energy consumption, and improve air quality. It also points out some of the challenges inherent in trying to optimize these efforts while at the same time addressing other County goals, such as promoting further investment in our urban centers, meeting the diverse needs of our residents and businesses, maintaining a healthy economy, and conducting fiscally-responsible government. We look forward to engaging with OLO and the County Council in a discussion of the actions the County can take to further our multiple objectives in this regard. Below are our comments on the recommendations contained in the report.
Recommendation #1: Establish parking policies that are consistent with [the] County’s transportation demand management goals.

There are several references to the number of County owned public parking spaces and their utilization rates in the Silver Spring and Bethesda Parking Lot Districts (PLDs). The statistics quoted are accurate. They are provided, however, with no background context as to the history of their construction and past utilization rates, near term projections of future parking demand (within 5 years), or explanation of the policy behind their allocation as short-term or long-term spaces. The lack of background may erroneously indicate, to some readers, that the number of spaces in each PLD were constructed on an arbitrary basis and their short or long term allocation may be similarly arbitrary. A brief explanation of each of these issues may be helpful.

Recommendation #1.a.: Establish a policy governing urban center parking requirements.

The recommendation, in part, suggests the County Council should consider the following question: Should the Council amend the Zoning Ordinance to replace minimum parking requirements with maximum parking requirements in urban centers served by transit?

The overall reading of the report would indicate that the PLDs should be considered “urban centers served by transit.” Other parts of the report highlight the importance of the parking Ad Valorem tax in the overall revenue structure of the PLDs. We suggest the report should acknowledge that such a radical change in the Code requirements for parking could invalidate the basis for the collection of this tax. Any limitation on the amount of parking should be structured in the framework of existing public and private parking spaces and outstanding obligations of any affected PLD, and with a clear understanding of market needs. We note that similar caveats have been provided for some of OLO’S other recommendations.

Recommendation #1.b.: Establish a policy on public parking supply and pricing.

The report suggests a number of possible actions may be taken including:

1. A cap on the total number of parking spaces in a PLD. Again, a concern is what affect this may have on the basis for the collection of the Ad Valorem tax and the outstanding obligations of a PLD.

2. The imposition of a surcharge for drivers that enter or exit County-operated parking facilities during peak hours. This concept is referred to in a number of places in the report. Although the idea may be technologically feasible, we are not aware of its implementation anywhere in the country. Parking is traditionally priced based on
duration of use of the facility rather than time of exit. We are not aware of any revenue collection system configured in this manner. If it is possible, the implementation of such a system may have significant capital and operating cost implications as well as adverse customer service effects.

3. Two other courses of action separately discuss variable pricing based on premium location and space duration. Currently, short-term spaces are priced higher than long-term spaces based on their premium location and customer service issues. Making long-term parking more expensive than short-term parking (by hour) may be inherently contrary to the concept of making premium spaces more expensive than non-premium spaces.

**Recommendation #2: Ask the Executive and the Planning Board to report annually on progress made toward achieving master plan commuting goals.**

The Executive Branch would be happy to report annually on progress toward achieving master plan commuting goals. Annual commuter surveys are conducted each year which provide insight into progress. Advisory committees in each TMD are kept apprised of progress throughout the year. Summary reports are prepared on a regular basis for the TMDs. These and other materials can be made available to the Council.

**Recommendation #3: Ask the Executive to evaluate transportation demand management practices used in other jurisdictions and to report to the Council on their potential applicability in Montgomery County.**

The Executive Branch has no problem in principle evaluating the examples of TDM practices used in other jurisdictions. In some cases work already has been done or is about to be done on programs of these types. Those which OLO has selected as having particular merit include:

- **The feasibility of implementing an “EcoPass” or similar employer-based transit benefit program in the County or in all areas served by WMATA.**

The County tried several years ago to launch such an employer-based pass program. As OLO aptly notes on page 54 of their report, Ride On is only one element of the County’s transit network, yet these employer-based transit passes are most successful if they are accepted by all transit providers. At the time the County attempted to implement this type of pass program earlier, efforts to obtain WMATA’s participation were unsuccessful. Discussions with employers indicated the program would be unappealing without WMATA’s participation, so it was abandoned.
However, a successful effort of a similar nature was undertaken with the Montgomery College U-Pass program. That program works because many students are able to use Ride On exclusively for their transportation to and from campus. The college collects $2 from every student in their activity fee, which yields approximately $550,000 annually paid to Ride On. In return, all Montgomery College students have unlimited use of Ride On by showing their current student ID card.

- **The implementation steps and funding needed to pilot transit signal prioritization for Ride On and Metrobuses.**

  Transit signal prioritization is encompassed within the traffic signal system modernization project recently approved for deployment beginning in FY09 and scheduled to run through FY14. It will be coordinated with Ride On’s new CAD/AVL (Computer Aided Dispatch/Automated Vehicle Locator) system, equipment which should be on all Ride On buses by the end of the calendar year. Transit signal prioritization will be implemented over time as the core signal system is replaced.

- **The effectiveness of employer and commuter reward programs in adjusting commuting behavior.**

  The Executive Branch is willing to evaluate other approaches to providing economic incentives for employers and employees to use alternative modes. However, it should be noted that the “seed money” approach taken with the County’s current Fare Share/Super Fare Share transit subsidy program has the advantage of leveraging employer participation over time, so that the County gradually contributes less to the transit benefits being provided, while the employer contributes more and, ultimately, takes over the entire cost of providing transit benefits to the employees. The approach taken with these programs also has been validated by national research as one of the most effective methods to accomplish mode shifts. In addition, there is benefit to the business community of retaining continuity of programs from the standpoint of planning – and the added challenge and cost of providing information and marketing of new programs to employers and employees also must be evaluated. Finally, as OLO points out, the effectiveness of a rewards program is dependent upon availability of resources to fund rewards that are large enough to affect commuter and business behavior.
Recommendation #4: Discuss the Council’s long-term vision for creating an efficient and sustainable alternative commuting infrastructure and the funding sources needed to realize the vision.

The Executive Branch would be happy to contribute to this discussion in whatever way is considered most constructive. At a minimum, we will provide whatever subject matter expertise is requested.

We appreciate the opportunity to comment on this draft report, congratulate OLO on a very thorough and thought-provoking exploration, and look forward to participating in the Council’s review.

Rockville, MD 20850

Dear Mr. Trombka:

RE: OLO DRAFT Report 2009-6
Transportation Demand Management Implementation, Funding, and Governance

We appreciate your coordination with us on the draft study. This study provides a useful compendium of current activities and its recommendations will help further our interest in developing and implementing alternatives to auto travel in the County. The study recommendations are consistent with the objectives in the Board’s 2007 Growth Policy report and will likely mirror recommendations included in the Climate Protection Plan. These separate initiatives have fairly common objectives and research and reporting efforts should be consolidated to the extent possible. We look forward to discussing these recommendations with the County Council in early 2009.

I offer three substantive comments on the report. First, the role of land use planning is included in the table of contents but not described in the text. The development of our urban centers and preservation of our agricultural reserve is the result of some four decades of careful land use planning and growth management. As environmental, economic, and fiscal constraints increase, we need to redouble our efforts on directing mixed-use development into areas best served by transit. These efforts will be prominently featured in our 2009 Growth Policy recommendations.

Second, we concur with the recommendations for focusing on parking policies. As you have noted, the development of a policy on public parking supply and pricing will require analysis similar to that proposed in the 2007 Growth Policy, but not funded. We are evaluating private parking supply in our Zoning Ordinance Revision work program.

Finally, we suggest the County also focus on technology approaches to address commuting and congestion problems. Journey to work strategies should include increased emphasis on both promoting and implementing flex time, telecommuting, and telework programs. Improved mobility analysis tools and traveler information systems
for transit services, parking availability, and roadway congestion can enable smarter commuting patterns that better match consumer demand to available supply on a real-time basis.

Detailed technical comments on the draft staff report are being submitted under separate cover. Please continue to coordinate with Dan Hardy on this effort and let me know if you have any questions.

Sincerely,

Rollin Stanley,
Planning Director
Montgomery County Planning Department

TRAFFIC MITIGATION AGREEMENT

THIS TRAFFIC MITIGATION AGREEMENT ("Agreement"), is made this ____ day of ____________, 200__, by and among (a) NAME OF APPLICANT ("Applicant"); (b) MONTGOMERY COUNTY DEPARTMENT OF TRANSPORTATION ("MCDOT"); and (c) MONTGOMERY COUNTY PLANNING BOARD OF THE MARYLAND-NATIONAL CAPITAL PARK AND PLANNING COMMISSION ("Planning Board"), a Maryland public body corporate.

RECEITALS:

This Agreement is entered into on the basis of the following facts, understandings, and intentions of the parties:

A. Applicant is the owner of a certain ___ acre tract of land in the ___ zone, located at the (give geographic location relative to major streets – e.g., "northeast quadrant of X & Y Streets") in City, Montgomery County, Maryland (the "Property").

B. Applicant proposes to redevelop the Property with three buildings consisting of ________ square feet of (describe development – e.g., "research and development, offices, residential condominiums") (the "Project"), which was the subject of an Application for Preliminary Plan of Subdivision that was captioned Preliminary Plan No. _______ (the "Preliminary Plan").

C. The Project is located in the ________ Metro Station Policy Area and in the ________ Transportation Management District.

D. On ____________, 200__ the Planning Board approved Preliminary Plan No. _______ for the Project. Attached hereto as Exhibit "A" is copy of the Planning Board’s Opinion dated _______200__ (the "Opinion").

E. The Opinion contains the following requirement of the Applicant:

Satisfy the master plan recommendation to participate in the ________ Transportation Management District (TMD). Submit a draft Traffic Mitigation Agreement (TMAg) with the Planning Board and MCDOT. The TMAg must be executed prior to release of building permits. The TMAg must include participation in the ________ Transportation Management Organization ("TMO"). The traffic mitigation goals for the master plan are to achieve and maintain:

a. A XX% non-auto-driver mode share for employees.

b. A YY% non-auto-driver mode share for multi-family residents.
NOW, THEREFORE, in consideration of the above Recitals, each of which is made a part of this Agreement, and for other good and valuable consideration, the receipt and sufficiency of which each of the parties hereto acknowledges, and intending to be legally bound thereby, the parties hereby agree to the following in compliance with the above requirements:

1. **Commencement.** The obligations and requirements set forth in this Agreement shall commence upon issuance of the first Use and Occupancy certificate for the first building of the Project. Applicant shall notify DPWT and the Planning Board when receipt of the initial U&O Certificate is estimated to be within six weeks, and again when the U&O is received.

2. **Participation in_____TMO.** Applicant agrees to participate with the _____Transportation Management Organization (the “_____TMO”) to encourage and assist the _____Transportation Management District (the “TMD”) in achieving and maintaining the XX% peak period non-driver mode share goal for residents and the YY% peak period non-driver mode share for employees within the _____Master Plan (the “Master Plan”) and related goals of the TMD.

3. **Appointment of Transportation Benefits Coordinator.** Applicant shall designate in writing to the TMD a Transportation Benefits Coordinator (TBC) who will assist residents and employees in exercising commuting options and serve as a point of contact for TMD staff. Applicant shall arrange for an initial meeting between the TBC and TMD Staff and provide the opportunity for subsequent meetings as needed. The TBC shall plan and coordinate with the TMO staff and monitor achievement of traffic mitigation as anticipated by the Master Plan. On an ongoing basis, the TBC will interact with TMO Staff in promoting ridesharing and other alternative transportation programs in order to maximize the participation of residents and employees at the site in such programs to help the TMD meet its goals. The TBC may be a property manager or other employee with other employment duties. Applicant will ensure the TBC attends periodic meetings and training sessions held by MCDOT and/or other local or regional agencies which are related to performance of these duties and coordination with other traffic mitigation programs. Applicant will promptly notify the TMD in writing of the designated TBC(s) and any subsequent change in the TBC(s) or contact information.

4. **Activities of Transportation Benefits Coordinator.**

   (a) **Promotional Programs.** The TBC will cooperate with staffs from MCDOT and the Planning Board on an ongoing basis to conduct promotional activities and information distribution for all features of the TMD program at the Project; facilitate access to residential and commercial tenants/employers and employees, and residents for purposes of informing and educating about programs and services available in the TMD; and assist with the distribution of “Welcome Packets” with information about commuting alternatives or other materials to be provided by the TMD or the County to new tenants, new employers, and new employees and residents. Applicant will provide the TMD with an updated list of tenants/employers on a semi-annual basis. Upon request, this information will be kept confidential by the TMD. Applicant will insure that all activities required of the TBC will be supported by adequate budgetary allocations so that efforts to help meet trip reduction goals of the TMD are feasible.
Promotional activities will include distribution of TMD and County information to employers and employees, and residents, through the use of displays, bulletins, brochures, notices, and the periodic hosting of ridesharing days and contests, prepared or conducted solely by the Applicant or in concert with the TMD and/or County. Applicant and the TBC will provide and facilitate use of space in the development on a periodic basis (by prior arrangement) for marketing and promotional activities of the TMD. Upon request by the County and/or TMD the TBC will also promote and arrange for the sale of discounted passes, tickets and tokens, including Ride-On passes, Metrorail Fare Cards, Metrobus passes, MARC commuter rail tickets, or other incentive programs provided by public or private institutions.

(b) **Surveys.** The TBC, in cooperation with the TMD and MCDOT, shall facilitate employer/employee participation in the TMD Annual Commuter Survey using a survey instrument provided by the TMD or the County. The survey shall be conducted of the transportation choices of residents and employees and related issues. Applicant and the TBC shall use best efforts to achieve an 80% response return rate from among employees and residents in the development. The TMD will tabulate and analyze this information, and provide results on the aggregate mode share profiles of employers/employees and residents in the Project upon request. [The term “best efforts” shall mean performance of such efforts with all available resources in a diligent and commercially reasonable manner; but, except as generally incident to the business of Applicant and the effort to conduct marketing activities in connection with the survey, nothing herein shall require Applicant to pay any sum of money or other economic consideration to any third party as part of its “best efforts.” *Note: Wording in brackets here was added by one of the attorneys & included in some TMAgs – but is not always included.*]

5. **Displays.** Applicant shall provide a permanent information display in a highly-used location on the Property for commuter information and promotional material on transportation management programs in the TMD, the County and the region. If the Project has different primary access points for visitors and members of the public from those access points for employees and/or residents, a display shall be provided in each of the primary access areas to reach each of these target markets.

6. **Flexible Work Hours.** Applicant will encourage its commercial tenants to maintain a flextime and telework policy for those employers/employees for whom it is feasible, to allow work trips of employees to be shifted out of peak travel periods.

7. **Car/Van Pool Parking.** Applicant shall provide car- and van pool parking spaces in a preferred location within its parking facility and shall take other actions in concert with the TMD to promote use of this commute option. At least ___ such spaces shall be provided initially, with increases as necessary to meet demand.

8. **Employee Parking.** Applicant will make pay parking available to employees working at the Project at price points that are appropriate to discourage the use of single-occupancy-vehicles to commute to the Project. These price points shall be determined based
upon relevant research or a survey of market rates for parking conducted at least once every three years, and will be established in consultation with DOT and M-NCPPC.

[Note: Inclusion of provisions requiring parking charges for employees is not standard at this time, but this type of provision is desirable and has been included in some TMAgs.

Another approach used on occasion is promoting reduced parking demand, including debundling parking from leasing, as in the Wisconsin Place TMAg:

"Engaging in voluntary parking reduction programs for the office component of the development by: (a) charging market rates for parking in the parking facility, (b) encouraging employers of the office component not to pay for parking for those employees who drive to work alone, (c) encouraging office employers to subsidize parking for vanpools and carpools, (d) not requiring that tenant leases commit to a minimum number of parking spaces as a precondition to leasing space in the office building, (e) notifying prospective office tenants of alternatives to monthly parking arrangements for their employees, including information about the availability of government transit subsidy programs and other transportation benefits with the materials provided by the Friendship Heights TMD as referenced in paragraph 3 below and (f) implementing a strategy to help ensure that there will be adequate parking for retail patrons within the parking facility.""

9. **Car Sharing Space.** Applicant shall provide __ car sharing parking spaces in a preferred and highly visible location within its parking facility or in a prominent surface location convenient to the main entrance of the hospital if at all possible. Applicant shall take other actions in concert with the TMD to promote use of car sharing in conjunction with other commute options to accomplish the objectives of the TMD. In the event after __ years no demand for car sharing is evidenced, or a car sharing program is not in place, Applicant will work with MCDOT, M-NCPPC, and the TMO to determine alternative use for these parking spaces in support of the objectives of the TMAg (e.g., car or van pool, or off-peak commuting parking) until such point as a car sharing program is feasible.

10. **Live Near Your Work.** Applicant will implement marketing efforts, in conjunction with MCDOT and other agencies, designed to attract employees working on site to purchase or rent housing within the Project or the nearby residential community, to increase the number of employees able to walk or bike to work, or take a short bus ride.

11. **Bicycle Facilities.** Applicant shall provide a secure weatherproof area in a conveniently-located, well-lit, high traffic part of the parking facility to house bicycles. Bicycle storage shall be provided for the number of bicycle parking facilities specified in Planning Board approvals or sufficient to meet demand in the event demand exceeds the number specified. No charges shall be imposed for bicycle parking.

12. **Shower Facilities.** Applicant shall provide shower facilities in the Project for the use of employees that bicycle or walk to the Property.
13. **Real Time Transit Information Sign(s).** Applicant shall provide the space and necessary electrical and technical infrastructure for (a) Real Time Transit Information signs at (a) highly-used location(s) in the Project to assist employees, residents, and visitors with commuter information. MCDOT will be responsible for installing such sign(s).

   [Note: In some cases provisions have been included requiring Applicant to pay for these signs. eg.: “Applicant will be responsible for installing the necessary equipment, including, but not limited to, conduit and, electrical connections to allow the County to install one (1) real-time transit information sign in the bus shelter and will pay MCDOT $20,000 for the upgrade of MCDOT’s real-time transit information sign program.”]

14. **Countdown Pedestrian Signal.** Applicant will provide a countdown pedestrian signal as part of the renovated intersection of __________________________ for the Project.

15. **Transportation Management Organization Assistance.** The TMO staff shall be available to provide transportation information, technical advice, and other forms of assistance normally provided by the TMO to sites within the __________ area, to the extent feasible within the constraints of staff and fiscal resources.

16. **Annual Report.** Applicant shall provide an annual summary report (1-2 pages) to MCDOT, with a copy of the TMD, on or about the anniversary of this agreement, or at another regular interval as designated by MCDOT. This report will outline the traffic mitigation program and activities conducted with the TMD during the course of the previous year, and will include the name and contact information for the current Transportation Benefits Coordinator.

17. **Fees.** Applicant shall pay all transportation management fees as required by law, without regard to whether this development would be construed as “new” or “existing” development at that time.

18. **Duration.** The provisions of this Agreement shall continue in force in perpetuity or until the Planning Board evaluates, after receipt of recommendations from MCDOT, the progress of the program and determines that components of the program, in whole or in part, are no longer appropriate or necessary.

19. **Enforcement.** If Applicant fails to comply with the terms and conditions of this agreement, MCDOT or the Planning Board shall be entitled to take such enforcement action against Applicant as may be permitted under the Code and other applicable law.

20. **County Information Obligations.** Upon request, and to the extent feasible within the constraints of staff and fiscal resources, MCDOT shall respond to inquiries from the Applicant regarding available transportation systems and facilities and shall provide the Applicant with any existing information, including printed and/or electronic materials, which MCDOT may have concerning Ride On Bus, Metrombus, Metrorail, MARC, Share-A-Ride, and any other public transportation systems or carpool and vanpool matching services now or here-
after serving the Project, in quantities sufficient to allow the Applicant to distribute to its employees, residents, and visitors.

21. **Applicant’s Obligations.** The obligations of Applicant under this Agreement shall apply only during the period when it is the holder of a ground lease for the Property or any part thereof and only to land it leases or owns. At such time as Applicant ceases to hold a ground lease interest in the Property or any part thereof, the obligations and liabilities thereafter accruing (but not any accrued and unperformed obligations and liabilities) shall be the obligations of Applicant’s successors and/or assigns, to the extent permitted by law.

22. **Assignment.** This Agreement is assignable, in whole or in part, by Applicant, without the consent of the Planning Board or Montgomery County. Applicant’s successor(s) in interest or assignee(s) shall sign the Assignment form, attached hereto as Exhibit “B”, indicating their obligation to be bound by the terms and conditions of this Agreement. A copy of the executed Assignment form shall be mailed to the Planning Board, to DPWT, and to the TMD.

23. **Notices.** All notices and other communications required to be given by any party under this Agreement shall be in writing and shall be deemed duly given by Certified Mail, Return Receipt Requested, Postage Prepaid, as follows:

(a) If to Applicant to:

Contact Name  
Applicant/Developer Name  
Street Address  
City, Maryland ZIP

with a copy to:

Attorney’s Name, Esquire  
Law Firm LLP  
Street Address  
City, Maryland ZIP

(b) If to the Planning Board to: Chairman, Montgomery County Planning Board of The Maryland-National Capital Park and Planning Commission, 8787 Georgia Avenue, Silver Spring, Maryland 20910, with a copy to Associate General Counsel, Office of the General Counsel, 8787 Georgia Avenue, Suite 205, Silver Spring, Maryland 20910.

(c) If to the MCDOT to: Director, Montgomery County Department of Transportation, Executive Office Building, 101 Monroe Street, 10th Floor, Rockville, Maryland 20850; with a copy to County Attorney’s Office, 101 Monroe Street, 3rd floor, Rockville, Maryland 20850.
24. Entire Agreement. This Agreement constitutes the entire agreement between the parties and no party is liable to the other or bound in any manner by express or implied warranties, guarantees, promises, statements or representations pertaining to the subject matter hereof unless such warranties, guarantees, promises, statements or representations are expressly and specifically set forth in this Agreement.

25. Counterparts. This Agreement may be executed simultaneously in any number of counterparts, each of which shall be deemed an original but all of which shall constitute one and the same Agreement.

26. Amendments/Modifications. This Agreement can be modified only in writing signed by all the parties hereto, their heirs, successors, assigns or their designees hereunder.

27. Governing Law. This Agreement shall be governed and construed in accordance with the laws of the State of Maryland.

28. Recordation. This Agreement will be recorded in the Land Records of Montgomery County.

IN WITNESS WHEREOF, Applicant, the Planning Board and MCDOT have entered into this Agreement on the day and year first written above.

[SIGNATURE PAGE FOLLOWS ]
Here’s our plan to reduce gridlock in Montgomery County by offering the selected transportation benefits to our employees. In the first column, we’ve placed an E next to the strategies that we already have in place, and N next to the strategies that we will implement with this year’s Traffic Mitigation Plan. In the last column, we’ve described our current or planned efforts.

TDM/New Mobility/EV Infrastructure
jmasuda@cityofpasadena.net
(626) 744-4111
Introduction to City of Pasadena’s TRO

- Regulations Requirements
- Policies/Process
- Implementation
- Annual Monitoring
- Changes to City’s TRO
  - Include Regulating Residential Developments
    » Assessing a fee for non-compliance
  - Benefits to gaining support for the development of its transportation infrastructure
Introduction

- TDM
- Policies and programs that increase the use of high occupancy vehicles
- Includes activities that shift travel away from congested peak periods
- Design elements to improve
  - Pedestrian-oriented design
  - Transportation Infrastructure
  - Sustainable transport
Purpose

• TDM Strategies in TRO

• Not designed to attain specific performance targets but to compliment other TDM approaches

• AQMD – Rule 2202

• Menu of options to reduce mobile source emissions to comply with Federal Clean Air Act Requirements
• County Congestion Management Program –
• Requires development of a travel demand management element that promotes alternative transportation modes.
  > Carpoools, vanpools, transit, bicycles, walking, flexible work hours and parking management.
• AQMD regulates employers
• TDM/TRO regulates developments
  > TDM design standards are the first step in broadening the options travelers have in getting to and from places.
  > TDM Ordinance addresses the importance of the transit system by requiring that transit system operators be incorporated into the development process (EIR) by linking transit coordination with CEQA-California Environmental Quality Act.
Implement

- Prepare Trip Reduction Ordinance
- City Council Review
- Coordinate with Planning/Business Development Department
- Condition developments during project review process
  > TDM Plan submitted for city approval before a building permit can be issued
  > Meet with responsible parties for an orientation of the TDM plan/site visit
Orientation

- Meet with representative provide:
  - Orientation to TDM Plan
    - Implementation
    - Monitor program
    - Marketing resources
    - Annual Reporting Requirements
    - Evaluate/Audit program goals
    - Recommend new strategies
      - Increase AVR
TDM Plan
Requirements/Setbacks

- Developer ignores TDM condition and does not have anyone on the team who can prepare a TDM plan.
- Developer cannot gain a building permit without TDM plan approval.
  > Provide developer with a list of TDM consultants who can prepare a TDM plan.
  > Without a plan on file, tenant cannot occupy the building.
Amendments to TRO

- Difficult to require compliance without penalties
- 2008 City Council amends TRO to include:
  > Monetary penalties for non-compliance
  > Increased AVRs for TOD’s
  > Regulating residential developments
  > Require attendance at TMA meetings.
TRO Benefits

- Policy required for compliance

- Developments are the audience needed for gaining support and understanding of the City’s goals (examples):
  - EV Infrastructure development
  - Increase AVR
  - Reduce congestion
  - Model city for implementing
    - Integrated Mobility Hubs
    - ITS capability for transforming transportation for future generations
Thank you.

SECTION 1:

INTRODUCTION, BACKGROUND, AND PROCESS
SECTION 1: BACKGROUND, PURPOSE, & PROCESS

BACKGROUND

The following guidelines support Pasadena’s vision of creating “a community where people can circulate without cars.” The vision relies upon an integrated and multimodal transportation system that provides choices and accessibility for everyone living and working in the City. Key strategies to achieve this vision promote non-auto travel including public transit services, parking strategies, bicycle facilities, and pedestrian components that are well coordinated and connected with a larger regional transportation system.

PURPOSE

The ability of a community to balance and facilitate the different components of its transportation system is important to the creation and preservation of a quality living and business environment. The function of a community’s transportation system is to provide for the movement of people and goods, including pedestrians, bicyclists, transit and other vehicle traffic flows within and through the community.

The Mobility Element of the City’s General Plan sets forth goals and policies to improve overall transportation in Pasadena. The Mobility Element is based on approaches that address the needs of multimodal corridors and streets as well as community neighborhoods that are affected by traffic. These guidelines have been developed to ensure that transportation system improvements necessary to support new development while maintaining quality of life within the community are identified prior to project approval and funded prior to construction.

Transportation impact analyses are an integral part of the environmental review process that is required for all proposed projects that are not categorically exempt under the California Environmental Quality Act (CEQA). Under CEQA, jurisdictions have the right to categorically exempt projects consisting of less than five housing units and non-residential projects with less than 2,500 square feet of floor area (CEQA 15303). Projects exempt under this class are qualified by consideration of where the project is located. If a project may impact an environmental resource or the location may be of critical concern, the project cannot be categorically exempt.
Projects characterized as in-fill development may also be categorically exempt if they meet the conditions described in Section 15332 of the CEQA Guidelines as follows:

1. The project is consistent with the applicable general plan designation and all applicable general plan policies as well as with applicable zoning designation and regulations
2. The proposed development occurs within city limits on a project site of no more than five acres substantially surrounded by urban uses
3. The project site has no value as habitat for endangered, rare, or threatened species
4. Approval of the project would not result in any significant effects relating to traffic, noise, air quality, or water quality
5. The site can be adequately served by all required utilities and public services

These guidelines have been developed to identify projects that may have environmental impacts and to provide step-by-step instructions for preparing a Transportation Assessment and a Transportation Impact Study.

**PROCESS**

Upon submission of an application for discretionary action, the City of Pasadena Department of Transportation (PasDOT) will determine whether or not a transportation review is required relative to the CEQA guidelines and City policy. If a review is required, the following steps describe the process for initiating the process:

1. Applicant selects a consultant from PasDOT’s pre-qualified list of traffic consultants.
2. Applicant shall deposit the City’s Traffic Review Fee based on City’s Current General Fee Schedule.
3. The selected consultant will submit a draft MOU for preparation of the traffic analysis to PasDOT for review and approval prior to proceeding with preparing the traffic analysis.
4. The selected consultant will submit a draft of the traffic analysis to PasDOT for review and approval.

*Thresholds for Determining Transportation Review*

The guidelines apply to all projects that require environmental review in accordance with the California Environmental Quality Act and the City’s established Environmental Policy Guidelines, significance thresholds, and transportation review guidelines.
Significance Thresholds
The thresholds contained herein determine a project’s expected level of impact on the transportation system and identify appropriate types of mitigation.

Traffic Counts
1. Traffic counts, including pedestrian counts, shall be collected by the traffic consultant in accordance with industry standards and established methodologies.
2. Counts should be collected when schools and colleges are in session. Counts collected when schools and/or colleges are not in session shall be approved by the Director of Transportation.
3. Counts should be collected during AM (7 a.m. to 9 a.m.) and PM (4 p.m. to 6 p.m.) peak hours, unless otherwise specified. Midday and Weekend counts may also be required.

Trip Generation and Applicable Credits
Trip generation is determined by one or more of the following:
1. Institute of Transportation Engineers (ITE) Trip Generation, 9th Edition or most current edition.
   A. Rates should be calculated using the weighted average formula when applicable
   B. Special consideration should be given for ITE rates based on antiquated data or a small sample may require additional data collection to determine the appropriate trip generation
2. Counts conducted for existing projects that are relocating or expanding
3. New rates should be generated using community examples for uses not updated or included in the ITE Trip Generation publication
4. Trip credits are given to certain uses located on major corridors and/or within the Transit Oriented District (TOD). The trip discounts are determined on a case by case basis and must be consistent with the City’s current practice
5. For new uses, parking demand should be based on ITE Parking Generation Handbook and/or parking demand analyses conducted for similar uses in the community.
SECTION 2:

THRESHOLDS USED FOR DETERMINING TRANSPORTATION REVIEW OF PROJECTS
SECTION 2: THRESHOLDS

Thresholds for Determining Transportation Review

Pasadena’s current practice for reviewing a project’s traffic begins with the submittal to the Pasadena Planning & Development Department of either a Pre-development Plan Review (PPR), or an application for a discretionary action, including but not limited to a master development plan, planned development, conditional use permit, variance, hillside development permit, design review, and a request to alter the assessor’s map.

PasDOT reviews several types and sizes of projects that could be subject to environmental review under the California Environmental Quality Act, including projects consisting of either five or more dwelling units or generating more than ten PM peak hour trips. The Department has two processes for reviewing a proposed project’s traffic impacts, including a Transportation Assessment (TA) and a Transportation Impact Study (TIS). Generally, projects that will generate less than 20 PM peak hour trips are required to conduct a TA, while larger projects are required to conduct a TIS. The primary difference between the two types of transportation review is the level of detail in the intersection analysis. The following table summarizes the thresholds of determination.

<table>
<thead>
<tr>
<th>TYPE OF PROJECT</th>
<th>EXEMPTION</th>
<th>Category 1: TRANSPORTATION ASSESSMENT</th>
<th>Category 2: TRANSPORTATION IMPACT STUDY</th>
</tr>
</thead>
<tbody>
<tr>
<td>Residential (based on # of units)</td>
<td>4 units or less (net new)</td>
<td>5 – 25 units (net new)</td>
<td>26+ units (net new)</td>
</tr>
<tr>
<td>Commercial (based on # of net new trips)</td>
<td>Less than 70 daily trips and less than 11 trips in any peak hour</td>
<td>71 – 150 daily trips, or 11 – 20 trips in any peak hour</td>
<td>151+ daily trips, or more than 20 trips in any peak hour</td>
</tr>
</tbody>
</table>
Thresholds for Determining Significant Impacts

The thresholds identified below were developed to measure potential impacts of net new trips resulting from projects that intend to intensify an existing land use or alter existing traffic patterns. The thresholds are designed to capture a project’s anticipated level of impact measured in terms of net new trips versus existing conditions.

Multi-Modal Thresholds for Street Segments and Intersections

Environmental quality of non-vehicular modes must be improved when assessment of project study street segments and intersection reveal less than average conditions.

Thresholds for Street Segments (Increase in Daily Traffic)

The following thresholds measure the relative change in daily traffic resulting from an increase in trips or a change in access that alters existing traffic patterns. A street segment analysis is required for Transportation Assessments and Transportation Impact Studies, unless otherwise determined by PasDOT. A conservative approach is taken when calculating the traffic growth by basing the calculation on the increase relative to existing traffic volumes as follows:

- \[ \text{Percentage of Increase} = \frac{\text{Net New Project Trips}}{\text{Existing Daily Traffic}} \]
Table 2: Street Segment Thresholds

<table>
<thead>
<tr>
<th>Traffic Growth on Street Segment</th>
<th>Required Multi-Modal Measures</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>(Please refer to pages 16-18 of the Guidelines for Transportation Review of Projects provided in Section 5)</td>
</tr>
<tr>
<td>0.0 - 2.4% Daily Traffic Growth</td>
<td>Staff review and conditions</td>
</tr>
</tbody>
</table>
| 2.5% - 4.9% Daily Traffic Growth| • Initial study required if existing count is greater than 2,000 VPD 
|                                 | • Soft measures required      |
| 5.0% - 7.4% Daily Traffic Growth| • Initial study required      
|                                 | • Soft measures required      
|                                 | • Physical improvements may be required |
| 7.5% + Daily Traffic Growth     | • Initial study required      
|                                 | • Soft measures required      
|                                 | • Extensive physical improvements may be required |
|                                 | • Project alternatives may be considered |

Thresholds for Intersections (Intersection Capacity Analysis)

Transportation Impact Studies must include an intersection analysis; however, Transportation Assessments are generally exempt from this requirement. The significance of project-generated traffic impacts at intersections is determined by calculating the projected volume-to-capacity (V/C) change from Existing and Future Without-Project conditions to Existing and Future With-Project conditions. Lane capacity shall be consistent with the CMP Guidelines for Biennial Highway Monitoring (Appendix A, June 2002) unless otherwise specified. Signalized intersections shall be evaluated using the Intersection Capacity Utilization (ICU) method of analysis; whereas, non-signalized intersections shall be evaluated as signalized intersections using a 60 second cycle length and reduced capacity of 1200 vehicles per lane for the stop-controlled approaches. A project’s traffic impact is considered significant if the change in capacity relative to the level of service (LOS) meets or exceeds the thresholds.
contained in the sliding scale below. The ICU method shall be utilized in order to determine the change in V/C ratios for purposes of defining significant impacts. Significant intersection impacts must be mitigated to a level of insignificance.

Table 3: Intersection Level of Service Thresholds

<table>
<thead>
<tr>
<th>Intersection Level of Service Under Current Conditions</th>
<th>Change in Volume to Capacity (Future w/Project less Future w/o Project)</th>

SECTION 3:

PROCEDURES FOR PREPARING A TRANSPORTATION ASSESSMENT (TA)
SECTION 3: PROCEDURES FOR PREPARING A TRANSPORTATION ASSESSMENT

The following procedures have been established for the preparation of a Transportation Assessment (TA). A TA is intended to focus on an accurate field inventory of existing circulation elements, and provide recommendations for incorporating existing and/or recommended circulation elements into the design of the proposed project to ensure safety and compatibility.

Overall Process of a Transportation Assessment

1. The Department of Transportation reviews applications for Pre-development Plan Review (PPR) and other discretionary approvals to determine if a Transportation Assessment must be prepared in accordance with the City’s established thresholds.

2. Applicant selects a consultant from PasDOT’s pre-qualified list of traffic consultants.

3. Applicant shall deposit the City’s Traffic Review Fee based on City’s Current General Fee Schedule.

4. Based on the project scope provided in the application, the consultant will prepare a draft Memorandum of Understanding (MOU) for the City. The consultant will obtain project-related information directly from the Department of Planning throughout the analysis period, unless otherwise specified by the Department of Transportation.

5. The selected consultant shall develop, examine, and recommend feasible transportation improvements. The recommendations will be incorporated into the report based on their consistency with the Mobility Element, Neighborhood Traffic Management Program, adopted specific plans, and the Capital Improvement Program. The selected consultant shall submit a nearly-complete (90%) report, marked as “working version – internal review only”, preferably via electronic mail, to the Department of Transportation case manager for review.

6. Revisions or comments to the draft submittal will be provided to the selected consultant (not to exceed 2 weeks).

7. Based on Department of Transportation comments or requested changes, the
consultant shall complete the Transportation Assessment, marked as “FINAL” on the cover page and footer of the report and submit three hard copies and one electronic copy as an Adobe Acrobat (PDF) file on a CD. The City will retain two of these copies and forward the other copy along with a notification letter to the applicant.

8. Based on the Transportation Assessment, the Department of Transportation will notify the Department of Planning & Development with a list of transportation conditions pertaining to the proposed project as part of the approval process.

Transportation Assessment - Report Format

Cover Page

A cover page containing the project address and name (if applicable), as well as the date and consultant contact information.

Table of Contents

Section 1: PROJECT DESCRIPTION

1. Type, size, and number of parking spaces
2. Trip generation and general project trip distribution on streets in close proximity to the project
3. Site plan

SECTION 2: FIELD SURVEY, DOCUMENT AND/OR IDENTIFY POTENTIAL IMPROVEMENTS FOR THE FOLLOWING:

1. Digital photo documentary of the project site, key street features, inventory of transportation elements.
2. Existing site (use, access, pedestrian walkways, etc.)
3. Adjacent intersections (both signalized and non-signalized), including lane configurations, type of controls, and any special traffic-related features/conditions (grade, curvature, raised medians, etc.);
4. Neighborhood streets near the project;
5. General land uses on the same and adjacent blocks of the project;
6. On-street parking restrictions and utilization on the adjacent street and nearby street(s);

7. Transit facilities within 800 feet of the project, including the service provider(s) (Pasadena ARTS, MTA, Foothill Transit,) and location, amenities, and condition of existing bus stops;

8. Ingress/egress of proposed use, such as sight visibility, potential need for parking restrictions, location of access gate, etc.;

9. Bicycle facilities, including bike lane/route designations on adjacent streets, existing bike racks/parking on or adjacent to site, and proposed on-site bicycle amenities; and,

10. Pedestrian amenities, such as sidewalk widths adjacent to the project and pedestrian indicators at the nearest signalized intersection.

SECTION 3: IDENTIFY TRAFFIC IMPACTS

1. Conduct a street segment impact analysis using the significance thresholds contained in Section 2 of this document.

2. Summarize traffic counts of the adjacent street and/or nearby streets (please indicate date of collection). Provide raw data as an appendix.

3. Multi-Modal: The Department of Transportation will identify study street segments within the relevant traffic study area of the proposed development.

   a. Study Street Segments
      
      I. Collect data elements that directly impact pedestrians, bicyclists, and transit operations along the street segment(s),

      II. Analyze the project impacts on pedestrians, bicyclists, and transit operations using industry standard methodologies such as PEQI, BEQI and/or 2010 Highway Capacity Manual (HCM) Multi-Modal Level of Service (MMLOS). PasDOT, at its discretion and consistent with industry standards, may change the Multi-Modal methodology for evaluating project impacts on non-vehicular modes.

      III. Require measures to improve the environmental quality of non-vehicular modes when the findings reveal less than average conditions (or exceed thresholds contained in Section 2).
SECTION 4: IDENTIFY SYSTEM DEFICIENCIES

Summarize the system deficiencies based on data collected for Section 3 and recommend prioritization for appropriate improvements that address increases in traffic on analyzed street segments.

SECTION 5: GENERAL PLAN MOBILITY ELEMENT CONSISTENCY CHECK

Identify and incorporate specific transportation-related elements that support the City’s goal of becoming a city where people can circulate without cars. Also identify and incorporate improvements that will protect nearby residential streets by encouraging project-related traffic to utilize multimodal corridors and/or through neighborhood traffic calming measures.

SECTION 6: CONCLUSION & RECOMMENDATIONS

Summarize key findings and elements to be incorporated into the development of the project, such as changes in access and recommended locations for bicycle amenities.

APPENDICES: DATA AND MISCELLANEOUS INFORMATION

Transportation Assessment – MOU
This Memorandum of Understanding (MOU) acknowledges City of Pasadena Department of Transportation requirements of the traffic assessment for the following project.

### TRANSIT

**Location(s) of bus and/or Gold Line stop(s) within 1300 feet of the project**

Provide a detailed description in the report of the existing amenities and conditions of each transit stop listed above, as well as photographs.
### PARKING

- Number of Existing Off-Street Parking Spaces: [ ]
- Number of Parking Spaces Required by Code: [ ]
- Number of Off-Street Parking Spaces Proposed: [ ]

Provide a detailed description in the report of existing on-street parking, including restrictions, prohibitions, and availability.

### PEDESTRIAN/BICYCLE

- Bicycle Parking Spaces Required by Code: [ ]
- Bicycle Parking Spaces Proposed: [ ]

Include a detailed description of existing bikeways, bike signage, and bicycle racks within 1000 feet of the site.

| Signalized intersection(s) within 1300 feet of the site: | (Add rows if necessary) |
| Type of Pedestrian Push Buttons: | (Add rows if necessary) |
| Type of Pedestrian Indicator: | (Add rows if necessary) |
| ADA Compliant Wheelchair Ramps? | (Add rows if necessary) |

### GENERAL PLAN CONSISTENCY

- The Project Site is (check one): [ ]
  - On a Multi-Modal Corridor
  - Near a De-Emphasized Street(s)
  - Near a Residential Neighborhood
  - Near a Private/Public School

### OTHER PROJECT CONSIDERATIONS

- MOU Prepared By (Traffic Consultant):
  - Name: [ ]
  - Title: [ ]
  - Signature: [ ]
  - Date: [ ]

- MOU Approved By (City Representative):
  - Name: [ ]
  - Title: [ ]
  - Signature: [ ]
  - Date: [ ]
SECTION 4:

PROCEDURES FOR PREPARING A TRANSPORTATION IMPACT STUDY (TIS)
SECTION 4: PROCEDURES FOR PREPARING A TRANSPORTATION IMPACT STUDY (TIS)

The Following procedures have been established for the preparation of a Transportation Impact Study (TIS). A TIS includes an accurate field inventory of existing circulation elements as well as analyses of existing and project-related vehicular, transit, pedestrian, and/or bicycle trips. The purpose of the study is to identify potential impacts and recommend appropriate mitigation measures.

Overall Process for Conducting a Transportation Impact Study

1. The Department of Transportation reviews applications for Pre-development Plan Review (PPR) and other discretionary approvals to determine if a Transportation Impact Study must be prepared in accordance with the City’s established thresholds.

2. The applicant selects a consultant from PasDOT’s pre-qualified list of traffic consultants.

3. The applicant shall deposit the City’s Traffic Review Fee based on City’s Current General Fee Schedule.

4. Based on the project scope provided in the application, the consultant will prepare a draft Memorandum of Understanding (MOU) for the City. The selected consultant will obtain project-related information directly from the Department of Planning throughout the analysis period, unless otherwise specified by the Department of Transportation.

5. The selected consultant shall develop, examine, and recommend feasible transportation improvements that are consistent with the Mobility Element, adopted specific plans, the Neighborhood Traffic Management Program, and the Capital Improvement Program. The selected consultant shall submit a near-completion (90%) report, marked as “working version – internal review only”, preferably via electronic mail to the DOT case manager for review.

6. Revisions or comments to the draft submittal will be provided to the selected consultant (not to exceed 2 weeks).

7. Based on the Department of Transportation’s comments or requested changes, the consultant shall complete the Transportation Impact Study, marked as
“FINAL” on the cover page and footer of the report. The final submittal shall consist of three hard copies and one electronic copy as an Adobe Acrobat (PDF) file on a CD. A notification letter with one hard copy of the final report will be forwarded to the applicant (not to exceed 1 week).

8. Based on the Transportation Impact Study, the Department of Transportation will notify the Department of Planning & Development with a list of transportation improvements pertaining to the proposed project as part of the approval process.

Transportation Impact Study - Report Format

Cover Page

1. Project address
2. Project name (if applicable)
3. Date (month/day/year)
4. Consultant contact information
5. Consultant job number (if applicable)

Table of Contents

SECTION 1: PROJECT DESCRIPTION

1. Existing Conditions (trips, land use, size, and parking)
2. Proposed project (trips, land use, size, and parking)
3. Site plan including access, circulation, parking, and loading (identify any changes from existing)

SECTION 2: FIELD SURVEY, DOCUMENT AND/OR IDENTIFY POTENTIAL IMPROVEMENTS FOR THE FOLLOWING:

1. Digital photo documentary of the project site, key street features, inventory of transportation elements.
2. Existing site (use, access, pedestrian walkways, etc.)
3. Adjacent intersections (both signalized and non-signalized), including lane configurations, type of controls, and any special traffic-related features/conditions (grade, curvature, raised medians, etc.);

4. Neighborhood streets near the project;

5. General land uses on the same and adjacent blocks of the project;

6. On-street parking restrictions and utilization on the adjacent street and nearby street(s);

7. Transit facilities within 800 feet of the project, including the service provider(s) (Pasadena ARTS, MTA, Foothill Transit,) and location/amenities of existing bus stops;

8. Ingress/egress of proposed use, such as sight visibility, potential need for parking restrictions, location of access gate, etc.;

9. Bicycle facilities, including bike lane/route designations on adjacent streets and existing bike racks/parking adjacent to or proposed on site; and,

10. Pedestrian amenities, such as sidewalk widths adjacent to the project and pedestrian indicators at the nearest signalized intersection.

SECTION 3: IDENTIFY PROJECT IMPACTS

1. Trip Generation: The Trip Generation Manual, current edition, published by the Institute of Transportation Engineers, is used as the primary document. Other trip production rates can be used if approved by the Department of Transportation. Any adjustments to standard rates, such as for special uses, mixed uses, high transit use, or pass-by trips must be approved by the City Traffic Engineer.

2. Trip Distribution/Traffic Assignment: Distribute project trips (include distributions for each peak hour in percentages and volumes). The traffic distribution is a prediction of the future travel paths of site users. It is generally based on population distribution and significant travel paths in the study area. The trip distribution is to be approved by the Department of Transportation prior to preparation of the report.

3. Traffic Count Data: The Department of Transportation will identify study street segments and intersections within the primary influence area of the proposed development.

   A. The Department of Transportation will require evaluation of all critical time periods based on the proposed uses and site location.
B. Unless otherwise specified, peak hours occur between 7:00 and 9:00 a.m. and between 4:00 and 6:00 p.m. on weekdays

C. Multi-Modal Analysis: Collect data elements that directly impact pedestrians, bicyclists, and transit operations along the street segment(s) and at intersections

4. Study Street Segments
   A. Describe speed limits, traffic control, pedestrian crossings, and parking restrictions
   B. Street segment analysis
   C. Multi-Modal Analysis: Analyze the project impacts on pedestrians, bicyclists, and transit operations using industry standard methodologies such as PEQI, BEQI and/or 2010 Highway Capacity Manual (HCM) Multi-Modal Level of Service (MMLOS). PasDOT, at its discretion and consistent with industry standards, may change the Multi-Modal methodology for evaluating project impacts on non-vehicular modes.
   D. Require measures to improve the environmental quality of non-vehicular modes when the findings reveal less than average conditions (or exceed thresholds contained in Section 2).

5. Study intersections
   A. Describe speed limits, stop control, pedestrian crossings, and parking restrictions, and include a diagram of existing lane configurations
   B. Display existing peak hour traffic volumes
   C. Show existing with project conditions (diagrams of peak hour trip distribution)
   D. Apply an ambient growth rate of 1.5 percent per year to existing volumes, unless otherwise specified
   E. Distribute trips from related projects. The projected travel demand for each development must be based upon approved TIS reports or other recognized, applicable data.
   F. Show future without project conditions (diagrams of peak hour trip distribution)
   G. Show future with project conditions (diagrams of peak hour trip distribution)
   H. Analyze intersection impacts
I. Analyze the project impacts on pedestrians and bicyclists using industry standard methodologies such as PEQI, BEQI and/or 2010 HCM MMLOS. PasDOT, at its discretion and consistent with industry standards, may change the Multi-Modal methodology for evaluating project impacts on non-vehicular modes.

J. Recommend mitigation measures.
   a. Require measures to improve the pedestrians and bicyclists environmental quality when the findings reveal less than average conditions.
   b. Developments must mitigate the increase in traffic caused by their development. Mitigation measures are required when level of service at any study intersection or on any street segment exceeds the thresholds contained in Section 2.
   c. If mitigation reflects trip reductions predicted as a result of implementing required Transportation Demand Management (TDM) measures, an approved report must be submitted substantiating such mitigation.
   d. All proposed roadway mitigation must be illustrated and a preliminary cost estimate provided to show the new intersection configuration, including lane widths, assignments, widenings, and trip reduction attributed to required TDM strategies.

6. **Transit Usage:** Analyze transit use by the project

7. **CMP analysis:** If applicable, conduct an analysis of project impacts to CMP locations

8. **Parking Requirements:** The traffic study should include an analysis of auto and bicycle parking requirements for the proposed project and should also include information regarding how the project will satisfy the parking requirements. Shared parking analysis should also be included if applicable. If off-site parking is proposed, the trip distribution (step 2 above) must reflect the location of the off-site parking.

9. **Construction Impacts:** Identify potential construction impacts.

SECTION 4: GENERAL PLAN MOBILITY ELEMENT CONSISTENCY CHECK

Identify and incorporate specific transportation-related elements that support the City’s goal of becoming a city where people can circulate without cars.
Also identify and incorporate improvements that will protect nearby residential streets by encouraging project-related traffic to utilize multimodal corridors and/or through neighborhood traffic calming measures.

SECTION 5: CONCLUSION & RECOMMENDATIONS

Summarize key findings and elements to be incorporated into the development of the project.

SECTION 5:

GUIDELINES FOR TRANSPORTATION REVIEW OF PROJECTS
GUIDELINES FOR TRANSPORTATION REVIEW OF PROJECTS
This material may be reprinted or quoted without permission, provided credit is given to the City of Pasadena Department of Transportation. This document can be downloaded at http://www.cityofpasadena.net/Transportation/. For comments or additional questions regarding the City's transportation review process, please contact Transportation Planning & Development Division at (626) 744-7208.
The Pasadena Mobility Element contributes to the City’s vision of **promoting a livable community where people can circulate without cars**. The Element is based on achieving the following three objectives: **Encourage** non-auto travel, **Protect** neighborhoods, and **Manage** multimodal corridors. The Mobility Element reflects extensive public review over a two-year period: Three Council policy workshops, twenty five neighborhood meetings, and five joint discussion meetings of the Planning Commission and the Transportation Advisory Commission were held prior to the document’s final approval.

The implementation programs of the Mobility Element include an increased emphasis on comprehensive review of transportation aspects of development projects in addition to the existing environmental review process. This document outlines major transportation factors that should be taken into account to facilitate project review and to guide development throughout the community.

All of the factors included in this document are drawn from Mobility Element policies, programs, and implementing actions. These considerations are applicable to all development projects subject to transportation project review. They should be applied in the context of City plans and policies.
The type, location, and operating characteristics of a development project should be taken into consideration at the outset of the project review process. Also, details pertinent to transportation issues should be identified at that time. Following are factors that should be addressed:

**PROPOSED PROJECT**
- ✓ New development
- ✓ Expansion and/or reuse of an existing development

**PROJECT LOCATION**
- ✓ Within a Specific Plan area
- ✓ On, or adjacent to, a multimodal corridor
- ✓ Located near other planned projects with opportunities to share mitigations and enhancements
- ✓ On, or adjacent to, a de-emphasized street
- ✓ On an existing or approved transit route
- ✓ Adjacent to a transit stop
- ✓ On a designated bikeway
- ✓ Close to sensitive land uses such as senior center, hospital, recreation center, school, park, etc.
**PROJECT SCOPE & DETAILS**

- ✔ Within a Transit-Oriented District (TOD)
- ✔ Adjacent to a Gold Line Station
- ✔ Adjacent to a busy pedestrian intersection
- ✔ On, or adjacent to, a Suggested Route to School
- ✔ Proximity to approved transportation projects

**LAND USE(S)**

- ✔ Single land use
- ✔ Mixed use
- ✔ Opportunity for shared parking

**PROJECT SCALE AND TRAFFIC IMPACT**

- ✔ Scale of development
- ✔ Number of intersections with significant traffic impact
- ✔ Street capacity consistent with City policy to minimize widening of streets

**OTHER TRANSPORTATION CHARACTERISTICS**

- ✔ Items based on community comments
- ✔ Vehicle fleet to be located on site
- ✔ Private shuttle for the project
PROJECT SCOPE & DETAILS

☑ User groups with special transportation needs such as children, seniors and persons with disabilities
☑ Special transportation considerations such as emergency uses, location adjacent to police or fire station, or public utility
☑ Specified tenant with alternative hours of peak activity
☑ Use includes special events
☑ Freight delivery considerations, both on-street and off-street
☑ Proximity to a bus stop or transit center
☑ Opportunities to provide transit/bicycle/pedestrian amenities and car-sharing
☑ Adequate lighting for transit/pedestrian purposes
☑ Site location and height for accommodating traffic video equipment
☑ Extent of pedestrian activity in project vicinity
☑ Extent of bicycle activity in project vicinity
☑ Sidewalk configuration and opportunity to place bicycle racks
☑ Traffic safety information regarding adjacent intersections
☑ Opportunities for rideshare drop-off
☑ Destination-oriented use of heavy vehicles
Once the scope of the development project has been defined, the project review process should assess the need for enhancements that would facilitate the implementation of the Mobility Element.

To assist review of projects, the following transportation aspects (see pages 7-15) should be addressed during the review process. They are grouped into six general categories: parking, bicycle, pedestrian, neighborhood protection, transit, and multimodal corridors. The need for including transportation measures or enhancements should be assessed if the project is characterized as follows:

- The project has an **impact on parking services** and/or requires a heightened need for parking.
- The project has a high or notable amount of **pedestrian traffic or bike use**.
- The project has a **detrimental traffic impact** on adjacent neighborhoods and/or on de-emphasized streets.
- The project is served by or impacts a **transit corridor**.
- The project is on/near a **multimodal corridor** or will have a notable impact on a multimodal corridor.

Following are transportation policies of the Mobility Element that should be considered during the review of new development projects and factors to be taken into account as part of that review.

**Parking**
Policies regarding the provision of parking are included in the Mobility Element because the presence of on-street and off-street public parking has a direct effect on the use of the street network. The Mobility Element policies discourage the oversupply of auto parking in new development and promote a balanced approach that fosters non-auto travel. The combination of Transit-Oriented District (TOD) policies, parking management policies, and transportation demand measures offers powerful and timely opportunities to achieve a livable community where people can circulate without cars.

An additional challenge in the development of parking solutions is recognition of the unique character of many areas of the city, which means that no one parking solution will fit all situations. The City will continue to engage in collaborative efforts with residents and the business community to define, and in some instances develop, parking programs to meet their particular needs.
PROJECT REVIEW CONSIDERATIONS

IDENTIFY OPPORTUNITIES TO MINIMIZE THE NEED FOR LONG-TERM AND EMPLOYEE PARKING IN COMMERCIAL AREAS THROUGH PROGRAMS DESIGNED TO REDUCE DEPENDENCE ON AUTO COMMUTING AND TO PROMOTE NON-AUTO TRAVEL. THE FOLLOWING ASPECTS SHOULD BE ADDRESSED:

- Apply the Trip Reduction Ordinance (TRO) to reduce dependence on the single-occupant automobile.
- Require developments of a threshold size to provide appropriate transit enhancements, bicycle facilities, and other provisions to encourage rideshare, such as taxi staging areas, and rideshare pick-up areas for carpools and vanpools.
- Develop parking guidelines for Transit-Oriented Districts that discourage an oversupply of long-term parking by placing a cap on the maximum allowable long-term parking for new development.
- Locate building entrances in close proximity to the street to provide for convenient access to transit stops and sidewalks.
- Place parking in the rear or below buildings to avoid creating a barrier to street access.
- Encourage mixed-use development to share parking and common driveways.
- Seek opportunities to enhance pedestrian circulation and safety with special attention given to the needs of seniors, youths, and persons with disabilities.
- Identify the feasibility of direct pedestrian linkages between transit portals/platforms and their adjacent commercial development through project orientation and design.
PROJECT REVIEW CONSIDERATIONS

- Mitigate traffic impacts by coordinating parking management policies, transit enhancement policies, and Transportation Demand Management (TDM) policies such as provision of transit passes in lieu of free parking.
- Provide visitor parking close to destinations.
- Assess short- and long-term bicycle parking options.
- Provide information on transportation benefit programs for employees that encourage non-auto travel and reduce traffic impacts.
- Assess the feasibility of shared parking between new mixed-use developments or with existing developments.
- Where appropriate, include provisions regarding the prohibition of parking of commercial vehicles in residential areas.
- Assess the need for short-term parking depending on proposed land uses.
- Consider availability and need for short- and long-term parking options such as bicycle lockers, bicycle valets, and/or bicycle stations.
- For developments of a threshold size, encourage application of technology to improve the efficiency of parking facilities to minimize their traffic impact on local streets.
- Identify opportunities to provide priority parking for clean-fuel vehicles and car-share vehicles.
BICYCLE

Pasadena has a number of existing and planned bikeways designated as paths, lanes, and routes. Well-placed and adequate bicycle parking supports the use of these bikeways. Mobility Element policies foster the use of bikeways and the provision of supporting bicycle facilities and amenities.

PROJECT REVIEW CONSIDERATIONS

Promote the use of bicycles and identify opportunities for bicycle enhancements. The following aspects should be addressed:

- Review opportunities for the provision of bicycle facilities as part of the trip reduction ordinance.
- Incorporate bike enhancements as part of improvements to the traffic signal system.
- Increase the availability of bicycle parking as part of the project and on the adjacent sidewalk.
**PROJECT REVIEW CONSIDERATIONS**

**PEDESTRIAN**

The City has developed walkway areas in specific locales. The further development of these facilities will improve safety for pedestrians and can also encourage the use of other non-auto modes of transportation. The improvements include appropriately scaled sidewalks and plazas, paths, trails, pedestrian bridges, crosswalks, and pedestrian signals with crosswalks at signalized intersections to accommodate pedestrian circulation.

### PROJECT REVIEW OBJECTIVE

Promote improvements for pedestrians to support vibrant and active streets. The following aspects should be addressed:

- Incorporate pedestrian-friendly features in the design of developments.
- Provide pedestrian linkages in developments adjacent to the Gold Line stations.
- Enhance pedestrian safety and provide pedestrian amenities at major places of activity with particular attention given to the needs of seniors, youths, and persons with disabilities.
- Provide pedestrian enhancements on multi-modal corridors including provisions that protect pedestrians from vehicular traffic.
- Provide pedestrian safety enhancements at busy intersections including traffic signal assists for seniors and persons with disabilities.
CITY OF PASADENA DEPARTMENT OF TRANSPORTATION
TRANSPORTATION REVIEW GUIDELINES

PROJECT REVIEW CONSIDERATIONS

- Refer to the *Old Pasadena Streetscapes and Alley Walkways Refined Concept Plan* for guidelines on affected projects.

NEIGHBORHOOD PROTECTION

The traffic conditions on a street affect not only pedestrians (both adults and children) but also people living within the residential structures along a street. The impacts of traffic include noise, dust, air pollution, vibration, traffic accidents, and decreased pedestrian safety. These impacts affect the quality of life for people who live nearby and may raise safety concerns. The City places an emphasis on the protection of neighborhoods from the impacts of traffic, particularly cut-through traffic, the speed of cars, on-street parking and, in some cases, noise impacts.

<table>
<thead>
<tr>
<th>PROJECT REVIEW OBJECTIVE</th>
</tr>
</thead>
</table>

Recognize the need to incorporate neighborhood protection measures in developments that could have spillover impacts on adjacent neighborhoods or on de-emphasized streets. The following aspects should be addressed:

- Assess whether proposed development adversely impacts adjacent neighborhoods and develop mitigation measures to minimize this impact.
- Identify measures to eliminate or minimize the intrusion of traffic generated by new development into residential neighborhoods and on de-emphasized streets.
- Address the need for mitigation of traffic impacts for projects intended to accommodate special events.
Do not plan or implement traffic capacity enhancement projects on de-emphasized streets.
**PROJECT REVIEW CONSIDERATIONS**

**TRANSIT**

The City benefits from an extensive network of local and regional transit routes that provide good citywide coverage. Initiation of the Gold Line Light Rail service, bus transit restructuring studies being conducted by the San Gabriel Valley Sector, expansion of the ARTS service, definition of Transit-Oriented Districts (TOD), and adoption of a Bicycle Master Plan provide considerable opportunities to promote and encourage non-auto travel. The planning and development of new projects are important to reduce dependence on the automobile and promote expansion and enhancement of the transit program.

**PROJECT REVIEW OBJECTIVE**

Promote the use of transit through improved and expanded services, convenient and comfortable transit centers; clear and easy-to-understand user information; clean, safe, and convenient transit waiting areas; and amenities that promote the use of transit. The following aspects should be addressed:

- Provide convenient transit access between affordable housing, employment, and services.
- Assess the need for additional transit stops, the location of existing stops, and the need for transit amenities at these locations.
- Seek opportunities to strengthen the transit components of the Trip Reduction Ordinance.
- Provide for adequate bicycle facilities linked with transit services.
Encourage provisions for clean, safe, and attractive transit stops as part of new project development.

Assess potential opportunities for non-auto travel demonstration programs such as car-sharing.

Improve public information at transit stops.

Provide well-lighted and clean transit stops.

Locate transit stops adjacent to uses that increase user convenience and safety.

Include the provision of wayfinding signs in the review of projects adjacent to major transit transfer locations.

Consider installation of bus shelters where appropriate.

Consider landscaping and related enhancements at transit stops.

Assess the vertical curb at transit stops for passenger safety in boarding and alighting.

Provide for passenger waiting areas that are set back from the street edge and are protected from vehicular traffic.

Review the transit stop location relative to adjacent intersections.

Insure that provisions are incorporated for seniors and persons with disabilities.

Locate transit stops in convenient user locations.

Incorporate transit priority provisions in traffic signal upgrade improvements required as mitigation measures.
MULTIMODAL CORRIDORS
Multimodal corridors are the City’s major thoroughfares for movement within, to, and from Pasadena and should be readily identifiable to the traveling public. These corridors should create an environment where different modes of travel can coexist. Where appropriate, the roadway should be shared, efficient travel should be facilitated, and convenient connections at key destinations and transfer locations should be encouraged. These streets are the site of many major places for pedestrian activity and destinations. The Mobility Element policies provide for seamless connections and modal transfers. They reinforce programs that contribute to a balanced and efficient transportation system linking existing and planned growth.

PROJECT REVIEW OBJECTIVE
Develop identifiable corridors that move traffic efficiently and keep traffic from intruding into adjacent neighborhoods. The following aspects should be addressed:

- Apply automated traffic signal technology to improve efficiency and environmental performance of major travel corridors.
- Provide streetscape amenities along the entire length of multimodal corridors that will be consistent with guidelines adopted as part of specific plan areas.
- Assess the need for measures to protect pedestrians from vehicular traffic particularly at major areas of pedestrian activity.
PROJECT REVIEW CONSIDERATIONS

- Assess the appropriateness of equipping a signalized intersection with vibrating or audible pedestrian functions for hearing/vision impaired persons.
- Develop engaging and active corridors through improved vehicular signage, pedestrian access, streetscape, and other enhancements.
- Provide for peak-hour parking restrictions where needed.
- Provide for and encourage mid-day delivery services.
- Provide signage to keep traffic on major travel corridors.
- Provide clear signage for transit, parking, and bicycle routes.
- Provide wayfinding signs to support pedestrian activity.
- Incorporate priority treatment for transit in determining bus stop locations, bus stop amenities, transit user signage/information, and traffic signal upgrades.
- Review the need for pedestrian safety considerations and related amenities.
- Include bicycle facilities and related amenities.
- Review truck deliveries to determine whether they can be made in mid-day hours.
- Assess the adequacy of existing on-street provisions for goods delivery.
- Assess whether a site is an appropriate location for a taxi staging area.
- Potential for frequent use of taxi cab service.
- Adequacy of street to accommodate a taxi waiting area.
SUITABLE MULTI-MODAL MEASURES

TRAFFIC MANAGEMENT SYSTEM

- Upgrade Transportation Management Center hardware, software, and monitoring equipment
- Expand Intelligent Transportation System (ITS) components, such as CCTV and Changeable Message Signs (CMS).
- Expand the City’s communication/fiber-optic backbone
- Install additional arterial loop detectors (system loops)
- Deploy traffic monitoring network in residential neighborhoods

ROADWAY SYSTEM

- Upgrade traffic signals to encourage traffic to use major arterials rather than residential streets
- Change roadway striping to enhance safety and reduce congestion
- Install wayfinding signage
- Minimize potential conflicts by encouraging developers to construct fewer driveways

PEDESTRIAN ACTIVITIES

- Equip signalized intersections with vibrating or audible pedestrian functions for hearing/vision impaired persons.
SUITABLE MULTI-MODAL MEASURES

- Provide streetscape amenities along the entire length of multimodal corridors that will be consistent with guidelines adopted as part of specific plan areas

**Public Transit**
- Provide information on transportation benefit programs for employees and multi-family residential development projects that encourage non-auto travel, including rideshare, vanpool, bus/rail route, and dial-a-ride information
- Provide transit stop amenities, including bus shelters, benches, and trash recepticles
- Consider landscaping and related enhancements at transit stops
- Upgrade traffic signal to provide transit priority provisions
- Contribute to capital costs

**Bicycle Facilities**
- Consider video detection for bicyclists at appropriate locations
- Increase the availability of bicycle parking both on-site and on the adjacent sidewalk
- Provide bicycle maps and bicycle safety brochures

**Parking and Loading**
- Apply technology to improve the efficiency of parking facilities to minimize traffic impacts on local streets
SUITABLE MULTI-MODAL MEASURES

- Identify locations for priority parking for clean-fuel and car-share vehicles
- Implement peak-hour parking restrictions
- Prohibit on-street parking at critical locations to improve visibility
- Assess the adequacy of existing on-street provisions for goods delivery
- Provide passenger loading areas at key locations
- Limit truck delivery to non-peak traffic hours
- Implement parking restrictions or prohibitions to protect adjacent residential neighborhoods from on-street parking spillover

NEIGHBORHOOD PROTECTION

- Assess the potential impacts on adjacent residential neighborhoods and install appropriate traffic calming measures, such as speed humps, chokers, partial road closures, etc.
Richmond, CA

MEMORANDUM

Date: June 1, 2012
To: Chris Janson, Opticos Design
From: Brooke DuBose, Tien-Tien Chan, and Carrie Nielson, Fehr & Peers
Subject: Richmond Livable Corridors: Draft TDM Program Memo

This memorandum documents the draft recommended Transportation Demand Management (TDM) programs for the City of Richmond Livable Corridors project, which supplants traditional zoning to provide a Form-Based Code to organize and structure future development. The study area consists of West and East Macdonald Avenue, 23rd Street, and San Pablo Avenue. These TDM strategies are intended to provide study-area-wide strategies to help reduce single occupancy vehicles trips to and increase walking, biking, and transit trips along these major corridors. Encouraging new transit and active mode trips along these corridors will further activate these streets, increase personal safety, and, in turn, promote future investment.

The recently adopted City of Richmond General Plan includes a discussion of developing TDM programs and incentivizing their implementation. Action CR5.A states the need to develop a TDM program in support of transit, bicycling, and walking through transit subsidies, car-share service, and bicycle facility enhancements, among other means. The Action item also includes discussion of an incentive program using strategies such as reduction in transportation impact fees for new development that commits to TDM measures and reducing parking requirements for mixed-use development. The TDM strategies outlined in this memo build on the strategies outlined in the General Plan and prioritize those that are most suited to the Richmond Livable Corridors study areas.

The TDM strategies detailed in this memo focus on five broad strategies to promote walking, bicycling, and transit trips while helping to manage auto demand. Each strategy is presented with additional sub-strategies that begin to create an action plan for TDM implementation through the Richmond Livable Corridors project. Figure 1 provides an illustrative summary of the existing strategies and the recommended Program. Existing programs primarily represent countywide
programs, such as carpool, vanpool, and schoolpool; Guaranteed Ride Home; and bicycle commuter assistance programs. A variety of other educational programs are also in place, including workshops on car-sharing and telecommuting, on-site assessments of commuter alternatives, and presentations to employers on the benefits of TDM programs. New Richmond-specific programs have been implemented through EasyGo, which includes peer-to-peer car-sharing, bike-sharing, and a "kid's cab" shuttle for elementary school-aged children.

---

**Figure 1 – Recommended TDM Programs**

Source: WCCTAC Transit Enhancement Strategic Plan; Fehr & Peers, 2012
Figure 1 represents the overall organization of TDM strategies. The following sections detail the five major TDM strategies and corresponding measures. Each measure is categorized based on relevance to small or large businesses or whether or not it is a broader community-wide strategy. The measures are also evaluated based on the following factors:

- Cost of implementation;
- Potential effectiveness in the context of the Richmond Livable Corridors project;
- Length of time needed to implement the strategy (short-term versus long-term); and
- Appropriate corridors for implementation.

1. DEVELOP A SHUTTLE IMPLEMENTATION PLAN TO PROVIDE INCREASED ACCESS TO TRANSIT CENTERS AND AROUND RICHMOND

As sections of West and East Macdonald Avenue, 23rd Street, and San Pablo Avenue densify and draw additional residents, workers and visitors to the area, shuttle service connecting major employers, BART stations, and other transit hubs such the proposed ferry terminal, will be an important strategy for reducing single-occupancy vehicle trips in Richmond. Based on the short-term and long-term development nodes identified in the Form-Based Code, a shuttle implementation plan can further help to prioritize development and can be a benefit to development in terms of increasing property values through additional amenities for new employees and residents. Table 1 presents recommended strategies related to development of a shuttle implementation plan.

The WCCTAC Transit Enhancement Strategic Plan includes next-steps for exploring shuttle service. The City of San Pablo’s San Pablo Avenue Specific Plan also identifies shuttles to connect with El Cerrito Del Norte BART, which may provide an opportunity to coordinate through locations in Richmond.

1.1 Identify Shuttle Markets

Identify new shuttle markets and key destinations. Consider conducting outreach to identify additional areas of high demand that are currently not being served. The City of San Pablo recently identified markets for new shuttle service from San Pablo into and through Richmond. For additional information consult the City’s 2011 San Pablo Avenue Specific Plan.

1.2 Establish a Shuttle Advisory Committee

Representatives from the City, neighborhood associations, business groups, and shuttle providers can meet regularly to identify implementation steps for shuttle service and continued evaluation of its effectiveness.

1.3 Consolidate Shuttles

Explore opportunities to consolidate existing shuttle services (four private shuttle services connecting BART with Kaiser, California Department of Public Health, Richmond Field Station, and Orton Development Ford Point). This analysis should be conducted in collaboration with the Shuttle Advisory Committee.
1.4 Provide Shuttle Service

Provide shuttle service from the Richmond BART station to key areas in Richmond based on analysis of shuttle markets and Shuttle Advisory Committee developed implementation plan.

2. IMPLEMENT EMPLOYER-BASED COMMUTE INCENTIVES

Employer-based commute incentives consist of subsides provided by employers to encourage use of transit and active modes as means to get to work. Employer-based commute incentives allow employers to provide less parking, which means that companies pay for fewer leased parking spaces or build fewer spaces initially. For the Richmond Form-Based Code, strategies should be tailored towards smaller businesses, which comprise the majority of the commercial activity along the study area corridors under existing and future conditions. As such, recommended TDM measures should focus on transit pass subsidies and group discounts for passes purchased by employers in bulk, which represent realistic TDM measures for small to medium sized businesses. Implementing these strategies will help to increase transit use both by Richmond residents and those who commute to Richmond, incentivizing their commute by bus or BART. Because every transit trip also ends in walking or biking to or from the transit stop, this will also help to make transit-rich streets safer, more active environments. These incentives are presented in Table 2.

Though parking cash-out has been recommended as a key strategy in other Richmond-area documents, including the recently adopted General Plan and the WCCTAC Transit Access Enhancement Strategic Plan, parking cash-out is a very long-term strategy for Richmond-based employers, particularly within the Livable Corridors study area. Parking demand management strategies and on-street pricing strategies must first be in place for this to be an appropriate TDM strategy for Richmond businesses.

#### 2.1 Provide Transit Subsidy

Employers can provide every employee with a monthly transit subsidy. Transit subsidies can be deposited directly in employee's Clipper Cards for ease of use and transferability to multiple transit agencies. Medium sized employers may be able to provide in the range of $100 monthly, which would cover the cost, for example, of a $80 AC Transit monthly pass.

#### 2.2 Utilize Group Discounts

The City can work with transit agencies to secure group discounts on transit fares for employers.

#### 2.3 Provide Parking Cash-Out

As a long-term strategy, employers that offer employees free parking can be required to offer a parking cash-out option. The parking cash-out may be in the form of a transit subsidy. As discussed previously, parking cash-out relies on the implementation of metered parking and parking demand management strategies in Richmond.

### 3. IMPLEMENT EFFICIENT PARKING STRATEGIES

On-street parking is currently free and largely unregulated throughout Richmond. Large employer parking lots are typically single-use and free or low-cost. The large lots typically located on-site discourage employees who work at major employers in Downtown Richmond from taking transit, walking in the neighborhood and spending money at local restaurants and
businesses. Free parking in some sections of the study area allow people to park in prime spaces in front of businesses without having to move their car for long stretches of time, such as in the Downtown area along Macdonald Avenue. Installing metered parking within the study area would help regulate demand and allow for money to go directly back into the corridor through parking management districts and similar funding mechanisms. Those funds could in turn be used to improve streetscapes as identified in the Form-Based Code and help maintain those new facilities. Parking strategies are presented in Table 3.

### 3.1 Implement Shared Parking

Shared-parking facilities can be implemented at existing and new locations where feasible. Though most lots in the study area are small and may not be able to support large shared parking areas, the Target site and the surrounding area may be an effective location to implement shared parking given the larger parcel size. Additionally, the City can consider identifying opportunities to convert under-utilized parking to open space or other public uses.
3.2 Install Metered Parking

The City can implement on-street and off-street parking meters at key commercial locations. The implementation may include a variable pricing strategy with higher parking fees during peak periods and lower fees during off-peak periods. Residential parking permit programs may also be considered if necessary to reduce the impact of spillover parking.

3.3 Implement Parking Management Districts

As a supplement to metered parking, the City may establish a parking benefits district whether the revenue earned from parking meters are used to fund parking management, traffic calming, or streetscape projects for the district.

3.4 Implement Additional Parking Policies

The City may establish parking maximums where applicable. This strategy may allow for reduced parking minimums or no parking requirements were feasible. Considerations could include on-street parking to count towards parking minimums where it is required, parking in-lieu fees, and waivers of parking based on parking demand analysis.

4. TRANSIT AND BICYCLE STRATEGIES

Recent studies and adopted plans have identified specific improvements at and around the Richmond BART Station. If implemented, these improvements would make regional transit a more attractive option for many choice transit riders and would also improve connections from regional commuter rail to local bus service. Walking and bicycling improvements would increase the multi-modal access to the station. In addition to improving operations, these identified access improvements would improve the perception and experience of this important regional gateway to the City of Richmond, a critical element of the Richmond Livable Communities strategy. Transit and bicycling strategies are shown in Table 4.
TABLE 4: TRANSIT AND BICYCLE STRATEGIES SUMMARY

</tbody>
</table>

4.1 Improve Access to and Service at Richmond BART

Access to and service at Richmond BART can be improved through the following strategies:

- Upgrade and expand circulation area for buses
- Improve bus waiting area with upgraded landscaping and improved shelters
- Real-time electronic information signs for buses
- Improve signage within the BART station
- Post general bus service information at bus transit center area
- Improve maintenance/cleanliness
- Upgrade benches for outdoor seating
- Improve street crossings, implement street lighting, and fill sidewalk gaps around the station

4.2 Provide Bicycle Facilities

Expand the citywide bicycle network by implementing proposed on- and off-street bikeways, closing key gaps in the citywide network, install wayfinding signage, and provide bicycle parking at key locations may be an important TDM tool to increase the number of bicycling trips. The City can consider converting select parking spaces into bicycle parking or public sitting areas and requiring bicycle parking for all development projects.
5. OTHER STRATEGIES

TDM strategies and policies such as those discussed in this memo do not have built-in enforcement mechanisms. Without additional strategies to incentivize or require their implementation, many employers and developers may be disinclined to implement these policies. Such a policy is congruent with the Circulation Element of the newly adopted City of Richmond General Plan, which identifies development of TDM program and incentive programs as an action item under the banner of Sustainable and Green Practices; though, such TDM and incentive programs are not currently in place. The summary of a TDM policy for new developments is shown in Table 5.

5.1 TDM Policy for New Developments

Citywide TDM policies can be established as conditions of approval for development. Additionally, the City can reduce transportation impact fees for projects that demonstrate commitment to TDM strategies and reduction in parking requirements. The policies should fall in-line with the TDM strategies recommended in this memo and those referenced in the General Plan.

CHAPTER 1. INTRODUCTION

This report presents the Transportation Demand Management (TDM) plan for the office development located at 580 N. Mary Avenue in Sunnyvale, CA. The proposed building size results in a Floor Area Ratio (FAR) for the site of 55 percent, where 35 percent is allowed. FAR represents the total floor area of the building compared to the size of the site (area). Certain developments in excess of 35 percent FAR require approval of a Use Permit. To achieve City Council approval for the density bonus, this project must demonstrate that it meets 26 review criteria, including providing a TDM plan.

PURPOSE OF THE TDM PLAN

The purpose of this TDM plan is to reduce the number of vehicle trips generated by the site. It contains a number of measures and strategies that encourage the use of alternative modes of travel such as transit, ridesharing (carpooling and vanpooling), bicycling, and walking. It may also contain measures that eliminate trips to the site such as telecommuting. The specific trip reduction goal of the plan is described in a subsequent section.

PROJECT DESCRIPTION

The project site is located at 580 N. Mary Avenue at the corner of W. Maude Avenue and contains 5.18 acres, or 225,640 square feet (sf). A site location map is shown on Figure 1. A US Post Office is currently operating at the project site. A previous study indicated that there would be no change in the number of trips generated during the AM peak hour and approximately half the number of trips generated during the PM peak hour with the proposed land use modifications. Therefore, the project will reduce PM peak hour demand on the surrounding transportation network.

The proposed project will include one building for general office use that will contain 124,000 sf representing a FAR of 55 percent. The site contains 424 parking spaces and 9 handicapped accessible spaces. It also contains 16 bike lockers and bike racks for 6 bicycles providing parking for 22 bicycles. The proposed site plan is shown on Figure 2.

TRIP GENERATION ESTIMATES

The purpose of the vehicular trip generation estimates is to determine the number of vehicle trips entering and exiting the site for a variety of purposes (employee trips, visitor trips, deliveries, etc.) during a selected time period. The amount of traffic was estimated using rates published in Institute of Transportation Engineers' (ITE), Trip Generation, 6th Edition (2008).

Trip estimates were prepared for the proposed building size (124,000 sf with an FAR of 55 percent) and for buildings sizes representing 35 percent FAR (79,000 sf) and 45 percent FAR (101,500 sf). The results are presented in Table 1. The proposed project is estimated to generate approximately 220 AM peak hour trips and 215 PM peak hour trips.

TRIP REDUCTION GOALS

The purpose of this TDM plan is to offer a reduction equivalent to the trip difference between 35 and 55 percent FAR with a minimum reduction goal equivalent to the trip difference between 35 and 45 percent FAR. The reduction goal of the program is a 27 percent reduction based on the average AM and PM peak hour trip estimates. The minimum reduction goal of the program is a 16 percent reduction based on the average for the AM and PM peak hour trip estimates.

</table>

Notes:
1. ksf = 1,000 square feet
2. Rate per ksf
3. Following ITE trip generation equations used (ITE Code 710 - General Office Building, 6th Edition):
   AM: Ln (T) = 0.80 Ln (X) + 1.55, Enter = 85%, Exit = 12%
   PM: T = 1.12 * (X) + 78.81; Enter = 17%, Exit = 83%
   Where X = 1,000 square feet of floor area, T = number of vehicle trips, Ln = natural log

CHAPTER 2. TRANSPORTATION FACILITIES AND SERVICES

The transportation facilities and services that support the use of modes of transportation other than the single-occupant vehicle (SOV) include commuter rail, light rail transit (LRT), buses and shuttle buses, bicycle facilities, and high-occupancy vehicle (HOV) lanes. Existing and planned support facilities and services near the 580 N. Mary Avenue site are discussed in this chapter. Rail and bus routes near the site are shown on Figure 3. Figure 4 presents the bicycle facilities and HOV facilities are shown on Figure 5.

COMMUTER RAIL – CALTRAIN

Caltrain provides intercity passenger rail service between San Francisco and San Jose, with limited service to Gilroy during commute hours. Both the Sunnyvale and Mountain View Caltrain Stations are accessible to the project site and are described below in further detail. Rail service to these stations are summarized in the schedule tables to the right.

The Sunnyvale Caltrain Station is the closest station to the project site. It is served by Local-Stop, Limited-Stop, and Baby Bullet (express) service. The station is served by three Baby Bullet and six Limited-stop northbound trains in the AM peak period with headways between five and forty-two minutes. In the PM peak period, the station is served by two Baby Bullet, five Limited-stop, and one Local-stop southbound trains with headways between five and thirty-four minutes. The distance between the station and the project site is 1.5 miles, or about a 30 minute walk. This distance is beyond what a typical commuter is willing to walk, generally up to a ½ mile, to reach their final destination. 1.5 miles is a manageable distance for biking, however, as described below, there are limited bike facilities connecting Sunnyvale Station to the project site. The Station has 15 bike racks and 75 bike lockers available for reservation. There are no Caltrain shuttles that connect to the Sunnyvale Station. However, Caltrain riders can connect to the project site via VTA Bus Route 54, which has a transit stop at the intersection of Mathilda Avenue and Maude Avenue, a half mile from the project site.

The Mountain View Station is one stop north on the Caltrain route. Although the station is nearly three miles from the project site, it is made accessible via the Mary Moffett Shuttle connection. The shuttle, which is described in further detail in the Caltrain Shuttle section below, has a stop adjacent to the project site. The Mountain View Station is served by Local-stop, Limited-stop, and Baby Bullet (express) service, with a higher frequency of trains in the AM and PM peak periods compared to the Sunnyvale Station. In the AM peak period, the Station is served by nine Limited-stop and three Baby Bullet northbound trains, and two Local-stop, four Limited-stop, and four Baby Bullet southbound trains. In the PM peak period, the station is

SUNNYVALE STATION SCHEDULE

am - italics | pm - bold
yellow - limited-stop | red - baby bullet

MOUNTAIN VIEW STATION SCHEDULE

am - italics | pm - bold
yellow - limited-stop | red - baby bullet
served by six Limited-stop and five Baby Bullet northbound trains, and one Local-stop, seven Limited-stop, and three Baby Bullet southbound trains.

The Mountain View Station has 25 bike racks and 116 bike lockers available for reservation. The commute between the Station and the Project site is approximately three miles, or a 15-20 minute ride. Caltrain bicycle riders can commute nearly the entire way on bicycle facilities, including Central Expressway and E Evelyn Avenue.

**Caltrain Shuttle**

The *Mary Moffett Shuttle* operates between the Mountain View Caltrain Station and the Mary-Moffett area during commute hours. The shuttle operates four trips in the AM peak period and four in the PM peak period, coordinated with Local, Limited, and Baby Bullet service. The morning and afternoon schedules are included below. Funded by both public and private sources, the shuttle is free for all Caltrain passengers. The Mary Moffett Shuttle route provides direct service to the project site at the corner of Mary & Maude, in addition to two other stops within walking distance. The shuttle operates four AM trips and PM trips with approximately 1-hour headways. The shuttle schedule is summarized in Table 2 & 3.

LIGHT RAIL TRANSIT

Santa Clara Valley Transportation Authority (VTA) operates light rail transit (LRT) and bus service in Santa Clara County. The VTA Mountain View to Winchester Avenue light rail line (Line 902) runs on tracks west and north of the project site. The line operates between 4:46 AM and 12:39 AM on 15- to 30-minute headways. On weekends, service is provided between 6:04 AM and 12:39 AM with 30-minute headways. The Middlefield Station is one mile west of the project site, though not an ideal walking distance (approximately 20 minutes), it is a manageable 7-minute bike ride.

The Moffett Park Station, also served by the Mountain View to Winchester Avenue light rail (line 902) is located less than a mile north of the project site. Although close to the project site, it is difficult to access; there are no direct pedestrian or bicycle connections across U.S. Route 101 and California State Route 237 to the station. Light Rail riders can take VTA Bus Route 54, which provides service on N. Mathilda Avenue. The travel time between the Moffett Park LRT Station and the Project Site would be approximately 31 minutes by bus.

Operating characteristics of Line 902 are summarized in Table 4.

VTA BUS ROUTES

There are two VTA bus routes that serve the site, Route 54 and Route 32.

Bus Route 54 operates along Mathilda Avenue and provides service between De Anza College and the Lockheed Martin Transit Center. During weekdays, Route 54 serves the stops near the project site between 6:03 AM and 9:29 PM with 30-minute headways. On weekends, Route 54 operates between 7:51 AM and 7:51 PM with 45 to 60-minute headways. Bus stops for Route 54 are provided along Mathilda Avenue near Maude Avenue and Del Ray Avenue.

Bus Route 32 operates on Mathilda Avenue and could be used as a connection to Bus Route 54. Route 32 provides service between the San Antonio and Santa Clara transit centers. Route 32 follows major
arterials and travels through Mountain View, Sunnyvale, and Santa Clara. These routes are summarized in Table 4.

**Notes:**

1. Headways are defined as the time interval between two transit vehicles traveling in the same direction over the same route.

Sources: VTA, Caltrain, November 2011.
HOV LANES

High Occupancy Vehicles (HOV) lanes, also known as diamond or carpool lanes, restrict use to vehicles with two or more persons (carpool, vanpool, and buses) or motorcycles during the morning (5:00 AM to 9:00 AM) and evening (3:00 PM to 7:00 PM) commute periods. US 101 and State Route 237 (SR 237) provide regional access to the Project site. Both of these travel routes include HOV lanes.

US 101 extends north through San Francisco and south through San Jose. Near the project site, US 101 travels in an east-west direction with approximately 140,000 daily vehicles. The freeway has three mixed-flow lanes and one HOV lane in each direction.

SR 237 is an east-west freeway providing access between the Cities of Mountain View and Milpitas. SR 237 has two mixed-flow lanes and one HOV lane in each direction east of the Lawrence Expressway. Near the project site, SR 237 has an average daily traffic (ADT) volume of approximately 90,000 vehicles.

The Santa Clara Valley Transportation Authority (VTA) is implementing the Silicon Valley Express Lanes Program. The Express Lanes will give single-occupancy vehicles (SOV) the option of using an express lane by paying a toll. Tolls will vary throughout the day based on congestion levels to help maintain level of service and free-flow conditions. The current toll price will be displayed on electric signs above the lanes. Tolls and fees will be collected electronically using the FasTrak collection system. Carpools, motorcycles, and transit buses can continue to use the Express Lanes without paying the toll. Similar to HOV lanes, the Express Lanes will be separated from mixed-flow lanes by a painted buffer. The express lanes are expected to increase efficiency of the roadway and create a revenue stream that can be reinvested into facility maintenance and transit enhancement.

The Silicon Valley Express Lanes Program anticipates 34 miles of express lanes on US 101 by 2016, and by 2012, express lanes on the SR 237/I-880 connectors.

BICYCLE FACILITIES

Bicycles are an important component of the City's transportation network. The City of Sunnyvale's bikeways are classified as Class I, Class II, or Class III facilities, as follows and shown to the right:

- **Class I Bikeway** – bike paths within exclusive right-of-way, sometimes shared with pedestrians
- **Class II Bikeway** – bike lanes for bicycle use only that are striped within the paved area of roadways
- **Class III Bikeway** – bike routes are shared with motor vehicles on the street. Class III bikeways may also be defined by a wide curb lane and/or use of a shared use arrow stencil marking on the pavement, known as a “sharrow”

Existing bicycle facilities near the project site are shown on Figure 4. Class II Bike Lanes (in purple) are provided on N. Mary Avenue, W. Maude Avenue, E. Middlefield Road, and the Central Expressway. Class III Bikeways (in orange) are provided on Mary Avenue south of the Caltrain tracks, and a small network of streets east of Fair Oaks Avenue. A Class I Bike Path (in green) runs adjacent to SR 85.

The bicycle network provides a nearly complete route for bicyclists traveling from the Middlefield LRT Station, along Middlefield Road and W. Maude Avenue, and the Mountain View Caltrain Station, along the Central Expressway and N. Mary Avenue. Gaps in the bicycle network, especially on N. Mary Avenue.
Avenue, prevent a complete bicycle route between the Sunnyvale Caltrain Station and the project site. The City of Sunnyvale 2006 Bicycle Plan recommends future bike lanes on N Mathilda Avenue and W Maude Avenue, which will help complete the route. In the meantime, however, although current facilities do not exist on these streets, N. Sunnyvale Avenue and Maude Avenue would serve as the most direct and practical bicycle route between the Sunnyvale Caltrain Station and project site.

PEDESTRIAN FACILITIES

Pedestrian facilities include sidewalks, crosswalks, trails, and pedestrian signals or warning devices. Sidewalks are located on both sides of the streets adjacent to the project site: N. Mary Avenue and W. Maude Avenue. There is a continuous sidewalk from the VTA Bus 54 stop at W. Maude Avenue and N. Mathilda Avenue, which provides a safe walking route for bus commuters to the project site. Sidewalks and crosswalks are also provided on the walking route from the Middlefield LRT Station, a mile west of the project site. The signalized N. Mary Avenue and W. Maude Avenue intersection adjacent to the project site includes both crosswalks and curb ramps. The next intersection north, N. Mary Avenue and Benecia Avenue, neither has crosswalks nor curb ramps. As mentioned earlier, SR 237 and US 101 create a barrier between the Moffett Park LRT Station a mile north of the project site. There is no direct pedestrian under or over crossing.
CHAPTER 3. LIST OF POTENTIAL TDM MEASURES AND STRATEGIES

The City of Sunnyvale has a long list of TDM measures and strategies that are described in Transportation Demand Management (TDM) Tool Kit, prepared by The Hoyt Company in December 1999. Since that time new measures and strategies have been developed primarily based on the prevalence of web-based tools. The list of measures from the toolkit is summarized in Tables 5 and 6. Measures from this list plus more recent measures that are included in the TDM Plan for 580 N. Mary Avenue are described in the next chapter.

The Sunnyvale TDM Tool Kit Measures can be divided into two sets of strategies: Planning and Design, and Programs and Services. The Planning and Design strategies are part of the initial planning of the development to ensure that multiple modes of travels will be supported by a project’s design, including sidewalks, bicycle parking, and urban design features. Further, these provisions help connect the project to its surrounding environment and transportation networks.

### On-Site Amenities

- Cafeteria with hot food service, ATM, exercise facilities, convenience retail, childcare, valet service, post office/stamps, Onsite transit pass sales

On-site amenities provide services that would otherwise require a separate trip before, during, or after work hours.

Source: Transportation Demand Management (TDM) Tool Kit, prepared for the City of Sunnyvale by The Hoyt Company, December 1999.

Fehr & Peers, 2011.

The Program and Service TDM measures are typically employer-implemented strategies that support employee specific commuting options. These programmatic measures are often dependent on the design measures. For example, bicycle parking at the project site will be necessary for an effective employee bicycle program. The program and service measures are listed and described in Table 6.

**Telecommuting**

| Telecommuting                     | Telecommuting allows employees to work from home or from neighborhood telecenters via telecommunicatiions. |

**Alternative work schedule**

| Flextime                          | Employees set or modify their arrival and departure times.                                             |
| Staggered Work Hours              | Work units or groups select or are assigned different starting and ending times for their work day.     |
| Compressed Work Week              | Employees work more hours in a single day, but fewer days of the week.                                 |

CHAPTER 4. SELECTED TDM MEASURES AND STRATEGIES

The TDM measures and strategies for 580 N. Mary Avenue are based on the physical attributes of the site and the proposed building, plus the transportation facilities and services currently near the site. Additional measures would be needed to achieve the trip reduction goals. These measures include programs that would be created by the tenants. Therefore, they would need to be included in lease agreements or some other instrument to ensure their implementation.

SITE AND DESIGN MEASURES

Building-Related Measures

1. Building Entries

The main building entrance is located on W. Maude Avenue, a roadway with pedestrian facilities. Locating the building entrance near pedestrian facilities supports an active pedestrian environment and encourages walking and transit use.

2. Building Setbacks

The building is located close to both N. Mary Avenue and W. Maude Avenue with only a circulation aisle and one or two rows of parking between the building and the street. Locating the building near pedestrian facilities encourages walking and transit use. Alternatively, having seas of parking between the roadway and the building encourages driving.

3. Passenger Loading Zones

The passenger loading zone is near the main entry. It is convenient for carpools and vanpools dropping off passengers. Passenger loading zones are also convenient if the project decides to implement a shuttle program in the future.

4. Building Wiring

The building will be wired with fiber optics to facilitate telecommuting.

Parking Design Measures

5. Parking Configuration

The parking lot layout is conducive for pedestrian access and circulation. The building entrances are a short distance from the street sidewalks with clearly defined pedestrian walkways and crossings.

6. Preferential Parking

There are several areas on the site plan near the building entrances that could be designated as carpool and vanpool spaces. These spaces would be located in premium and convenient locations to incentivize carpooling. If the spaces are underutilized, the carpool spaces may be made available to single occupancy vehicles after peak commute times.
Pedestrian Design Measures

8. Minimize Walking Distances

As described under Building Entries and Building Setbacks, the building design and placement on the site are such that pedestrian walking distances to the sidewalks on the adjacent streets are minimized.

9. Pedestrian Connections

The parking lot layout is conducive for pedestrian access and circulation. The building entrances are a short distance from the street sidewalks with clearly defined pedestrian walkways and crossings.

Bicycle Design Measures

10. Showers and Lockers

The building will have shower facilities and lockers and/or changing facilities to accommodate people bicycling to work. Shower and changing rooms will help promote bicycling as an alternative commute option for interested employees.

11. Bicycle Parking

The site plan depicts 16 bicycle lockers located adjacent to the building on the N. Mary Avenue frontage and bike racks accommodating 6 bicycles on the opposite end of the building. The number and placement of bicycle facilities is adequate according to the City of Sunnyvale municipal code.

PROGRAM AND SERVICE MEASURES

In addition to the Site and Design attributes that contribute to alternative mode use, the tenants of the building will need to provide additional measure to meet the TDM goals. These measures include a Commute Trip Reduction Program and subsidized transit passes.

12. Commute Trip Reduction Program

The Commute Trip Reduction Program includes a variety of measures to encourage ridesharing, bicycle use, and transit use such as:

a) Dissemination of TDM information
b) Carpooling encouragement
c) Ride-matching assistance
d) Preferential carpool parking
e) Flexible work schedules for carpools
f) Part-time transportation coordinator

This program incorporates many of the programs in the toolkit list including carpool, pedestrian, bicycle, and promotional programs. It would be managed by a part-time transportation coordinator who would be responsible for disseminating information, overseeing promotional activities, and conducting the annual monitoring and reporting. Information regarding transit service in the area plus connections to the site, maps of bicycle facilities, etc. and/or website links should be included in employee handbooks and discussed during new employee orientation. Carpooling should be encouraged by either providing a
carpool matching program on-site or via peer-to-peer matching program such as ZimRide. Bicycling should be encouraged by adopting a bicycle program that pairs riding buddies, promotes Bike to Work Day, and provides introductions to the basics of bicycle commuting and safety.

13. Subsidized Transit Passes

All employees who elect to use transit should be provided with subsidized transit passes through the Commuter Check or other similar program.

ADDITIONAL MEASURES

If the TDM monitoring shows that the trip reduction goals are not met, then measures would need to be added to the plan. Examples of measure that could be added are described in the following sections.

14. Guaranteed Ride Home

A common reason that employees do not use alternative modes (i.e., carpool, vanpool, or transit) is the inability to leave work unexpectedly for a family emergency or the fear of being stranded if they need to work late. One TDM element that allays these fears is a Guaranteed Ride Home program. With this program, employees can use a taxi service, rental car, or other means to get home, and the employer pays for the service. The lease agreement will state that the tenants must participate in a Guaranteed Ride Home program, which will be managed by the TDM Coordinator. Employees who wish to use the service would contact the transportation coordinator to make the travel arrangements.

15. Parking Cash-Out

With a parking cash-out program, employees are offered the option of a “free” parking space or a cash equivalent that can be used to offset the cost of commuting by an alternative mode. Employers would be required to offer employees a cash payment equivalent to the cost of the parking space to the employer based on their rent payments.

16. Shuttle Bus Program

The project employer’s would establish a shuttle bus program that transports employees to residential locations, transit centers, or designated pick-up and drop-off stops.

TRIP REDUCTION EVALUATION

The project’s TDM target is a 23 percent reduction in peak hour trips. This target stems from the project’s increased FAR from the designated 35 percent FAR for the site to the project’s planned 55 percent FAR.

Methods documented in *Quantifying Greenhouse Gas Mitigation Measures*¹, a report recently released by the California Air Pollution Control Officers Association (CAPCOA), were used to estimate the trip reduction effects of the proposed TDM strategies. The CAPCOA report provides methods for quantifying vehicle miles traveled (VMT) and vehicle trip (VT) reduction for a list of mitigation measures, primarily focused on project-level mitigation. The CAPCOA measures were screened on the basis of the feasibility of quantifying the reductions, the availability of robust and meaningful data upon which to base the quantification, and whether the measures would result in appreciable reductions. The report represents

the state of practice in quantifying effectiveness of TDM strategies. It has been adopted into CalEEMod, a statewide land use emissions model developed in collaboration with the air districts of California, and is recommended for use in California Environmental Quality Act (CEQA) documentation by the Bay Area Air Quality Management District.

The Site and Design measures and the Program and Service measures are projected to have a combined reduction of 16 percent based on the empirical data in the CAPCOA report. This meets the minimum goal of a 16 percent reduction. Adding the guaranteed ride home, parking cash-out, and shuttle bus program are anticipated to increase the total reduction to 19 percent. The actual reductions and resulting vehicle trip generation will be measured during the annual monitoring and reporting process discussed in the next chapter.
CHAPTER 5. MONITORING, EVALUATION, AND REPORTING

The intent of the TDM plan is to reduce vehicle trips and lessen the impact to traffic congestion anticipated to occur by the proposed development. Therefore, it is important to ensure strategies are implemented to monitor and evaluate how successful the programs are in performing their respective reductions and report the results to the City of Sunnyvale. The monitoring program will evaluate how effective the strategies are in meeting the reduction goals and identify areas the plan may be enhanced to assist the needs of the tenants on site.

The goal of the TDM program is a trip reduction of 27 percent, with a minimum allowable reduction of 16 percent. The program will be assessed annually to assess compliance with the target rate. The City will base TDM program compliance on the percentage of total employees who used transportation alternatives, not the percentage of survey respondents. Survey non-respondents will be assumed to be driving alone and will count against the compliance rate. It is important to conduct as thorough a survey as possible. The following procedures will be used to monitor and evaluate how effective the strategies are in meeting the target rate.

Annual Commute Surveys – Surveys will be provided by the developer or building tenants (employers) to measure the number of employees commuting by alternative modes. The survey results should include mode splits and employee perceptions of the strategies available to them. Results will be used to monitor how effective current strategies are and enhance areas not meeting expectations.

The developer/building tenants (employers) must survey every year to collect data required for the TDM Annual Status report. The new data should be analyzed and compared to the previous survey results to determine progress and potential modifications needed to improve the program.

TDM Status Report to the City – A TDM report presenting a summary of the survey results will be provided to the City for review. It will provide the progress and effectiveness of current strategies and identify areas in need of improvement. For areas identified in need of improvement, the report should present what changes will occur in the TDM plan and how these enhancements are anticipated to meet the target rate.

Modifications to the TDM Program – The Transportation Demand Management (TDM) Tool Kit, CAPCOA report, and other TDM research documents should be consulted to identify modifications to the TDM program that will result in increases in alternative mode use and decreases in vehicle trips.

A successful TDM program will reduce the development’s impact to traffic congestion and improve air quality in the community. When alternative mode commute trips are increased and drive alone commute trips are reduced the program is effective.
CHAPTER 6. SUMMARY AND CONCLUSIONS

This report presents the TDM plan for the office development at 580 N. Mary Avenue. The purpose of this plan is to reduce the number of vehicle trips generated by the site. It contains a number of measures and strategies that encourage the use of alternative modes of travel such as transit, ridesharing (carpooling and vanpooling), bicycling, and walking.

The proposed building size results in a FAR for the site of 55 percent, where 35 percent is allowed. The goal of this TDM plan is to offer a reduction equivalent to the trip difference between 35 and 55 percent FAR, or a 27 percent average AM and PM peak hour reduction. The minimum reduction goal of the TDM plan is to offer a reduction equivalent to the trip difference between 35 percent and 45 percent FAR, or a 16 percent average AM and PM peak hour reduction.

This comprehensive TDM Plan was designed to meet the specific needs for this project. The planning, design, program, and service strategies will reduce project trips by 16 to 19%. In addition to reducing single-occupancy vehicle trips, this TDM Plan will make use of existing regional and local transit systems, and provide flexible commuting solutions for future employees.

The TDM measures and strategies are based on the physical attributes of the site and the proposed building, plus the transportation facilities and services currently near the site. Additional measures would be needed to achieve the trip reduction goal of 27 percent. These measures include limiting parking supplies, implementing a car share program and improving transit system frequency and accessibility.
TRANSPORTATION DEMAND MANAGEMENT (TDM) TOOL KIT

WHAT IS TDM?

Transportation Demand Management (TDM) is a combination of services, incentives, facilities and actions that reduce automobile trips to help relieve traffic congestion, parking, and air pollution problems. TDM encourages more efficient use of our transportation system.

WHY IS TDM IMPORTANT TO THE CITY OF SUNNYVALE?

Growth and expansion experienced in the region has contributed to the increased demand on our local transportation systems. This increased demand results in traffic congestion, greater traffic volumes and declining air quality (50% of our air pollution comes from mobile sources). In fact the increased demand impacts a number of factors which are important to the City of Sunnyvale including:

Economic Growth: Efficient transportation access to employment and shopping sites is an important consideration to business and developers when considering expansion opportunities. A good transportation system is an important selling point of communities that desire to attract development. In addition, good transportation is very important to the movement of goods and services and thus has a direct impact on sound economic growth and productivity.

Environmental Quality: Congested road conditions can have a detrimental effect on the environment, in particular air quality. Making improvements to the transportation system or trying to change travel behavior has been an important objective of those wanting to improve environmental quality.

Quality of life: To some people, congested highways and roads are a symptom of deteriorating quality of life in a community. Transportation is an important issue for our residents. Safe and convenient access to jobs is a key quality of life issue for people who live and/or work in Sunnyvale.

The purpose of Transportation Demand Management is to promote more efficient utilization of existing transportation facilities, and to ensure that new developments are designed in ways to maximize the potential for alternative transportation usage.

LAND USE PLANNING AND SITE DESIGN MEASURES

Sometimes called "urban design" or "transit oriented design", these are measures that are incorporated in the planning phase of a development that will ensure that
the development is designed to reduce single occupancy vehicle (SOV) trips, and encourage alternative transportation usage. The strategies associated with this type of urban design can range from provision of sidewalks, to the design orientation of an entire development that is more conducive to pedestrian movement. Design considerations can also provide stronger intermodal connections for the community, providing opportunities for pedestrians and bicyclists to better link with transit and regional pedestrian/bike trail system.

Any new development in the City of Sunnyvale should take into consideration existing and planned transit, bikeway, pedestrian and roadway facilities when designing the project.

Benefits/Costs: The benefits of urban design strategies to enhance mobility are primarily found in the increased use of alternative modes of transportation and the reduction in vehicle miles traveled for these types of communities.\(^1\) They also can benefit the developer by creating a more marketable project.

\(^1\) Institute of Transportation Engineers, A Toolbox for Alleviating Traffic Congestion and Enhancing Mobility, 1997, p. 226.
LIST OF PLANNING/DESIGN MEASURES
I. LIST OF PLANNING/DESIGN MEASURES:

A. BUILDING DESIGN/LAYOUT

1. Building Entries. Building entries should be orientated toward plazas, parks, and pedestrian oriented streets rather than oriented towards parking lots. Entrances should be close to existing or planned transit stops.

2. Building Setbacks. Building setbacks should be reduced and standardized to provide closer access to sidewalks and transit stops.

3. Passenger Loading Zones. Passenger loading zones should be placed in convenient locations near entrances, preferably covered, to provide accessible locations for the drop off and pick up of carpool and vanpool riders and transit/shuttle passengers.

4. Building Wiring. Buildings should be wired with fiber optics to facilitate teleworking.

B. TRANSIT DESIGN ELEMENTS

1. Intersection Geometrics. Street intersections should be designed to accommodate transit vehicles (including internal project circulation roads if bus or shuttle service is anticipated to enter project).

2. Street Designs. Street designs should be structurally capable of supporting the weight of buses (including internal project circulation roads if bus or shuttle service is anticipated to enter project).

3. Land Dedication for Transit Facilities. Land may be dedicated for construction of a rail station/bus stop or other purposes related to transit if a need is determined by the transit district. Evidence of the land dedication is required prior to the issuance of building permit or in conjunction with the final filing of an approved parcel or tentative map. This measure will provide for future transit accessibility and growth.
4. Transit Passenger Shelter/Bus Stop. If the proposed development is located along an existing or designated transit route the applicant may want to include this TDM measure. The applicant must agree to construct or pay for the construction of a shelter or bus stop on or adjacent to the property.

5. Bus/Rail Station Subsidy. When a proposed development is located within 1/4 mile from a bus route or 1/2 mile from a site designated as a future bus transit center/rail station, the applicant may agree to pay all or part of the cost associated with that center. Land, construction and/or maintenance of the center/station are included in these costs. The applicant may agree to cover the expenses of another center/station within the transit system in lieu of constructing a new facility.

C. PARKING DESIGN MEASURES

Perhaps more than any other TDM action (other than congestion pricing), parking management can have a dramatic impact on travel behavior. Two important benefits to developers of reduced parking requirements are the savings in construction costs associated with reduced parking, and the availability to utilize land that otherwise would be used for parking as increased density or project amenities such as landscape or park area. The actual savings in cost will vary from one location and situation to another. A study estimated that the capital cost of parking structures at UCLA was at least $23,600 per parking space added, and the average cost of providing parking was at least $124 per space per month (Shoup 1995).

1. Off Street Parking. Off street parking should be primarily located on the side or in the rear of buildings; not in the front of the building resulting in a sea of parking between any transit service and the building.

2. Parking Configuration. The parking lot layout should not dominate pedestrian oriented streets or interrupt pedestrian routes.

3. Preferential Parking. Designate spaces for "carpool/ vanpool/alternative fuel vehicles only." The spaces must be labeled or marked carpool/vanpool/alternative fuel vehicles
only. A minimum of 10% of all parking places should be permanently reserved. Placement of the spaces must be designated in the construction plans, and approved prior to receiving the building permit. The rules and regulations regarding the usage of the preferential parking and auditing procedures must be defined as part of the Annual TDM Status Report submitted to the City of Sunnyvale.²

4. Reduced Parking. Reducing the number of parking spaces combined with a strong TDM program can help shift people into alternative modes of transportation. This can save developers a tremendous amount of money in real estate and construction costs by not having to build the maximum number of parking spaces allowable. This measure should not be utilized without companion TDM measures (such as subsidized transit passes for employees).

5. Reduced Parking Fees. In the event that a site has paid parking, the preferential parking spaces are provided free (or reduced by at least 50%) to incentivize employees to carpool, vanpool, or purchase clean fuel vehicles. This incentive works in tandem with the High Occupancy Vehicle (HOV) lanes in and around Sunnyvale, allowing carpools and vanpools to commute quickly and cheaply.

D. PEDESTRIAN DESIGN MEASURES

1. Minimize Walking Distances. Designing pedestrian access so that there is the minimum walking distance and/or the most direct route to transit stops will help promote transit usage.

2. Pedestrian Connections. Safe, convenient pedestrian connections should be provided from the project to surrounding external streets. Lighting, landscaping and building orientation should be designed to enhance pedestrian safety.

3. Internal Pedestrian Access. Safe, convenient pedestrian walkways should be incorporated into the project design.

² Refer to City of Sunnyvale zoning code section 19.48.025 Preferential parking for carpool vehicles, and Ord. 2081-83 § 14: Ord. 1967-80 § 15.
E. BICYCLE DESIGN MEASURES

1. Showers and Clothes Lockers. The applicant may provide shower and clothes locker facilities free of charge for the employees of the development to encourage bicycle commuting and walking. Half length lockers are preferable as they allow employees to store professional clothing without it becoming wrinkled. The applicant shall specify the number of and location of such facilities, and if user fees will be imposed. Shower and locker facilities should be conveniently located near the bicycle storage facilities. These must be included in building plans.

2. Bicycle Parking. Secured bicycle parking facilities shall be located in convenient, safe, clean and well lighted areas, near building entrances, out of pedestrian parks, and within view of windows, security offices or high volumes of pedestrian traffic. Secured bicycle parking shall be protected from the weather and have surfaces that are mud, dust and debris free, and not be adjacent to car parking or traffic lanes without adequate protection.

Secured bicycle parking devices shall include the following: lockers; or enclosed, locked limited access areas with rigid metal racks or fixed stationary objects which allow the bicycle frame and both wheels to be locked with a bicycle locking device or the bicyclist supplying only a lock and six foot cable. Secured bicycle parking shall be located in a flat area on the ground level. If located within a building, secured bicycle parking shall be easily accessible on the ground floor or by elevator to other floors. Reasonable and sufficient ingress and egress must be provided so that a bicycle may be easily moved in and out of the locker or locked limited access area.

3. Short-Term Bicycle Parking. Short-term bicycle parking provides shoppers, customers, messengers and other visitors who generally park for two hours or less a convenient and readily accessible place to park bicycles.

a. Short-term bicycle parking shall be located within 50 feet of a main entrance.

b. Distribute short-term parking. Where there is more than one building on a site, or where a building has more than one main entrance, the parking must be distributed to serve all buildings or main entrances.

c. If more than 10 short-term spaces are required at least 50% must be covered.
4. **Long-Term Bicycle Parking.** Long-term bicycle parking provides secure weather protected parking for bicyclists who stay on site for several hours.

   a. **Cover.** At least 50% of long-term spaces must be covered.

   b. **Security.** Security must be achieved in one of the following ways:
      - In a locked controlled access room or area enclosed by a fence with a locked gate.
      - Within view or within 100 feet of an attendant or security guard.
      - In an area that is monitored by a security camera.

F. **ON-SITE AMENITIES**

On-site amenities provide services at the development that otherwise would require a separate trip before, after or during work hours. On-site amenities can include such things as:

1. Cafeteria with hot food service
2. Automatic teller machine
3. Exercise facilities
4. Convenience retail (newspaper, sundries, snacks, nylons, etc.)
5. Childcare
6. Valet services (dry cleaning, auto detailing, bicycle tune-up/repair service, etc.)
7. Post office/stamps
8. On-site transit pass sales

G. **INFORMATION BOARDS**

Information boards and/or kiosks located in the design of the development provide for a permanent location for TDM information. These information boards must be updated regularly to keep the information current and interesting.
LIST OF PROGRAM/
SERVICE MEASURES
II. LIST OF PROGRAM/SERVICE MEASURES

TDM Program/Service measures are programs, incentives and marketing activities that promote alternative mode usage. Some of these strategies, such as a telework program, can only be implemented by the employer. However, there are some things that a developer can do that will assist an employer's ability to implement these measures (i.e. in the case of telework, the developer can install fiber optic wiring). In addition, if the developer is also going to be the occupant (i.e. Applied Materials builds a building to house Applied Materials' employees), then Program/Service measures should be an integral part to a comprehensive TDM program.

The TDM Matrix (see Attachment) identifies which measures can be implemented by developers, and which measures can be implemented by employers.

A. TRANSPORTATION COORDINATOR SERVICES

The Transportation Coordinator is responsible for developing, marketing, implementing and evaluating the TDM programs. The Transportation Coordinator is a designated, on-site staff person (half to full time) with specific TDM responsibilities and authority. The TDM programs and design measures that you implement will not be used unless they are actively promoted. Transportation Coordinator duties at a minimum should include:

1. Distribution of pertinent information to all tenants/employees regarding the facilities, programs and services available at the work site.

2. Contracting and acting as a liaison to all appropriate transit agencies. This includes distribution of appropriate transit information, transit passes, commuter check, and any other duties related to the utilization of transit services.

3. Contacting and acting as a liaison with Rides for Bay Area Commuters, the Bay Area Air Quality Management District, Santa Clara Valley Transit and other transportation agencies.

4. Distribution of carpool/vanpool matching applications to all new tenants upon occupancy and/or new employees upon hire, as well as on an annual basis.

5. Distribution of alternative commute mode information to all new tenants upon occupancy and/or new employees upon hire, as well as on an annual basis. This shall include, but not be...
limited to, transit information, bicycle maps, vanpool information, preferential parking information, guaranteed ride home information, etc.

6. Distribution and placement of fliers on informational boards and kiosks and other appropriate locations. At a minimum this information should be updated quarterly.

7. Development and implementation of promotional programs and/or coordination with regional promotional programs relating to TDM. Regional programs includes such campaigns as California Rideshare Week, Bike to Work Week, Spare the Air Programs, Clean Air Month, and Back to Transit. Information on the regional programs can be found on the RIDES web page (www.rides.org/).

8. Monitoring and evaluation of TDM programs including an annual survey of tenants/employees and development of annual status report which is submitted to the City of Sunnyvale on or before January 1st each year.

B. CARPOOL PROGRAMS

A carpool is two to six people sharing a ride in an automobile. The most common carpool approach is rotating automobile use among carpoolers with no exchange of money. Another method is a carpool group using one car and sharing commute expenses. Either way, the driver of the carpool has the vehicle available for personal or company use during the workday. Carpooling reduces the cost of commuting and provides a stress-free ride to and from work for non-drivers. The City of Sunnyvale is fortunate to have a number of High Occupancy Vehicle (HOV) lanes which provide a tremendous time savings and therefore incentive for carpoolers.

Carpooling is an easy TDM program to implement, simply put it aims to fill an empty seat in a commuting automobile. Carpools can provide door-to-door directness and a convenience level and flexibility that is most like a single occupancy vehicle. A carpool can be as simple as a husband and wife, or neighbors commuting together. The biggest barrier to carpooling is committing to a common work schedule. This can cause difficulties for commuters whose work hours are not consistent from one day to the next. Often these problems can be avoided through schedule planning, part-time carpooling, and the provision of back-up services, such as a guaranteed ride home when unexpected situations arise.
Developers can implement physical improvements that will assist carpool formation. Developers who also occupy the building can implement an employee carpool program.

Program Implementation:

1. Call RIDES for Bay Area Commuters. RIDES can help you with free services to help your company promote commute alternatives including a regional carpool matching database. The RIDES Commute Services Representative for Santa Clara County is Linda Furnas (510) 273-2069.

2. Use your survey results and an annual distribution of carpool matching information to find out how many employees are currently carpooling, and the number of employees that are interested in carpooling.

3. Determine what complementary design measures and programs that you can incorporate into your carpooling program. Do you provide preferential parking? Do you offer a Guaranteed Ride Home Program? If not, can you implement one? Does your budget allow you to offer incentives or prize drawing for carpoolers?

4. Get the word out! Market your carpooling program to your employees. Utilize established company communication mediums (newsletters, employee memos, e-mails, staff meetings) and specialized events and marketing pieces.

5. Periodically touch base with employees who were carpool candidates. See if they indeed switched transportation modes. Ask them what is working, or what programs could help them commit to a carpool option. Do not substitute this informal contact for comprehensive monitoring and evaluation.

6. Monitor and evaluate your program. Include the evaluation results in your annual status report. Utilize your annual survey as a basis for your evaluation. Add qualitative results such as commuter testimonials as well.
C. VANPOOL PROGRAMS

A developer could implement a vanpool program by subsidizing the cost of a vanpool for a set number of years or by providing company sponsored vanpools. Company sponsored vanpools would make most sense when the developer was also the employer (i.e. owner/occupant) of the building.

A comprehensive vanpool program can be an integral part of your TDM program. Vanpool formation and operation can require special assistance. RIDES for Bay Area Commuters has staff who specialize in vanpools. They can help you start and promote a vanpool program at your work site. They provide free presentations and step-by-step assistance to help you or your employees organize vanpools. The City of Sunnyvale is fortunate to have a number of High Occupancy Vehicle (HOV) lanes which provide a tremendous time savings and therefore incentive for vanpoolers.

Vanpools operate like a mini-transit service, with an organized route, schedule and passenger fare charges. Vanpools are comprised of 7 to 15 people. Fares depend on the commute distance, the total number of riders, the type of van, company-provided equipment, and incentives or subsidies. For passengers, vanpools provide a low cost, convenient, stress-free commute. Typically, the vanpool driver rides free of cost in exchange for driving, collecting fares, and managing maintenance for the van. Vanpooling is a great way to utilize the High Occupancy Vehicle Lanes in Santa Clara County and the region.

Site benefits of a vanpool program can include:

- Reduced demand for parking.
- Improved access to employment sites where traffic congestion is a problem.
- Improved community relations as a result of decreased traffic, energy use, and air and noise pollution.
- Better access to an expanded labor pool.

1. Developer/Employer-sponsored: The company owns or leases the van(s) and administers the program. Riders pay a fare that represents their prorated share of operating cost. The driver typically rides for free. A company can choose to subsidize the van in direct or indirect ways. Employer sponsored vans usually carry company employees only and are not available for other riders.
Advantages:

- Possible lower passenger fares.
- Potential for fare collection through payroll deductions.

Other considerations:

- Financial obligation for van(s).
- Insurance and legal liabilities.
- Long-term commitment.
- Personnel and budget allocations required to operate the vanpool program.

2. Subsidized Vanpools: There are two types of vanpool that a developer could subsidize a third party lease arrangement, or an owner/operated vanpool. In either case, the developer could commit to providing a certain amount on a monthly or annual basis to help pay for the cost of vanpooling.

3. Third-party Lease: A group of employees lease a van from an auto dealership, van leasing company, transit agency, or nonprofit organization. Vans are generally leased on a 30-day basis. Van lease rates are based on cost of the vehicle, maintenance, mileage, fuel cost and insurance costs.

Advantages:

- Leasing company assumes legal and financial responsibility for the van(s). Insurance coverage is available through the vendor.
- Leasing company is responsible for van maintenance.
- Immediate program start-up.
- Vendor may help design and maintain the program.

Other considerations:

- Possible higher passenger fares.
- Lack of employer control over vanpool vehicle.

4. Owner-operated: The vehicle and vanpool is the sole responsibility of the employee acting as owner/driver. The owner has complete responsibility for organizing the vanpool, and all financial, maintenance and insurance requirements.
Advantages:

- Employee's vehicle is funded by fares.
- Possible lower passenger fares.
- No company capital investment or administration required.

Other considerations:

- Insurance coverage may be expensive and difficult to obtain.
- Driver/owner administers the program.
- Driver absorbs the cost if the program fails.

Program Implementation:

1. Call RIDES for Bay Area Commuters. RIDES can help you with free services to help your company promote commute alternatives including vanpool formation assistance. The RIDES Commute Services Representative for Santa Clara County is Linda Furnas (510) 273-2069.

2. Identify clusters of potential vanpool riders. You can do this through your Commute Mode Survey, e-mail, posting “vanpool riders wanted” flyers, at a transportation fair, or through newsletters. If possible, tap into human resources departments and identify clusters of employees via home zip code data.

3. Determine design elements and programs that can be incorporated into your vanpool program. Do you have preferential parking? Do you have a Guaranteed Ride Home program?

4. Market your program. Contact the potential riders to determine interest in vanpooling. Determine if there is a concentrated level of interest in vanpooling originating in one area or corridor.

5. If the level of interest is strong, bring the potential riders together to:

- discuss the benefits of vanpooling
• discuss possible route, pick-up points, work schedules
• discuss the fare structure
• determine driver(s)
• discuss any company sponsored benefit (subsidy, free parking, etc.)
• discuss vanpool type (owner-operated, company sponsored or third party lease)

6. Determine type of vanpool; employer sponsored, third party provider or owner operator. Secure vehicle(s).

7. Determine vanpool fares.

8. Complete driver qualifications and medical screening.

9. Arrange for insurance and adequate maintenance.

10. Set the vanpool rules.

• Determine wait time at stops.
• Determine procedure to notify driver of days when you won’t be a rider due to vacation, illness, etc.
• Determine hours of operation, schedule to arrive 5 to 10 minutes early to allow for unforeseen delays.
• Determine policies for the radio, eating on the van, etc.

11. Begin vanpool service.

12. Monitor and evaluate your program. Utilize your annual survey for quantifiable results. Monitoring can include requiring vanpool drivers to provide you with a copy of their monthly log sheets, and/or parking lot counts.
D. TRANSIT PROGRAMS

Public transit provides practical transportation at a low cost. Transit systems in the Sunnyvale area include bus, shuttles, commuter and light rail. Public transit is an essential part of our transportation system. Transit plays a particularly important role in serving peak period travel demands associated with the commute and school trips. Transit also provides basic mobility for people who do not have an alternative. For many commuters, transit is the preferred choice of travel during the peak periods because commutes are more relaxing with someone else driving and faster in HOV or dedicated rail lanes.

Do not rule out transit if the nearest stop is more than 1/4 mile from your work site. Look for opportunities to connect employees to transit via a shuttle program, by advocating for a transit route change to serve your work site, or by encouraging bicycles to be allowed on buses (to travel the remaining distance).

Developers can incorporate site amenities such as transit shelters, transit stops, or space for on-site transit pass sales that will encourage transit as well as provide transit subsidies for tenants.

1. Transit pass subsidy. Developers and/or employers can subsidize transit passes. Providing financial incentives by partially or fully subsidizing transit passes makes this choice more attractive. An employer can provide up to a $65 per month tax-free transit subsidy. The varying bus and train systems in and around Sunnyvale are key to reducing the number of cars on the roads.

   a. Commuter Check - Commuter Checks are vouchers employees or tenants can use to subsidize transit passes or vanpool fares. Commuter Check Services Corporation (CSCS), based in Englewood, NJ, was formed in 1990 to operate transit fare discount programs as a self-supporting service in coordination with local public transit operators, metropolitan planning agencies and State transportation departments. Over 1500 Bay Area employers participate in Commuter Check.
b. Eco Pass - The Eco Pass is provided by Santa Clara VTA. Companies purchase passes annually for employees and receive a tax write off in return. Over 40,000 Silicon Valley workers are part of the Eco Pass program.

2. On-Site Transit Pass Outlet. Contact your local transit agency to see if your work site can be set up as a transit pass outlet. Providing transit passes for sale at the work site offers a convenient way for your employees to purchase transit passes. Use monthly number of passes sold to help you monitor your transit program.

a. Regional Transit Connection (RTC) - The Regional Transit Connection (RTC) is the transit ticket clearinghouse serving Bay Area employers. By delivering transit tickets to your work site, RTC enables you to provide your employees with tickets from eight Bay Area transit systems. You can choose to either sell them to your employees or offer them as part of a transit subsidy benefit. By creating a convenient way for your employees to buy transit tickets, RTC encourages the use of public transit. More transit usage means fewer cars on the road and a better quality of life for everyone in the Bay Area.

b. How does RTC work?

i. RTC will help you design a program that is right for your company. You decide which tickets to offer, how tickets will be sold, whether to subsidize ticket costs and how employees will pay.

ii. Submit a ticket order each month. RTC can assist you in determining what quantities and which tickets and passes best fit your employees' or tenants' transit needs.

iii. Each month, RTC staff will deliver your tickets by mail or in person. Deliveries are scheduled between the 17th and the 25th of every month.

iv. All tickets are held on consignment. Each month you pay RTC only for the tickets you sell.
RTC sells tickets from the following transit agencies:

- AC Transit
- Alameda-Oakland Ferry
- BART
- Caltrain
- County Connection
- Golden Gate Transit
- MUNI
- SamTrans

More than 160 companies in the Bay Area participate in the RTC program. Call MUNI Tickets to Go at (415) 923-6050 to speak with an RTC representative. Once you are signed up, your ticket order will be delivered to you each month.

3. Shuttle Programs. Developers can sponsor shuttle programs to provide convenient connections to transit and rail stops. In addition, shuttle programs which operate during the mid-day can reduce the need for automobile driving for work related travel and lunchtime trips.

4. Monitoring & Evaluation. Developers can monitor and evaluate your transit program in a number of ways. Include quantifiable results (number of transit riders, number of cars removed from work site) as well as qualitative results (i.e. commuter testimonials) whenever possible. Developers can monitor transit ridership by tracking pass sales, and or obtaining ridership counts from your transit agency.

E. PARKING PROGRAMS

1. Preferential Parking. Reserved, preferred parking spaces set aside for carpoolers can be an incentive for employees to join a car and vanpool or drive an alternative fuel vehicles. These spaces are typically the best spaces in the parking lot, close to the building, in the shade or in a covered location. Use your preferential parking program to help monitor car and vanpool participation.
Developers can implement preferential parking or paid parking programs at leased buildings through property management; developer/occupants can implement this program on-site for their employees.

To implement a preferential parking program:

a. Designate premium parking spaces for registered rideshare (carpool/ vanpool/alternative fuel) vehicles only. Stripe the parking spaces and sign them reserved carpool/vanpool.

b. Numbering the spaces helps with monitoring the program. However, some programs will simply set aside a certain number of reserved preferential spaces and not actually assign a specific spot to the participant.

c. Register carpoolers/vanpoolers and alternative fuel vehicles and assign parking spaces. Be sure to obtain the names, telephone numbers/extension of the participating person. Also list make, model and vehicle license plate numbers.

d. Provide each participant a placard to hang from the rear view mirror or place on their dashboard in order to identify the vehicle as a carpool/vanpool or alternative fuel vehicle. If assigned parking spaces are designated, clearly mark the space number of the placard as well.

e. Monitor the preferential parking spaces to ensure that the spaces are used by car and vanpoolers and alternative fuel vehicles.

   i. Ask other employees to report vehicles that are illegally parked in the preferential parking spaces.

   ii. If applicable, have on-site security monitor the preferential parking spaces as part of their daily rounds. Provide the security department with a roster of registered vehicles per space. Have the security guard monitor for proper preferential parking placards.
iii. Spot check the parking lot personally, by conducting random walk through checks.

iv. Periodically update the preferential parking registration forms to ensure that the participants are still active and that current vehicle information is reported.

v. Develop a project-wide parking policy. This policy should outline the rules of the parking lot, describe the preferential parking program, and establish procedures to address parking lot misuse. Many preferential parking programs will ticket and tow (at the employee's expense) violators of the parking policy.

2. Paid Parking. Parking costs can be the most influential factor in encouraging alternative mode use. Reduced cost of parking for carpools and vanpools is an incentive for people to choose these commute modes. Propose that your company implement discounted or free parking for carpools and vanpools. These parking stalls should be located close to lot entrances or elevators and be clearly marked.

3. Parking Cash Out. Federal legislation included in the Transportation Efficiency Act-21 includes a Commuter Choice Benefits package. Part of the Commuter Choice Benfits Package allows for employers to establish a parking cash out program. Parking cash out allows employees to choose to cash out the value of employer-provided parking (up to $175 per month/$2,100 per year) forego parking, and receive the taxable cash value of the parking, or receive a tax-free transit or eligible vanpool benefit up to $65 per month.

Cash out provides an incentive for employees to try other commuting alternatives. The employer transfers its expenditure for the parking space, assuming it is leased, to a direct payment to the employee. If the employee accepts the cash value rather than a tax-free transit or vanpool benefit, then the employee also incurs payroll and income taxes on the amount. The employer only incurs payroll taxes on the cash value provided.
This additional compensation will allow the employee to finance other commuting modes that are not considered qualified transportation fringe benefits, such as walking, bicycling, carpooling, roller blading, or other means of commuting to work. Reducing employee demand for parking can free up parking spaces for customers, permit employers to use the space for other purposes than parking or remove the need to build expensive new parking facilities.

F. PEDESTRIAN PROGRAMS

Walking to work is often overlooked as an alternative mode of transportation. By walking, commuters help reduce traffic congestion and air pollution. Walking is great exercise for a variety of fitness levels and does not require expensive equipment.

Developers can provide physical improvements such as pedestrian pathways around the property to help promote a walking program. Developers who also occupy the project can implement a pedestrian program for their employees.

Program Implementation:

1. Explore the immediate area so that you will be able to assist walkers in plotting their routes. Consider safety and convenience of the commuter including properly lighted sidewalks and paths designed for pedestrian use.

2. Determine interest in a walking program. Analyze your survey data to identify employees who are interested in walking and/or employees who live relatively close to the work site (under 3 miles). Since the average person walks about 3 m.p.h., suggest that commuters allow 20 minutes travel time per mile.

3. Determine what components or strategies you can include in your walking program. Can you provide incentives such as free walking shoes, or prizes. Do you have a Guaranteed Ride Home program, and are walkers eligible.
4. Market your walking program. Consider starting a walking club or help match walkers with fellow walking employees in a buddy system. Utilize your company’s communication mediums to help get the word out.

5. Check in with your walking employees. Are there program elements that could be improved? Are walking paths on-site connected to the sidewalks. Are there suggestions you can pass along to local jurisdictions for improvements to cross walks, sidewalks and other safety considerations in the area surrounding your work site?

6. Monitoring and evaluating your walking program can be done through your annual Commute Mode Survey. You can also observe walkers coming onto the work site. Questions could be added to the baseline survey such as: What would encourage you to walk to work?

G. BICYCLE PROGRAMS

Bicycle commuting can be fun! Bicycle commuting lowers commute costs, is environmentally friendly and can incorporate exercise into your commute. While bicycle commuting typically is targeted at employees living within 0 to 10 miles of the work site, serious bicyclists will commute much farther.

Establishing a bicycle program can demonstrate your company’s interest in your employees’ well-being, reduced traffic congestion and energy consumption, a concern for the environment, and reduced demand for parking space and expense. Ten to 15 bicycles can park in the space of one automobile parking space! Bicycling is a zero emission choice, directly reducing air pollution by eliminating vehicle trips.

Cyclists save money by using less gas, reducing vehicular wear and tear, and eliminating automobile parking costs. Sometimes, automobile insurance costs may be lower due to reduced mileage on their personal vehicle. Bicycle parking is generally free or very inexpensive. Cyclists also benefit from the exercise during their commute. A 180-pound man cycling at 15 m.p.h. burns almost 10 calories per minute.3

Developers can provide the physical amenities such as bike lockers, bike racks, showers and clothing lockers that will help promote bicycle commuting. Developers who are also the tenant of the building can implement bicycle commute programs for their employees.

Program Implementation:

1. Contact the City of Sunnyvale Public Works Department or RIDES for Bay Area Commuters for a bicycle map of the Sunnyvale area.

2. Conduct a site check to identify the availability of bike lanes, bicycle storage including bicycle lockers and racks, showers and lockers at or near your work site. If showers and lockers are not available on site, identify a location where employees can store clothing and personal items.

3. Check with the local transit agencies to determine their bicycle policy. The option of completing a trip using a combination of bicycling and transit allows for more flexibility.

4. Determine the bicycle commuting interest of employees using your Commute Mode Survey.

5. Determine what other programs that you offer that will compliment your bicycle program. Do you have a Guaranteed Ride Home program? Can you provide incentives to bicycle commuters?

6. Tap into experienced bicycle commuters to buddy-up with those who would like to try commuting by bike.

7. Market your bicycle program. Use a variety of methods. Hold a bicycle commuter brown bag. Bring in a local bike shop to talk about bicycle commuting, safety, and maintenance.

8. Help employees plan their commute route using the City of Sunnyvale bicycle map. Suggest that they make a trial run to determine how long it will really take to commute to work.

9. Monitor and evaluate your program. You can monitor and evaluate your bicycle commute program in a number of ways. Utilize your annual commute mode survey to quantify the
number of bicycle commuters. Because bicycling does not produce emissions, it is an excellent mode to highlight the positive impacts to air quality.

H. PROMOTIONAL PROGRAMS

A developer can implement many of these promotional programs through their Transportation Coordinator or property manager. Developers who are also tenants can implement all of the promotional programs.

1. New Employee Orientations. Add a section in your employee handbook or new employee orientation to introduce your company’s TDM Program to new hires. Incorporate TDM benefits and tax incentives into the presentation of your company’s overall benefits. It is also an opportunity to request a carpool and vanpool matchlist, transit information, bicycle commuter map or other TDM information.

2. Flyers, Posters and E-mails. A flyer, poster and/or e-mail campaign is one way to keep the TDM message in front of your employees on a regular basis. Periodically rotate posters and flyers or send new e-mail messages promoting alternative modes of transportation as a better way to commute.

3. Transportation Fairs. A transportation fair can be a fun way to bring variety of alternative mode information to one location. Add some food, music, speakers and/or prizes and now you have an event! A transportation fair allows employees to ask questions and gather information in a non-threatening environment. Transportation fairs are most successful when held in a location with high foot traffic. Cafeterias and break rooms are ideal. Combining a transportation fair with a benefits fair or a health and safety fair has also proven to be successful because of high attendance rates. Having food at the fair will ensure attendance, because everyone likes free food!

4. Newsletter Articles. Incorporate articles about TDM in a company or department newsletter. Utilize this space to advertise for car/vanpool riders wanted along certain commute routes. Incorporate commuter testimonials into your articles to provide real life examples.
5. Commuter Information Center. Create a Commuter Information Center location by developing a bulletin board or designating a central location to contain commuter information (on-site cafeterias are an excellent location for commuter information). Provide transit system maps, schedules, carpool information, advertise available vanpool seats, etc. Also include construction information, summer driving tips, and other helpful information.

6. Transit Field Trip. Help orient new transit riders by taking them on a transit field trip. This activity will help them become familiar with the local route, fare collection method, transfer points and other operational features. This also provides for a non-threatening opportunity for employees, particularly those not familiar with riding the bus, to ask questions.

7. Free Trial Rides. Work with your local transit agency to purchase or obtain trial ride tickets. Provide these to employees who are interested in trying transit. This provides them a free opportunity to try out the system.

8. Transit Riders Guide. Develop a public transit guide for your work site. Include transit routes and schedules that service your work site, and locations to purchase transit passes. Make sure to include any program that your company has that can benefit a transit rider, such as a subsidy program or guaranteed ride home program.

9. Bike to Work Day. This is a fun way to introduce bicycle commuting to your employees. If an area wide event is not already planned, implement your own Bike to Work day for your employment site. Ask experienced employee bicyclist to volunteer to lead “pedal pools” during the commute time. Designate pick up points along designated bicycle routes. Offer participating employees free coffee and muffins in the morning.

10. Bicycle Riders Guide. Develop a bicycle riders guide for your work site. Include local bike routes, bicycle locker and rack locations, and other pertinent information. If your local transit agency has a bicycle policy for taking bikes on buses or trains include this as well. Make sure to include any program that your
company has that can benefit a bicycle commuter, such as a guaranteed ride home program.

11. Guaranteed Ride Home. Many commuters will not rideshare because they have to work unexpected overtime or fear not being able to get home in an emergency. By offering a guaranteed ride home to ridesharing employees, you can eliminate that barrier. Any employer can set up a guaranteed ride home component whether it is a formal program utilizing transportation service providers (taxi or rental car) or and informal policy using company vehicles and/or designated employees provide rides home in emergency situations.

I. TELECOMMUTING

Telecommuting is a way to bring the job to the person rather than the person to the job. This program can eliminate the commute trip entirely if the employee is telecommuting from his/her home. If a neighborhood telecenter is being utilized, this strategy can significantly reduce an employee’s commute time and distance. Telecommuters may switch from solo driving to walking, cycling, or transit to access neighborhood or satellite centers close to home. Or conversely, they could switch from alternative modes to solo driving for the days they do not telecommute, if part-time carpool or vanpool use is not an option. There is an ongoing debate, however, that the public benefit is not so clear as telecommuting is likely to contribute to sprawl.

Telecommuting is not the answer for everyone. Adjustments must be made to create a workable telecommuting environment for both your company and your employees.

The developer of a project can implement site measures, such as installing fiber optic wiring and extra phone lines to make sure the site is prepared for teleworking. If the developer is also the tenant of the project then they can implement an employer-based telework program. In order to utilize telecommuting as a measure in a Transportation Demand Management Plan you must be able to quantify the impact the telecommuting program has on the building size and/or building occupancy and the number of vehicle trips reduced as a result of the telecommute program.
Employer Benefits:

1. Increased Productivity: A productivity increase by as much as 20% was measured by Bellcore for telecommuting employees. Also, telecommuters have the opportunity to work at their own personal “peak” times, rather than standard hours.

2. Decreased Absenteeism: Employees are able to work in spite of minor illness, car trouble, or family/household emergencies.

3. Decreased Turnover: Employees see telecommuting as a job benefit, thus increasing morale and motivation. Turnover, recruitment costs and training expenses can be reduced.

4. Competitive Advantage in Recruitment: A telecommuting program is an innovative addition to an employee benefits package. You can tap into new labor markets (handicapped, elderly, and geographically remote areas) by incorporating telecommuting programs into your company’s structure.

5. Decreased Overhead: Telecommuting can decrease the amount of office space required by employers. To facilitate telecommuting, employers may establish satellite offices in less costly office space in outlying areas. Fewer employee parking spaces are needed at the main office, resulting in significant savings. This can offset potential capital outlay for the purchase of home equipment.

Program Implementation:

1. Determine employees and/or job classifications that would be good candidates for telecommuting. Managers and employees wishing to participate in your telecommute program should consider:
   a. Isolation from co-workers;
   b. Less visibility;

---

4 TDM Case Studies and Commuter Testimonials, p. 69.
c. Lack of on-site support services;
d. Loss of living space
e. Increased at-home costs;
f. Distraction in the home environment;
g. Monitoring of actual work hours;
h. Union, regulatory and legal parameters; and
i. Start-up operating costs.

2. Decide whether your Telework program will be home-based or located at a neighborhood site(s).

3. Work with supervisors to develop realistic performance measures. Working cannot be defined as merely “being at work.” Managers must determine the amount of work that can reasonably be accomplished within an 8-hour period and communicate those expectations to the telecommuting employee. Monitoring of telecommuters can be arranged by telephone, fax, and even occasional in-person visits.

4. Determine equipment needs and who will pay for capital costs/monthly expenses.

5. Determine Telework schedule. Will the employee work full time or part time from a remote location or from home?

6. Monitor and evaluate your program. Monitoring and providing the results of this program is especially important because employees are not visible during work hours. Monitoring should be done through managers or supervisors who are familiar with the telecommuters productivity and work habits. In addition to monitoring the impact of telecommuting on productivity, you should quantify the impact of your Telework program as part of your annual Commute Mode Survey. Count trips and/or Vehicle Miles Traveled (VMT) reduced as a result of your Telework program.
J. ALTERNATIVE WORK SCHEDULE

An Alternative Work Schedule program (compressed work week, flextime, staggered hours) can be beneficial in a number of ways. It can provide versatility, enabling employees to more conveniently use rideshare options, and avoid traffic congestion and transit crowding. It can also be an attractive employee recruitment tool that allows employees to work around childcare or school schedules. Employees tend to view Alternative Work Schedule programs as a highly desirable benefit.

From a developer perspective, the following things need to be taken into consideration if the future tenant would like to implement an alternative works schedule:

- Can building heating, cooling, and ventilation systems be adjusted for longer hours?
- Can security hours be adjustment?
- Will parking policies need to be changed to ensure parking for all shifts?
- Is building access flexible?

If the developer is also the project tenant, they may choose to implement an Alternative Work Hour program for their employees. Alternative Work Hour program elements:

- Flextime
- Staggered Work Hours
- Compressed Work Week

It is not necessary to provide all three to employees; you may choose any or all of these to incorporate into your overall Transportation Demand Management (TDM) program.

TIP - To maximize alternative mode use, offer or give preference for alternative work schedules to employees who use or will use an alternative to the Single Occupant Vehicle (SOV). Keep in mind that changing employees’ work schedules has the potential to break up car and vanpools.
1. **Flextime**

A flextime program permits employees to set or modify their arrival and departure times. Flextime policies usually state that the flexibility in scheduling must not conflict with work flow. Most flextime programs establish a core period of time in which all employees must be present. Employees then can adjust their start and end times around this core period. Supervisors usually retain a significant degree of control over the actual scheduling limits. This could mean that some departments in your company may offer the option of flextime, while others do not.

Flextime can positively influence travel behavior by allowing employees to adjust their work schedules to meet their transportation needs (i.e., adjust to match a bus or vanpool schedule).

*TIP - Some research suggests flextime works against co-workers carpooling, but may facilitate forming pools with neighbors, other companies, etc.*

2. **Staggered Work Hours**

Under a staggered work hour program, work units or groups of employees select, or are assigned, different starting and ending times for their work day. These working hours are usually staggered at 15 to 30 minute intervals. A staggered work hour program can focus on the work unit, or can be based on spreading employee arrival and departure times company wide.

If the goal of the program is to relieve localized traffic congestion, a major schedule shift change may be necessary. This can also lessen impacts on the surrounding neighborhood by dispersing traffic over time.

3. **Compressed Work Weeks**

A compressed work week allows employees to work longer hours, but shorter weeks. The shortened work week and shifted hours may help employees avoid rush hour traffic and reduces the number of commute days. Employees also have an
additional day for leisure activities, personal business and family time. Compressed work week systems can include:

a. "4/10" schedule, in which employees work four 10-hour days/ per week. Employees typically are divided into two groups. One group works Monday through Thursday, the other group works Tuesday through Friday.

b. "3/36" schedule, in which employees work three 12-hour days/ per week. This plan allows for days off other than just Monday or Friday. Employees are divided into five groups and each group is assigned different days off.

c. "9/80" schedule, in which employees work eight 9-hour days (72 hours) plus one 8-hour day for a total of 80 hours over two weeks. This program allows employees to have one day off every two weeks.

TIP - Encourage alternative mode use in conjunction with a compressed work week schedule by giving ridesharing employees first choice of days off.

Program Implementation:

- Determine what elements you will incorporate into your Alternative Work Hours program.

- Determine the rules for each element.

5. Flextime:

Core hour approach - For example: employees may choose when they come to work as long as they work 8 hours a day and all employees are working between 10:00 a.m. and 3:00 p.m.

Case by case basis - Employees change their start and end times to fit their alternative mode choices; the new schedule is consistent day to day. For example the old schedule was 7:30 a.m. to 4:30 p.m. and they needed to adjust it to 8:30 a.m. to 5:30 p.m. to carpool.

Employees flex their own hours to meet business and personal needs as long as 40 hours are worked in a 5 day time period.
6. Staggered Hours:

Starting times are staggered in intervals. Example: first start time is 6:00 a.m., with additional start times every 15 minutes.

Work period assignments can be determined by some designated standard, such as by building, floor, or department.

a. Employees can sign up for desired schedule slot.
b. Pre-assign schedules for employees and give out new schedules.

7. Compressed Work Week:

Are you going to implement one or a combination of a 9/80, 4/40 or 3/36 work schedule?

Who gets to participate: Only alternative mode users? Everyone? Determined by lottery?

a. Check logistics:

Check building availability - Does the building(s) access need to be modified? In some cases employees may need special entrance privileges (given keys to front door, electronic cardkey, etc.).

b. Supply employees interested in the program with written guidelines and explain that schedule flexibility is dependent upon satisfactory work coverage and completion.

c. Implement new flexible schedules where appropriate. Document new employee schedules and provide to others if applicable (personnel manager, payroll manager, etc.).
III. IMPLEMENTATION MECHANISMS

Conditions of approval can require a developer of a project to implement a Transportation Demand Management Program. To ensure the success of a Transportation Demand Management (TDM) program it is important that the developer put mechanisms into place to guarantee the perpetuity of the TDM program.

Two examples of mechanisms that can be utilized to guarantee the perpetuity of the TDM Program are covenants, conditions and restrictions and tenant leases.

A. Covenants, Conditions & Restrictions (CC&Rs)

Incorporating TDM program requirements into the CC&Rs of a property ensure that the TDM program runs with the land.

Sample C.C.&R. language:

Transportation Demand Management Program. The Property (and each and every portion thereof) and every Owner and Occupant thereof shall be subject to and shall abide by and satisfy each and all of the provisions and obligations contained in that certain Transportation Demand Management Plan for the (fill in parcel) approved by the City of Sunnyvale (enter date), applicable to the Property and/or each Parcel therein, including any obligations to provide funding and resources to implement the Transportation Demand Management Plan, and compliance with any applicable requirements of any condition of approval enacted by the City of Sunnyvale applicable to the Property or to the City of Sunnyvale generally.

Mutuality, Reciprocity: Runs with Land. All restrictions, conditions and covenants contained herein, by reference or otherwise, are made for the direct mutual and reciprocal benefit of each and every portion of the Property; shall create mutual, equitable servitudes upon each portion of the Property in favor of every other portion; shall create reciprocal rights and obligations between the respective Owners of all portions of or interests in the Property and privity of contract and estate between all grantees of said portions or interests therein and their Successors; and shall, as to each Owner and its Successors, operate as covenants running with the land for the benefit of all other portions of the Property. The Property, and every part thereof or interest therein, shall hereafter be held, transferred, sold, leased conveyed and occupied
subject to the covenants, conditions and restrictions herein set forth, each and all of which is and are for, and shall ensure to the benefit of an shall apply to every Owner and/or Occupant thereof, and their Successors.

B. Lease Requirements

Incorporating TDM program requirements into tenant leases ensures that occupants of buildings with TDM requirements that are part of their conditions of approval coordinate and cooperate with the building owner and/or property manager to implement TDM programs.

Sample lease language:

Traffic. Tenant hereby agrees to designate one of its employees to act as a liaison with Landlord to facilitate and coordinate such programs as may be required by governmental agencies to reduce the traffic generated by (fill in property name) as required by the City of Sunnyvale as part of conditions of approval and to facilitate the use of public transportation.
IV. MONITORING AND EVALUATION

Monitor the program closely for the first several weeks and make any necessary adjustments. A six month trial period should be sufficient to fairly assess the appropriateness of an alternative work schedule program for your company.

Developers will be responsible for an annual status report to the City of Sunnyvale. Monitoring and evaluation of the TDM programs a developer implements will need to be incorporated into this status report. The City will base TDM program compliance on the percentage of total employees who used transportation alternatives, not the percentage of survey respondents. Survey non-respondents will be assumed to be driving alone and will count against the compliance rate. It is important to conduct as thorough of a survey as possible.

Commute Mode Survey. Use your baseline data as a measuring stick. After six months, re-survey your employees to evaluate the impacts on your mode split. Ask additional attitudinal questions specific to alternative work schedules to evaluate how employees feel about the program. For example, ask questions like:

- Did you change your drive alone behavior because of the Alternative Work Hour program?
- Did you know that you could participate in a flextime program if you commute to work using an alternative to the SOV?
  - If no, would you use an alternative transportation mode if you could flex your work schedule?

A. WHY MONITOR AND EVALUATE PROGRAMS?

Developers will be responsible for submitting an Annual Status Report to the City of Sunnyvale. Monitoring and evaluation of the TDM programs that a developer implements will need to be incorporated into this status report.

It is imperative that you monitor and evaluate your program. For developers, monitor and evaluating your TDM program will allow you to present the effectiveness of your program to the City of Sunnyvale and to the Bay Area Air Quality Management District. In addition, it
allows the developer to track programs to see which programs are most effective. By tracking programs, it also provides the developer information to adjust programs in future years to make sure that their investment in TDM is paying off.

Finally, sharing the success of your TDM program with the City of Sunnyvale provides an opportunity to promote your company’s “Good Neighbor” policy. Your successful TDM program will positively impact those who live and work in Sunnyvale by reducing traffic and improving air quality in the community.

When alternative mode commute trips are increased and drive alone commute trips are reduced your program is effective.

1. For the most valid program evaluation, specific baseline data (employee method of commute and attitudes towards using alternatives) should be collected; conduct a baseline survey before you begin your TDM Program (see survey on following page and survey tips sheet on page 37).

2. You must survey every year to collect data required for the Annual Status report. Analyze your new data and compare it to the previous survey results to determine progress and potential modifications needed to improve your program. If you can, ask alternative mode users when they switched to an alternative and from what mode.

3. Add questions to the baseline survey tool regarding specific components of your TDM Program. These answers will help you modify your program to maximize your program success.

4. Air quality benefits and cost effectiveness can also be evaluated. Providing these results can be very useful when trying to obtain or retain funding for your TDM Program. Cost effectiveness is important in determining the overall costs and benefits of the program and to assess the most cost effective strategies. Bottom line numbers can help you evaluate which programs are most valuable to your TDM program. Contact the Bay Area Air Quality Management District for assistance in evaluating air quality benefits.

The following pages provide the tools needed to evaluate a TDM Program:
a. Baseline Survey  
b. Survey Tips Sheet  
c. Sample Cover Letter  
   (accompanies survey)  
d. Cost Effectiveness Information

RIDES for Bay Area Commuters can also help you with your survey. Linda Furnas is the RIDES Commute Services Representative for Santa Clara County. She can be reached at (510) 273-2069.
### BASELINE SURVEY

#### How far from work do you live? (one way mileage)

- 0 - 9 miles
- 10.0 - 14.9 miles
- 15.0 - 19.9 miles
- 20.0 - 21.9 miles
- 25.0 + miles

#### What is your home zip code?

#### Do you work? Full time ( )
Part time ( )
Compressed work week ( )

#### How did you travel to work each day?

<table>
<thead>

#### A. If you normally use an alternative mode, what motivated you? (√ one-three)

- Cost savings
- Stress reduction
- Guaranteed ride home program
- Time savings
- Convenience
- To help improve our air quality
- Save wear & tear on personal vehicle
- Cash incentive program
- Preferential car/vanpool parking space
- Flextime program
- Showers & clothing lockers
- Other ________

#### B. Before you used an alternative mode, how did you get to work? ________

(Pick the number from question 4 that matches your previous commute mode and enter in the space provided.)

#### Please Answer #6, #7 & #8 if you DRIVE ALONE to work:

#### What is your main reason for driving alone to work? (√ one)

- Need my car at work for company business
- Need my car at work for personal business
- Parking is free or inexpensive
- Need to run errands before or after work
- Prefer to drive my own car
- Need to transport children
- No reasonable transit option
- Transit costs too much
- Safety concerns
- Cannot get home in an emergency
- Live close to work
- Don't have anyone to ride with
- Don't like to depend on others
- Irregular work schedule
- Anything else takes too much time
- Poor bicycle and pedestrian access
- Other ________

#### What would encourage you to use an alternative to driving alone?

- Help finding carpool/vanpool match
- Change in work shift/Flexible work schedule
- Monthly cash subsidy for ridesharing
- Guaranteed ride home program
- Secure, convenient bicycle parking
- Prizes, drawings, time off
- Other ________

#### If you normally drive alone, would you consider commuting using an alternative mode on an occasional basis? Yes  No

If yes, what modes?

- Carpool driver
- Carpool rider
- Vanpool drive/ rider
- Walk
- Bicycle
- Other ________
- Public transit
C. SURVEY TIPS

The statistical reliability of a survey depends in part upon the response rate (number of correctly completed surveys compared to number of distributed surveys). Remember survey non-respondents are assumed to be driving alone and will count against the compliance rate. It is imperative to conduct a thorough survey. Your survey will have a higher response rate if you do the following.

1. Copy/print surveys onto colored paper (light yellow or light green works best).

2. Attach a cover memorandum to each survey (or copy to the backside of the survey to consolidate) requesting their cooperation by completely filling out the survey. The cover memorandum should be signed by someone at the senior management level (see sample cover letter page 39).

3. Let employees know that their responses are strictly confidential.

4. Call a meeting during the survey week where employees can fill out the surveys and you can answer any questions they may have. You may also wish to offer refreshments as they are filling out the survey. Ask employees to hand in the survey to you prior to leaving the meeting.

5. One department could challenge another department to see who can obtain the highest response rate.

6. If possible, names of employees who have completed their survey could be placed into a prize drawing. A prize (for example, a lunch for two) could be given to the employee whose name was drawn.

7. Offer one hour of administrative time off for filling out the survey, or some other incentive.

8. Personally collect the surveys if at all possible.

NOTE: Have your survey translated into non-english languages if significant number of employees need it.
D. SAMPLE COVER LETTER
(ON YOUR COMPANY LETTERHEAD)

DATE:

FROM: IDEALLY SOMEONE IN UPPER MANAGEMENT

RE: EMPLOYEE TRANSPORTATION SURVEY

During the week of INSERT DATES, COMPANY NAME will be disseminating Employee Transportation Surveys to assess current commuting patterns of all personnel. Survey results will be used to adjust or to implement employee programs that benefit you the employee, our company and the community; your input is very important. All individual responses will be kept confidential.

Our goal is to achieve a 100% response rate. Optional: If your company is providing a prize or incentive, you will want to acknowledge that here.

Please make every effort to complete this survey and return it to INSERT NAME(S) by INSERT DUE DATE.

Should you have any questions or need assistance, please contact INSERT CONTACT NAME/PHONE/EMAIL.

Thank you for your cooperation.
E. COST/BENEFIT OF YOUR TDM PROGRAM

You will need to keep track of both capital costs and operating costs. Examples of capital costs include computers and electronic equipment. Since electronic equipment typically has a 5-year life, your annual cost for this equipment should be one-fifth of the total cost. Examples of operating costs are salaries for program managers, commute alternative subsidies and incentives, and marketing costs. If the TDM Program manager position is not full-time, staff hours devoted to the TDM Program will need to be tracked. Cost savings for the employer can be subtracted from program costs. Savings may include reduced leased parking costs or the need to construct additional parking as a result of fewer solo drivers and reduced office space costs for an extensive telecommute program.

Perhaps more difficult to track, but never the less important would be reduced tardiness by employees, reduced absenteeism, and reduced employee turnover. All three behaviors have been attributed to successful TDM programs. However, the information is usually anecdotal rather than scientific.

Analyzing Other Benefits

Your company's TDM Program has produced other benefits besides improved air quality. These should not be excluded from an analysis of the program.

1. The program reduced peak-hour vehicle trips, which reduces gasoline consumption and helps reduce congestion in the region.

2. The program also saved alternate mode commuters money -- not driving to work reduces employee parking and vehicle operating costs. (Costs to drive alone = $0.41 per mile - costs include gas, oil, maintenance, tires, insurance, and lease/purchase price)

3. An effective TDM Program is often considered a valued benefit that attracts job candidates and lowers employee attrition. Related questions on an employee survey can often solidify this value of the TDM Program.

4. Include other benefits of the TDM Program specific to your program and your company/work site.

---

V. COMMONLY ASKED QUESTIONS AND ANSWERS

A. CARPOOL

Q. Who drives the carpool?
A. Each carpool group decides their own rules. In some carpools, the responsibility of driving is rotated amongst members of the carpool. In other cases, some members of the carpool prefer to ride only.

Q. What if I need my car during the day?
A. Plan ahead and be the driver of the carpool on the days that you need your car. If you need your car frequently, look for a carpool partner that prefers to ride only.

Q. Who pays the cost of the commute?
A. Each carpool group sets their own rules. If you are sharing the responsibility of driving you do not need to split expenses. If one person in the carpool is the designated driver or drives the majority of the time, figure out what an appropriate share of the commute cost is for each person in the carpool.

Q. What if I have a mid-day emergency or need to work unexpected overtime?
A. Be prepared. Have a plan that addresses these situations before you experience one. Many companies offer their employees a Guaranteed Ride Home program that provides them with a ride home in case of an emergency or unexpected overtime. If a Guaranteed Ride Home program is not available, set up a contingency plan with your carpool partner(s) and/or co-workers.

Q. Do I have to carpool everyday?
A. No. A carpool can be as flexible as you want it to be.
Simply set up the rules and coordinate with your carpool members. Carpooling once or twice a week can help reduce traffic congestion and air pollution.

Q. Will my insurance adequately cover my carpool?

A. Check with your insurance company to ensure that you have adequate coverage. Also ask if they offer reduced rates if you are not using your car everyday to commute to work.

B. VANPOOL

Q. How is the vanpool fare determined?

A. The only true way to determine cost is to run the expense numbers based on vanpool type, number of riders and mileage. If it is an employee owned or company sponsored van make sure to include operation and maintenance costs. Third party providers will be able to help you with these numbers. For employee actual cost, factor in any employer sponsored tax-free subsidy for fare or parking.

Q: What kind of commitment do I have to make to vanpool?

A: Typically vanpools operate on a month to month basis, requiring a 30 day notice (minimum) prior to leaving the vanpool.

Q: What happens if the regular driver is not available to drive?

A: Each vanpool needs to have back-up drivers to fill in when the regular driver is not able to drive due to vacations, sick leave or travel/overtime commitments for work. If no driver is available for the van for a particular day, vanpool riders typically coordinate carpools.
Q: Does a vanpool provide door to door service?

A: Each vanpool group sets up its own rules. Some vans will provide door to door service, however most will schedule a set number of pick-up points.

Q: What is the responsibility of the driver?

A: The driver is responsible for operating the vehicle, making the scheduled stops, arranging for the vehicle maintenance, fueling and fare collection. In return, drivers typically ride for free and may also get a set number of miles per month that they can use the vehicle for personal business.

Q: What if I have a mid-day emergency or need to work unexpected overtime?

A: Be prepared. Have a plan that addresses these situations before you experience one. Many companies offer their employees a Guaranteed Ride Home program that provides them with a ride home in case of an emergency or unexpected overtime. If a Guaranteed Ride Home program is not available, set up a contingency plan with your co-workers. Keep a transit schedule on hand to identify if you can take a later bus or train home.

TRANSIT

Q: Do I have to take transit everyday?

A. No. You can be as flexible as you want it to be. Taking transit once or twice a week can help reduce traffic congestion and air pollution.

Q: Should I purchase a monthly pass or pay a daily fare?

A. Typically monthly passes become more economical than daily fares if you take transit at least 18 to 20 days per month.
Q. Can I include transit in my TDM program if the nearest transit stop is more than 1/4 mile from our work site?

A. Absolutely. First, some employees may not mind walking a little further -- a 1/4 of a mile is a rule of thumb measure. Secondly look for opportunities to make transit more convenient. Can you provide an employee shuttle between your work site and the transit stop? Also, talk to the transit provider(s) about the potential to adjust their route(s) to better serve your work site.

Q. What if I am out of shape?

A. Choose an easy pace, and you’ll find cycling no more strenuous than walking. Do a trial ride. Ease your way into better shape and maintain it once you’ve become a regular bicycle commuter.

Q. Won’t it take too long?

A. The average bike commuter travels 10 m.p.h. in traffic. In urban areas cycling generally takes less time than driving for trips of three miles or less, and about the same time for three-to five-mile trips. Or compare it to the time you spend exercising and commuting.

Q. Do you have to live close to work to bike?

A. If you live too far from work for a practical bicycle commute, consider cycling to the bus, transit, or a co-worker’s house and carpool. Or drive part of the way and bike the rest.

Q. Where can I park my bike?

A. With a little research, you can always find a bike parking solution. Some employers will let you bring your bike into the building. Stash your bike at work in a covered, secure place, like a closet or storage room. Existing bike parking may be available in nearby buildings or parking garages. If your employer doesn’t provide parking, make a formal request with other employees. Park outside, but use a good U-lock.
Q. **Do I need a special bike?**

A. If the bike is mechanically sound and fits correctly, you have a commute bike. If you can’t maintain it yourself, take it to a good bike shop. Remember that good maintenance is important when you rely on your bike to get you to work on time.

Q. **What if my work site does not have showers?**

A. Many bike commuters don’t find it necessary to shower at work. Commuting is different than fitness cycling and generally is not a sweaty affair. If you like to ride hard and get a good workout but can’t find a shower where you work, try a nearby health club.

Q. **How can I dress professionally and still ride my bike?**

A. Some bike commuters ride in their business attire, and still look good when they get to work. Most simply ride in causal or cycling clothing and change when they arrive. Some commuters keep several outfits at work, rotating outfits on days they don’t ride, or they take their clothes to a dry cleaner near work.

---

D. **ALTERNATIVE WORK HOURS**

Q: **How does flextime impact forming carpools?**

A: Flextime can help facilitate carpool formation by allowing employees to adjust their work schedule to meet their carpool needs. However, if too many different flextime schedules are created, forming carpools within the company may be negatively affected.

Q: **Do staggered work hours and flextime provide air quality benefits?**

A: Not usually, because staggered hours or flextime by themselves do not result in actual trip reduction. In order
to benefit air quality, these programs must be implemented in conjunction with alternative mode use promotion.

Q: I have a very large company, will this program overburden my staff?

A: This program may initially require additional staff time. Once the program is up and running, staff time should not be impacted.

Q: Do staggered work hours and flextime reduce peak hour congestion?

A: Yes. By spreading out the peak period, traffic is dispersed over a longer period of time, thereby reducing congestion.

Q: What if the employee is needed and he/she is not there?

A: Put together a flow chart for all employees with instructions on who to contact if a particular person is out that day. In smaller offices the employee who is out may provide their home number to be contacted if necessary.

Q: How can I make sure productivity is not negatively impacted?

A: Monitor project schedules and deadlines and see if they are being met. Provide the results. In most cases productivity goes up.

E. TELECOMMUTING

Q: How will managers know that the employee is working and not doing other things while at home?

A: The telecommuting employee should have the same deadlines and productivity levels as if he or she were at
work. The answer will be self-evident; if deadlines are being met or not.

Q. How can a manager ensure that an employee who is telecommuting feels included in the team and/or department?

A: Schedule meetings and/or work days for telecommuters at the office. Make sure they are included in the communication loop for internal correspondence and e-mails.

Reference/Resource List

The Hoyt Company assisted the City of Sunnyvale in preparing this TDM Tool Kit. They can be contacted at any time to answer questions or to provide creative ideas on TDM programs and services.

The Hoyt Company
801 K Street, 23rd Floor
Sacramento, CA 59814
(916) 448-2440

Contact: Wendy J. Hoyt (whoyt@ns.net)

LOCAL/REGIONAL ORGANIZATIONS

Commute programs can be money savers for both businesses and employees. Businesses may reduce on-site demand for parking and work space. Employees may reduce the monthly cost of their commute by avoiding frequent gas tank refills, and wear and tear on their cars.

Contact the following local agencies to learn more about public transit, carpooling, vanpooling, or bicycling in the Sunnyvale area.

Santa Clara Valley Transportation Authority (VTA)
3331 North First Street
San Jose, CA 95134-1906
Customer Service Phone: (408) 321-2300 or (800) 894-9908
Customer Service Fax: (408) 321-7535
www.vta.org

VTA provides bus service throughout the Sunnyvale, San Jose, Santa Cruz, and Dumbarton areas and light rail train service in the Santa Clara county area. Call the Customer Service Representatives for information about routes, schedules, fares or transfers.

Caltrain
P.O. Box 3006
San Carlos, CA 94070
Customer Service (800) 660-4287 or (650) 508-6200
Caltrain provides rail service throughout the Bay Area, from San Francisco to Gilroy. Call for information about routes, schedules, fares or transfers.
www.caltrain.com/caltrain/index.html
TravInfo
(408) 817-1717
www.travinfo.org
Up-to-date Bay Area travel related information about public transit, current traffic conditions, carpooling or vanpooling, park and ride lots, bicycling, etc.

Rides for Bay Area Commuters
1333 Broadway Suite 601
Oakland, CA 94612
(510) 893-7665 or (800) 755-7665
Find out how to join or start a carpool or vanpool, learn how to use transit, bicycles or your feet to commute to work.
www.rides.org

Association of Bay Area Governments (ABAG)
Mailing Address: P.O. Box 2050
Oakland, CA 94604-2050
(510) 464-7900
Fax: (510) 464-7970
www.abag.gov
This regional organization has information about commute programs.

Santa Clara County Wide Bicycle Advisory Committee
C/O Santa Clara VTA
3331 North First Street, Building B
San Jose, CA 95134
(408) 321-5725
Reviews transportation projects to ensure adequate bicycling facilities are included. Santa Clara County Bicycle Map is accessible via the website.

Silicon Valley Bicycle Coalition
(650) 965-8456

(415) 995-9860
Find out more about telecommuting.

NATIONAL ORGANIZATIONS

America WALKs
PO Box 29103
Portland, OR 97210
Pedestrian Advocacy Group.
Contact: Ellen Vanderslice, 156 Milk Street, Boston, MA 02109.
Email: americawalks@hevanet.com
www.webwalking.com/amwalks

American Public Transit Association
1201 New York Avenue, N.W. Suite 400
Washington DC 20005
www.apta.com
APTA is a non-profit international association of over 1,100 member organizations
including transit systems; planning, design, construction and finance firms; product
and service providers; academic institutions, and state associations and departments
of transportation.

Association for Commuter Transportation (ACT)
www.vanpoolusa.com
The Association for Commuter Transportation (ACT) supports its members in their efforts to enhance mobility, improve air quality, and conserve energy through Transportation Demand Management (TDM) activities. ACT serves as an information resource, provides advocacy on transportation issues involving commute alternatives, and offers networking and professional development opportunities to its members. ACT is located at 1418 “K” Street, NW, Suite 503, Washington, DC 20005 Phone: (202) 393-3497 Fax: (202) 638-4833

Bicycle Federation of America
www.bikefed.org
A non-profit organization working with people in communities to make America more bicycle friendly and walkable. For more information write to 1506 21st Street, NW, Suite 200, Washington D.C. 20036. E-mail: bikefed@aol.com.

Bicycle Helmet Safety Institute
www.bhsi.org
The helmet advocacy program of the Washington area. A small, active, non-profit consumer-funded program acting as a clearinghouse and a technical resource for bicycle helmet information.

California Alliance for Advanced Transportation Systems
www.caats.org
CAATS is a market-driven public/private partnership to deploy advanced transportation technologies and create jobs in California.

Institute of Transportation Engineers
www.ite.org
The Institute of Transportation Engineers (ITE) is an international, individual member, educational, and scientific association. ITE is one of the largest and fastest-growing multimodal professional transportation organizations in the world. Also prints ITE journal. 525 School Street, SW, Suite 410, Washington, DC 20024. Phone number: (202) 554 - 8050 Fax: (202) 863 - 5486.

International Telework Association
www.telecommute.org
The International Teleworking Association, is a non-profit organization dedicated to promoting the economic, social and environmental benefits of teleworking.

International Bicycle Fund
www.ibike.org/index.htm
IBF is a non-governmental, non-profit organization, promoting sustainable transport and international understanding.

International Federation of Pedestrians
Pedestrian Advocacy Group.
Contact: Ralph B. Hirsch, 3500 Race Street, Philadelphia, PA 19104-4925
Phone number: (215) 386 - 1270. E-Mail: hirsch@igc.org

ITS America
www.itsa.org/home.nsf
The mission of the Intelligent Transportation Society of America (ITS America) is to foster public/private partnerships to increase the safety and efficiency of surface transportation through the application of advanced technologies.

League of American Bicyclists
www.bikeleague.org/home.htm
A non-profit organization with membership of more than 35,000 bicyclists, 450 affiliated recreational clubs and 45 advocacy organizations nationwide. To obtain membership information write to The League of American Bicyclists, 1612 “K” Street, NW, Suite 401, Washington, D.C. 20006.

Telecommute America
www.att.com/ehs
Telecommute America is the first nationwide public awareness, information and education program focusing on the benefits of telecommuting and nontraditional work environments including virtual office, work-at-home, satellite offices, and more!

Telecommuting Safety & Health Benefits Institute (TSHBI)
www.orednet.org/venice/rick/telecommutesafe/
TSHBI advocates telecommuting as a means to save lives, reduce injuries, and improve health, thereby enhancing the quality of life for workers and the general public everywhere.

Woman’s Transportation Seminar
808 17th Street, NW, Suite 200, Washington, D.C. 20006-3953.

California Bicycle Coalition
www.jps.net/cbc

Site contains forms, documents, and information of tax matters from the Internal Revenue Service.

**United States E.P.A. Internet Pages**
The following are html documents the U.S. E.P.A. has posted on their Internet site.
- **Office of Mobile Sources**
  www.epa.gov/oms/omshome.htm
  Information on motor vehicles, fuels, and non-road engines.
- **Smart Travel Resource Center (STRC)**
  www.epa.gov/omswww/traq
  Summaries of public education programs that address transportation and air quality issues.
Survey of Episodic Control Programs
www.epa.gov/omswww/traq
Database on collected data and ECPs not implemented or under development across the country.

Transportation Air Quality (TRAQ) Center
www.epa.gov/omswww/transp.htm
Provides state and local air quality regulators and transportation planners with access to critical information regarding transportation programs and mobile source incentive-based programs, partnership opportunities, grant funding sources, useful contact names, and technical assistance.

United States Pedestrian & Bicycle Research Safety Page
www.tfhrc.gov/safety/pedbike/pedbike.htm
The Pedestrian & Bicycle Research Safety Page provides information on issues and research related to improving pedestrian and bicyclist safety. Tools, information, and contacts to make communities more livable through transportation policy.
Glossary of Terms

ACE - Altamont Commuter Express

ACT - Association for Commuter Transportation
The Association for Commuter Transportation (ACT) supports its members in their efforts to enhance mobility, improve air quality, and conserve energy through Transportation Demand Management (TDM) activities. ACT serves as an information resource, provides advocacy on transportation issues involving commute alternatives, and offers networking and professional development opportunities to its members.

ADA - Americans with Disabilities Act of 1990
Federal Law that requires public facilities, including transportation services, to be fully accessible for persons with disabilities. ADA also requires the provision of complementary or supplemental paratransit services in areas where fixed route transit service is operated. Expands definition of eligibility for accessible services to persons with mental disabilities, temporary disabilities, and the conditions related to substance abuse. The Act is an augmentation to, but does not supersede, Section 504 of the Rehabilitation Act of 1973 which prohibits discrimination on the basis of disability against otherwise qualified individuals in programs receiving federal assistance.

ADT - Average Daily Traffic
The average volume of vehicles passing a fixed point in a 24-hour time frame.

Air Pollution
The undesirable addition to the atmosphere of substances (gases, liquids, and solid particles) that are foreign to the “natural” atmosphere or occur in quantities exceeding their natural concentrations and interfere either with one’s health, safety, or comfort, or with full use and enjoyment of one’s property. Substances or elements often associated with air pollution include Oxides of Nitrogen (NOx), Carbon Monoxide (CO), Carbon Dioxide (CO2), Ground Level Ozone (O3), Volatile Organic Compounds (VOCs), and Particulate Matter (PM).

In the Bay Area automobiles are the single largest source of air pollution. Motor vehicles emit more than 50% of the ground level ozone-forming components and over 70% of the carbon monoxide. There are 20 to 30 days each year when our air pollution levels violate State and Federal Health Standards.¹

¹ Bay Area Air Quality Management District, 1999 Spare the Air brochure.

The City of Sunnyvale

G-1
Alternative Fuels
Any motor fuel other than ordinary gasoline, especially those that result in lower levels of air pollutants (i.e. reformulated gasoline, natural gas and liquid propane).

Alternative Transportation
Modes of transportation other than the single-passenger motor vehicle, including but not limited to carpools, vanpools, buspools, public transit, walking, and bicycling.

AQI - Air Quality Index
A number between 0 and 300 used to indicate the amount of ground level ozone pollution at a given time and location. Stepped air quality categories, from Good to Very Unhealthy, are issued on a daily basis. Categories are issued based on data from monitoring stations around the Bay Area.

BAAQMD - Bay Area Air Quality Management District
The regional air quality enforcement agency for nine counties including Alameda, Contra Costs, Marin, Napa, San Francisco, San Mateo, Santa Clara, southwestern Solano, and southern Sonoma. The District regulates stationary sources such as manufacturing plants, dry cleaners, gas stations, bakeries, etc. The District also sponsors programs to reduce the number of automobiles and trucks on Bay Area roads and the amount of air pollutants emitted from those vehicles.

Bikeway
A facility designed to accommodate bicycle travel for recreational or commuting purposes. Bikeways are not necessarily separated facilities; they may be designed to operate and be shared with other travel modes.

   Bike lanes are striped along the sides of roadways such as Sunnyvale-Saratoga Road. Bike paths are separated from vehicular traffic such as the off-street trail between Calabazas Creek and Mathilda Avenue.

Bus (Motorbus)
A rubber-tired, self-propelled, manually-steered vehicle with fuel supply carried on board the vehicle.

Bus, Express
A bus that operates a portion of the route without stops or with a limited number of stops.

Bus, Feeder
A bus service that picks up and delivers passengers to a rail transit station (such as ACE or Caltrain) or express bus stop or terminal.
Bus, Subscription
A commuter bus express service operated for a guaranteed number of patrons from a given area on a prepaid, reserved-seat basis.

Bus Shelter
A building or other structure constructed near a bus stop, to provide seating and protection from the weather for the convenience of waiting passengers.

Bus Stop
A place where passengers can board or alight from the bus, usually identified by a sign.

CAA - Clean Air Act, also known as FCAA
Federal legislation that sets national air quality standards; requires each state with areas that have not met federal air quality standards to prepare a State Implementation Plan. The 1990 amendments to the CAA, sometimes referred to as CAAA, established new air quality requirements for the development of metropolitan transportation plans and programs.

CAAA - Clean Air Act Amendments of 1990
The comprehensive federal legislation which establishes criteria for attaining and maintaining the federal standards for allowable concentrations and exposure limits for various air pollutants; the act also provides emission standards for specific vehicles and fuels.

Carbon Dioxide (CO₂)
A colorless gas which enters the atmosphere as the result of combustion process; it is a normal component of ambient air. Increasing amounts of carbon dioxide in the air may be a factor in the rise of the Earth’s surface air temperature.

The burning of one gallon of gasoline produces about 20 pounds of CO₂. A Bay Area resident, driving 10,000 miles per year at 25 miles/gallon will produce about 8,000 pounds of CO₂. By comparison, a human exhales about 1 kilogram per day. (Carbon Dioxide Information Analysis Center)

Carbon Monoxide (CO)
A colorless, odorless, tasteless gas that impedes the oxygenation of the Blood. CO is formed in large part by incomplete combustion of fuel.

In the Bay Area, oxygenated fuel has been sold at gas stations. The oxygenated fuels help reduce the amount of CO emitted by automobiles.
Carpool
An arrangement where two or more adults share the use and cost of privately owned automobiles in traveling to and from pre-arranged destinations together. This can be as simple as two roommates driving to work together.

Clean Fuels
Fuels that, when burned, generate fewer pollutants than gasoline. Compressed natural gas (CNG), methanol, ethanol, and others are considered clean fuels. Also known as, "Alternative Fuels."

CMO - Commute Management Organizations
In some areas Transportation Demand Management programs are carried out by regional entities which perform both the matching function of ridesharing agencies and the management functions of a Transportation Management Association.

In Sunnyvale, Santa Clara VTA, Silicon Valley Manufacturing Group, and RIDES preform the varying tasks of commute management organizations.

CMS - Congestion Management System
One of six management systems that states may develop under Intermodal Surface Transportation Efficiency Act (ISTEA). CMS strategies could include transportation demand management measures, traffic operations improvements, measurements, measures to encourage the use of high-occupancy vehicles, and other actions. In the Bay Area, our CMS is developed in cooperation with the congestion management agency, Santa Clara VTA.

CMAQ - Congestion Mitigation and Air Quality Improvement Program
A categorical funding program created as part of ISTEA. Directs funding to projects that contribute to meeting national air quality standards in non-attainment areas. CMAQ funds generally may not be used for projects that result in the construction of new capacity available to SOVs (single-occupant vehicles).

CNG - Compressed Natural Gas
A clean burning alternative fuel for vehicles.

Commuter
A person who travels regularly between home and work or school.

Commuter Assistance Programs
Services such as ridesharing, transit, and parking policies that help workers commute to work.
Compressed Work Week
A scheduling program which consists of condensing standard working hours into fewer than five days per week or fewer than ten days per two week period.

Conformity
The ongoing process that ensures the planning for highway and transit systems, as a whole and over the long term, are consistent with the state air quality plans for attaining and maintaining health-based air quality standards; conformity is determined by the Metropolitan Transportation Commission (MTC) and the U.S. Department of Transportation (U.S. DOT), and is based on whether transportation plans and programs meet the provisions of a State Implementation Plan. The conformity process is defined by the Clean Air Act.

Congestion Pricing
The imposition of fees, in differential rates varying by time of day and location depending on the level of congestion, on road users in congested areas or traveling on congested roads.

Demand Responsive
Non-fixed-route service utilizing vans or buses with passengers boarding and alighting at pre-arranged times at any location within the system’s service area. Also referred to as “Dial-a-ride”.

Dial-a-Ride
Term for demand-responsive systems usually delivering door-to-door service to clients who make requests by telephone on an as-needed reservation or subscription basis.

Employee Transportation Allowance
A regular periodic payment from employers to employees to defray the cost of travel. Allowances provide positive economic incentive to shift from driving alone to other modes of travel (ie. walking, carpooling, etcetera). Allowances are sometimes implemented in conjunction with a parking charge and are set to be equal to the parking charge. Employees can buy parking or apply the allowance to other travel costs. This is not an eligible tax-free transportation benefit. See Qualified Transportation Benefit for eligible tax-free transportation benefits.

EIR/EIS - Environmental Impact Report/Environmental Impact Statement
An analysis of the environmental impacts of proposed land development and transportation projects; it's an EIR when conducted in response to California Environmental Quality Act, and an EIS when conducted for federally funded or approved projects per National Environmental Protection Act. A draft EIR or draft...
EIS (DEIR or DEIS -- often they are prepared simultaneously) is circulated to the public and agencies with approval authority for comment. A Draft EIR or Draft EIS progresses to a certified Final EIR or Final EIS that contains responses to public comments and ways to mitigate adverse impacts.

EPA - Environmental Protection Agency
The federal source agency of air quality control regulations affecting transportation.

Episodic Program
A trip reduction program that takes place during certain time periods such as during the summer months. A Spare the Air program for Sunnyvale businesses and residents is run by the Bay Area Air Quality Management District. More information about this episodic program is available at http://www.sparetheair.org.

ETC - Employee Transportation Coordinator
Someone designated within a business or organization to assist its workers with forming carpools and vanpools, promoting bicycle commuting, public transit, and other forms of alternative transportation.

FCR - Flexible Congestion Relief
A state-directed funding program made possible by ISTEA that applies state and federal dollars to local and regional transportation projects that cause traffic congestion relief, regardless of mode.

FHWA - Federal Highway Administration
Division of the United States Department of Transportation that oversees highways.

Fixed-Route
Term applied to transit service that is regularly scheduled and operates over a set route. Usually refers to bus service.

Flexible Work Hours (Flextime)
A scheduling policy that gives employees the option of varying their starting and stopping times each work day when all employees are required to be present. The intent is to allow employees greater flexibility to adjust to work hours to individual time schedules and commuting.

FRA - Federal Railroad Administration
Division of the United States Department of Transportation that supervises rail lines.
Freeway
A divided arterial highway designed for the unimpeded flow of large traffic volumes at higher speeds. Access to a freeway is rigorously controlled and intersection grade separations are required.

FTA - Federal Transit Administration
Division of the United States Department of Transportation that funds transit planning and programs.

GRH - Guaranteed Ride Home
Refers to a program that encourages employees to carpool, use transit, bike or walk to work by guaranteeing them a ride home in case they cannot take the same mode home (e.g., if they need to work late or if an emergency occurs).

Highway Trust Fund
The federal trust fund established by the Highway Revenue Act of 1956; this fund has two accounts -- the Highway Account and the Mass Transit Account. Trust fund revenues are derived from federal highway-user taxes and fees such as motor fuel taxes; trust fund uses and expenditures are determined by law.

Home-Based Work Trip
A trip to or from home for the purpose of one's employment.

HOV - High Occupancy Vehicle Lane
The technical term for a carpool lane, commuter lane or diamond lane, which is a lane designated for vehicles carrying two or more (or three or more) people depending on the facility.

HOVs - High Occupancy Vehicles
Generally applied to vehicles carrying two or three or more people. Freeways, expressways and other large volume roads may have lanes designated for HOV use. HOV lanes may be designated for use by carpoolers, vanpools, and buses. The term HOV is also sometimes used to refer to high occupancy vehicle lanes themselves.

Informal Carpool
Form of carpool in which the composition of traveling passengers varies from day to day. There is no formal arrangement for regular riders.

Infrastructure
A term referring to the components of the physical structure, including, but not limited to, roads, bridges, transit, waste system, public housing, sidewalks, utility installations, parks, public buildings, and communications networks.
Intermodal
Those issues or activities which involve, integrate, or affect more than one mode of transportation. Also known as "multimodal".

Inversion
A layer of the atmosphere through which the temperature increases with altitude. An inversion may be found at ground level or aloft.

ISTEA - Intermodal Surface Transportation Efficiency Act
Pronounced "Ice Tea," this landmark $155 billion federal legislation signed into law in December 1991 called for broad changes in the way transportation decisions are made. ISTEA expired in 1998 and has since been replaced by TEA-21. See TEA-21 definition.

ITS - Intelligent Transportation Systems
Use of computer and communications technology to facilitate the flow of information between travelers and system operators. Includes concepts such as "freeway management systems," "automated fare collection," and "transit information kiosks."

Joint Use Development
1.) In transportation, ventures undertaken by the public and private sectors for development of land above, below, or along transportation facilities.
2.) Coordinated development of an area by the public and private sectors.

Kiss and Ride
A place where commuters are driven and dropped off at a station to board a public transportation vehicle.

Land Use
Refers to the manner in which portions of land or the structures on them are used, i.e., commercial, residential, retail, industrial, etc.

Long-Range Transportation Plan
A plan that every state and Metropolitan Planning Organization must develop. The long-range plan for transportation improvements includes a bicycle and pedestrian element in addition to highway, transit, and other elements. The LRP usually looks 20 years ahead and is revised every three to six years.

---
2 Florida Department of Transportation, Committee Alternatives Systems Handbook, page 95.
LOS - Level of Service
A system that rates traffic flow from A (excellent) through F (flunks), and compares actual or projected traffic volume with the maximum capacity of the intersection or road in question.

LRT - Light-Rail Transit
Fixed guideway transportation mode that typically operates on city streets or dedicated right of ways and draws its electric power from overhead wires; include streetcars, trolley cars and tramways (i.e. Santa Clara's Valley Transportation Authority light rail line). Differs from heavy rail in that it has lighter passenger capacity per hour and more closely spaced stops.

MPO - Metropolitan Planning Organization
The organizational entity designated by law with lead responsibility for developing transportation plans and programs for urbanized areas of 50,000 or more in population. MPOs are established by agreement of the Governor and units of general purpose local government which together represents 75 percent of the affected population or an urbanized area.

Mixed-Use Development
Defined by the Urban Land Institute as developments with the following criteria: (1) three or more revenue-producing uses that in well-planned projects are mutually supporting, (2) significant physical and functional integration of project components, including uninterrupted pedestrian connections, and (3) development in conformance with a coherent plan.

Mobile Source
A source of pollutants from a self-propelled transportation vehicles, such as motor vehicle, boat, ship, locomotive, aircraft, or off-road motor vehicle.

Mode, Intermodal, Multimodal
Form of transportation, such as automobile, transit, bicycle and walking. Intermodal refers to the connections between modes and multimodal refers to the availability of transportation options within a system or corridor.

Mode Split
An itemization of the types of vehicles or methods used by commuters to travel to work.

---

Florida Department of Transportation, Committee Alternatives Systems Handbook, page 96.
NAAQS - National Ambient Air Quality Standards
Federal standards that set allowable concentrations and exposure limits for various pollutants.

NHS - National Highway Systems
A federal transportation program authorized by ISTEA that designates nationally significant Interstate Highways and roads for interstate travel, national defense, intermodal connections, and international commerce. Other eligible activities include bikeways and park-and-ride lots. The NHS is currently being developed as the first component of a larger, intermodal National Transportation System. See "National Transportation System."

Nonattainment Area
Any geographic region of the United States that the U.S. Environmental Protection Agency (EPA) has designated as not attaining the federal air quality standards for one or more air pollutants, such as ozone, carbon monoxide, or particulate matter. Sunnyvale and the surrounding Bay Area are designated as "non-attainment" for ozone.

Off-Peak Period
Non-rush periods of the day when travel activity is generally lower and less transit service is scheduled.

Ozone
Ozone is a colorless gas with a sweet odor. Ozone is not a direct emission from transportation sources. It is a secondary pollutant formed when hydrocarbons (HC) and nitrogen oxides (NOx) combine in the presence of sunlight. The ozone is associated with smog or haze conditions. Although the ozone in the upper atmosphere protects us from harmful ultraviolet rays, ground level ozone produces an unhealthy environment in which to live.

Paratransit
Comparable transportation service required by the Americans with Disabilities Act (ADA) of 1990 for individuals with disabilities who are unable to use fixed-route transportation systems. In Sunnyvale, paratransit service is provided to eligible clients by Outreach.

Park and Ride Lot
Designated parking areas for automobile drivers who then board transit vehicles or meet carpool or vanpool service from these locations.
Parking Cash Out
A strategy that employers can utilize to encourage employees to use alternate modes of commuting by giving up their tax-free parking. Employees can use the taxable cash value to pay for expenses associated with other modes like carpooling or to receive a tax-free subsidy for transit or vanpools.

Parking Management
Measures that encourage alternative mode usage. Measures can include parking charges, preferential parking for car and vanpools, reduced parking cost for car and vanpools, and reduced parking supply.

Parking Pricing
A specific parking management strategy of establishing a pricing mechanism to encourage carpool and vanpool use at a parking facility. This could include charging rates for single occupant vehicles (SOVs), especially during commuter peak hours, and free parking for carpools and vanpools.

Peak Period/Peak Hour
Morning and afternoon time periods when traffic is heaviest (i.e. "rush hour").

Preferential Parking
Designating the most desirable parking spaces, such as those closest to the building entrances, for the exclusive use of carpools and vanpools.

Public Transportation
Transportation by bus, rail, ferry, or other conveyance which provides to the public general or special service on a regular and continuing basis. Also known as "mass transportation", "mass transit", and "transit".

Qualified Transportation Fringe Benefit
This represents a transportation fringe benefit that is tax-free for the employee. This benefit can be in the form of a mass transit subsidy, vanpool subsidy, and employer-provided parking. Carpool subsidy does not qualify. The maximum amount of tax-free benefit is established as $65 per month for transit and vanpool and $175 per month for parking. These benefits can be combined for a total benefit of $240 per month or $2,880 per year.

Rail, Commuter
Railroad local and regional passenger train operations between a central city, its suburbs and/or another central city. It may be either locomotive-hauled or self-propelled, and is characterized by multi-trip tickets, specific station-to-station fares, railroad employment practices and usually only one or two stations in the central business district.
Rail, High Speed
A rail transportation system with exclusive right-of-way which serves densely traveled corridors at speeds of 124 miles per hour (200 km/h) and greater.

Rail, Light
An electric railway with a "light volume" traffic capacity compared to heavy rail. Light rail may use shared or exclusive rights-of-way, high or low platform loading and multi-car trains or single cars. Also known as "LRT", "streetcar," "trolley car" and "tramway".

Real Time Ridesharing
System in which short term (one-trip) carpools are formed to meet current needs of travelers. A person in need of a ride is matched on short notice with one or more drivers headed to that person's destination. This could also be called an informal or instant carpool.

Reverse Commuting
Movement in a direction opposite the main flow of traffic, such as from the central city to a suburb during the morning peak period.

Reversible Lanes
A highway or street lane on which the direction of traffic flow can be changed to use the maximum roadway capacity during peak periods.

Ride Matching
The process of creating carpools and vanpools through finding people whose travel characteristics (origin and destination and time of travel) closely match.

Ridesharing
A form of transportation, other than public transit, in which more than one person shares the use of the vehicle, such as a van or car, to make a trip. Also known as "carpooling" or "vanpooling".

Seasonal Program
A Seasonal Program is a trip reduction program that takes place during certain time periods such as during the summer months.

Shuttle
A public or private vehicle that travels back and forth over a particular route, especially a short route or one that provides connections between transportation systems, employment centers, etc.

The City of Sunnyvale
SIP - State Implementation Plan
Required documents prepared by states and submitted to the Environmental Protection Agency (EPA) for approval. SIPs identify state actions and programs to implement designated responsibilities under the Clean Air Act.

Smog
A general term used to describe the irritating haze produced by photochemical reactions in the atmosphere.

SOV - Single-Occupant Vehicle
A vehicle with one occupant, the driver.

Staggered Work Hours
An alternative work scheduling program in which the times that groups of employees begin and end work are staggered over a range from 15 minutes to two hours, thus reducing commuting peaks. This is one of the programs that is included under alternative work schedules.

TDM - Transportation Demand Management
Low-cost ways to reduce demand by single occupant vehicles on the transportation system, such as programs to promote telecommuting, flextime and ridesharing.

TEA-21
TEA-21 stands for the Transportation Equity Act for the 21st Century, Public Law 105-178. This law reauthorizes ISTEA and provides federal funding and program authorization for all surface transportation, primarily highways and public transit. It also includes in Title IX, Section 910, an amendment to the Internal Revenue Code, Section 132(f), permitting employers to allow their employees to set aside a portion of their gross income up to certain monthly statutory maximums for transit, vanpools, and qualified parking.

Telework (also known as Telecommuting)
The substitution, either partially or completely, of transportation to a conventional office through the use of computer and telecommunications technologies (e.g., telephones, personal computers, modems, facsimile machines, electronic mail). Implies either work at home or at a satellite work center that is closer to an employee's home than the conventional office.

TMA - Transportation Management Association
A voluntary, non-profit association of private employers, developers, property managers and public agencies joined to cooperatively develop transportation-enhancing programs in a given area. Sometimes called Transportation Management Organizations or TMOs.

The City of Sunnyvale
TMP - Transportation Management Plan
A plan required or volunteered as part of a developer's building permit process. A TMP addresses how to minimize the impacts of employee work trips. Sometimes addresses customer and visitor trips as well.

Traffic Mitigation
The use of transportation management techniques to reduce the traffic impact of new development.

Transit
Generally refers to passenger service provided to the general public along established routes with fixed or variable schedules at published fares. Related terms include: public transit, mass transit, public transportation, urban transit and paratransit.

Trip Generation Rates
Average rates of vehicular travel to and from a development, which are usually cited per square foot, per housing unit, or per acre. The rates published by the Institute of Transportation Engineer (ITE) are often used by transportation professionals in setting up ridership standards and establishing TDM goals.

Vanpool
An arrangement in which a group of passengers share the use and cost of a van in traveling together between pre-arranged destinations and work.

Variable Work Hours
A work schedule that permits employees to arrive and depart during times other than the commuter peak traffic hours.

VMT - Vehicle Miles of Travel
A standard area wide measure of travel activity. Most conventional VMT calculation is to multiply average length of trip by the total number of trips.

Vehicle Trip Reduction
Elimination of actual vehicles due to alternative mode use (i.e. one person taking transit to and from work equals two vehicle trips reduced).

SUBJECT: 2011-7657 – Peery-Arrillaga / A & P Children Invsllc:
Application on a 5.2-acre site located at 580 North Mary Avenue in an M-S Zoning District (APN: 165-41-002) for a Use Permit to allow a new 124,095 square foot, 5-story office building resulting in approximately 55% Floor Area Ratio with a new 1.5-story parking structure.

### BACKGROUND

#### Description of Proposed Project

The proposed project will redevelop the site with a new 124,095 square foot five-story office building and a new 2-level parking structure. The project will result in approximately 55% Floor Area Ratio (FAR) and requires approval of a Use Permit by the City Council due to the requested FAR exceeding 35%.

#### Previous Actions on the Site

Previous planning applications for the site are summarized below:

### EXISTING POLICY

#### General Plan Goals and Policies:

The following are key goals and policies from the Land Use and Transportation Element of the General Plan which pertain to the proposed project:

**Goal LT-6:** Sustain a strong local economy that contributes fiscal support for desired City services and provides a mix of jobs and commercial opportunities.

**Policy LT-6.2:** Balance land use and transportation system carrying capacity necessary to support a vital and robust local economy.

**Policy LT-6.4:** Encourage sustainable industries that emphasize resource efficiency, environmental responsibility, and the prevention of pollution and waste.

**Floor Area Ratio:** The standard Floor Area Ratio (FAR) permitted in the M-S Zoning District is 35%. A 10% FAR bonus (to 45%) is granted for new non-residential construction which achieves LEED certification at a Gold level.
Buildings proposing additional FAR above these standards require review and approval of a Use Permit by the City Council. To assist the decision makers in considering approval of higher FAR developments, *Review Criteria for Projects Greater than 35% FAR* were developed by the City Council in 2000. These criteria are required as part of the findings to approve a Use Permit. A list of the review criteria is provided in Attachment A.

**Policies Related to Peery Park:** The project site is located in the “Peery Park” industrial area, which is characterized by a large number of Class B and C buildings (see Attachment H for a detailed description of office class levels). While the Sunnyvale Municipal Code (SMC) does not require new office buildings to be of a particular class, several past and present City policies encourage renovation and redevelopment in Peery Park.

In 2003, staff developed a five-year *Community Development (CD) Strategy* to apply City resources strategically for community benefit. The goals of the CD Strategy were adopted by City Council and the document was updated in 2005. The CD Strategy identifies Peery Park as one of four industrial zone action areas, and encourages staff to explore incentives for redevelopment of Class C buildings in Peery Park to Class A structures. The CD Strategy notes that attraction of strong growth companies such as bio-technology to the area is an economic development goal.

In 2008, at the sunset of the five-year CD Strategy, the City Council directed staff to study preparation of a Specific Plan for Peery Park to incentivize reinvestment in the area by considering higher FARs, establishing a Development Reserve, and planning for public improvements. This study has been placed on hold due to budget constraints, but its selection by Council provides a further policy context for the project.

**Industrial Design Guidelines:** The City’s Industrial Design Guidelines (1993) provide recommendations for site planning, architecture, and design. These guidelines are referenced in the discussion and analysis below.

**DISCUSSION AND ANALYSIS**

**Present Site Conditions**
The project site is a single 5.2-acre parcel at the northeast corner of North Mary Avenue and Maude Avenue. The site is developed with a single-story concrete tilt-up building and two surface parking lots. The existing building is occupied by the U.S. Postal Service as a Post Office. Existing site access consists of three driveways along Maude Avenue and two driveways along Mary Avenue. Site landscaping includes 56 mature trees in generally good condition.
Project Context: The project site is located in Peery Park near the City's western boundary. The area includes industrial and office projects developed at a variety of FARs in the 1970s and 1980s. Several nearby properties have recently redeveloped with higher FARs. One key example is the HP site (formerly Palm) located at the opposite corner of Mary and Maude. Redeveloped in 1999, the three-building campus has an average FAR of 55% on two lots. Attachment G illustrates current development intensities in the project area.

Use Permit

Use: The proposed project is for a new five-story Class A office building intended for Corporate Office uses. Multiple smaller professional office tenants could also be accommodated within the building; however, the proposed building would not be appropriate for medical office or clinic use based on the parking provided (see Attachment B, Condition of Approval GC-6).

Floor Area Ratio: The Review Criteria for Projects Greater than 35% FAR (or greater than 45% FAR with green building bonus) are located in the Recommended Findings in Attachment A along with staff's discussion of the criteria. The applicant has also provided project justifications and discussion of the evaluation criteria which are included in Attachment E. Key project features meeting these criteria include high-quality architecture and site design, green building certification, and a Transportation Demand Management (TDM) Program to reduce trips generated by the project.

Site Layout: The proposed site plan locates a five-story office building near the center of the parcel. A two-level parking structure is located along the north property line with a half level below grade. Site access will be provided by one driveway along Mary Avenue and two driveways along Maude Avenue. A paved patio feature will be located at the corner of Mary and Maude Avenues and is a possible location for the project’s required artwork. (See Attachment D for site plans.) The following Guidelines were considered in analysis of the site design:

<table>
<thead>
<tr>
<th>Industrial Design Guidelines (Site Design)</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>A1. New development shall enhance the character of its surrounding area through quality architecture, and landscaping and appropriate site arrangement.</td>
<td>The proposed plan enhances the site and surroundings through high-quality architecture and site design, and by retaining mature trees and integrating them into an upgraded landscape. The siting and design of the building will ensure visibility of its features from streets and surrounding properties.</td>
</tr>
</tbody>
</table>
Industrial Design Guidelines
(Site Design) | Comments
--- | ---
A2. New development in an area with an established character shall be compatible with its surrounding development in intensity, design, setback, building form, scale, material, color and landscaping unless there are specific planning goals to change the character of an area. | The proposed project is consistent with the character of other sites in the area which have redeveloped with higher FAR buildings, including the HP/Palm site across Mary and Maude. Redevelopment with Class A buildings in Peery Park is consistent with City policy.

B1. Site components such as structures, parking, driveways, and out-door functions shall be arranged and located to emphasize the aesthetically pleasant components of the site such as existing mature trees and views, or superior architectural features, and disguise its less attractive scenes such as service facilities, outside storage and equipment areas, and trash enclosures through placement and design of structure and landscaping. | The building’s high-quality architecture will be visible from streets and surrounding properties. The low-lying parking structure is located along a side property line and screened by landscaping. The trash enclosure is integrated into the rear of the parking garage to minimize visibility. A patio feature is located at the corner of Mary and Maude. The central project driveway is aligned with the building’s main entry to create a sense of arrival.

Architecture: The existing building on the site is a one-story concrete tilt-up, which is a typical Class C industrial design found in Peery Park. The proposed Class A building uses high-quality architecture constructed of glass and steel. The building form consists of a central elongated oval flanked by curved areas with terraced roof decks on each level. The architecture generally has a strong horizontal orientation through the lines of glass, but the unique building forms are used to add interest. (See Attachment D for architectural plans.) The following Guidelines were considered in the analysis of the project architecture:

Industrial Design Guidelines
(Building Design) | Comments
--- | ---
B1. New buildings shall maintain diversity and individuality in style while improving aesthetic character of their surrounding area | The proposed architectural style is distinctive and of high quality. The design will enhance the aesthetic character of the area which includes several newer Class A buildings. The proposal is consistent with nearby sites while using new forms and colors for variety.

B2. Roof equipment shall be fully screened by parapets, roof screens or equipment wells. | The proposed design includes an integrated roof screen composed of 12-foot tall spandrel glass mimicking a building floor. This element will enhance architectural quality by camouflaging mechanical equipment without use of a separate roof screen.
<table>
<thead>
<tr>
<th><strong>Industrial Design Guidelines</strong> (Building Design)</th>
<th><strong>Comments</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>B5. Main entrances of the buildings shall be well defined</strong></td>
<td>The building’s architecture does not prominently emphasize entrances; instead, site design and landscaping are used to define entrance areas. The main building entrance along Maude Avenue is defined through alignment with the central entry driveway. All building entrances are defined by decorative paving and landscaping.</td>
</tr>
<tr>
<td><strong>B6. New buildings shall have at least one major focal point and minor focal point. Focal points should be achieved through horizontal and vertical lines, change in material, change in color, changing the form and shape of a portion of the building, etc. Combining the main entrance and the focal points is encouraged.</strong></td>
<td>The building’s unique forms provide several architectural focal points. The pointed ends of the elongated central oval element draw focus on the east and west facades. On the north and south facades, terraced roof decks form focal points. The site design is also developed to create landscaping focal points at the north and south building entrances and at the corner patio feature.</td>
</tr>
<tr>
<td><strong>E1. A comprehensive material and color scheme shall be developed for each site.</strong></td>
<td>The proposed office building will be constructed of glass and steel with aluminum mullions between glass panels. The building exterior will be composed primarily of glass in a green-blue color, with metal support columns at the base. The proposed parking garage will be constructed of precast concrete in an off-white color with metal railings.</td>
</tr>
<tr>
<td><strong>E3. Large expanses of high reflective surface and mirror glass exterior walls shall be avoided to prevent heat and glare impacts on the adjacent public streets and properties.</strong></td>
<td>The proposed office building will utilize clear glass and spandrel glass along exterior facades to minimize reflection on public streets and adjacent properties. Mirror glass is not proposed. The project site is not adjacent to residential uses.</td>
</tr>
</tbody>
</table>

**Landscaping:** The project provides approximately 24% of the lot area as landscaping in compliance with current SMC requirements. Landscaping will be located throughout the site and will include a variety of plant materials. There are 56 existing trees on-site, 43 of which are defined as protected by the SMC based on size. Existing trees are generally in good condition, but other site landscaping is minimal. A total of 23 protected trees will be removed for site plan reconfiguration. A significant number of existing protected trees along the project perimeter will be retained. The applicant is also proposing to plant approximately 130 new trees within a significantly upgraded landscape. Staff recommends Condition of Approval BP-11.g (Attachment B) requiring that any
protected tree removed be replaced by a 36-inch box size tree. The project data provided by the applicant indicates the proposal meets the requirement for trees to provide 50% shading of parking and drive aisles within 15 years of planting; however, the shading data have not been calculated correctly. Staff recommends Conditions of Approval PS-1.c and BP-11.a requiring increased shading which will be verified by staff. The following Guidelines were considered in analysis of the project landscaping:

<table>
<thead>
<tr>
<th>Industrial Design Guidelines (Landscaping)</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>A2. All areas not in use by structures, driveways, and parking spaces shall be properly landscaped.</td>
<td>The project will upgrade the current site landscaping while preserving the majority of the existing mature trees. All areas not utilized by structures, parking, and driveways will be landscaped with live plant materials, walkways, and patios.</td>
</tr>
</tbody>
</table>

**Parking/Circulation:** Industrial and Corporation Office uses require a minimum of one parking space per 500 square feet of floor area and a maximum of one space per 250 square feet. The proposed project is consistent with this standard by providing approximately 1 parking space per 300 square feet of floor area. A total of 267 surface parking spaces are provided in addition to 144 spaces within a two-level parking structure (411 spaces total). All spaces are standard size. Site access will be provided by one driveway along Mary Avenue and two driveways along Maude Avenue. The new driveways will be located similarly to the existing site driveways with some reconfiguration.

A Traffic Impact Analysis (TIA) was not required for this project. The existing Post Office use is a very high generator of vehicle trips. Despite the high FAR of the proposed project, the peak hour vehicle trips expected to be generated by the new development are significantly less than those generated by the existing use. A more detailed discussion of trip generation and traffic analysis is provided in the Initial Study document (Attachment C, page 18). In addition, the applicant is proposing a Transportation Demand Management (TDM) Program to further reduce vehicle trips. There is no anticipated negative traffic impact of the proposed project.

**TDM Program:** The applicant has submitted a draft TDM Program prepared by Fehr and Peers Transportation Consultants (Attachment F). The program proposes to achieve at least 16% reduction in peak hour trips, which is equivalent to the difference in trips between 35% and 45% FAR. The program proposes TDM measures including site design, a carpool/vanpool program, transit subsidies, and telecommuting program, and notes that additional measures such as guaranteed rides home, parking cash-out, and shuttles could be used to further decrease trips. The TDM Program will be managed by
the building tenant(s) who are not known at this time. Based on the reductions required for other higher-intensity projects, staff recommends requiring the TDM Program be revised to achieve a minimum of a 20% reduction in total daily vehicle trips and a 20% reduction in daily peak hour vehicle trips. An annual report to the City would be required to monitor compliance. Staff also recommends a penalty clause for non-compliance be included in the program similar to other approved TDM Programs. Penalties would vary with the level of compliance, and would be calculated based on the estimated cost per employee of implementing a successful TDM Program. Finally, staff recommends the requirement to implement and manage a TDM Program be included in tenants’ lease agreements. A final TDM Program must be submitted for review and approval by staff prior to issuance of building permits. (See Attachment B, Conditions of Approval BP-18 and AT-9).

**Green Building:** The minimum green building standard required by the SMC for new non-residential construction over 5,000 square feet is to design for LEED Silver level. LEED certification is not required provided the design level is verified by a LEED professional. Per SMC 19.39, designing for a LEED Gold level with certification allows a 10% FAR bonus with no City Council approval required (staff would verify LEED compliance, verify the TDM Program meets requirements, and complete a Design Review). Using the green building bonus would result in an FAR of 45% for this site; however, since the proposed project exceeds that FAR, a City Council hearing is required with consideration of the Review Criteria for Projects Greater than 35% FAR regardless of the level of LEED certification achieved.

The existing project design has been verified to meet LEED Silver standards (56 points achieved where 50 is the minimum for Silver). The applicant has indicated an intent to design to LEED Gold level (at least 60 points). The applicant is working with a LEED consultant on modifications to achieve additional points for Gold certification. LEED consultants generally recommend designing for 5 points above the minimum certification standard as it is common for several intended points to be lost in the construction process. With this standard, an additional 9 points would be needed for reasonable assurance of Gold certification.

Exemplary design is one of the review criteria to be considered by the City Council in granting FAR over 35%, and “green” or sustainable features are typically considered as an element of design quality. While the proposed project complies with the minimum Code requirement of LEED Silver design, it does not provide an exemplary level of sustainability. Staff recommends Conditions of Approval PS-1.d, BP-19 and PF-6 (Attachment B) requiring the project to meet a LEED Gold design level and achieve LEED Gold certification. This will ensure the project design is exemplary in terms of sustainability.
**Stormwater Management:** The project will replace greater than 10,000 square feet of impervious surface; therefore, a Stormwater Management Plan (SWMP) is required. The current Municipal Regional Permit for stormwater discharge requires all treatment be achieved through Low Impact Development measures such as infiltration, harvesting/use, and biofiltration and limits the use of mechanical treatment. The applicant has prepared a draft SWMP which uses landscaped “raingardens” to retain and treat the site’s stormwater prior to discharging it to storm drains. Condition of Approval BP-16 requires third-party certification of a final SWMP prior to issuance of building permits.

**Easements/Undergrounding:** All utilities shall be placed underground per Conditions of Approval PS-4 and BP-29.

**Art in Private Development:** Sites over two acres in size are required to provide publicly displayed artwork (SMC 19.52). A separate permit for approval of the specific installation is required and is subject Arts Commission review. A variety of media are permitted, but required artwork must be visible from the street. The applicant has indicated the proposed patio at the corner of Maude Avenue and Mary Avenue is the preferred location for the project’s art installation. Staff has included a condition of approval addressing the placement and integration of the art to ensure the artwork will be designed specifically for this site (Attachment B, Condition of Approval BP-10).

**Compliance with Development Standards**

As conditioned, the proposed development meets SMC standards for the M-S zoning district including setbacks, lot coverage, height, landscaping, parking, and solid waste. Conditions of Approval are recommended to ensure compliance with parking lot shading requirements (Attachment B). The project complies with the Industrial Design Guidelines as discussed above.

**Expected Impact on the Surroundings**

The proposed project will include demolition of an existing one-story industrial building. Short-term construction-related impacts will include increased noise and dust (see construction plan in Attachment C, pages 3-4). These impacts are not expected to be significant as their proposed duration is short and there are no nearby sensitive uses such as residential. Long-term project impacts include increased building mass and height. These impacts are minimized through exceptional architecture and site design. Peak hour traffic is expected to be reduced by the proposed project. The site plan and high-quality building design will enhance the site and streetscape while minimizing negative impacts. The project is expected to improve the character of the surrounding area.
Environmental Review

A Mitigated Negative Declaration has been prepared in compliance with California Environmental Quality Act provisions and City guidelines (see Attachment C). An Initial Study determined that construction of the proposed project has the potential to result in significant effects on biological resources (possible disturbance of nesting birds) and cultural resources (possible discovery during excavation). Implementing mitigation measures during the construction phase will reduce these impacts to a less-than-significant level. The Mitigation Measures have been incorporated as Conditions of Approval (Attachment B).

FISCAL IMPACT

The proposed project is anticipated to have a positive fiscal impact on the City. Redevelopment of the site as proposed will increase the assessed value of the property and is estimated to result in the City receiving an additional $17,565 in property taxes annually (see Attachment A, page 10 for additional information). In addition, the proposed office building is designed to attract high-quality tenants such as corporate headquarters of technology companies. These tenants will have a positive economic impact by providing jobs and enhancing the image of the City.

Transportation Impact Fee: A Transportation Impact Fee is not required for this development, as the expected number of trips does not exceed the number generated by the existing Post Office use.

Housing Mitigation Fee: Higher-intensity industrial projects are required to mitigate the demand for affordable housing created by the development through payment of a Housing Mitigation Fee (SMC 19.22.035). The current Housing Mitigation Fee requirement is $9.08 per square foot of floor area exceeding 35% FAR. The required fee for this development is estimated at $409,698.68 (see Condition of Approval BP-9.a, Attachment B).

PUBLIC CONTACT

Planning Commission Study Session: The Planning Commission held a Study Session on the proposed project on November 28, 2011. Planning Commissioners generally supported the proposed development intensity, as well as the unique architectural design. Several Commissioners commented on the corner patio feature, stating that artwork placed at the corner may not be visible behind existing mature trees and that pedestrian or vehicle access at the corner may be desirable. Visibility of artwork from the street is a Code requirement and will be considered by the Arts Commission in their final decision on the location and type of artwork. A driveway near the corner is not
recommended as it could pose a traffic hazard. Staff and the applicant have explored a corner pedestrian entry; however, tree removals and grading would likely be required to locate a path from the street corner to the patio due to the steep grade, existing tree locations, and ADA accessibility requirements. Staff recommends Condition of Approval PS-1.e requiring pedestrian access from the public sidewalk into the site be provided as close to the corner as feasible, taking into account preservation of existing trees and accessibility requirements (see Attachment B).

Several Commissioners also had comments about the main driveway along Maude Avenue. The proposed driveway is close to the unsignalized intersection at Potrero Avenue (across Maude Avenue), and concerns were expressed about potential traffic conflicts. Staff reviewed the proposed driveway and found that its location is very similar to an existing site driveway. There is no history of vehicle collisions in this location. With the reduced traffic expected from the project, increased collision potential is unlikely. Relocating the driveway further from Potrero Avenue would have a significant impact on the project’s site plan, including eliminating the alignment of the driveway with the building entrance. As a result, staff does not recommend relocating this driveway. Should a safety issue with conflicting left turns arise in the future, the City has the ability to restrict eastbound left turns into the proposed site using signage or a median.

**CONCLUSION**

**Findings and General Plan Goals:** Staff was able to make the required Findings for the Use Permit with the recommended conditions. Recommended Findings and General Plan Goals are located in Attachment A.

**Conditions of Approval:** Recommended Conditions of Approval are located in Attachment B.
**ALTERNATIVES**

1. Recommend the City Council adopt the Mitigated Negative Declaration and approve the Use Permit with the attached conditions.

2. Recommend the City Council adopt the Mitigated Negative Declaration and approve the Use Permit with modified conditions.

3. Recommend the City Council adopt the Mitigated Negative Declaration and deny the Use Permit.

4. Recommend the City Council not adopt the Mitigated Negative Declaration and direct staff as to where additional environmental analysis is required.

**RECOMMENDATION**

Alternative 1: Recommend the City Council adopt the Mitigated Negative Declaration and approve the Use Permit with the attached conditions.

RECOMMENDED FINDINGS

Recommended Findings - Use Permit

In order to approve the Use Permit, the City Council must make one of the following two findings:

1. The proposed use attains the objectives and purposes of the General Plan of the City of Sunnyvale.

   This finding can be made for the project as conditioned. The project will enhance the character of the site, surrounding neighborhood, and community through redevelopment of a Class C industrial building with a high-quality Class A building. Compliance with adopted General Plan goals and policies is discussed below.

   **Land Use and Transportation Element**

   **Goal LT-6:** Sustain a strong local economy that contributes fiscal support for desired City services and provides a mix of jobs and commercial opportunities.

   **Policy LT-6.2:** Balance land use and transportation system carrying capacity necessary to support a vital and robust local economy.

   The proposed project allows for industrial redevelopment and economic growth which can be accommodated without significant impacts on the existing infrastructure and roadway systems.

   **Policy LT-6.4:** Encourage sustainable industries that emphasize resource efficiency, environmental responsibility, and the prevention of pollution and waste.

   The proposed project will redevelop an older industrial site with a new Class A facility intended for use by technology companies which are more likely to be engaged in sustainable industry. The project as conditioned will have a highly sustainable design achieving LEED Gold certification. The project as conditioned meets the General Plan policy for environmentally responsible developments.

   **Community Design Sub-Element**

   **Policy CC-3.1:** Place a priority on quality architecture and site design which will enhance the image of Sunnyvale and create a vital and attractive environment for businesses, residents and visitors, and be reasonably
balanced with the need for economic development to assure Sunnyvale’s economic prosperity.

The proposed project design uses exceptionally high-quality architecture that enhances the streetscape and the neighborhood, as well as a high-quality site design. The project will also provide additional jobs, enhancing both the image of Sunnyvale and the City’s economic prosperity.

2. **The proposed use is desirable, and will not be materially detrimental to the public welfare or injurious to the property, improvements or uses within the immediate vicinity and within the Zoning District.**

The above finding can be made for the project as proposed. The project will enhance the character of the site, surrounding neighborhood, and community by redeveloping a Class C industrial building with a new Class A structure. The proposed project uses exceptional architecture and high-quality site design as well as adequate setbacks and parking. The proposed project is expected to reduce peak hour vehicle trips and is not anticipated to have a negative traffic or circulation impact in the project area. Potential impacts on biological and cultural resources on the site will be mitigated as noted in the Mitigated Negative Declaration and Conditions of Approval. No other negative environmental impacts are anticipated. The project does not have a potential for detrimental impacts on surrounding properties or uses.

In addition to the two findings above, the City Council policy is to consider the following Review Criteria for Projects Greater Than 35% FAR:

3. **Certain development in excess 35% floor area ratio (FAR) in Industrial Zoning Districts (M-3 or M-S) requires approval of a Use Permit. To assist the decision makers in considering higher FAR developments, the following review criteria will be used:**

<table>
<thead>
<tr>
<th>Review Criteria</th>
<th>Discussion/Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>CATEGORY I: COMMUNITY CHARACTER</strong> addresses the issues of land use and transportation capacity and neighborhood compatibility within the context of an overall City image.</td>
<td></td>
</tr>
<tr>
<td><strong>A.</strong> Is there sufficient current and future land use and transportation capacity to incorporate this project?</td>
<td>There is approximately 2.6 million square feet remaining in the City-wide development pool; this project would utilize 45,121 square feet. The project is expected to decrease peak hour vehicle trips compared to the existing use. In addition, the project will implement a TDM Program to further reduce vehicle trips.</td>
</tr>
<tr>
<td>Review Criteria</td>
<td>Discussion/Explanation</td>
</tr>
<tr>
<td>---------------------------------------------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>B.</strong> Does project use and design contribute positively to a City image and community character that reflects current and future “high-tech” Silicon Valley?</td>
<td>The proposal will upgrade the site from an existing Class C tilt-up building to a new Class A building ideal for use by technology companies. The unique and high-quality architecture will contribute positively to community character. As conditioned, the building will be required to achieve LEED Gold certification. The contemporary architecture and sustainable features enhance the City’s high-tech image.</td>
</tr>
<tr>
<td><strong>C.</strong> Does the project include minor upgrading of the building for safety or special function purposes?</td>
<td>The proposed project includes redevelopment of the entire site and does not include minor upgrading of the building for safety or specific function purposes.</td>
</tr>
<tr>
<td><strong>D.</strong> Have potential adverse impacts on nearby land uses been avoided, minimized or mitigated?</td>
<td>The project site is surrounded by other industrial and office uses in the Industrial and Service zoning district. There are no anticipated negative impacts on surrounding sites. An initial study identified several potential impacts on biological and cultural resources on the subject site. Mitigation measures have been identified to reduce these impacts to a less-than-significant level.</td>
</tr>
</tbody>
</table>

**CATEGORY II: ENVIRONMENTAL: TRAFFIC AND AIR QUALITY** focuses on the ability of a proposed project to avoid, minimize or mitigate City-wide and local traffic and air quality impacts.
<table>
<thead>
<tr>
<th>Review Criteria</th>
<th>Discussion/Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>E.</strong> Does the project avoid or mitigate significant effects on the regional or City-wide roadway system? Is the project sited to avoid impacts on constrained intersections or roadway segments?</td>
<td>The proposed project is estimated to result in a reduction in vehicle trips due to the high trip generation rates of the existing use. As a result, no Traffic Impact Analysis or Transportation Impact Fee is required. Significant effects on regional and City roadways are not anticipated. The applicant has submitted a TDM Program to further reduce vehicle trips to and from the site.</td>
</tr>
<tr>
<td></td>
<td>The adjacent roadways (Mary and Maude Avenues) are sufficiently wide in the vicinity of the project to provide adequate traffic flow. The intersection of Mary and Maude Avenues is not listed in the City’s Deficiency Plan.</td>
</tr>
<tr>
<td><strong>F.</strong> Are potential air quality impacts mitigated?</td>
<td>A project analysis prepared by ENVIRON has demonstrated the project is not expected to result in significant air quality or greenhouse gas impacts.</td>
</tr>
<tr>
<td><strong>G.</strong> Does the project provide opportunities for appropriate on-site retail/support services and amenities to minimize mid-day vehicle trips?</td>
<td>An existing neighborhood shopping center is located on Mary Avenue approximately ¼ mile from the project site. This center provides support services including restaurants and a shipping/postal center within a convenient walking distance. The proposed office building is speculative at this time and therefore has not developed detailed plans for on-site services. Future tenants may choose to provide on-site services such as employee laundry pick-up and delivery, shipping/postal services, and cafeteria or restaurant.</td>
</tr>
<tr>
<td><strong>H.</strong> Does the project provide mixed uses on the site to complement the primary use and adjacent land uses?</td>
<td>The proposed project is not a mixed-use project.</td>
</tr>
<tr>
<td>Review Criteria</td>
<td>Discussion/Explanation</td>
</tr>
<tr>
<td>--------------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>I.</strong> Is the project located in close proximity to a light rail or Cal-Train station, and/or other convenient transit stops?</td>
<td>The site is located 1.5 miles from the Sunnyvale Caltrain station. The Mountain View Caltrain station is 3 miles away from the project site but offers convenient shuttle service via the Mary Moffett Shuttle which stops adjacent to the project site. The site is located one mile from the Middlefield Light Rail Station in Mountain View. A bus stop is located across the street from the project site (on Maude just south of the intersection with Mary Avenue) which provides transportation to and from Caltrain and Light Rail. While transit ridership may be low compared to vehicle travel, there are sufficient nearby transit options to facilitate a reduction in single-occupant vehicle trips.</td>
</tr>
<tr>
<td><strong>J.</strong> Can identifiable and measurable negative impacts on City infrastructure and services be mitigated?</td>
<td>The proposed project is expected to reduce vehicle trips due to the high trip generation rates of the existing use on the site. While the proposed project requests higher FAR, a development pool is included in the General Plan land use scenario to allow intensification of individual sites above 35% FAR. The proposed project will draw from the development pool for its additional area. The project will pay Housing Mitigation Fees to offset housing demand inducing impacts, and will be required to pay connection and impact fees to offset any impacts on sewer capacity and other public utilities.</td>
</tr>
</tbody>
</table>
### Review Criteria Discussion/Explanation

<table>
<thead>
<tr>
<th><strong>K.</strong></th>
<th>Is a Transportation Demand Management program planned for the site? Does it reduce traffic in general and promote transit use?</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>The applicant has submitted a draft TDM Program prepared by Fehr and Peers Transportation Consultants (Attachment F). The draft program is intended to achieve a minimum of 16% peak hour trip reduction using measures including site design, a carpool/vanpool program, transit subsidies, and telecommuting programs. Staff recommends conditions of approval to modify the program goals to achieve at least 20% reduction in both total daily trips and peak hour trips. Staff also recommends conditions to ensure the program is implemented effectively by future tenants (Attachment B).</td>
</tr>
</tbody>
</table>

**CATEGORY III: SITE DESIGN AND ARCHITECTURE** addresses several components of site design and architecture; focusing on the visual features and aesthetics, techniques to reduce the bulk and mass of the buildings, ways to reduce the amount of surface parking on the site.

<table>
<thead>
<tr>
<th><strong>L.</strong></th>
<th>Does the project demonstrate exemplary architecture and design through:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>The proposed project architecture demonstrates excellent design through the following elements:</td>
</tr>
<tr>
<td></td>
<td>• Unique building forms creating an state-of-the-art architectural design on a key corner site</td>
</tr>
<tr>
<td></td>
<td>• High-quality materials including glass and steel for exterior facades</td>
</tr>
<tr>
<td></td>
<td>• Green building design at a LEED Gold level (as conditioned)</td>
</tr>
<tr>
<td></td>
<td>• High-quality site design including decorative paving, patio feature, and upgraded landscaping</td>
</tr>
</tbody>
</table>

• use of unique and/or high quality building materials, singly and in combination
• state of the art design and materials
• introduction of significant, innovative, and noteworthy architectural forms and elements
• special or unique features of the site plan design and implementation
<table>
<thead>
<tr>
<th>Review Criteria</th>
<th>Discussion/Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>M.</strong> Does the project complement the City image and community character currently primarily low profile with a less intensive development density?</td>
<td>The proposed five-story Class A office building and site design meet SMC requirements and comply with the Industrial Design Guidelines. Although much of the surrounding community has a lower-profile character, the subject site is located on a corner site along a busy corridor near several other sites which have been redeveloped with higher-FAR Class A buildings. The proposed project complements the character of the surrounding area.</td>
</tr>
<tr>
<td><strong>N.</strong> Does the site plan reduce the bulk and mass of the buildings on the site? Are the following techniques and others used in a creative and resourceful way?</td>
<td>The proposed architecture reduces the effect of mass and bulk through the following:</td>
</tr>
<tr>
<td>• Façade and roofline variations</td>
<td>• The high-quality glass exterior materials create a sense of lightness and translucency that reduces the apparent mass and bulk of the structure</td>
</tr>
<tr>
<td>• Reduction in the building footprint and significant increase of landscaping required by Zoning Code</td>
<td>• Unique building forms including diagonal elements at the east and west sides and terraced roof decks on each building level at the north and south sides create significant façade interest which reduces the bulk and mass of the building</td>
</tr>
<tr>
<td>• Substantially greater setbacks than required by the Zoning Code</td>
<td>• The building footprint is minimized (24% lot coverage where 45% is the maximum) while significant trees and landscaping are used to soften the building’s appearance</td>
</tr>
<tr>
<td><strong>O.</strong> Does the site plan include techniques to reduce non-point source pollution?</td>
<td>The project has prepared a draft Stormwater Management Plan incorporating Best Management Practices to reduce storm water runoff on the site. In compliance with the current Municipal Regional Permit, landscaped raingardens will be used to treat stormwater runoff through biofiltration.</td>
</tr>
<tr>
<td>Review Criteria</td>
<td>Discussion/Explanation</td>
</tr>
<tr>
<td>-----------------</td>
<td>------------------------</td>
</tr>
<tr>
<td><strong>P.</strong> Is a reduction in the amount of surface parking achieved?</td>
<td>The proposed project reduces parking supply by providing 86 fewer parking spaces than the maximum permitted. This reduces the amount of impervious surface by approximately 14,000 square feet. A two-level parking structure is also provided to accommodate a portion of the site’s parking, which further reduces impervious surface.</td>
</tr>
<tr>
<td>• Significant reduction in the number of surface parking spaces</td>
<td></td>
</tr>
<tr>
<td>• Provision of structured parking and/or underground parking</td>
<td></td>
</tr>
<tr>
<td>• Introduction of a landscape reserve that can be converted to parking on an as-needed basis, or as a permanent park.</td>
<td></td>
</tr>
<tr>
<td><strong>Q.</strong> Is the site comprehensively planned through the creation of a Master Plan or Site Specific Plan? Has a long-term development plan been prepared that allows phasing of the project based on implementation of improvements and mitigations?</td>
<td>The proposal does not include a Master Plan or a Site Specific Plan and does not have a long-term development plan. The project is a single office building located on a single parcel.</td>
</tr>
<tr>
<td><strong>R.</strong> How is the calculation of the “effective” FAR being conducted? Does the size of the project warrant a different method of calculating the FAR?</td>
<td>The FAR has been determined based on SMC standards for FAR; which includes all square footage within the exterior walls of the buildings. No street dedication is required, so gross FAR is not a factor in this project. There is currently no tenant identified for the building. Therefore, no amenities are planned at this time such as cafeterias, large meeting venues, non-employment areas or other services that may reduce effective FAR.</td>
</tr>
</tbody>
</table>
**Review Criteria** | **Discussion/Explanation**
--- | ---
**CATEGORY IV: ECONOMIC, FISCAL AND COMMUNITY BENEFIT** identifies the need to relate the project to the economic prosperity program of the City, potential impact on the City, the relationship to the local economy and employment in terms of the types and numbers of jobs likely to be generated by the project and other features of the development that will result in an overall positive community benefit. The following questions provide examples of how benefit can be described. Please respond to as many as apply.

1. **Does the project implement the goals of the Economic Prosperity Program?**

   The proposed project will assist in achieving the goals of the Economic Prosperity Program which includes business retention, expansion, and economic vitality in a significant industry sector.

   *Goal - Retention of Jobs: Actively promote the City to companies that will create jobs for Sunnyvale residents.*

   *Goal - Local Service Businesses: To preserve opportunity for profitable operation of those small local businesses which provide critical support services to other business and to residents.*

   A new Class A facility will attract companies that will create jobs for Sunnyvale residents. While a Class A building is unlikely to be occupied by small local businesses, site employees are likely to patronize small businesses such as those located at the nearby commercial center on Mary Avenue.
<table>
<thead>
<tr>
<th>Review Criteria</th>
<th>Discussion/Explanation</th>
</tr>
</thead>
</table>
| 2. Does this project have a significant net positive fiscal impact over the next 5-20 years? | Finance staff has calculated the potential fiscal impact to the City, including potential net revenue generation, property tax and Building Permit fees. The project does not include a “point of sale” use since the building is speculative; therefore no sales tax revenues are anticipated at this time.  
  - The City share of the property tax increase after redevelopment (based on valuation) has been estimated to be $17,565 annually. (Note: future assessed value was not available at the time of this estimate, therefore the construction value of the project was used in-lieu of assessed value.) |
| 3. Does the project include the provision of on-site corporate headquarters and/or a “point of sale” office? | The proposed building is speculative at this time. The site and building design is appropriate for use by corporate headquarters or major divisions of a large company.                                                                                                                                                                                  |
| 4. To what extent does this project provide resident and/or youth employment opportunities both now and in the future? | The proposed building is speculative and the future tenants of the building are not known at this time. A high-quality Class A building is expected to provide additional employment opportunities in the City.                                                                                                                   |
| 5. Do the anticipated types and numbers of jobs complement the current and desired future job profile in Sunnyvale? | The proposed building is speculative and the future tenants of the building are not known at this time. However, the project is designed to accommodate corporate headquarters such as technology companies. These types of jobs are consistent with the City’s economical development goals and are critical to job expansion. |
| 6. To what degree do the proposed jobs generate related jobs and services in Sunnyvale? | The proposed jobs are expected to generate minor additional demand for related services. Using the industry multiplier forecast, for every one job created in this industry segment, three additional jobs are created in the community as support services. |

ATTACHMENT B

RECOMMENDED CONDITIONS OF APPROVAL AND STANDARD DEVELOPMENT REQUIREMENTS FEBRUARY 7, 2012

Planning Application 2011-7657
580 North Mary Avenue

Use Permit for a new 124,095 square foot, 5-story office building resulting in approximately 55% Floor Area Ratio with a new 1.5-story parking structure.

The following Conditions of Approval [COA] and Standard Development Requirements [SDR] apply to the project referenced above. The COAs are specific conditions applicable to the proposed project. The SDRs are items which are codified or adopted by resolution and have been included for ease of reference, they may not be appealed or changed. The COAs and SDRs are grouped under specific headings that relate to the timing of required compliance. Additional language within a condition may further define the timing of required compliance. Applicable mitigation measures are noted with “Mitigation Measure” and placed in the applicable phase of the project.

In addition to complying with all applicable City, County, State and Federal Statutes, Codes, Ordinances, Resolutions and Regulations, Permittee expressly accepts and agrees to comply with the following Conditions of Approval and Standard Development Requirements of this Permit:

GC: THE FOLLOWING GENERAL CONDITIONS AND STANDARD DEVELOPMENT REQUIREMENTS SHALL APPLY TO THE APPROVED PROJECT.

GC-1. CONFORMANCE TO APPROVED PLANNING APPLICATION:
All building permit drawings and subsequent construction and operation shall substantially conform to the approved planning application, including: drawings/plans, materials samples, building colors, and other items submitted as part of the approved application. Any proposed amendments to the approved plans or Conditions of Approval are subject to review and approval by the City. The Director of Community Development shall determine whether revisions are considered major or minor. Minor changes are subject to review and approval by the Director of Community Development. Major changes are subject to review at a public hearing. [COA] [PLANNING]

GC-2. PERMIT EXPIRATION:
The permit shall be null and void two years from the date of approval by the final review authority at a public hearing if the approval is not exercised, unless a written request for an extension is received prior to expiration date and is approved by the Director of Community Development. [SDR] [PLANNING]
GC-3. TITLE 25:
Provisions of Title 25 of the California Administrative Code shall be satisfied with dependence on mechanical ventilation. [SDR] [BUILDING]

GC-4. STORMWATER MANAGEMENT PLAN:
The project is subject to Provision C.3 of the Municipal Regional Stormwater Permit Order No. R2-2009-0074, as determined by a completed “Stormwater Management Plan Data Form”, and therefore must submit a Stormwater Management Plan as per SMC 12.60.140 prior to issuance of the building permit. [SDR] [PLANNING]

GC-5. ENCROACHMENT PERMIT:
Prior to any work in the public right-of-way, obtain an encroachment permit with insurance requirements for all public improvements including a traffic control plan per the latest CA MUTCD standards to be reviewed by the City's Transportation and Traffic Division [SDR] [PUBLIC WORKS].

GC-6. USES:
The building is approved for use by industrial, corporate office, and research and development office uses. Medical offices and medical clinics are not permitted by this Use Permit due to insufficient parking. Medical office and clinic uses require separate review and approval by the Director of Community Development. [COA] [PLANNING]

PS: THE FOLLOWING CONDITIONS SHALL BE MET PRIOR TO SUBMITTAL OF BUILDING PERMIT, AND/OR GRADING PERMIT.

PS-1. REQUIRED REVISIONS TO PROJECT PLANS:
The plans shall be revised to address comments from staff, the Planning Commission, and/or the City Council including the following:

a) The parking lot design shall be modified to remove the parking space located closest to the eastern Maude Avenue driveway and replace it with landscaping area. This will extend the driveway throat and reduce potential vehicle conflicts.

b) The parking lot design shall be modified to use standard curbs instead of rolled curbs, unless otherwise approved by the Director of Community Development upon a finding that the proposed rolled curbs provide an effective backstop without the use of separate wheel stop bars.
c) Parking lot shading data shall be corrected to count only the portion of a tree’s canopy which casts shade over an adjacent paved area, not the full size of the canopy. Parking lot landscaping shall comply with the requirement for 50% shading of parking areas and drive aisles within 15 years of planting.

d) Demonstrate the project is designed to meet the standards for LEED Gold certification. A LEED checklist shall be submitted including verification by a qualified LEED professional.

e) Revise site access to locate a pedestrian path from the public sidewalk into the site as close to the corner of Mary Avenue and Maude Avenue as possible, taking into account tree preservation goals and ADA accessibility requirements. [COA] [PLANNING]

PS-2. EXTERIOR MATERIALS REVIEW:
Final exterior building materials and color scheme are subject to review and approval by the Director of Community Development prior to submittal of a building permit. [COA] [PLANNING]

PS-3. PARKING AND CIRCULATION PLAN:
Submit a revised parking and circulation plan subject to review and approval by the Director of Community Development prior to submittal of a building permit. The parking and circulation plan shall include all striping and signage required to direct on-site vehicles. [COA] [PLANNING]

PS-4. UNDERGROUND UTILITIES:
The applicant shall demonstrate that all project utilities including transformers can be placed underground in compliance with SMC requirements. Any modifications shall be submitted to the Director of Community Development for review prior to submittal of building permit plans. [COA] [PLANNING]

BP: THE FOLLOWING CONDITIONS SHALL BE ADDRESSED ON THE CONSTRUCTION PLANS SUBMITTED FOR ANY DEMOLITION PERMIT, BUILDING PERMIT, GRADING PERMIT, AND/OR ENCROACHMENT PERMIT AND SHALL BE MET PRIOR TO THE ISSUANCE OF SAID PERMIT(S).

BP-1. CONDITIONS OF APPROVAL:
Final plans shall include all Conditions of Approval included as part of the approved application starting on sheet 2 of the plans. [COA] [PLANNING]
BP-2. RESPONSE TO CONDITIONS OF APPROVAL:
A written response indicating how each condition has or will be addressed shall accompany the building permit set of plans. [COA] [PLANNING]

BP-3. NOTICE OF CONDITIONS OF APPROVAL:
A Notice of Conditions of Approval shall be filed in the official records of the County of Santa Clara and provide proof of such recordation to the City prior to issuance of any City permit, allowed use of the property, or Final Map, as applicable. The Notice of Conditions of Approval shall be prepared by the Planning Division and shall include a description of the subject property, the Planning Application number, attached conditions of approval and any accompanying subdivision or parcel map, including book and page and recorded document number, if any, and be signed and notarized by each property owner of record.

For purposes of determining the record owner of the property, the applicant shall provide the City with evidence in the form of a report from a title insurance company indicating that the record owner(s) are the person(s) who have signed the Notice of Conditions of Approval. [COA] [PLANNING]

BP-4. BLUEPRINT FOR A CLEAN BAY:
The building permit plans shall include a “Blueprint for a Clean Bay” on one full sized sheet of the plans. [SDR] [PLANNING]

BP-5. RECYCLING AND SOLID WASTE ENCLOSURE:
The building permit plans shall include details for the installation of a recycling and solid waste enclosure. The required solid waste and recycling enclosure shall:

a) Match the design, materials and color of the parking garage building into which the enclosure will be integrated.

b) Be of masonry construction.

c) Provide screening of the enclosure interior through solid/opaque enclosure doors. [COA] [PLANNING]

BP-6. RECYCLING AND SOLID WASTE CONTAINER:
All recycling and solid waste containers shall be metal or State Fire Marshall listed non-metallic. The building permit plans shall provide details illustrating compliance with this condition. [COA] [PLANNING]
BP-7. **SOLID WASTE DISPOSAL PLAN:**
A detailed recycling and solid waste disposal plan shall be submitted for review and approval by the Director of Community Development prior to issuance of building permit. [COA] [PLANNING]

BP-8. **ROOF EQUIPMENT:**
Roof vents, pipes, flues, and equipment shall be combined and/or collected together behind parapets out of public view as per Title 19 of the Sunnyvale Municipal Code and shall be painted to match the roof. [COA] [PLANNING]

BP-9. **FEES AND BONDS:**
The following fees and bonds shall be paid in full prior to issuance of building permit:

a) **HOUSING MITIGATION FEE** - Pay Housing Mitigation fee estimated at $409,698.68, prior to issuance of a building Permit. (SMC 19.22). [SDR] [PLANNING]

b) **ART IN PRIVATE DEVELOPMENT BOND** – A bond, letter of credit, cash deposit or other similar security instrument for 1% of the construction valuation of the entire development project will be required prior to issuance of a building permit. The bond will not be released until completion and installation of the artwork requirement including related landscaping, lighting, base work and commemorative plaque. [SDR] [PLANNING]

BP-10. **ART IN PRIVATE DEVELOPMENT:**
a) Publicly visible artworks shall be provided along Mary Avenue and/or Maude Avenue. The artwork shall be integrated into the building architecture or landscape and be designed specifically for this site to ensure a strong association with the site and context.

b) An Art in Private Development application shall be submitted to the Director of Community Development, subject to review and approval by the Arts Commission, prior to issuance of a building permit. [COA] [PLANNING]

BP-11. **LANDSCAPE PLAN:**
Landscape and irrigation plans shall be prepared by a certified professional, and shall comply with Sunnyvale Municipal Code Chapter 19.37 requirements. Landscape and irrigation plans are subject to review and approval by the Director of Community Development through the submittal of a Miscellaneous Plan Permit (MPP). The landscape plan shall include the following elements:

a) Parking lot shading data shall be included in the landscaping plans and shall be corrected to count only the portion of a tree’s canopy which casts shade over an adjacent paved area, not the full
size of the canopy. Parking lot landscaping shall comply with the requirement for 50% shading of parking areas and drive aisles within 15 years of planting.

b) Landscaping plans shall include locations and details of equipment such as backflow prevention devices. Any such equipment shall be appropriately screened with screening details provided on plans.

c) All areas not required for parking, driveways or structures shall be landscaped.

d) Provide trees at minimum 30-foot intervals along the side and rear property lines, except where mature trees are located immediately adjoining on neighboring properties.

e) Deciduous trees shall be provided along southern and western exposures where possible for passive solar heating and cooling purposes.

f) At least ten percent (10%) of trees planted shall be 24-inch box size or larger and no tree shall be less than 15-gallon size.

g) Any “protected trees” (as defined in SMC 19.94) approved for removal shall be replaced with a specimen tree of at least 36-inch box size.

h) Provide a minimum ten-foot wide landscape buffer along the Mary Avenue and Maude Avenue frontages.

i) Ground covers shall be planted so as to ensure full coverage eighteen months after installation.

j) Landscaping plans shall demonstrate compliance with the water efficient landscaping requirements in SMC 19.37.

k) Landscaping plans and stormwater management plans shall be developed in conjunction to prevent conflicts.

l) Decorative paving as shown on the approved site plans shall be retained as an integral landscaping feature of the final building permit plans.

m) Backflow devices and other appurtenances shall include screening and covers as approved by the Director of Community Development. This includes all devices (irrigation, DCDA, etc.) located above ground. Screening shall consist of black metal mesh with rounded top covers (e.g. – “mailbox style”) and may also incorporate landscaping as additional screening. [COA] [PLANNING]

BP-12. LANDSCAPE MAINTENANCE PLAN:
Prepare a landscape maintenance plan subject to review and approval by the Director of Community Development prior to issuance of building permit. [COA] [PLANNING]
BP-13. TREE PROTECTION PLAN:
Prior to issuance of a demolition permit, a grading permit or a building permit, whichever occurs first, obtain approval of a Tree Protection Plan from the Director of Community Development. The Tree Protection Plan shall include measures noted in Title 19 of the Sunnyvale Municipal Code and at a minimum:

a) An inventory shall be taken of all existing trees on the plan including the valuation of all ‘protected trees’ by a certified arborist, using the latest version of the “Guide for Plant Appraisal” published by the International Society of Arboriculture (ISA).

b) All existing (non-orchard) trees on the plans, showing size and varieties, and clearly specify which are to be retained.

c) Provide fencing around the drip line of the trees that are to be saved and ensure that no construction debris or equipment is stored within the fenced area during the course of demolition and construction.

d) Overlay civil plans including utility lines to ensure existing tree root systems are not damaged during utility work.

e) The tree protection plan shall be installed prior to issuance of any building, grading, or demolition permits, subject to on-site inspection and approval by the City Arborist and shall be maintained in place during the duration of construction and shall be added to any subsequent building permit plans. [COA] [PLANNING/CITY ARBORIST]

BP-14. FENCES AND WALLS:
Design, height, and location of any proposed fencing or walls shall be subject to review and approval by the Director of Community Development. [COA] [PLANNING]

BP-15. STORMWATER MANAGEMENT PLAN:
Submit two copies of a Stormwater Management Plan subject to review and approval by Director of Community Development and third party certification, pursuant to SMC 12.60, prior to issuance of building permit. [COA] [PLANNING/PUBLIC WORKS]

BP-16. STORM WATER MANAGEMENT PLAN THIRD PARTY CERTIFICATION:
Third party certification of the Storm Water Management Plan is required per the following guidance: City of Sunnyvale – Storm Water Quality BMP Applicant Guidance Manual for New and Redevelopment Projects - Addendum: Section 3.1.2 Certification of Design Criteria Third-Party Certification of Storm Water Management Plan Requirements. The third party certification shall be provided prior to building permit issuance. [SDR] [PLANNING/PUBLIC WORKS]
BP-17. BEST MANAGEMENT PRACTICES - STORMWATER:
The project shall comply with the following source control measures as outlined in the BMP Guidance Manual and SMC 12.60.220. Best management practices shall be identified on the building permit set of plans and shall be subject to review and approval by the Director of Public Works:

a) Storm drain stenciling. The stencil is available from the City's Environmental Division Public Outreach Program, which may be reached by calling (408) 730-7738.

b) Landscaping that minimizes irrigation and runoff, promotes surface infiltration where possible, minimizes the use of pesticides and fertilizers, and incorporates appropriate sustainable landscaping practices and programs such as Bay-Friendly Landscaping.

c) Appropriate covers, drains, and storage precautions for outdoor material storage areas, loading docks, repair/maintenance bays, and fueling areas.

d) Covered trash, food waste, and compactor enclosures.

e) Plumbing of the following discharges to the sanitary sewer, subject to the local sanitary sewer agency’s authority and standards:
   i) Discharges from indoor floor mat/equipment/hood filter wash racks or covered outdoor wash racks for restaurants.
   ii) Dumpster drips from covered trash and food compactor enclosures.
   iii) Discharges from outdoor covered wash areas for vehicles, equipment, and accessories.
   iv) Water feature and fountain discharges, if discharge to onsite vegetated areas is not a feasible option.
   v) Fire sprinkler test water, if discharge to onsite vegetated areas is not a feasible option. [SDR] [PLANNING]

BP-18. TRANSPORTATION DEMAND MANAGEMENT:
A final Transportation Demand Management (TDM) Program shall be submitted for review and approval by the Director of Community Development Prior to issuance of a building permit. The final TDM program shall incorporate the following:

a) The program goals shall be revised to require a minimum of a 20% reduction in total daily vehicle trips and a minimum of a 20% reduction in daily peak hour vehicle trips.

b) A penalty clause shall be included for non-compliance with the TDM measures. Penalties shall vary with the level of compliance
and shall be calculated based on the estimated cost per employee of implementing a successful TDM Program.

c) All lease agreements with future tenants of the site shall note that the tenant is responsible for the tenant to implement and manage the TDM Program. [COA] [PLANNING]

BP-19. GREEN BUILDING:
Final plans shall incorporate a completed LEED green building checklist demonstrating the project design achieves a LEED Gold level as verified by a qualified LEED consultant. [COA] [PLANNING]

BP-20. CITY STREET TREES:
The landscape plan shall including existing and proposed City street trees and shall be submitted for review and approval by the City Arborist prior to issuance of building permit. [COA] [ENGINEERING/CITY ARBORIST]

BP-21. PHOTOMETRIC PLAN:
Prior to issuance of a building permit submit a contour photometric plan for review and approval by the Director of Community Development. The plan shall meet the specifications noted in the Standard Development Requirements. [COA] [PLANNING]

BP-22. LIGHTING PLAN:
Prior to issuance of a building permit submit a detailed lighting plan for review and approval by the Director of Community Development. The plan shall include light fixture design, materials, and colors as well as information on photocell control, shielding, vandal-resistant covers, lighting type, and energy efficiency. [COA] [PLANNING]

BP-23. COMPACT SPACES:
Specify compact parking spaces on the building permit plans. All such areas shall be clearly marked prior to occupancy, in accordance with Title 19 of the Sunnyvale Municipal Code. [SDR] [PLANNING]

BP-24. BICYCLE SPACES:
Provide a minimum of 16 Class I bicycle parking spaces and a minimum of 5 Class II bicycle parking spaces (per VTA Bicycle Technical Guidelines) or as approved by the Director of Community Development. [COA] [PLANNING]

BP-25. BICYCLE SUPPORT FACILITIES:
Indoor shower and locker facilities shall be provided for men and women at the ratio of one shower for every 30 employees and
individual lockers and shall be subject to review and approval by the Director of Community Development prior to issuance of a building permit. [COA] [PLANNING]

BP-26. CARPOOL PARKING:
The plans submitted for building permits shall incorporate preferential parking spaces reserved and so marked in the closest possible rows adjoining the building (allowing for visitor, disabled and pool van parking) for exclusive use by carpool vehicles carrying at least two employees per vehicle. [COA] [PLANNING]

BP-27. MITIGATION MEASURE – BIOLOGICAL RESOURCES:
Final construction drawings shall incorporate all mitigation measures related to biological resources as set forth under “Mitigation Measures” in the approved environmental document and as noted below. Mitigation Measure

WHAT:
In conformance with Federal and State regulations regarding protection of raptors, the following CDFG protocols shall be completed prior to any development on the site to ensure that development does not disturb nesting raptors:

1. Avoidance. Construction activities should be scheduled to avoid the nesting season to the extent feasible. The nesting season for most birds in Santa Clara County extends from April 1st through August 31st.

2. Preconstruction/Pre-disturbance Surveys. If demolition and/or construction are to occur between April and August, then preconstruction surveys for nesting birds shall be conducted by a qualified ornithologist to ensure that no nests will be disturbed during project implementation. This survey shall be conducted no more than seven days prior to the initiation of demolition/construction activities. During this survey, the ornithologist shall inspect all trees and other potential habitats (e.g., shrubs, ruderal grasslands, buildings) within and immediately adjacent to the impact areas for nests. If an active nest is found sufficiently close to work areas to be disturbed by these activities, the ornithologist, in consultation with CDFG, shall determine the extent of a construction-free buffer zone to be established around the nest (typically 250 feet for raptors and 50-100 feet for other species) to ensure that no nests of species protected by the MBTA or California Fish and Game Code will be disturbed during project implementation.
3. *Inhibit Nesting.* If vegetation is to be removed by the project and all necessary approvals have been obtained, potential nesting substrate (e.g., bushes, trees, grass, burrows) that are scheduled to be removed by the project shall be removed before the start of the nesting season (prior to April 1st), if feasible, to help preclude nesting. This will preclude the initiation of nests in this vegetation and prevent the potential delay of the project due to the presence of active nests in these substrates. A final report of nesting birds, including any protection measures, shall be submitted to the Director of Community Development prior to the start of grading.

**WHEN:**
These mitigation measures shall be converted into conditions of approval for the Use Permit prior to its final approval. The conditions will become valid when the Use Permit is approved. Conditions will be applicable during the construction of the project.

**WHO:**
The property owner will be solely responsible for implementation and maintenance of these mitigation measures.

**HOW:**
The conditions of approval will require these mitigation measures to be incorporated into the project construction plans.

[COA]  [PLANNING]

---

BP-28. **MITIGATION MEASURE – CULTURAL RESOURCES:**
Final construction drawings shall incorporate all mitigation measures related to cultural resources as set forth under “Mitigation Measures” in the approved environmental document and as noted below.

**Mitigation Measure**

**WHAT:**
1) For projects involving substantial ground disturbance, the individual project sponsor shall be required to contact the California Historical Resources Information System (CHRIS) to determine whether the particular project is located in a sensitive area. Future development projects that the CHRIS determines may be located in a sensitive area, on or adjoining an identified archaeological site, shall proceed only after the project sponsor contracts with a qualified archaeologist to provide a determination in regard to cultural values remaining on the site and warranted mitigation measures.

2) In the event that subsurface cultural resources are encountered during approved ground-disturbing activities for a project area construction activity, work in the immediate vicinity shall be stopped
and a qualified archaeologist retained to evaluate the finds following the procedures described below. If human remains are found, special rules set forth in State Health and Safety Code section 7050.5 and CEQA Guidelines section 15126.4(b) shall apply. Preservation in place to maintain the relationship between the artifact(s) and the archaeological context is the preferred manner of mitigating impacts to an archaeological site. Preservation may be accomplished by:

- Planning construction to avoid the archaeological site;
- Incorporating the site within a park, green space, or other open space element;
- Covering the site with a layer of chemically stable soil; or
- Deeding the site into a permanent conservation easement.

3) When in-place mitigation is determined by the City to be infeasible, a data recovery plan, which makes provisions for adequate recovery of the scientifically consequential information about the site, shall be prepared and adopted prior to any additional excavation being undertaken. Such studies must be submitted to the California Historical Resources Regional Information Center. If Native American artifacts are indicated, the studies must also be submitted to the Native American Heritage Commission. Identified cultural resources shall be recorded on form DPR 422 (archaeological sites). Mitigation measures recommended by these two groups and required by the City shall be undertaken, if necessary, prior to resumption of construction activities. A data recovery plan and data recovery shall not be required if the City determines that testing or studies already completed have adequately recovered the necessary data, provided that the data have already been documented in another EIR or are available for review at the California Historical Resource Regional Information Center [CEQA Guidelines section 15126.4(b)].

**WHEN:**
These mitigation measures shall be converted into conditions of approval for the Use Permit prior to its final approval. The conditions will become valid when the Use Permit is approved. Conditions will be applicable during the construction of the project.

**WHO:**
The property owner will be solely responsible for implementation and maintenance of these mitigation measures.

**HOW:**
The conditions of approval will require these mitigation measures to be incorporated into the project construction plans.

[COA] [PLANNING]
BP-29. **UNDERGROUND UTILITIES:**
All utilities shall be placed underground, including boundary lines and transformers, in compliance with SMC requirements. The applicant shall provide a copy of an agreement with affected utility companies for undergrounding of any existing overhead utilities which are on-site or within adjoining rights-of-way prior to issuance of a building permit. [SDR] [PLANNING]

BP-30. **UTILITY CONDUITS:**
Install conduits along the project frontage for cable television, electrical and telephone lines in accordance with standards required by utility companies. Submit a conduit plan prior to issuance of a building permit. [COA] [PLANNING]

BP-31. **FIRE PROTECTION WATER SUPPLY:**
The water supply for fire protection and fire fighting shall be approved by the Department of Public Safety prior to issuance of building permits. A fire hydrant will be required within 50 feet of the FDC on the same side of the street. [SDR] [DPS/FIRE PREVENTION]

BP-32. **FIRE SPRINKLERS:**
A fully automatic fire sprinkler system, fire alarm system, standpipes, and smoke control system are required. Trash enclosures located within 5 feet of building exterior walls or overhangs require fire sprinkler protection. [SDR] [DPS/FIRE PREVENTION]

BP-33. **FIRE EXTINGUISHERS:**
Provide the required number of approved fire extinguishers. [SDR] [DPS/FIRE PREVENTION]

BP-34. **FIRE HYDRANTS:**
Replace all fire hydrants on the project site and along the project frontages which are 30 years or older. [COA] [DPS/FIRE PREVENTION/PUBLIC WORKS ENGINEERING]

BP-35. **FIRE ACCESS ROADS:**
Provide fire access roads as required by Fire Prevention Services. On-site fire hydrants may be required along fire access roads and/or in parking lots. [SDR] [DPS/FIRE PREVENTION]
BP-36. KNOX BOX:  
A Knox (key) box will be required for site and building access in accordance with Fire Prevention guidelines. [COA] [DPS/FIRE PREVENTION]

BP-37. RADIO RETRANSMISSION:  
Radio retransmission equipment may be required for emergency responder radio coverage. [COA] [DPS/FIRE PREVENTION]

BP-38. CONSTRUCTION FIRE ACCESS:  
Prior to any combustible materials on-site, provide fire access drives and operational on-site fire protection systems. [SDR] [DPS/FIRE PREVENTION]

BP-39. FIRE PROTECTION PLAN:  
Provide a written Fire Protection Construction Plan for review and approval by Fire Prevention Services prior to issuance of building permits. [SDR] [DPS/FIRE PREVENTION]

BP-40. ELECTRONIC PLANS:  
Provide an electronic version of building permit plans to Fire Protection Services to assist with Fire Department “Pre-Fire Survey” maps. [SDR] [DPS/FIRE PREVENTION]

BP-41. CONNECTION FEES:  
The developer shall pay all applicable Public Works fees including utility frontage fees, connection fees, and off-site improvement plan and inspection fees prior to issuance of any building permit or encroachment permit. This includes an incremental sewer connection fee estimated at $75,215.15 and an incremental water connection fee estimated at $14,869.98 prior to issuance of a building permit or encroachment permit, whichever occurs first. [COA] [PUBLIC WORKS ENGINEERING]

BP-42. SIDEWALKS:  
Replace all uplifted sidewalk along the project’s Mary Avenue frontage and install root barriers according to the latest City standards. [COA] [PUBLIC WORKS ENGINEERING]

BP-43. DRIVEWAYS AND RAMPS:  
All driveways and access ramps shall be ADA compliant and meet current City standards. Curb-return style driveways are not permitted. [COA] [PUBLIC WORKS ENGINEERING]
BP-44. Curb Striping:
Restrripe the existing red curb along the entire project frontage and maintain as new facilities warrant. [COA] [Public Works Engineering]

BP-45. Double Check Detector Assembly:
Replace the double check detector assembly (DCDA) to current City standards. [COA] [Public Works Engineering]

BP-46. Sewer Cleanout:
Install sanitary sewer cleanouts at the property lines. [COA] [Public Works Engineering]

BP-47. Water Meters:
Upgrade all water meters to radio-read disk-type. [COA] [Public Works Engineering]

BP-48. Signal Equipment:
Due to the potential increase in pedestrian traffic, upgrade pedestrian signal equipment. Proposed upgrades shall be reviewed and approved by the City’s Transportation and Traffic Division. [COA] [Public Works Engineering]

BP-49. Abandoned Driveway Approaches:
All unused driveway approaches shall be replaced with curbs, gutters, and sidewalks meeting current City standards. [SDR] [Public Works Engineering]

BP-50. Equipment at Driveway Approach:
No meters or vaults shall be located within the driveway approach areas. [COA] [Public Works Engineering]

EP: The following conditions shall be addressed as part of an Encroachment Permit Application.

EP-1. Connection Fees:
The developer shall pay all applicable Public Works fees including utility frontage fees, connection fees, and off-site improvement plan and inspection fees prior to issuance of any building permit or encroachment permit. This includes an incremental sewer connection fee estimated at $75,215.15 and an incremental water connection fee
estimated at $14,869.98 prior to issuance of a building permit or encroachment permit, whichever occurs first. [COA] [PUBLIC WORKS ENGINEERING]

**PF: THE FOLLOWING CONDITIONS SHALL BE ADDRESSED ON THE CONSTRUCTION PLANS AND/OR SHALL BE MET PRIOR TO RELEASE OF UTILITIES OR ISSUANCE OF A CERTIFICATE OF OCCUPANCY.**

**PF-1. LANDSCAPING AND IRRIGATION:**
All landscaping and irrigation as contained in the approved building permit plan shall be installed prior to occupancy. [COA] [PLANNING]

**PF-2. COMPACT SPACES:**
All such areas shall be clearly marked prior to occupancy, as indicated on the approved building permit plans. [COA] [PLANNING]

**PF-3. PARKING LOT STRIPING:**
All parking lot striping, carpool and compact spaces shall be striped as per the approved plans and Public Works standards. [COA] (PLANNING/ENGINEERING)

**PF-4. IRRIGATION METERS:**
For commercial and industrial projects, to ensure appropriate sewer billing (water used for irrigation may not be billed for sewer), the developer may provide separate (irrigation and other) intake meters. Such meters may be installed prior to occupancy of the building. [COA] [PLANNING]

**PF-5. MITIGATION MEASURES:**
Documentation indicating that all environmental mitigation measures have been satisfied shall be provided to the Director of Community Development prior to release of occupancy or utilities. Refer to the Mitigated Negative Declaration and Conditions of Approval BP-24 and BP-25 for detailed measures. [COA] [PLANNING] Mitigation Measure

**PF-6. GREEN BUILDING:**
As soon as possible after construction of the project, the developer shall submit the project for LEED certification at a Gold level. The City shall be provided with documentation of the submittal and the final determination on certification. [COA] [PLANNING]
DC: THE FOLLOWING CONDITIONS SHALL BE COMPLIED WITH AT ALL TIMES DURING THE CONSTRUCTION PHASE OF THE PROJECT.

DC-1. BLUEPRINT FOR A CLEAN BAY:
The project shall be in compliance with stormwater best management practices for general construction activity until the project is completed and either final occupancy has been granted. [SDR] [PLANNING]

DC-2. TREE PROTECTION:
All tree protection shall be maintained, as indicated in the tree protection plan, until construction has been completed and the installation of landscaping has begun. [COA] [PLANNING]

DC-3. TRAFFIC SIGNAL CABINET:
The applicant is advised that the northeast intersection houses the main traffic signal cabinet and electrical service point for the entire traffic signal system. The applicant shall exercise extreme caution when working around these facilities to avoid damage. If project construction affects the existing equipment, the applicant shall be responsible for immediate repair and/or replacement of the equipment to restore the traffic signal system at their own cost. [COA] [PUBLIC WORKS ENGINEERING]

AT: THE FOLLOWING CONDITIONS SHALL BE COMPLIED WITH AT ALL TIMES THAT THE USE PERMITTED BY THIS PLANNING APPLICATION OCCUPIES THE PREMISES.

AT-1. RECYCLING AND SOLID WASTE:
All exterior recycling and solid waste shall be confined to approved receptacles and enclosures. [COA] [PLANNING]

AT-2. LOUDSPEAKERS PROHIBITED:
Out-of-door loudspeakers shall be prohibited at all times. [COA] [PLANNING]

AT-3. EXTERIOR EQUIPMENT:
All exterior materials, equipment and/or supplies of any kind shall be maintained within an approved enclosure area. Any stacked or stored items shall not exceed the height of the enclosure. [COA] [PLANNING]
AT-4. UNENCLOSED STORAGE (PROHIBITED):
Unenclosed storage of any kind shall be prohibited on the premises. [COA] [PLANNING]

AT-5. LANDSCAPE MAINTENANCE:
All landscaping shall be installed in accordance with the approved landscape plan and shall thereafter be maintained in a neat, clean, and healthful condition. Trees shall be allowed to grow to the full genetic height and habit (trees shall not be topped). Trees shall be maintained using standard arboriculture practices. [COA] [PLANNING]

AT-6. PARKING LOT MAINTENANCE:
The parking lot shall be maintained in accordance with the approved plans and as follows:
a) Clearly mark all employee, compact, carpool, and other designated spaces. This shall be specified on the building permit plans and completed prior to occupancy.
b) Maintain all parking lot striping and marking in good condition.
c) Assure that adequate lighting is available in parking lots to keep them safe and desirable for the use.
d) Require signs to direct vehicles to additional parking spaces on-site, as needed. [COA] [PLANNING]

AT-7. BMP MAINTENANCE:
The project applicant, owner, landlord, or HOA must properly maintain any structural or treatment control best management practices to be implemented in the project, as described in the approved Stormwater Management Plan and indicated on the approved building permit plans. [SDR] [PLANNING]

AT-8. BMP RIGHT OF ENTRY:
The project applicant, owner, landlord, or HOA, shall provide access to the extent allowable by law for representatives of city, the local vector control district, and the Regional Water Quality Control Board, strictly for the purposes of verification of proper operation and maintenance for the storm water treatment best management practices contained in the approved Storm Water Management Plan. [SDR] [PLANNING]

AT-9. TRANSPORTATION DEMAND MANAGEMENT:
An annual monitoring report shall be submitted to the Director of Community Development in January of each year. The report shall demonstrate compliance with the approved TDM Program including measures implemented and data on trip reductions achieved. If the
TDM goals are not met in a given year, the property owners and/or tenant shall submit to the Director of Community Development proposed program modifications intended to achieve the required goals in future years. [COA] [PLANNING]

NOTICE OF INTENT TO ADOPT A
MITIGATED NEGATIVE DECLARATION

This form is provided as a notification of an intent to adopt a Mitigated Negative Declaration which has been prepared in compliance with the provisions of the California Environmental Quality Act of 1970, as amended, and Resolution #118-04.

PROJECT TITLE:
Application for a Use Permit filed by Peery-Arrillaga.

PROJECT DESCRIPTION AND LOCATION (APN):
2011-7657: Peery-Arrillaga [Applicant] A&P Children Invsllc [Owner] Use Permit for a new 124,095 square foot, five-story office building resulting in approximately 55% Floor Area Ratio with a new 1.5-story parking structure located at 580 N. Mary Avenue. (APN: 165-41-002)

WHERE TO VIEW THIS DOCUMENT:
The Mitigated Negative Declaration, its supporting documentation and details relating to the project are on file and available for review and comment in the Office of the Secretary of the Planning Commission, City Hall, 456 West Olive Avenue, Sunnyvale.

This Mitigated Negative Declaration may be protested in writing by any person prior to 5:00 p.m. on Tuesday, February 7, 2011. Protest shall be filed in the Department of Community Development, 456 W. Olive Avenue, Sunnyvale and shall include a written statement specifying anticipated environmental effects which may be significant. A protest of a Mitigated Negative Declaration will be considered by the adopting authority, whose action on the protest may be appealed.

HEARING INFORMATION:
A public hearing on the project is scheduled for:
Monday, January 9, 2011 at 8:00 p.m. and Tuesday, February 7, 2011 at 7:00 p.m. in the Council Chambers, City Hall, 456 West Olive Avenue, Sunnyvale.

TOXIC SITE INFORMATION:
(No) listed toxic sites are present at the project location.

Circulated On December 19, 2011

Signed: [Signature]

Sunnyvale, CA 94085 |
| Zoning | M-S (Industrial and Service) |
| General Plan | Industry |
| Other Public Agencies whose approval is required | None |

**Brief description of the Project:** The proposed project includes demolition of an existing 50,406 square foot single-story industrial building and construction of a new 124,095 square foot five-story office building with a new two-level parking structure. The project will result in approximately 55% Floor Area Ratio (FAR) and requires approval of a Use Permit due to a requested FAR exceeding 35%.

**DETAILED PROJECT DESCRIPTION:**

**On-site Development:** The proposed project involves demolition of an existing single-story concrete tilt-up building, grading and site preparation, and construction of a new five-story steel framed office building. A new two-level parking structure will be located partially below grade resulting in 1.5 stories visible above grade. Existing mature trees located on the interior of the site will be removed during demolition. Mature perimeter trees will be retained and protected during construction to the extent feasible.

**Off-site Improvements:** An existing driveway and curb cut along Mary Avenue will be removed, and existing curb, gutter, and sidewalk will be repaired or replaced as needed along Mary Avenue. An existing driveway along Maude Avenue will be widened. No other off-site improvements are proposed.

**Construction Activities and Schedule:** The existing use is expected to vacate the site in May of 2012. Demolition is proposed to begin as soon as possible after vacancy. The proposed construction schedule spans a total of 16 months for demolition, site preparation, and construction. Time estimates for specific construction phases are as follows:
Demolition – 1 week
Site Preparation – 3 weeks (includes staking, grading, and layout for foundation)
Foundation/Reinforcing Steel – 1 month
Structural Steel/Metal Decking – 2 months
Underground Utilities – 1 month
Roof and Decks Construction – 1 month
Exterior Skin and Mechanical – 4 months
Interior Construction including Electrical and Plumbing – 4 months
Fine Grading and Landscaping – 2 months

Construction of the project will not involve pile driving or other extremely high noise-generating activities, with the exception of jack hammering which will occur only during the demolition phase.

Surrounding Uses and Setting: The project site is located on the corner of Mary Avenue and Maude Avenue within an existing industrial area. It is currently occupied by the U.S. Postal Service and used as a Post Office. Surrounding sites are developed primarily with single-story industrial buildings similar to the existing building on the subject site. There are several sites in the immediate vicinity which have been redeveloped with multi-story office campuses with Floor Area Ratios (FARs) similar to the FAR requested on the subject site. Surrounding uses are industrial, R&D, and offices. There is an existing commercial shopping center located on Mary Avenue approximately 1/4 mile from the subject site which is occupied by restaurants and other supportive commercial uses. There are no surrounding residential uses within 1/3 mile of the project site.
EVALUATION OF ENVIRONMENTAL IMPACTS:

1. A brief explanation is required for all answers except "No Impact" answers that are adequately supported by the information sources a lead agency cites in the parentheses following each question. A "No Impact" answer is adequately supported if the referenced information sources show that the impact simply does not apply to projects like the one involved (e.g. the project falls outside a fault rupture zone). A "No Impact" answer should be explained where it is based on project-specific factors as well as general standards (e.g. the project will not expose sensitive receptors to pollutants, based on a project-specific screening analysis).

2. All answers must take account of the whole action involved, including off-site as well as on-site, cumulative as well as project-level, indirect as well as direct, and construction as well as operational impacts.

3. Once the lead agency has determined that a particular physical impact may occur, then the checklist answers must indicate whether the impact is potentially significant, less than significant with mitigation, or less than significant. "Potentially Significant Impact" is appropriate if there is substantial evidence that an effect may be significant. If there are one or more "Potentially Significant Impact" entries when the determination is made, an EIR is required.

4. "Negative Declaration: Potentially Significant Unless Mitigation Incorporated" applies where the incorporation of mitigation measures has reduced an effect from "Potentially Significant Impact" to a "Less Significant Impact." The lead agency must describe the mitigation measures, and briefly explain how they reduce the effect to a less than significant level (mitigation measures from Section 17, "Earlier Analysis," may be cross-referenced).

5. Earlier analysis may be used where, pursuant to the tiering, program EIR, or other CEQA process, an effect has been adequately analyzed in an earlier EIR or negative declaration. Section 15063 (c) (3) (d). In this case, a brief discussion should identify the following:

6. Earlier Analysis Used. Identify and state where they are available for review.

7. Impacts Adequately Addressed. Identify which effects from the above checklist were within the scope of and adequately analyzed in an earlier document pursuant to applicable legal standards, and state whether such effects were addressed by mitigation measures based on the earlier analysis.

8. Mitigation Measures. For effects that are "Less than Significant with Mitigation Measures Incorporated," describe the mitigation measures which were incorporated or refined from the earlier document and the extent to which they address site-specific conditions for the project.

9. Lead agencies are encouraged to incorporate into the checklist references to information sources for potential impacts (e.g. general plans, zoning ordinances). Reference to a previously prepared or outside document should, where appropriate, include a reference to the page or pages where the statement is substantiated.
ENVIROMENTAL FACTORS POTENTIALLY AFFECTED:
The environmental factors checked below would be potentially affected by this project, involving at least one impact that is a "Potentially Significant Impact" as indicated by the checklist on the following pages.

☐ Aesthetics  ☐ Hazards & Hazardous Materials  ☐ Public Services
☐ Agricultural Resources  ☐ Hydrology/Water Quality  ☐ Recreation
☐ Air Quality  ☐ Land Use/Planning  ☐ Transportation/Traffic
☐ Biological Resources  ☐ Mineral Resources  ☐ Utilities/Service Systems
☐ Cultural Resources  ☐ Noise  ☐ Mandatory Findings of Significance
☐ Geology/Soils  ☐ Population/Housing

MANDATORY FINDINGS OF SIGNIFICANCE (see checklist for further information):

Does the project have the potential to degrade the quality of the environment, substantially reduce the habitat of a fish or wildlife species, cause a fish or wildlife population to drop below self-sustaining levels, threaten to eliminate a plant or animal community, reduce the number or restrict the range of a rare or endangered plant or animal, or eliminate important examples of the major periods of California history or prehistory?

☐ Yes  ☑ No

Mandatory Findings of Significance? Does the project have impacts that are individually limited, but cumulatively considerable? ("Cumulatively considerable" means that the incremental effects of a project are considerable when viewed in connection with the effects of the past projects, the effects of other current projects, and the effects of probable future projects)?

☐ Yes  ☑ No

Mandatory Findings of Significance? Does the project have environmental effects which will cause substantial adverse effects on human beings, either directly or indirectly?

☐ Yes  ☑ No
DETERMINATION:
On the basis of this initial evaluation:

- I find that the proposed project COULD NOT have a significant effect on the environment, and a NEGATIVE DECLARATION will be prepared. □
- I find that although the proposed project could have a significant effect on the environment, there will not be a significant effect in this case because revisions in the project have been made by or agreed to by the project proponent. A MITIGATED NEGATIVE DECLARATION will be prepared. □
- I find that the proposed project MAY have a significant effect on the environment, and an ENVIRONMENTAL IMPACT REPORT is required. □
- I find that the proposed project MAY have a "potential significant impact" or "potentially significant unless mitigated" impact on the environment, but at least one effect (1) has been adequately analyzed in an earlier document pursuant to applicable legal standards, and (2) has been addressed by mitigation measures based on the earlier analysis as described on attached sheets. An ENVIRONMENTAL IMPACT REPORT is required, but it must analyze only the effects that remain to be addressed. □
- I find that although the proposed project could have a significant effect on the environment, because all potentially significant effects (a) have been analyzed in an earlier EIR or NEGATIVE DECLARATION pursuant to applicable standards and (b) have been avoided or mitigated pursuant to that earlier EIR or NEGATIVE DECLARATION, including revisions or mitigation measures that are imposed upon the proposed project, nothing further is required. □

Checklist preparer: Mariya Hodge

Further Discussion if "Less Than Significant" with or without mitigation:

**#4. Population and Housing (Less than Significant):** The proposed project at 124,095 square feet represents approximately 55% Floor Area Ratio (FAR) where 35% FAR is permitted by right. Additional FAR over 35% requires approval of a Use Permit by the City Council. The proposed development intensity is consistent with the existing zoning (Industrial and Service – M-S) and General Plan designation (Industry) of the site as the proposed development intensity may be permitted by Use Permit. The new office square footage would create opportunities for new jobs and could cause a small increase in the City’s jobs/housing balance. Sunnyvale Municipal Code section 19.22.035 requires payment of a Housing Mitigation Fee for any new floor area exceeding 35% FAR in industrial zoning districts. Housing Mitigation Fees are paid at building permit issuance and may be subject to change annually based on the adopted fee schedule. Housing Mitigation Fees are intended to mitigate the potential housing impacts of new jobs by providing funds for the creation of new housing units. This is a standard Code requirement for all projects exceeding 35% FAR in industrial zoning districts and is therefore not a project-specific mitigation. With payment of the required Housing Mitigation Fee, the project will mitigate any potential population growth and job growth impacts. As a result, the project will not be inconsistent the Sunnyvale General Plan.

**#10 and #12. Moffett Federal Airfield AICUZ (Less than Significant):** The project site is located in the vicinity of the Moffett Federal Airfield. According to the Air Installation Compatible Use Zones (AICUZ) Map, the project site is located in a "C3" zone with respect to accident potential. This zone is identified as having minimal accident potential. The zone is identified as being unacceptable for residential uses but normally acceptable for office buildings. While some accident potential exists associated with the airfield, it is minimal. The impact is determined to be less than significant and requires no mitigation.
#17. Biological Resources (Less than Significant with Mitigation): The proposed project includes the removal of several large trees and site grading. The site is currently developed and in active use, therefore the site is unlikely to have been occupied by burrowing owls (Athene cunicularia) which are present in some areas of Sunnyvale. Nesting raptors have not been specifically observed on the site, but there is a potential for raptors to establish nests in tall mature trees such as those on the project site. Although the discovery of nesting raptors on the site is not anticipated, the following mitigation measure has been included in the project to reduce the potential impact to a less than significant level.

WHAT:
In conformance with Federal and State regulations regarding protection of raptors, the following CDFG protocols shall be completed prior to any development on the site to ensure that development does not disturb nesting raptors:

1. Avoidance. Construction activities should be scheduled to avoid the nesting season to the extent feasible. The nesting season for most birds in Santa Clara County extends from April 1st through August 31st.

2. Preconstruction/Pre-disturbance Surveys. If demolition and/or construction are to occur between April and August, then preconstruction surveys for nesting birds shall be conducted by a qualified ornithologist to ensure that no nests will be disturbed during project implementation. This survey shall be conducted no more than seven days prior to the initiation of demolition/construction activities. During this survey, the ornithologist shall inspect all trees and other potential habitats (e.g., shrubs, ruderal grasslands, buildings) within and immediately adjacent to the impact areas for nests. If an active nest is found sufficiently close to work areas to be disturbed by these activities, the ornithologist, in consultation with CDFG, shall determine the extent of a construction-free buffer zone to be established around the nest (typically 250 feet for raptors and 50-100 feet for other species) to ensure that no nests of species protected by the MBTA or California Fish and Game Code will be disturbed during project implementation.

3. Inhibit Nesting. If vegetation is to be removed by the project and all necessary approvals have been obtained, potential nesting substrate (e.g., bushes, trees, grass, burrows) that are scheduled to be removed by the project shall be removed before the start of the nesting season (prior to April 1st), if feasible, to help preclude nesting. This will preclude the initiation of nests in this vegetation and prevent the potential delay of the project due to the presence of active nests in these substrates. A final report of nesting birds, including any protection measures, shall be submitted to the Director of Community Development prior to the start of grading.

WHEN:
These mitigation measures shall be converted into conditions of approval for the Use Permit prior to its final approval. The conditions will become valid when the Use Permit is approved. Conditions will be applicable during the construction of the project.

WHO:
The property owner will be solely responsible for implementation and maintenance of these mitigation measures.

HOW:
The conditions of approval will require these mitigation measures to be incorporated into the project construction plans.

20. Biological Resources (Less than Significant): An Arborist's Report and Tree Survey was completed by Barrie D. Coate and Associates, dated October 7, 2011. The report reviewed the existing trees on-site and concluded that as part of the project, a number of trees will need to be removed to allow the reconfiguration of parking and circulation areas and the construction of the new buildings. Protected trees are defined by the Sunnyvale Municipal Code as any tree greater than 38" in circumference measured at 4.5' from the adjacent grade. The survey evaluated 56 trees and shrubs existing on the site and identified 43 as protected trees. The project site plan and landscaping plans have been developed to
<table>
<thead>
<tr>
<th>Planning</th>
<th>Potentially Significant Impact</th>
<th>Less than Significant with Mitigation</th>
<th>Less Than Significant</th>
<th>No Impact</th>
<th>Source Other Than Project Description and Plans</th>
</tr>
</thead>
</table>

retain the existing mature protected trees to the greatest extent feasible. A total of 23 protected trees are proposed for removal. These trees will be replaced as required by the Sunnyvale Municipal Code and as per the final landscape plan.

**#23. Historic and Cultural Remains (Less than Significant with Mitigation):** The proposed project includes grading, land disturbance, and excavation for the new building and parking structure. Although there are no recorded archeological sites in the immediate area of the proposed building locations, there still remains the possibility of discovery of Native American remains during grading since there are archeological sites in the greater vicinity. In the event of a discovery, project grading could result in potential disturbance of subsurface cultural resources which would result in a significant impact unless mitigated. There are no surface historic resources currently known to be on the project sites. Although the discovery of cultural resources on these sites is not anticipated, the following mitigation measure has been included in the project to reduce the potential impact to a less than significant level:

**WHAT:**

1) For projects involving substantial ground disturbance, the individual project sponsor shall be required to contact the California Historical Resources Information System (CHRISS) to determine whether the particular project is located in a sensitive area. Future development projects that the CHRISS determines may be located in a sensitive area, or on or adjoining an identified archaeological site, shall proceed only after the project sponsor contracts with a qualified archeologist to provide a determination in regard to cultural values remaining on the site and warranted mitigation measures.

2) In the event that subsurface cultural resources are encountered during approved ground-disturbing activities for a project area construction activity, work in the immediate vicinity shall be stopped and a qualified archaeologist retained to evaluate the finds following the procedures described below. If human remains are found, special rules set forth in State Health and Safety Code section 7050.5 and CEQA Guidelines section 15126.4(b) shall apply. Preservation in place to maintain the relationship between the artifact(s) and the archaeological context is the preferred manner of mitigating impacts to an archaeological site. Preservation may be accomplished by:

- Planning construction to avoid the archaeological site;
- Incorporating the site within a park, green space, or other open space element;
- Covering the site with a layer of chemically stable soil; or
- Deeding the site into a permanent conservation easement.

3) When in-place mitigation is determined by the City to be infeasible, a data recovery plan, which makes provisions for adequate recovery of the scientifically consequential information about the site, shall be prepared and adopted prior to any additional excavation being undertaken. Such studies must be submitted to the California Historical Resources Regional Information Center. If Native American artifacts are indicated, the studies must also be submitted to the Native American Heritage Commission. Identified cultural resources shall be recorded on form DPR 422 (archaeological sites). Mitigation measures recommended by these two groups and required by the City shall be undertaken, if necessary, prior to resumption of construction activities. A data recovery plan and data recovery shall not be required if the City determines that testing or studies already completed have adequately recovered the necessary data, provided that the data have already been documented in another EIR or are available for review at the California Historical Resource Regional Information Center [CEQA Guidelines section 15126.4(b)].

**WHEN:**

These mitigation measures shall be converted into conditions of approval for the Use Permit prior to its final approval. The conditions will become valid when the Use Permit is approved. Conditions will be applicable during the construction of the project.

**WHO:**
The property owner will be solely responsible for implementation and maintenance of these mitigation measures. The conditions of approval will require these mitigation measures to be incorporated into the project construction plans.

**#34. Seismic Safety (Less than Significant):** Per the Santa Clara County Geologic Hazard Zones maps, the project site is located in a liquefaction hazard zone. The Uniform Building Code contains a series of requirements to address safety issues regarding soil types. These standards must be met for a building permit to be issued. Through the City's implementation of the Uniform Building Code requirements for areas with potential for seismic activity, potential impacts related to liquefaction hazards will be less than significant and require no additional mitigation.

#### Further Discussion:

**#35 and #36. Capacity and Congestion Management (No Impact):** Although the proposed project would increase floor area ratio on the site from approximately 22.3% FAR to approximately 55% FAR, the project is anticipated to result in a reduction in vehicle trips. The existing Post Office use is a very high generator of vehicle trips. According to the ITE Trip Generation Manual 8th edition, a 50,406 square foot Post Office is expected to generate approximately 560 PM peak hour trips. A 124,000 square foot office building is expected to generate only 218 PM peak hour trips, which represents less than 40% of the estimated existing peak hour trips. Due to potential variations in activity among Post Office locations, the applicant commissioned a trip generation survey to count actual trips generated by the existing Post Office use on this site. According to the Memorandum on Project Trip Generation Estimates (Fehr & Peers, October 14, 2011), 401 PM peak hour trips were generated by the existing site during the survey period. While these trips are fewer than the 560 estimated by ITE, they still represent nearly twice the peak hour trips expected to be generated by the proposed 55% FAR office development. As a result, the project is expected to result in a decrease in vehicle trips and roadway congestion. There is no anticipated negative transportation impact.

Further Discussion if “Less Than Significant” with or without mitigation:

#47. Geology and Soils (Less than Significant): Per the Santa Clara County Geologic Hazard Zones maps, the project site is located in a liquefaction hazard zone. The Uniform Building Code contains a series of requirements to address safety issues regarding soil types. These standards must be met for a building permit to be issued. Through the City’s implementation of the Uniform Building Code requirements for areas with potential for seismic activity, potential impacts related to liquefaction hazards will be less than significant and require no additional mitigation.

General Discussion: The California Building Code contains a series of building code requirements to address safety issues regarding seismic shaking, flooding, and soil types. In addition, Title 16.62 of the Sunnyvale Municipal Code requires a series of measures for provisions to reduce flood-related hazards to buildings. These standards are suggested by the Federal Emergency Management Agency and required by code by the City of Sunnyvale. These standards must be met for a building permit to be issued.

Attachment D is provided as two separate files (Part 1 and Part 2) on the website under “Attachments and Supplemental Information.”
To build a new 124,000 sf 5-story office building on an existing site occupied by a post office. And seek LEED Gold certification for FAR bonus increase to 55%.

This class A office building is designed with contemporary architectural vocabulary, high quality and high performance materials. the central boat-shape screen walls and the corner terraces provide an interesting variation of building heights and visual effects.

The configuration of the site and the design of the building make this project highly desirable to prime businesses and surrounding neighborhoods.

The new project will also comply with CalGreen Mandatory measure (chapter 5)/checklist.
Category I Community Character

A. The building site is ideally located proximate to the Hwy 237 and Hwy 101 off-ramp to minimize cross-city traffic impacts at intersections and roadway segments.

B. The proposed building has a high quality of design and excellent architecture. They are the type of building/development the City is hoping to attract to the area.

C. The proposed building includes greater security and fire safety through an upgraded non-combustible construction type, fire sprinklers/ fire alarm systems and exterior lighting.

D. The adjacent buildings in the area have the same zoning and land use. Potential adverse impacts to such adjacent sites have been minimized.

Category II Environmental Traffic and Air Quality

A. The building site is ideally located proximate to the Hwy 237 and Hwy 101 off-ramp to minimize cross-city traffic impacts at intersections and roadway segments. The proposed building replaces the existing post office. Despite the double in FAR, the number of parking spaces for new building is only increases 40%, while the overall parking ratio decrease from 6.0/1,000 to 3.3/1,000.

B. A Transportation Demand Management (TDM) Program will be adopted to reduce vehicle trips to the greatest extent feasible. A draft TDM Program has been prepared with a goal of at least 16% reduction in peak hour trips.

C. A prospective tenant has been identified for the building and will provide appropriate on-site amenities that minimize midday vehicle trips (e.g. break-room/lunchroom, cafeteria, fitness area, etc.).

D. The project is not a mixed-use project.

E. Bus stops are located along West Maude Avenue in both directions. Stops are located at Mary Avenue, only one block from the proposed project.

F. Capital facilities and city services are already being provided to existing buildings on the site. The additional requirement of such expenditures and services to justify the increased FAR is very small.
Category III Site Design and Architecture

A. This Class A office building is designed with contemporary architectural vocabulary, high quality and high performance materials. The central boat-shape screen walls and the corner terraces provide an interesting variation of building heights and visual effects.

B. The configuration of the site and the design of the building make this project highly desirable to prime businesses and surrounding neighborhoods.

C. The appearance of the proposed building/development complements the City image and community character.

D. Bulk and mass of the proposed building have been reduced by:
   a. Providing greater front setback than the existing (from 25 feet to 90 feet).
   b. Increasing landscaping by 18,000 sf.
   c. Providing floor terraces at the building corners.

E. Non-point source pollution for the project is controlled through implementation of a Stormwater Management Plan (SWMP). The SWMP will treat all of the site’s stormwater on-site using Low-Impact Development measures such as raingardens.

F. The number of parking spaces provided for the proposed building is based on the number of spaces required to attract prime businesses to the building. The proposed building provides lower parking ratio (3.3/1,000) than the existing building (6.0/1,000).

G. The proposed building is completely designed for its site with no phasing or future consolidation anticipated.

H. The new project will also comply with CalGreen Mandatory measure (chapter 5)/checklist and LEED Gold certification.

Category IV Economic, Fiscal and Community Benefit

A. The proposed building is designed to become desired locations for prime businesses. There is a prospective tenant identified for the building and will enrich the community benefit.
The new project will comply with CalGreen Mandatory measure (chapter 5)/ checklist.

**Alternative Transportation**
Showers/ Lockers will be provided for bicyclists. Bus stops at West Maude Avenue and North Mary Avenue are located within a block of the project.

**Reduced Site Disturbance**
The building coverage has been reduced by 4,500 sf. The landscaped area has been increased by 18,000 sf.

**Storm water Management**
Rain gardens will be provided to treat parking lot and roof drainage.

**Heat Island Effect (non-roof)**
Tree shading (50% min) will be provided for parking lot/ Light colors are provided for building materials.

**Heat Island Effect (roof)**
'Energy Star' high reflectance cap-sheet roof system is provided for roof.

**Light Pollution Reduction**
Lighting will not exceed Illuminating Engineering Society of North America requirements (1 foot candle/sf). Directional reflectors will be provided at perimeter light standards away from public roads.

**Water Efficiency**
Water closets will have 1.6 gallon flush valves and urinals will have 1 gallon flush valves. Sloan valves will be used on all fixtures. Showerheads will be water efficient and provide less than 2.5 gallons per minute.

**Energy and Atmosphere**
Building will meet or exceed the CalGreen Mandatory measure/ Title 24 Energy requirement. High performance glass (Viricon VS6-14) is being used. Terrace/ arcade provide shading to glass and reduce heat-gain. Landscaping is strategically planted adjacent to sun exposed glass areas. HVAC system will have an economizer cycle capability using outside cool air. The building will utilize digital main HVAC controls for its energy management system. Non-ozone depleting R-22 (versus R-12) refrigerant for HVAC will be used. Flourescent interior lighting vs incandescent lighting will be used.
Materials and Resources
Low VOC adhesives and sealants will be used. Entry frate/mats will be used at entries to capture particulates.

Storage and Collection of Recyclables
Trash enclosures include recyclables.

Construction Waste Management
Greater than 75% of demolished materials will be diverted from landfill.

Local/Regional Materials
Local/ regional materials such as glass and pavers are specified to use local suppliers to reduce transportation pollution. Fly ash will be used in concrete foundations and slabs.

Indoor Environmental Quality
Deferred to Tenant Improvement.

Office Class Levels

The following is a brief summary of the typical characteristics of Class A, B, and C office buildings, as well as examples of each building type in Sunnyvale. The attributes of the various class levels are somewhat subjective in their application and any specific building may exhibit characteristics of multiple classes, but overall these attributes work collectively to classify buildings with a reasonable degree of accuracy. This information was generated by the City's Economic Development Division using professional commercial real estate broker samples.

**Class A**
- Built after 1985 to qualify as Class A
- Setbacks from street are greater than other similar projects (typically include generous front landscaping and site features)
- At least two stories (one-story buildings do not qualify as Class A)
- Steel frame or higher-end concrete tilt-up with four sides of windows
- Aesthetically pleasing, “high image”
- Extensive window lines (made mostly of glass exterior)
- Buildings constructed with glass curtain-wall, granite, and/or glass fiber reinforced concrete (GFRC) are typically Class A

**Examples of Class A:**
- Most of the new buildings in Moffett Park including Moffett Towers, Yahoo!, Juniper Networks, Ariba, and Network Appliance
- HP/Palm campus
- AMD campus (on De Guigne Drive)
- Downtown – three Mozart buildings (Broadcom); Nokia

**Class B**
- Typically built between 1980 and present
- Limited setbacks
- One- and two-story buildings
- Limited window line: 2.5 to 3 sides made of glass exterior
- Limited landscaping with no special character

**Examples of Class B:**
- Sun buildings off Mary (formally Boeing); likely B+
- 333 West El Camino Real (corner of W. El Camino Real and Mathilda); likely B+
- “Horizontal Skyscraper” Building (Oakmead Pkwy. and Lakeside)
- OKI Semiconductor (corner of Mary and Almanor)
Class C

- Typically built prior to 1980
- Limited setbacks
- Typically one-story but may be two-story
- Limited or no glass exterior
- Buildings generally of concrete tilt-up construction
- Dated architecture (e.g. rock wall panels)
- Any architectural styling which obviously dates a building

Examples of Class C:

- Most of Peery Park industrial area
- Most of the buildings located on Elko Avenue (the “Woods” industrial area)
Evaluation and Survey of TDM Programs

Santa Monica Zoning Ordinance Update

Transportation Demand Management: Issues and Recommendations

Prepared for
The City of Santa Monica

Introduction and Overview

This paper discusses approaches to revising the provisions in Chapter 9.16, Transportation Demand Management, to implement the LUCE’s policies and proposals for reducing traffic congestion and associated impacts on the environment and the quality of life in Santa Monica by sharply reducing single occupancy vehicle trips. The existing requirements, which the City adopted in 1991 and substantially revised in 1996, are intended to comply with requirements of the South Coast Air Quality Management District and the Los Angeles County Metropolitan Transportation Authority’s Congestion Management Program. The proposed revisions are a major component of the City’s strategy for achieving the LUCE’s goal of No Net New Evening Peak Period Vehicle Trips.
Discussion and Key Policy Questions

The transportation sector is the largest source of emissions in California, contributing up to 36 percent of all statewide GHG emissions. Because the distribution of land uses has a major effect on Vehicle Miles Traveled (VMT), land use decisions also affect the proportion of GHG emissions generated by the transportation sector. VMT can, therefore, be translated into tailpipe emissions per mile traveled. Transportation emissions constitute about 40 percent of all GHG emissions in Santa Monica and, of that, about three quarters come from personal trips. Even though Santa Monica’s per capita emission rates are already about half that of more auto-dependent places in Southern California (LUCE p. 4.0-4), the LUCE creates a framework to achieve further reductions in GHG emissions through a variety of measures including programs and regulations that can reduce trips by managing transportation demand.

To discourage auto usage and promote the use of more sustainable means of travel, communities can create restrictions on new parking development. However, the effectiveness of parking reduction measures in reducing auto trips and traffic congestion ultimately depends on the alternatives available and choices made by individuals. If people decide to drive (instead of biking, walking, or using public transit) to a site with limited parking, they will end up increasing local congestion in their search for scarce available spaces. Thus, it is crucial to have a holistic transportation strategy to reduce automobile trips particularly during peak travel times. Transportation Demand Management (TDM) is the term given to a variety of measures that encourage people to change their mode or time of travel, with requirements or incentives to utilize alternatives to the single occupant vehicle to manage congestion and reduce GHG. TDM strategies are particularly appropriate for Santa Monica because they are one of the most cost-effective ways to allow new development in moderately dense areas without increasing traffic and parking demand. Even though it is impossible to eliminate congestion entirely in Santa Monica, especially near popular destinations, the City can promote additional changes that would improve the city’s livability. The TDM strategy is supposed to provide low-cost travel solutions that reduce or eliminate demand on roads and freeways.

REGIONAL REQUIREMENTS

The South Coast Air Quality Management District imposes GHG reduction requirements, and the Los Angeles County Metropolitan Transportation Authority’s Congestion Management Program imposes trip reduction requirements. However, these two regional agencies have different thresholds. The AQMD standards apply to employers with 250 or more employees, and the CMP standards apply to non-residential development projects over 25,000 square feet. Santa Monica’s Transportation Management Ordinance (SMMC Chapter 9.16) is intended to comply with both sets of requirements, which are described in more detail below.

South Coast Air Quality Management District

South Coast Air Quality Management District (SCAQMD) has adopted an air quality management plan to maintain the California Clean Air Act air quality standards. It has established regulations to reduce pollution generated by commuter travel. Rule 2202 applies to employers with 250 or more employees, and defines an Employee Commute Reduction Program (ECRP) to meet average vehicle ridership (AVR) goal of 1.3-1.75
(depending on geographic location) persons per vehicle in the AM peak period of 6:00-10:00 am. SCAQMD calculates AVR as the total number of employee trips divided by the total number of employees for a one-week survey period. Additionally, the SCAQMD requires employers subject to Rule 2202 to provide a survey to ascertain the level of success in achieving the goals of reducing vehicle trips in order to achieve corresponding reductions in emissions. An employer subject to this Rule shall annually register with the District to implement their emission reduction program for each worksite. Santa Monica’s Transportation Ordinance, with thresholds under 250 employees and also requiring an annual survey to demonstrate compliance with its worksite reduction target, meets and exceeds the District’s requirements and identifies compliance the Rule 2202 as one of the purposes of the Ordinance.

Los Angeles County Metropolitan Transportation Authority

Los Angeles County Metropolitan Transportation Authority’s (Metro) Congestion Management Program (CMP) coordinates land use and transportation policy for L.A. County. To comply with the Metro CMP, Santa Monica must report certain information on new development projects, follow the program’s guidelines for analyzing traffic impacts of new development, implement programs and regulation to discourage peak-hour auto travel, and monitor and enforce these programs and regulations. The City must also self-certify conformance. Metro monitors the success of TDM programs by requiring cities to submit information about the impact of new development by projecting the impact of new trips on the arterials and freeways that comprise the regional transportation system. Local jurisdictions are required to conform to the CMP requirements in order to continue receiving portion of state gas tax money and also to remain eligible for state and federal funding for transportation projects. While the primary objective of the CMP’s TDM program is to reduce regional congestion, it is also designed to complement SCAQMD’s Rule 2202, which calls on large employers to use TDM, as well as other strategies to reduce mobile source emissions.

LUCE FRAMEWORK

In addition to being responsible for meeting the requirements of regional air quality and congestion management agencies, the City must also implement its own land use and circulation policies set forth in the LUCE. The LUCE recommends a very aggressive program for TDM and sets high TDM targets, including a 35 percent reduction in peak trips per capita for residential uses and a 50 percent per capita reduction in peak period trips for commercial uses. Achieving the LUCE objectives would require the City to assume significant responsibilities for managing its transportation system through the establishment of new programs as well as continuing implementation of current ones. These provisions would exceed those that the City is obliged to implement in order to meet the CMP and SCAQMD requirements discussed in the previous sections.

In addition to strengthening existing TDM requirements, the LUCE proposes new Transportation Impact Fees (TIF) and the designation of TDM Districts that would make it easier to craft strategies tailored to the specific needs and circumstances in different areas of the city. Together with implementation of improvements to transit, pedestrian and bicycle facilities and land use policies that promote development along existing and proposed transit corridors, these measures are intended to help the City achieve the LUCE’s goal of No Net New Evening Peak Period Vehicle Trips. Along with the new TIF program, which Staff presented to the City Council in March, the City’s most powerful regulatory techniques for implementing the LUCE’s trip reduction policies are the transportation management requirements codified in Chapter 9.16 of the Zoning Ordinance and the identification of trip reduction and traffic management as one
of the five priority categories of the community benefits program, which is a key component of the LUCE approach.

The LUCE establishes a ministerial maximum allowable building height and density as the baseline for each of the plan's five land use categories--neighborhoods, boulevards, mixed-use centers, employment and commerce, and community and public uses. Applicants desiring to develop projects that exceed the base height and density are subject to a discretionary review and must provide community benefits in compliance with a new set of regulations that will be included in Chapter TBD of the new ordinance. Applicants proposing projects that exceed the Tier 1 base height and density for the applicable district will be subject to approval of a conditional use permit and have to provide benefits from one of the five categories the LUCE identifies including trip reduction and transportation management. These could include trip reduction measures such as bicycle facilities, dedicated shuttles, car-sharing, transit passes, parking “cash-out,” shared parking, and pricing parking separately from housing units. The measures will be in addition to other requirements applicable to the project such as traffic mitigation fees, trip reduction measures imposed by the TDM ordinance, and any transportation-related measures imposed to mitigate potentially significant environmental impacts identified through the CEQA review process.

The new TDM Districts, which would be established in transit-oriented mixed-use areas such as the Downtown, Bergamot Transit Village, and Memorial Park Activity Center Overlay, would capitalize on opportunities in these high-intensity land use area and tailor approaches to specific areas each of which will have different mode split targets and demand management strategies. (See LUCE pp. 4.0-58 to 4.0-62) The Districts are broken down into Highest Goal, Higher Goal, District-Wide Goal, and Major Transit Stop Zones. TDM strategies are then described for three sample land use types: Office, Commercial, Employment; Residential; and Schools. Strategies tailored to meet the specific characteristics of different areas could include Transportation Management Organizations (TMOs), parking pricing, universal transit passes, tailored transit, carpool and vanpool programs, personalized travel assistance, and parking management. In order to limit total peak VMT, there should be a combination of appropriate TDM requirements for new development, and incentives that encourage existing employers or multi-unit residences (for example by Home Owners Associations and property managers) to reduce VMT.

SANTA MONICA’S EXISTING TDM REGULATIONS

The current TDM ordinance, which the City adopted in 1991 to implement State-mandated requirements for implementing the Los Angeles County Metropolitan Transportation Authority’s Congestion Management Plan and last revised in 1996, includes requirements applicable to employers and to non-residential developers. Chapter 9.16 was intended to meet SCAQMD and CMP requirements but, as stated in the Findings (Section 9.16.010) it was also designed to implement policies of the City’s General Plan.

The requirements for employers distinguish among those with ten to 49 employees (Level 1), 50 to 249 employees (Level 2), and 250 or more employees (Level 3). Level 3 employers are also subject to the requirements of SCAQMD Rule 2202 for adoption of an Employee Commute Reduction Program (ECRP) to meet average vehicle ridership (AVR) goals. Level 1 employers must file a Worksite Transportation Plan that provides employees with information about alternative commute options. All employers of 50 or more employees must submit an Emission Reduction Plan. The ordinance includes several optional approaches for meeting the detailed requirements and all employers pay an annual fee for administration and enforcement.
In addition to requirements applicable to employers, the ordinance includes a separate set of regulations for developers of nonresidential projects expected to generate ten or more peak period trips who must submit plans for City approval before receiving a building permit. Additional requirements apply to projects of 25,000 square feet or more and those with 100,000 square feet or more. In addition to imposing annual fees to cover the cost of administration and enforcement of the employer requirements (Section 9.16.050 (a)), the existing code requires developers to pay a one-time impact fee intended to defray the costs of providing transportation facilities and services associated with new commercial development (Section 9.16.050 (b)). Fees are reduced for multi-story projects with supermarkets or pedestrian-oriented uses on the ground floor. As mentioned above, the Council has received a Staff recommendation for adopting a new Transportation Impact Fee (TIF) that would apply to both residential and non-residential development. The City has also completed a nexus study for the new fee program in compliance with the requirements of the State Mitigation Fee Act. The new TIF would presumably supplement the existing impact fee for non-residential projects, with limited fees retained to cover the costs of staff review of initial Transportation Demand Management plan and annual compliance reports.

**KEY POLICY QUESTIONS**

1. **How should TDM requirements be expanded to apply to residential and mixed-use development? Are the proposed thresholds appropriate?**

   LUCE Goal T21 states that the City should use all available tools to make the most effective possible use of the transportation system. The policies to achieve this goal include updating TDM requirements for new development, triggering TDM requirements for new development consistent with LUCE performance standards, and incentivizing new multi-family and nonresidential development to include design element that will enable price control for parking. (LUCE p. 4.0-64). The LUCE does not specifically propose to expand the applicability of the TDM requirements, but some cities are beginning to apply trip reduction requirements to residential and mixed-use development. While these are often incorporated in an incentive program, as design standards or under a development agreement, others are imposing requirements for submitting and implementing TDM plans as part of the zoning approval process especially for new development located close to transit.

   Pasadena's ordinance, for example, applies to residential development with more than 100 units and mixed-use development with more than 50 units if the nonresidential floor area exceeds 50,000 square feet. Sunnyvale, in Santa Clara County, requires all multi-family development within a third of a mile of a light rail station, Caltrain Station, or high activity commute to work bus stop to propose and implement TDM techniques. Contra Costa County requires trip reduction plans for residential and mixed-use projects that require a public hearing and include at least 13 dwelling units. It is reasonable to assume that more cities will begin requiring trip reduction or TDM plans for residential and mixed-use development as they implement the Sustainable Communities Strategies being adopted by the Southern California Association of Governments and other regional agencies under Senate Bill 375.

   In order to achieve the LUCE objectives for reducing per capita trips and ensure that new development under the LUCE does not generate a net increase in PM peak period vehicle trips, Staff has considered lowering the thresholds as follows:
• All public and private employers, including the City of Santa Monica, that have a permanent place of business in the City and ten or more employees;

• Developers of multi-family residential projects with 20 or more units;

• Developers of mixed-use projects with 20 more residential units or 7,500 sq. ft. or more of non-residential development;

• Developers of non-residential projects with 7,500 square feet of gross floor area or more; and

• Any property or business owner proposing a change in the use of non-residential property that would result in or accommodate an increase in the number of average daily trips by 10 percent or more or would increase the floor area of an existing building with at least 7,500 square feet of floor area by 10 percent or more.

2. How should TDM requirements be distinguished from provisions that are incorporated in the community benefits program?

The LUCE proposes to both strengthen the TDM requirements applicable across the board, and to provide incentives for developers who exceed these requirements as part of the community benefits program. The existing Ordinance already includes requirements that go beyond the measures necessary to comply with SCAQMD and CMP requirements. To implement the LUCE’s robust transportation management policies, the City needs to determine which additional measures should be specified as development standards or mandatory requirements and which should be identified as optional TDM programs or community benefits applicable to projects seeking to exceed Tier 1 development thresholds.

3. Should the TDM requirements identify and distinguish among different TDM Districts?

The LUCE identifies and maps TDM Districts that are broken down into Highest Goal, Higher Goal, District-Wide Goal, and Major Transit Stop Zones. It also describes TDM strategies for three sample land use types: Office, Commercial, Employment; Residential; and Schools. Strategies tailored to meet the specific characteristics of different areas could include Transportation Management Organizations (TMOs), parking pricing, universal transit passes, tailored transit, carpool and vanpool programs, personalized travel assistance, and parking management. Glendale has adopted a series of requirements that vary based on project size. Pasadena has established an Average Vehicle Ridership (AVR) goal of 1.5 for all projects and 1.75 for projects in the Transit-Oriented District. (Under the existing Santa Monica TDM, the AVR target for all worksites is 1.5.) South San Francisco provides flexibility by allowing an applicant to select nine trip reduction measures of their own choosing in addition to 14 that their ordinance requires.

4. Should TDM requirements apply to additions and changes of use? If so, what floor area thresholds would be appropriate triggers? Should the City also enact requirements to ensure that TDM programs continue to apply when there is a change of occupancy or use that does not require discretionary zoning approval?

Staff has proposed to extend the program to include additions to existing nonresidential buildings and changes of use. Examples from other jurisdictions include:
• South San Francisco requires approval of a new TDM plan if there is a change in an approved project that would result in the addition of 10 percent of the building area or a 10 percent increase in the number of average daily trips.

• San Carlos: Additions to nonresidential buildings that are 10,000 square feet or more in size that expand existing gross floor area by 10 percent or more and changes of use or operational characteristics in a building that is 10,000 square feet or more in size that results in an average daily trip increase of more than 10 percent above current use.
Transportation Demand Management Regulations

Purpose

This introductory session will consolidate and update provisions in Sections 9.16.010 and 9.16.020 of the existing Ordinance to make specific reference to LUCE goals and policies.

The purpose of this Chapter is to implement the goals and policies of the City’s General Plan to manage change through programs to create and maintain a more sustainable Santa Monica that will thrive without compromising the community’s unique character or the ability of future generations to meet their own needs and enjoy and benefit from living and working in a special place. More specifically, these provisions are intended to proactively manage congestion, reduce automobile dependence and enhance alternative modes of transportation by requiring trip reduction plans that will:

A. Ensure City compliance with the applicable requirements of the South Coast Air Quality Management District Rule 2202 and implement air quality control measures required of local governments by the District’s 1991 Air Quality Management Plan and subsequent updates and the Los Angeles County Metropolitan Transportation Authority’s Congestion Management Program to reduce air pollution and greenhouse gas emissions by reducing vehicle miles traveled and vehicle trips from new developments;

B. Accommodate growth and development allowed under the General Plan’s Land Use and Circulation Element (“LUCE”) while reducing peak-hour automobile commute trips from new and existing places of employment to achieve the LUCE’s goal of no net increase in PM peak hour vehicle trips;

C. Reduce traffic impacts within the community and region through a reduction in the number of vehicular trips and total vehicle miles traveled.

D. Reduce vehicular air pollutant emissions, energy usage and ambient noise levels through a reduction in the number of vehicular trips, total vehicle miles traveled and traffic congestion.

E. Minimize the percentage of employees traveling in single-occupant vehicles to and from work at the same time and during peak-hour periods.

F. Promote and increase work-related transit use, ridesharing, walking and bicycling to minimize parking needs, prevent critical intersections from severe overload, and protect the quality of life in Santa Monica’s neighborhoods and districts;

G. Improve the mobility and general efficiency of circulation and transportation systems by increasing reliance on public transit, ridesharing, cycling and focusing development in areas close to transit and employment;

H. Improve the quality and level of access for residents and for employees and patrons of local businesses by reducing congestion and the time of commute trips;

I. Decrease the City’s cost for transportation and parking facility construction and improvements.
J. Coordinating transportation systems management, transportation demand management and transportation facility development strategies with other cities and counties in the region and through regional agencies.

Definitions

This section will carry forward and, as necessary, revise the definitions of key terms such as “peak period” and “worksite,” that are unique to this Chapter. Terms will be defined according to the AQMD and County CMP requirements.

Applicability

The proposed provisions will maintain the current thresholds for employers and non-residential development but extend the scope of the program to residential and mixed-use projects and specify a floor area threshold for non-residential projects as proposed by Staff. The provisions describing the contents of TDM Program Plans will establish content requirements that vary based on the number of employees and size of projects.

Transportation Fees

This section will specify how to calculate fees the City imposes to defray the cost of providing transportation facilities and improvements needed to mitigate the impact of new development as well as the fees charged to employers for administering and enforcing the Chapter’s requirements. The provisions in Section 9.16.050 of the current Ordinance will be updated as necessary to reflect the 2012 Transportation Impact Fee Nexus Study and other relevant analyses and requirements. The section will also incorporate provisions regarding the deposit and use of fees, which are now in Section 9.16.060.

Employer Trip Reduction Plan Requirements

This section will consolidate and revise Sections 9.16.070 through 9.16.090 to establish the requirements for the worksite transportation plans (WTPs) and employee trip reduction plans (ETRPs), if the City decides to retain that nomenclature. Revisions will include incorporation of revised and additional mandatory and optional provisions based on the LUCE and best practices employed by other jurisdictions to achieve their trip reduction goals.

Developer Trip Reduction Plan Requirements

Sections 9.16.110 and 9.16.120 of the current Ordinance apply to developers of nonresidential projects that will generate ten or more peak-period trips upon completion. The proposed revisions will expand the requirements to cover residential and mixed-use projects and floor area additions if the Ordinance is revised to cover these projects. If the Ordinance is revised to apply TDM requirements to changes of use that will generate additional trips, those provisions could also be included in this section. Revisions will include incorporation of revised and additional mandatory and optional provisions based on the LUCE and best practices employed by other jurisdictions to achieve their trip reduction goals.
Required Findings

Chapter 9.16 of the existing Ordinance specifies requirements for TDM plans but does not list determinations that the Transportation Management Coordinator must make in order to find that a TDM plan complies with the applicable requirements of the Chapter. This new section would establish findings that the Coordinator must make in order to approve a TDM plan. The need for making findings will become more important if a wider range of employers and development projects are subject to the requirements of the TDM ordinance.

Modifications and Changed Plans

The LUCE supports including new TDP Plan triggers for additions, changes of use, and modified plans. In South San Francisco, a change in an approved project that would result in the addition of ten percent of the building area or a ten percent increase in the number of average daily trips requires a new TDM plan. In San Carlos, additions to nonresidential buildings that are ten thousand square feet or more in size that expand existing gross floor area by ten percent require a new TDM plan. Additionally, establishment of a new use, change of use, or change in operational characteristics in a building that is ten thousand square feet that results in an average daily trip increase of more than ten percent of the current use is treated as a new application.

Monitoring and Enforcement

The section specifies the procedures for audits, violations, and penalties. Staff has proposed requirements for an annual status report documenting the TDM measures undertaken by a property owner and their results to implement LUCE proposals for thorough monitoring and reporting requirements. This would allow the City to determine if the property owner has implemented and maintained the TDM plan, and whether the property has made progress toward achieving the applicable AVR target. A three- to five-year review report, with historical comparisons, would serve a similar function while also evaluating the overall effectiveness and allow the City keep track of which projects and measures work best. Pasadena has adopted similar requirements for property owners and their TDM coordinators to write a statement of commitment to conduct surveys in conformance with the AQMD. New provisions for TDM status reports could be included in this section or in the one that details requirements for submission of trip reduction plans.

Appeals

This section will carry forward the provisions in Section 9.16.140 of the existing Ordinance, which establish procedures enabling the City’s Emission Reduction Plan Appeals Board to hear appeals of decisions by the Transportation Demand Management Manager. Decisions by the ERP Appeals Board are final, except for judicial review, and may not be appealed to the City Council.

Transportation Management Associations

Transportation management associations are groups of employers, employees, developers, and building owners that are formed to provide a framework for TDM programs and services that promote more efficient use of transportation and parking resources. By allowing small employers to provide Commute Trip Reduction services comparable to those offered by larger companies they could be particularly important if the thresholds are lowered so requirements apply to a wider range of property owners and
projects. Section 9.16.100 of the existing Ordinance will be revised and expanded to reflect the range of projects to which the updated requirements of the Chapter will apply.
### Appendix A: Sample Trip Reduction Measures by DMD and Project Size

Required baseline (✓) and other recommended No Net New Trips (NNNT) measures by Demand Management District (DMD) and project size are intended to achieve the established project Average Vehicle Ridership (AVR). This list is not exhaustive and applicants would be encouraged to work with the City to select from the recommended measures and identify additional measures as appropriate to their location and tenant mix, to be specified in their individual Transportation Demand Management Plans. All elements required of larger developments in the highest goal Demand Management District are also recommended for consideration by smaller developments and those in the lower Demand Management Districts:

MEMORANDUM

To: Mike Nilsson
From: Bonnie Nelson, Linda Rhine, Todd Vogel
Date: September 26, 2008
Subject: Policy Considerations for an updated TDM Ordinance

Introduction

The purpose of this memorandum is to provide policy guidance to the City of Glendale with the goal of strengthening its existing Transportation Demand Management (TDM) Ordinance and the successful implementation of TDM measures by Transportation Management Associations/Organizations (TMA/TMOs)\(^1\) in the downtown area and citywide. The overall objective is to reduce traffic congestion and improve access by all modes through a series of incentives and programs focusing on people who work in Glendale as well as new residents in larger residential developments.

The memo includes the following sections:

- A review of the existing TDM Ordinance
- A review of current functionality of the Glendale TMA
- A peer review of other TMAs and TDM Ordinances that could serve as models and/or references for the City of Glendale
- A discussion of characteristics of successful TMAs
- Recommendations for ways to improve the Glendale TDM Ordinance, especially as a tool to strengthen the role of TMAs in the City of Glendale to reduce vehicle trips and improve mobility in downtown Glendale and citywide.
- Detailed information about the TMAs reviewed is included in Appendix A of this memo. A summary of TDM ordinances is included as Figure 1. A draft revised TDM Ordinance for the City of Glendale, based on this analysis, is included as Appendix B.

\(^1\) TMA and TMO are interchangeable, though Transportation Management Association is most common.
Existing Conditions – Glendale TDM Ordinance

The City of Glendale enacted a TDM ordinance within the Parking and Loading Chapter (30.32) of the Title 30 Zoning Code of the Municipal Code.² The goal of the ordinance is “to minimize the number of peak period vehicle trips, promote the use of alternative transportation, and improve air quality.”

Key elements of the TDM ordinance include the following:

1. Review of Transit Impacts – prior to the approval of any development project for which an Environmental Impact Report (EIR) will be prepared under the California Environmental Quality Act (CEQ), the impacts of that project on regional and local fixed-route transit must be evaluated. Opportunities to mitigate impacts on transit service, while also still minimizing automobile trips on the Congestion Management Plan (CMP) network, should be identified. The ordinance does not, however, require that these mitigations be pursued or funding provided to support their implementation.

2. Development Standards – most new non-residential development (see below for exceptions) is required to make provision for the following transportation demand management measures:

   • Development that is 25,000 gross square feet or more: A bulletin board, display case, or kiosk displaying information about public transit, bicycling, carpooling and vanpooling, and ridesharing, as well as information about the Glendale TMA

   • Development that is 50,000 gross square feet or more: The above requirements, as well as the provision of preferential parking for carpools and vanpools, bicycle racks or other secure bicycle parking facilities (4 spaces plus an additional space for each additional 50,000 square feet of development)

   • Development that is 100,000 gross square feet or more: Above requirements plus a loading area for vanpools and carpools, sidewalks from public sidewalks to each building in the development, bus stop improvements (if deemed necessary by the director of public works), and access by bicycle from the external system to the parking facilities on-site.

   These standards apply to all non-residential development, at the levels indicated above, except projects for which a development application has been deemed “complete” by the City pursuant to Government Code Section 65943, or for which a Notice of Preparation for a Draft EIR had been circulated or an application for a building permit had been received, prior to April 1, 1993.

   Notably, the current TDM Ordinance does not have any requirements for residential development. This is an important consideration, because of the significant number of housing units being planned and built in downtown Glendale. Further, the requirements for non-residential development do not include participation in the Glendale TMA or other TMA, nor do they require any action on the part of the developer beyond making information available and making minor capital investments.

   • Monitoring – the City shall monitor compliance in a manner it deems appropriate and reasonable. No specific requirements are indicated in the ordinance, though examples are provided, including monitoring during review and approval of site plan development permits, before the issuance of a certificate of use and occupancy, in response to complaints, and/or annually. Building owners are required, to sign an “Annual TDM

Ordinance Compliance Form,” to certify that the on-going requirements of the ordinance are being met.

- Enforcement is delegated to the neighborhood services section of the community development and housing division of the City of Glendale. It does not appear that there are penalties for non-compliance or a formal process for enforcement of mitigation measures, except the requirement that the compliance form mentioned above be signed and submitted each year.

**Existing Conditions – Glendale TMA**

The Glendale TMA was formed in 1989 by businesses and community organizations in Glendale to assist employers in meeting the new South Coast Air Quality Management District Regulation XV. These regulations require all employers with 250 or more employees to implement a ridesharing program to increase their overall vehicle ridership. Although the Air District regulations have been modified over time, the TMA continues in its work as an association of Glendale businesses. The TMA is a city-wide organization, with members located in most of the major business areas of the City. The majority of the current membership is located in downtown Glendale, circumscribed approximately by South Brand Blvd to the north, North Central Avenue to the west, East Colorado Street to the south, and Highway 134 to the north, including businesses fronting on each of these streets. Some member companies are also located along the San Fernando Road corridor, including the Walt Disney Company and DreamWorks Animation SKG.

The TMA is a private not-for-profit organization with 12 members – business and property-owners – including the City of Glendale, which is one of the City’s largest employers. The TMA has a Board of Directors with seven members, including four “Founding Members” and three “Regular Members.” The City of Glendale is one “Founding Member,” with a voting seat on the Board. The Board makes all policy decisions and the general members vote for the Board of Directors and on changes to the bylaws that affect membership.

The TMA has one paid staff member, an Executive Director working an average of 32 hours per week. The Glendale TMA represents between 10,000 and 15,000 employees, including 2,200 City employees.

Between 2000 and 2006, the TMA received $40,000 grant funding through the Los Angeles County Metropolitan Transportation Authority (Metro). In 2007, it received a $36,000 grant from Metro. The grant program ended in September 2007 and currently all funding for the TMA is obtained through annual membership dues. Companies with less than 250 employees currently pay $7.30 per employee per year and those with 250 or more employees pay $10.40 per employee per year, with fees capped at 750 employees. For developers (e.g. property-owners), the fee is $0.015 per square foot of leasable space if their tenants are provided TMA services and pay TMA dues themselves, and $0.03 per leasable square foot if tenants do not pay TMA dues and are therefore not provided TMA services. The TMA does not have any other funding sources, but are provided in-kind office space by the City and occasionally in-kind services by the other member companies. The Glendale TMA last changed their fees in 1993. The expected revenue

---

3 When first implemented, this regulation applied to employers with 100 or more employees, but subsequent amendments have reduced the threshold to employers with 250 or more employees.

4 The Founding Members of the TMA that are still doing business in Glendale are: City of Glendale, Glendale Galleria, The Walt Disney Company, Glendale Adventist Medical Center. Other members include: Catholic HealthCare West, CIGNA Healthcare, DreamWorks Animation SKG, Glendale Plaza, Nestle USA, and Person & Covey, Inc.

5 Per email communication received from the Executive Director of the Glendale TMA on August 6, 2008.
for the TMA in Fiscal Year 2008 is $94,000, with the City contributing $7,725 in membership dues.⁶

Programs and services currently provided by the TMA include:

- Immediate available resource for employees transportation needs
- Emergency Ride Home Program
- Marketing Material (including regular bulletin board material)
- New employee orientation materials
- Emergency information regarding transportation emergencies
- Monthly bus pass sales
- Consultation with regulatory programs
- Consultation with establishing transportation demand management programs
- Regular educational member meetings
- Vanpool listing and assistance
- Website
- Transportation updates
- Meeting with companies, including management presentations
- Onsite promotional events
- Other individualized programs to meet members needs
- A forum for businesses to work together to improve congestion
- Assistance with employee commute options compliance (per Air Quality Management District requirements)
- Parking management strategies to help employers reduce parking demand and costs to provide parking for employees.

Peer Review – TMAs

Nelson\Nygaard conducted a review of thirteen TMAs in California and Oregon to provide a point of comparison for Glendale. Criteria used in selecting the peer cities included the local geographic context and implementation of successful programs, strategies, and funding mechanisms that could be pursued in Glendale. Information gained by the peer review is included throughout the memo, and a matrix providing detailed information about each TMA is included in Appendix A of this memo.

The following TMAs were reviewed:

1. Lloyd District TMA (Portland, Oregon)
2. Gresham Regional Center TMA (Gresham, Oregon)
3. Westside TMA (Washington County, Oregon)
4. Emeryville TMA (Emeryville, California)
5. Moffett Park Business and Transportation Association (Sunnyvale, California)
6. Hacienda Business Park (Pleasanton, California)
7. South Natomas TMA (Sacramento, California)
8. North Natomas TMA (Sacramento, California)
9. Anaheim Transportation Network (Anaheim, California)
10. Burbank TMO (Burbank, California)
11. Irvine Spectrum TMA (Irvine, California)
12. Warner Center TMA (Los Angeles, California)
13. Downtown Denver TMA (Denver, Colorado)

⁶ Note that though membership dues are based on the number of employees, dues are capped at 750 employees, so dues are not assessed for any number of employees in excess of this.
Characteristics of Successful TMAs

The following characterize successful Transportation Management Associations, and will be important to consider to help reduce vehicle trips and improve multi-modal transportation access in downtown Glendale and citywide.

1. Coordination and support from Public Agencies

Most TMAs are private organizations, not public agencies. However, success is achieved through close coordination and communication with local cities and other government entities, and both the TMA and the City or other governing agency often have vested interests in the mission of the TMA. Thus, as in Glendale, it is common for public agencies to be members of the TMA board.

However, in most circumstances, public agencies have only an ex-officio non-voting position on the board of a TMA. This is to avoid a potential conflict of interest where the public agency must represent the interests of a broader, or somewhat different, constituency, compared to the membership of the TMA. Most of the TMAs reviewed in this memo have public agencies on their board. However, they are ex-officio members for almost all TMAs, except two:

(1) In the Lloyd District, the public agencies on the board with voting privileges have employees and/or own property in the District, but do not fund nor have direct influence over the TMA (e.g. one such member is the U.S. Department of Wildlife)

(2) The Westside TMA, represents an entire county, and according to TMA staff, they have had some difficulty recruiting new private members due to the strong presence of public agencies on the Board.

The City of Glendale is a voting “founding member” of the Board of the Glendale TMA. City employees represent a large proportion (about 20%) of all employees working in the TMA service area. Most TMAs reviewed have non-voting “ex-officio” members of the Board, due to concerns about there being a conflict of interest if a governing agency that has direct influence over the TMA also serves as a voting member of the Board. The determination of whether the City or another governing agency is a voting or non-voting member of the Board is currently determined in the by-laws, though it could be defined by the TDM Ordinance.

Public agencies can also play an important role in the determination of whether membership in a TMA is voluntary or mandatory, as described in the following section.

2. Voluntary versus Mandatory Membership

The existing TDM Ordinance does not require mandatory membership in a TMA. Membership requirements vary for the other TMAs reviewed. Some, such as the Lloyd District TMA and the Moffett Park Business and Transportation Association, have voluntary membership. Others, including the Burbank TMO, Emeryville TMA, and Irvine Spectrum TMA, require membership for new development and businesses in their service area. The policy process by which membership is required varies. The Irvine Spectrum TMA was formed when the property was initially developed, and thus new tenants and property owners must also join the TMA. The Emeryville TMA is citywide and funded by a Property-Based Business Improvement District, which assesses a property tax for all commercial land uses in the city. The Burbank TMO is not citywide, but the city has enacted a TDM Ordinance that specifically requires all new development to join the TMO.

Notably, the TMAs reviewed that require mandatory membership do so only for new development, or redevelopment. The Anaheim TMA has also added a covenant to the title of
some developed land so that if it changes ownership, the new property-owners will also be required to be members of the TMA. Mandatory membership for existing employers and property owners will require careful consideration of legal issues and exploration of examples where levies have been placed on existing property-owners to help pay for public benefits.7

3. Funding Sources
Funding sources for TMAs include fees assessed based on property size, building square footage, number of employees, etc. as well as “lump sum” grants from public agencies. Just as with the Glendale TMA, several TMAs collect annual fees based on the number of employees. This is the sole source of funding for the Burbank TMO, though they have mandatory participation and charge a higher rate than the Glendale TMA, at $18 per employee. It is important that higher fees be coupled with a TDM ordinance and TMA programs and activities that strongly encourage attainment of TDM goals.

Compared to a fee based on building square footage or property size, the per employee fee is more directly related to the goal to reduce the number of vehicle trips per employee.

4. Roles and Responsibilities
TMA members, public agencies, and the TMA itself each have important roles and responsibilities to help reduce vehicle trips in the TMA service area. An especially important opportunity for public agencies is to require, through policy decisions, membership in a TMA, and to require members to implement programs and strategies to reduce vehicle trips. Public agencies can also set trip reduction goals either for an entire TMA service area or separately for individual businesses/developments.

In some circumstances, new development is required to join a TMA as part of their development agreements. Such a process, however, can increase the planning and permitting process for new development, especially if terms are open for negotiation. In other circumstances, such as Burbank, a TDM or other trip reduction ordinance specifically requires all businesses and/or property owners to join the TMA and pay dues if they are located within the service area of the TMA. The increased costs from TMA dues are offset by the reduced costs of a streamlined development process as well as, of course, the benefits of the services offered by the TMA.

In Glendale, many employers have a relatively small number of employees (less than 100). Property managers of office parks and other development leasing to these employers can play a key role as members of the TMA, similar to the role of the management of the Galleria. This approach is used by the Irvine-Spectrum TMA. Similarly, housing associations could be members of the TMA, on behalf of individual residents.

5. Visibility and Identity
It is important for a TMA to have a strong identity and presence to be able to effectively reach out to potential new customers, especially when encouraging a shift in travel behavior. If staff from the TMA are interacting directly with potential customers, it is often helpful for their office to be located in a prominent highly visible location to attract passers-by whom they especially wish to target with their programs and services.

---

7 Assessment Districts and Mello-Roos Districts are two examples of this in California, but both have become more limited in their application in recent years.
6. Monitoring and Enforcement

Travel behavior surveys and other evaluation methods are important to ensure efficient use of resources to maximize vehicle trip reductions and improved access for TMA members. A TMA can develop a single survey to administer to all members, through a website and/or distributed on paper through member representatives. Several of the peer TMAs conduct surveys, typically on an annual basis, including the Lloyd District TMA, Emeryville TMA, and Burbank TMO.

TMAs can also help ensure employers and other TMA members effectively implement programs that they have committed to. If an employer, for example, is not offering commuter checks to their employees, an employee can contact the TMA to help resolve the situation, rather than having to directly confront their employer. Penalties are rarely assessed. TMAs instead try to work collaboratively with employers and other members to help them pursue program objectives more effectively. If employers are unable to meet their targets TMAs work with employers to focus their efforts on strategies that may yield more effective results.

7. Performance Measures

The members of a TMA, including employers and public agencies, share a common mission and goals, and responsibility to pursue these goals. They also make a significant financial contribution towards this effort. Thus, it is prudent for members and governing agencies to monitor the progress of a TMA towards reaching its goals, and to be able to ensure that a TMA is pursuing these goals as effectively as possible. Specific performance measures can be defined to measure progress towards specific goals. TMAs often, for example, are able to help people become more aware of and comfortable with various transportation options available to them. A performance measure could therefore be defined confirming whether all new members of a TMA are contacted and offered the opportunity to learn more about the transportation options available to them.

In practice, performance measures are not defined for a TMA, despite a TMA often having performance measures for its members. Defining performance measures for a TMA, however, would help both TMA members and TMA staff understand how to adjust programs and strategies to better meet the goals of the TMA. If a TMA is having trouble reaching out to new employers or residents, then the success of its other programs will be compromised, no matter how effective they could be otherwise. Thus, a discrete set of performance measures defined in relationship to each activity of a TMA could help identify areas of success as well as goals which might require additional resources or a different approach to be more successful.

Recommendations to Strengthen TMAs

In consideration of the experiences of other TMAs and the context for the City of Glendale, Nelson\Nygaard recommends that the following strategies be pursued to strengthen the role of a TMA in reducing vehicle trips and improving multimodal access downtown and elsewhere in Glendale.

1. Coordination and support from Public Agencies

The City is a Founding Member of the TMA and continues to invest significant resources and time to create and support the TMA, and City employees currently constitute 20% of the employee base in the TMA. However, if the City strengthens the TDM ordinance and places additional reporting and compliance requirements on developments, the City of Glendale will represent a broader constituency than the employee base of the TMA. Furthermore, it is typically the responsibility of the City or other public entity to enforce certain requirements, such as program monitoring and implementation.
Thus, as is the experience of other TMAs, under most circumstances public entities such as the City of Glendale are better able to support the goals and programs of the TMA by serving as non-voting “ex-officio” members of the Board. Therefore, we recommend that the City reconsider whether a TMA could be more effective if they City were a non-voting ex-officio member of the Board.

Notably, public agencies do, however, continue to pay dues at the rate of other members of the TMA, typically based on the number of employees served by the TMA. This approach is also recommended for the City of Glendale.

2. Voluntary versus Mandatory Membership

As is common practice for other TMAs, the City should require new development and subsequent occupants to become dues paying members of a TMA or similar City-endorsed organization. This would yield a significant revenue stream from new development to be spent on programs to improve transportation, both for that new development and for all employees, residents, and visitors to the City of Glendale. This requirement would be best enacted through a revised TDM Ordinance.

An important consideration is the number of employees at an organization. It may be preferable to permit voluntary membership for employers outside of the downtown who have a smaller number of employees. Property owners citywide with employers as tenants that, in combination, have a greater number of employees should be required to join the TMA. Property managers in these circumstances could serve as a liaison between the TMA and their tenants. This policy would mirror the policy of the City of Los Angeles stating that new commercial properties of at least 30,000 square feet join a TMA serving their location. For example, this would require that the Americana be a TMA member even though their individual tenants might be small.

Additionally, all new residential development over a certain size, perhaps 6-10 dwelling units in a single development, should also be required to join the TMA. Typically these larger developments have a home-owners association or renters-association, which are excellent bodies through which residents can obtain representation on the TMA, and for the TMA to most effectively communicate with residents of the development.

3. Funding Sources

The effectiveness of TMA programs and activities is significantly dependent on the level of funding the TMA receives. Funding from member dues typically represents a significant (or sole) source of funding for a TMA. An increase in dues may be desirable for a TMA to be more successful, but this must be balanced by consideration of what members consider an appropriate level, especially voluntary members.

Therefore, Nelson\Nygaard recommends consideration of one or more of the following strategies to increase the ability of a TMA to improve mobility and reduce congestion in the City of Glendale:

- New market-rate housing development downtown should be required to join a TMA. Membership fees should be per dwelling unit or perhaps per bedroom. If per dwelling unit, a lower fee should be assessed for multi-family and rental units.
- New development over a minimum square footage (25,000 square feet) and ALL new development in the Downtown Specific Plan area could be required to join a TMA by ordinance. In addition, approval of any parking exception could be linked to participation in a TMA and development and implementation of an active TDM plan for the applicant.
• The Glendale TMA has received grant funding through the Los Angeles County Metropolitan Authority (Metro) for approximately $40,000 per year for the years 2000 through 2006, and $36,000 from the grant in 2007, to help support outreach activities to the community. Though this grant expired in September 2007, similar grant opportunities should be explored and pursued, especially in coordination with the City of Glendale, LA Metro, and other TMAs in the region.

• A member company could provide in-kind office space to reduce administration costs for a TMA in Glendale. The by-laws could be written to require voting member companies elected to the Board to provide in-kind office space for a TMA on a rotating basis.

• Furthermore, funding for expanded outreach efforts, combined with a more prominent physical location for the TMA office, and increased coordination with property managers leasing to smaller employers (two additional strategies noted below), could help a TMA recruit new members and increase funding from membership dues.

• In addition, the following two measures could be considered for non-voluntary members, or if supported comfortably by voluntary members of a TMA:
  ▪ The cap on membership dues from each employer could be raised to increase the fees paid by larger companies and shift the per employee fee (based on total number of employees) to be more equitable between large and small employers. The total revenue for the TMA could then be increased by 10 or 20% or more, to support expansion of its programs and services.
  ▪ The per employee fee could be raised to be closer to the level assessed by the Burbank TMO ($18 per employee). It also does not appear necessary for a TMA to charge a lower rate for smaller companies.

Glendale is considering a Business Improvement District (BID) in the downtown area, currently focused on improving security. It may be possible to expand the BID to include implementation of the Downtown Mobility Plan. Members of the BID could be automatically enrolled in a TMA serving the downtown, with the remainder of the funding generated from this element of the BID managed through the Downtown Transportation Fund (see separate report on the Downtown Transportation Fund).

4. Roles and Responsibilities

The primary role of a TMA is to help its members and the City achieve its TDM goals, including a reduction in vehicle trips and increased mobility. One way the City could support this by strengthening its TDM ordinance, to require membership in a TMA and define discreet trip reduction goals for TMA members.

There is an increasing number of small employers in downtown Glendale that may not have the resources to participate fully in a TMA compared to larger employers. In these circumstances, property managers should take on an increased role to support the programs and activities of a TMA. They should sponsor membership in the TMA for their tenants, representing their common interests and acting as a liaison between individual employers and the TMA. This requirement could be enacted through a revised TDM Ordinance, as discussed further below.

TMAs and the City should also work together with the Glendale Beeline to explore the potential to establish a universal transit pass that is sold at a deep bulk discount to residents and employees. Similarly, the City and TMAs could negotiate with MTA a deeper discount on their universal pass, especially as new service comes online. Some changes to the MTA bus route structure may also be worth discussing, to better serve downtown employees and residents.
5. Visibility and Identity
A TMA should be encouraged to discuss the pros and cons of various locations for the TMA office. It may be most beneficial to be located in a prominent location visible to downtown employees and residents, where they can talk to someone directly for information about TMA programs and other transportation questions they may have.

6. Monitoring and Enforcement
The TMA, with the City’s guidance, should conduct annual surveys of all downtown employees and residents, and ideally not just current members. The survey could be conducted online, and incentives offered to encourage people to participate. The cost to employers and property managers would be minimal, but would provide invaluable insight and information regarding travel behavior and transportation needs in downtown Glendale, and the success of various TMA programs in addressing these needs.

7. TMA Board Membership
Successful TMAs, especially with a smaller number of members having a large number of employees and/or residents, often have CEO’s, CFO’s and large developers on their board. Other TMAs may have board members representing smaller employers as well. In all circumstances, it is highly advantageous for board members to have a significant decision-making capacity in their organization, and such a requirement should be included in the by-laws developed for a TMA.

8. Performance Measures
The following are examples of performance measures that could be defined for the Glendale TMA, to measure its success in reaching out to its members, educating them about their transportation options, and supporting increased use of the variety of programs and activities of the TMA seeking to increase mobility and reduce congestion in the City of Glendale. The City or an independent organization could be enlisted to complete the evaluation on an annual basis.
Recommended TMA Programs and Strategies

The following programs and strategies should be considered as potential opportunities for a TMA to further increase mobility and reduce congestion in the City of Glendale.

1. City Carshare

Following on the merger of Flexcar and Zipcar, the presence of a carshare organization in the Los Angeles basin has declined dramatically. Zipcars are now only available at two university campuses (UCLA and USC). Recent successful experience in the City of Emeryville has demonstrated that there may be targeted potential to reopen the market in the Los Angeles area to carshare services, especially with increasing gas costs and new infill residential and office development occurring. In Emeryville, the TMA provided a partial subsidy to carshare services, to help test whether a viable market could be established. After less than a year of operation, this market has developed firmly, with some carshare pod locations no longer requiring a subsidy and others demonstrating potential to no longer need one with further outreach and adjustments to services.

2. Bikesharing

Though not firmly established in the United States, many cities are currently exploring the potential to provide shared bicycle services (similar to carshare). Washington D.C. has initially implemented a small bikeshare service this year, following on the tremendous success of bike sharing programs throughout Europe over the past several years. These experiences overseas, coupled with the work being done here in the United States, would provide useful information for the City of Glendale and the Glendale TMA to explore a pilot bikeshare program downtown or perhaps elsewhere in the City.

3. Travel Training and High-Touch Marketing

Transportation agencies around the world have been experimenting with travel training and face-to-face information sharing, often called high-touch marketing, where the focus is to personalize the experience and participation as much as possible. Rather than blanketing communities with transportation billboards or putting advertisements on radio stations, personalized travel information has demonstrated itself to often be the strategy of choice.

Many of the TMAs reviewed noted that this personal approach was their most effective strategy to recruit new members and encourage people to take advantage of TMA programs and other available transportation services. Activities include presentations to groups of employees and one-on-one conversations with individuals at a prominent and accessible office location for the TMA. Another successful strategy is to recruit people who already use TMA programs and are familiar with public transit to help others explore them as well.

4. Transit Passes

TMAs, especially those located in central locations, often are able to facilitate the purchase of transit passes by individuals represented by their member organizations. Sometimes, passes can be purchased at a bulk discount, to reduce the cost for each individual pass. This convenience, particularly if costs are reduced, can be a key incentive to encourage individuals to use public transit instead of driving.
Peer Review – TDM Ordinances

A peer review was conducted of TDM ordinances enacted by other cities in California. Ordinances from the following cities were reviewed:

- Burbank
- Pasadena
- Santa Monica
- West Hollywood
- Los Angeles
- South San Francisco

The City of Pleasanton was also reviewed, but is not included in the table because their ordinance is voluntary (for both existing and new development). Furthermore, several other cities investigated appear to have no TDM ordinance, including Irvine, Anaheim, Sacramento, Emeryville, and San Mateo (all in California), and the city of Portland, Oregon. A matrix providing summary information about each TDM ordinance is included as Figure 1 below.

Significant variations were found between the TDM ordinances reviewed. These variations lead to important questions about what type of ordinance would be appropriate for the City of Glendale, including:

1. To what types of development (land use and size) should the ordinance apply?
2. What target should be set for reduction in vehicle trips? How should the baseline rate be determined?
3. What facilities to support TDM should be required of new development?
4. What TDM programs should be required to help meet the trip reduction goal? Should they be prescriptive (e.g. parking cash-out) or performance-based (e.g. chosen by the developer or property manager)?
5. How should monitoring occur, and what level of enforcement should be applied if the target is not met? Who should pay for the monitoring and enforcement?

### Burbank Center Overlay Zone

- **Voluntary or Mandatory?** Mandatory for employers with more than 25 employees or over 25,000 sq ft within the Media District Overlay Zone. (2) Voluntary for others within Zone. Multi-family residential excluded.

- **Trigger** for TDM requirements: See above

- **Fees**

- **TDM Plan Required?**

- **TDM Programmatic Requirements** Suggested strategies, but not required. See below

- **Opt-out?** (e.g. in-lieu fee?) Yes, for those with same requirements as above.

- **Alternative Approach?**

- **Must join TMA?**

- **Performance**

  - **Trip Reduction Target**: 9.5% reduction after first 5 years, additional 9.5% reduction each subsequent 5 years. If project build-out projections exceeded, any firm with 25 or more employees must achieve 38% reduction in first year of occupancy.

  - **Monitoring**: Annual report of programs and strategies and outcomes (PM peak-hour trips). Yes, by Department of Transportation

  - **Enforcement**: If targets not achieved. City may impose TDM programs to help achieve.

  - **Applicant to reimburse city for costs to monitor and enforce?** Yes - Sidewalk connectivity (Tier 3)

- **CEQA / EIR requirements**

**Recommendations for a Revised TDM Ordinance**

The peer review demonstrates that a key strategy for a strong TMA is through a more robust and comprehensive TDM Ordinance. An updated TDM Ordinance could enable a TMA to:

- Increase their membership base and revenue
- Increase the impact of existing programs and pursue new programs and strategies
- Provide for monitoring of programs and ensure enforcement.

An updated TDM Ordinance could also support other TDM strategies the City wishes to pursue, including improved bicycle, pedestrian, and public transit facilities, more strategic use of the existing parking supply, and an overall increase in mobility in downtown Glendale.

Nelson\Nygaard therefore recommends the following elements be included in an updated TDM Ordinance for the City of Glendale. A draft ordinance based on these recommendations is included as Appendix B.

- **Objectives and Purpose.** State the objectives and purpose of the TDM Ordinance. Objectives should include defining what types of development are subject to the ordinance and who is required join a TMA and pay membership dues. The ordinance should also define a targeted reduction in vehicle trips, and have monitoring and enforcement provisions to ensure participation by all that are subject to the ordinance.

- **Definitions.** Clearly define the meaning of Terms such as “Transportation Demand Management” and “Carpool.”

- **Applicability.** Define what types of development will be subject to the terms of the ordinance. Overall, all new development of a minimum size and expansions of existing development should be subject to the ordinance. Opportunities to incentivize TMA membership and/or participation in TDM programs and activities should be explored.

- **Requirements.** Stipulate what facilities and programs will be required of new development, or what performance level is required. Facilities include bicycle parking and pedestrian, bicycle, and transit access requirements, and preferred parking for carpools and vanpools. Programs include designation of an on-site transportation coordinator, information sharing and outreach, ridesharing and parking cash out.

- **Monitoring and Enforcement.** Require an annual survey and report to City staff by participants. The City should enforce requirements by levying a fine until compliance is achieved. Compliance with the State of California’s parking cash out law should also be demonstrated by participants.

- **Reimbursement for City Costs.** Stipulate which party or parties will pay for monitoring and enforcement actions. Participants should pay for monitoring costs, whereas the City would provide staff time for review and enforcement activities.

- **Performance Measures.** The following set of performance standards should be required of any TMA in the City of Glendale. The City should withhold any dues or other funding provided to the TMA until such measures are met.
  - Conduct an annual AVR survey for all member organizations
  - All members of the board should be decision makers or their designees, for the organizations they represent
  - The Board should meet at least four (4) times per year with a quorum of at least 50% at all meetings.

</thead>
<tbody>
<tr>
<td><strong>Membership</strong></td>
<td></td>
</tr>
<tr>
<td>Number of Companies/ Property Owners Represented</td>
<td>85 member businesses</td>
</tr>
<tr>
<td>Number of Employees and Residents Represented</td>
<td>Approx. 10,000 employees</td>
</tr>
<tr>
<td>Composition</td>
<td>Office and retail development in the Lloyd District of Portland, Oregon</td>
</tr>
<tr>
<td>Voluntary or Required Membership</td>
<td>Voluntary</td>
</tr>
<tr>
<td>Board Structure</td>
<td>19 members: 16 voting, 3 ex-officio. Voting members include: property owners; large, medium, and small employers, neighborhood associations, public sector employers with offices in the Lloyd District. Non-voting members include Portland Development Commission, Department of Transportation, and TriMet. Public agencies with voting privileges have offices or own property within the Lloyd District, but do not fund TMA or have direct influence. Ex-officio members do not have offices in the Lloyd District.</td>
</tr>
<tr>
<td><strong>Financial Information</strong></td>
<td></td>
</tr>
<tr>
<td>Fees / Membership Dues</td>
<td>No fee.</td>
</tr>
<tr>
<td>Other Funding Sources</td>
<td>The LDTMA derives its funding from the following sources: Business Improvement District (private sector contribution of $90,000), Parking Meter Revenue from the District (City of Portland contribution of $75,000), a commission from the sale of transit passes (TriMet contribution of $40,000), and Regional grant (Metro regional government contribution of $25,000).</td>
</tr>
<tr>
<td>Annual Operating Budget</td>
<td>The LDTMA maintains an annual operating budget of approximately $230,000.</td>
</tr>
<tr>
<td>Programs and Strategies</td>
<td></td>
</tr>
<tr>
<td>Services Offered</td>
<td>LDTMA PASSport annual transit pass program, Commuter Connection Transportation Store, District bike locker program, District pedestrian infrastructure fund, Policy &amp; Advocacy, 14 annual district outreach and educational events</td>
</tr>
<tr>
<td>Monitoring</td>
<td>Annual reporting to both the Board of Directors and to the regional government.</td>
</tr>
<tr>
<td>Trip Reduction Target</td>
<td>Trip targets are set for 2015. The goals are set as mode split goals. 2015 targets are: 42% transit, 10% bike, 5% walk, 10% rideshare and 33% drive alone.</td>
</tr>
<tr>
<td>Enforcement</td>
<td>No penalties if not achieved</td>
</tr>
<tr>
<td>Actual Trip Reduction</td>
<td>32% reduction in vehicle trips, compared to base year, before TMA established. Current mode split is 39% transit, 4.8% bike, 2.4% walk, 16.6% rideshare, and 40.5% drive alone.</td>
</tr>
<tr>
<td>Overall Effectiveness</td>
<td>Each program has been very successful and supported by results from the annual district survey. The transit program is successful because businesses purchasing the program for their employees receive (a) a business tax credit for the purchase and (b) a discount on the price of the pass. The Bike program is successful because of the coordination of the program through the Bike Committee, the availability of secure bike lockers and the ability to manage all the services through the Commuter Connection Transportation Store.</td>
</tr>
<tr>
<td>Successful Recruitment and Outreach Efforts</td>
<td>Free membership provided through Business Improvement District and funding partnership with the public sector. Direct outreach to businesses and one-on-one assistance to employees</td>
</tr>

### Moffett Park Business and Transportation Association

**Year Founded**: Not known  
**Members**: 9 businesses, including: Yahoo, Juniper Networks, Jay Paul Company, Network Appliance, cgfx, Lockheed Martin, Labcyte, and Infinera. City of Sunnyvale also a dues paying member, and operates SMART recycling station in Park.  
**Number of Companies/Property Owners Represented**: Not known.  
**Number of Employees and Residents Represented**: Not known.  
**Composition**: Office development and public sector employees  
**Voluntary or Required Membership**: Voluntary.  
**Board Structure**: Nine voting board members (representatives from private businesses who are members of the TMA) and two ex-officio members representing public agencies (Valley Transit Authority and Sunnyvale Chamber of Commerce)  
**Fees / Membership Dues**: Specifics not available, but fees range from $550 to $15,500 and approximately $25,000 for Founding members.  
**Other Funding Sources**: City of Sunnydale originally funded the organization's feasibility study and provided a startup contribution. Now, the City pays a membership rate as they have offices in the Park. Staff receive in-kind office space, with computer and IT assistance.  
**Annual Operating Budget**: Approx. $140,000 per year. Approximately $250,000, exclusive of administration costs.  
**Services Offered**: Guaranteed Emergency Ride Home; Transportation Consulting; Advocacy for local and regional transportation projects and commute services that affect companies and employees; Employee Commute Survey; Network of Commute Coordinators (monthly meeting of TMA director with transportation coordinators from each member company).  
**Monitoring**: Annual surveys and reports. Use of transit system by employees and residents is monitored.  
**Trip Reduction Target**: 20% vehicle trip reduction target for new companies  
**Enforcement**: If a company fails to meet trip goals and does not demonstrate a good-faith effort, they can then assess penalties, though this has not yet occurred (nor, perhaps, been necessary).  
**Actual Trip Reduction**: 20% reduction in 2007, due to efforts of individual companies.  
**Overall Effectiveness**: 1) Network of Commute Coordinators and 2) Advocacy/lobbying to maintaining transit services to the Park. Coordination of many companies provides a greater impact than they could achieve individually. Bus services are most successful, especially by employees who live nearby and use the routes to go to more than work locations.  
**Successful Recruitment and Outreach Efforts**: Can be difficult initially, but once they become members, companies find that the networking opportunities and communication with the City that the TMA facilitates is invaluable.  
**Website**: [www.mpbta.org](http://www.mpbta.org)  

### Hacienda Business Park

**Year Founded**: 1984  
**Members**: Not known  
**Number of Companies/Property Owners Represented**: 8 businesses, including: Yahoo, Juniper Networks, Jay Paul Company, Network Appliance, cgfx, Lockheed Martin, Labcyte, and Infinera. City of Sunnyvale also a dues paying member, and operates SMART recycling station in Park.  
**Number of Employees and Residents Represented**: Not known.  
**Composition**: Mix of office, R&D, retail, and residential uses.  
**Voluntary or Required Membership**: Mandatory for all property owners, not necessarily business owners.  
**Board Structure**: Not known.  
**Fees / Membership Dues**: Fees levied per square foot of land; thus, higher density projects pay less per square foot of leasable space.  
**Other Funding Sources**: Not known.  
**Annual Operating Budget**: Not known.  
**Services Offered**: Free EcoPasts on WHEELS Public Transit for employees and residents; Guaranteed Ride Home; First-Time Riders Program on Public Transit; preferential parking for carpools/vanpools, commute alternative programs and customized commute assistance.  
**Monitoring**: Use of transit system by employees and residents is monitored.  
**Trip Reduction Target**: None.  
**Enforcement**: None.  
**Actual Trip Reduction**: Not known.  
**Overall Effectiveness**: Not known.  
**Successful Recruitment and Outreach Efforts**: Not known.

</tr>
<tr>
<td><strong>Annual Operating Budget</strong></td>
<td>$225,000</td>
<td>Approx. $758,000 (FY 2006-2007)</td>
</tr>
<tr>
<td><strong>Programs and Strategies</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Services Offered</td>
<td>Subsidized regional transit passes, Amtrak subsidy. Emergency Ride Home Program. Network and monthly programs for Employee Transportation Coordinators, Bike Users Group (benefits include: bi-monthly lunches with informative programs, bike forums and safety training, Bike to Work Day breakfast and activities, and bike subsidies, when available); Rideshare Express (regional carpool database), advocacy, and a periodic newsletter for members.</td>
<td>• Advocacy - infrastructure improvements, increased support for transit, bike, ped; Bike/Ped Elementary School Programs; Smart Routes to School children's web-based program; $1 Commuter Shuttle daily to downtown, Mon-Fri; Guaranteed Ride Home program; Commuter Club - web-based rideshare, travel training; vanpool subsidies</td>
</tr>
<tr>
<td>Monitoring</td>
<td>Sporadic surveys of employee travel behavior, but none conducted recently.</td>
<td></td>
</tr>
<tr>
<td>Trip Reduction Target</td>
<td>City ordinance encourages a 35% trip reduction goal.</td>
<td>35% reduction in vehicle trips and 35% reduction in air pollution (reactive organic gases). The firm objective is for non-residential uses to reduce trips by 50% and residential uses to reduce trips by 20%.</td>
</tr>
<tr>
<td>Enforcement</td>
<td>No penalties.</td>
<td>None</td>
</tr>
<tr>
<td>Actual Trip Reduction</td>
<td>Not available.</td>
<td>Not known.</td>
</tr>
<tr>
<td>Overall Effectiveness</td>
<td>Fully subsidized transit pass - progressive workforce desires to use transit. 1400 out of 7500 employees currently in possession of an annual pass (approx. 20%).</td>
<td>Just starting Commuter Club and elementary schools programs. School programs will be successful, but need hands-on physical motivation to continue work in the schools. Schools are stretched to take on more. Shuttle stands out as most valued by residents and City politicians, as North Natomas is all but forgotten in the public transit arena. Huge issue with senior development projects located out here who public transit.</td>
</tr>
<tr>
<td>Successful Recruitment and Outreach Efforts</td>
<td>Not applicable - most members are required to join and pay dues.</td>
<td>Difficult to reach out to new and smaller employers, and to convince new employees and residents to try services. Also, some people are surprised to find additional property taxes on their first bill, so an increased effort is being made to notify them in advance.</td>

Appendix B – Draft TDM Ordinance for the City of Glendale

Objectives and Goals
Adopted policies, through the General Plan and other commitments, have affirmed the desire of the City of Glendale to reduce traffic congestion, improve air quality, and improve overall mobility for residents, employees, and visitors. These goals apply to travel within Glendale, regional travel with origins or destinations within the City, as well as travelers passing through the City.

This ordinance establishes a quantitative trip reduction goal for new and existing development in the City of Glendale, defines what types of development are subject to the requirements of the ordinance, and identifies specific facilities, programs and strategies that must be implemented by employers and property managers to pursue this goal.

Definitions of Terms
For the purpose of this section, certain words and terms are defined as follows:

**Carpool.** A vehicle carrying two to five persons to and from work on a regular schedule.

**Development.** The construction of new non-residential floor area.

**Gross Floor Area.** That area in square feet confined within the outside surface of the exterior walls of a building, as calculated by adding the total square footage of each of the floors in the building, except for that square footage devoted to vehicle parking and necessary interior driveways and ramps.

**Preferential Parking.** Parking spaces, designated or assigned through use of a sign or painted space markings for Carpools or Vanpools, that are provided in a location more convenient to the entrance for the place of employment than parking spaces provided for single-occupant vehicles.

**Transportation Demand Management (TDM).** The alteration of travel behavior through programs of incentives, services, and policies, including encouraging the use of alternatives to single-occupant vehicles such as public transit, cycling, walking, carpooling/ vanpooling and changes in work schedule that move trips out of the peak period or eliminate them altogether (as in the case in telecommuting or compressed work weeks).

**Trip Reduction.** Reduction in the number of work-related trips made by single-occupant vehicles.

**Vanpool.** A vehicle carrying six or more persons to and from work on a regular schedule, and on a prepaid basis.

**Vehicle.** Any motorized form of transportation, including but not limited to automobiles, vans, buses and motorcycles.
Applicability

The TDM ordinance shall apply to the following developments (hereafter referred to as Tier 1):¹

1. All new non-residential development in the City of Glendale to exceed 25,000 square feet or gross floor area or having 25 employees.

2. Any expansion of existing non-residential development exceeding 25,000 square feet of gross floor area or having more than 25 employees, either prior to or subsequent to the expansion.

3. Any change of use for an existing non-residential development that currently has a nonconforming use, and for which the new use will require a conditional use permit, variance, or amendment to the zoning code or General Plan.

4. All new residential development with 100 or more units, or mixed-use projects with 50 or more residential units and 25,000 gross square feet or more of non-residential floor area.

5. All new development with multiple employers on one site that in combination have more than 25 employees, with the TDM ordinance thereby applying to the property manager of that site.

6. All projects meeting the above criteria or any other project that joins a Business Improvement District in the City of Glendale.

7. Other projects to which the ordinance shall be applicable, based on a covenant, development agreement, or other such binding agreement with the City or another governing organization.

Developments greater than 50,000 square feet in gross floor area or an expansion resulting in a development greater than 50,000 square feet shall be subject to further requirements defined by this ordinance (Tier 2).

Furthermore, this ordinance defines additional requirements of development exceeding 100,000 square feet, or an expansion resulting in a development greater than 100,000 square feet (Tier 3).

Requirements

New or existing development, for which the TDM ordinance is considered applicable according to the above criteria, shall incorporate each of the listed facilities into the design of the project, and implement each of the listed programs.

Facilities shall be maintained in clean, functional condition for the duration of the project, and programs shall continue to be implemented except by arrangement with the Director of Planning for the City to define alternate strategies expected to be more effective at achieving the goals of this ordinance.

¹ These criteria are a synthesis of requirements in the cities of Burbank, Pasadena, and Los Angeles. The criteria for other cities include a threshold of expected daily trips, an applicant’s desire to develop at higher densities, or companies with a fewer number of employees (see Figure 1).
Transportation Demand Management Plan

Prior to obtaining a development agreement or other permits for a project subject to this ordinance, a Transportation Demand Management plan must be developed, with a detailed list of facilities and programs that will be implemented, to meet the requirements of this ordinance, as indicated below. A schedule of implementation for TDM programs, and budget for both programs and facilities, must be included with the Plan. All programs shall be implemented within one year of initial occupancy.

Transportation Management Association / Organization

All projects subject to this Ordinance shall become dues paying members of the designated Transportation Management Association (TMA) or Transportation Management Organization (TMO), and eligible for participation in the programs and activities of the TMA/TMO. Rates shall be set by the Board of the TMA/TMO and adopted by the City Council, with the provision that they may be increased annually, based on changes to the Consumer Price Index. Prior to the issuance of a certificate of occupancy, annual dues for the first year of membership shall be paid to the City and then transferred to the designated TMA/TMO.

Performance Standards

The City shall define performance standards for the designated TMA/TMO, to ensure effective administration of the TMA/TMO and communication with and between members of the TMA/TMO. These standards shall include:

1. Completion of an annual AVR survey for all member organizations, with a report provided to the City documenting the results of this survey
2. Assurance that all members of the board are decision makers or their designees, for the organizations they represent
3. At least four (4) meetings of the Board each year, with a quorum of at least 50% at all meetings.

Facilities

The following facilities shall be implemented as indicated before a certificate of occupancy may be issued for a development.

Bicycle Facilities

- Secure bicycle parking should be provided for all development subject to the bicycle parking ordinance, at the following rates for various land uses:2

<table>
<thead>
<tr>
<th>Facility Type</th>
<th>Long-term</th>
<th>Short-term</th>
</tr>
</thead>
<tbody>
<tr>
<td>Single family and residential with private garage</td>
<td>None</td>
<td>None</td>
</tr>
<tr>
<td>Multifamily Residential</td>
<td>1 space per 4 units</td>
<td>1 space per 20 units</td>
</tr>
<tr>
<td>Retail</td>
<td>1 space per 12,000 sq ft</td>
<td>1 space per 5,000 sq ft</td>
</tr>
<tr>
<td>General Food Sales</td>
<td>1 space per 12,000 sq ft</td>
<td>1 space per 2,000 sq ft</td>
</tr>
<tr>
<td>Office</td>
<td>1 space per 10,000 sq ft</td>
<td>1 space per 20,000 sq ft</td>
</tr>
</tbody>
</table>

"Long-Term" bicycle facility means a locker, individually locked enclosure or supervised area within a building providing protection for each bicycles therein from theft, vandalism and weather.

"Short-Term" bicycle facility means a rack, stand or other device constructed so as to enable the user to secure by locking the frame and one wheel of each bicycle parked therein. Racks must be easily usable with both U-locks and cable locks. Racks should support the bikes in a stable upright position so that a bike, if bumped, will not fall or roll down.

2 Some cities require bicycle parking as a ratio of automobile parking. However, Nelson\Nygaard recommends against this. A development which reduces its parking supply, in anticipation of generating fewer vehicle trips, might also then reduce its bicycle parking supply, rather than increase it to support a shift from auto to bicycle.
• Tier 2 development shall also provide a changing room and shower facilities.

Pedestrian Facilities
• Tier 1 and Tier 2 facilities shall provide full pedestrian access as required by other sections of the zoning code and design guidelines as adopted by the City.
• Tier 3: Sidewalks or other designated pathways following direct and safe routes from the external pedestrian circulation system to each building in the development.

Transit Facilities
• The design of all projects should enable safe and convenient access to nearby transit stops and facilities.
• For Tier 3 projects, if so determined by the Director of Planning for the City, a bus stop with shelter and other amenities may be required.

Auto Facilities
• Preferential parking shall be provided for carpools and vanpools (most proximate to main entrances and/or at a reduced price)
• For Tier 3 projects, and for Tier 2 projects at the discretion of the Chief of Planning, a convenient drop-off point for carpools and vanpools should be provided onsite.

Programs
The following programs shall be implemented within one year of project completion, following the schedule included in the TDM Plan for the project. All employers shall:

• Designate an on-site transportation coordinator to be a point of contact with the City of Glendale and the designated TMA/TMO regarding transportation demand management facilities and programs. For Tier 1 development with multiple employers that in combination have 25 or more employees, the property manager shall designate an on-site transportation coordinator.
• Provide an information board or kiosk in a prominent location for employees, residents, and/or visitors, with information about access to all modes of transportation, as well as the activities of the designated TMA/TMO.
• Tier 2 and 3 employers shall either provide on-site transit pass sales or a pre-tax transit pass program.
• Participate in the Guaranteed Ride Home program of the designated TMA/TMO.
• Demonstrate proof of compliance with the State of California’s parking cash out law.
• Develop or participate in a ridesharing program to encourage carpooling and vanpooling.

Monitoring and Enforcement
Each project subject to this ordinance shall strive to achieve an average vehicle ridership (AVR) of at least 1.5. AVR is the ratio of the total number of employees or residents to the average daily number of vehicles used.3

3 http://www.metro.net/riding_metro/commute_services/avr_services.htm
All projects subject to this Ordinance shall submit an annual performance report to the City to validate continue compliance with the requirements of the Ordinance. A statistically-valid survey shall be conducted of employees and/or residents of the project, to ascertain the level of success in achieving the goals of the Ordinance, including a determination of the AVR for that project. The AVR shall be determined according to the requirements of the South Coast Air Quality Management District (AQMD). The AQMD currently requires such a survey, amongst other requirements, of all employers with 250 or more employees. This ordinance further stipulates that the survey shall be conducted for all projects subject to this ordinance.

The costs to conduct the survey and produce the report shall be borne by the employer, property owner, or homeowners association, as appropriate.

City staff shall confirm to the City Council on an annual basis that all projects subject to this ordinance are in compliance with its requirements. If a project subject to this ordinance is not in compliance, a nominal fine per employee per day shall be assigned by the City until compliance is achieved.

Staff shall also prepare a summary report evaluating the overall success of achieving the goals of the TDM ordinance. If goals are not being met, staff shall propose alternate programs or strategies that could be pursued to achieve these goals. Costs for preparation of staff reports shall be borne by the City.

Furthermore, Tier 2 and Tier 3 projects that fail to achieve an AVR of at least 1.25, the City will work with the designated TMA/TMO and the employer to modify their TDM plan to include programs and strategies that are expected to better support achievement of an AVR of at least 1.25. The City may mandate the implementation of certain programs and strategies until this goal is reached.
TDM Research Reports

This project is partially funded by a grant from the Transportation and Growth Management (TGM) Program, a joint program of the Oregon Department of Transportation and the Oregon Department of Land Conservation and Development. This TGM grant is financed, in part, by federal Moving Ahead for Progress in the 21st Century (MAP-21), local government, and State of Oregon funds.

The contents of this document do not necessarily reflect views or policies of the State of Oregon.
INTRODUCTION AND PURPOSE

Some Transportation Demand Management (TDM) measures require large-scale system changes (e.g., high occupancy vehicle lanes), while others can be implemented on a local or site-by-site basis. When TDM is implemented on a site-by-site basis through land use and zoning, the focus is typically on creating supportive infrastructure. In many communities, some form of TDM is already required by the development code. Because the land use process usually involves a one-time decision, it lends itself more easily to reviewing these types of built improvements. More challenging to implement through land use review are those programmatic TDM measures that require ongoing monitoring. This guide is intended to help local jurisdictions who are considering expanding their TDM efforts to incorporate programmatic TDM measures into the land use permit process.

Examples of Development-Related TDM Measures

<table>
<thead>
<tr>
<th>TDM-Supportive Infrastructure</th>
<th>Programmatic TDM</th>
</tr>
</thead>
<tbody>
<tr>
<td>° Requirements for pedestrian or transit oriented design</td>
<td>° Subsidized transit passes for employees</td>
</tr>
<tr>
<td>° Parking maximums</td>
<td>° Parking cash-out programs</td>
</tr>
<tr>
<td>° Minimum bicycle parking standards</td>
<td>° Provide bicycle safety education classes</td>
</tr>
<tr>
<td>° Requirements for transit amenities</td>
<td>° Transportation Management Associations</td>
</tr>
</tbody>
</table>

More specifically, this guide outlines one mechanism to incorporate programmatic TDM strategies in the land use review process: requiring applicants to prepare a TDM Plan that details how the applicant (and subsequent owners and/or tenants) will accomplish measures to reduce transportation impacts from the development over time.

This guide contains background information about TDM, a step-by-step approach for local governments interested in implementing a TDM Plan program, and model code language compatible with the Model Development Code for Small Cities.
WHY MANAGE TRANSPORTATION DEMAND?

Our personal, economic, and environmental health are all heavily influenced by how we travel. Driving less or choosing alternatives to single-occupancy vehicle (SOV) travel can contribute to environmental and public health. Reducing SOV trips also helps the state, regional, and local economies by freeing scarce roadway capacity for freight and transit use; retains money in the economy that would otherwise be exported to pay for fuel; and reduces the need to build expensive roadway, highway, and parking infrastructure.

Transportation Demand Management (TDM) can be a cost-effective way to reduce SOV trips. TDM entails a host of relatively low-cost strategies aimed at reducing the demand for transportation infrastructure and/or improving the efficiency of transportation systems. Benefits of TDM include efficient use of transportation resources, enhanced livability, and improved environmental quality and public health, among others. The State of Oregon has been helping local communities achieve these benefits through such programs as the Transportation and Growth Management (TGM) Program, ODOT's Transportation Options Program, and the state’s first statewide Transportation Options Plan under development in 2013 – 2014.

TDM is more than individual solutions to individual problems, such as road pricing to reduce congestion or transit improvements to reduce pollution. TDM is most effective if implemented as an integrated program that includes improved transportation options and incentives to use the most efficient option for each trip.

What is a TDM Plan?

A “TDM Plan” (as the term is used in this guide) is a written document that outlines targets, strategies, and evaluation measures to reduce vehicle miles traveled (VMT) and reduce single-occupancy vehicle (SOV) mode share to and from a specific site.

TDM PLANS FOR DEVELOPMENT

The purpose of a TDM Plan is to monitor and mitigate the transportation impacts of a specific site over time. A TDM Plan details the process through which a developer and subsequent tenants commit to measures that decrease SOV travel to the facility over time. This process provides a menu-based approach for...
Transportation Demand Management Plans
For Development

developers and tenants to implement supportive programs that encourage and educate employees and residents about travel options. A TDM Plan includes targets (e.g., mode split, emissions, or reduced vehicle miles traveled), a description of TDM strategies used to meet those targets, and evaluation measures to assess progress towards those targets.

Things to keep in mind
Local jurisdictions should consider the following questions:

- Do adopted plans provide an adequate policy basis for requiring TDM Plans?
- What are appropriate targets for TDM Plans? How might these targets be applied over time and support identified policy goals?
- When and where might TDM strategies be required? What are appropriate geographic locations (e.g., downtown) and thresholds (e.g., building square footage or number of employees)?
- Which types of TDM strategies typically work best for which types of projects?
- What types of regulations and procedures are needed to ensure successful TDM Plans?

The following sections of the guide provide a step-by-step approach for local governments interested in implementing a TDM Plan program.
ESTABLISHING A POLICY FOUNDATION

Expanding application submittal requirements and approval criteria for development review can be controversial. The first step is to determine whether existing plans provide an adequate policy basis for additional TDM requirements or if new policies need to be adopted.

Local policy documents, including the Comprehensive Plan, Transportation System Plan (TSP), and Climate Change Action Plan (if available), should be reviewed. These plans may already provide sufficient support for an expanded local TDM program. If not, they may need to be amended.

**Examples of TDM supportive policies:**

**Portland Plan (2012):** By 2035, Portland residents have reduced the number of miles they travel by car to 11 miles per day on average and 70 percent of commuters walk, bike, take transit, carpool or telecommute to work. Portland’s transportation-related carbon emissions are 50 percent below 1990 levels, and effective strategies to adapt to climate change are in place and being implemented.

**Tualatin’s TSP (2013)**

- TDM Policy 1: Support demand reduction strategies, such as ride sharing, preferential parking, and flextime programs
- TDM Policy 2: Partner with the Chamber of Commerce, the Westside Transportation Alliance, major employers, and business groups to implement TDM programs
- TDM Policy 3: Explore the use of new TDM strategies to realize more efficient use of the City’s transportation system

In some cases there may not be local policy support for requiring TDM Plans. However, requiring TDM Plans in conjunction with an incentive or bonus, such as increased Floor Area Ratio (FAR) or reduced parking requirements, may be an alternative.

Additionally, Oregon’s Transportation Planning Rule recognizes TDM as an option for reducing traffic projections from a proposed zoning amendment.

**Transportation Planning Rule OAR 660-012-0060(1)(c)** “...As part of evaluating projected conditions, the amount of traffic projected to be generated within the area of the amendment may be reduced if the amendment includes an enforceable, ongoing requirement that would demonstrably limit traffic generation, including, but not limited to, transportation demand management....”
While this guide is focused on establishing requirements for TDM Plans for development, much of the information is also applicable to developing an incentive-based TDM program or TDM requirements triggered by a zone change.

**SETTING TARGETS AND EXPECTATIONS**

Setting targets and expectations for any TDM effort – and relating those targets back to local or regional goals – is essential. By connecting targets to vehicle miles traveled, emissions, and/or mode share goals, a jurisdiction can strengthen its case for requiring the implementation of a TDM Plan because it aligns with the community’s broader goals.

**Case study research** illustrates the effectiveness of TDM in reducing drive alone trips and vehicle miles traveled (VMT). Washington State achieved a 2.8% reduction in drive alone rate and 2.6% VMT reduction at Commute Trip Reduction worksites from 2007-2009 (as well as a 1% reduction in drive alone rate and 9.3% reduction in VMT for those within Growth and Transportation Efficiency Centers).

In Portland and the surrounding areas, employers with 100+ employees are subject to Oregon Department of Environmental Quality (DEQ) Employee Commute Options (ECO) program. This rule requires employers to submit a TDM Plan to reduce the number of trips to the worksite and to survey their employees. ECO survey data shows a 6.5% decrease in SOV mode-split. This equates to an average reduction of 273 annual VMT per employee (among all covered employees). NOTE: Jurisdictions that are subject to the ECO Rule should ensure that TDM Plan requirements match Eco Rule requirements to avoid overburdening employers.

**Community TDM Targets**

Communities require TDM strategies as part of the development process to help meet a range of goals, including reducing the number of vehicle miles traveled, vehicle-related emissions, and SOV travel:

- **Vehicle Miles Traveled (VMT):** VMT is a calculation of the number of miles traveled from an origin to a destination. In this context, the calculation of VMT would be measured by surveying the number of vehicle miles traveled for employees or users at the specific development site. Communities often have a total or per capita regional or local VMT target. A VMT-based target emphasizes the need to reduce the length of trips, in addition to reducing the number of single occupancy vehicle trips in general. An example of a target might be to “reduce the number of vehicle miles traveled to 1990 levels by 2020.”

- **Emissions:** Related to vehicle miles traveled, a transportation-related emissions target sets a goal to reduce the amount of transportation-
related emissions in a specific timeframe. A sample target might be to “reduce transportation-related emissions to 1990 levels by 2020.”

- **Mode share:** Mode share is the percentage of trips by type (i.e., biking, walking, transit, SOV, etc.). Communities often have mode share targets, especially for downtown areas. A sample mode share target might be to “achieve 50% non-single-occupancy vehicle travel by 2035.”

Having measurable targets that relate to local and/or regional policy goals adds validity and purpose to the TDM Plan process.

**Identifying TDM Targets**

Once the community’s overall vehicle miles traveled, emissions, or mode share goals have been defined, the next step is to identify goals or targets specifically for a TDM Plan that support the broader community goals. The metrics by which the TDM Plan will be evaluated have a direct impact on how TDM is approached.

As a first step, the applicant will need to establish a baseline estimate of the VMT, emissions, or mode share for the development. In most cases, employees or tenants will not be occupying the building at the time the TDM Plan is being prepared; therefore, the applicant will have to rely on recent comparable data. Comparable data may either be from a similar nearby development that has established a TDM Plan or, in the case of mode share, the applicant may use the community-wide mode share determined by the American Community Survey or another local source.

Once the baseline data is documented, phased targets will be set showing how the program will work toward meeting the community targets. As noted above, VMT, mode share, and emissions targets are often long-term community goals set over two or three decades. To be effective, the TDM Plan process must set realistic annual or two year targets that will achieve the long term goals over time. For example, if the community has a mode share goal to reach 50% SOV mode share by 2020, the TDM Plan will detail interim targets to meet those goals based on the.

As noted in the Monitoring and Enforcement section below, the applicant (or property owner) will be required to survey employees every year or every two years to report on progress toward the mode share goal. For example, as shown below, if the baseline mode share is 75% in 2013 and the 2020 target is 50%, the 2015 target would be 69%, the 2017 target would be 63%, and so on until the 2020 target is met.

APPLICABILITY – WHEN AND WHERE SHOULD TDM PLANS BE REQUIRED?

One of the first steps is to determine when and where TDM Plans should be required. Not all locations and development projects are equally well suited to TDM. Creating and monitoring TDM Plans is not without cost, both for the developer and the jurisdiction, so requirements should focus on areas where real benefits can be achieved.

TDM Plans could be required citywide, within regional or town centers, in employment centers, or in Multimodal Mixed Use Areas. TDM Plans can also be required based on the type of use, the projected number of trips to the site, the number of parking spaces, the number of employees, or the square footage of the development (or redevelopment). In some cases, the type of land use approval is also a factor (e.g., TDM Plans are required for master plan or conditional use approval).

Ideally, requirements reflect both appropriate geography and size or magnitude of the development. Defining the requirement solely based on the type of use, for example, may mean that commercial buildings in outlying industrial sites have the same TDM requirements as a commercial building in downtown where there are bicycle facilities, transit service, and high pedestrian connectivity. Similarly, a trigger that relies solely on geographic location may overburden very small buildings that will likely have very little impact on the transportation system. Therefore, selecting multiple triggers from the list below is recommended, depending on the community’s goals and land use context. Determining which triggers initiate the requirement of a TDM Plan will be an important policy decision for each community.

---

1 The Multimodal Mixed Use Area (MMA) designation is applied by local governments to downtowns, town centers, main streets, or other areas where the local government determines that there is: (1) high-quality connectivity to and within the area by modes of transportation other than the automobile, (2) a denser level of development of a variety of commercial and residential uses than in surrounding areas, (3) a desire to encourage these characteristics through development standards, and (4) an understanding that increased automobile congestion within and around the MMA is accepted as a potential trade-off.

<td>Master plan approval, conditional use permits</td>
</tr>
</tbody>
</table>

Once it is determined where TDM Plans will be required, it must be determined how they will be required. The approach outlined in this guide suggests that TDM Plans be handled in a manner similar to Transportation Impact Analyses and other technical reports. Where required, an applicant would submit a TDM Plan prepared in accordance with the jurisdiction’s requirements as part of a complete development application.

WHICH TDM STRATEGIES SHOULD BE INCLUDED IN A TDM PLAN?

This section provides an overview of TDM strategies that can be used to reduce the transportation impacts of new development (or major redevelopment) and allow the applicant to meet the targets set in the section above.

TDM strategies can be infrastructure-based (e.g., bicycle parking and shower facilities) or programmatic (e.g., Guaranteed Ride Home program, subsidized transit passes, or rideshare program sponsorship). While infrastructure-based TDM measures can be implemented at the time of construction, a TDM Plan focuses on the programmatic elements that will be implemented by the building manager or employer throughout the lifetime of the building (see the section “TDM Plans Last for the Life of the Development” for guidance on how to ensure that TDM Plans are implemented and monitored throughout the lifetime of the development).

The table below provides a menu of TDM strategies. TDM strategies listed below are not all created equal; the effectiveness of the strategies depends on the land use context and existing infrastructure and programs. The TDM strategies listed
do not represent an exhaustive list, but rather a sampling of strategies. Jurisdictions should tailor the list of applicable TDM strategies based on the local context. However, it is important to provide a menu of options for developers to choose from given that the land use context, type of development, and location will vary greatly. In all cases, city staff will need to work with the developer through the TDM Plan process to ensure that the TDM strategies selected will help achieve the identified goals and targets.

**Example Menu of TDM Plan Strategies**

<table>
<thead>
<tr>
<th>Category</th>
<th>TDM Strategy</th>
<th>Program Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parking</td>
<td>Market-priced parking</td>
<td>Charging the market price for parking instead of subsidizing employee parking encourages employees to use alternative modes. Under the right conditions (i.e., in parking-constrained areas), priced parking can be a highly effective strategy.</td>
</tr>
<tr>
<td></td>
<td>Preferential parking for rideshare vehicles</td>
<td>Priority and designated parking for carpools, vanpools, and bike share stations can help encourage the use of rideshare, particularly in areas that are not well served by transit or biking and walking facilities.</td>
</tr>
<tr>
<td></td>
<td>Parking cash-out program</td>
<td>Parking cash-out is a program by which employers who offer free or reduced-price parking to their employees are required to offer an equal transportation fringe benefit to employees who use modes other than driving alone to get to work.</td>
</tr>
<tr>
<td>Transit</td>
<td>Universal transit pass</td>
<td>Universal transit pass systems typically require a partnership between the city, the transit provider, and potentially a local university. Universal passes typically allow unlimited rides on local or regional transit for a low monthly fee, which are often absorbed entirely by the employer, school, or developer. The universal transit pass system typically requires that the participating agency purchase passes at a discounted rate for all employees, students, or residents. Universal transit pass programs can benefit developers if implemented along with reduced parking requirements, which consequently lowers construction costs.</td>
</tr>
<tr>
<td>Category</td>
<td>TDM Strategy</td>
<td>Program Description</td>
</tr>
<tr>
<td>---------------</td>
<td>------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Transit</td>
<td>Transit pass pre-tax purchase</td>
<td>The Internal Revenue Service allows up to $245 of a transit pass to be deducted from an employee paycheck pretax. This benefit reduces the amount of federal taxable income for the employee and reduces the amount of payroll taxes for the employer. (There are also permitted deductions for bicycle commuting and carpooling.)</td>
</tr>
<tr>
<td></td>
<td>Transit pass subsidy</td>
<td>Employers, building managers, or developers can provide a subsidized transit pass to employees or residents. In this case, the employee or resident purchases a transit pass from the employer or building manager at a discounted price.</td>
</tr>
<tr>
<td>Rideshare</td>
<td>Sponsored rideshare programs</td>
<td>Rideshare programs include both carpooling and vanpooling. Rideshare programs work particularly well in areas that are not well-served by transit, bicycling, or walking facilities. Rideshare – particularly vanpools – are also best supported in employment areas where employees are traveling more than 10 miles each way to work. Employer sponsorship of a vanpool program in the form of coordination, ridematching, and/or monetary subsidy significantly increases the success of the program.</td>
</tr>
<tr>
<td></td>
<td>Vanpool pre-tax deduction</td>
<td>The Internal Revenue Service allows up to $245 to be deducted from an employee paycheck pretax for vanpool costs.</td>
</tr>
<tr>
<td></td>
<td>Shuttle service</td>
<td>Employment sites that are not close to transit service can benefit from an employer-sponsored shuttle service. Shuttle programs are typically sponsored by the employer and provide transportation between the employment site and major transit stops.</td>
</tr>
<tr>
<td></td>
<td>Guaranteed Ride Home program</td>
<td>A Guaranteed Ride Home program provides a set number of subsidized rides to commuters who use alternative modes to work. Rides are typically provided by a local taxi company.</td>
</tr>
<tr>
<td>Telecommute</td>
<td>Telecommute program</td>
<td>Telecommute programs allow employees to work from home for a certain number of hours per week or shift the time of day when employees travel to work to shift peak-hour travel.</td>
</tr>
<tr>
<td>Category</td>
<td>TDM Strategy</td>
<td>Program Description</td>
</tr>
<tr>
<td>--------------</td>
<td>---------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Information</td>
<td>Information kiosk</td>
<td>An on-site information kiosk provides information on transit routes, schedules, and fares; carshare and vanpool ridematching services; bicycle maps and resources; and other ways to help people travel by using alternative modes.</td>
</tr>
<tr>
<td>Transportation Coordinator</td>
<td>Transportation Coordinator</td>
<td>A Transportation Coordinator is a trained, designated employee on-site who is responsible for providing transportation options information to employees and facilitate employee surveying.</td>
</tr>
<tr>
<td>Individualized marketing</td>
<td>Individualized marketing</td>
<td>Individualized marketing campaigns typically target a neighborhood, corridor, or employment site. These campaigns provide individualized marketing travel options materials in a designated area to encourage people to use alternative modes.</td>
</tr>
<tr>
<td>Other</td>
<td>TMA membership</td>
<td>A Transportation Management Association (TMA) is a member-supported organization that provides transportation services to employers in a specific area. A TMA membership typically provides hands-on support from the TMA to help the employer survey the commute patterns of its employees and provide transportation information.</td>
</tr>
<tr>
<td></td>
<td>Bicycle commuter tax reimbursement</td>
<td>Participating employers may provide up to $20 per month reimbursement to commuters for qualified bicycle commuting expenses. See more information here.</td>
</tr>
<tr>
<td>Promotion</td>
<td>Sponsor events to promote alternative modes</td>
<td>Promotional events and competitions help to promote alternative modes of travel. These events include competitions such as Bike to Work Week, during which employees compete with themselves or other companies to ride the most number of miles in a week.</td>
</tr>
<tr>
<td>Shared Mobility</td>
<td>Bikeshare</td>
<td>Bikeshare programs provide a fleet of bicycles typically available to the public through a membership program. Bikeshare bikes help residents and employees take more trips by bike.</td>

### Transportation Demand Management Plans

#### For Development

<table>
<thead>
<tr>
<th>Category</th>
<th>TDM Strategy</th>
<th>Program Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Carshare</td>
<td>Carshare programs allow carshare members to reserve a car for a short period of time – typically a number of hours or a day. Carshare vehicles reduce the need for people to need to own their own vehicle, and therefore can reduce the need to build parking.</td>
</tr>
</tbody>
</table>

The types of TDM strategies selected for the TDM Plan will vary based on the proposed use. For example, residential developers should select TDM strategies that support all types of trips, such as bikeshare and carshare memberships, subsidized transit passes, and an information kiosk onsite. Commercial developers will select strategies that are geared towards employees, such as a TMA membership, telecommute programs, and parking cash-out programs. The target audience and types of trips must also be considered when selecting the TDM strategies. For example, TDM strategies for a large institution, such as a hospital, will focus on the travel patterns of both the employees and the visitors.

**WHAT TYPES OF REGULATIONS ARE NEEDED TO ENSURE SUCCESSFUL TDM PLANS?**

A TDM Plan is the document submitted by a developer as part of the development review process to demonstrate compliance with TDM targets. Similar to a transportation impact analysis or other technical report, in order to ensure quality submittals and a fair process, submittal and procedural requirements for TDM Plans should be specified. The minimum specifications for TDM Plans can be included in the jurisdiction’s development code or engineering standards or other administrative rules; however, the regulations establishing when and where TDM Plans are required should be included in the development code.

This section provides an overview of TDM Plan requirements. These concepts are further illustrated by the attached model code which outlines one approach to establishing TDM Plan requirements.
**Seattle Children’s Hospital – A case study in TDM Implementation**

The Seattle Children’s Hospital has a renowned TDM Plan that focuses on changing the travel patterns for employees and visitors through the following strategies:

- Paid employee parking: employees have to pay $50/month to park; employees are also paid $50/month if they choose not to park
- Robust shuttle-to-transit system linking Children’s to regional transit hubs
- Innovative bicycle programs including Flexbike (shared bicycle program) and Company Bikes which offers free bicycles to employees committed to cycling at least two days per week
- Financial rewards for employees who commute without driving alone
- Guaranteed Ride Home program
- Subsidized bicycle tune-ups
- Onsite showers and lockers
- Secure bike parking
- Cover 100% of vanpool fares and provide incentives to vanpool drivers

The Seattle Children’s Hospital has also made investments in Supportive Infrastructure:

- Campus design and near-site improvements to encourage alternative transportation
- Intelligent Transportation Systems (ITS) for NE 45th Street / Montlake Boulevard / Sand Point Way NE to optimize the performance of key intersections and reduce vehicle delay and travel time (for more information about ITS see [http://www.its.dot.gov/](http://www.its.dot.gov/))
- Contributions to capital projects that will improve the northeast Seattle transportation network
- Investments in walkable and bikeable northeast Seattle

The Seattle Children’s Hospital TDM program has seen marked success. Between 1995 and 2010, the drive-alone rate of employees has decreased considerably from 73% to 38%.

**Submittal Requirements**

As outlined in this guide, TDM Plans would be implemented as part of the land use review process. At minimum, TDM Plans should include the following:

- Project description
- Trip forecasts: volumes, times of day, modes, origins/destinations (if known), methodologies
- Performance targets that conform to those set by the jurisdiction
- TDM strategies proposed for implementation
- Performance Monitoring & Adaptive Management Plan
Transportation Demand Management Plans
For Development

- Copies of documentation to ensure deed notification of mandatory participation in the final TDM program to all subsequent purchasers and owners of the project

**Review Process**

If the TDM Plan will be submitted and reviewed concurrently with the land use application, a timeline for the internal review of the process should also be included. Under this approach, the implementation of the final TDM Plan can be made a condition of a project’s approval.

**TDM Plans Last for the Life of the Development**

The TDM Plan will be submitted at the time of the development review process, and in many cases, the developer will not be occupying the building post-development. For this reason, the regulations should specify how the requirements in the TDM Plan will be passed on to the tenants for the lifetime of the building.

**Monitoring and Enforcement**

As noted above, setting targets in the TDM Plan that relate to community mode split, VMT, or emissions goals is preferred to enhance the validity of the process and ensure progress is being made towards the identified targets over time.

The developer – and subsequently the employer or building manager – will be required to implement the strategies agreed upon in the TDM Plan and survey the employees and/or residents in the building annually to document progress towards the identified targets. For example, if the target is to reach a 50% SOV mode split by 2020, the employer or building manager will survey employees or residents in year one to document a baseline mode split. Employees or residents

---

**Case study research** reveals that monitoring and enforcement are among the biggest challenges of implementing a TDM Plan program. Surveying employees or tenants to monitor the progress made toward the identified mode share goals can be time consuming and expensive. Implementation of a TDM Plan over time requires coordination between the jurisdiction, the developer, the landowner, and ultimately the tenant. The cost of monitoring for compliance should be taken into consideration when establishing the applicability of the TDM Plan requirements.

In Portland, Oregon, the Lloyd District Transportation Management Association (TMA) helps employers meet the requirements of the state-mandated Employer Commute Options (ECO) rule which requires employers with more than 100 employees to track mode split every two years. The Lloyd TMA assists over seventy-five employers and 9,000 employees adhere to ECO requirements.
will then be surveyed again in years three, five, etc. to document progress towards the identified goal. Monitoring every other year is recommended.

If targets are not being met, it will be up to the local jurisdiction to determine an enforcement or “adaptive management” strategy to ensure TDM strategies are appropriately matched to reach the identified target. An “adaptive management” strategy is recommended over stringent enforcement in order to avoid deterring development. Affecting travel behavior takes time, and TDM strategies may need to be adjusted based on the initial surveys of the employees, residents, or visitors. Ultimately, a jurisdiction may need to consider enforcement in those cases where there is a lack of significant progress towards identified goals and a good faith effort is not being made. If the TDM Plan was approved as part of a land use decision, the zoning enforcement provisions of the code could be applied.

TDM PLANS FOR DEVELOPMENT - MODEL CODE LANGUAGE

This section outlines the minimum specifications for TDM Plans. The language below has been formatted as an additional module for inclusion in the TGM program’s Model Development Code for Small Cities, 3rd Edition as a new subsection “Q.” within Section 3.6.020 (Transportation Standards). However, these specifications could be included with a jurisdiction’s engineering standards or other administrative rules.

3.6.020 Transportation Standards

Q. Transportation Demand Management Plans

1. Purpose.

Transportation Demand Management (TDM) Plans are intended to help achieve State, [regional,] and City policies to: improve health and safety, reduce travel delay by reducing discretionary drive-alone trips, strengthen the economy by reducing money exported for fuel, reduce greenhouse gas emissions, and improve community livability by reducing vehicle trips and providing attractive options to driving alone.

Effective TDM requires collaboration between transportation system users, employers, developers, builders, building managers, residents, and the City government. This subsection outlines the process to prepare an effective TDM plan.

2. Applicability.

These standards apply to all new [non-residential] development [and redevelopment] within [designated multimodal mixed use areas (MMAs) and mixed use corridors] as shown on Map 3.6.020.Q.1.

3. Exemptions.

Projects projected to generate fewer than [100 trips] on a peak day are exempted from the TDM Plan requirement.

NOTE: The requirement to provide a TDM Plan (Applicability) and any exemptions should be included in the development code even if the other specifications are maintained in a separate Administrative Rule.
4. TDM Plan Requirements.

At a minimum, TDM Plans shall include the following:

- Project description
- Trip forecasts: volumes, times of day, modes, origins/destinations (if known), methodologies
- Performance targets (per section 3.6.020.Q.5 below)
- TDM program strategies proposed for implementation (per section 3.6.020.Q.6 below)
- Performance Monitoring & Adaptive Management Plan (per section 3.6.020.Q.7 below)
- Copies of documentation to ensure that notice of the deed restrictions requiring mandatory participation in the final TDM program is provided to all subsequent purchasers and owners of the project (see Section 3.6.020.Q.9 below)

5. Performance Targets.

Long term modal performance targets are established in the City Transportation System Plan (TSP). Targets vary based on Design Type.

The applicant will propose a baseline (opening year) mode share using recent and accurate data for the location and types of trips to and from the proposed development.

The applicant will propose a [2040] modal target consistent with at least the mid-point of the modal targets in Table 3.6.020.Q.1. The applicant will also propose interim targets for three, six, and nine years from project opening.

Table 3.6.020.Q.1: 2040 Non-SOV Modal Target by Design Type

<table>
<thead>
<tr>

<th>Non-SOV Modal Target</th>
</tr>
</thead>
<tbody>
<tr>
<td>Multimodal Mixed Use Area (MMA)</td>
<td>60 percent</td>
</tr>
<tr>
<td>Mixed Use Corridors</td>
<td>45 percent</td>
</tr>
</tbody>
</table>

6. TDM Program Strategies.

Applicants shall identify strategies to achieve the [2040] and interim modal targets. The effectiveness of each TDM strategy varies based on land use, scale of
development, and the range of travel options currently, and projected to be, available. Parking pricing and financial incentives are often the most effective strategies.

The TDM Program Strategies Menu in Table 3.6.020.Q.2 below provides potential TDM strategies for applicants to consider and evaluate.

Applicants shall identify when strategies are proposed to be implemented and provide evidence of the combined effectiveness and likelihood of achieving the modal targets consistent with the location and availability of travel options.

The menu in Table 3.6.020.Q.2 provides suggested strategies or guidance; it does not represent a comprehensive list of TDM strategies.

7. **TDM Performance Monitoring & Adaptive Management Plan.**

   a. Annual Performance Monitoring. The applicant will propose a plan for annual performance monitoring; including when and how travelers to and from the site will be surveyed; who will provide the Annual TDM Performance Report to the City (per section 3.6.020.Q.9); an annual due date for submitting the data; and how the survey response threshold, consistent with the Oregon Employee Commute Options requirements, will be met.

   b. Adaptive Management Plan. The applicant will propose additional TDM actions, likely to achieve performance thresholds, to be evaluated and implemented if interim mode share targets are not achieved.

8. **Review Process.**

   TDM Plans will be reviewed concurrently with the land use application. The design and implementation of the final TDM Plan shall be a condition of a project’s approval.

   The [Planning Official] will provide applicants with information on the TDM requirements at a pre-application conference.
NOTE: Internal review of TDM Plans should follow the same general process that is used for the review of Transportation Impact Analyses and similar technical reports. However, if the requirements for TDM Plans are adopted into Administrative Rules, language specifying how the review will be conducted may need to be included. See example below.

[Following receipt of an application, including a draft TDM Plan, the [Planning Official] will provide the draft plan to the [City Engineering Department] within five days. The [City Engineering Department] will respond with comments and recommendations to the [Planning Official] within five days. If additional changes are needed, the [City Engineering Department] will provide comments and recommendations to the [Planning Official] within five days of receiving the changes.]

a. Annual Transportation Demand Management Performance Report. The property owner shall submit an annual "TDM Performance Report" to the [Planning Official] beginning one year from initial occupancy and at one year intervals thereafter. If the site is not meeting modal performance targets, the property owner will propose additional TDM actions as outlined in the Adaptive Management Plan and document why they are likely to achieve the modal targets within the next year.

Consistent with the Oregon Employee Commute Options (ECO) Survey, questions at a minimum shall cover the type and frequency of modes of transportation used in a typical week (e.g., walk, cycle, drive alone, carpool, vanpool, use public transit, etc.), reasons for driving alone (e.g., availability of free parking, needing privacy, flexibility to assist family members, etc.), strategies that would lead drive alone respondents to use alternative modes (e.g., a guaranteed ride home program, subsidized transit passes, parking pricing, etc.), and whether or not respondents participate in telecommuting and/or flex work hour arrangements.

The [Planning Official] may provide the property owner with written notification indicating whether the TDM Performance Report and Adaptive Management Plan are deemed acceptable within 60 days of their receipt. The [Planning Official] may request auditable documentation to determine compliance.

b. Commitment to Maintain Transportation Demand Management for the Life of a Project. Applicants are required to incorporate the TDM Plan modal performance targets and performance monitoring reporting into deed restrictions, such as Covenants, Conditions & Restrictions (CC&Rs), to ensure that the TDM Plan runs with the land. Wording of the deed restrictions must ensure that the property, as well as every owner and
occupant, shall be subject to, abide with, and satisfy all of the provisions and obligations contained in the TDM Plan. This includes any obligation to provide funding and resources to implement the TDM Plan, and all requirements of associated conditions of approval imposed by the City. It is important to clarify that the TDM Plan requirements apply equitably to all portions of the property. They also apply to all owners and tenants, as well as their successors, in case the property is transferred, sold, or leased.
UNDERSTANDING TDM AND ITS ROLE IN THE DELIVERY OF SUSTAINABLE URBAN TRANSPORT

Colin S. Black
Contemporary Transport, UK

Eric N. Schreffler
ESTC, USA

ABSTRACT

Outdated notions of TDM (transport demand management) as a collection of vaguely related initiatives are constraining the true potential of the concept. This paper explains how TDM is far more effective when framed as a philosophical approach which in time is likely to become a cornerstone of sustainable urban transport systems. A new paradigm in transport planning, internationally recognised as TDM, is emerging which embraces concepts commonly referred to as Mobility Management, Smarter Choices, and Active Travel Management under its umbrella. Transport professionals worldwide have been collaborating to update understanding of TDM as a philosophy that underpins our approach to improving the sustainability of transport.

A review of TDM internationally has demonstrated the importance of combining a number of key aspects to an effective strategy. Key to successful policy transfer of sustainable urban transport is integrating the TDM philosophy into urban transport planning, as well as the daily management and operation of transport services and infrastructure. The paper presents a powerful policy tool, developed to help assist this process of integration - METRIC© (Mobility Enhancement and Trip Reduction Index to aide Comparison), being used internationally to benchmark comparative progress on TDM implementation.

ABOUT THE AUTHORS

**Dr. Colin Black** is the founder of specialist independent consulting firm Contemporary Transport, providing advice on TDM strategies, sustainable transport policy, strategic organizational change, and travel behavior modification programs to clients across the world. His doctorate explored the meaning, the implications and the key challenges of implementing a more sustainable system of transport in the UK. This provided a useful background in behavioral research and an in-depth understanding of the concept of sustainability. He has played an instrumental role in developing strategic policy guidance in the UK. He served for 2 terms as President of the Association for Commuter Transport and currently sits on a number of advisory committees and steering groups. Over the last two decades he has developed a wealth of practical knowledge leading high-profile transport projects establishing new visions underpinned by bespoke TDM strategies for a wide range of applications, from development sites to towns and cities. He is passionate about his work and finds great reward in inspiring others to think more innovatively about transport.

colin.black@contemporarytransport.co.uk

**Eric Schreffler** is independent consultant located in San Diego, California. He is perhaps best known for his work developing quantification methods for measuring the impacts of demand management strategies on travel and air quality. He has also authored or co-authored several seminal reference documents on TDM effectiveness for the Federal Highway Administration, Environmental Protection Agency, European Commission, and the Organization for Economic Co-operation and Development. He is the chair of the Transportation Research Board’s Transportation Policy Section and serves on several advisory groups, including: the European Conference on Mobility Management, the National Center for Transit Research, the ACT TDM Institute and the Transportation Planning Council of the Institute for Transportation Engineers. He holds an M.S. in Transportation from M.I.T. and a B.A. in Urban Studies from the University of California at San Diego.

1 INTRODUCTION
1.1 Why Manage Demand?

There is a broad and growing recognition that future plans to address urban mobility and accessibility needs cannot rely solely on expansion to transport infrastructure, be it roads, rails or even smart cars.

A sustainable transport system will need to address near term needs in a manner that does not compromise future generations' ability to meet theirs. Therefore, the days of “predict and provide” transport planning and management are likely behind us.

Many tools are available to address urban mobility and accessibility without expensive and environmentally controversial capital projects. It is astonishing that, despite the seemingly empowering policy rhetoric of European countries in particular, most major capital projects are still funded and implemented without drawing upon the range on proved initiatives and measures, that are capable of significantly increasing return on investment.

One set of these tools is broadly titled Transport Demand Management (TDM). Related concepts include:

- Mobility management;
- Travel awareness;
- Smarter Choices;
- Travel planning;
- Trip reduction programs; and
- Active Traffic Management.

All of these concepts are part of a system to manage travel demand within a Sustainable Urban Transport approach. (1) The European Commission and many of its member states are working to adopt and integrate this approach. (2)

1.2 What is TDM?

Traditionally in the United States, TDM has involved strategies to induce commuters to shift to higher occupancy modes, such as carpooling, vanpooling, and public transport.

In recent years the concept of TDM has become confused as a range of professionals specialising in different disciplines have attempted to redefine it in relation to their relevant sphere of knowledge. Whilst they are effectively dealing with the same issue, namely managing demand, each discipline has become rather too narrowly focussed. So, for example, engineers might view the issues from a traffic flow or reducing congestion perspective, the economists may view the issues from a pricing perspective, the computer specialists could view the issues as a technological challenge, whilst the marketing specialists frame the issues from a behaviour change perspective. To date, there has been little appreciation of the concept of TDM as a philosophical approach which combines the specialism’s of all disciplines to address policy objectives.

The traditional view of TDM is no longer consistent with the broad variety of measures being implemented in the United States and Europe to manage demand. According to a recent FHWA report:

“demand management is designed to better balance people’s needs to travel a particular route at a particular time with the capacity of available facilities to efficiently handle this demand.” (3)

A contemporary understanding of demand-side strategies is broader in scope than prior, more traditional views of TDM. Managing demand in the 21st century is about providing travelers,
regardless of whether they drive alone, with travel choices, such as work location, route, time of travel, and mode.

The European Commission has taken this concept further in its Green Paper on Urban Mobility, calling for policy-makers, planners and transport managers to:

"search for innovative and ambitious urban transport solutions with a view to arriving at a situation where towns and cities are less polluted and more accessible and where traffic within them flows more freely. Working together, we must seek ways of achieving better urban and suburban mobility, sustainable mobility, and mobility for all the inhabitants of Europe, while allowing economic operators to play their role in our towns and cities." (4)

Finally, TDM is recognized, internationally, as a supportive tool for mitigating the impacts of greenhouse gas (GHG) emissions. With the transport sector comprising almost a quarter of energy-related GHG emissions (with three-quarters of that from road vehicles), TDM is viewed as an important means to reduce private car use. (5)

Recently the UK, like many international governments, has started to embrace a wider perspective on the way to tackle transport issue, by recognising in particular the need to combine technological and behavioural change initiatives alongside each other (6). Whilst the political intention is clearly expressed, understanding and commitment to implement the broad range of policy interventions required to realise the full benefits of TDM are less evident (7). The UK, like most other governments, still appear far more comfortable dealing with technological approaches than the broad range of complementary initiatives required to deliver an effective TDM strategy. This apparent fixation with technology is evident across the range of initiatives designed to help tackle climate change (including those orientated towards the transport system), and evidenced by the composition of the UK Committee on Climate Change.

It is vital to broaden the understanding and thus adoption of TDM policies in more cities. This paper will to suggest reasons for this current failure to realize the potential of TDM and offer some key recommendations for tapping into the benefits of TDM. This is intended to help illuminate the circumstances upon which an overall TDM philosophy might be adopted at the sustainable urban transport policy in a city or metropolitan area.

1.3 Paper Structure

The remainder of this paper presents a TDM as a new paradigm for sustainable urban transport. This concept is then expanded further with reference to a range of international experiences with managing travel demand. The paper then explores the importance of effective policy transfer through integration. To assist with this process a new tool for benchmarking is presented, METRIC®, which is intended to help cities gauge their progress in maximizing the potential of their TDM strategy. The paper then concludes with practical recommendations for transferring more holistic policy approaches to assist the implementation of more sustainable systems of transport.

2 A NEW PARADIGM

Managing travel demand has largely been compartmentalized as a set of “soft measures” to promote sustainable travel options or programs to promote and offer shared ride arrangements. Demand management means different things to different disciplines. To Information Technology (IT) specialists, managing demand is new technology to provide information; to operations managers, managing demand is controlling the flow onto highways; to economists, it is pricing the system to find equilibrium with capacity; to marketers, it is promoting innovative campaigns; and worst of all, to policy-mangers is a largely unknown. It is perhaps therefore not surprising that the concept has become confused as each discipline tries to mold the concept to their set of tools.
This “silo” thinking inhibits the kind of policy integration that is needed to craft a truly sustainable urban transport solution strategy.

But travel demand management is a much broader concept than that assigned to mobility management or ridesharing. Implicit in the use of the term is the assumption that it is accompanied by the implementation of sustainable mobility, introduction of full cost pricing and organizational or structural measures to ensure a broad range of complementary interventions work effectively together to realize the benefits of sustainable transport. It is the unifying philosophy of TDM, not specific measures associated with it, that underpins the policy objective of a more sustainable system of transport.

This philosophy of managing demand accepts that meeting unfettered demand for travel is impractical and that therefore the system needs to be managed. That demand for travel needs to be managed by:

- Expanding the supply and availability of (more sustainable) alternatives;
- Controlling demand for the use unsustainable modes;
- Providing incentives and rewards for undertaking sustainable travel habits; and
- Imposing full-cost pricing on the use of the automobile.

Perhaps this philosophy is better understood simply as ‘urban transport management’ – i.e. obtaining a more appropriate balance in favour of needs over wants. Put simply, where transport used to be supplied to accommodate travel demand, travel must now be managed to use the available transport supply most efficiently. The following describes TDM’s key contributions to transportation sustainability:

- **TDM reduces the need for new or wider roads**
  By persuading people to drive less often, to closer destinations, outside of rush hours or using less busy routes, TDM can reduce the demand for new road infrastructure.

- **TDM makes personal travel decisions more efficient**
  Many drivers make travel decisions based on poor information and a lack of experience with non-automobile options. TDM improves their awareness and understanding of options, and their willingness to try them.

- **TDM maximizes return on infrastructure spending**
  Studies have shown that good information can significantly increase ridership on new transit infrastructure and services.

- **TDM makes the most of our current assets**
  It saves people money and time by helping them make efficient travel decisions. It improves health by promoting physical activity and less-polluting modes. It benefits employers by increasing productivity, reducing parking costs, and helping to attract and retain workers. It promotes economic development by reducing congestion and enhancing worker mobility.

- **TDM is a versatile and dynamic management tool**
  TDM measures can be customized for specific audiences (e.g. business park commuters), destinations (e.g. major hospitals), travel modes (e.g. cyclists), travel corridors (e.g. a busy highway), trip purposes (e.g. school) or specific timeframes (e.g. major events). They can be delivered in months, rather than years.

- **TDM initiatives have multimodal benefits**
It recognizes that people see alternatives to driving as a “suite” of options. Non-drivers tend to be public transport users, car-poolers, pedestrians or cyclists at different times, for different reasons.

**TDM works at the scale of individuals, but has huge power across a community**

If every person who drives to work in a community decided to leave their car at home just one day a month, the 5% reduction in commuter traffic could significantly ease daily congestion.

### 2.1 Components of a Broader Concept of TDM

A more comprehensive view of managing travel demand goes beyond traditional means to provide and promote commute alternatives (US) or new soft measures in communication tools and partnership-building (Europe) to fulfill the broader definition of balancing peoples travel (and activity) needs with the capacity of available facilities and services to met these needs. In this broader approach, four types of strategies can be considered:

- Operational (such as dynamic route information on highways);
- Physical (such as auto restrictions in city centers or HOV lanes);
- Financial/pricing (such as congestion charging); and
- Organizational (such as sustainable travel planning).

The next section provides a litany of examples of each of the strategies, from Europe, the U.S. and elsewhere in the world. Individually, the specific measures within each category can have a significant impact on localized traffic at a worksite, new development, corridor, or event venue. However, as will be argued in the following section, it is the integration of these measures into urban transport plans and the management and operation of the overall mobility system that is paramount.

### 3 INTERNATIONAL EXPERIENCE WITH MANAGING TRAVEL DEMAND

An international scanning study on managing travel demand to address congestion identified European examples of TDM strategies, organized into the four categories listed in the last section: operational, physical, financial and institutional. (8) This scanning study, along with US and Japanese examples, forms the basis of the experienced provided here.

#### 3.1 Operational Measures

At the heart of operational measures to manage demand are enhanced choices and traveler information about these choices. Among the interesting strategies the scan team made a number of key observations summarized in box 3.1.

**Box 3.1: Operational TDM Measures**

| Traffic management centers use real-time, dynamic information to manage the system and provide users with route choices during their trip. The way they provide individualized and customized data from the centers to users varies among public, public-private, and private providers. Newer innovations include the provision of door-to-door pre-trip, near-trip and en route information on time, route, and mode choice. Integrated examples of real-time multimodal information systems include: Stadtinfoköl in Cologne, SWINGH in The Hague and several “511” systems in the U.S. |
| Demand management is a key part of highway reconstruction to mitigate the impacts of the disruption. In the Netherlands, the reconstruction of the A10 and A9 near Amsterdam have included comprehensive mobility management programs to induce mode, time, and route shifting and have included information on and incentives to use public transport to get to work during the construction period. |
| Travel time prediction, based on recent (the past few hours) or archived (historic) data, is being developed in many |
countries. The national traffic information website includes both real-time and predicted traffic conditions in terms of average speeds. The system in the Netherlands provides users with predictions of travel times on the highway at a given time of day. The system also informs the user of travel times during periods before and after the desired time. The system in Cologne, developed as part of Stadtinfoköln, predicts travel times on public transit and roads and provides a comparison to users via in-vehicle or hand-held information or signs near park-and-ride facilities. A similar system is in place and being enhanced in the San Francisco Bay Area. In all, travel time reliability is a significant issue and performance indicator in Europe, as in the United States.

Planning for demand and traffic management during large-scale events has been undertaken in a comprehensive, coordinated fashion using many management techniques. This includes traveler information, traffic flow and diversion strategies (Silverstone Grand Prix event in England), use of closed highway segments as park-and-ride facilities (World Youth Day in Cologne), integrated event and public transport tickets (Rotterdam Marathon and soccer matches in Germany), and schedule changes to free buses for use in shuttling visitors (in Rome after the death of Pope John Paul II).

It has been common in Europe to use overhead changeable signs for speed harmonization for many years. Changeable speed signs and explanatory icons warn motorists before they reach queuing or incidents. Variable speed limits for speed harmonization have recently been implemented in the U.S., in Northern Virginia, Orlando and St. Louis.

Speed harmonization, use of the hard shoulder during congested period, ramp metering, incident management, and real-time travel information are all being used together under the concept of Active Traffic Management (such as on the M42 near Birmingham) or Dynamic Traffic Management (the Netherlands).

New public transport and shared ride services are being developed, such as taxi-sharing (Bristol, England) and car-sharing (Rome, Cologne, etc.). The implementation of supportive park-and-ride facilities and improved express bus and rail services are being implemented. Carpooling, vanpooling, and teleworking are still not widespread in Europe, but remain a significant share for commute trips in the U.S.

3.2 Physical Measures

Physical measures either restrict the use of cars in certain areas or during certain times of the day, or involve strategic improvements to the transportation network to enhance system efficiency or provide new capacity for public transport or high occupancy vehicles. The physical measures observed in Europe and elsewhere to influence demand are summarized in box 3.2 below.

<table>
<thead>
<tr>
<th>Box 3.2: Physical TDM Measures</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Access control system</strong> in Rome operates as a physical barrier by restricting vehicles from the historic core during much of the day. A limited number (150,000) of permits are sold that allow access by some vehicles. Rome also bans all cars without a catalytic converter from the core. The access control zone has resulted in a 20 percent reduction in traffic during the restricted part of the day, but has had an unintended effect of increasing the use of higher polluting motor scooters. Access control is also being implemented on a more limited basis, such as weekend road closures (e.g., Ciclovia) to accommodate bicycling and walking in places such as Bogotá, New York City, Mexico City.</td>
</tr>
<tr>
<td>Many cities are making improvements to their public transport system by building extensive park-and-ride facilities on the periphery of the city and offering express bus or rail service into the city center. The Ferrytoll park-and-ride system in Edinburgh includes dedicated access lanes to the facility and traffic queue management on the bus route to optimize bus travel times. Winchester in England, offers parking price discounts for lower emission vehicles at its main park-and-ride facility. Rome has built park-and-ride lots outside its “green area” and added 350 km of new urban rail lines.</td>
</tr>
<tr>
<td>An HOV lane has been constructed on the M62 /M606 in England in to the city of Leeds to demonstrate the efficiency and effectiveness of such a facility to encourage ridesharing (2+ carpools). Bus lanes (using red pavement in the United Kingdom) serve buses and other high occupancy vehicles (HOVs) to Heathrow and Schipol airports. In the U.S. some HOV lanes are being converted to High Occupancy Toll lanes to allow single occupant drivers to pay for unused capacity and cross-subsidize new public transport services.</td>
</tr>
<tr>
<td>The Dutch are using the hard shoulder as rush hour lanes and narrower plus lanes in the median to enhance capacity during the most congested periods. These are accompanied by slower speed limits and have not resulted in any fatal accidents since being implemented. The hard shoulder is used as a bus-only lane during peak periods in Minneapolis.</td>
</tr>
</tbody>
</table>

3.3 Financial/Pricing Measures

Congestion pricing is widely acknowledged as an effective demand management tool, but it is also being used to address environmental concerns, fund new public transport improvements, and preserve historic city centers. A summary is provided in box 3.3 below.
**Box 3.3: Physical TDM Measures**

**Congestion pricing** schemes are being implemented to reduce congestion (London) and emissions (Stockholm and Rome), not primarily to raise revenue for transport or other uses. The alternative to driving a car into the city center is mainly public transport, which carries 80 to 85 percent of peak-hour commuters in London and Stockholm.

In Stockholm, the national legislature enacted a law requiring the city to implement a congestion tax for cars entering the city center. The pilot program was implemented in early 2006 for 7 months, although the enhanced transit component (which amounts to half of the US$400 million budget) was implemented in August 2005. Users pay the tax daily. A national referendum was held in September 2006 making the congestion tax permanent. An extensive evaluation effort was used to assess the pilot program and it reported 20-25% percent reduction in traffic entering the core and resulting improvements in overall accessibility (travel times reduced 30-50%) and air quality (CO2 decreased in core by 14% and in region by 2.5%). (1)

**Truck pricing systems** have been implemented for trucks over 12 metric tons (European law, with plans to lower the limit to 3.5 tons) in several central European countries, including Switzerland, Austria, and Germany. The German system is complicated in terms of payment and enforcement and was plagued by implementation delays, but is designed to reduce road damage resulting from wear and tear on the German autobahn network and to reduce environmental and energy impacts of the growth in truck volumes throughout central Europe.

Financial incentives are also being used as a demand management strategy. As part of a highway reconstruction project near Amsterdam, **free monthly transit passes** were distributed to area residents and workers to complement transit service improvements and employer-based TDM initiatives. Commuter incentive programs, provided to those using alternative modes, has been shown to be a popular and cost effective means from reducing car trips in the U.S. in places like Atlanta and Los Angeles.

---

**3.4 Institutional Measures**

Demand management requires new partnerships, planning processes, and approaches to addressing traffic congestion. The ability to institutionalize a demand management philosophy in supply-oriented organizations is a key factor in the success of the endeavor.

**Box 3.4: Institutional TDM Measures**
Partnerships

Traveler information is often gathered and compiled by the public sector and disseminated by public and private operators. The Utrecht traffic control center, for example, manages the system on one side of the building and disseminates information to providers through the information center on the other side. A new regional partnership, SWINGH, has been formed in The Hague to coordinate traveler and traffic management and information.

New public/private partnerships have formed to address employee and visitor parking and commuting issues, such as the Transport Forums at all major UK airports and Transportation Management Associations in the U.S.

One strategy to manage demand is to better coordinate the timing and nature of travel, even in goods movement. The British, among others, have experimented with consolidated delivery schemes in which a subsidized carrier assembles deliveries from participating delivery companies at a peripheral location and delivers them to downtown merchants. This has resulted in a 65 percent reduction in delivery vehicles in Bristol.

Planning

The Swedish and British are integrating travel demand management planning into transport and land use plans. The Swedish Road Administration has adopted a four-stage principle that requires consideration of (1) demand management and mode shifting before considering (2) efficiency or systems management, 3) minor improvements, or (4) new investment or major rebuilding. Finally, the U.K. and Swedish governments have developed best practice and planning guidelines for integrating demand management into new development site planning and approval and many countries are requiring or recommending Sustainable Urban Transport Planning for larger urban areas.

Individualized travel planning, also called travel blending, individualized marketing or travel feedback services are provided to residents in areas with the potential for increased public transport use, bicycling and walking in many countries, including: Japan, the UK, Germany, Australia and the U.S.

The United Kingdom and Italy require all municipalities and large employers to develop and implement travel plans or trip reduction or travel plans at worksites, as is the case in Washington State and Arizona. These regulations are implemented through local government and provide funding and technical assistance to local agencies. The British government has a school travel initiative to develop travel plans for all school sites in the United Kingdom by 2010. The smarter choices program in the UK projects that high-intensity “soft” demand management measures could reduce overall traffic levels by as much as 11 percent and lower intensity measures by 2 to 3 percent. These soft measures include travel planning (sustainable travel plans) for towns, employer worksite, schools, hospitals, and new developments.

4 KEY TO POLICY TRANSFER: THE NEED FOR INTEGRATION

The TDM measures cited in the previous section seems impressive in terms of the range of techniques, application settings, impacts, and international scope. However, many TDM programs are viewed as a “foot in the door” and way to get people to try a more sustainable behavior in the hopes that they can lead up a virtuous ladder to even more far-reaching behavioral changes. Some commentators suggest that an emphasis on changing attitudes to particular initiatives is flawed and that strategies should instead be re-focussed on influencing values. Compton (9) highlighted the importance of engaging values and self-identity as basis for motivating pro-environmental behavioural change. He argues that individuals who engage in behaviour in pursuit of ‘intrinsic goals’ (of personal growth, emotional intimacy or community involvement) tend to be more highly motivated and more persistent in engaging in this behaviour, when compared to individuals motivated by ‘extrinsic goals’ (for example, of acquisition of material goods, financial success, image and social recognition). He suggests therefore that motivations which are intrinsic are more likely to lead to pro-environmental behaviour.

Indeed, the measures typically associated with TDM, when considered in isolation, can be fraught with contradictions. Car sharing, for example, may not lead to net environmental benefits if the money that an individual saves by selling their own car and joining a car-share scheme is spent on say purchasing a time-share apartment in a distance place resulting in a larger carbon footprint. Likewise, efforts to provide more flexibility to when and where employees work, make it harder to serve them with public transport and may break-up existing shared ride arrangements.

Therefore, TDM needs to be set into context. We can no longer rely on forecasts of future travel demand, with no policies in place to modulate that demand, that require us to meet all that desired (and presumed) travel. The TDM philosophy must rely on “back-casting” to determine the
nature of the sustainable future we want for progenies and ourselves. Once we know what this sustainable future might look like, we can develop plans and projects to achieve and work toward this. The gasoline price spike of 2008 reveal that drivers are willing to reduce auto use, if given a rational reason for doing so.

How do we create this future vision of sustainable urban transport, plan for it, and then operate the transportation system with this new TDM philosophy. The answer may lie in the integration of these strategies into a cohesive, comprehensive approach in order to maximizing intended effects.

TDM Integration in Planning - In the U.S. TDM is often an afterthought to highway and public transit improvements. In some long-range planning exercises, unmet demand that cannot be satisfied with funded infrastructure is assumed be reduced via TDM, without specifying how or integrating predicted behavior responses into the planning process.

One place that has created a vision of a sustainable transport future and implemented a plan to reach it, is Lund, Sweden. Comprehensive, sustainable transport planning has been successfully undertaken in Lund, Sweden (so-called LundaMaTs or Lund Environmentally-Friendly Transport plan), where travel growth (expressed as vehicle kilometers of travel) has been arrested while economic growth continued (decoupling traffic from economic growth). The integrated program included transit service improvements (a new bus rapid transit line), traffic management, bicycle and pedestrian improvements, and individualized marketing efforts to increase bus and bike use. The city of Lund bought land adjacent to the right-of-way of the bus line and is reselling the land to private interests for sustainable developments. The result of this process was a 2-4% reduction in per capita vehicle travel. Given Lund is still growing, LundaMaTs showed that economic growth can be decoupled from transport growth. Increases in employment and population were accommodated by growth in transit and bicycle use. The key to the success of the integrated plan was the involvement of stakeholders, including elected officials, early in the process. (10)

TDM Integration in System Operations - Congested highway networks and public transport system have prompted transport managers to become more mobility managers than highway or transit operators. Efforts to provide pre-trip traveler information, incentives for traveling in the shoulders of the peak period, ramp metering, and congestion charging are more about managing demand than operating a facility.

But, this role of demand manager comes on a rather ad hoc basis, as most traffic engineers and managers do not see themselves as such. This philosophy of managing demand needs to be built into the plans and operating procedures at a systemic level. The urban transport system needs to be grounded in managing demand rather than fall back on it as a default.

One city that has embraced the philosophy of managing demand is Rome. Rome’s Mobility Policy includes four key components:

- Managing demand management with access control and parking management;
- New institutional structure for public transport and traffic management;
- Complementary measures: land use integration, clean fuels and mobility management; and
- Transport management of buses and cars using technology to provide real-time information.

The plan is based on concentric rings that place greater restrictions on the automobile as one gets closer to the historic core (see Figure 1 on next page). Cars are intercepted at suburban park-and-ride facilities as travelers transfer to regional trains. Higher polluting cars are not allowed into the region without a “blue permit” (Bollino Blu). Parking is managed and priced within
the next inner ring. Finally, Rome’s access control zone prohibits most cars from entering the historic core during the day. Holders of an entry permit must prove that they have an off-street parking space. Public transport operations and the traffic management center are both within the same city agencies, enabling better control of relative automobile and transit travel times.

Based on our review of the need for and experience with integrating the demand management philosophy into urban transport, we believe that the following represent characteristics of effective integration in a city:

- A genuine desire to reduce car use by reducing trips and VMT;
- A pervasive belief that economic growth can be “decoupled” with transport growth;
- A consensus-building process to garner buy-in by politicians, technicians and the traveling public;
- Regional goals to manage demand that are realistic and measurable;
- Serious treatment of both demand and supply solutions;
- Commitment to implement a comprehensive package of strategies;
- Targeting to various travel markets recognizing that travelers are not generic;
- Active management of the transport system and information on on-going basis;
- An evolution from project/site/corridor programs to region-wide effort;
- Evaluation of each strategy, synergistic impacts and comparative cost effectiveness; and
- Feedback loop to improve plans and programs.

These characteristics may be part of the recipe for policy transference to other cities, beyond those named here or others, such as the recipients of the IDTP Sustainable Transport Award (New York, Bogotá, Seoul, Guayaquil). Of course, the ultimate test of integration would be that case that managing demand is simply the normal way so planning and operating the transport system and meeting the true needs of people. We have a long way to go to realize the TDM philosophy as “the norm,” but it begins with recognizing that a sustainable future requires a different approach to urban travel. The METRIC© tool, described in the next section, offers a means to evaluate the progress of a city in adopting this overall philosophy of effectively managing demand.

5 A NEW TOOL FOR ASSESSING TDM INTEGRATION: METRIC©

One means for assessing the ability, readiness and capability of cities to adopt the TDM philosophy and resulting policy framework is to compare cities progress toward some standard that fulfills the characteristics enumerated in the last section. Such a comparison can be aided by some sort of a progress “report card.” Ultimately, a comparative system will help formulate a common set of criteria for success.

Why benchmark cities progress with a report card? Not to judge good or bad, but to elicit dialog to seek improvements in work towards a sustainable transport approach. Such a comparative tool is now available in the form of METRIC©, the Mobility Enhancement and Trip Reduction Index to aide in Comparison.

Such tools have been used in transit peer reviews and assessments of bicycle-friendly communities, but METRIC© is intended to bridge modal and disciplinary constructs to assess the full range of requirements for a sustainable transport system.
Using our growing understanding of TDM, within the broader definition offered earlier in this paper, seven key components of a sustainable urban transport policy can be enumerated for the purposes of benchmarking, along with the type of enablers to see them implemented:

- **Physical Measures** – infrastructure to make demand management measures work
  The “enlightened engineers”
- **Operational Enhancements** – processes to manage /influence trips
  The “applied IT’ers”
- **Financial Mechanisms** – using economics of affect trip choice
  The “exciting economists”
- **Organisational Support** – institutional integration
  The “marvellous marketers”
- **Political Will** - commitment to address obstacles and provide adequate funding
  The “progressive politicians”
- **Research Program**- analysis to evaluate performance –
  The “reality researchers”
- **Integration** - application across broad range of operational levels
  The “out-the-box thinkers”

The METRIC© assessment process involves a detailed internal review of local experience in the seven areas enumerated above. This review includes several hundred individual measures that can contribute to sustainable transport. Each initiative or measure, with the category can be evaluated on a seven-point differential scale, or less formally if desired. Weighting is then applied to specific sections, as agreed by recognised international experts on the METRIC© panel. The assessment includes both qualitative and quantitative data and each of the seven sections is summarized into a report card.

The report card is a “consumer reports” type summary to show, at a glance, how a city is doing in implementing a full range of demand management strategies in an integrated approach. METRIC© has been applied to several cities in which the developers of the tool are working and more cities have voiced interest, as well as some corporate interests looking to assess which cities are moving toward sustain transport in an integrated fashion.

In time, the report cards are intended to demonstrate the particular strengths and weaknesses of TDM strategies being implemented in city regions. This will help transport practitioners identify opportunities to transfer knowledge and assist the implementation of more holistic policy approaches, which will help facilitate the implementation of more sustainable systems of transport.

An example of the METRIC© report cards is provided below for two cities that the authors are particularly familiar with.
### 6 CONCLUSIONS AND RECOMMENDATIONS

It is evident that outdated notions of TDM as a jumble of tenuously linked policies, initiatives, measures and schemes is constraining the true potential of the concept. TDM is far more effective when framed as a philosophical approach representing a paradigm shift from the past where a philosophy of ‘predict and provide’ prevailed. In time this broader definition of TDM will become a cornerstone of sustainable urban transport systems.

The effectiveness of TDM becomes most diluted when the philosophies are confused. Where, for example, a new road bypassing a town is constructed without consideration of how the capacity benefits might be locked in, and enhanced return on investment achieved, through an effective TDM strategy.
The first comprehensive review of international experience has discovered that there are now examples of a broad range of new and innovative strategies TDM being implemented throughout the world. From this scan of TDM internationally it is evident that the approach is most effective when implemented to include four main types of strategy, namely: Operational; Physical; Financial; and Organizational. Effectiveness of a holistic TDM strategy is bolstered further when combined with strong political support which helps to address institutional obstacles and ensures adequate funding is allocated. The momentum of implementation is maintained which combined with a robust research program which enables analysis to evaluate the program performance and provide evidence of a strong return on investment.

The key to successful policy transfer of sustainable urban transport is integrating the TDM philosophy into urban transport planning as well as the daily management and operation of transport services and infrastructure. Unlocking the potential of TDM relies on effective integration. TDM strategies operating independently in a specific disciplinary silo, such as traffic engineering for example, are less effective as they are unable to tap into the complementary benefits of parallel TDM initiatives, such as travel planning. Understanding TDM as a broader concept has enormous potential to improve integration, by encouraging transport professionals across the spectrum to work together towards common objectives.

To assist this process of integration, a useful policy tool has been developed. METRIC©, has been developed to help cities gauge their progress in maximizing the potential of their TDM strategy. Initial response to using METRIC© has been very positive and it has been employed in a wide range of strategic transportation studies in North America and Europe to date. The TDM evaluation process it employs helps foster greater practical understanding of the potential to enhance the effectiveness of TDM at the local level. The resulting report card provides a graphical illustration of this potential which can quickly be compared to other cities and regions. This has proved to be a particularly powerful way to garner political support, and to discourage leading world cities from resting on their laurels.

Research sponsored by the Federal Transit Administration in cooperation with the Transit Development Corporation
The nation’s growth and the need to meet mobility, environmental, and energy objectives place demands on public transit systems. Current systems, some of which are old and in need of upgrading, must expand service area, increase service frequency, and improve efficiency to serve these demands. Research is necessary to solve operating problems, to adapt appropriate new technologies from other industries, and to introduce innovations into the transit industry. The Transit Cooperative Research Program (TCRP) serves as one of the principal means by which the transit industry can develop innovative near-term solutions to meet demands placed on it.

The need for TCRP was originally identified in TRB Special Report 213—Research for Public Transit: New Directions, published in 1987 and based on a study sponsored by the Urban Mass Transportation Administration—now the Federal Transit Administration (FTA). A report by the American Public Transportation Association (APTA), Transportation 2000, also recognized the need for local, problem-solving research. TCRP, modeled after the longstanding and successful National Cooperative Highway Research Program, undertakes research and other technical activities in response to the needs of transit service providers. The scope of TCRP includes a variety of transit research fields including planning, service configuration, equipment, facilities, operations, human resources, maintenance, policy, and administrative practices.

TCRP was established under FTA sponsorship in July 1992. Proposed by the U.S. Department of Transportation, TCRP was authorized as part of the Intermodal Surface Transportation Efficiency Act of 1991 (ISTEA). On May 13, 1992, a memorandum agreement outlining TCRP operating procedures was executed by the three cooperating organizations: FTA, the National Academies, acting through the Transportation Research Board (TRB); and the Transit Development Corporation, Inc. (TDC), a nonprofit educational and research organization established by APTA. TDC is responsible for forming the independent governing board, designated as the TCRP Oversight and Project Selection (TOPS) Committee.

Research problem statements for TCRP are solicited periodically but may be submitted to TRB by anyone at any time. It is the responsibility of the TOPS Committee to formulate the research program by identifying the highest priority projects. As part of the evaluation, the TOPS Committee defines funding levels and expected products.

Once selected, each project is assigned to an expert panel, appointed by the Transportation Research Board. The panels prepare project statements (requests for proposals), select contractors, and provide technical guidance and counsel throughout the life of the project. The process for developing research problem statements and selecting research agencies has been used by TRB in managing cooperative research programs since 1962. As in other TRB activities, TCRP project panels serve voluntarily without compensation.

Because research cannot have the desired impact if products fail to reach the intended audience, special emphasis is placed on disseminating TCRP results to the intended end users of the research: transit agencies, service providers, and suppliers. TRB provides a series of research reports, syntheses of transit practice, and other supporting material developed by TCRP research. APTA will arrange for workshops, training aids, field visits, and other activities to ensure that results are implemented by urban and rural transit industry practitioners.

The TCRP provides a forum where transit agencies can cooperatively address common operational problems. The TCRP results support and complement other ongoing transit research and training programs.
The National Academy of Sciences is a private, nonprofit, self-perpetuating society of distinguished scholars engaged in scientific and engineering research, dedicated to the furtherance of science and technology and to their use for the general welfare. On the authority of the charter granted to it by the Congress in 1863, the Academy has a mandate that requires it to advise the federal government on scientific and technical matters. Dr. Ralph J. Cicerone is president of the National Academy of Sciences.

The National Academy of Engineering was established in 1964, under the charter of the National Academy of Sciences, as a parallel organization of outstanding engineers. It is autonomous in its administration and in the selection of its members, sharing with the National Academy of Sciences the responsibility for advising the federal government. The National Academy of Engineering also sponsors engineering programs aimed at meeting national needs, encourages education and research, and recognizes the superior achievements of engineers. Dr. Charles M. Vest is president of the National Academy of Engineering.

The Institute of Medicine was established in 1970 by the National Academy of Sciences to secure the services of eminent members of appropriate professions in the examination of policy matters pertaining to the health of the public. The Institute acts under the responsibility given to the National Academy of Sciences by its congressional charter to be an adviser to the federal government and, on its own initiative, to identify issues of medical care, research, and education. Dr. Harvey V. Fineberg is president of the Institute of Medicine.

The National Research Council was organized by the National Academy of Sciences in 1916 to associate the broad community of science and technology with the Academy’s purposes of furthering knowledge and advising the federal government. Functioning in accordance with general policies determined by the Academy, the Council has become the principal operating agency of both the National Academy of Sciences and the National Academy of Engineering in providing services to the government, the public, and the scientific and engineering communities. The Council is administered jointly by both the Academies and the Institute of Medicine. Dr. Ralph J. Cicerone and Dr. Charles M. Vest are chair and vice chair, respectively, of the National Research Council.

The Transportation Research Board is one of six major divisions of the National Research Council. The mission of the Transportation Research Board is to provide leadership in transportation innovation and progress through research and information exchange, conducted within a setting that is objective, interdisciplinary, and multimodal. The Board’s varied activities annually engage about 7,000 engineers, scientists, and other transportation researchers and practitioners from the public and private sectors and academia, all of whom contribute their expertise in the public interest. The program is supported by state transportation departments, federal agencies including the component administrations of the U.S. Department of Transportation, and other organizations and individuals interested in the development of transportation. www.TRB.org

TDM (transportation demand management or travel demand management) is a process that can encompass a variety of measures intended to influence travel choices. TDM is used to manage heavy traffic demand and parking requirements, and to enhance the effectiveness of transit services. Employer and institutional TDM actions within the scope of this chapter can be classified into four major categories: employer or institutional support actions, provision of transportation “services,” financial incentives or disincentives, and alternative work arrangements.

In this report, new as well as synthesized research is presented. Using a collection of 82 cases as an analysis platform, the authors evaluate the relative importance of particular categories of TDM strategies (e.g., support versus incentives), and even, to some degree, of particular strategies (e.g., a transit subsidy versus an HOV parking discount), through pair-wise comparisons from the sample.

TCRP Report 95: Chapter 19, Employer and Institutional TDM Strategies will be of interest to transit, transportation, and land use planning practitioners; land developers, business associations, employers, institutions, and employees; educators and researchers; and professionals across a broad spectrum of transportation and planning agencies, MPOs, and local, state, and federal government agencies.

The overarching objective of the Traveler Response to Transportation System Changes Handbook is to equip members of the transportation profession with a comprehensive, readily accessible, interpretive documentation of results and experience obtained across the United States and elsewhere from (1) different types of transportation system changes and policy actions and (2) alternative land use and site development design approaches. While the focus is on contemporary observations and assessments of traveler responses as expressed in travel demand changes, the presentation is seasoned with earlier experiences and findings to identify trends or stability, and to fill information gaps that would otherwise exist. Comprehensive referencing of additional reference materials is provided to facilitate and encourage in-depth exploration of topics of interest. Travel demand and related impacts are expressed using such measures as usage of transportation facilities and services, before-and-after market shares and percentage changes, and elasticity.

The findings in the Handbook are intended to aid—as a general guide—in preliminary screening activities and quick turn-around assessments. The Handbook is not intended for use as a substitute for regional or project-specific travel demand evaluations and model applications, or other independent surveys and analyses.

The Second Edition of the handbook Traveler Response to Transportation System Changes was published by USDOT in July 1981, and it has been a valuable tool for transportation professions.
sionals, providing documentation of results from different types of transportation actions. This Third Edition of the *Handbook* covers 18 topic areas, including essentially all of the nine topic areas in the 1981 edition, modified slightly in scope, plus nine new topic areas. Each topic is published as a chapter of TCRP Report 95. To access the chapters, see the project write-up on the TCRP website: http://www.trb.org/TRBNet/ProjectDisplay.asp?ProjectID=1034.

A team led by Richard H. Pratt, Consultant, Inc. is responsible for the *Traveler Response to Transportation System Changes Handbook, Third Edition*, through work conducted under TCRP Projects B-12, B-12A, and B-12B.

**REPORT ORGANIZATION**

The *Handbook*, organized for simultaneous print and electronic chapter-by-chapter publication, treats each chapter essentially as a stand-alone document. Each chapter includes text and self-contained references and sources on that topic. For example, the references cited in the text of Chapter 6, “Demand Responsive/ADA,” refer to the Reference List at the end of that chapter. The *Handbook* user should, however, be conversant with the background and guidance provided in *TCRP Report 95: Chapter 1, Introduction*.

Upon completion of the *Report 95* series, the final Chapter 1 publication will include a CD-ROM of all 19 chapters. The complete outline of chapters is provided below.

**NOTES:**

* Primary cutoff was first year listed, but with selected information up into second year listed.

* The source data cutoff date for certain components of this chapter was 1999.

* Deferring for a future TCRP project effort.

* The edition in question addressed only certain aspects of later edition topical coverage.
CHAPTER 19 AUTHOR AND CONTRIBUTOR ACKNOWLEDGMENTS

Richard H. Pratt is the Principal Investigator. Dr. Katherine F. Turnbull of the Texas Transportation Institute assisted as co-Principal Investigator during initial Project B-12 phases, leading up to the Phase I Interim Report and the Phase II Draft Interim Handbook. With the addition of Project B-12B research, John E. (Jay) Evans, IV, then of Jay Evans Consulting LLC, was appointed co-Principal Investigator. Lead Handbook chapter authors and co-authors, in addition to Mr. Pratt, are Mr. Evans (initially with Parsons Brinckerhoff and now with Cambridge Systematics); Dr. Turnbull; J. Richard Kuzmyak, initially of Cambridge Systematics and now of J. Richard Kuzmyak, L.L.C.; Frank Spielberg of VHB; Brian E. McCollom of McCollom Management Consulting, Inc.; Herbert S. Levinson, Transportation Consultant; Erin Vaca of Cambridge Systematics, Inc.; and Dr. G. Bruce Douglas of PB. Contributing authors include Dr. Kiran U. Bhatt, K.T. Analytics, Inc.; Shawn M. Turner, Texas Transportation Institute; Dr. Rachel Weinberger, Cambridge Systematics (now with the University of Pennsylvania); Andrew Stryker, PB; Dr. C. Y. Jeng, Gallop Corporation; and Daniel Nabor, VHB.

Other research agency team members contributing to the preparatory research, synthesis of information, and development of this Handbook have been Stephen Farnsworth, Laura Higgins, and Rachel Donovan of the Texas Transportation Institute; Nick Vlahos, Vicki Ruiter, and Karen Higgins of Cambridge Systematics, Inc.; Greg Benz, Bill Davidson, G.B. Arrington, and Lydia Wong of PB, along with the late travel demand modeler/planner extraordinaire Gordon W. Schultz; Kris Jagarapu of VHB; Sarah Dowling of Jay Evans Consulting LLC; and Laura C. (Peggy) Pratt of Richard H. Pratt, Consultant, Inc. Dr. C. Y. Jeng of Gallop Corporation has provided pre-publication numerical quality control review throughout. By special arrangement, Dr. Daniel B. Rathbone of The Urban Transportation Monitor searched past issues. Assistance in word processing, graphics, and other essential support has been provided by Bonnie Duke and Pam Rowe of the Texas Transportation Institute; Karen Applegate, Laura Reseigh, Stephen Bozik, and Jeff Waclawski of PB; others too numerous to name but fully appreciated; and lastly the warmly remembered late Susan Spielberg of SG Associates (now part of VHB).

Special thanks go to all involved for supporting the cooperative process adopted for topic area chapter development. Members of the TCRP Project B-12/B-12A/B-12B Project Panel, named elsewhere, are providing review and comments for what will total some 18 individual publication documents/chapters. They have gone the extra mile in providing support on call including leads, reports, documentation, advice, and direction over the almost-decade-and-a-half duration of the project. Four consecutive appointed or acting TCRP Senior Program Officers have given their support: Stephanie N. Robinson, who took the project through scope development and contract negotiation; Stephen J. Andrele, who led the work during the Project B-12 Phase and on into the TCRP B-12A Project Continuation; Harvey Berlin, who saw the Interim Handbook through to Website publication; and Stephan A. Parker, who is guiding the entire project to its ultimate fruition. Editor Natassja Linzau is providing her careful examination and fine touch, while Publications Director Eileen Delaney and her team are handling all the numerous publication details. TRB Librarian Jessica Fomalont has provided invaluable literature procurement aid. The efforts of all are greatly appreciated.

Continued recognition is due to the participants in the development of the First and Second Editions, key elements of which are retained. Co-authors to Mr. Pratt were Neil J. Pedersen and Joseph J. Mather for the First Edition, and John N. Copple for the Second Edition. Crucial support and guidance for both editions was provided by the Federal Highway Administration’s Technical Representative (COTR), Louise E. Skinner.

In the TCRP Report 95 edition, J. Richard Kuzmyak is the lead author for this volume: Chapter 19, “Employer and Institutional TDM Strategies.” Contributing authors for Chapter 19 are John (Jay) Evans, IV, and Richard H. Pratt.

Participation by the profession at large has been absolutely essential to the development of the Handbook and this chapter, which has received the special attention of TRB Transportation Demand Management Committee ABE50 past chairs/chair and selected members. Past Chairs Eric Schreffler and Philip L. Winters, and Chair Lori Diggins—aided by committee members Tom Rye, Peter Valk, and members of the MassRIDES Outreach team, including Kay Carson, Jennifer Doyle, and Donna Smallwood—reviewed an early version, providing extensive comments, guidance, and information leads. Sara Hendricks, Ed Hillsman, and Judy Clark stepped in to provide additional reviews of the formal review draft. The contribution of each and all is truly valued.

Finally, sincere thanks are due to the many other practitioners and researchers who were contacted for information and unstintingly supplied both that and all manner of statistics, data compilations, and reports. Though not feasible to list here, many appear in the “References” section entries of this and other chapters.
CONTENTS

19-1 Overview and Summary

19-173 How to Order TCRP Report 95
OVERVIEW AND SUMMARY

Transportation Demand Management (TDM) refers to a body of actions that seek “to manage the demand for travel by drive-alone private car, rather than catering for that demand, or managing the road system . . .” (Ison and Rye, 2008). Managing the road system comes under the category of Transportation Systems Management (TSM). TDM is in the family of actions referred to as demand-side strategies (Association for Commuter Transportation et al., 2004).

TDM program goals include achieving traffic and vehicle miles of travel (VMT) reduction and all of the associated transportation, environmental, conservation, and sustainability benefits, generally without large infrastructure investments. Actions may be directed at increasing vehicle occupancy, shifting travel mode or time of travel, or reducing the need for travel. Programs can include supportive actions, special transportation services, financial incentives, or alternative work arrangements. TDM programs can also involve parking management and regular transit service enhancements; however, these topics are for the most part discussed in other chapters within this TCRP Report 95 “Traveler Response to Transportation System Changes” Handbook (see below).

TDM can involve many stakeholders, including landowners, developers, employers and institutions, employees, business associations, and local, regional, and state levels of government. This chapter provides a synthesis on the potential for employer- or institution-based TDM strategies, in particular, to influence travel behavior.

This “Overview and Summary” section presents:

- “Objectives of TDM Strategies,” highlighting the various goals and purposes of employer and institutional TDM strategies.

- “Types of TDM Strategies,” categorizing and describing the predominant employer and institutional TDM program elements for purposes of chapter organization.

- “Analytical Considerations,” covering methods used in quantifying response to employer and institutional TDM strategies, limitations of available research, and cautions that thus apply to its use.

- “Traveler Response Summary,” providing an encapsulation of the key travel demand findings related to employer and institutional TDM strategies. It is recommended that all lead-in “Overview and Summary” subsections be read as background for both the “Traveler Response Summary” and the chapter as a whole.
Following the “Overview and Summary” are sections on:

- “Response by Type of TDM Strategy,” reviewing travel demand findings related to a variety of individual TDM program elements.
- “Underlying Traveler Response Factors,” providing perspective on the behavioral mechanisms at work in achieving results with employer- and institutional-based TDM.
- “Related Information and Impacts,” addressing non-travel-specific implications of TDM strategy implementation such as air quality impacts.
- “Case Studies,” presenting five examples of employer and institutional TDM strategy applications with varying degrees of public involvement.

Because this chapter is focused on employer and institutional TDM strategies, it does not directly address public-agency-based TDM programs, most especially programs with which an employer or institution would have little direct involvement. Travel demand effects of most of such program types are covered in other chapters of this “Traveler Response” Handbook, as follows:

- High occupancy vehicle (HOV) lanes and other provisions for expediting movement of HOVs (strategies typically classed as TDM and/or TSM) are covered in Chapter 2, “HOV Facilities.”
- Road value pricing, including central area congestion pricing, is the subject of Chapter 14, “Road Value Pricing,” with a High Occupancy Toll (HOT) lane update within Chapter 2 under “Traveler Response by Type of HOV Application”—“Response to HOV Facility Exempt Vehicle and Value Pricing Programs.”
- Operational-level transit service enhancements are addressed in Chapter 9, “Transit Scheduling and Frequency”; Chapter 10, “Bus Routing and Coverage”; and—to the extent express bus can be considered an operational-level strategy—in Chapter 4, “Busways, BRT and Express Bus.”
- “Vanpools and Buspools” is the sole subject of Chapter 5.
- Transit promotion and pricing, including travel pass partnership programs, are topics of Chapter 11, “Transit Information and Promotion,” and Chapter 12, “Transit Pricing and Fares.”
- Parking strategies, especially important to TDM, are covered in two chapters—Chapter 13, “Parking Pricing and Fees,” and Chapter 18, “Parking Management and Supply.”
- Land use and non-motorized travel considerations are addressed in Chapter 15, “Land Use and Site Design”; Chapter 16, “Pedestrian and Bicycle Facilities”; and Chapter 17, “Transit Oriented Development.”

Beyond what is contained within the chapters of TCRP Report 95, resources that cover the broader scope of TDM are identified in the “Additional Resources” section. Also, the regional effect of employer and institutional TDM strategies is felt to be of sufficient importance that a “Site- Versus System-Level Impacts” discussion is included in this chapter’s “Related Information and Impacts” section, supported by a case study on overall TDM program effects.

Within the realm of employer and institutional TDM strategies, Chapter 19 is unique in the extent to which individual components—individual TDM measures—are covered in other chapters, specif-
ically the chapters identified above. In general, where individual TDM measures are the subject of other chapters or chapter subsections, the material assigned to this “Employer and Institutional TDM Strategies” chapter is only that which pertains to how a measure relates to overall TDM programs and works in conjunction with other measures within TDM program packages. However, for most TDM measures, the more recent twenty-first century findings are presented only here in Chapter 19, which serves as a limited update for TDM-related Handbook chapters published earlier.

**Objectives of TDM Strategies**

TDM strategies are used as an important component in the mix of improvements and policies needed to address congestion and provide more options than driving alone. They include incentives and disincentives which are designed to encourage automobile drivers to travel in less congested times or to find an alternative mode which does not lead to the same peak-hour congestion. Among the objectives of TDM actions are: congestion mitigation, improved air quality, reduced energy consumption, reduced carbon emissions, land development support, and employee benefits.

Actions to mitigate congestion may include as objectives increasing vehicle occupancy and reducing vehicle miles of travel. Such actions tend to have benefits in reducing emissions and energy usage. Actions oriented to spreading peak-period travel may target overcrowding of both transit and highway facilities.

Some TDM strategies are used with the objective of supporting more development or density than might otherwise be possible because of either regulations or physical constraints. TDM actions can improve the access to or utilization of particular sites. Parking needs or requirements may also be reduced, potentially freeing up space for additional development.

Finally, some TDM actions may have as their objective to ease travel burdens for employees or customers, or to address employer worksite issues, such as benefits, recruitment, retention, productivity, or absenteeism.

**Types of TDM Strategies**

TDM can stand for transportation demand management or travel demand management. The terms are interchangeable. It is a process that can encompass a variety of measures intended to influence travel choices. TDM is used to manage heavy traffic demand and parking requirements, and to enhance the effectiveness of transit services. Employer and institutional TDM actions within the scope of this chapter can be classified into four major categories: employer or institutional support actions, provision of transportation “services,” financial incentives or disincentives, and alternative work arrangements. Each is described in more detail in the subsections that follow.

**Employer or Institutional Support Actions**

This broad category of actions includes measures taken by employers or institutions to support the use of alternatives to single occupancy vehicles during peak hours by employees and others. These measures, which serve to raise awareness, provide information, remove impediments, and encourage use of travel alternatives, generally do not involve any financial inducement or physical service offerings. Examples include: transportation coordinators; on-site transit information and/or pass sales; rideshare matching services; preferential parking for carpools or vanpools; provision of bike lockers, showers, and/or changing facilities; and guaranteed ride home.
Many TDM employers also offer flexible work hours, in order to allow employees to accommodate transit or ridesharing scheduling constraints. While this is an important support action, it is discussed in more detail later in conjunction with alternative work arrangements. Employers in a large employment center may also belong to a transportation management association (TMA), which avails them and their employees of a wider array of travel opportunities and incentives. Support actions include:

**Transportation Coordinators.** Transportation coordinators are professionals located at a transportation management association or at an employment site who provide personalized trip planning and assistance to commuters. The presence of an on-site coordinator can make it easier to obtain information about alternatives to single occupancy vehicle commutes.

**Transportation Management Association (TMA).** TMAs are an association of public and private entities concerned with traffic congestion and transportation issues in a specific geographic area. TMAs allow businesses to pool their resources in executing commuter support strategies. The TMA may also act in an advocacy role with local government on behalf of its membership.

**On-Site Transit Information and Pass Sales.** Providing transit information on-site can lower the barriers that may prevent people from trying transit. Convenient purchase of transit passes may also facilitate trying out transit use. In addition, on-site sales may support introduction of site-specific transit pass discounts.

**Rideshare Matching Services.** Rideshare matching services put compatible commuters in touch with one another to enable carpooling. Employers can facilitate formation of ridesharing arrangements by employees in a number of ways, ranging from simple in-house employee match listings to computerized matching programs. These services may be unique to the given employer or can pool matching candidates from a larger area ranging from multiple employers in a building or complex to large regional matching systems.

**Guaranteed Ride Home.** Guaranteed ride home programs provide backup transportation to employees who rideshare or use transit if they need to return home suddenly for an emergency, or if they must work late and therefore cannot connect with the mode they used to travel to the site on that day. Generally, these programs provide vouchers for the person to travel home by taxi, although some employers permit use of company vehicles as well. Guaranteed ride home may be provided by the individual employer or through a broader local or regional program. While a guaranteed ride home may be seldom used, it is felt to be important in reducing reliance on a personal vehicle at the workplace and thus lessening the need to drive alone.

**Preferential Parking.** Employers may set aside reserved parking spaces as an incentive to carpool or vanpool. This is a non-monetary benefit that can be an important incentive if parking is tight, or if the parking lot is large and the reserved spaces are near the building entrance. Reserved spaces may also be sheltered versus outdoors, lessening the impact of severe weather.

**Bicycle Storage, Lockers, and Changing Facilities.** Changing facilities and showers and secure bicycle parking are key features for an employer or institution interested in encouraging bicycle use. Such facilities may be combined with an exercise facility and may encourage healthy habits. Some employers provide a transportation allowance that may be used by bicycle commuters. Chapter 16, “Pedestrian and Bicycle Facilities,” discusses these in more detail, but this chapter discusses employer and institutional support for bicycles in the context of TDM programs.
**Provision of Transportation Services**

A small number of employers choose to become directly involved in providing attractive transportation alternatives to their employees. They do this either by contracting for special services, operating their own services, or taking a lead role in the purchasing, leasing, or maintenance of transportation vehicles. Most often this occurs because the work site is poorly located in relation to public transit access. On other occasions, the employer feels a need or desire to become active in employee transportation, or has a preference for a particular type of mode or service.

**Shuttle Bus Services.** Some employers choose to operate shuttle bus services to provide easy connections with nearby rapid transit services or other important facilities. Shuttle services may be an individual employer effort or a collective effort of a few sites. In some instances, shuttles are also used for local circulation during the midday, lessening the need to bring a personal vehicle to the job site.

**Contract Transit Service.** In some cases, employers will contract with a private bus operator or with a public transit agency to either operate special transit routes or to supplement service to their particular site. Urban hospitals or medical centers with limited parking for staff and visitors frequently make arrangements for additional bus service, often through financial assurances that a given level of ridership will occur.

**Vanpool Formation Assistance/Cost Sharing.** Since a vanpool carries between 7 and 12 passengers, large employers may find that vanpools provide an effective commute alternative for their employees, particularly when a large percentage live a substantial distance from the site and when transit service to the site is limited. Employers can support vanpooling through a variety of ways, from purchase or leasing of vehicles, to underwriting insurance or maintenance costs, or even providing and maintaining the vehicles themselves. Fare subsidies are a particular type of vanpool assistance measure, and these are discussed under “Financial Incentives or Disincentives” below. While this chapter discusses the role of vanpools in travel demand management programs, Chapter 5, “Vanpools and Buspools,” provides detailed information on vanpools as a travel alternative.

**Use of Company Vehicles.** Employers who maintain fleet vehicles (which may include employee vanpools) will sometimes offer those vehicles for midday business travel, and sometimes for personal errands or emergencies. Some employers allow use of company vehicles for commuting by a registered carpool. (The phrase “company vehicles” is often used within this chapter as shorthand for these types of activities.)

**Bicycle Loan Programs.** While bicycling may or may not be suitable in current workplace locations as an alternative mode for commuting, making bicycles available for employees on site can help reduce the need to use a car for certain midday trips. Particularly on large suburban campuses, easy access to a bicycle can aid in trips to other functions on the site or nearby commercial/retail opportunities. Bicycles can also facilitate access to transit from the employment site.

**Financial Incentives or Disincentives**

Financial incentives or disincentives are actions of tangible monetary value which either encourage employees/commuters to make use of a particular alternative, or discourage them from some other course of action. These actions may have an obvious monetary value, such as a subsidy or parking fee. Alternatively, they may be of such a nature that a monetary value can be imputed, an example being the earning of points toward a tangible reward. There are many variations on how “money” can be used to influence behavior.
Transit Subsidies. Employers can reduce the cost of taking transit by offering prepaid or discounted transit passes to employees who agree to commute by transit. This benefit can vary from a modest share of the actual cost to full absorption of the cost, and instances have been observed where employees have been subsidized more than the actual fare being charged. Federal tax law allows employees to receive a transit subsidy of up to $230 per month without incurring tax liability for that benefit, while some states offer the employer a tax credit for paying such subsidies. Governments or transit agencies can supplement these subsidies through their own special programs that reward large customers or employers who provide substantial subsidies.

Vanpool Subsidies. Employers may subsidize the cost of vanpooling in a variety of ways. Federal tax law now extends the tax-free subsidy provision to vanpool as well as transit user fees. Employers can also offer start-up (empty seat) subsidies to support a vanpool during its formative stage (keeping the cost down for initial riders), short-term promotional fare subsidies, or driver subsidies. Vanpools can also be subsidized through a variety of indirect methods, the monetary value of which can be quantified. Employers can help procure or arrange financing for the vehicle, they can provide fuel or maintenance, and they can pay for or underwrite insurance.

In-Kind Incentives. Instead of cash, direct support for alternative transportation may be provided in other ways. Free or discounted products or services may be provided in lieu of cash. Relating the in-kind incentives to the transportation mode can provide synergism. For example, carpoolers and vanpoolers might receive gasoline or oil changes, transit riders might receive transit passes, walkers might receive shoes, and bicyclists might receive bike accessories or mechanical services.

Parking Supply and Pricing. Perhaps the biggest lever available to employers and institutions interested in reducing single occupancy vehicle use for access to their facility is the imposition of parking supply constraints or parking pricing. Because parking is itself such a powerful determinant of travel behavior, it has been given separate coverage in Chapter 13, “Parking Pricing and Fees,” and Chapter 18, “Parking Management and Supply.” An effort has been made not to duplicate that coverage in this chapter. The reader should be aware that many employer and institutional TDM programs include a parking component.

Alternative Work Arrangements

Flexible Work Hours. Flexible work hours are programs allowing employees a degree of freedom in choosing their starting and quitting times. Employees must be at work during core periods (typically 9:30 to 11:30 AM and 1:30 to 3:30 PM) and must observe earliest allowed starting time and latest allowed quitting time limitations. Employers may restrict how much daily flexibility workers have in scheduling their work day.

Staggered Work Hours. Staggered work hours are a fixed scheduling of work that normally spreads the employee starting and quitting times over a 1- to 3-hour period, with individual groups of employees designated to report and leave at 15 to 30 minute intervals. Staggered work hours are generally employed in large facilities, especially manufacturing, where work schedules are otherwise regular.
**Compressed Work Week.** CWW allows employees to work a greater-than-standard number of hours each day so as to reduce the total number of days worked, and hence, the number of times it is necessary to commute to the work site. A popular arrangement is the 9/80 schedule in which employees work 9 hours per day versus the standard 8 hours, and then get the 10th day off. Generally, employees arrange with the employer which day of the week will be their day off, typically choosing a Monday or Friday in order to extend their weekend.

**Telecommuting.** Telecommuting (or “Telework”) is an arrangement whereby an employee is permitted to work at a remote location one or more days a week rather than commute to the work site. The availability of telecommunications technology which allows the worker to remain in “virtual” contact with the work site via a networked home or other remote computer is the basis for the naming of this strategy. However, not all employees who telecommute are necessarily working on a computer, and hence the real characteristic of the strategy is that the employee is allowed to work offsite. The offsite location is generally the home or sometimes at a remote “telework center” which has the necessary equipment. As with CWW or staggered work hours, employees who telecommute generally do so on a fixed schedule that they negotiate with their employer.

**Analytical Considerations**

Attempting to quantify the impact of TDM strategies on traveler behavior brings several critical analytical considerations to light.

- It is almost never the case that a given TDM strategy is implemented (or evaluated) in isolation, as a unique action. Rather, strategies are normally implemented in combinations, or “packages,” such that ascertaining the effectiveness of an individual action is statistically very challenging.

- Added to the statistical challenge is the fact that the available data for conducting these analyses are seriously limited. If travel data have been collected, they are almost always for a post-implementation period and do not offer a comparative “before” measure. The data collection methods themselves are also often suspect, as is the aggregate format (total mode split or “average vehicle ridership”) in which they are typically presented.

- Accounting for setting and context is very important. The effects of some strategies may be much more significant in an environment where there is good transit service, where parking is limited and priced, or where other activities are reachable from the work site without a personal vehicle.

- Finally, the details on program strategies themselves are often incomplete or inconsistent. It is often the case that neither the magnitude of incentives/services nor the time a strategy has been in place is reported. Moreover, it is usually not recorded whether individual strategies were poorly implemented or well run.

As is evident from the list in the preceding subsection, there are a large number of TDM strategies. Given the many ways in which they can be bundled and applied, attempting to present estimates of travel impact for individual strategies is simply not always possible with the data and analyses from existing research studies and databases.

Many TDM studies are both topical and qualitative, focusing on a particular type of programmatic strategy or approach, but offering little numerical information as to impacts. These studies tend to
be focused more on reporting “who” has used a particular strategy or approach, “how” they imple-
mented it, and the circumstances underlying “why” that approach was taken. In many cases, the
impetus is a legal or regulatory requirement, and the issue is in assessing the reasonableness or
overall effectiveness of the requirement.

It might be expected that significant TDM impact information would be available from the vari-
ous state- or regionally-enacted employer trip reduction programs introduced in the late 1980s/
early 1990s, largely in response to concerns about worsening air quality in major metropolitan areas.
California was the vanguard in these efforts, with passage of Regulation XV in 1987. This action
legally required employers in the Los Angeles region with 100 or more employees to introduce mea-
ures to discourage driving and to reduce employee vehicle trips by 15 percent. This state initiative
presaged a similar national initiative written into the 1990 Clean Air Act Amendments, requiring
metropolitan areas in “severe” non-attainment of National Ambient Air Quality Standards (NAAQS)
for ozone to implement similarly-structured Employee Commute Options (ECO) programs.

The California program, and many of those patterned after it (e.g., Washington State’s Commute
Trip Reduction Law and Portland, Oregon’s Regional Transportation Options program) formal-
ized employer participation by requiring travel surveys of employees and the development of a
plan detailing the trip reduction goal, the current gap, and the specific set of TDM strategies that
would be used to reach the goal. These travel data and employer TDM plans were computerized
and stored in massive databases to be used for subsequent tracking of performance and evaluation
of effectiveness. Employers would be evaluated on a biennial basis, necessitating a new employer
survey and a revised plan with additional strategies as necessary to achieve their respective trip
reduction target.

While these data archives would appear to offer great opportunity to obtain measurements of
exactly the type of strategy-impact relationships which are the subject of this chapter, a number of
factors cause these data to be of limited use:

- The travel survey data collected by employers were reduced to aggregate measures before data
release. Five-day-week average mode shares for the employer were computed. Also computed
was the Average Vehicle Ridership (AVR), an amalgam of employee commute trips by all
modes and means into an effective commutes-per-vehicle rate (covered employees reporting
to work divided by the vehicle round trips thus produced, per average day, over a 5-day week).
To the extent that some employees telecommuted or participated in a CWW schedule, that too
was embedded into the AVR for an average day.¹

- The processed data lack any record of the characteristics of individual trips, and there is no
tracking of individuals between surveys. The analyst must try to explain changes in the aggre-
gate travel measures—between consecutive plans—with nothing more than information about
the composition of the TDM program. The processed data provide no clue as to individual

---

¹ The inverse of the AVR is average vehicle trips per employee, one of two common vehicle trip rate expres-
sions found in the TDM literature, though not always implying a rigorous 5-day average. The other common
vehicle trip rate expression is average vehicle trips per 100 employees. Both are used within this chapter. The
former is always less than one, e.g., 0.85, while the latter is nearly always a two-digit number, e.g., 85. Both
are expressed in terms of complete round trips, in contrast to the usual transportation demand analysis prac-
tice of counting individual one-way trips or trip ends. Either trip rate expression (and also AVR) may be used
to compute vehicle trip reduction (VTR), a dimensionless rate, so long as consistency is maintained.
worker socio-demographics, trip origins/destinations, trip length, quality of travel alternatives, or changes over time in travel alternatives available.

- There is considerable uncertainty in determining exactly what strategies (or incentives) were being applied in a given employer program, based on the information supplied in the required Trip Reduction Plans. Details were often found to be missing in terms of specific strategies, when they were invoked, to whom they were available, or what monetary value they represented. For example, it might be recorded that a transit subsidy was provided, but with no information on the dollar value of that subsidy.

- The reliability of the data, as entered into the massive databases involved, has often been found wanting. In some areas, such as in Washington State and Portland, Oregon, the massive amounts of information collected tended to overwhelm budgeted data processing capabilities, resulting in large amounts of these data waiting to be processed or purged of questionable data records.

Numerous entities have attempted to take on the challenge of analyzing these data, but with limited success (Giuliano, 1992; Comsis, 1993b; CUTR, 2004). Simply put, the precision of the data was found to be too coarse to permit use of the necessary multivariate statistical tools. Two exceptions are noted here, largely because of an important departure from the standard analytic approach:

- The first is a study sponsored by the California Air Resources Board (CARB) which, recognizing the limitations of the Regulation XV database, commissioned an original survey of 45 employers in Los Angeles and Sacramento. This enabled the researchers to control the quality of the response data on employee travel and specific strategies in operation, and to analyze travel response at an individual traveler level, rather than an aggregate outcome for the employer. Unfortunately, the research did not have access to pre-program baseline data for the surveyed employees, which seriously limited its ability to analyze behavioral changes in response to the given employer program (Comsis, 1993a). Nevertheless, the findings from this study are somewhat unique and are reported later in the “Related Information and Impacts” section.

- The second is a more recent effort by the University of South Florida’s Center for Urban Transportation Research (CUTR), done under its National Center for Transit Research, which has attempted to develop a Worksite Trip Reduction Model using data from the California (Regulation XV), Washington State Commute Trip Reduction (CTR), and Tucson, Arizona, employer databases. While CUTR experienced the same types of data problems as identified by Comsis in its 1993 study for CARB, it opted to use a different statistical approach, one incorporating “neural networks,” to extract relationships (CUTR, 2004). This research is also summarized in the “Related Information and Impacts” section. (The model itself has subsequently been updated, as covered in Footnotes 14 and 20 of the “Related Information and Impacts” and “Additional Resources” sections, respectively.)

The primary focus of this chapter on quantifying the link between TDM strategies and travel behavior ultimately led to a small number of studies that specifically focused on that aspect of TDM programs without attempting to rely exclusively on the large databases critiqued above. The three studies most extensively utilized are as follows:

While somewhat dated, these studies nevertheless provide the most comprehensive set of employer and institutional TDM project examples available in which a travel change has been calculated. The calculation is based either on before and after data, or on comparison with an objective control site or measure against which to gauge a travel behavior difference.

The primary travel change measure utilized is the vehicle trip reduction for the site. Vehicle trip reduction (VTR), a term commonly used in both analytical studies of TDM and travel mitigation legislation, is the percentage of vehicles removed (actual, presumed, or estimated) from a site’s commute traffic load. More specifically, it is the incremental reduction achieved in the vehicle trip rate, expressed as a percentage of the starting-point trip rate. Planned and apparently successful trip reductions are reported as positive VTRs. A negative VTR indicates that the travel change appears to have been an increase in the vehicle trip rate. A VTR may be associated with TDM, land-use and site-design modifications, or related actions, although TDM per se is the subject of this chapter.

VTR may be computed from mode shift data if one knows the before-and-after carpool occupancy rates and the amount of trip suppression attained from CWW and telecommuting strategies.

---

2 TCRP Project B-4, “Cost-Effectiveness of TDM Strategies,” is an important TDM research project whose detailed findings were never formally published. This project was centered on a national survey of 50 employers (49 officially accepted) covering the details of their TDM programs. The sample was designed to include employers of all sizes, basic industry groups including institutions, locations within or outside urban areas, presence or lack of a regulatory requirement, and various types of strategies within programs. Extensive analyses were done with the survey data, including the effect of both program strategies and environment on vehicle trip reduction, reasons for engaging in TDM, sources of information for program design, changes made over time and compelling circumstances for the change, and costs and benefits. The initial analysis was documented in the identified “working memo” and technical appendices, but the review panel opted to frame the final report in a less technical, more executive format. The authors of Chapter 19 have had access to this unpublished technical information, and the TCRP Report 95 team received support for using these Project B-4 data and findings in developing this third edition Handbook.

3 Slightly different methods were used by the three studies to establish a baseline against which to gauge the given program’s presumed vehicle trip reduction (VTR). The Rutherford et al. (1994) case studies compared the given project with area-wide mode split averages. TCRP Project B-4 selected as its datum the area modal split from the 1990 Census Transportation Planning Package (CTPP). The earliest study—Comsis and ITE (1993)—used a variety of comparative methods depending on data availability. These included before-and-after survey information, comparison against a local peer site of similar character but without a formal TDM program, or transportation mode split taken from regional model estimates for the subarea. Occasionally one of these methods gives an individual trip reduction value that is open to question (key instances are highlighted in chapter footnotes). Overall, however, the approaches used are a reasonable response to difficult data constraints. For simplicity, travel differences relative to the baseline are referred to in this chapter as vehicle trip reduction (VTR) although in fact most are inferred by comparison against the selected baseline.
Successful vehicle trip reduction does not necessarily infer less traffic than before. VTR is a dimensionless rate, referring to the reduction in vehicle trips from what they would have been without the TDM or other travel mitigation strategy.

There are a combined 80 different project examples provided by the three primary studies listed above. A fourth study (Comsis et al., 1996) provided two of the examples. These examples cover a wide range of situations in terms of employer type and size, setting, and composition of TDM program. Using this collection of cases as an analysis platform, the approach taken in this chapter is along the lines of a descriptive analysis. Namely, for this reasonably large and diverse sample of employer and institutional TDM projects—for which there is fairly reliable and complete data—an analysis has been structured that partitions the examples into cases that do versus cases that do not have a particular TDM element or other characteristic. The evaluation then attempts to infer the relative importance of particular categories of TDM strategies (e.g., support versus incentives), and even to some degree of particular strategies (e.g., a transit subsidy versus an HOV parking discount), through pair-wise comparisons from the sample. Unweighted project averages within categories are used in these comparisons.

This approach is used to examine each of the four basic TDM strategy groupings: employer support, transportation services, financial incentives, and alternative work arrangements. This 82-program sample becomes the basis or starting point for the analysis in each of the program areas. To the extent that there is sufficient clarity about an individual TDM strategy—either from the 82 examples or, more often, a supplemental study out of the literature that focuses on that strategy—additional detail about the nature and impact of that strategy is provided.

There are four major caveats in the primary approach of this analysis, which uses the sample of 82 programs as a basis. First and foremost, in no way should these 82 examples be construed as a random sample of TDM programs. While there are a number of examples that are fairly average in their impact, many of the examples were originally selected because they were distinct in some way—often because they were regarded as success stories. Hence, the performance of this group of programs should not be looked upon as being “typical.” As a group, they are probably considerably above average in effectiveness relative to what one would expect to find in a large random sample of programs.

Second, even though there can be reasonable confidence about the quality of the data for this sample, the “pairwise” approach used in evaluation is a very simplistic means for trying to quantify the impact of individual strategies. The only way that one can begin to discern the relative impact of any given strategy is through a multivariate statistical approach, such as regression. Unfortunately, the data in this sample are too coarse and too aggregate to enable such a statistical approach, so one is resigned to trying to learn as much as possible from the data available, acknowledging the many shortcomings. Later in the report, in the “Related Information and Impacts” section, the results of two research studies that have attempted to apply more advanced statistical methods to this task are presented, though both were ultimately limited by the same data issues outlined here.

Third, except where before and after data is available and exogenous influences are known, causality is only inferred—not demonstrated. It is presumed that observed travel differences are largely caused by the TDM measures in place, but there is no analytical proof. In discussion, the terms “implied” or “inferred” are occasionally inserted as a reminder that the effect is presumed, not proven. Indeed, a majority of the VTR outcomes presented are not direct observations but rather estimates/inferences based on comparison with control sites or areas.
Fourth, there is a particular limitation specific to those alternative work arrangements actions designed to reduce the absolute number of commute trips involved. The two actions affected are telecommuting and CWW. The nature of the travel data collection affecting all 82-program samples was such that numbers of trips eliminated outright by telecommuting one or more days a week or by reducing the number of workdays by compressing work weeks cannot be ascertained. Thus outcome analysis based on the 82-program sample can only address effects of associated mode shifts, exclusive of trip elimination effects. Other available evidence must be drawn upon to obtain a full picture of telecommuting and CWW effectiveness.

Finally, a reminder as to the role of Chapter 1, “Introduction,” is in order. Chapter 1 not only outlines development of the Handbook, it also provides important technical guidance in its “Use of the Handbook” section. One example of the helpful material included is the tabulation, in Appendix B, of U.S. Consumer Price Index factors for conversions to constant dollars. These may be applied to give up-to-date context to price and cost data in cited studies from various time periods.

**Traveler Response Summary**

Examples of effective TDM programs—defined as having a measurable trip reduction—may be found in all types of environments. Nevertheless, those employers or institutions located near good transit service have been found to have better-performing programs than those not close to good public transit. In the mostly exemplary 82-program sample of employers, the sites with high transit availability had an average program-level vehicle trip reduction (VTR) of 26 percent, compared with 12 percent where transit availability was low.

**Employer Support Actions**

Employer support actions are by far the most commonly-applied TDM strategies, providing a necessary—but not alone sufficient—ingredient for TDM program success. They cover providing better information on travel alternatives to employees, offering assistance in seeking out and using those alternatives, and marketing and promotional activity to persuade experimentation and use. Common measures in this group include commuter information services, employee transportation coordinators, rideshare matching, transportation fairs, on-site transit pass sales, and guaranteed ride home. One of their important benefits is an increase of employee awareness about TDM-related alternatives to driving. Employee awareness of individual incentive and assistance programs in support of alternatives has been found to range from 77 percent down to 15 percent aware.

The average empirically based estimate of site-specific vehicle trip reduction impacts for full-scale employer support programs alone is on the order of 4 to 5 percent VTR. Such estimates tend to be drawn from programs that are exemplary more often than not. Employer support programs actually have the most consistently significant impact where transit accessibility is low, making non-transit alternatives critical. Support programs are most appropriate and productive when implemented in conjunction with tangible actions such as provision of transportation services, management of parking supply and price, financial incentives, or combinations thereof. What is also clear is that simply adding “more” employee support measures to an existing solid but basic support-only program will have limited additional trip reduction benefit, but will generally raise the cost of the employer’s program effort.

**Guaranteed Ride Home**

Guaranteed Ride Home (GRH) is a unique form of employer support action. It is effectively a standby transportation service—insurance that an employee who chooses an alternative to driving
alone to work has a low- or no-cost recourse when faced with an unanticipated need to get home at a time when his/her alternative mode is unavailable or inadequate. GRH effectiveness remains somewhat of an enigma, in that empirical quantitative data on its travel impacts are scarce and not sufficiently informative. The handful of empirically-based and modeled estimates of GRH impact ranges from nil to upwards of 5 percent VTR. (The employer support actions average impact estimate provided immediately above is inclusive of GRH effects.) In any case, a good logical argument can be constructed for the role of GRH as an effective TDM catalyst, and with appropriate limits, it is relatively inexpensive to provide.

**Employer Transportation Services**

Employer transportation services include employer assistance with vanpool creation and program management, transit assistance either in the form of running separate shuttles or contracting with the transit operator to intensify service, or allowing use of company vehicles for ridesharing or midday business trips. In the 82-program sample of employers, those TDM programs which provided transportation services were considerably more effective as a group in reducing vehicle trips (22 percent program VTR) than those that did not (14 percent), an 8 percentage point advantage.4

The benefit of transportation services is enhanced in the presence of modal subsidies (monetary incentives linked to use of the preferred alternative modes) and is damped without modal subsidies. The synergy between transportation services and modal subsidies is both obvious and strong. Programs in the 82-program sample with services but without modal subsidies averaged slightly over 9 percent VTR, while programs with both achieved just under 27 percent VTR, almost three times as much. In a well-studied exceptional case with time-series data available—a Tennessee Valley Authority program of the 1970s—the VTR for a multimodal transportation services program (aided by a gasoline shortage) was 25 percent, increasing to 51 percent with the addition of modal subsidies, a doubling of effectiveness.

**Incentives and Disincentives**

Among inducements to use alternative modes, incentives and disincentives encompass a variety of TDM strategies that constitute “incentives.” These may in turn be separated categorically into non-monetary incentives and monetary incentives. Non-monetary incentives include such strategies as preferential parking, awards, or other special treatment, while monetary incentives are those that have a tangible dollar value to the employee. Even this distinction still blurs somewhat in strategies where the financial benefit to the employee is somewhat diffuse, such as prizes and raffles or time off with pay. The most tangible financial incentives are either modal subsidies or travel allowances, where the association between the incentive and the behavior is visible and direct. Of course, the incentive must logically be relevant to the travel alternatives available at the site. Many employers offer their employees a transit subsidy simply because of its tax-exempt advantage, although in many cases transit is not a viable commute alternative.

In the 82-program sample, those employers who featured transit subsidies in their TDM programs had an average VTR of 21 percent, versus 14 percent for those who did not. Carpool subsidies, per se,

---

4 All VTR findings reported from the 82-program sample examination include the effects of not only the TDM strategy being discussed (with or without employer transportation services in this case), but also all other TDM actions that may have been in place within the particular programs in question (in this instance, the 34 programs with employer transportation services on the one hand and the 48 programs without services on the other).
were not found to be common, but employers who offered them as part of their programs averaged a 23 percent trip reduction versus 17 percent for those who did not. HOV parking discounts were a much more prevalent form of subsidizing carpooling, and those programs averaged 26 percent trip reduction versus 14 percent for those who did not. Travel allowances, which include parking cash-out, were still an early concept when the 82-program sample data were assembled in 1990–1993 and are not well represented in the data set. A 1997 review of eight California parking cash-out programs found an average decline in vehicle trips of 17 percent.

In the realm of “disincentives” to driving, the management of employer parking can play an important role. Through controlling parking availability, price, or both, parking management has a major effect on TDM program success in reducing vehicle travel. The impact is similar in magnitude to the supportive effect of good transit availability, and the two are most commonly found together. Those employer TDM programs in the 82-program sample that were accompanied by restricted parking had average VTRs of 25 percent. If the parking was also priced with parking fees, the average VTR increased to 28 percent, and if discounts were also offered to carpools or vanpools, the average VTR was 30 percent.

The combination of parking fees and employer transportation services produces a particularly strong synergistic effect, with the average of such combinations within the 82-program sample exhibiting an implied 37 percent VTR. The University of Washington U-PASS program combines parking pricing, transportation services, and modal subsidies, and has obtained a 31 percent VTR as measured with time-series data over a span of 16 years. Clearly, if it is more difficult or costly to drive, TDM alternatives become more attractive.

**Alternative Work Arrangements**

Alternative work arrangements constitute the final major category of TDM strategies. They include flexible work hours, staggered work hours, compressed work weeks (CWW), and telecommuting. An important finding has been that the only work hours strategy with a measurably positive effect on choice of alternative commute modes is flexible work hours. In many cases use of flexible work hours has been restricted to employees using alternative modes, which may help explain the synergy. In the 82-program sample, employer programs that included flexible work hours averaged a VTR of 20 percent compared to 13 percent for other programs, a difference that may or may not be wholly attributable to the work hours strategy.

CWW and telecommuting are the only TDM strategies intended to lead to outright elimination of commute trips by whatever travel mode. CWW programs achieve this with more hours per work day and correspondingly fewer work days per week or two-week period. A comprehensive 1980s experiment in Denver involving 9,000 federal employees found the longer work day flattened the peak, reducing the peak 1/2 hour from 56 to 42 percent of all arrivals; had no adverse effect on ridesharing or transit use; and reduced vehicle miles of travel (VMT) by a net 15 percent among participating employees. Employee participation in the program was 65 percent.

Telecommuting has yet to live up to its anticipated theoretical promise as a TDM measure. Surveys indicate that employees who telecommute from home avoid a physical commute about 1.8 days a week on average. A Washington State analysis of the special case of telework centers found 83 percent drive-alone mode shares for the daily telework center commute compared to 56 percent for these telecommuters on days they went to the main work site, detracting from telework center efficacy. A 1998 synthesis-type study of telecommuting overall estimated, starting with empirical observations, that a regional program would reduce employee VMT by 1 percent or less—and perhaps not at all—depending on residential relocation decision assumptions. Newer evidence does
not contradict the vehicle trip reduction basis for this estimate, though a slow, steady growth of telecommuting has been seen.

The trip timing decisions employees make when given the option of flexible work hours have been found in most cases to be as effective as mandatory staggered work hours in spreading out work arrival and departure times, although the 1980s Bishop Ranch and Pleasanton suburban programs in California stand as exceptions. A large-scale urban program could smooth traffic peaks enough, in the 1970s, to reduce maximum 15-minute passenger and vehicular loads by 15 to 35 percent at terminal facilities such as rapid transit stations and major parking lots. The effects dissipate, becoming diluted by 50 percent or more, on radial facilities serving the involved employment core. It is not known to what extent the gradual adoption of flexible work hours in recent years may have reduced the remaining potential for peak spreading by shifting the baseline starting point for concentrated alternative work arrangements programs.

**Site-Specific and System-Level Impacts**

Site-specific impacts are the focus of this chapter, but it is important to understand the relationship with area-wide, regional, and system-level impacts of employer TDM programs. As one moves from the site level toward the broader area-wide or regional transportation facility level, dissipation of site-specific impacts occurs. Effectiveness is leveled out among differing participating employers and institutions, averaging out big and small employers and high- and low-effectiveness programs. Participating employer commuting is mixed in with commuting to and from non-participating employers. Mixing also occurs with passenger and vehicular flows associated with non-work activities either at the site or at other nearby land uses. Further leveling-out of impacts occurs as locally generated trips become mixed on specific facilities with other intra-regional travel and even intercity travel in the case of major highways.

A limited number of estimates have been made of actual and potential regional and system-level impacts of employer and institutional TDM strategies. In the Minneapolis-St. Paul airport area, for example, it was estimated that TDM with limited mandatory involvement and strong parking management combined with mixed-use development would offer an 8 to 27 percent VTR at participating sites, a 6 percent average workplace VTR, and a 2 percent peak-traffic reduction on adjacent I-494. Another examination of potential regional impact calculated that only 13 percent of daily VMT would be affected by a mandatory TDM program, and went on to estimate that a 25 percent increase in average vehicle ridership (AVR) at involved employment sites would produce a 2 to 3 percent reduction in regional vehicle trips and a 3 to 4 percent decrease in regional VMT. An evaluation of actual 2003 Commute Trip Reduction (CTR) mandatory TDM program effects along an 8.6 mile centrally located section of I-5 in Seattle estimated that the average VTR at 189 involved employers was between 11 and 14 percent. Traffic simulation was then used to project that absent the TDM programs, peak-period I-5 ramp volumes would increase by about 4 percent, peak-period traffic congestion would be up from 23 to 44 percent, and corridor peak-period vehicular emissions would rise on the order of 11 percent.

**RESPONSE BY TYPE OF TDM STRATEGY**

This section examines the response of travelers to implementation of various employer and institutional transportation demand management (TDM) strategies. To the extent possible, what is known as to the effect of individual strategies on such key travel measures as vehicle trip generation/
trip reduction, vehicle miles of travel, mode split changes, vehicle occupancy, or time of day/frequency—where relevant—is reported. Historically, TDM response findings have been difficult to derive in this detail, since strategies are frequently implemented in often unique groupings or packages, are not monitored in a manner that facilitates travel impact research, and may be changed or offered to different groups of employees.

As noted earlier in the “Analytical Considerations” subsection, the approach that has been used by the Handbook authors to explore the relationships between particular types of TDM strategies and traveler behavior depends heavily on the detailed examination of a sample of 82 employer and institutional TDM programs (the 82-program sample). These project examples have been drawn primarily from three separate research studies, selected for comparable detail on program description and measurement of travel impact. A listing of these individual programs, along with the employer characteristics, TDM strategies encompassed, and computed travel impact, is provided as Appendix Table 19-A.

Travel impacts in this analysis are gauged by the inferred change in average vehicle trip rate. The vehicle trip rate is the number of vehicle trips made by the employees commuting to a given work site in relation to the total person trips to the site, expressed in Appendix Table 19-A in the form of average daily vehicle trips per employee. (See Footnote 1 in the “Analytical Considerations” discussion above for alternative vehicle trip rate units of measurement.)

By comparing the vehicle trip rate of the employer with the TDM program relative to the vehicle trip rate measured either before implementation or as some other control rate representing background conditions, one may interpret the change or difference in trip rate as a vehicle trip reduction (VTR) attributable to the TDM program. Control rates employed by the source studies include a similar employer in the adjacent area, the average performance for a sample of employers in similar physical settings, or the average vehicle trip rate for the local area derived from modal split information in the Census Transportation Planning Package (CTPP) for the nearest comparable time period.

Even though the sample of projects used for this assessment is viewed as the most robust data resource available in terms of program detail and impact measurement, the types of analyses and conclusions it allows are still quite limited. There are also important caveats to keep in mind when making use of findings drawn from it. These were enumerated at the conclusion of the “Analytical Considerations” subsection within the “Overview and Summary.”

The basic analysis consists of comparing VTR for a group of employers who have a particular TDM element with those who do not. For this comparison to be statistically valid at demonstrating the actual effect of the given element, it would be necessary to assume that everything else about the two groups being compared is the same, apart from this element. Clearly, this is a big assumption given the diversity of the examples highlighted in Appendix Table 19-A. In very large samples (as in epidemiological studies), the randomness with which these other characteristics occur can be assumed to produce fairly comparable samples, and hence determining whether the difference between the means is real can be addressed with statistical reliability tests. In the case at hand, however, a relatively large sample of TDM programs is still small statistically in terms of all of the sources of internal and external variance, particularly given the small number of observations in some analysis cells.

As a result, the relationships presented here should be regarded as primarily descriptive, although in some instances the differences are so great that one may begin to suggest that the particular element surely must be influencing the outcome. The nature of this analysis is to begin to show what types of actions appear to be the most influential, and what underlying factors may complement or detract from the inferred effect.
The key employer characteristics of the 82-program sample are as follows (size of sample sub-set shown in parentheses):

- **Employment Type:**
  - Professional/Office (25)
  - Commercial/Service (8)
  - Manufacturing/Industrial (14)
  - Government (10)
  - Utility (8)
  - Medical Institution (6)
  - University (4)
  - Miscellaneous Research or Non-Profit Institution (7)

- **Number of Employees:**
  - 10,000 or more (8)
  - 5,000 to 9,999 (7)
  - 1,000 to 4,999 (26)
  - 500 to 999 (5)
  - 100 to 499 (34)
  - less than 100 (2)

- **Location:**
  - Central Business District (CBD) (14)
  - CBD Fringe (9)
  - Suburban CBD (14)
  - Suburb (10)
  - Office Park (13)
  - Campus (12)
  - Exurban/Rural (10)

- **Transit Availability:**
  - High (24)
  - Medium (18)
  - Low (40)

- **Parking Conditions:**
  - Restricted Parking (34 with, 48 without)
  - Parking Fees (30 with, 52 without)

Inferences from the 82-program sample are presented together with results of synthesizing available TDM travel demand impact studies and research. In most instances the one is supportive of the other, but in some cases disparate findings illustrate inability to draw definitive conclusions and corresponding need for further research.

**Response to Support Actions**

Support actions are arguably the most basic initial strategies an employer can implement when creating an employee TDM program. Frequently, low utilization of alternative modes for commuting or of alternative work arrangements such as telecommuting or CWW is a result of low awareness and poor information. Several studies have shown that even in an employment setting where
the employer is offering a wide array of transportation options and benefits, a substantial percentage of employees are unaware or under-informed regarding the nature and availability of these options. This aspect of awareness is covered in more detail in the “Individual Behavioral and Awareness Considerations”—“Awareness and Comprehension of Options” discussion within the “Underlying Traveler Response Factors” section. A primary function of TDM support actions is to increase knowledge and awareness, not only of reasons why changing commute habits is important, but—most importantly—what means exist to make that change and what advantages may come to the employee for changing.

However, as important as support actions are for directing attention to an employer TDM program, many programs rely too heavily—or even exclusively—on support actions while ignoring measures shown to produce more substantive behavioral change. Support actions are perhaps best viewed as a catalyst—important in stimulating the reaction, but generally with a minimum role in the reaction itself. Regardless, many employers or institutions have tried to use a rigorous program of marketing and promotion to raise employee consciousness levels, hoping to change the “culture” in accepting alternative choices.

Support Action Insights from the 82-Program Sample

Because there are so many TDM strategies that fall in the category of support actions, and with countless combinations and renditions of those strategies, a typology has been used to examine the relative effectiveness of different levels of employer support. The 82-program sample has been categorized into levels of high, medium, and low support, based on the range of strategies employed and the level of intensity with which they are applied.

In general, a low-support program is one in which the employer shows little or no active effort in promoting alternative commuting habits to employees. For example, such employers may allow employees to participate in rideshare matching or allow the transit agency to drop off literature, but will not themselves get involved in the process. In a medium-support program, by the definition used here, the employer makes a conscious effort to get involved. There seems to be good spirit behind providing information about commute options and programs (inside and outside the organization), an employee transportation coordinator is appointed (even if only part time), and there is an openness to assisting with ridesharing (matching), transit (pass sales), and promoting the use of these programs. In a high-support program, the employer appears to be applying just about every strategy possible, even though in some cases the applicability or objective may not be clear.

Table 19-1 provides an employer trip reduction performance comparison of programs that incorporate high, medium, and low levels of support actions. This is the first of a number of tables of this genre. In these tables, vehicle trip reduction strategies are cross-classified, either with each other or with ambient conditions such as transit availability. Drawing from the 82-program sample, the VTRs of programs that match each of the strategy/strategy or strategy/condition combinations defined by the table’s columns and rows are averaged using unweighted computations. These program average VTRs are the percentage values displayed in each cell of the table defined by the column and row strategies/conditions.

Just below each VTR, in parentheses, is the number of programs out of the 82-program sample that have met the combination criteria and have been used in calculating the average. In the tables these counts are identified as sample size. It is crucial to remember that the VTR convention is to show vehicle trip reductions (or the degree to which vehicle trips are less than in baseline sites) as positive numbers, reflecting that vehicle trip reduction is the TDM objective. The occasional negative
VTR implies that the average in question reflects vehicle trip rates actually greater than the average baseline values with which they were originally compared.

As an example, take the “28.4%” value near the upper left-hand corner of the table. It is in the high employer support level column and the high transit availability row. Below it is the sample size of “(10).” This indicates that out of the 82-program sample, 10 programs have been found to be characterized both by a high level of employer support actions in their TDM programs and location in areas of high transit availability. The simple average VTR of these 10 programs has been calculated to be 28.4 percent. The fact that it is positive suggests success in trip reduction in connection with the high-transit-availability location of the 10 sites, the high level of support actions applied, and also (importantly), whatever other TDM actions these particular 10 programs may have also included. The VTR value may be compared with others in the table to begin to infer the effect of different combinations of TDM actions and situations.

In the “All” row, Table 19-1 first compares VTR performance with reference to the level of employer support actions included in the programs. The table then connects the support program levels with other important characteristics of the sites or of the TDM programs. Looking only from the perspective of level of support, the data suggest that employers or institutions offering high levels of support in their programs, with a 19.0 percent average VTR, performed better than medium-level support (15.9 percent VTR) and low-level support (15.0 percent VTR) programs.

**Sources:** Derived (see Appendix Table 19-A) from Comsis (1994), Comsis and ITE (1993), Rutherford et al. (1994), and Comsis et al. (1996).
What is not reflected in this simple comparison, however, is the extent to which the performance of high-level programs is influenced by packaging with other high-impact strategies, such as parking fees or modal subsidies. This question is further explored in the following discussion, in parallel with Table 19-1. It will be shown that support actions have less effect than either ambient area transit service levels or programs involving parking management/pricing, transportation service provisions, or modal subsidies.

**Transit Availability.** Sites with high transit availability show a rather small difference between high- and low-support programs (28.4 percent versus 24.3 percent VTR), but there is a marked difference between sites with high and low transit availability, regardless of the support program level. The difference between high and low transit availability sites with high support is 28.4 percent versus 15.9 percent VTR, while the same comparison for medium-support sites is 28.2 percent versus 13.6 percent, and for low support it is 24.3 percent versus 8.6 percent. Interestingly, though, the implementation of higher-level support programs when transit service is limited seems to have more of a benefit—while the difference between low- and high-support programs when transit availability is high is only 4.1 percentage points (24.3 percent versus 28.4 percent). The difference is 7.9 percentage points (3.2 percent versus 10.1 percent) for medium transit availability and 7.3 percentage points (8.6 percent versus 15.9 percent) where transit availability is low.

**Incentives and Disincentives.** A similar result may be seen in relation to support actions in programs with incentive and disincentive characteristics such as restricted parking, priced parking (parking fees), or where the employer provided transportation services or modal subsidies. In each of these cases, the difference in VTR between employers who had any of these TDM program elements and those who did not is significantly greater than the corresponding difference associated with different support levels. Clearly, higher support levels are associated with higher rates of trip reduction in most of these cases (all cases if the comparison is restricted to high- versus low-support levels), but the effects are small relative to the impacts of the other types of strategies in the comparison.

**Alternative Work Arrangements.** Higher levels of support programs seem to enhance trip reduction in combination with both telecommuting and CWW programs, as they do in cases without telecommuting or CWW, though the modest positive effect on trip reduction is not entirely consistent between individual support levels. Note that, as previously cautioned, data from the 82-program sample are not capable of reflecting the full range of telecommuting and CWW impacts. A full discussion of how these alternative work arrangements perform as strategies is provided in the subsection on “Response to Alternative Work Arrangements.” It should be consulted before attempting interpretation of the “Yes” versus “No” telecommuting and CWW comparisons in Table 19-1.

**Additional Evidence of Individual Support Action Effects**

**Information, Marketing, and Promotion.** As suggested earlier, for a TDM program to succeed, several conditions must be present. In the case of persuading employees to switch modes or adopt an alternative work schedule, they must: (1) be convinced of the inherent value of changing their behavior; (2) have access to the type of information that allows them to understand their options, which also means being made aware that their employer offers particular options; and (3) be motivated to test and ultimately continue using the recommended options. This is rightly seen as the role of marketing and promotion.

---

5 “Percentage points” refers to an absolute difference in percentages, rather than a relative difference.
An example of the possible effects of active marketing, promotion, and information campaigns on commute behavior is offered by a “Transportation Days” experiment in the Cross Westchester Expressway Corridor of New York State in the early 1990s. Rapid employment growth in the corridor in the late 1980s was resulting in severe traffic congestion, causing the New York State Energy Office to award a grant to the Westchester County Department of Transportation to develop and implement transportation management programs to save energy, and reduce congestion and air pollution. The resulting public-private effort included targeted transit service improvements coupled with marketing of alternatives and information on their availability and use. The information was presented throughout 1992 at 79 different employer locations in the corridor, representing about 12,000 of the corridor’s estimated 100,000 employees.

Before-and-after employee surveys showed that about 17 percent of the targeted employees attended the promotional events. Of these, about 32 percent changed mode in the subsequent year, although the changes were not uniformly from drive-alone to alternative modes. However, among promotional event attendees, single occupancy vehicle (SOV) use fell from 68.6 percent to 63.7 percent—an almost 5 percentage point reduction—while among those who did not attend, SOV use increased from 68.9 percent to 70.8 percent, an increase of almost 2 percentage points. What is unclear from these results is whether the people who attended the promotion were different in some way, such as more in need of a transportation alternative, and how stable these choices were over time, given that the follow-up survey was conducted within 1 year of the promotion (SG Associates and Howard/ Stein-Hudson Associates, 1993; Spielberg et al., 1993). This program is covered in more detail later in the “Case Studies” section (see “ ‘Transportation Days’ Marketing and Outreach Programs—Cross Westchester Expressway Corridor”).

In a 1993 study for the California Air Resources Board (CARB), it was found that a surprising percentage of employees were unaware that their employer offered a particular type of TDM strategy. While 1/2 to 2/3 of employees were aware of employer-offered measures such as preferential parking (77 percent), rideshare matching (70 percent), company vanpool vehicles (67 percent), and rideshare prizes (64 percent), much smaller numbers were aware that their employer conducted transportation fairs (15 percent), or offered bus pass discounts (17 percent), on-site pass sales (41 percent), or guaranteed ride home (36 percent). These findings were a revelation to CARB and to the participating employers, and argued strongly for more aggressive information and marketing efforts as part of the programs (Comsis, 1993a). For tabulation and further discussion of these awareness level findings see “Individual Behavioral and Awareness Considerations”—“Awareness and Comprehension of Options” within the “Underlying Traveler Response Factors” section.

Employee Transportation Coordinators (ETCs) are a popular strategy for performing this information and promotional function. Most of the example programs in the 82-program sample incorporate ETCs, either on a part-time or full-time basis. The time investment required for an ETC is a function of the size of the employer, the complexity of the given program and local travel alternatives, and the pressure felt by the employer to have its program succeed. In addition to interacting with employees, ETCs are also the point of contact with outside programs and agencies, such as regional ridematching, transit, or a Transportation Management Association.

CUTR’s National Center for Transit Research performed a study to try to determine the importance of an ETC in the success of an employer TDM program, while at the same time accounting for differences in management support and factors like transit availability. Based on a review of 13 work sites in the Puget Sound area, the study reached an interesting, almost dichotomous conclusion: ETCs are necessary for a successful work site trip reduction program if the work site is not located in an area with access to high quality public transportation, but are not necessary if the work site is located in an area with good public transportation and the employment base consists of lower-
income staff who must choose transportation cost savings over time savings and convenience. The study further concluded that, in a successful program, top management backs up these factors through support such as the provision of meaningful incentives (Hendricks and Joshi, 2004).

**Guaranteed Ride Home.** A strategy appearing to address an important concern of employees considering use of an alternative commute mode to reach a work site is Guaranteed Ride Home (GRH). Numerous surveys have suggested that having the assurance of a back-up mode that can be used in the event of a personal emergency or unplanned schedule change can be the “deal clincher” in getting an employee to switch from driving alone. The issue from an evaluation perspective is determining just how important a “supporting” strategy like GRH is in the overall trip-making decision process, and what portion of vehicle trip reductions can be directly attributed to this strategy.

An examination of 11 GRH programs throughout the United States, representing many different program types, scales, and settings, found—in general—strong intuitive support for GRH among the program managers. The evaluation was, however, unable to statistically support or reject the contention that GRH services actually encourage ridesharing. This situation was attributed to a frequent lack of adequate before-and-after data and the fact that GRH was usually implemented concurrently with other incentive programs, making it difficult to attribute changes in alternative mode use exclusively to the GRH service (Polena and Glazer, 1991).

In its 2001 State of the Commute Survey, the Metropolitan Washington Council of Governments (MWCOG) found that 31 percent of commuters who decided to use a non-drive-alone mode felt that GRH was very important to their decision, while 33 percent said it was somewhat important and 36 percent said that it was not at all important. Asked another way, 20 percent said that they would be 100 percent likely to use an alternative mode even if GRH were not available, 48 percent said they would be very likely, 23 percent said they would be somewhat likely, and 8 percent said they would be not at all likely (MWCOG, 2002).

A 1994 review of a GRH program demonstration conducted in the Baltimore/Washington International Airport Business District reached a similar set of conclusions. These responses suggest that despite a highly favorable view of GRH, evaluation of its importance in actually determining a shift in mode must consider that only a small percentage of employees making a shift (8 percent) would be unlikely to make the change without GRH.

Under the 12-month Airport Business District experiment, a registered program participant would notify his/her supervisor of the emergency or overtime requirement and directly call one of the participating service providers (a taxi company and a rental car company). The service, which was available 24 hours a day, was provided within 30 minutes, with the user permitted to make en route stops related to the emergency. The fare was passed directly on to the administrating agency (BWI Partnership). The number of participants grew steadily from 241 to 732 over the course of the program, amounting to roughly 25 percent of eligible employees. In all, 114 participants (15 percent of all participants) used the GRH program for a total of 287 trips. The majority of users made only one GRH trip, with the average number of trips per user being 2.5. Forty-five percent of the GRH trips were for unexpected overtime, while the remainder were for personal or family emergencies.

The evaluation of the program concluded that there was no reliable evidence that the GRH program directly increased alternative mode use in the study area, although it may have helped retain existing alternative mode users. Analysis of commute behavior before and after the demonstration indicated that overall it remained virtually unchanged. Surveys revealed a decrease of less than 1 percent in SOV use and a 1 percent increase in High Occupancy Vehicle (HOV) and transit use over the course of the project. Some 58 percent of those respondents who changed their mode during
this time period said that the GRH program was not an important factor in their choice (Jewell and Schwenk, 1994).

An evaluation of the impact of trip reduction requirements for the City of Sacramento suggests a different result. Looking at annual employer and employee travel survey data compiled by the city, covering 58 employers and roughly 26,000 employees, vehicle trip rates were compared for the 38 employers who offered GRH with the rates of the 20 employers who did not. An increase in carpool mode share by an average of 4.6 percent was found at the employers offering GRH as compared to only 1.6 percent at those where it was not offered. Similarly, an increase in vanpool share of 1.7 percent was found in the presence of GRH versus a decline of 0.2 percent otherwise, along with an increase in transit share of 1.2 percent when GRH was offered versus a no-GRH decline of 0.1 percent. These findings correspond to an average VTR of 7.3 percent in the programs where GRH was offered versus only 1.7 percent in those where it was not, suggesting a net VTR effect of 5.6 percentage points for GRH (Schreffler, 1997). Of course, as with the Handbook authors’ own pairwise analysis of the 82-program sample, other characteristics of program or setting that may have influenced this result are not known.

Support Action Combinations. A National Center for Transit Research study aimed at developing a “Worksite Trip Reduction Model and Manual” provides an overview of the types of employer support strategies that are most commonly employed, and roughly what role they have in TDM program effectiveness. Using data from major publicly mandated employer trip reduction programs in Los Angeles, Tucson, and Washington State, the researchers first identified the 50 most common types of program combinations that were offered by employers. They then calculated the average VTR associated with each combination of strategies. The most common support measures observed were marketing, rideshare matching, guaranteed ride home, and facilities and amenities such as bike racks, showers, and changing areas (CUTR, 2004). What was evident in comparing the different programs with regard to their composition and VTR is that while the support strategies occurred in virtually all of the program packages, the programs with the higher impacts were clearly those which also implemented financial and other incentives. This provides further support for the premise that support strategies are a necessary, but not sufficient, ingredient for a successful TDM program.

Consulting the 82-program sample once more, judgment has been used to identify those programs which were exclusively or substantially high-employer-support programs, with none or few other meaningful strategies offered. There were 15 programs that fit this definition. The programs are identified in Appendix Table 19-A as Childress Buick, K-Mart Valencia, Mercy Home Care, Hillsborough County, Rosarita Foods, Shure Bros., California Franchise Tax Board, McClellan AFB, Dean Witter, Kinko’s Service Corp., Payroll One, Varian, UCLA, University of Central Florida, and AT&T Pleasanton. The average VTR for this set of programs is 4.1 percent, substantially below the average of 16.9 percent for the entire 82-program sample.

An analysis of information previously compiled by the legislatively-mandated employer trip reduction program of Maricopa County, Arizona, was prepared in 1993 for the Chicago Area Transportation Study (CATS) as an aid to developing guidelines for Employee Commute Options (ECO) program implementation in Chicago. The Arizona program had required all employers with 100 or more employees to develop a set of strategies aimed at reducing vehicle trips by 5 percent annually. The analysis looked at data on TDM measures, employer characteristics, and travel behavior changes taken from annual surveys covering the first 3 years of program operation—from inception through year 3—for 556 work sites.

Maricopa County had identified approximately 55 distinct TDM measures, and those which had been actually implemented were consolidated in the CATS analysis into 16 strategy categories. The
first 10 were classified as “marketing and support” measures. Table 19-2 shows the change in Average Passenger Occupancy (APO)\(^6\) for programs that—according to this classification system—only employed support and marketing strategies. (It will be noted that several of these strategies were not classified as employee support programs for purposes of this chapter’s discussions.) Where a particular strategy (e.g., Bike Incentives) was one of the strategies in a package, that program is included in the tabulation under that strategy.

A percentage increase in APO may be roughly compared to a percentage increase in VTR. APO increases were found to range from 3.4 percent to 9.0 percent depending on the included strategies, with an average 4.6 percent for the group as a whole (Teal, 1993). This Maricopa County/CATS analysis suggests that 4.6 percent may be taken as a reasonable estimate of the vehicle trip reduction potential for TDM programs that incorporate only “marketing and support” strategies, an estimate very close to the 4.1 percent average VTR for the 15 support-strategy-only programs identified in the 82-program sample.

</table>

Note: The typical program had more than one “Marketing and Support” strategy, thus the last column does not add to the total number of programs.

Still further corroborative evidence is provided by an analysis conducted by the Washington State Commute Trip Reduction (CTR) program. With very high statistical correlation, it was estimated that early employer TDM programs in both city and suburban locations achieved an average drive-alone mode share reduction close to 5 percentage points in the first 2 years after program implementation.

---

\(^6\) Average Passenger Occupancy (APO) is the weekly total number of employee person trips divided by the weekly total of employee vehicle trips (commute trips only). A percentage change in APO may be roughly compared to a percentage change in vehicle trip rate. APO is essentially the same as AVR, except that legal definitions of AVR may introduce slight differences, such as specification of covered commute hours instead of having the computation cover full 24-hour periods.
Although records of individual program actions implemented were not assembled, the sense is that they were dominantly focused on providing information, making employees aware of their options, and offering and publicizing a guaranteed ride home (Hillsman, 2009).

An interesting supplemental analysis from the Maricopa County/CATS assessment looked at the potential cumulative benefit from multiple marketing and support measures. Many employers were found to have implemented multiple measures of this category. Table 19-3 shows the percent change in APO in relation to the total number of measures, and also the number of those measures that were “non-information” in nature (Teal, 1993).

The tabulation suggests a very modest APO improvement when the number of measures increases from 6 to 8 (APO from 5.0 percent to 5.7 percent), and again from 8 to 10 measures (APO from 5.7 percent to 6.6 percent). However, since the number of measures that are non-information is also increasing to the same extent as total measures, one is left to wonder if the very modest effect is coming solely from non-information measures. The other side of this coin is the potential inference that the primary marketing and support program effect is that associated with the information measures. Perhaps the major point to be made is that simply adding more marketing and support measures to a core marketing/support program does not appreciably enhance its bottom-line effectiveness, though in many cases it will likely add to program costs.

**Response to Employer Transportation Services**

It is relatively uncommon for employers or institutions in the United States to become involved in the physical transportation of their employees, and more likely that they will simply encourage them to use alternatives that are available in the marketplace. In some circumstances, however, no meaningful travel alternatives are available, such as at a remote business campus where transit does not directly serve the site. In such cases, some employers have taken the initiative to provide tangible transportation services for their employees. They may do this by:

- Arranging for bus service to the site under contract or other agreement with a public or private transit provider, or paying to augment the level or quality of a pre-existing service.
- Arranging for shuttle service to connect with a rail transit station beyond walking distance.
- Assisting in the startup, operation, maintenance, or cost sharing of a vanpool program.
• Making company fleet vehicles available for use by employees for ridesharing or site-based uses, such as travel to business meetings, errand running, or emergency trips home.

It may be argued that other types of strategies also serve as transportation services in which the employer is directly involved, such as assisting with rideshare matching, providing bike facilities and showers and/or preferential parking for carpools, or offering a guaranteed ride home. However, because these strategies generally entail less direct, physical involvement of the employer, they have been included among support actions in this chapter’s typology, reflecting how they are generally regarded among TDM practitioners.

Not all employers/institutions that provide transportation services are characterized by remote/campus locations. Some become involved simply because transit service to their site or from particular employee concentrations is too limited. Some become involved in vanpool programs, as a special example, even when they are located in an urbanized setting near transit, simply because they feel it best suits their company ethic or policies, or because they judge more employees can be served effectively through such a program.

**Employer Transportation Services Insights from the 82-Program Sample**

Table 19-4 examines the employers in the 82-program sample that had transportation services as part of their TDM program. As with the support actions assessment, the table is developed from information displayed in Appendix Table 19-A. It shows the average VTR associated with particular groups of employers and the number of employer examples in each category.

For convenience, the employer transportation efforts are divided into four groups: those who provided transit assistance, those who provided vanpool assistance, those who provided both transit and vanpool assistance, and those who provided company vehicles for employee use. The last two columns summarize and compare the programs of all employers providing services with those who did not. Finally, trip reduction impacts are presented in relation to such elements as transit availability, restricted parking, parking fees, level of support program, modal subsidies, and the alternative work arrangements of telecommuting and CWW. This is done to gauge the importance of transportation services in relation to other program strategies or site conditions and of any synergistic effects of combining these actions/conditions.

One thing Table 19-4 indicates is that 34 of the employers in the 82-program sample, or 41 percent, offered one or more types of transportation service. Of these, four programs exclusively provided transit service assistance, 11 exclusively offered vanpool assistance, 11 provided both transit and vanpool assistance, and those who provided company vehicles for employee use. The last two columns summarize and compare the programs of all employers providing services with those who did not. Finally, trip reduction impacts are presented in relation to such elements as transit availability, restricted parking, parking fees, level of support program, modal subsidies, and the alternative work arrangements of telecommuting and CWW. This is done to gauge the importance of transportation services in relation to other program strategies or site conditions and of any synergistic effects of combining these actions/conditions.

In general, the programs where employers offered transportation services have better performance than those that did not. Looking at the summary row in Table 19-4 marked “All,” it may be noted that the average VTR of the 34 employers who provided transportation services is 21.6 percent, in comparison to 13.6 percent for the 48 employers who did not provide services. Among the different types of transportation services provided, programs offering company vehicles for uses supportive of not driving to work alone rank highest, with an average VTR of 24.6 percent. These are followed by vanpool assistance at 21.3 percent, and transit and transit–plus-vanpool at 18.9 percent and 18.8 percent, respectively.
Looking at the combination of these transportation service programs with other employer TDM elements or site conditions yields the following insights:

**Transit Availability.** Not surprisingly, the largest number of instances where employers offered transportation services is where transit availability was low. Seventeen of the 34 employers providing services fell in this category, and virtually all of them attempted to compensate for the absence of transit by providing vanpool assistance, either by itself (six employers, averaging 18.6 percent VTR), or in combination with transit (seven employers, averaging 16.1 percent VTR). The best-performing programs in this low transit availability category are the six that provided use of company vehicles, averaging 21.8 percent VTR. As a whole, the programs in this low transit availability category only account for an average VTR of 15.5 percent—below the average of 16.9 percent for the overall sample of 82 sites, and only 4.4 percentage points better than the average of 11.1 percent for the 22 programs in this category that offer no services.

</table>

**Note:** Asterisked samples (*) include cases combined with other transportation services.

**Sources:** Derived from the Table 19-A sources (see Appendix A).
A surprisingly large number of employers (11) located in areas with high existing transit service availability are found to have engaged in providing transportation services. Examining the cases in this group, reasons seem to include:

1. The employer is very large, with a widely-scattered regional employment base, and either existing transit service doesn’t extend far enough or cannot spread wide enough to serve employees.

2. The employer has felt, despite the generally good transit service, that it needed more capacity or more route coverage than the public transit agency is able to provide.

3. The employer has felt a particular kinship with some service, such as vanpools, for reasons unique to the organization.

Programs in this high transit availability category have an average VTR of 28.8 percent, which is quite high but still only 5.2 percentage points greater than those programs that had high transit availability but did not offer additional transportation services.

**Restricted Parking.** Sites where parking supply was restricted have higher overall VTR rates, and programs that provided transportation services in conjunction with restricted parking also perform better than those that do not. Sites with restricted parking that provided transportation services average a 27.9 percent VTR, which is 7.6 percentage points higher than comparable sites with restricted parking but no transportation services (20.3 percent VTR). Where parking was not restricted, programs offering transportation services outperform those without services by a similar margin, 6.1 percentage points, or 15.4 percent versus 9.3 percent. The overall effect of restricted parking as a condition corresponds with a greater difference in VTR than the difference related to transportation services. Having restricted parking averages about twice the impact of providing services. Nevertheless, there is clear evidence that providing services makes a significant difference.

**Parking Fees.** The influence of parking pricing is similar to that of restricted parking, only more so. The difference in VTR at sites with parking fees between programs that provided transportation services and those that did not is 31.4 percent versus 18.2 percent, or 13.2 percentage points. Meanwhile, for comparable programs where parking was not priced, those that provided transportation services average 13.9 percent VTR versus 11.3 percent for those without services, or only a 2.6 percentage point difference. Similarly, the difference between programs with transportation services that had parking fees versus those where parking was not priced is 17.5 percentage points, whereas programs that did not provide services have only a difference of 6.9 percentage points between situations were parking was priced versus not priced. Hence, not only do services make an important difference, the effect is accentuated when combined with parking fees.

**Employer Support.** Examining the relationships between transportation services and employer support programs yields somewhat inconclusive findings. Programs with transportation services at both high and low levels of employer support appear to perform quite well, both overall and in relation to programs at the same support level but without transportation services. Programs with services and high support average 26.5 percent VTR, or 14.1 percentage points higher than those without services (12.4 percent). Similarly, programs with low support but offering services average 24.2 percent VTR compared to 11.2 percent for those without services, a difference of 13 percentage points. This suggests that transportation services are very important in this relationship, and that the level of employer support seems to be relatively unimportant to the outcome if services are offered. This conclusion must be tempered, however, by the small sample size of 5 observations in the services/low support category and the curious result for programs with medium support. With medium support there is no major or logical difference between programs that offered
transportation services and those that did not, and both cases are below the average 16.9 percent VTR for the sample. One thing that can be said is that the data in this table provide weak justification at best for expanded levels of employer support.

**Modal Subsidies.** The combining of modal subsidies with transportation services produces a set of outcomes that are similar to those with parking pricing. Transportation services programs which were paired with modal subsidies produce an average VTR of 26.7 percent, compared to only 9.4 percent for those without modal subsidies, a difference of 17.3 percentage points. This compares to a difference of only 8.7 percentage points between situations where modal subsidies were or were not provided within programs not including transportation services (14.7 percent versus 6.0 percent VTR). Also noteworthy is that programs that provided modal subsidies exhibit a much bigger difference in VTR performance with versus without transportation services—26.7 percent against 14.7 percent, or a 12.0 percentage point difference—than when no subsidies were offered, namely 9.4 percent with transportation services versus 6.0 percent without, or only a 3.4 percentage point difference. The synergy between transportation services and modal subsidies is both obvious and strong.

**Telecommuting.** An inference that can be drawn from the VTR comparisons in Table 19-4 is that work hours strategies like telecommuting may conflict with the modal shift objectives of transportation services. Where telecommuting was offered along with transportation services, the result is a VTR which—when computed on the basis of mode shifts alone—is 4.6 percentage points lower than when telecommuting is not provided. It may be that when employees are released from the expectation of traveling to the worksite each day, it becomes harder to conform to the schedule discipline of using an alternative mode, particularly ridesharing.

Despite that possible effect, the presence of a telecommuting program may still reduce overall vehicle trip making through its elimination of physical commute trips in an amount equal to the average number of days per week that the telecommuting individuals do not go to their employment site. TDM regulatory programs typically provide credit for these reductions in their trip generation formulas, which account for total trips by mode over a 5-day cycle. Unfortunately, data from the 82-program sample drawn upon here is insufficient to calculate a trip generation reduction for telecommuting, since neither the percentage of employees who telecommuted nor the number of days per week they did so is known.\(^7\)

The only positive observation that can be made given data limitations is that even with the possibly adverse mode choice effects of telecommuting, programs that offered transportation services appear to perform better than those without services. It is also important to point out that overall evidence on the mode choice effects of telecommuting is mixed, as suggested by the examples provided under “Response to Alternative Work Arrangements”—“Additional Research Evidence on Alternative Work Arrangements”—“Telecommuting.”

**Compressed Work Weeks.** A slightly less ambiguous result is produced in combination with CWW, another alternative work hours strategy, even though the same 82-program sample data limitations apply. Programs offering transportation services perform just about the same in terms of mode shifts with or without the presence of CWW (about 23 percent VTR computed on the basis of mode shifts alone). This would suggest that, in the presence of transportation services, the gain

\(^7\) For additional discussion of this limitation in the 82-program sample, and its implications, see the final paragraph of the “Analytical Considerations” subsection in the “Overview and Summary.”
in trip reduction that comes from fewer work days is not cancelled out by mode shifts. As with telecommuting, CWW programs that offered transportation services have higher VTRs than those not providing services. It does not appear, however, that transportation services and CWW have a synergistic relationship.

**Additional Evidence of Transportation Services Effects**

**Employer-Assisted Transit Service.** Two types of employer intervention with transit service are observed. One is supplementing existing fixed-route bus service with additional service or routes, and the other is operation of shuttle services to either connect with regional rail transit service or to provide midday circulation.

Table 19-5 lists a number of employers from the 82-program sample that achieved fairly substantial vehicle trip reductions in conjunction with providing one or more transportation services. Of course, there are many other aspects of these particular exemplary programs that may have led to their performance, such as parking conditions, financial incentives, and employer support, and these characteristics are also summarized in the table. This presentation is provided to offer some insight as to what elements may contribute to the success of these service-oriented programs.

The “Type of Services” column of Table 19-5, as the heading suggests, indicates the type of transportation service offered by each particular employer or institution at the time the information was compiled. The first two examples, Puget Sound Blood Center and Swedish Hospital, are neighboring medical establishments in Seattle’s First Hill area. This area, which lies on the fringe of the CBD, has above-average transit service. However, these employers took steps to coordinate with each other and the transit operator, Metro, to bring more service to the area. Parking in the area is limited, which affects access not only by employees but also by patients and visitors. The increased transit service was matched by employee transit subsidies and other financial incentives as part of the arrangement with Metro to ensure ridership. The results were vehicle trip rates of 42.4 percent and 28.2 percent, respectively, below the average for the surrounding area, indicating very effective vehicle trip reductions.

P. L. Porter and Pacific Bell had programs that focused mainly on vanpooling, but also provided transit or van shuttle service to distant rail transit stations. Even though they are in remote locations with free parking, the combination of the transportation services with subsidies resulted in vehicle trip rates of 0.67 and 0.73, which are 23 percent and 21.5 percent lower, respectively, than their adjacent areas.

Notes:  

a  Codes:  TR = Transit, VP = Vanpool, CV = Company Vehicles.

b  Codes:  R = Restricted, P = Priced, D = HOV Discounts.

c  Codes:  T= Transit Subsidy, V = Vanpool Subsidy, C = Carpool Subsidy, A = Travel Allowance, O = Other Monetary.

d  VTR = vehicle trip reduction, defined as the percentage by which the vehicle trip rate (vehicle round trips per 100 employees commuting) for the program is less than the vehicle trip rate for the control population.

e  See accompanying text and also case study “University of Washington’s U-PASS Program — Seattle, Washington” Footnote 21.

Sources: Derived (see Appendix Table 19-A) from Comsis (1994), Comsis and ITE (1993), Rutherford et al. (1994), and Comsis et al. (1996).
Sears, upon relocation of its headquarters operations to Hoffman Estates in the outskirts of Chicago, arranged for contract transit service for its employees, many of whom realized long commutes. Subsidy was paid through the employees to the transit provider. In conjunction with its vanpool program, Sears achieved a vehicle trip rate of only 0.53, 42.4 percent lower than the average for the surrounding area. The Sears example is somewhat of a special case, given the relocation involved, though a similar situation applies to the Pacific Bell example as well. (Further background on the Sears Hoffman Estates program is found in the case study, “Pace Vanpool and Subscription Bus Programs in Suburban Chicago,” in Chapter 5, “Vanpools and Buspools.”)

The University of Washington, involving students as well as faculty and staff, also presents a special case. Located on a campus that is somewhat removed from downtown Seattle, it made arrangements with transit operator Metro to provide up to 6,000 hours of additional service to the campus per year. To support this commitment of service, the University has carefully managed its parking supply and prices, and in addition has offered attractive subsidies to students and staff through Metro’s U-PASS program. The result is a vehicle trip rate on the order of 0.27 to 0.29 per person for the campus. This rate has been calculated as being 62 percent lower than the surrounding area (Comsis, 1994), or 31 percent lower than the before-program University rate. The University of Washington program is covered further in the case study, “University of Washington’s U-PASS Program—Seattle, Washington” (see “Case Studies” section including Footnote 21).

**Shuttles and Circulators.** Although they are not purely employer-provided transit services, there are many examples where cooperative efforts have been made to institute shuttle services to either close a gap in existing service, formalize a connection with regional transit, or improve internal circulation and thus reduce auto dependency. Table 19-6 lists ten such services that were staged as demonstration projects under the Los Angeles County Metropolitan Transportation Authority’s regional TDM program.

This group of examples is selected for presentation because of special evaluation data that were obtained for the projects, permitting assessment of the services’ impact on diverting SOV trips and subsequent claimed vehicle trip reduction. The table also shows annual cost for the service and the resulting cost per VTR as a measure of effectiveness. (No information on the physical magnitude of the services is available.) Daily ridership on these services ranged from 11 to 239 riders and costs ranged from $5.15 to $75.60 per VTR. Perhaps what is most interesting about these services is the degree of prior SOV use for the commute, ranging from a low of 33 percent prior SOV mode share among users up to 75 percent or more. One-half of all the cases are in the over-75-percent category. Data are insufficient to ascertain how frequently the former SOV users actually used the shuttle, or the extent to which the feeder service or the internal circulation element is most critical to the modal shift (Comsis and Pansing, 1997).

**Employer-Assisted Vanpool Service.** There are numerous ways that employers can get involved in providing a vanpool option for their employees. Perhaps the simplest is offering a subsidy, although the evidence from the 82-program sample is that, by itself, that approach is not particularly effective (as discussed in the “Response to Incentives and Disincentives” subsection below). What does seem to have more impact is when employers get materially involved in the facilitation and administration of a vanpool program, relieving employees of major logistical burdens.

Effective vanpool involvement includes taking the lead in procuring vehicles, either through lease or purchase; underwriting a service arrangement with a vanpool provider; offering use of company vans for use by vanpool units; providing or cost sharing in van maintenance, fueling, or insurance; and, perhaps most importantly, being a strong advocate for the program. The strong vanpool system performers in Table 19-5 are all marked by solid corporate/institutional backing of the vanpool program. Organizational leadership views the program as an important benefit for employees, a demonstration of their loyalty, and not coincidentally, a means for acquiring and retaining employees, particularly when the site is remotely located and travel there is viewed as a burden.

In the case of Sears and Pacific Bell, the vanpool program was an important element facilitating relocation of large operations from an urban site to a remote exurban area. The sense is that the vanpool and related programs were key to the viability of the move. At the other extreme are employers like Atlantic Richfield Company in downtown Los Angeles or Travelers Insurance in downtown Hartford that opted for vanpool programs in spite of locations near good public transit service. They may have concluded that including a vanpool alternative was the only way to fully serve all of their employees.

It should be noted that not all successful vanpool programs are limited to large employers. The programs of P. L. Porter (230 employees), Bonneville Power (100 employees), and Rockbestos (400 employees) are examples of modest size employers that have been very effective with a well-executed vanpool effort. Nor are vanpool programs necessarily limited to commute populations with long trip lengths, although longer trips are usually the primary market.

The vanpool chapter in the 1993 Federal Highway Administration report on Implementing Effective Travel Demand Management Measures describes an interesting program at the Aerospace Corporation in Los Angeles where vanpools were used to serve a variety of employee travel markets. As of 1990, 15 percent of Aerospace’s employees were using vanpools (another 19 percent used carpools), thanks to attractive pricing and treatment. The company enabled lower fares by 12-year amortization of vehicles, and maintenance was performed by the company. Preferential parking was a meaningful perk given the large size of the workforce (6,000 employees). But perhaps most interesting is that 13 of the 60 vanpools had average trip lengths in the 10 to 20 mile range, which is fairly short for vanpools. Vanpooling was motivated by the company’s extensive support as well as the fact that many of the employees lived in clusters across the region, enabling easy assembly of travel groups (Comsis and ITE, 1993). TCRP Report 95, Chapter 5, “Vanpools and Buspools,” provides additional information on this service.

Use of Company Vehicles. An increasing number of employers are offering company fleet vehicles to employees as an inducement to use alternative modes for commuting. In most instances the company vehicles are made available for midday business trips. This was the case with Johnson & Higgins, City of Simi Valley, CH2M Hill, Southern California Gas, and Wm. H. Mercer, in Table 19-5. The City of Bellevue, Washington, at the time offered a slightly different twist—allowing employee groups of three or more to use the vehicles for commuting (a practice since discontinued). Each of these listed sites achieved a notable vehicle trip reduction, although it would appear that parking conditions, transit availability, and financial incentives also played a significant role in each program’s performance. Nevertheless, providing for the employee’s travel needs once at the work site, particularly in pedestrian-unfriendly areas like office parks or suburban strip developments, can alleviate a major impediment to the decision to forego having one’s car at the workplace.

Car Sharing. An alternative to offering use of company or fleet vehicles involves utilizing quickly executed short-term vehicle rentals from a private vendor, known as car-sharing. Registered users
reserve a car online or by phone, walk to a conveniently located available vehicle, and access it with an electronic key card. The user is subsequently billed for all transactions. An introduction to car sharing is provided in Chapter 14, “Road Value Pricing,” under “Response by Type of Strategy”—“Response to Vehicle Use Pricing Systems.”

The concept has been popular for some time outside the United States as a residential-based service, particularly in urban areas where car ownership is difficult. Increasingly, however, employers are finding value in car-sharing to help address employee transportation issues, including not only mobility for midday business travel, but as a means to reduce parking demand and traffic associated with employee vehicle use. TCRP Report 108, “Car-Sharing: Where and How It Succeeds,” presents examples of employers in the Seattle, Washington, CBD and CBD fringe area who have successfully incorporated car-sharing strategies into their TDM programs (Nelson\Nygaard and Westat, 2005):

- The Seattle Times has used car-sharing to reduce parking demand following sale of several of its surface parking lots. Of employees surveyed in advance of the program, 15 percent stated that access to a car during the day would help them not to drive to work.

- Swedish Medical Center has employed car-sharing as a commute trip reduction strategy and as a way to provide transportation between its six campuses. Staff calculated that car-sharing was cheaper than either a shuttle or paying parking and mileage expenses. Swedish allows all employees access to car-sharing for business purposes, and also allows personal use by those who have not obtained a parking permit.

- The Defender Association used car-sharing to eliminate one-half of its 20 parking spaces, thereby qualifying it for a Metro transit incentive, FlexPass. This allowed it to absorb the cost of continuing to provide transit passes to its employees while also applying savings to costs of the FlexCar car-sharing service (Nelson\Nygaard and Westat, 2005).

Transportation Management Associations (TMAs) may have the potential to become brokers in the use of car-sharing services by providing memberships for employers and integrating those programs with transit and other TDM strategies. Portland’s Lloyd District TMA built on its “PASSport” employer transit pass to fund the PASSport+ program, which allows unlimited use of FlexCar vehicles in the TMA district during business hours for PASSport holders who sign up for car-sharing (Urban Transportation Monitor, 2002).

Back-to-back car-sharing demonstration projects conducted in the San Francisco Bay area between 2001 and 2003, branded CarLink, provide more travel behavior change information and additional support for the potential of this strategy. In CarLink I (January–November 1999), 54 individuals from San Francisco, Oakland, and the East Bay enrolled in a program involving 12 compact rental cars. The vehicles were based in premium parking spaces at the Dublin-Pleasanton BART station and, except for accommodating 10 home-based “traditional” commuters, were set up to serve travel needs of employees at the Lawrence Livermore National Laboratory. Three separate user groups were involved: home-based users commuting to the BART station, work-based commuters reverse-commuting to Lawrence Livermore via the BART station, and shared vehicle day users at the worksite. Each group paid a distinct fee according to duration of car use, with fees including fuel, insurance and maintenance costs. Travel behavior analysis for CarLink I showed an increase in rail transit (BART) mode share of 23 percent, a reduction in drive-alone mode share of 44 percent, and a decrease in average daily vehicle miles of travel (VMT) of 18 miles (Shaheen and Rodier, 2005).
CarLink II was a more expansive test, involving 19 cars and 107 participants, and running for 12 months (July 2001–June 2002). The experiment was located in Palo Alto in conjunction with Caltrain commuter rail service and the employment base of Stanford Research Park (150 research and technology companies and 23,000 employees). Workplace involvement was, however, limited to 6 employers. Again, three distinct categories of users shared the CarLink vehicles:

1. Home-based users, who lived in or near Palo Alto, and for a fee of $300 a month were able to drive a CarLink vehicle to the Caltrain California Avenue station each weekday morning before taking a train to work and then home again at night, while also having access to the vehicles on evenings and weekends.

2. Work-based commuters, who were employees at Stanford Research Park and, for a fee of $50/month, used the vehicles parked at the California Avenue station to shuttle between Caltrain and the worksite.

3. Work-based day users, employees of the participating employers at Stanford Research Park, who were able to use the vehicles for personal and business trips during the day under a subscription package to employers of $300/month per vehicle.

Table 19-7 shows what appear to be rather impressive results from the CarLink II experiment. Using before-and-after surveys along with 3-day travel diaries, the researchers determined a fairly significant decline in driving alone as a commute mode. SOV use for all or part of the home-to-work commute dropped from 37.5 percent to 12.5 percent for the home-based users, and from 64.1 percent to 41.2 percent for the work-based commuters and day users. Correspondingly, use of Caltrain—obviously as the primary commute mode—increased from 56.3 percent to 100 percent for the home-based group and from 35.9 percent to 56.9 percent for the work-based group. At the same time, however, rates of carpooling and bicycling dropped for both groups, and use of bus/shuttle declined for the work-based group, reflecting the greater convenience of CarLink. Also, many participants still used personal vehicles to access transit on their non-CarLink terminus.

The VMT results for CarLink II showed that VMT for round-trip commuters was reduced by 23 miles per day as members shifted to Caltrain. The VMT reduction was entirely produced, however, by the work-based commuters/employees, as detailed in Table 19-7. Meanwhile, travel times increased by an average of 31.5 minutes per day, while commuter stress reportedly decreased. Almost 6 percent of program participants sold or stored a personal vehicle, while none leased or purchased a personal vehicle (Shaheen and Rodier, 2005).
An important factor that cannot be tested in a limited-scale pilot program such as this is the market penetration a full-scale program could achieve. The market for the home-based users and the work-based commuters in a transit-linked program like CarLink II would be limited by the extent of the transit service residential and employment commutersheds involved and the proportions and quantities of daily commutes actually oriented to the transit line. The market would also be limited by the degree of employer interest, an aspect of TDM effectiveness examined in the “Voluntary Versus Regulatory Employer Motivation” subsection of the “Underlying Traveler Response Factors” section. Finally, it should be noted that all reports encountered of workplace-based car-sharing successes come from areas where transit service is quite strong.

Transportation Brokerage. For lack of a better term, there are occasions when either an area-wide organization or a large employer takes on the role of transportation broker, in which it attempts to provide for the transportation needs of commuters in an environment where alternatives to driving are very limited. Historical examples of employers adopting this approach include the 3M Corporation in the Twin Cities and CONOCO in Houston (Pratt and Copple, 1981; Enoch and Zhang, 2008).

---

Notes: Unlike most presentations of mode share data, this tabulation treats each component mode of a multi-mode trip separately. Thus a trip from work to home via CarLink, Caltrain, and walking is entered into the tabulation as one CarLink trip, one Caltrain trip, and one walk trip. Since many participants already took more than one mode to commute, the total percentages of mode use sum to more than 100 percent both before and after CarLink.

- \(^a\) HB = Homebased Users.
- \(^b\) WB = Workbased Commuters and Day Users.
- \(^c\) Total Drive Alone, Carpool, and CarLink VMT.

A classic example is that of the Tennessee Valley Authority (TVA) in Knoxville, where extensive involvement by the TVA in the 1970s led to large increases in ridesharing among employees. The TVA program was oriented almost exclusively toward its approximately 3,000 central headquarters employees in downtown Knoxville. The program grew from one express bus in late 1973 to 10 buses carrying 330 people and six vanpools carrying 69 people 1 year later. Support actions included worksite advertising, a (pre-internet) telephone information service, carpool matching, and vehicle leasing assistance. Not insignificantly, a national fuel crisis occurred that year, with gasoline price increases that obviously raised interest in alternatives to driving. The program continued, however, long after the initial shock. Bus and vanpool subsidies were added, as were preferential, inexpensive carpool parking spaces. By the end of 1976, 23 express buses, 18 vanpools, and 436 carpools were carrying 950, 2,400, and 1,400 employees, respectively, while site employment had grown by 400. The dramatic mode shifts and parking demand reductions that occurred are shown in Table 19-8 below for pre-program, program without monetary incentives, and program with monetary incentives (Wegmann, Chatterjee, and Stokey, 1979):

The success of the TVA project spawned a citywide “brokerage” program in January 1976. By June 1977, 47 vanpools were carrying 450 commuters to 12 employers. Over 18,000 people had requested and received carpool match lists. A random sample indicated that 13 percent of the lists were used to make initial contacts with the intent of ridesharing. However, only 3.3 percent of those using the lists (approximately 80 persons) actually entered into ridesharing agreements. Degree of response was said to relate to the level of employer interest at each firm contacted (U.S. Department of Energy, 1979).

Response to Incentives and Disincentives

The theoretical basis for the role of incentives and disincentives in encouraging use of alternative modes is examined in the “Individual Behavioral and Awareness Considerations” subsection of the “Underlying Traveler Response Factors” section. In summary, to make alternative modes
more attractive, it is frequently necessary to provide incentives to reduce the competitive advantage driving often provides in terms of door-to-door time savings and convenience. These incentives may act to reduce either the travel time or the travel cost associated with using the alternative, such that the comparative disadvantage vis-à-vis auto use is reduced or reversed. Both travel time and cost incentives are relevant in the choice of commute mode. Ways to improve the comparative travel time of alternative modes include:

- Reducing over-the-road travel time by providing HOV lanes on highways or streets, or providing exclusive access via HOV ramps or turning provisions.

- Reducing wait or walk time in the case of transit, by shortening headways between transit vehicles, reducing the number or duration of transfers, or enhancing route coverage.

- Providing exclusive, close-in parking at the work site for carpool or vanpool users, thus offering a walk time advantage over those driving alone.

With exception of the third strategy, preferential parking, which was discussed earlier as a support strategy, these travel time strategies are not the subject of this chapter. Over-the-road travel time savings and reductions in transit wait or access time are public-side strategies (neither employer-provided nor TDM per se), and are discussed in detail in Chapters 2 and 3, “HOV Facilities” and “Park-and-Ride/Pool”; Chapters 4 through 8, which as a group cover “Transit Facilities and Services”; and Chapters 9 through 11, which address “Public Transit Operations.”

The economic incentives covered in this chapter and this section are financial incentives. In other words, they involve actions that either transfer money to decrease the cost of using alternative modes, increase the cost of driving alone (disincentives), or otherwise provide a benefit which has monetary value to those who would use alternative modes. These include:

- Alternative mode subsidies (incentives).

- Parking fees or surcharges (disincentives).

- HOV parking discounts for carpools or vanpools (incentives).

- Travel allowances (also includes parking “cash-out”), which allow the recipient to make the best travel choice given a discretionary budget, perhaps in lieu of free parking (normally functioning as incentives).

- Various gifts, drawings, prizes, or privileges that have a tangible monetary value (incentives).

In this discussion, “incentives” will generally be used as shorthand for both incentives and disincentives.

Incentives Insights from the 82-Program Sample

Table 19-9 cross-classifies incentives used by the employers in the 82-program sample and presents the VTRs associated with each cross-classification and with each incentive category overall (the “All With Incentive” row). The sample data in the cross-tabulation frame a picture of the frequency with which particular incentives were used within the sample, alone or in combination. The VTR percentages illuminate their relative associations with apparent employee vehicle trip reductions.
Note that restricted parking is included in this table, not because it is considered a financial incentive, but for the purpose of conditioning its importance in relation to other incentives.

**Individual Incentives.** Focusing first on the bottom two rows of Table 19-9, it is possible to review the separate occurrence rate and impact differential for each incentive. Clearly the biggest differential among the incentives shown is with parking pricing: The 31 programs that employed parking fees have an average VTR of 24.6 percent, which is double the 12.3 percent VTR for those sites with free parking.

Of similar magnitude, in comparison with unpriced parking, is the effect of providing parking discounts for HOVs as part of parking pricing. Obviously, parking must first be priced in order for the discounts to be relevant, hence 22 of the 31 programs with parking fees also offered discounts for HOVs. These 22 programs exhibit an average VTR of 25.7 percent, which is 1.1 percentage points above the VTR for all 31 sites with parking fees and 13.4 percentage points greater than for the 51 sites with no parking pricing or discounts at all.

Transit fare subsidies were the most commonly offered incentive, seen in over one-half of the examples. Programs with transit subsidies have the third largest impact in terms of VTR, with such programs exhibiting an average VTR of 20.6 percent, 7.5 percentage points higher than the 13.1 percent VTR in those programs not offering transit fare subsidies.

The VTRs associated with vanpool subsidies in Table 19-9 suggest a curious inverse relationship, wherein programs that offered subsidies show up as less effective than those that did not (15.3 percent VTR versus 17.2 percent VTR). A deeper analysis of this finding—beyond that available in the table—reveals that of the 12 programs providing vanpool subsidies, six operated a vanpool program as a transportation service and six did not. The six with a vanpool service have an average implied VTR of 20.9 percent. The other six, which had a vanpool subsidy but not a vanpool service, average a VTR of only 9.8 percent. Hence, the effectiveness of the vanpool subsidy is more than doubled when combined with a formal vanpool service.

Also relevant are the results for 16 employers who provided a vanpool transportation service but did not offer a separate and distinct vanpool subsidy. These sites had an average VTR of 19.8 percent, almost as high as programs that reported both a vanpool service and a vanpool subsidy. This dissection of the data suggests that vanpool service provision may be much more important than a separate subsidy. It may also be that the employer vanpool service programs contained one or more implicit subsidies. In any case, it is the inclusion of relatively more programs without vanpool operations in the Table 19-9 aggregation of employers offering vanpool subsidies that drags down the average VTR, not any inherent flaw in subsidization of HOV use.

</table>

Note: Restricted parking is not a monetary incentive per se, but is included for comparison.

Sources: Derived (see Appendix Table 19-A) from Comsis (1994), Comsis and ITE (1993), Rutherford et al. (1994), and Comsis et al. (1996).
Table 19-9 shows that carpool and bike/walk subsidies were fairly uncommon, found at only four and three sites, respectively, although they are associated with above-average rates of VTR in the particular cases involved. The travel allowance and other monetary incentives are associated with above-average rates of VTR, while the comparable employers without those incentives have below-average VTRs. In these examples, the travel allowance only accounts for a 3.3 percentage point difference compared to programs not offering it, while the other monetary category accounts for a 7.0 percentage point difference.

Incentive Combinations. The top portion of Table 19-9 illustrates VTR performance for incentive combinations found in the 82-program sample. There are many cases where the combined occurrence of an incentive pairing is sufficiently uncommon that it shows a small sample size (three or less), and hence its average VTR performance must be treated with special caution. What seem to be the most frequent incentive combinations and their effective impacts follow:

- Parking fees (priced parking) together with restricted parking averages 27.6 percent VTR, while restricted parking overall and priced parking overall both average 24.6 percent.

- Parking fees with HOV parking discounts averages 25.8 percent VTR, slightly greater than parking pricing overall (24.6 percent).

- Programs including a transit fare subsidy (20.6 percent average VTR) have a lower VTR average when combined with subsidies for competing modes, such as vanpool subsidies (14.4 percent) and bike/walk subsidies (12.1 percent). There is no clear explanation for this except possibly the small sample sizes (two to three programs) when in combination with carpool and bike/walk subsidies. In any case, the VTR is virtually undiminished when combined with carpool subsidy (20.5 percent), and is enhanced when combined with the travel allowance (26.2 percent) and other monetary incentives (22.5 percent).

- The travel allowance does better than its average program VTR of 19.3 percent in all combinations with other incentives, including transit (26.2 percent), vanpool (23.4 percent), and carpool subsidies (24.7 percent), and also works better with parking fees (23.8 percent) or restricted parking (22.8 percent).

- Other monetary incentives (23.1 percent) appear to be enhanced when teamed with restricted parking (29.9 percent), parking fees (29.0 percent), HOV parking discounts (29.0 percent) and travel allowance (26.2 percent), but show less impact when teamed with transit (22.5 percent), vanpool (9.7 percent), or bike/walk subsidies (12.1 percent).

One is tempted to wonder if the relatively poor VTR showing for several modal subsidy combinations is a reflection of lack of program focus. There is, unfortunately, no data to either support or reject such speculation. Small program sample sizes in the case of several combinations together with the inherent variability among program circumstances remain more obvious potential explanations.

Effects Without Restricted or Priced Parking. It is generally acknowledged that parking conditions at a work site have a major underlining effect on the success of TDM programs. Where parking supply is limited or restricted (Chapter 18, “Parking Management and Supply”) or where it is not free (Chapter 13, “Parking Pricing and Fees”), the desire of employees to find and use alternatives is demonstrably more urgent. To test this effect in the analysis of incentive measures, Table 19-10 summarizes the performance of those 27 programs that offered incentives but had no restrictions on parking. As a group, these 27 programs have an average VTR of 14.3 percent, which is less than the overall average for the 82-program sample of 16.9 percent. In addition, in a direct cell-by-cell com-
parison of Table 19-10 with Table 19-9, the combinations without restricted or priced parking exhibit a lower VTR in each case with data available where the included examples are not identical.

On the other hand, the 14.3 percent overall average VTR for the 27 programs without restricted/priced parking is greater than the average VTR of 7.0 percent for the 14 programs that had unrestricted parking and also did not offer subsidies. The four employers in the 82-program sample who had restricted/priced parking but did not offer subsidies have an average VTR of only 11.5 percent. The 37 employers who had both restricted/priced parking and offered subsidies have an average 23.3 percent VTR.

Sources: Derived (see Appendix Table 19-A) from Comsis (1994), Comsis and ITE (1993), Rutherford et al. (1994), and Comsis et al. (1996).
Level of Transit Availability. Across the board, programs located in proximity to good transit service outperform those with medium to poor service. The 24 programs of all types favored with high transit availability have an average VTR of 26.0 percent, compared to only 12.1 percent for those with medium availability and 13.8 percent for those with low availability. Given a comparative advantage of high transit availability, particular incentives then either enhance or lessen VTR—or have negligible additional effect—based on their compatibility with transit use.

For example, parking pricing further encourages transit use. Programs with high transit availability and parking fees have an average VTR of 27.0 percent versus only 18.9 percent without priced parking. At the same time, offering parking discounts for HOVs is hardly an incentive to use transit, and accordingly there is only a small difference in VTR with or without the incentive (26.4 percent versus 25.1 percent). The same is true for vanpool subsidies, where the difference is 26.2 percent VTR with, versus 25.9 percent without.

In high transit availability cases transit subsidies are, logically, associated with a higher VTR (27.4 percent) than programs with no transit subsidies (22.5 percent). In the case of other monetary incentives, for whatever reason, the difference is even larger (38.2 percent with such incentives versus 24.9 percent without). No programs in the sample were observed to provide carpool or bike/walk subsidies in areas with high transit availability.

Programs in areas with medium or low transit availability also show positive impact on VTR from application of incentives like parking pricing, transit subsidies, and other monetary measures. Parking discounts for HOVs show a positive effect on VTR in the medium and low availability cases, illustrating the greater importance of HOV benefits where the transit alternative is less attractive. The travel allowance cases produce a somewhat curious result in that they show positive impacts on VTR for medium and low availability cases, but a negative effect where transit availability is high. Generally, the travel allowance provides for maximum user choice, and where transit service is at a maximum, one would expect that transit would be a preferred alternative.

Level of Employer Support. At all levels of employer support—from high to low—there is generally a demonstrably positive effect on VTR performance by providing incentives. This is certainly the case with regard to parking pricing, HOV parking discounts, and transit subsidies, and is true in most cases for carpool and bike/walk subsidies, travel allowances, and other monetary incentives. In the case of parking pricing, the effect on VTR seems to be almost independent of level of support, with low support programs registering a 22.8 percent VTR compared to 24.4 percent for high support programs, and both substantially higher than the equivalent programs without parking pricing (9.6 percent and 12.5 percent, respectively). HOV parking discounts and transit subsidies have a similar effect of increasing trip reduction almost independent of level of support, even though level of support shows a measurable VTR difference between high and low programs. Travel allowances seem to work better in combination with high or medium support levels and more poorly with low support levels. Oddly enough, in the 82-program sample, other monetary measures are associated with higher VTRs in the instance of medium support levels than they are in combination with high support levels.

Transportation Services. Once again, several of the financial incentives have a demonstrable, positive effect on the VTR performance of employer programs, in this case with respect to programs that provide transportation services. Parking pricing, HOV parking discounts, and transit subsidies again show evidence of a major additional VTR impact when combined with the respective transportation service. A number of combinations involve particularly low program sample sizes, however, requiring extra caution vis-à-vis individual VTR percentages.
Employer-enabled transit service, when combined with parking pricing, shows an average VTR of 35.3 percent compared to only 2.6 percent when parking is not priced. The differential is 34.1 percent with pricing versus 10.7 percent without when vanpool programs are the service provided, 23.6 percent versus 16.1 percent for combined transit and vanpool programs, and 36.6 percent versus 14.6 percent for service programs offering use of company vehicles. These VTR performance attainments exceeding 20 to 30 percent when parking pricing is applied contrast substantially not only with those programs that do not price parking, but also with programs that do not provide services, where VTR averages only 18.2 percent when parking is priced. These findings suggest an important combined benefit for mixing these two types of strategies. The same situation is evident for HOV parking discounts in combination with services and for transit subsidies with services. The various combinations appear to yield a much larger impact than either the monetary strategy or the transportation services strategy acting independently.

**Additional Evidence of Transportation Incentive Effects**

**Parking Supply and Pricing.** As revealed in the preceding analysis, the supply and price of parking serving a worksite have the single largest effect on the performance of employer-based TDM programs. Not only does limited parking or the existence of parking fees discourage solo driving outright, but such conditions also tend to increase the appeal of travel alternatives and other TDM strategies. Providing corroboration, a study of six San Francisco Medical Institutions found that the monthly charge for employee on-site parking was the single most influential factor in determining employee drive-alone rates. The monthly parking charge at each institution was also found to be highly correlated to the severity of off-site parking restrictions and the abundance of transit service (the second and third most important factors after parking pricing). An increase of $8 per month in employee parking charges was found to be necessary to decrease employee SOV mode split rates by one percentage point (Dowling, Feltham, and Wycko, 1991).

Because parking has such a powerful role, it is the exclusive subject of Chapter 13, “Parking Pricing and Fees,” and Chapter 18, “Parking Management and Supply.” These chapters offer substantially more information on the key role played by parking in employer and institutional TDM programs. In particular, see Table 13-22, “Relationship Between Parking Pricing and/or Subsidies and Vehicle Trip Rates at Employment Sites,” and associated narrative, in conjunction with parking pricing. Likewise, see especially Table 18-8, “Parking and Transportation Characteristics at Six San Francisco Medical Institutions,” in relation to parking supply.

Beyond the lessons of Chapters 13 and 18, further insight on the impact of parking and other financial incentives may also be derived from the 82-program sample, drawing upon the information on the composition of individual programs in Appendix Table 19-A. A subgroup of 56 sites, which incorporated some combination of financial incentives into their programs, has been extracted and tabulated in Table 19-12.

Notes:  CP = Car Pool, VP = Van Pool, TR = Transit.

Source: Appendix Table 19-A.
The data in this table not only provide a guide as to which sites have used particular incentives, but also help illustrate how varied the combination of incentive strategies is in practice. This variability, plus lack of uniformity in the way the various incentives are defined or measured, demonstrates why it has been difficult to isolate the contribution of individual incentive strategies.

In relation to parking, previous analysis indicated that those 39 sites with restricted and/or priced parking achieved an average VTR of 24.1 percent, versus 12.2 percent for those without parking controls. One way in which the incentive effect of parking pricing can be increased is by teaming it with strategies that further magnify the cost advantages of shifting travel modes. Two such strategies that have close linkages with parking pricing are parking discounts for HOVs and parking cash-out.

**HOV Parking Discounts.** HOV parking discounts offer employees who rideshare an additional cost advantage through reduced parking rates. Frequently these discount rates are scaled to the number of occupants, with HOVs of 3 or more often parking for free or at nominal cost. Sites in Table 19-12 that employed HOV parking discounts include: Atlantic Richfield Company—Los Angeles (34.5 percent VTR), Bellevue City Hall (30.0 percent), Broadway Plaza 1 (5.6 percent), Broadway Plaza 2 (15.4 percent), CH2M Hill (38.9 percent), City and County of Denver (19.8 percent), Hartford Steam Boiler (36.4 percent), Heller Financial (15.6 percent), Pasadena City Hall (18.5 percent), Puget Sound Blood Center (42.4 percent), San Diego Trust and Savings (22.7 percent), Southern California Gas (47.4 percent), Swedish Hospital (28.2 percent), TransAmerica (18.8 percent), Travelers Insurance (44.2 percent), the University of Washington (62.0 percent), US West (31.3 percent), and Wm. H. Mercer (22.7 percent). This combination of balancing fee-based disincentives with positive incentives has a clear impact on the success with which these programs reduce vehicle trips. Table 19-12 provides detail on the combination of strategies and circumstances which are at play in each of the examples and there is additional information in Appendix Table 19-A.

**Parking Cash-out.** Another strategy that works in tandem with parking pricing is parking cash-out, in which employees are given the option of exchanging the privilege of a free parking space for the cash equivalent, which they may then use flexibly to defray the cost of other transportation options including transit, walking, or biking. Such cash-out programs work best when employers are paying separately for parking, or where there is a parking shortage. The 82-program sample does not have many examples of parking cash-out as it is a relatively new TDM strategy. Only the City of Pleasanton, California, and Cedars Sinai Hospital officially cited cash-out programs. Aetna Insurance provided a $21 monthly transit subsidy in exchange for the employee’s parking space, and State Farm Insurance in Orange County, California, took the unusual approach of paying employees not to park by offering cashable scrip linked to travel mode.

There are various studies of parking cash-out covered in Tables 13-12 through 13-14 of Chapter 13, “Parking Pricing and Fees.” A 1997 study of eight parking cash-out programs in California found that total vehicle trips declined by 17 percent on average after a parking cash-out option was introduced at various urban and suburban work sites. This outcome was achieved by a reduction in drive-alone share from 76 to 53 percent, coupled with an increase in carpooling from 14 to 23 percent, transit from 6 to 9 percent, and bike/walk from 3 percent to 4 percent (Shoup, 1997).

**Alternative Mode Subsidies.** While parking has a powerful effect on vehicle trip making, its principal drawback is that it is very unpopular to implement proactively as a strategy. For employers located in areas with already restricted parking, pricing is more likely to be accepted as a fact of life for commuters. The one major difficulty would be in removing an existing parking subsidy when commuters have become accustomed to it. In contrast, in suburban areas where parking is generally not constrained, it is difficult to institute pricing without fearing a competitive dis-
advantage and loss of employees. Subsidies represent an important alternative way to use travel cost as a TDM strategy, since they encourage a desired behavior rather than discourage an undesired behavior. Of course, used in tandem, their effect is complementary, and the subsidy may allow the employer to also implement controls on parking. Parking fees, in turn, can provide the revenue source to fund the subsidies.

Federal and state tax incentive changes have made alternative mode subsidies more attractive for both employers and employees. Since 1984, Section 132(f) of the Internal Revenue Service (IRS) Code has authorized special treatment for commuter benefits. Initially, the law permitted employers to provide employees with a tax-free transit subsidy of up to $15/month. Meanwhile, employer-provided parking benefits had always been and remained fully tax exempt. Over time, the scope and amount of the alternative mode tax benefits have been steadily expanded. A major change occurred in conjunction with the Energy Policy Act of 1992 that raised the monthly employee tax-free transit subsidy limit to $60, included vanpools as an eligible mode, put a first-time ceiling on employer-provided parking of $155/month, and provided for inflation indexing. By early February of 2009, the non-taxable monthly transit/vanpool subsidy limit was $120, as compared to $230 per month for parking.

Transit/vanpool and auto commute mode federal tax treatment was equalized for the first time with the signing on February 17, 2009, of The Emergency Economic Recovery Act. This law raised to $230 per month the pre-tax income that employees in employer-sponsored commuter benefit programs can apply to payment for use of these alternative modes (TransitCenter, 2009). The tax deduction equalization does not extend to non-motorized transport, but there now exists a similarly applied $20 per month tax allowance for bicycling expenses (Los Angeles County Metropolitan Transportation Authority, 2009). Note that the timing of these new equalization and bicycling provisions is such that no program results reported in this chapter reflect these latest tax benefit enhancements.8

A number of states have also implemented tax incentive programs to encourage employers to provide transit or vanpool benefits to employees. These programs generally work to enhance cost savings for businesses. Examples range from a $25 annual tax credit for each employee receiving a commuter benefit in Georgia to $30 per employee per month for specified alternative mode benefits in Maryland (U.S. Environmental Protection Agency, 2005).

Transit Vouchers/Passes/Discounts. The easiest way to convey this employer subsidy is through transit vouchers or passes. Many metropolitan transit agencies actively administer transit pass programs designed to facilitate employers’ efforts to provide subsidies to employees. A popular medium used in places like Philadelphia and New York City is TransitChek, in which an agreement between the employer and the transit agency provides employees with vouchers that can be used to buy tokens, tickets or passes from public or private transit operators (Comsis et al., 1996). Both Portland’s TriMet and Seattle’s King County Metro offer a similar set of instruments to entice employers and institutions to cost share in employees’ or students’ alternative mode costs.

Both the Portland and Seattle transit agencies market passes to private employers and universities by offering introductory discounts, although the primary discounting for the user is provided by

---

8 During publication preparations for this chapter it was announced that direct federal grants (as contrasted to tax deductions) are being made through the new Energy Efficiency and Conservation Block Grant Program to government entities for, among other things, use in incentive programs to reduce commuting with single-occupancy vehicles (Institute of Transportation Engineers, 2009).

19-53
the employer/institution. Both agencies also offer a special instrument and program to employers who are required under state regulations to reduce vehicle trips. Metro credits its proactive pass programs with increasing regional use of non-SOV modes—principally transit, but also vanpool, carpool, and non-motorized—from 4.7 million to 6.7 million annual trips between 1997 and 1999. With its FlexPass program, Metro targeted 433 King County employers affected by the Commute Trip Reduction law. As of 2000, 120 employers were participating in the program, representing 80,000 employees, who took over 7 million transit trips in 2000. Over 2,300 vanpool riders also received an employer subsidy via their FlexPass in 2000 (Hansen and Slachowitz, 2001).

Some examples of subsidized transit pass efforts and the reported outcomes include the following (Comsis et al., 1996, or as indicated):

- **First Hill (Seattle):** A program serving employers in this area led to doubling of riders in a 12-month period. Of new riders, 60 percent formerly drove alone.

- **Denver/Boulder:** A total of 132 companies generated 9,648 new riders from introduction of an ECO Pass Program.

- **Charlotte Uptown Council:** A program of transit passes combined with other TDM measures gave employees at eight companies a choice between subsidized transit passes or parking. Transit ridership increased by 800 riders between 1989 and 1991.

- **Cornell University:** Discount passes to commuters living outside Tompkins County, combined with parking pricing, reduced vehicles parked on campus by 26 percent.

- **University of Washington:** The U-PASS discount program combined with more intensive bus service and higher parking fees increased the transit mode share by 81 percent (17 percentage points) and led to a 31 percent VTR as measured over the 1989–2004 period (see “University of Washington’s U-PASS Program—Seattle, Washington” case study). AM peak period traffic counts taken in 2002 were 18 percent below 1983 levels (Association for Commuter Transportation et al., 2004). A transit pass program for Husky Stadium (free transit scrip for all ticket purchasers plus new park-and-ride services) increased game attendee transit share from 29 percent to 34 percent and dropped the auto mode share from 71 percent to 66 percent (Comsis et al., 1996).

- **University of California (Los Angeles):** Provision of an unlimited-access pass program, in the first year of promotion, increased commuting to campus via transit by 56 percent, decreased solo driving by 20 percent, and released at least 1,020 parking spaces (Georggi et al., 2007).

- **Ann Arbor:** A discounted or free transit pass program (depending on level of employer involvement), introduced to employees in the downtown between 2000 and 2001, reduced vehicle trips by 3.5 percent while bus passenger trips increased by 9.2 percent (Association for Commuter Transportation et al., 2004).

Reflecting again on the 82-program sample of employers provides additional insights on the role and impact of transit subsidies. Individual program examples featuring transit subsidies as their principal financial incentive measure have been selected from the tabulation for listing in Table 19-13. (This comparison is different from the Table 19-12 subsample because it takes transit availability into account.) An argument can be made that the impact of transit subsidies is likely to be greater if, in fact, there is good-to-reasonable transit service available to the site. Based also on the evidence that
parking constraints (supply or pricing) have a strong disincentive effect on driving, the sample of sites has been divided into three groupings that are distinguished in relation to both transit availability and restricted parking.

(Average VTR = 30.4%) (Average VTR = 7.6%) (Average VTR = 2.4%)

Note: A negative VTR implies that the sample program(s) had vehicle trip rates that were actually greater than the average from the surrounding area with which they were compared.

Source: Appendix Table 19-A.

In the Table 19-13 listing, those programs offering transit subsidies in the presence of both good transit and restricted parking have a significantly higher VTR (30.4 percent) than those with good transit but free parking (averaging a 7.6 percent VTR) or those with both free parking and limited transit availability (averaging a 2.4 percent VTR). Other details associated with these programs are found in Appendix Table 19-A.

A somewhat different take on the same question of transit pass program effectiveness in relation to the quality of transit service has been tested using Employee Commute Options survey data in Portland, Oregon. The researchers used a multiple regression approach to explore the relative importance of a list of employer-provided incentives—including particularly the transit agency’s PASSport program—on employee transit mode share. TriMet’s PASSport (introduced earlier in this section) allows employers to purchase transit passes for all employees at a cost based on only the number of employees who actually use transit.
The analysis, in addition to reflecting whether or not an employer offered PASSport to its employees and the proportion of cost paid by the employer, also considered the effects of transit proximity (within 1/4 mile of either a light rail transit (LRT) station or a frequent bus route), street connectivity (using an intersection ratio), and location of the worksite (in or out) in relation to Portland’s “Fareless Square,” a free transit zone covering downtown Portland and adjacent Lloyd Center. A dummy variable was used to reflect the offering of one or more other incentives such as flextime, CWW, guaranteed ride home, or company car (Dill and Wardell, 2007).

At the top of the list of key findings was that the location of an employer within the Fareless Square accounted for a 26 percentage point difference in transit mode share relative to employers not so located. (Note that the Fareless Square provides free transit rides internal to the zone but not for riding into the zone from outside or vice-versa.) As modeled on the full, unstratified data set, offering PASSport contributed 6.9 percentage points to transit mode share. Being within 1/4 mile of an LRT station added 4.1 percentage points, while being within 1/4 mile of frequent bus added 1.8 percentage points. Ideal street connectivity, relative to the worst encountered, added about 3.7 percentage points taking the variable construct into account.

Part of the reason that the Fareless Square was such an important determinant is thought to be its “urban” characteristics such as priced parking (on- and off-street) and more compact (and typically mixed-use) development patterns. When the study sample was split based on location relative to the Fareless Square, the PASSport incentive became worth 11.8 percentage points of transit share inside the fare-free zone versus 5.4 percentage points outside. Similarly, if the sample is split based on location within 1/4 mile of LRT, PASSport is worth 12 percentage points in transit share inside of the 1/4 mile range versus only 3.5 percentage points outside. Basically, the PASSport incentive has the greater effect on transit mode share where the employment location is more urban (with parking fees) and/or the transit service is better (Dill and Wardell, 2007).

Vanpool and Other Subsidies. Transit subsidies are clearly the most common alternate mode subsidies, in large part because of the favorable tax treatment they receive. Extension of comparable tax treatment to vanpools has increased the attractiveness of subsidy incentives to that mode, although most of these programs are already implicitly subsidized through the employer-provided vanpool program. Within the 82-program sample, 21 employers were identified as operating or facilitating an employee vanpool program. Employer-defrayed or shared costs in such areas as vehicle acquisition/financing, maintenance, insurance, fuel, and the like, already discussed under “Response to Employer Transportation Services”—“Employer-Assisted Vanpool Service,” constitute in-kind subsidies. Monetary subsidies differing from these in-kind discounts may consist of vanpool-driver subsidies (to attract good volunteer drivers), empty-seat subsidies (to maintain a reasonable average fare level), or start-up subsidies.

Only seven of the 82 employers offered a vanpool subsidy among their incentives without actually operating a vanpool program: Bellevue City Hall, California Franchise Tax Board, the City of Pleasanton, City and County of Denver, Hartford Steam Boiler, Shur-Lok Corporation, and Walker, Richer & Quinn. In all of these seven cases, the stand-alone vanpool subsidy was offered along with a transit subsidy and often other financial incentives, such that its effect is difficult to separate. It is judged to be minimal.

Targeted subsidies to modes other than transit or vanpool are less common, probably because they have not been receiving favorable tax treatment. The sparse data make it difficult to generalize the traveler response. An example that does provide results for incentives as applied to various individual modes is the 1970s TVA program outlined earlier under “Response to Employer Transportation Services”—“Additional Evidence of Transportation Services Effects”—“Transportation Brokerage.”
Table 19-8 listed the mode shares obtained before and after each stage of the program. The TVA example, although dated, is of particular interest because the transportation services were implemented as a first stage, and the incentives were provided as a second stage, allowing the impact of the incentives to be viewed in at least partial isolation.

Table 19-14 is designed to illuminate this additional perspective on the TVA results by highlighting the incremental percentage point changes in mode shares attained with incentives as contrasted to the initial mode shifts achieved with transportation services alone. Incentives included bus and vanpool fare subsidies and inexpensive parking for carpools. (Otherwise it is inferred that parking prices appropriate to the downtown location applied.)

**Source:** Adapted from Wegmann, Chatterjee, and Stokey (1979).

Response to the initial stage, services without incentives, was given an unexpected boost by the first 1970s fuel crisis and associated gasoline price increases. The second 1970s gas crisis was late enough in the decade that it did not occur between measurement of first stage results without incentives and measurement of the second-stage results with incentives (Pratt and Copple, 1981). This timing makes the shifts in response to incentives all the more notable.

Table 19-14 makes it clear that the mode shifts obtained for the vanpool, express bus, and other alternative modes, as well as the net effect on driving alone, were larger for the addition of incentives than for the original provision of transportation services. Only carpooling and regular bus ridership were largely insensitive to the incentives, perhaps because other alternative modes became more attractive. Although the effects of incentives were not boosted by additional gasoline price increases, they undoubtedly were enhanced by the vanpool and express bus service increases necessitated by the sheer volume of new users. Some of the incentives would have been worthless without the provision of transportation services. Prior to the program there was no express bus service or vanpool offering at all.

Typically, carpool subsidies are conveyed via a more general instrument, such as HOV parking discounts, parking cash-out, or transportation allowances, and—as with vanpool subsidies provided independent of a vanpool program—tend to be part of a broad package of financial and other incentives. The same is true with subsidies for biking, walking or other modes like ferry. In these situations too few observations are available or too many other measures are being applied to allow clear-cut attribution of impact to the subsidy.
Transportation Allowances. A transportation allowance is similar in function to parking cash-out in that it provides a sum of money that can be used at the employee’s discretion toward the cost of his/her own chosen option, though the amount is not necessarily related to the employer’s cost for parking. In the 82-program sample, 10 employers used some variation of parking cash-out or transportation allowances as part of their program. These 10 cases are among those detailed in Table 19-12. It is instructive to examine them with regard to how their program success may be related to the measures they applied:

- Southern California Gas (47.4 percent VTR), offered a $50/month Travel Allowance in conjunction with parking fees and HOV parking discounts.
- City of Simi Valley, California (43.5 percent VTR), used a $2–$3/day travel allowance, plus a $0.75/day bus subsidy, and a CWW policy with 90 percent employee participation.
- CH2M Hill in Bellevue, Washington (38.9 percent VTR), provided a $40/month travel allowance, plus a $15 subsidy for transit or carpool users, and restricted/priced parking.
- Atlantic Richfield Company in downtown Los Angeles (34.5 percent VTR), offered a $15/month travel allowance in conjunction with restricted and priced parking.
- Commuter Transportation Services in Los Angeles (17.5 percent VTR), used a $40/month travel allowance combined with parking fees.
- Kirkland, Washington, City Hall (16.3 percent VTR), had a $25/month travel allowance and parking fees.
- Pacific Pipeline (15.1 percent VTR), gave a $24/month travel allowance if an alternative mode was used at least 60 percent of the time, in a context of restricted/priced parking.
- Cedars Sinai Hospital in Los Angeles (12.6 percent VTR), used a parking cash out policy in conjunction with restricted and priced parking.
- Nike of Beaverton, Oregon, offered $1 per day for alternate mode use, but presumably because its parking was unpriced and unrestricted, its VTR was only 5.7 percent.
- Similarly, the City of Pleasanton, California, offered a $1/day cash-out incentive, but with unpriced and unrestricted parking, its VTR was only 5.6 percent.

Financial Incentive Experimentation. An experiment in Atlanta motivated by air quality objectives offers additional perspective on the role of financial incentives focused on the work commute. Implemented under the regional Clean Air Campaign and named “Cash for Commuters” (CFC), it was an incentive program that rewarded SOV commuters who agreed to switch to a commute alternative for a specified period of time. Eligible commuting alternatives included carpooling, transit, cycling, walking, or teleworking. Commuters who participated in the program could earn up to $180 in cash over a 90-day period at the rate of $3 per day that an alternative was used. Participants were required to live in the 13-county Atlanta region, register for the program, and affirm that they had not used any of the alternative commute modes more than 5 times during the preceding 90-day period. To receive compensation, participants were required to submit a travel log at the end of the enrollment period, which had to be verified and signed by the commuter’s employer supervisor. Three separate program waves were conducted, during the 2002, 2003, and 2004 smog seasons, involving a total of 5,460 participating commuters.
An evaluation survey was conducted to track the behavior of the Wave 1 participants and gauge both initial impact on behavior and long-term effect on alternative mode-use rates. Prior to program enrollment, commuters in the Wave 1 group drove alone on 85 percent of their commute trips. During the period that they were receiving a CFC incentive, driving alone dropped to 14 percent of all trips, thus 86 percent of trips were made by an alternative. In 3 to 6 months after completing the CFC program, the proportion of drive-alone trips increased to 38 percent, by 9 to 12 months it reached 47 percent, and by 18 to 21 months after the program the drive-alone rate was at 53 percent. It appears that the financial incentive not only had a significant impact on initial disposition to use alternatives, but also led to a fairly high rate of alternatives use even 18 to 21 months past the time of the incentive offering (Center for Transportation and the Environment, 2004).

**Financial Incentives in General.** One attempt to sort out the relative importance of various economic incentives in employer TDM programs was made in the study of TDM at medium-sized employers that has contributed 38 employer case study examples to the 82-program sample. As illustrated in Figure 19-1, the researchers used linear regression analysis to estimate the relationship between the application of economic incentives and SOV rates (SOV commute mode shares). For the analysis, only economic incentives that apply to all employees were used to calculate a net HOV incentive. Parking charges and alternate mode travel allowances were counted as additive HOV incentives, whereas a general travel allowance was assumed to decrease the HOV incentive of a parking charge. In other words, if an employer had both a parking charge and a general travel allowance, the allowance is subtracted from the parking charge to get the net HOV incentive value. The resultant regression equation (sample size of 38, \( r^2 = 0.54 \)) implies a reduction in SOV commuting rate of 0.27 percent for every $1 of monthly incentive (Rutherford et al., 1994).
In-Kind Incentives. In lieu of cash, employers have attempted to encourage use of transportation alternatives through in-kind incentives with a tangible monetary value. The most popular among these methods are periodic raffles and time off with pay. Table 19-12 shows that 12 of the 56 employers in the 82-program sample who provided incentives offered some form of in-kind incentive. Allergan, Arlington Heights, the City of Simi Valley, Gotcha Sportswear, and Heller Financial all offered time off with pay for alternative mode use. Allergan, Chubb Insurance, the City of Pleasanton, IT Corporation, and Varian had raffles for alternative mode users, offering a chance at major cash or other prizes. Other interesting approaches include the Puget Sound Blood Center, which offered one day of free parking to qualifying alternate mode users; Ventura County and State Farm Insurance, who paid employees for not driving (similar to parking cash-out); and US West in Bellevue, which offered equipment rebates for bike commuters.

Unfortunately, it is difficult from the available data to quantify the effectiveness of these strategies on travel behavior, since in almost all cases they are grouped with one or more other strategies that would appear to have at least as great an impact as the in-kind measure. Only Ventura County, with a 13.3 percent VTR, and Gotcha Sportswear, with a 34.1 percent VTR, relied exclusively on their respective in-kind incentive for their TDM program.
A 1992 study by Commuter Transportation Services reported on the experience of five employers in the Los Angeles area who offered time off with pay as an incentive. As summarized in Table 19-15, there is a relatively modest financial value represented by these incentives. The first program, offered by the bank, seems to have been offering the highest incentive level and—probably not coincidentally—exhibited the highest VTR at 16.7 percent. Correspondingly, the software developer’s program appears to have been offering the smallest incentive and had the lowest VTR achieved in the group (Stewart, 1992).

Response to Alternative Work Arrangements

Alternative work arrangement actions are strategies that modify the time at which travel occurs or the frequency of travel. From a TDM perspective, their objective is either to reduce the concentration of travel in a peak travel period or to reduce the overall number of trips made on a daily or weekly cycle to an employment site. The strategies included in this group were defined in the
“Overview and Summary” section under “Types of TDM Strategies,” but a quick review of important characteristics will assist in interpretation of their effects:

- Flexible work hours are where employees are given freedom in choosing their starting and quitting times. Flextime programs fall into two important groups, those where employees are allowed to adjust their arrival and departure times in order to avoid traveling during the most congested time periods, and those where employees are explicitly permitted to adjust their schedules to meet transit, carpool, or vanpool scheduling requirements. Most of the programs reviewed here are of the latter type, designed essentially as an incentive (removal of an impediment) to use an alternative mode. General shifting of work hours to avoid congestion is less common, although it was an important strategy for meeting the requirements of peak traffic reduction ordinances common in the late 1980s.

- Staggered work hours are generally unique to large employers, where some departments or employee groups are assigned to a different but set work day schedule to reduce the impact of having all employees arriving at or departing the site at the same time. This is not to be confused with shift schedules, such as are found at large manufacturing establishments or health centers, which are for purposes of evening and night staffing, not travel management. Neither should it be confused with flexible work hours, which are discussed in the preceding paragraph.

- Compressed work week (CWW) programs enable employees to work fewer days per week (or bi-week) in exchange for working longer hours each day. The two most common arrangements are the 9/80 schedule, where employees work a 9-hour day and receive the tenth day of the 2-week cycle off, and the 4/40 arrangement, where employees work four 10-hour days and receive the fifth day off. In both cases, the transportation benefit is that the employee is able to forego physical commutation to the work site one day per cycle. A secondary benefit is that the longer work day pushes the timing of the commute trip outside the standard peak period as defined by 8-hour work days.

- Telecommuting, also known as telework, allows the employee to work from home some number of days per week or month, usually by virtue of an electronic connection that keeps the employee in continuous real-time contact with the work site. A less common alternative is where the employee works from a special satellite “telework” center.9

Alternative Work Arrangements Insights from the 82-Program Sample

A key question regarding alternative work schedule strategies is whether or not they are supportive of TDM strategies that encourage use of alternative modes and thereby reduce vehicle trip rates and, if not, whether their introduction leads to a net reduction or gain in vehicle trips. Alternative work arrangements that allow employees to synchronize their work schedules with the demands of an alternative mode are designed to explicitly encourage alternative mode use. Conversely, policies

---

9 Telecommuting evaluation is complicated by the fact that there are three distinct forms of working at home, of which telecommuting is only one. Another is home-based-business (HBB) workers, self-employed individuals who operate or manage their business primarily from the home. HBB workers may or may not be segregated out from telecommuters in surveys, research, and summaries. The third form is overtime homeworkers, who go to the formal workplace but bring home work to do, primarily outside of normal working hours. This third kind is of little interest to transportation planning, because it does not have much effect on the occurrence of travel (Tang, Mokhtarian, and Handy, 2007).
that allow employees to shift their travel outside of the peak, CWW, and telecommuting may or may not detract from the appeal of alternative mode use by either reducing the pressure of peak-period congestion or disrupting a routine daily schedule that might better support ridesharing arrangements and transit use.

Ability to ascertain the net effect of these potentially opposing outcomes from the 82-program sample is impeded by the nature of the data as it pertains to CWW programs and telecommuting. The data limitations involved were highlighted in the “Analytical Considerations” discussion of the “Overview and Summary” and have been referred to in previous “Response by Type of Strategy” subsections. To summarize, in virtually all cases within the 82-program sample, there is only sufficient employer survey data to calculate a vehicle trip rate based on modal split reported for commute trips which actually occur. To do more, it would be necessary to know exactly what type of CWW arrangement the employee opted for (4/40 or 9/80 arrangement), or how many days per week the employee telecommuted. Although in some cases there may be an indication of the percentage of employees who are using the measures in question, none of these cases offers the details necessary to calculate the net effect on bottom-line vehicle trip rates.

To illustrate the interplay of mode shift and trip elimination effects involved, assume an employee has been commuting 5 days per week in a two-person carpool. He/she has been generating the equivalent of 0.5 vehicle round trips per day. Now the employee is offered a telecommuting choice, and chooses to work from home 2 days per week. That eliminates two commute round trips outright. However, if that employee now opts to make the three weekly trips to the worksite by driving alone, she now averages 0.6 vehicle trips per day—a 20 percent increase in the daily vehicle trip rate, apart from any increase in non-work travel which may be occurring on telecommute days. However, if the employee were required to remain in the pre-existing two-person carpool arrangement, the average daily vehicle trip rate would only be 0.3, which would qualify as a 40 percent trip reduction. Obviously, accounting for the precise combination of strategies and resulting changes in behavior is critical to determining the net effect of CWW and telecommuting on vehicle trip making. For analysis it would be necessary to have a record of the commuter’s behavior on each day of the travel “cycle” in question. In most cases this would be a 5-day week, though in the case of a 9/80 compressed work week it would be longer.

In the 82-program sample, only the average vehicle trip rate for a “typical” day can be ascertained, and not in full consideration of the combined effect as depicted above. Mode shifts are taken into account (such as the shift from two-person carpool to drive alone in the example above) but trips eliminated outright cannot be (such as the 2 telecommute-day trips not made in the example). It is important to be aware of this distinction when reviewing the calculation results provided in Table 19-16 and the following discussion on relationships observed in the 82 example programs. The data limitations lead to an understatement of overall CWW and telecommute vehicle trip travel savings, but they do directly shed light on the issue of variable work hours effects on alternative mode use.

**Overall Effect of Alternative Work Arrangement Strategies.** Table 19-16 summarizes the comparative trip reduction performance among the 82 examples from the perspective of alternative work arrangement strategies. Focusing first on the boldface “All” row in the table, the VTR performance of each of the four alternative work schedule strategies—shown with and without the respective strategy in place—can be compared. What is evident is that only in the case of flexible hours is the calculated VTR substantially greater in the presence of the strategy than without it. Of employers in the 82-program sample, 45 offered flexible hours and averaged 20.1 percent VTR, compared to 13.1 percent VTR for the 37 employers where it was not offered. With staggered hours,
only seven employers offered this program, and they averaged a 15.9 percent VTR compared to 17.0 percent for the 75 who did not. With CWW, the 54 employers who offered the program averaged a calculated VTR of 15.8 percent, well below the 19.1 percent VTR for the 28 who did not, but not necessarily less effective given the computational limitations described above. For telecommuting, the 65 who offered the program had an average calculated VTR of 17.1 percent, barely above the 16.5 percent for the 17 who did not. Again, the CWW and telecommuting calculations reflect only mode shifts and not trip avoidance effects.

**Alternative Work Arrangements in Relation to Transit Availability.** Flexible hours seem to have their positive impact only when applied in the presence of medium or low transit availability. Perhaps this is where employees who would use transit find the transit schedules least accommodating, and thus are more substantively aided by work hours flexibility. In high transit availability areas there is less than a percentage point of difference in average VTR between programs with flexible hours and those without.

Programs offering staggered hours have the opposite relationship with transit availability. Staggered hours implemented in the presence of high transit availability exhibit a difference in average VTR of only 1.5 percentage points with versus without staggered hours. However, for those situations where transit availability is medium or low, the programs where staggered hours are not offered have higher average VTRs than those where they are. It should be noted that these latter staggered hours programs are represented by very small sample sizes.

Both CWW and telecommuting have marginally better VTR performance, as computed on the basis of mode shifts alone, when implemented with high transit availability. For CWW, programs with high transit availability average a VTR of 27.4 percent, compared to 25.1 percent without. Programs with telecommuting average a VTR of 26.4 percent with high transit availability versus 25.9 percent without. At medium and low transit availability levels the effects vary as to whether the work schedule program is associated with a positive or negative difference.

**Alternative Work Arrangements in Relation to Level of Employer Program Support and Employer Transportation Services.** No clear or intuitive relationships emerge from examining alternative work arrangements in the context of employer support levels. For the most part, the same must be said for combinations involving transportation services. In the case of transportation services, particularly small sample sizes impede the effort to reach substantive conclusions.

Note: Compressed work week and telecommuting VTRs as calculated reflect only mode shift effects and not trip elimination benefits.

Sources: Derived (see Appendix Table 19-A) from Comsis (1994), Comsis and ITE (1993), Rutherford et al. (1994), and Comsis et al. (1996).
It can be said, however, that programs offering vanpool or vanpool-plus-transit services perform better overall without work hours strategies than in their presence. Employer programs without any transportation services are the ones that appear to do better with alternative work arrangements strategies. Among programs without services the highest calculated VTRs are found in the presence of flexible hours (17.9 percent VTR with versus 9.7 percent without) and CWW (16.2 percent VTR with versus 12.3 percent without).

**Alternative Work Arrangements in Relation to Parking Pricing and Management.** The top portion of the second page of Table 19-16 highlights the effects of alternative work hours strategies when combined with restricted parking, parking fees, and HOV parking discounts. Of the 35 programs with restricted parking, 20 also featured flexible hours, five had staggered hours, 11 offered CWW, and five had telecommute programs. In all cases except staggered hours, the work hours strategy is associated with a greater VTR when it is included than when it is not. Restricted parking with flexible hours exhibits an average VTR of 28.5 percent compared to 19.2 percent without flexible hours; restricted parking with CWW has a 29.1 percent VTR versus 22.5 percent without; and restricted parking with telecommuting added has a slightly higher VTR with (26.5 percent) versus without (24.3 percent). As a reminder, these VTRs are computed with reference to mode shifts alone. Where staggered hours are found with restricted parking the VTR is 19.2 percent compared to 25.4 percent without.

The apparent effect of linking work hours strategies with parking fees is similar in pattern to that of restricted parking, but less pronounced. Flexible hours found in the presence of parking pricing yields an average VTR of 25.2 percent, versus 23.4 percent without flexible hours. Staggered hours in this case exhibits a positive association, showing an average VTR of 27.2 percent with staggered hours and 24.2 percent without. CWW teamed with parking fees has a VTR of 28.2 percent, compared to 22.3 percent without CWW. Telecommuting has the most neutral association of the work hours strategies, showing essentially no difference between programs with versus without parking pricing when examined on the basis of mode shifts alone.

Finally, variable hours in relation to HOV parking discounts present a mixed bag. Table 19-16 indicates that HOV parking discounts exhibit higher VTRs in the presence of CWW and telecommuting than without, while the opposite occurs in the presence of flexible and staggered hours. Exactly why this may be is unclear. With CWW and telecommuting, the direction of the effect is consistent with the restricted parking and priced parking relationships, but with staggered hours and particularly flexible hours, it is not.

**Alternative Work Arrangements in Relation to Modal Subsidies.** Flexible hours appear to combine well with transit subsidies, travel allowances, and other monetary incentives, but not with vanpool subsidies. This parallels the earlier observation that flexible hours seem to have a positive relationship with employer-provided transit service, but a negative effect with vanpool and transit/vanpool. The same is seen for CWW, with VTR impacts complementary for all incentive strategies but vanpool subsidies. Telecommuting shows a positive effect only with transit subsidies, as calculated on the basis of mode shifts alone. Finally, staggered work hours show a positive effect only with the travel allowance incentive.

**Alternative Work Arrangements in Relation to Each Other.** The final comparison in Table 19-16 examines the outcome when different alternative work hours strategies are combined with each other. Note that to read and interpret this table, the same rules of order apply as in the preceding comparisons: For a program with the strategy listed as a row, each VTR number in the row corresponds to the average observed when the strategy listed as the corresponding column is or is not applied. To illustrate, of the 45 employer programs offering flexible hours, four of those programs
also included staggered hours (presumably for different employees). They have an average VTR of 27.2 percent, while those without staggered hours average 19.5 percent. (One might well surmise that the reason for the significantly enhanced performance of these particular four programs is something more than just inclusion of a staggered work hours strategy.)

Reviewing the table, flexible hours programs exhibit a higher calculated VTR when combined with staggered hours (27.2 versus 19.5 percent VTR) and CWW (24.2 versus 16.6 percent), but not when telecommuting is offered (19.1 versus 20.5 percent). Staggered work hours programs are apparently enhanced by the addition of each of the other work hours strategies. CWW programs are found to perform better when combined with flexible work hours (24.2 versus 4.1 percent). The sampled CWW programs exhibit somewhat lower efficacy in combination with staggered hours and telecommuting. Like staggered hours, telecommuting programs appear to be enhanced with the addition of any of the other work hours programs. They exhibit higher VTRs in the presence of flexible hours (19.1 versus 10.4 percent), staggered hours (16.9 versus 16.5 percent), and CWW (17.1 versus 14.6 percent).

As stressed in the introduction to this discussion, all combinations involving compressed work hours and telecommuting would be associated with higher VTRs than reported above and in Table 19-16 were it possible to include the effect of trips eliminated outright in computations made with the 82-program sample. It is thus particularly important to make full use of such additional research evidence as it is available, which is the subject of the next subsection.

**Additional Research Evidence on Alternative Work Arrangements**

While alternative work arrangement strategies like flexible work hours, CWW, and telecommuting are widely applied as TDM strategies, the amount of quality public information providing a quantitative insight into the effectiveness of these programs is surprisingly limited—most particularly for recent years. This research shortcoming notwithstanding, this subsection supplements the preceding descriptive analysis of the 82-program sample with a selection of individual studies out of the literature that offer additional information on this important category of TDM strategies. While some of these examples are rather dated, several represent carefully constructed experiments, and their value—as should be evident—is not necessarily diminished by time.

The one major question with respect to the older studies, especially those from the 1970s, is whether and to what extent the fresh ground plowed by the early experiments and demonstrations focused on mitigating traffic peaking still exists. The U.S. Department of Labor data reviewed immediately below suggests that the baseline ambient peak-spreading effects of flextime in particular must now be more extensive than earlier. The further peak-spreading possibilities for alternative work hours may thus be diminished by the smaller remaining increment of potential. The degree to which this may pertain can be assessed in individual cases by determining the amount of travel peaking found in the “before” condition. Note that the concern expressed here is much less likely to be of importance with regard to either mode shift or trip reduction findings/outcomes.

**Flexible Work Hours.** The U.S. Department of Labor has reported that, in 2002, almost 29 percent of the U.S. workforce of full-time wage earners and salaried employees had schedules permitting them to vary the time they begin or end their day. Interestingly, only about one-third of those employees worked for companies with official flextime policies. The proportion of such workers has grown slightly since the U.S. Department of Labor’s previous survey in 1997, when 26.6 percent reported working flexible schedules. More striking is the comparison with 1991, when just 15 percent of workers had flexible hours options. Flexible schedules were found, in 2002, to be most
common among executives, administrators and managers, with 45.5 percent able to vary their schedules. Almost 41 percent of sales personnel were also able to adjust their schedules (Associated Press, 2003).

At Bishop Ranch in exurban San Francisco, flextime policies were a major part of employee commute assistance programs for major employers relocating to this business park from downtown San Francisco. Faced with a local traffic management ordinance requiring a reduction not only in vehicle trips, but also in the number of those trips occurring in the peak hour, flextime was found to be very effective in shifting employee arrival times to less congested periods. A survey of 14,800 employees 2 years after the opening of Bishop Ranch showed an increase from 8 percent to 17 percent in the percentage of employees starting work before 7:00 AM. The percentage starting after 9:00 AM increased from 1 percent to 9 percent. Departure peaking also was reduced, with the percentage of workers leaving before 4:00 PM increasing from 12 percent to 17 percent (Beraldo, 1990).

About 6,000 employees from 23 San Francisco employers participated in a broad-scale trial offering of flextime in the 1980s. Post-implementation surveys showed at least one-half of the participants arriving to work 30 or more minutes earlier than before flextime, with many arriving before 7:00 AM. By traveling before the main peak period, those arriving by car or by carpool saved an average of 9 minutes each trip, with over 60 percent reporting much less congestion on the way to work (Jones, 1983).

The larger trial in San Francisco was preceded by the Downtown San Francisco Flextime Demonstration Project. Through surveys of participating employees, researchers found that the start-time peaks of three employers offering flextime were significantly smaller than the peak for downtown employees as a whole and/or they occurred before the downtown peak. Employers surveyed included the California State Automobile Association (CSAA), Metropolitan Life, and Fireman’s Fund, with findings as illustrated in Table 19-17. The peak 30-minute arrival period for downtown employees as a whole was 8:00 to 8:30 AM. Of all employee arrivals, 61 percent occurred during that period. Among variable work hours participants, the CSAA employee arrival peak was 40 percent, during the same time period; the Metropolitan Life peak was 53 percent, occurring between 7:00 and 7:30 AM; and the Fireman’s Fund peak was 34 percent between 7:30 and 8:00 AM (Harrison, Jones and Jovanis, 1979). This experience provided early corroboration with other evidence that typical flextime employees in the United States, as well as in Germany’s extensive programs, select earlier arrival schedules than the pre-existing norm (Pratt and Copple, 1981).

In 1978, the U.S. Department of Transportation’s Transportation System Center (now Volpe Center) in Cambridge, Massachusetts, conducted a 1-year experiment of flextime offered to its 600-person staff. It was able to stage an evaluation of the test using the monitoring resources of its Service and Methods Demonstration program.
Beginning in March 1978, Transportation System Center employees were given the flexibility to shift their time of arrival from the existing 8:15 AM to a larger period extending from 7:00 AM to 9:30 AM. A core workday of 9:30 AM to 4:45 PM was maintained, and employees could arrive and depart when they chose around these hours so long as they worked a full 8-hour day with a mandatory 30-minute lunch period.

The majority of employees opted to adjust their schedules under this arrangement, shifting the mean arrival time to 7:55 AM. The distribution of arrival times around this mean was fairly symmetrical, with a 32-minute standard deviation. About 56 percent arrived at or before 8:00 AM, and 14 percent at or after 8:30, meaning that 30 percent arrived in the 8:00 to 8:30 time frame. In this program, employees were also allowed to vary their schedules from day to day without prior approval. This feature showed surprising variation, with more than one-half of all workers deviating more than 10 minutes from their mean arrival time more than one-half of the time. Among the reasons given for adjusting their schedules, the top two reasons were “to accommodate after-work activities” (72 percent of all responding) and “avoiding traffic congestion” (cited by 69 percent of respondents) (Ott, Slavin, and Ward, 1980).

In September 1974, the Port Authority of New York and New Jersey began a flexible hours experiment that lasted 8 months and involved about 850 headquarters staff. Those involved in the experiment included employees previously on staggered hours and also those on a normal work schedule. The basic 5-day work week remained unchanged for flexible hours program participants. The total expanded day covered the period between 8:00 AM and 5:30 PM, during which time employees were required to be at work for a core period between 9:30 AM to 4:00 PM. Workers were given 45 minutes for lunch. The 1-1/2 hour periods preceding and following the core period were flexible periods within which the employee could vary time to any extent, as long as a 40-hour work week requirement was fulfilled.

To support evaluation, arrival and departure counts were made before and after the experiment, for both participants and also two control groups of employees whose work schedule (floating day and normal) did not change. Because the different participating and control groups also worked on separate floors, arrival and departure times by floor could be meaningfully com-

pared, as illustrated in Table 19-18. Fifteen-minute work floor arrival and departure peaks were decreased by 13 percentage points (from 31 percent to 18 percent) and 10 percentage points (from 35 percent to 25 percent), respectively, on floor A, where the majority of employees changed from a conventional fixed schedule to flextime. Meanwhile, peaking changes were insignificant on the floors that changed from staggered hours to flextime (Port Authority of New York and New Jersey, 1975).

Note: Arrivals and departures were surveyed on the individual work floors. The surveys included some employees not participating in the flexible work hours experiment.

Source: Port Authority of New York and New Jersey (1975).

The association between allowing flexible arrival/departure times and employee choice of mode is somewhat unclear, and may depend significantly on the conditions placed on the flextime policy by the employer or institution. In many of the examples within the 82-program sample, flextime was a special privilege made available to employees using alternative modes, with flextime intended to provide additional latitude for accommodating the schedules of transit service or of a ridesharing unit. Indeed, the regional rideshare agency in the San Francisco Bay area found the placement rate among its rideshare applicants on flextime to be 30 percent compared to 16 percent for applicants not on flextime (Burch, 1988).
In the Transportation Systems Center flextime study described above, 9 percent of workers were found to have changed modes due to flextime, with a small net change in favor of ridesharing (+2.0 percent) and transit (+1.0 percent) and a reduction in driving alone (−3 percent), primarily attributed to savings in travel time offered by a schedule shift (Ott, Slavin, and Ward, 1980). Employee surveys in Pleasanton, California, suggested that only 7.6 percent of workers under flextime also rideshare, compared to 11.4 percent of the entire Pleasanton workforce (Cervero, 1988). Another study covering flextime, as introduced at the Tennessee Valley Authority (TVA), suggests a 2 percent loss in vanpool ridership paired with a much larger loss in bus ridership. Vanpoolers adjusted vanpool schedules to meet rider preferences for earlier arrivals, but bus schedules were not changed in a similar way, and bus ridership fell by 21 percent (Wegmann and Stokey, 1983).

In-depth survey results for the CSAA organization (see Table 19-17 for arrival times) showed that flextime had especially aided work trip ridesharing among friends and family, a particularly resilient form of carpooling (Harrison, Jones, and Jovanis, 1979; Pratt, Pedersen, and Mather, 1977). Among six early implementers of flextime in the San Francisco Bay Area, ride-sharing was the big beneficiary, with shared-ride increases ranging from 1 percent to 28 percent.10 Drive-alone activity decreased in all cases, with declines between 3 and 26 percent for the three employers with significant drive-alone activity. Transit mode share impacts were mixed, with shifts ranging from −22 percent to +8 percent, with three losers and three gainers (Harrison, Jones, and Jovanis, 1979; Jovanis and May, 1979).

The early observation that “The majority of actual before and after survey data . . . indicates at worst an insignificant or neutral effect on single occupant auto usage and gives some evidence of a predominance of mode shifting to carpools” (Pratt and Copple, 1981) seems borne out by more recent information. However, there is one caveat: Particular circumstances, as in the TVA example above, may cause atypical and undesirable shifts.

Staggered Work Hours. The state of Hawaii, as a demonstration project to determine whether spreading arrival times of downtown workers would relieve peak-period congestion, changed official office hours for state, city, and county employees from 7:45 AM–4:30 PM to 8:30 AM–5:15 PM for a test period covering February 22 through March 18, 1988. Private sector participation was encouraged but not required. About one-half of all public sector employees shifted their work hours to the prescribed later schedule, while only 8.4 percent of private employees shifted schedule (Giuliano, 1992).

The net effect was that about 4,000 workers, or 6 to 7 percent of the downtown workforce, participated in the project. The shift in start times was judged to have had a significant positive effect on traffic conditions. Average estimated time savings for commuters were 3 to 4 minutes, or 7 to 9 percent of the average 45-minute commute time. Travel-time savings differed by route and time of day. The project did spread out peak travel, which improved conditions for those traveling during the most-congested time periods, but made conditions slightly worse for those already traveling during the less-congested time periods.

Most project participants experienced little or no significant change in travel conditions during the project, with some important exceptions. Participants from the most distant suburbs who had previously worked the 7:45 AM–4:30 PM schedule saved 9 to 15 minutes (15 to 25 percent), while those

---

10 The percents reported here are not percentage point changes but are relative percentage shifts.
who had been starting work prior to 7:30 AM experienced increased travel time of up to 10 minutes (30 percent relative to their originally shorter travel times). Demographic characteristics of participants and non-participants were quite different. Non-participants had more children, used child care services, were younger, and a higher percentage were female. Participants were more likely to be in professional or technical occupations and to be from households with fewer numbers of workers. Participants were also more likely to be car drivers, and reported more problems with time pressures or schedule constraints (Giuliano, 1992).

Flexible and Staggered Hours Employee Involvement. An important consideration in any variable work hours program, be it flexible/staggered work hours or CWW, is that a sufficiently high percentage of the employment base needs to participate in the program. If peak-spreading and congestion reduction are the primary objectives (as opposed to mode shifts and vehicle trip reduction), then enough employees must be involved in order to have a tangible effect on total travel volumes.

In Ottawa, for example, where the Canadian government is the dominant employer, it was possible to include almost all government workers—and thus almost 50 percent of the central area workforce—in a variable work hours program. Peak hour to peak period ratios for transit rider loads were reduced by 8 to 19 percent at the downtown Ottawa cordon and even more as measured at the workplace (Safavian and McLean, 1975). (See “Site- Versus System-Level Impacts” under “Related Information and Impacts” for additional detail on Ottawa highway and transit impacts.) About 100,000 out of some 480,000 Lower Manhattan employees eventually became involved in a program jointly sponsored by the Port Authority of New York/New Jersey and the Downtown-Lower Manhattan Association. Transit passenger counts at key subway stations were lowered by 18 to 26 percent (O’Malley and Selinger, 1973). (See the case study “Staggered Work Hours in Manhattan—New York, New York” for more.) Thanks to U.S. federal government support, circa 1980 variable work hours programs in Washington, DC, and Denver likewise involved substantial portions of both the federal, as well as the overall, employment base (Pratt and Copple, 1981).

Given a choice, uninitiated employers—at least prior to more experience with flextime—have preferred the concept of staggered hours to flexible hours, since flexible hours puts considerably more discretion in the hands of the individual employees, making the number of employees who will show up at any given time less certain. However, evidence from the 1970s experiments in Manhattan and San Francisco suggested that employees on flexible hours do tend to stagger their own work hours. Between 73 percent and 75 percent of employees involved in those flextime programs reported selecting work arrival and departure times designed to avoid traffic and transit congestion. The trip timing results were comparable to those achieved with typical staggered hours schedules (Pratt and Copple, 1981). It should be noted, however, that certain more recent suburban applications (Bishop Ranch and Pleasanton in California) stand as exceptions.

Compressed Work Week. In the early 1980s, a carefully controlled experiment involving CWW schedules was staged in Denver, involving about 9,000 federal employees in 42 separate agencies. The participation within federal agencies exposed to the program was 65 percent. The most popular schedules were the 9/80 and the 4/40, which resulted in participants arriving at work an hour earlier and departing about an hour later than before. The program was shown to flatten the peak, with the maximum percentage of total arrivals in the peak half hour declining from 56 percent to 42 percent, and the equivalent percentage of departures dropping from 47 percent to 34 percent. Evaluations suggested that the CWW strategy had only small effects on aggregate ridesharing and transit mode shares. Within the aggregate figures, matched data did show that non-participating employees showed decreased ridesharing and increased solo driving and transit use, largely counterbalanced by increased ridesharing by participants. It was inferred that ridesharing arrangements had been disrupted for non-participants, but it was also evident that those electing CWW had been able
to form carpools and to do so to a greater degree than before (Atherton, Scheuernstuhl, and Hawkins, 1982; Cambridge Systematics, 1980).

The Denver Federal Employee CWW experiment found, with regard to travel mitigation, that net household VMT reductions for both work and non-work travel together averaged 14 to 15 percent for participating employees. This determination took into account not only commute VMT savings from the 1 or 2 days per week where travel to work was not required, but also household travel effects for the full 7-day week. The strong implication from the Denver evaluations is that CWW allowed more efficient accomplishment of non-work travel objectives, may have discouraged travel on the inherently longer workdays, and did not induce expanded weekend travel. Similarly, no expansion of out-of-area travel and no offsetting of work trip VMT savings were observed in Washington, DC, federal CWW applications (Cambridge Systematics, 1980; Skinner and Shea, 1981; Atherton, Scheuernstuhl, and Hawkins, 1982).

As part of its effort to meet the trip reduction requirements of the Air Pollution Control District’s Rule 210 (predecessor to Regulation XV), Ventura County tested a variable work hours program consisting of flextime and both 9/80 and 4/40 work weeks. Commuter Transportation Services, Inc. (CTS) conducted a 6-month pilot project to determine the impact on ridesharing and organizational effectiveness. A total of 367 employees were involved, with 172 adopting a 9/80 schedule, 76 on flex-time, and 33 on a 4/40 schedule. The remaining 86 either did not opt for one of the variable work hours offerings or chose to discontinue participation somewhere in the 6-month program.

Survey information revealed that drive-alone rates in the sample of 367 declined from 82.2 percent to 76.6 percent over the course of the project, while ridesharing rates increased from 8.0 percent to 12.8 percent, and use of “other” methods increased from 9.8 percent to 10.6 percent. While the CTS evaluation also determined that commute time decreased for persons participating in one of the variable work hours programs, the actual amount of time saved was not determined, nor was a link drawn between the specific variable work hours program and the pattern of mode shifts. The time savings was believed to be related to shifting out of peak period traffic and possibly also to the ability of ridesharing participants to use carpool lanes (Freas and Anderson, 1991).

A 1995 study of the effects of CWW on employee travel by the California Air Resources Board found that 2,600 Southern California employees on CWW schedules reduced their net number of trips by an average of 0.5 per week. Those employees working a 9/80 schedule drove an average of 13 fewer miles per week, while those working a 4/40 schedule drove an average of 20 fewer miles per week (Association for Commuter Transportation et al., 2004).

Analysis of Washington State CTR Program data indicates that employee participation in CWW schedules at CTR-covered employers grew steadily from 14.5 percent in 1993 to 20.0 percent in 2005. The 2005 rate was in a context where roughly 2/3 of CTR Program employees were apparently eligible to choose CWW. Participation in 9/80 schedules doubled between 1993 and 2005, to 5.8 percent. Participation in 4/40 schedules grew more slowly, but still remained most prevalent at 7.3 percent. The 3/36 variation, common in health care facilities, attracted 2.3 percent of employees covered by the CTR program in 2005, with a health care worker participation rate of 33.6 percent. A related notable statistic was the craft/production/labor employee CWW participation rate of around 24 percent, actually a shade higher than the rate for professional/technical employees (Zhou and Winters, 2008). More information on relationships between CWW involvement and worker characteristics is found in the upcoming “Underlying Traveler Response Factors” section, under “Individual Behavioral and Awareness Considerations”—“Alternative Work Arrangements Considerations.”
Telecommuting. A 1992 national telecommuting survey obtained information on telecommuting behavior from 16 organizations representing almost 5,000 telecommuters. The organizations consisted primarily of government agencies (13) and telecommunications companies (2). One of the 16 was a telework center. While the overall size of these organizations is not known, the number of telecommuters ranged from seven to 2,600, with a mean of 310 and a median number of participants of 82. The great majority of employees taking part in these telecommute programs were found to be in professional (61 percent) or managerial (23 percent) occupations, with clerical and data entry (14 percent) and other classes of employees (2 percent) making up the remainder (Rathbone, 1992). (More information on telecommuter demographics, job types, and workplace characteristics is found in the above-mentioned “Individual Behavioral and Awareness Considerations” discussion.)

The most common telecommute schedule found in the 1992 survey was 1 day per week, representing 55 to 59 percent of the sample (depending on interpretation), followed by 18 percent who telecommuted 2 days per week. On the other hand, 12 percent were found to telecommute 5 days per week. The organization with 2,600 participants, a county government, reported telecommuting frequency distributions of 5 days per week (1 percent), 4.5 days (6 percent), 3 days (14 percent), 2 days (53 percent), 1 day (8 percent), 1 day per 2 weeks (13 percent), and 1 day or so per month (5 percent) (Rathbone, 1992), for an average of 1.96 days per week. Most of the 16 organizations surveyed reported telecommuting rates that average 1 to 2.3 days per week. The 2 outliers are the telework center with 24 participants averaging 4.8 days a week and a transit agency with 10 clerical workers telecommuting 5 days a week (clearly a telephone service-information operation). The average for the overall sample is 1.8 days per week and the median is 1.6.

It is important to note that only a fraction of responding organizations in the 1992 survey reported telecommuting at frequencies of less than 1 day per week, creating some ambiguity. A 2002 Southern California Association of Governments (SCAG) home-based survey of about 5,000 Southern California residents does fully address infrequent telecommuting, having first identified persons in the workforce, and then the telecommuters among them, and finally those who telecommuted in the previous week. A strict definition of telecommuting was utilized, eliminating home-based-business workers and overtime home-workers. Out of 2,766 workers, 24.6 percent were employees reporting at least 1 day of teleworking in the last 2 months, 7.0 percent were home-based-business workers, and 68.4 percent were non-teleworking employees. Table 19-19 provides a telecommuting frequency analysis derived using a final frequency analysis sample of 499 telecommuters (Walls, Safirova, and Jiang, 2007).
From Table 19-19 it may be calculated that workers who had telecommuted the previous week averaged 3.2 days per week of telecommuting. If one makes an assumption that the remaining telecommuters averaged 0.25 telecommutes per week, then the average per week for all persons in the telecommuter sample was 1.7 telecommutes per week. Applying this all-telecommuter rate back to the full sample suggests an all-worker rate of 0.4 telecommutes per week for the 2002 Southern California working population as a whole.

There are contemporary estimates of telecommuting that may appear to be, but are not necessarily, higher. For example, it has been concluded that data collected in national workplace surveys suggest that “the incidence of work at home at least one day per week ranges from 8.9 percent of all employed persons in Ireland to 11.1 in the UK and 15 percent in the US” (J. H. Pratt as quoted in Lyons, Farag, and Haddad, 2008). From the SCAG survey findings for telecommuters, it may be computed that 12 percent of Southern California employees telecommute at least 1 day per week (48 percent of 24.6 percent). However, since the quoted international comparison appears to include home-based-business workers and may even include overtime home-workers, which the SCAG analysis does not, the Southern California rate is most likely highest when placed on equal footing.

A definitively higher estimate of telecommuting comes from Washington State, although this estimate is based on surveys limited to firms in the state’s CTR program (generally firms of over 100 employees). In 2007, telecommuting displaced about 2 percent of commute trips among the covered firms. Periodic surveys have showed a slow but steady increase in telecommuting (Hillsman, 2009). Quite possibly increasing gasoline prices were a factor up through the latest available survey dates. Increases in telecommuting have also been reported from the United Kingdom, which lags a little behind the United States in adoption (Lyons, Farag, and Haddad, 2008).

Turning to observed commuter response to telecommuting, there are several demonstration programs of interest. Beginning in 1990, the Washington State Energy Office staged a 2-year Telecommuting Demonstration project in the Puget Sound area involving 25 public and private organizations and 280 participants. In structuring the monitoring and evaluation of the experi-

Source: Derived from Walls, Safirova, and Jiang (2007).
ment, the researchers obtained information through surveys, travel logs, and related media using four groups of people: telecommuters, their supervisors and co-workers, and a comparison group. Most of the telecommuters were home-based, but 24 individuals from nine organizations used the Energy Office’s new State Telework Center. Pre-program surveys revealed that 61 percent of the telecommuters previously drove alone to work, 18 percent used carpools, 17 percent used transit, and the remainder walked, biked, or were dropped off. The comparison group was similar, but with lower use of carpools (12 percent). These proportions did not change significantly over the demonstration, with 63 percent of telecommuters and 64 percent of the controls reporting drive alone as their usual method of reaching work. Average commute trip length for telecommuters was 18 miles, compared to 8 miles for the comparison group and 10 miles on average in the Puget Sound region, suggesting that telecommuting is particularly attractive to employees living a long distance from work.

The survey data indicated that by the end of the demonstration, telecommuters had reduced their total commute trips by about 26 trips per year, while members of the comparison group reduced their trips by 10 per year, primarily as a result of shifts in mode motivated by the employers’ commute assistance programs. A travel log analysis revealed that telecommuters were saving trips and miles traveled on their telecommute day, and not making up for lost trips on their non-telecommute days. Before the program began, the telecommute participants made 4.3 trips per day, corresponding to 52 miles in 101 minutes. One year later, they made 2.6 trips per day on telecommute days, traveling 13 miles in 35 minutes, and on non-telecommute days made 3.9 trips, going 49 miles in 91 minutes. Sample size limitations prevented an analysis of use by other household members of the telecommuter’s car on telecommuting days. Telecommuting was estimated to have reduced average commute VMT per telecommuter on telecommute days by 36 miles, netting out to 29 miles after accounting for mode shifts.

In the special case of the telework center, travel data indicated that vehicle trips did not decrease for these participants, since they still had to commute to the center. Furthermore, while only 56 percent of these telecommuters drove alone to the main work site, 83 percent drove alone to the telework center (Washington State Energy Office, 1992).

A Southern California telecommuting test among SCAG employees in 1988 showed a reduction in person trip miles as a result of work trips avoided and shorter trips to telework satellite centers. The average net person trip distance reduction was 46 miles for each telecommute occasion. Allowing for the usual mode of travel for telecommuters—accounting for the fact that some normally used transit or carpool—31 vehicle miles of travel were saved per telecommute. Fourteen percent of SCAG’s employees participated in the experiment, with average participation being once every 9 days. Most worked from home, and one worked at a satellite work center. The SCAG experiment showed some increase in non-work trips due to telecommuting. It was estimated that VMT “created” as a result of working at home amounted to 14 percent of the miles saved; therefore, the net savings in VMT per telecommute was 26 miles, not 31 (SCAG, 1988).

The state of California also conducted a pilot telecommuting project in the late 1980s, involving over 400 state employees across 13 agencies (both participants and non-participating “controls”). The findings suggested that physical trips to work by telecommuters decreased by 30 percent, from 0.90 to 0.63 trips per day, compared with non-telecommuters whose rates did not change. Those participating were found to telecommute 1 to 2 days per week. Preliminary findings showed no increase in non-work trips by telecommuters, but instead found a reduction in non-work trips for other household members. Non-work person trips fell by 35 percent, from 3.6 to 2.3 per day (Kitamura et al., 1990).
In Hawaii, the state department of transportation conducted a satellite telecommute demonstration project in which it established a telework center in Mililani, Oahu, located 20 miles from downtown Honolulu. Seventeen employees participated in the demonstration (seven public sector and 10 private sector). An evaluation found that 93 percent of the employees experienced a reduction in number of work trips and an average drop in fuel consumption of 29 percent. Travel time savings averaged 7.4 hours per week (Giuliano, 1992).

An important 1990s synthesis-type study on telecommuting aimed at providing a framework for more accurately estimating the travel benefits associated with telecommuting. A model proposed on the basis of this synthesis accounts for two essential factors when attempting to estimate telecommute VMT savings:

1. Determining the amount of telecommuting that occurs on a given day.

2. Determining the actual vehicle miles of travel avoided as a result of a telecommute event.

In addressing the first factor, cross-sectional data from various telecommute programs (including Puget Sound and the state of California) were used to conclude that about 16 percent of all employees are in a type of occupation where they can reasonably telecommute, that 50 percent of these will want to telecommute, 76 percent of these will actually participate, and—based on an average frequency of 1.2 days per week—about 24 percent will telecommute on a given day. When these proportions are jointly accounted for, the model projects that about 1.5 percent of the workforce could and would telecommute on a given day (Mokhtarian, 1998).

In terms of the second factor, telecommute day VMT reduction, the study points out that not every telecommute event results in a VMT reduction equal to the commute trip length. The reasons are that not all of these trips are otherwise made as drive-alone, that some workers actually drive in to the worksite for all or part of their telecommute day, and that there may also be an increase in non-work trips taken that day. The analysis estimates that about 82 percent of telecommuters normally drive alone—compared to a national average for all commuters of 73.2 percent in 1990—and that about 6 percent will actually commute on the telecommute day. These estimates suggest that a telecommute day only eliminates a vehicle trip 76 percent of the time (82 percent drive alone less 6 percent actually commuting). When taken together with the proportion of the workforce that would telecommute on a given day, the evaluation framework estimates that the average daily VMT reduction per employee achievable with a (regional) telecommuting program would be 0.5 miles on an average round trip by SOV of 43 miles, or roughly 1 percent.

In light of these calculations, the researcher concludes that it would be unlikely that a TDM program based purely on telecommuting would ever reduce travel sufficiently to obviate the need for new transportation capacity. Also, if certain assumptions are made in the model with regard to residential relocation or induced demand enabled by telecommuting, the travel stimulation effects could equal or exceed the VMT reductions from telecommuting (Mokhtarian, 1998).

**UNDERLYING TRAVELER RESPONSE FACTORS**

The travel response of commuters to TDM initiatives involves many of the same underlying individual behavioral and decision processes found to influence response to most types of transportation system changes. In the case of TDM, however, there are more layers of factors involved. Some are fairly unique to TDM. The environment is relatively atypical as well. While individual com-
mater response to TDM in part involves normal travel choice and decisionmaking functions, the context is one where peer (or supervisor) influences and corporate culture may be uniquely important. The “changes” involved—produced by the TDM strategies themselves—are dependent on choices by the employer or institution. Employee awareness of travel options can also be significantly affected by the organization.

These managerial outcomes in turn will have been influenced by the needs being addressed by the TDM program and the laws and regulations involved (or not involved). Overall effectiveness will be a function of not only employee participation and response, but also the precursor employer participation and response. This section, along with additional topics in the “Related Information and Impacts” section, seeks to illuminate key aspects of these underlying influences on how TDM programs are likely to be implemented and how effectively they will influence travel decisions.

Individual Behavioral and Awareness Considerations

As alluded to previously, a commuter’s travel response to TDM programs represents a complex intermixture of individual behavior presumed to conform with established travel demand theory plus less-well-understood interactions with workplace dynamics. Lifestyle and life cycle impacts also seem to be more evident than in the response to more conventional transportation system changes, either because they are in fact more important in the case of responses to TDM or perhaps because they simply have received more attention given the shorter-term focus and more individualized nature of TDM actions. This subsection starts with examining the role of tripmaker economic utility decisions and then proceeds through other layers of influences including barrier effects, interactions of the employer and employee, special considerations involved in alternative work arrangements, and employee awareness of available program elements.

Time, Cost, Convenience, and Barrier Effects

Travel demand theory suggests that travelers’ choice of travel mode is heavily tied to the comparative economic utility among the alternatives. This utility is most commonly expressed in terms of travel time, travel cost, and certain measures of convenience. In this paradigm, travelers see additional travel time, cost, or inconvenience as a “disutility,” and make their choices in such a manner as to minimize this disutility.

In the majority of cases facing commuters nationwide, the private automobile offers the lowest disutility. This is because its users have little difficulty accessing it at the beginning of the trip, generally pay no direct cost to use public roadways, and in most cases can park for free or at a substantial discount at the employment site. These advantages are particularly evident for commute trips beginning or ending in suburban areas. With such advantages, along with the convenience of being able to define one’s own schedule of departure and arrival, it is little surprise that the majority of commuters opt to use their private vehicle. The alternative commute modes involve the effort and time constraints of participating in a carpool or vanpool, or taking the time to travel by walking or bicycling, or having to drive or walk to a transit line where there may be a wait for the vehicle to arrive—with potentially no unoccupied seat and certainly requiring payment of an often substantial fare. The situation is not helped by the fact that, once in the carpool, vanpool, or transit vehicle, the commuter is most often stuck in the same traffic congestion as the private car, minimizing any apparent advantage to switching modes. There are also related barrier effects where, for example, use of transit may not be feasible because of lack of a connection or service at the needed time.
One thing TDM must do in order to be effective is to change the equation by making the alternative modes more attractive in terms of relative time, cost, and convenience and by addressing related barrier effects. Preferential closer-in parking for carpool and vanpool, and contract transit service enhancements that lessen wait for a bus, are examples of strategies with elements of time saving and enhancement of convenience.

Straightforward incentives and disincentives directly address the cost component of the utility equation. Transit, vanpool, carpool, and walk/bike subsidies provide monetary savings to the employee through choice of the covered alternative commute modes. Parking pricing impacts the cost equation by enhancing the out-of-pocket cost advantage of alternative modes. The companion strategy (or phenomenon, as the case may be) of restricted parking supply makes driving and parking less convenient and more time-consuming by increasing uncertainty about space availability and often lengthening the walk from parking to the workplace.

Commute mode choice response to travel time, cost, and certain convenience changes introduced by TDM actions may be anticipated using travel demand model relationships. Table 19-20 lists key mode choice model coefficients averaged across 1990–2002 modeling results from 26 urban areas across the United States. Ranges are also provided. These coefficients were assembled as part of an update to EPA’s COMMUTER model (U.S. Environmental Protection Agency, 2005), outlined in the “Additional Resources” section.

Each average coefficient in Table 19-20 is paired with commentary as to what it signifies with regard to how commuters weigh time, cost, and convenience factors in mode choice travel decisions. Convenience factors are implicit in the “Out-of-Vehicle” times: Walking implies something less than doorstep service, and waiting implies less than continuously or immediately available service. The higher these out-of-vehicle time values are the more inconvenience is implied.

### Table 19-20 United States 1990–2002 Mode Choice Model Coefficients with Interpretation

<td>-0.0135 to -0.0004</td>
<td>Dollar per dollar, transit fares are somewhat less onerous (less of a disincentive) than parking cost.</td>
</tr>
</tbody>
</table>

Notes: The coefficient ranges exclude certain values deemed by the researchers to be outliers.

The researchers report historic guidelines that conflict somewhat with certain interpretations provided in this table, most notably, that 1 minute of in-vehicle-time is only as important as 3 cents of parking cost ($1.80/hour value of time).

Source: U.S. Environmental Protection Agency (2005), with certain interpretations by the Handbook authors.
Barriers to the use of alternative commute modes are not amenable to incorporation as continuous variables in a forecasting relationship—they are more in the “go”/“no go” realm of cause and effect. Barriers are addressed by such actions as contracting to bring transit service to an otherwise unserved employment site. Shuttles connecting suburban worksites with outlying rail transit stations eliminate a barrier to employee use of time-competitive rapid transit or commuter rail services. Lockers and changing facilities address a barrier to active transportation—walking, jogging, or bicycling—by providing a place to freshen up and change out of athletic gear or informal clothing prior to reporting to work. Circulator shuttles or availability of company cars addresses the perceived or actual need for a car during the day for errands or company business, making use of any alternative commuting mode more tractable.

Need to drive alone in order to run errands or meet other family needs, such as childcare drop-offs and pickups en route to or from work, is a barrier effect similar to the need for having one’s own car at hand during the day. En route satisfaction of travel needs is a phenomenon addressed at the end of the “Underlying Traveler Response Factors” section, in the “Trip Chaining” subsection. A travel demand modeling effort to include both time, cost, and convenience factors on the one hand, and barrier (and other) effects on the other hand, is described in the “Related Information and Impacts” section under “Modeling Studies”—“California Air Resources Board Survey and TDM Program.”

**Facilitation and Encouragement**

Alternative mode use may involve new ways of doing things for the employee that are, or at least seem to be, complex. For example, formation of a vanpool is not a simple endeavor for the uninitiated. Even forming a carpool requires hard-to-obtain information on who is commuting in about the same direction at about the same time. In addition, vanpool and carpool formation and continuation involves interpersonal influences that may include possible reluctance to travel with strangers or to assume a lead role in organizing rideshare arrangements. These concerns and also uncertainty as to the risks and responsibilities involved are thought to be major obstacles to ridesharing (Pratt and Copple, 1981).

Help and encouragement in crossing these thresholds, in the example of vanpooling, is the function of vanpool formation and cost sharing assistance. Such programs provide facilitation through varying degrees of employer involvement in vehicle purchasing or leasing, underwriting of insurance and maintenance costs, or possibly providing and maintaining the vehicles themselves or arranging with another entity to do the same.

For encouraging use of the broader array of alternative transportation choices, transportation coordinator support, on-site transit information and pass sales, and rideshare matching services all serve to overcome the information barriers, discomfort, and uncertainty associated with forming group travel arrangements or taking the leap to become a transit or walk/bike commuter. Indeed, the whole array of “Support Action” strategies, addressed at the beginning of the “Response by Type of TDM Strategy” section, are focused on facilitation and encouragement.

The fear of being stranded at work in an emergency or because of unscheduled overtime is still another barrier. Guaranteed ride home is the strategy geared to addressing situations where alternative modes can’t themselves meet such off-schedule needs.

A factor that has characterized a number of the most successful worksite TDM programs, but is very hard to propagate on a multi-employer basis, is a deeply supportive company culture. One of the best examples comes from the 1970s and 1980s in the form of a program with heavy vanpool
emphasis, that of the Minnesota Mining & Manufacturing Co. (3M) in St. Paul. During this period the 3M vanpooling program attracted usage that recognized rules of thumb suggest should be improbable. It is hypothesized that the program may have been operating in a “supersaturated” mode in response to not only the 1970s energy crises but also a very special corporate enthusiasm and ethic. For a full discussion of this example, see Chapter 5, “Vanpools and Buspools,” under “Response to Vanpool and Buspool Programs”—“Employer Sponsored Vanpool Programs”—“Outstanding Employer Vanpool Programs.”

Alternative Work Arrangements Considerations

Variable work hours arrangements are somewhat unique among TDM strategies in that the trip timing decision process of the individual employee comes into full play when employees are given the discretion to choose their own work times, as with flextime. This decision process involves trade-offs among at least partially conflicting factors. A survey of California State Automobile Association (CSAA) employees early in the development of discretionary alternative work arrangements found four causal factors to be particularly important. These considerations were occupational factors (deemed important by 81 percent of surveyed employees), travel congestion effects (75 percent), social/family responsibilities (71 percent), and issues related to the use of alternative modes (92 to 36 percent depending on mode).

Occupational factors relate to employee matching of work hours to the needs of the office, which include work coverage requirements such as receptionist duties. Congestion effects relate to desired avoidance of rush hour conditions in order to shorten travel times or minimize the discomfort of crowding. Social/family responsibilities include the desire to spend more productive time at home with friends and family, and such responsibilities as seeing that children get to school or day care. Modal usage factors encompass the trip coordination required to participate in vanpools and carpools (increasingly important with increasing numbers of passengers) and to match transit schedules (50 percent responding important in the CSAA interviews) (Harrison, Jones, and Jovanis, 1979; Jovanis and May, 1979).

Modal usage factors would vary by location—the CSAA offices were in downtown San Francisco—and occupational factors would obviously vary in response to employer requirements. The interplay and relative importance of factors influencing changes in travel mode in conjunction with work time shifts have been difficult to research. Outcomes in relation to individual categories of employer and institutional TDM strategy have been examined in each subsection of the preceding “Response by Type of TDM Strategy” section.

Compressed work week (CWW) options introduce another dimension of travel pattern effects. They bring the opportunity and/or necessity for major non-work travel adjustments. Evidence from the federal employee experimental programs indicates that travel on the weekday off typically consists of urban trip tours of linked trips to multiple destinations, like normal Saturday travel, with trip purposes similar to the usual weekday non-work trips. Extension of weekday work trips to include intermediate linked-trip destinations becomes less common, either because non-work travel needs are met on the weekday off, or because the workday simply becomes too long for much detouring. Previous weekend travel may also be shifted to the weekday off (Cambridge Systematics, 1980; Skinner and Shea, 1981).

Regression analysis of CWW schedule participation among workers under the Washington State Commute Trip Reduction (CTR) program suggests that CWW is more attractive for employees with supportive employers, long commutes, and multi-modal commutes such as drive to transit. CWW participation is less among single-mode transit and shared-ride commuters. Work in man-
ufacturing and health care industries, along with government, was found to be a positive indicator for CWW choice. Work in information service/software was found to be negative for CWW, along with jobs involving management and administration (Zhou and Winters, 2008).

As will be seen, the employment-related positive/negative indicators for CWW participation have major differences compared to telecommuting. Indeed, few manufacturing firms are typically found among any other forms of TDM involvement. CWW appears to work well (quite likely in non-optional applications) for industries where workers must be present at their jobs, on a regular schedule. It thus may fill an important gap in the spectrum of TDM strategies. With regard to the lesser CWW participation among single-mode transit and shared-ride commuters, it is not clear if such commuters feel less urgency to work fewer days, prefer regular hours to support their choice of mode, or are more likely to give up on single-mode transit and shared-ride commuting.

Telecommuting adds even more decision dimensions, because it involves an actual shift in work location away from company facilities to the home or sometimes a telework center. Examination of telecommuter trip characteristics, demographics, job types, and characteristics of their employers, along with other information, provides a basis to make inferences about factors affecting telecommuting. The following information summarization is drawn from the literature reviews and modeling efforts of two California studies, one utilizing the 2002 home-based Southern California Association of Governments (SCAG) survey (Walls, Safirova, and Jiang, 2007) and the other a survey of residents in eight Northern California neighborhoods (Tang, Mokhtarian, and Handy, 2007):

- Longer commute trip distance and time are positive indicators for telecommuting adoption. (One reviewed study found the converse, but may have included home-based-business workers, with their trip distance of zero.) Modeling success using the square of distance suggests a heightening of positive impact for particularly long commute trips.

- Pay parking at the workplace is a positive indicator, as is the opportunity to make more money as a telecommuter. An increase in work-related costs and substantive technology requirements are negative indicators, as is reduced salary. Both the trip distance/time finding and these cost/income findings demonstrate once again the importance of time and money in commuting decisions.

- Findings are very mixed for the effect of gender. One reviewed study suggests, based on Montreal data, that the key relationship is one of more empowerment in the workplace being a positive indicator for telecommuting. Where women have less workplace responsibility and freedom of choice, the telecommuting rates tend to be higher for men relative to women.

- Presence of more than one adult in the household is a positive, but findings are very mixed for presence of children. If anything, children under 6 are a neutral or positive indicator, while older children (along with household distractions) are a neutral or negative indicator. Reported results are split between health limitations not being a factor and situations of disability or parental leave being a positive indicator for telecommuting.

- High incomes and a college education, along with other highly correlated factors such as age, are all broadly-reported strong positive indicators for telecommuting adoption—as is intensive and proficient use of computers.

- Work in architecture, engineering, other professions, education and training, sales, and senior or middle management are all positive indicators. Employment in the arts and entertainment, consulting, finance, insurance, and real-estate industries is likewise a positive indicator for telecommuting adoption.
• Work in health care, construction, maintenance, and production, along with employment in the transportation, communication, and retail trade industries are negative indicators. A distinction needs to be drawn between retail trade and sales, as the latter frequently involves home and business visits and is thus often conducive to telecommuting.

• Results are mixed for part-time work as an indicator. Being a contract or self-employed worker is a positive while being a full-time regular employee is a negative indicator.

• As might be expected, job suitability for telecommuting is a positive indicator, whereas the converse is a negative indicator, along with workplace misunderstanding and lack of manager support. Individual perception of a need for office discipline or desirability of face-to-face-communication or social interaction with co-workers is a negative indicator.

• Being a driver or driving to work is a positive indicator, along with perceiving the commute to be stressful. The influence of transit use or availability is mixed.

• Orientation to the family, desire for lifestyle quality improvement, enjoyment of walking, and preference for appealing outdoor landscapes are all positive attitudinal indicators for telecommuting adoption. A non-rural residential location and preference for regional accessibility tend to be negatives.

A potentially quite important finding from the SCAG survey modeling analysis is that employment in an organization with 25 to 249 employees is a negative indicator for telecommuting. The researchers hypothesize that the firms of under 25 employees offer a flexibility conducive to telecommuting, while firms of 250 and more employees are likely to have an established telecommuting program. Mid-size firms are thought not to offer either benefit, being too big for responsive flexibility and too small to support formal programs (Walls, Safirova, and Jiang, 2007).

Both of the California studies also looked at indicators of telecommuting frequency, as distinct from telecommuting adoption. Together, the literature reviewed and the studies’ original research suggest that many but not all of the same factors apply, certainly not always in similar degree, but generally in the same positive/negative relationships. Both studies in their own modeling efforts encountered more analysis difficulties with frequency than adoption (Walls, Safirova, and Jiang, 2007; Tang, Mokhtarian, and Handy, 2007). The eight-neighborhood Northern California study concluded that each of three different degrees of telecommuting frequency were associated with significantly different needs and desires (Tang, Mokhtarian, and Handy, 2007). The SCAG-survey-based analysis, in the context of having added a telecommuting program variable to the frequency formulation, found employer size not to be of importance to frequency. However, employees of firms with formal telecommuting programs were found to be 22 percent more likely to be high-frequency telecommuters (4 or 5 days a week) than others (Walls, Safirova, and Jiang, 2007).

Awareness and Comprehension of Options

Whatever influence the utility and characteristics of alternative commute modes have on commute mode choice is dependent on employee awareness and comprehension of the available options and support programs. In the previously mentioned 1993 study for the California Air Resources Board (CARB), a survey of 45 employers engaged in TDM programs in the Los Angeles and Sacramento areas found that a surprising percentage of the employees were unaware that their employer offered a particular type of TDM strategy. Because employees were asked to identify particular TDM incentives made available by their employer, it was possible to compare this knowledge with a listing of
the actual incentives supplied by the employer. From this comparison, level of employee awareness was calculated as the number of employees reporting that an incentive was available, divided by the number of employees who actually had the incentive available according to their employers. Employees whose employer did not report providing a particular incentive were not included in the computation. Table 19-21 shows how these awareness levels were found to vary across the different types of strategies.

Source: Comsis (1993a).

While two-thirds of employees were aware of employer-offered measures such as preferential parking and rideshare matching, awareness of certain other measures like transportation fairs and bus pass discounts was below one-fifth of employees. The findings were a revelation to all concerned, and argued strongly for more aggressive information and marketing efforts by the programs. The study concluded that annual TDM marketing plus administrative cost per employee offered the best explanation for variations in awareness. The implication of this relationship is that higher levels of marketing, outreach, and information exchange lead to better informed employees capable of more conscious transportation choices, which in turn translates to the TDM strategies having greater use and impact (Comsis, 1993a). The research effort in question is further described under “Related Information and Impacts”—“Modeling Studies”—“California Air Resources Board Survey and TDM Program.”

**Voluntary Versus Regulatory Employer Motivation**

To appreciate the full array of factors underlying employer and institutional TDM effectiveness, it is essential to recognize that degree of employee motivation is in large measure a function of employer motivation. TDM programs are generally motivated by one of two conditions:

- The employer or institution is facing issues with employee transportation, which are either affecting employee morale and retention or are raising the prospect of high costs and increasing resources devoted to employee transportation needs, particularly parking.
• The employer or institution is required under law or regulation to reduce its vehicle trip generation—particularly peak-period vehicle trips—in order to mitigate congestion, vehicle miles of travel (VMT), or emissions, or to forestall the need for new road capacity.

While a regulatory requirement can compel an organization to implement a TDM program, it is the first of these motivations that is most likely to lead to a productive in-house program. If its employees are suffering congestion delay with few existing options, or entailing the expense of driving long distances, the employer or institution has an economic self-interest in its TDM program success. Economic self-interest will also apply if the organization is seeking to avoid a major employee parking provision expense, be it building and maintaining more of its own facilities or subsidizing the cost of employee parking through a third-party provider. There are also other examples where self-interest pertains, such as when the organization needs to expand, but is opposed by neighbors concerned about traffic and pollution impacts.

In the case of a regulatory requirement, the employer or institution is obligated to implement a program of measures that have the objective of reducing its vehicle trip rate to a specified level. There is little doubt that such a requirement will capture the employer’s attention regarding its employees’ transportation activity, and equally little doubt that the vast majority of employer TDM programs have been initiated under such circumstances. Beyond that, however, the composition and ultimate impact of a program depends on factors that are much more related to the employer or institution, including:

• Whether the organization perceives employee transportation options improvement, trip reduction, and the opportunity to be a good citizen as a clear advantage to its operation or is simply out to meet the letter of the law.

• Whether the employer holds a fear of losing competitive advantage with its peers in attracting and retaining employees.

• Whether the company administration has an understanding of which strategies will have the desired impact.

While a regulatory requirement may force an employer’s hand in implementing a TDM program, the actual composition of that program can vary widely. No known employer TDM regulation specifies the exact strategies to be implemented, or penalizes an organization for failing to achieve a trip-reduction goal. Even in the experience of California’s Regulation XV—one of the most stringent TDM regulatory programs tried—employers faced only the pressure of having to revamp their plans at the end of an annual or bi-annual review cycle if they failed to achieve their trip reduction targets. Penalties were incurred only for failure to submit a plan, not for failing to achieve targets.

Lacking direction to the contrary, employers who fail to meet trip reduction targets have been found to generally opt for “more” TDM measures in their revamped plans rather than shift to the more influential financial incentive or disincentive measures. In a review of employer performance under Regulation XV for the South Coast Air Quality Management District (SCAQMD), instances were found where employers had introduced literally dozens of measures into their programs in the hopes of finally finding the right combination. However, most often the simplest programs—those with few measures but including monetary incentives and perhaps one or more transportation services—had the most demonstrable impact on travel behavior and vehicle trip reduction (VTR) (Comsis, 1993b).

It is generally difficult to persuade employers or institutions to adopt financial measures, particularly disincentive actions like parking management or pricing, unless they see a clear benefit to
their bottom line. Hence, the existence of a regulatory requirement is no guarantee that this class of measures will be widely adopted. The experience gleaned from the 82-program sample reinforces this conclusion, in that while a number of “success stories” may emanate from areas with regulatory requirements, almost as many of the successful examples come from areas where there is no formal motivation beyond economics, concern for employees, or peer pressure.

These conclusions are supported by the data in Table 19-22, which shows the frequency with which particular TDM strategies are applied in regulatory versus voluntary environments. The first two columns characterize the types of strategies offered by employers and institutions in the 82-program sample, in which 59 programs were conceived under regulatory pressures while the remaining 23 were “voluntary” (although this latter group may have experienced tacit pressure from the community or peers to participate). What can be seen in this initial two-column comparison is that, overall, there is not a substantial difference in terms of how frequently many of the strategies appear in TDM programs.

Most regulatory programs have required provision of certain basic measures, especially marketing and promotion, information on alternatives, rideshare matching, an employee transportation coordinator (ETC), guaranteed ride home, bike racks, and preferential carpool parking. In this respect, the regulatory programs do show somewhat higher participation in these strategies. However, for the more material measures, such as pioneering a vanpool program, managing parking, or providing financial incentives, the voluntary programs in the sample have action inclusion rates that are similar—and sometimes superior—to the regulatory programs.

While there is a higher rate of occurrence of parking fees among the regulated employers, in the vast majority of cases—both voluntary and regulatory—the parking fees existed before the TDM program was enacted. Almost none of the firms reviewed in the sample explicitly chose to levy parking fees as an integral part of their program. Those that did, such as CH2M Hill and US WEST in Bellevue, Washington, encountered parking fees as a consequence of office relocation, and simply went on to use the fees as a mechanism in their program. Most with pre-existing parking fees altered the structure of those fees, generally to provide cost incentives to carpools and vanpools through High Occupancy Vehicle (HOV) parking discounts, and/or they used the parking revenues to help subsidize other program measures, such as modal subsidies. These pricing strategies, however, were not found to be unique to either regulated or voluntary programs. Indeed, turning from parking pricing to parking availability, the voluntary examples exhibit a slightly greater degree of restricted parking. Constrained parking may help explain the employer’s interest in having an effective TDM program.

Strategy-frequency assessments of two specific regulatory programs, those in Los Angeles and Sacramento, are highlighted in the last two columns of Table 19-22. Here a slightly different perspective is seen in the approach to TDM. In particular, the “perfunctory” measures are shown to occur with high frequency, including marketing and information (90 to 100 percent of all employers offering); rideshare matching (84.7 percent in Los Angeles); bike racks, showers, and changing facilities (70.7 to 80.6 percent); and guaranteed ride home (65.5 to 71.8 percent). ETCs were not broken out in these studies, but are specified in the regulations and are probably subsumed in the marketing and information category.

<sup>c</sup> Schreffler (1997).
Transit subsidies were also relatively common offerings in both locations—48.5 percent of all cases in Los Angeles and 53.4 percent in Sacramento—probably because of the tax advantages and the strong statement it makes in the employer’s transportation management plan as a legitimate financial incentive. Transit use by commuters in both of these California metropolitan areas is relatively small by national standards, primarily because transit service is not a strong alternative in many locations. Hence, most of the trip reductions have been the result of shifts to carpooling, even though subsidies for modes other than transit were considerably less frequent (21.9 to 29.8 percent). The higher incidence of parking fees in the Sacramento findings compared with Los Angeles is a result of the Sacramento program having been instituted by the city, leading to more focus on employers within the core urban area (Young and Luo, 1995; Schreffler, 1997).

Alternative work schedules are an interesting element in all programs. For the most part, the relatively frequent appearance of flextime in these examples was for the purpose of facilitating alternative mode use, rather than for encouraging travel outside the peak period. Most of the legal requirements studied here did not grant credit for peak shifting. However, most of the regulatory programs did grant trip reduction credit for CWW and telecommuting. One analysis found employers in the Los Angeles Regulation XV environment to have opted for such strategies in later stages of their programs, when the traditional mode shift strategies were not proving sufficient to achieve targets (Comsis, 1994). (Data presented further on in Table 19-27 present a more mixed picture for program Years 1 and 2 in this regard.)

There has been considerable question about the effectiveness of mandatory employer TDM programs, particularly from the standpoint of their regional benefit in reducing congestion or improving air quality in relation to the cost imposed on employers. The issues of air quality and cost-effectiveness are addressed in a subsequent section (see “Energy and Environmental Relationships” and “Cost-Effectiveness” under “Related Information and Impacts”). In terms of net behavior change, however, Table 19-23 provides some insight on the measured impact of the programs on choice of commute method (including both mode and alternative work arrangements). Shown in the table are before-and-after percentage shares obtained from three regulatory programs. The first two are the Los Angeles and Sacramento examples, which were profiled in Table 19-22. The third is taken from Portland, Oregon’s Employee Commute Options program, for which equivalent data on adopted TDM measures were not available (TriMet, 2000). In all 3 cases, the averages presented are for employers in the mandatory program only, exclusive of exempted employers.

The Los Angeles program was perhaps the most stringent of the three, requiring employers with 100 or more employees to meet a specified Average Vehicle Ridership (AVR) goal within one year of approval of a trip reduction plan. A rigorous plan approval process was designed to determine whether individual plans were capable of achieving their goal. If they were deemed not sufficient, the employer was persuaded to try new or additional strategies. Employers could be fined for non-compliance, but in virtually all cases where fines were levied, it was for not submitting a plan or for failing to implement strategies that were promised rather than failing to meet an AVR target. Results shown in Table 19-23 for Los Angeles are over a 5-year period, for 4,999 employers that had submitted at least two plans.

In Sacramento, an initial ordinance required employers to reduce peak-period employee single occupant vehicle (SOV) use by 35 percent, and required annual travel surveys and management plans. However, the city attorney’s office soon determined that the city could not mandate such a requirement, at which point participation became voluntary. The results shown in the table are for 58 large employers (100 or more employees) participating in the program between 1990 and 1996.
The program in Portland required all employers with 50 or more employees to reduce vehicle trips by 10 percent over 3 years; there were no penalties for non-compliance. The data in Table 19-23 represent 503 employers and 127,000 employees, with a mixture of participation time ranging from 320 sites with only 1 follow-up survey (average of 1.3 years), to 165 sites with two follow-up surveys (average of 2.6 years), and 18 sites with three follow-up surveys (average of 3.9 years).

The overall results in Table 19-23 indicate that each program resulted in a reduction of SOV share of less than 10 percentage points—from a high of 7.6 percent in Sacramento to a low of 5.4 percent in Portland—among the population of large employers. There are interesting differences in how those reductions came about. In Los Angeles and Sacramento, the changes were primarily achieved through a shift to carpool and vanpool, whereas in Portland—with its strong regional focus on its MAX light rail transit (LRT) system and complementary bus services—more of the reductions were the result of shifts to transit. There was little or no change observed in walk or bike use, or in telecommuting, though both Los Angeles and Portland showed above average increases in CWW.

These are, of course, jurisdiction-wide perspectives. A look at one specific district within Portland is provided by the example “Lloyd District Travel Demand Management—Portland, Oregon,” found in the “Case Studies” section. In the Lloyd District, initial shifts were to carpooling, followed by a later overriding shift toward greater transit usage—quite possibly associated with LRT service expansion. Between 1997 and 2005, the employee drive-alone share dropped from 60 percent to 43 percent (Bianco, 2000; Victoria Transport Policy Institute, 2008; TriMet, 2009). Also of interest in assessing the local area potential of mandatory TDM (under favorable circumstances) is the description of central Seattle I-5 corridor CTR program outcomes. This description starts in the “End Results of Dissipation” discussion under “Related Information and Impacts”—“Site-Versus System-Level Impacts” and is taken through the “Cost-Effectiveness” and “Energy and Environmental Relationships” subsections. The CTR program is credited with avoiding, on aver-

Critics of mandatory TDM as a means of cost-effective, region-wide solution to congestion and air quality problems point to both the relatively small number of employers whose programs have substantial trip reduction impacts and the dilution of these impacts over a large employment base and background regional traffic. A 1993 article written at the height of the regulatory controversy by Kenneth Orski acknowledged that there were compelling examples of substantial modal shifts and trip reductions achieved at individual employment sites, but questioned whether comparable reductions could be achieved at a regional level. He argued, firstly, that work trips constituted only about 25 percent of all daily trips, and were not more than 40 percent of the trips occurring in the peak period. Secondly, he contended that work trips to major employment sites (those with 100 or more employees) constituted only about 40 percent of total work trips, hence about 10 percent of daily trips (16 percent of peak-period trips) and 13 percent of daily VMT would be the maximum affected by a mandatory TDM program. He then calculated that a full 25 percent increase in average vehicle ridership (the theoretical target) would produce a 2 to 3 percent decrease in regional vehicle trips and about a 3 to 4 percent decrease in regional VMT (Orski, 1993).

While such a reduction might prove cost-effective in particular situations, it is well to recognize the relationship between the achievements of a few excellent TDM programs and measurable impact at a regional, corridor, or subarea level. The relationships between individual employer-level results and regional- or facility-level results are further dissected in the above-mentioned “Site- Versus System-Level Impacts” subsection.

**Characteristics of Employer**

It may be rightly asked whether there is any relationship between the characteristics of the employer or institution staging a TDM program and the types—and thus combined effectiveness—of strategies which are employed. Tables 19-24 and 19-25 explore this question on the basis of two characteristics, type of employer and employer size, once again drawing upon the 82-program sample as described in Appendix Table 19-A.11 This investigation only attempts to chart the types of strategies which may be more common to particular types of employers, and does not address the implications of these strategy preferences on outcome, namely vehicle trip reduction. Earlier sections have examined the relative effectiveness of various types of strategies versus others.

Many of the conclusions that might be drawn from these displays should be treated with special caution, given the sparse sample sizes for many of the strata. For example, the commercial/service, utility, medical institution, university, and other institution groupings are each represented by less than 10 observations. The samples of employer groupings of fewer than 100 employees, and 500 to 1,000 employees, are represented by only two and seven observations, respectively. Hence, the data should be used only for broadly descriptive purposes.

---

11 For an alternative perspective on the mix of strategies offered by employers, focusing on strategy combination information rather than employer type stratification, see the discussion surrounding Table 19-31, “CUTR Worksite Trip Reduction Model—Ranking by Frequency of Occurrence of the 50 Most Common Program Combinations,” found in the “Related Information and Impacts” section under “Modeling Studies”— “CUTR Worksite Trip Reduction Model.”
With respect to type of employer (Table 19-24), it can be seen that the practice noted earlier of providing basic employer support type strategies—such as offering commute information, rideshare matching, and guaranteed ride home—is widely followed across all of the employment types. It would appear, though, that office, utility, government, universities, and other institutions are somewhat more likely to offer these strategies with high frequency compared to commercial, manufacturing, and medical types of employers. Interestingly, utilities and universities are the most likely to have limited parking and to charge for that parking, while commercial, manufacturing, government, and other institutions are more likely to have ample parking and to provide it without charge.\textsuperscript{12}

The offering of preferential parking appears to coincide with the restricted/priced parking that more frequently occurs with utilities, universities, and other institutions, possibly because these are also generally large employers with large parking facilities, where offering close-in parking for HOVs could actually be a meaningful incentive. Consistent with this reasoning, a high percentage of industrial/manufacturing employers (64.3 percent) also offer preferential parking despite the fact that only 14.3 percent report restricted parking capacity. Conversely, medical institutions do not offer preferred parking because, in general, their parking is at such a premium given the multitude of uses (staff, visitors, outpatients) that they have no surplus capacity to part with. (For more insight on the particular circumstances faced by medical institutions, consult Dowling, Feltham, and Wycko, 1991, or the summary provided in this Handbook’s Chapter 18, “Parking Management and Supply,” under “Response by Type of Strategy”—“On-Street Residential Neighborhood Parking Management”—“Effects on TDM Program Effectiveness”).

In terms of transportation service type strategies, particularly vanpool programs, it appears that these occur most frequently among industrial/manufacturing employers, utilities, and universities, in part because of the large sizes and often remote campus locations involved. Transit subsidies are offered at a high rate across the entire set of employers, but have their highest prevalence in professional/office, government, utilities, medical, and other institutions. Provision of modal subsidies other than transit is most prevalent at office, government, and medical institutions.

\textsuperscript{12} There is an odd result in the “Other Institution” category where only 28.6 percent have restricted parking but 42.9 percent charge for it. This is not a data error, but rather reflects the policy of the organizations in the sample.

**Sources:** Derived (see Appendix Table 19-A) from Comsis (1994), Comsis and ITE (1993), Rutherford et al. (1994), and Comsis et al. (1996).
Finally, with respect to alternative work arrangements, several but not all relationships appear to confirm intuition on the types of employment that are best suited or not suited to these relaxations from a standard 40-hour/5-day work week. For example, government and utilities appear most inclined to offer flextime, while manufacturing and medical institutions do not. Surprisingly, 3/4 of commercial/service employers in the sample offer flextime. Perhaps in-store schedule adherence needs are counterbalanced by order-taking, administrative, and off-site functions. What also seems an anomaly is finding that 1/2 of medical institutions allow telecommuting, despite the critical nature of physical presence at the institution. Other institutions, medical institutions, utilities, and government seem to be the most likely to allow CWW, with a lower but not insubstantial rate of involvement (about 1/4) for office, commercial, manufacturing, and universities. Telecommuting appears at a low rate overall in this sample, more likely to be encountered among government, medical, and other institutions, and less so at office, commercial, manufacturing, utilities, and universities.

Table 19-25 portrays the frequency by which individual TDM strategies are applied in relation to employer/institution size. Unfortunately, uncontrollable irregularities in the distribution of the sample result in too few observations of smaller employers (under 100 employees) and those in the medium-to-large category (500 to 1,000). Limiting the comparison mainly to the 100-to-500 size versus the over-1,000 size employers suggests the following trends: First, those TDM strategies that seem to be offered more frequently by larger employers are rideshare matching; on-site pass sales; transportation fairs and promotions; preferential HOV parking; bike racks and changing facilities; vanpool and supplemental transit programs; parking fees; modal subsidies; other monetary incentives (raffles, prizes, award points, time off with pay); and telecommuting. Strategies where size of employer does not obviously correlate with higher frequency of offering include information center/ETC, guaranteed ride home, use of company vehicles, transit subsidies, HOV parking discounts, flextime, and CWW.

Partially compensating for the lack of information on smaller employers in Table 19-25, Table 19-26 shows the rates at which particular strategies were adopted by employers in their introductory plans for compliance under Regulation XV in Southern California. These data were compiled from SCAQMD’s Regulation XV database in a study of TSM Measures in Suburban Settings (JHK & Associates, 1992). The strategies in the table appear in order of the frequency with which they were applied by the largest employers (more than 1,000 employees), although it will be noted that the distribution for the large (500 to 1,000) and medium (100 to 499) size employers is similar in pattern. For the smaller employers, however, the pattern begins to diverge a bit, apparently in relation to the lesser resources of the smaller employers.

A common phenomenon across employers of all sizes is the very infrequent use of parking management, pricing, and direct financial incentives. Also, work at home and alternative work schedules were not particularly popular strategies in the first year of these programs. What is perhaps surprising is the relatively high rate of employers offering transit subsidies, even among the smaller employers, and even when transit service is not particularly good. One conclusion that might be drawn is that as employers are compelled to add strategies, it is relatively inexpensive to offer transit subsidies if it isn’t likely that they will actually be used.
Also of interest is what happens over time to TDM programs, as experience is gained and the need arises to either secure more trip reduction impact or improve cost-effectiveness. The same study that provided the information for Table 19-26 developed a comparison on how the preference for strategies changed between program Years 1 and 2. The results are shown in Table 19-27, which compares the frequency of offered strategies in terms of the number of employees exposed to them. Next to the number is the corresponding rank, with “1” being the most commonly applied strategy in that year. The final column shows the change in rank between Years 1 and 2, calculated as the difference between the first- and second-year rankings. The top 10 strategies in Year 1 were, in order: (1) on-site services, (2) ongoing transit subsidy, (3) regional ridematching, (4) commuter information center, (5) internal rideshare matching, (6) flextime for ridesharers, (7) preferential parking, (8) drawings and prizes, (9) guaranteed ride home, and (10) transit information. In Year 2, the preference order changed to: (1) showers and lockers, (2) on-site services, (3) regional ridematching, (4) commuter information center, (5) marketing/other, (6) guaranteed ride home, (7) internal rideshare matching, (8) drawings and prizes, (9) preferential parking, and (10) passenger loading areas.

</table>

Table 19-27 is ordered by which strategies had the biggest changes in rank. At the top of the list, passenger loading areas gained 21 net points in rank, showers and lockers gained 15 points, marketing gained 8, direct financial incentives gained 7, and on-site services gained 6. Most of these measures are “soft” strategies, as previously noted in the “Voluntary Versus Regulatory Employer Motivation” discussion above.

Ongoing transit subsidies fell by 17 ranking points, company vans by 7 points, and introductory transit subsidies by 6 points. One should also look at the actual employee participation numbers as well as the rank change, in order to have a proper appreciation of the relative scale of each strategy’s popularity. For example, while SOV parking fees increased in rank by 2 points, this only represents a change in position from 34th to 32nd place.

These SCAQMD-regulated employer shifts in strategy, with their failure to take on or even stick with much in the way of financial incentives and disincentives or transportation services, held trip reduction to modest levels. Employment sites involved for the longest time period achieved, in 3-plus years, slightly over a 7 percent average reduction in journey-to-work vehicle trips per employee. Results from sites with greater progress were partially washed out in regulated-employer averages by diminished success on the part of a number of firms that actually started out with high performance. SCAQMD results are further discussed in the “Related Information and Impacts” section under “Site- Versus System-Level Impacts”—“Intermediate Effects of Dissipation.”

**Land Use and Site Design**

A growing number of research studies have investigated the link between transportation and land use at the residential end of the trip, but fewer have probed the synergy between travel behavior and land use at the destination. It would seem reasonable to assume that a work site located in an attractive setting with good walkability, access to transit, and convenient proximity to attractions and services would find it easier to entice commuters from their cars. A major reason often given for driving to work is that the worksite is located in an area that is isolated from any other activities, requiring a personal vehicle to tend to midday needs for lunch, errands, or going to meetings. A more complete discussion of such relationships is found in Chapter 15, “Land Use and Site Design.” See also Chapter 17, “Transit Oriented Development,” for additional information. Reported on here in Chapter 19 are two studies specifically designed to examine the relationship of employment area land use and site characteristics to TDM effectiveness.

TCRP Project B-4, introduced earlier and described in Footnote 2, obtained information via survey from 50 different employers on their TDM programs and also on employer and site characteristics. With this information, an attempt was made to determine the approximate number of services reachable within a 5-minute walk. Correspondence between this local accessibility and the calculated VTR was found to be surprisingly strong. The 11 employment sites rated as having “poor” access to services (2 or less) averaged a VTR of only 5.3 percent. The 11 sites rated as having “fair” access (3 to 5 services) averaged an 8.3 percent VTR, while those 25 with “good” access (more than 5 services) averaged 21.5 percent.

Influences beyond local accessibility were quite possibly a factor—the accessibility measure may have acted as a surrogate for urban conditions in general. The types of TDM programs implemented in these various settings do show some important differences, with 23 of the 25 programs in the “good” access category offering financial incentives. On the other hand, eight of the 11 programs in the “fair” category and seven of the 11 in the “poor” category also offered financial incentives (Comsis, 1994).
A more deliberate and comprehensive attempt to investigate the synergy between land use and TDM impact was made in a study for the Federal Highway Administration (FHWA). The researchers selected a sample of 330 employment sites in Los Angeles County that were participating in the Regulation XV program, and appended information on a wide range of land use and site design characteristics to existing data file information on TDM program characteristics and employee travel. The expanded data were then analyzed both descriptively and statistically.

Overall, the sample of 330 programs indicated the following shifts in behavior in relation to the first Regulation XV plan (Cambridge Systematics, 1994):

- Drive-alone share decreased from 76.2 percent to 71.4 percent, while carpool/vanpool share increased from 13.4 percent to 18.8 percent.
- Small mode share losses were incurred by both transit (down from 4.6 to 4.4 percent) and bike/walk (down from 5.8 to 5.4 percent) as an apparent result of the initial program.

It is not clear whether this outcome reflected an overemphasis on programs and incentives for ridesharing (as suggested by the study) or whether transit and bike/walk were simply not as viable as ridesharing in this travel market. Flexible work schedule shares (telecommuting and CWW) also declined, from 3.8 to 3.1 percent. AVR increased from 1.213 to 1.245, equating to a VTR of 2.5 percent.

The 330 sites were a randomly selected subsample from a database of 1,100 employers who had completed at least one trip reduction plan under Regulation XV. The land use data were compiled for the following three different levels of geographic resolution (Cambridge Systematics, 1994):

- The surrounding subarea (1/2 to 2 square miles), recording land use mix, predominant land use type, building types and special features, main streets, traffic levels, sidewalks, and landscaping.
- The immediate environs (1/4-mile radius), recording horizontal and vertical land use mix, specific land uses present, number and type of and distance to services, street characteristics, “streetwall” characteristics, sidewalks, pedestrian activity, and landscaping.
- The actual site, recording the number and characteristics of parcels and blocks, building architecture, size and orientation, on- and off-street parking, access to bus stops, sidewalks, and street life.

The research approach was then try to explain the change in modal share for the 330 employers based on both the characteristics of their TDM programs and the land use characteristics of the sites. Given the large number of TDM strategies and land use/site descriptors, it was found necessary to pare and consolidate the list of measures into index-type variables. TDM program strategies were divided into five categories: assistance programs, financial incentives, awards programs, flexible work schedules, and other. The land use characteristics were also partitioned into five categories, as follows:

- Mix and variety of land uses within 1/4 mile.
- Availability of convenience services (number and mix of key services within 1/4 mile).
- Walk accessibility to convenience services (design of area to promote walking).
• Perception of safety (sidewalks, street lights, pedestrian flow, number of vacant lots).

• Aesthetics (sidewalk widths, landscaping, absence of graffiti).

Initial analysis of the link between the observed changes in mode share and the TDM strategies applied at the 330 employers revealed that only financial incentive strategies were statistically significant. Therefore, for the TDM aspect of the analysis the researchers basically distinguished programs (employers) with financial incentives from those without. The five land use measures were similarly treated as having a “low” or “high” value for the particular index. A summary of the findings corresponding to this structure is presented in Table 19-28 (Cambridge Systematics, 1994).

Overall, the findings suggest that for drive alone, carpool/vanpool, and flexible work schedules, the impact of the TDM financial incentives is measurably more important on changing share than any of the land use measures. In fact, for carpool/vanpool, better land use—specifically as represented by land use variety, availability of convenience services, and walk access to services—actually was associated (at least in the model) with a decrease in the use of that mode. With transit, however, and to a lesser extent bike/walk, supportive land use proved to be very important, increasing the shares for these modes.

It is also interesting to note that the combination of financial incentive TDM programs with better land use is almost always synergistic, i.e., it produces a higher net effect on both mode share and AVR than the two measures independently. The notable exception is carpool/vanpool, where combining the measures was identified as being detrimental to carpool/vanpool share in all but the category of aesthetic appeal, which—somewhat surprisingly—is overall the most influential measure of land use identified by the study. It is difficult to comprehend how the elements captured in the aesthetics measure would have more influence on mode share than the other four measures, unless the measure is somehow acting as a surrogate for other aspects of the environment that were not captured by the set of indices.

Trip Chaining

A significant issue related to the importance of the land use adjacent to the work site is the matter of trip chaining. It has been argued that a major deterrent to shifting commuters away from driving alone and into transit, ridesharing, or other alternatives is the degree to which they are dependent upon their cars for needs and activities which occur at, or on the way to or from, the work site. Particularly in suburban areas, where work sites tend to be isolated from other land uses (especially services), commuters can feel justifiably nervous about abandoning their cars.

In response to this isolation and dependency, commuters double-up on the purpose of their commute trip by incorporating additional stops on the way to or from work. These multi-stop trip tours, or “trip chains,” introduce an additional challenge and complexity to planning for TDM programs. Multi-task commute trips are commonplace, and often hard to accomplish when not driving alone. When trying to entice the drive-alone commuter into a wholesale shift to an alternative mode, much depends on how essential these intermediate stops are to the household, how frequently they are made, and whether or not there are options at the home or work end of the commute trip that can satisfy the same needs.

A thorough study of this phenomenon was performed in the Brentwood area of Nashville, Tennessee, using survey data obtained from a sample of 1,845 employees representing 42 employers in this predominately suburban district. The survey probed in detail into the frequency with which the commuters made stops on the way to or from work, and also into their purpose. The survey found that only 9 percent of all workers surveyed traveled directly to and from work— the vast majority made routine stops. It also found that stops on the return-home trip were twice as likely as stopping on the way to work. Table 19-29 gives an indication of how frequently trip chaining occurred (Davidson, 1991).

The display shows the frequency with which employees traveled to or from work without making additional stops along the way. It reveals that almost one-half, 49 percent, of the commuters studied essentially never stopped on the way to work, although only 19 percent traveled from work to home without making a stop at least 1 day a week. So, viewed the opposite way, 51 percent of commuters stopped at least once a week on the way to work, and 81 percent stopped at least once a week on the way home from work. The other interesting statistic in this display is the proportion of commuters who always stopped along the way: 15 percent of commuters stopped daily on the way to work and 13 percent stopped daily on the way from work. The average number of days a stop was made on the way to work is 1.38, while on the way home the average is 2.0 days per week.
The predominant reason given for stopping was to get fuel for the vehicle. This activity accounted for 45 percent of the stops on the way to work and 63 percent of the stops on the way home from work. In approximate order of decreasing prevalence, other reasons given were: going to the bank (23 percent of trips to work and 50 percent of trips from work), visiting the dry cleaners (19 percent to and 31 percent from), getting something to eat (16 percent to and 20 percent from), shopping (12 percent to and 56 percent from), work-related activity (10 percent to and 13 percent from), child care (10 percent to and 10 percent from), taking a child to or from school (10 percent to and 6 percent from), visiting a doctor (6 percent to and 14 percent from), transporting another person including carpool (7 percent to and 7 percent from), exercise (2 percent to and 11 percent from), and entertainment (1 percent to and 9 percent from) (Davidson, 1991).

The data were also manipulated to examine patterns in the way trips were grouped into chains and correspondence between morning and evening stops. For example, it was noted that the purposes which most often occurred on both the trip to work and the trip home were child care (91 percent), dropping off children (80 percent), stopping to eat (33 percent), and stopping at the dry cleaners (33 percent). It was also discovered that for those commuters who stopped for gas on the way to work (45 percent), 21 percent would also stop to eat, 16 percent would visit a dry cleaner, 16 percent would stop at the bank, and 12 percent would attend to child care.

This latter type of assessment begins to suggest strategies for successful TDM efforts. For example, if a drive-alone commuter were to shift to a vanpool, the need to stop for fuel could be virtually eliminated. However, to make the shift more permanent, it would be necessary to find a way to provide better access to banking, dry cleaners, and eating establishments on or near the site. Employees’ expressed preferences for on- or near-site services included: post office (32 percent), restaurant (31 percent), general retail (25 percent), snack bar (20 percent), exercise facility (19 percent), convenience store (18 percent), dry cleaners (11 percent), and medical care (10 percent). The conclusion drawn by the study was that while linked trips had a negative effect on TDM efforts, a better mix of land uses or the delivery of services to employer sites might go a long way toward reducing auto dependency and making TDM more effective (Davidson, 1991).

RELATED INFORMATION AND IMPACTS

Synergy and Complementarity

The body of empirical information compiled on TDM programs makes it fairly evident that the effectiveness of these programs depends on several key factors:

- Marketing, information, and promotional strategies are clearly important catalysts in successful TDM programs by raising awareness, knowledge of, and interest in commute alternatives. However, ultimately a TDM program has to offer the commuter an attractive alternative to driving alone, in which instance the marketing and promotion is essential in ensuring that the employee understands the advantages of the choice. However, if competitive alternatives are not provided, simply trying to convince the commuter that driving is wrong and some other approach is more acceptable will be ineffective and short-lived in changing behavior.

- Driving alone has many strong advantages for the commuter, including schedule management, travel time, and even out-of-pocket cost in many cases. Travel demand research tells us that travel time and cost are primary determinants in the choice among modes. If a traveler cannot
save time by choosing an alternative mode (because buses or carpools travel the same congested roads as SOVs) or cost (cars are given free parking whereas transit users must pay a fare), it is difficult to persuade the commuter that it makes economic sense to not drive. Hence, any strategies that help even out this competitive disadvantage—management of the supply or price of employee parking, priority access or routing for buses or car/vanpools, or modal subsidies—make an alternative mode easier to promote.

- Strategies must be appropriate to the travel environment in which they are applied; for example, widespread offering of transit subsidies may not mean much if the level or quality of transit service is poor.

- The effect of individual strategies is enhanced if they are combined with other strategies which are known to be “synergistic.” For example, providing transportation services is likely to have greater impact if the offering is paired with financial incentives such as user subsidies, and providing carpool matching services and HOV reserved spaces is more likely to be effective if employees driving to the worksite are not guaranteed free parking.

- The synergy of employer commitment and engagement has a key role to play as well. “Employment-based programs work when a party accountable for performance . . . is experiencing a critical problem (parking, congestion, regulation) that demand management can solve, puts resources into solutions, follows through on implementation, changes activities and resources based on actual performance, and demands results” (Valk, 2007).

- Alternative work hours/schedules may have conflicting effects. Evidence suggests that a policy of flexible work hours can be an important incentive for employees who rideshare or use transit, as it allows them greater latitude to deal with the scheduling demands of those modes. On the other hand, strategies like CWW and telecommuting appear to be more neutral and—although more research is needed—may even detract from the use of alternative modes. Attractive combinations within the 82-program sample occur when the privilege of a modified work schedule is tied to the use of alternative modes.

Informed program design and development is obviously crucial. Efforts to enhance the TDM program development process, largely in the hands of employers, are covered in the next two subsections in particular.

**Program Development Outreach and Support**

The success of TDM programs clearly depends on the level of information and assistance that is made available to the individual employers. Employers faced with a requirement or need to reduce vehicle trips are placed into unfamiliar territory, where they must somehow identify a set of actions that not only will help meet their trip reduction goal, but also be affordable and compatible with the type of business activity in which they are engaged. Whether motivation to reduce employee vehicle use is caused by regulation or a desire to either reduce demand for scarce parking or to provide helpful alternatives for employees stuck in traffic, employers are typically ill-equipped to design and implement effective programs. They are also constrained by an underlying concern of not wanting to frustrate employees or impose an action that will threaten their competitive advantage in finding and retaining workers/staff.

Agencies such as the South Coast Air Quality Management District (SCAQMD), which was charged with administering the requirements of Regulation XV in Southern California, have employed a
variety of methods to provide guidance and technical assistance to affected employers. SCAQMD
developed a range of tools to help employers learn how to develop a trip reduction plan, and
increasingly (as more information became available) provided technical support for selection of
strategies. Consultant expertise increased as well. Ultimately, SCAQMD, with help from CARB,
undertook development of a Travel Demand Management Program to provide improved guidance
on selection of strategies capable of achieving trip-reduction goals. This information was made
available to employers in the form of software and also a hard-copy manual. A description of this
research is provided in the next subsection, “Modeling Studies.”

Other, less formal approaches to sharing information, building support, and shaping effective
programs than those of the regulatory agencies are evident in the marketing and outreach pro-
grams of local and regional governments, transportation agencies, and transportation manage-
ment associations (TMAs). Most metropolitan planning agencies actively support employer TDM
efforts, often in support of efforts to attain or maintain federally mandated air quality standards.
For example, the Metropolitan Washington Council of Governments operates an ambitious suite of
programs, termed Commuter Connections, through which it provides a range of information, out-
reach, and technical assistance in support of TDM (LDA Consulting, 1999). Commuter Connections
operates an employer outreach program to encourage large, private sector employers to volun-
tarily implement TDM strategies to reduce vehicle trips by employees. It offers an integrated
rideshare program that provides regional rideshare matching as well as information on other
alternative modes to all who receive a matchlist, a guaranteed ride home program in which it runs
a regional emergency ride service for participating employers across the region, a telework resource
center through which it provides information and assistance to commuters and employers to fur-
ther in-home and satellite center telework programs, and a network of information kiosks in many
locations to provide transit route and schedule information, maps, and rideshare information.

Sometimes TDM program development information and technical assistance is provided by the
public transit agency, through a special regional ridesharing organization, or through TMAs.
Many transit agencies actively work with employers to provide better information to employees
on transit alternatives, to assist in selling commuter passes on-site, and to encourage employers
to subsidize their employees’ transit costs through programs like TransitChek in New York and
Philadelphia and Snap Pass/PASSport in Portland, Oregon, both of which have been discussed
earlier in this chapter. At one time, regional ridesharing agencies were popular fixtures in many
urban areas, such as Commuter Transportation Services in Los Angeles and Commuter Computer
in Pittsburgh. These organizations eventually broadened their scope to promote alternative modes
other than just ridesharing or vanpooling. A number were assimilated into the corresponding
Metropolitan Planning Organization (MPO) when air quality became an important driver for pro-
moting alternative modes, following the passage of the Clean Air Act Amendments of 1990, and
the introduction of transportation conformity legislation in several states and jurisdictions.

A highly innovative program was conceived and implemented by Seattle Metro, now King County
Metro, the public transportation agency for Seattle/King County, in the mid-to-late 1980s. Beginning
with the development of its 1990 Transit Plan in 1981, the agency realized that it needed to broaden
its base of products and services beyond simply fixed-route transit service. Proliferation of signif-
icant new activity centers outside the Seattle CBD posed an entirely different set of travel needs
than those served by traditional CBD-oriented bus service. In January 1986, Metro undertook a
restructuring that reflected a shift to a market-oriented approach, emphasizing different products
and services for the new developing markets.

One element of this shift was to incorporate Commuter Pool, the regional carpool and vanpool
agency, into Metro. Another element was the establishment of a Research and Market Strategy
function to act as a leading edge in identifying, marketing, and evaluating new products and services. This action morphed Metro into more of a “mobility broker,” packaging and selling both services and assistance appropriate to the marketplace. Included were a wide range of transit services and High Occupancy Vehicle (HOV) facilities, service contracts with major employers, and a giant university pass program (U-PASS at the University of Washington), as well as carpool matching, vanpool program management, and telecommute program assistance. To make these programs as effective as possible, Metro worked extensively with local communities, TMAs, and with individual employers to design the programs and ensure maximum flow of information down to commuters (Comsis, 1991).

Perhaps one of the most interesting elements of Metro’s program activities was the HOV/TSM evaluation study, a 2-year study to evaluate the effectiveness of a set of transportation programs, incentives, and promotional techniques applied in four project areas in King County. Beginning in 1987, Metro began monitoring the performance of TDM programs at 52 suburban employment sites, each having received some program assistance from Metro to establish a TDM program. These sites, along with a group of regional control sites where no special actions were taken, were tracked using employee surveys. The results were used to ascertain employee awareness of programs and incentives available to them, and to track changes in mode shares as influenced by the programs.

As a primary tactic, transportation coordinators were hired for each project area to provide personalized assistance to employees in planning their commute and taking advantage of marketed transportation programs and incentives. The initial evaluation surveys, as previously discussed in connection with Table 19-21, demonstrated a surprisingly low level of employee awareness of particular programs and incentives that were available to them. The most visible effect of the transportation coordinators’ (TCs) efforts was on measurable increases in employee awareness.

Between 6 percent and 19 percent of employees in the four project areas changed commute mode between 1988 and 1989, and overall, 5.5 percent of employees in these four areas stopped driving alone and began using an HOV mode. However, the same proportion discontinued their HOV use and began driving alone, with the result being no net change in mode split. Meanwhile, at the control sites, 4.7 percent of employees shifted from driving alone to use of an HOV mode, but a slightly greater percentage, 6.0 percent, changed from HOV to driving alone.

The interpretation of these results by Metro was that in an environment where there are few good alternatives, plenty of free parking, and considerable staff turnover with new hires, the TDM outreach activities helped prevent net losses in HOV mode use in the managed areas. For those employees who shifted from driving alone to an HOV mode, 48 percent of those individuals cited one or more of the TC activities as affecting their choice, whereas 39 percent of employees at the control sites cited TC activities. Among employees who switched from HOV to driving alone, only 18 percent of those working in the four project areas cited TC activities as affecting their choice, and 11 percent of employees in control areas cited TC activities (Municipality of Metropolitan Seattle, 1990).

**Modeling Studies**

**California Air Resources Board Survey and TDM Program**

Critical limitations in the travel and impact data compiled and released in the large-scale state and regional employer TDM programs have been outlined in the “Analytical Considerations” subsection of the “Overview and Summary.” In appreciation of these shortcomings, CARB spon-
sored a research study, in 1993, centered on the collection of original travel survey data from an acceptably large and diverse employer sample in the Los Angeles and Sacramento air quality management areas.

The objective was to develop a mathematical tool that would be credible for designing or testing the capability of employer TDM programs to meet mandated trip reduction goals. Detailed travel data were acquired from 2,437 employees at 45 different employers, along with sufficient information to permit geocoding of trip origin and destination, which was used to append corresponding travel time and cost of available travel alternatives from the respective regional travel models. An attempt was then made to evaluate the effectiveness of particular TDM strategies through the estimation of logit-type mode choice models. These models were structured to predict the probability of choosing a particular travel option in relation to individual travel characteristics and the strategies applied by the respective employer (Comsis, 1993a).

The results of this modeling exercise are summarized in Table 19-30, presenting parameter estimates for those variables that were found to be statistically meaningful in selection of the respective travel mode. The first group of variables in the table represents the travel time and cost variables typically at the heart of mode choice models. The modeling analyst compared the coefficients for in-vehicle time, transit out-of-vehicle time, auto operating cost, transit fare, and parking cost with the estimates from ten other metropolitan area travel models and found them to be satisfactorily comparable in both relative and absolute magnitude.

Source:  Comsis (1993a).
The second group of variables represents employee characteristics. The estimates imply that workers who are laborers are more likely to choose carpool or transit, especially transit, while professionals and managers are among the least likely to choose those modes. Professionals are most likely to choose vanpooling as a commute alternative. Males are the most likely to bike or walk, while the likelihood of carpooling, vanpooling or taking transit is clearly greater for older workers. Persons who must make midday business trips are fairly unlikely to want to carpool, but for some reason that effect doesn’t seem to carry over to vanpooling or transit.

A modeled relationship that seems inconsistent with other findings is that employees on staggered work hours are much more likely to take transit. Part-time workers are more likely to opt for transit as an alternative, not surprising since other ridesharing modes require daily commitment. Employees who are the sole worker in the household are less likely to carpool, but do not seem to be discouraged by transit or vanpooling, while married employees are most likely to choose vanpooling.

A limited set of worksite characteristics constitutes the third group of variables. Testing of the worksite variables suggests that transit use is likely to be less where parking space ratios are higher, that carpooling is less likely at campus locations or institutions, and that as the number of adjacent retail land uses increases, the rate of carpooling and transit use will increase (Comsis, 1993b).

The above relationships helped set the stage for evaluating the contributions of TDM strategies (labeled “incentives” in the study). The TDM strategies shown in the lower portion of Table 19-30 were the only “incentives” that could be quantified as strategy-specific variables in the models. Their relationships with the respective mode choice observations were strong enough that statistical significance could be demonstrated. This does not mean, however, that the value of individual coefficients is regarded as wholly plausible in all cases.

Having an employee transportation coordinator (ETC) and offering rideshare matching is estimated to have a moderately positive influence on employee choice of carpooling or vanpooling (the two measures were only significant when combined), as does the offering of preferential parking. Predictably, maintaining a transit information center and offering on-site transit pass sales has a fairly solid positive influence on choice of transit, while offering bike racks or showers/lockers has a moderately positive effect on the decision to bike or walk. Offering use of company vehicles has a clearly positive effect on carpooling or vanpooling choice, while providing company vans has a very substantial effect on vanpooling choice.

A dilemma arises in the estimates shown for Guaranteed Ride Home (GRH) and the monetary incentives (modal subsidies). GRH has a surprisingly large effect in the model on commuter choice of all alternative modes, at a level (model coefficient of 0.4476) that exceeds most other strategies. This finding stands in contrast to the relatively modest effect of providing modal subsidies (0.0125). The offering of prizes, free meals, and awards also garners a higher coefficient value (0.0826) than does provision of modal subsidies.

There are several possible explanations for this apparent anomaly. First, GRH has been demonstrated to be a very popular and highly demanded feature of an employer TDM program, so it is possible that it actually does carry a higher value in employee choice of alternative commute modes. Second, the survey did not ask what the monetary value was of either the financial incentives or the cost of parking at the worksite, so a wide range of dollar magnitudes was presumably lumped together. Third, it is probably useful to note that, while the data collected explicitly for this study were both more reliable and less aggregated than those found in the regulatory agencies’ databases, they do represent only a single point in time—when the survey was conducted. They reflect behavior inside an employer that was applying certain combinations of TDM strategies, but how
long it had been since the strategies had been implemented could not be known, nor could there
be empirical identification of the degree to which introduction of any of the individual strategies
directly affected employee travel choice.

Another matter of interest is the degree to which individual employees were aware of the availabil-
ity or implication of particular TDM strategies. Because employees were asked to identify particular
TDM strategies made available by their employer, it was possible to cross-check against what strate-
gies were actually available. As described and tabulated in the “Underlying Traveler Response
Factors” section, under “Individual Behavioral and Awareness Considerations”—“Awareness and
Comprehension of Options” (see Table 19-21), the program awareness of employees ranged from
77 percent for preferential parking down to only 17 percent for bus pass discounts and 15 percent
for transportation fairs.

Awareness was seen as such an important issue that it was decided to attempt to model the per-
cent awareness for the eight TDM incentives that were included in the mode choice model. Sub-
models were calibrated to accompany the mode choice model, with separate equations calculated
for each incentive. Test plots led to the use of annual ETC marketing plus administrative cost per
employee as offering the best explanation for variations in awareness.

The implication of this relationship is that higher levels of marketing, outreach, and information
exchange lead to a more informed, and hence more “aware” employee, which translates to the TDM
strategies having greater use and impact. Ultimately, this chain of mode choice-TDM Incentive-
awareness relationships provided the basis for a software tool known as the Travel Demand
Management Program, which was pilot tested by SCAQMD in Los Angeles (Comsis, 1993a). The
software’s Users Guide summarizes the default coefficient values for each model (Comsis, 1993b).

Center for Urban Transportation Research Worksite Trip Reduction Model

A more recent attempt to model the effects of TDM strategies on travel behavior was undertaken by
the University of South Florida’s National Center for Transit Research Program at CUTR. This
research set out to use as its primary data source the employer plan data compiled under California’s
Regulation XV/Rule 2202 program, as well as comparable data from Washington State’s Commute

The CUTR researchers quickly recognized the same challenges in working with these data that
had been experienced by the research efforts mentioned earlier, namely problems of aggregation,
missing or incomplete employer plan records, and insufficient information on the nature or mon-
etary value of key incentive actions. The strength of these data are in the large number of records
(submitted plans), the diversity of programs and settings, the derivation of employee travel from
a 5-day work week cycle, and the ability to compare the same employer over time. Nevertheless,
the nature of the data makes it difficult to assess the effects of individual TDM strategies through
statistical methods like multiple regression.

A principal reason for this difficulty is the inability to construct a framework around those key
determinants of travel choice that are largely peculiar to the individual—such elements as trip
length, availability and quality of travel alternatives like transit, nature of occupation, and even
income and auto ownership. With the regulatory program data, the conceptual framework must
be limited to analyzing changes in aggregate employer vehicle trip rate in relation only to the iden-
tified strategies in the trip reduction plan.

19-110
In response, the researchers opted for a different analytic approach, based on the neural network concept. Neural networks are described as “a group of highly interconnected and relatively simple computational units” (representing a structure of links and nodes). “Each of these computational units performs processing of its inputs to produce a single output. The neural network connects the output of each unit to the inputs of many other units through different weights.” The process of calibrating the different units and paths is characterized as “learning,” in the context of “training,” in which one of several learning techniques is used to modify the weights in an orderly fashion. Since it is not the purpose of this summary to appraise the theory or accuracy of the neural network approach, the reader with an interest in better understanding this approach is advised to consult an authoritative source, starting with the project report (CUTR, 2004). This discussion will focus primarily on the findings from the CUTR application.

Standard linear regression models were used by CUTR in an early exercise to sort through and rank the relative importance of the numerous incentive measures. Because many measures were found to be quite similar, it was decided to group them into 12 categories, consisting of the following (CUTR, 2004):

- Facilities and Amenities: Passenger loading areas, facility improvements, preferential parking areas, bike racks and lockers, showers, and changing facilities.
- Guaranteed Ride Home: TMA provided program, company vehicle use, emergency guaranteed ride, rental car guaranteed trip, and taxi guaranteed trip.
- Flexible Schedules: Flextime for ridershareers including work shifts and grace periods.
- Marketing Programs: Information center, transportation fairs, focus groups, posted materials, new-hire orientation, personal communication, company recognition, special interest clubs, TMA membership, written materials, and zip code meetings.
- Rideshare Matching: Regional commuter matching agency and employer-based matching system.
- Financial Incentives: Transportation allowances, walk or bike-to-work subsidies, carpooling subsidies, and other direct financial subsidies.
- Parking Management: Increased parking fees for drive-alone commuters and subsidized parking fees for rideshare units.
- Telecommuting and Telework: Work at home and work at satellite center.
- On-Site Services: On-site childcare, cafeteria, ATMs, postal facility, fitness center, transit information, or pass sales.
- Non-Financial Incentives: Auto services (fuel, oil, tune-up); gift certificates; free meals; catalogue points; time off with pay; drawings; and awards.
- Commuter Tax Benefit Incentives: Introductory or ongoing transit passes or subsidies, subsidized vanpool seats, and ongoing vanpool subsidization.
The researchers used these 12 categories of strategies to sort and analyze the types of programs that were being implemented in the employer sample. They found 1,671 distinct strategy combinations among the sample plans, and out of these, identified the 50 most common applications. These are pictured in Table 19-31, in declining order of occurrence, from the most common combination—found in 1,036 plans—to the least, found in 76 plans. Together, this set of plan combinations accounted for 9,886 of all 21,267 plan records, or about 46 percent.

One feature of interest that can be observed in Table 19-31 is the frequency with which particular strategy types are employed in these most common programs. The most frequently applied strategies are shown in the leftmost column while the least frequent are on the right. The key trends shown here are the inclusion of marketing, facility amenities, rideshare matching, and guaranteed ride home in 90 percent or more of all programs. Non-financial incentives were present in 39 of the 50 programs, and on-site services were present in 33 of 50. Commuter tax benefit strategies, consisting of financial incentives that offer tax advantages (basically alternative mode subsidies) were present in a surprising 30 of 50 programs. Non-exempt financial incentives were only offered in 23 cases and parking management strategies showed up only in 1 of the 50 categories. Perhaps also surprisingly, alternative work schedule strategies—flexible work hours (13 programs), telecommuting/telework (eight programs), and CWW (16 programs)—were among the least frequently offered strategies. Overall, these findings have a basic similarity to those presented earlier in Table 19-27 from a 1992 study, supporting the assertion that marketing and other “soft” TDM strategies are the most commonly found in TDM programs, even those conceived under regulatory circumstances. The more influential “economic incentive” strategies are generally much less common.

The new Worksite Trip Reduction Model was then used to estimate the vehicle trip reduction impact of each of the 50 most common programs. To do this, the model was run parametrically, with different baseline conditions in terms of starting transit mode share and starting vehicle trip rate level. Results are presented in Table 19-32, organized according to starting ranges of transit mode shares and vehicle trip rates (CUTR, 2004).

---

13 Note that VTR as used in the source document stands not for vehicle trip reduction, but rather for vehicle trip rate. The vehicle trip rate in the source and in Table 19-32 is computed in the form of vehicle trips per 100 employees, and is the inverse (times 100) of Average Vehicle Ridership (AVR).

Note: The vehicle trip rates shown as ranges, and also the trip rate change estimates, are in units of average vehicle trips per 100 employees.

The reason it is necessary to specify the starting conditions in this manner is because the strategy combinations in each package affect the distribution of mode choices differently depending on the starting point. For example, if an employer currently has carpooling as the dominant mode among employees using alternative modes, and the package of strategies is such that transit use is predominately encouraged, the effect would be to move some percentage of both SOV commuters and carpoolers to transit. The proportionate shifts that occur among modes depend heavily on the starting modal distribution and the corresponding vehicle trip rate. A similar approach was used in Chapter 3 of the 1993 FHWA guidebook Implementing Effective Travel Demand Management Measures (Comsis and ITE, 1993).

Studying the vehicle trip reduction estimates in Table 19-32 suggests in general that any given program of strategies starting with a lower initial vehicle trip rate will normally have a lesser trip reduction impact than if it were to start with a higher vehicle trip rate. In other words, given the same set of TDM strategies, employers whose starting vehicle trip rate is already down in the 80-70 vehicle trips per 100 employees range will see less additional trip reduction than an employer whose starting vehicle trip rate is in the 100-90 range. The same is more-or-less true of higher starting transit mode shares, as it would appear that many of these strategies may appeal more to potential carpool/vanpool users than to potential transit users, and may even begin to lure some employees away from transit. At the extreme, the effect of the given TDM program may even be to begin increasing vehicle trip making through non-optimal modal shifts. Such results are reflected in the non-negative vehicle trip rate change entries in Table 19-32.

The results shown in Table 19-32 have been abstracted from Chapter 5 of the CUTR model report (CUTR, 2004), and should be taken as illustrative of the model’s behavior in forecasting the effects of typical TDM program packages over common background conditions as might be encountered in the field. For actual user applications, the model is accessible via the internet at http://www.nctr.usf.edu/worksite, allowing the user to input his/her own current conditions and to test combinations of TDM strategies on reducing their vehicle trip rate.

To illustrate the nature and sensitivity of the model, the Handbook authors executed a series of runs for a hypothetical employer of 100 employees, where as a starting condition 86 percent of employees drive alone, 2 percent take transit, 10 percent rideshare, and the remaining 2 percent bike or walk. These conditions correspond to a starting vehicle trip rate of 90.6. Using these conditions, the authors investigated the trip reduction impact which would result from the application of each of the 12 primary strategy groups—first individually, and then each paired with each of the others. The results of this exercise are shown in Table 19-33 in terms of the percentage vehicle trip reduction from the starting vehicle trip rate base of 90.6.

While readers will want to study the results in the table and develop their own conclusions, the following general observations are offered on the nature of the estimated vehicle trip reduction (VTR) results for this particular set of strategy conditions:

- The highest-impact strategies are the commuter tax benefit incentives (5.0 percent VTR), financial incentives (4.1 percent), and facilities and amenities (4.1 percent). The lowest-impact were guaranteed ride home (1.5 percent VTR) and non-financial incentives (1.3 percent), while rideshare matching (−0.3 percent) and on-site services (−0.7 percent) were projected to actually increase vehicle trips for this particular set of starting conditions.

Notes: Hypothetical employer of 100 employees, with starting employee mode shares of 86 percent drive alone, 10 percent rideshare, 2 percent transit, and 2 percent bike or walk (90.6 Vehicle Trips per 100 Employees).

A negative value indicates that the program or combination will actually increase vehicle travel under the conditions assumed.

Source: Illustrative model application prepared by the Handbook authors utilizing the CUTR Worksite Trip Reduction Model available at http://www.nctr.usf.edu/worksite (now superseded — see Footnote 14). Center for Urban Transportation Research. (Website accessed Winter/Spring 2007.)
The strongest two-category combinations were commuter tax benefits teamed with facilities and amenities (6.8 percent VTR) and commuter tax benefits teamed with CWW (7.0 percent). The poorest results seem to come when on-site services are combined with rideshare matching (~3.2 percent VTR), non-financial incentives are paired with rideshare matching (~1.5 percent), and non-financial incentives are teamed with on-site services (~1.3 percent). Such seeming anomalies often occur using models when complex modal tradeoffs are occurring in the calculations. In this particular test, however, a combination like rideshare matching with on-site services might be expected to lead to a more favorable result, given that the starting conditions are favorable to ridesharing over transit.

There are only eight cases in the 66 pairs pictured in Table 19-33 where the pairing actually results in a positive, or at least somewhat synergistic effect, i.e., the combination of the two strategies leads to a trip reduction impact that is larger than either strategy individually. These pairings are: commuter tax benefits teamed with CWW (7.0 percent VTR versus 5.0 percent and 3.8 percent individually) or with facilities and amenities (6.8 percent VTR versus 5.0 percent and 4.1 percent individually), CWW with facilities and amenities (5.7 percent versus 3.8 percent and 4.1 percent individually), parking management with facilities and amenities (4.2 percent VTR versus 3.0 percent and 4.1 percent individually) or with marketing (4.5 percent VTR versus 3.0 percent and 3.5 percent individually) or with financial incentives (4.8 percent VTR versus 3.0 percent and 4.1 percent individually), and financial incentives with facilities and amenities (4.9 percent VTR versus 4.1 percent and 4.1 percent individually) or with marketing (4.9 percent VTR versus 4.1 percent and 3.5 percent individually). In none of these scenarios is the synergy sufficient that the estimated trip reduction effect in combination is greater than the sum of the separately applied individual strategies.

The Worksite Trip Reduction Model would appear to be an excellent start toward a set of tools that can help TDM planners make sense of the vast number of strategies available to them. In addition to being easy to use, a very appealing aspect of this new tool is that it does not seem to generate unrealistic estimates of trip reduction. The predicted reductions are generally on the order of 3 to 6 percent. Reduction estimates of this magnitude compare more realistically with the typical employment site results seen within large area-wide programs than do the 15 percent to 30 percent reductions seen in the 82-program sample. It should once again be stressed that the 82 examples include many exemplary programs, and that that group should not in any way be construed as typical of what might be realized in a large area-wide regulatory program.¹⁴

Practitioners are urged to apply caution and common sense to any model projection, whether it be the two models featured in this subsection, or the FHWA TDM Evaluation Model, or the U.S. Environmental Protection Agency (EPA) COMMUTER Model introduced later in the “Additional Resources” section. Empirical case studies such as those presented in this chapter, or contained in a number of the recommended resources, always serve as a good way of cross-checking a TDM program’s potential impact.

International Experience

Outside the United States, interest in TDM has been particularly high in the Netherlands and in the United Kingdom. A study prepared for the British Department for Transport (DfT), Smarter

¹⁴ During the timeframe of the Chapter 19 review and publication process, CUTR issued an update to the Worksite Trip Reduction model, now renamed TRIMMS© (Concas and Winters, 2009). See the “Additional Resources” section for additional information.
Choices—Changing the Way We Travel (Cairns et al., 2002), provides a summary of TDM experience in those two venues. Key studies and findings from the experience reviewed are summarized in the following section.

**Making Travel Plans Work**\(^\text{15}\)

This analysis and report was originally prepared for the DfT in 2002 by Cairns, Davis, Newson, and Swiderska of ESRC Transport Studies Unit UCL, and Adrian Davis Associates. It represented the biggest study of British workplace travel plans to date and presents results based on an analysis of best practice at 20 organizations employing over 69,000 employees. These cases represented a range of public and private organizations, all of which were selected as examples of good (not average) practice. Taken overall, the 20 organizations had reduced the number of cars driven to work by 14 for every 100 staff, representing an average reduction of 18 percent in the proportion of commute trips by car driver. On average, the organizations had doubled the proportion of staff commuting by bus, train, cycling, and walking, and car sharing (carpooling) had also been reasonably successful.

A study of factors that made some travel plans more successful than others produced very few generalizations that could be made. All travel plans had involved real changes to employee travel options, so it was not possible to assess the effects of plans that focused on awareness-raising only. The one factor that did emerge was parking. For the 13 travel plans that had addressed parking, either by restricting supply, introducing charges, or providing incentive payments to those giving up a parking space, the proportion of commute trips made as car driver was reduced by 24 percent, compared to 10 percent for those plans that had not addressed parking (Cairns et al., 2002).

**Effective TDM at Worksites in the Netherlands and the United States**

This study, performed by Organisational Coaching and Schreffler in 1996, compared 20 paired case studies from the Netherlands and the United States. The organizations examined included a large hospital, a large manufacturer, a government organization or utility, a bank, an insurance or telecommunications organization, a major university, an airport, a consultancy firm, and a smaller employer with less than 250 employees. Again, examples chosen were all considered to be success stories. Results showed remarkable similarity across the two sets of case studies, with the programs in the United States revealing VTR rates in a range of 6 percent to 49 percent, with an average of 19 percent, while those in the Netherlands had reductions in vehicle kilometers of travel ranging from 6 percent to 32 percent, averaging 20 percent (Cairns et al., 2002).

**Netherlands Ministry of Transport Study**

A 1998 Dutch study by Ligtermoet included a review of new results from 40 organizations in the Netherlands plus other Dutch data. Analysis showed that plans with “basic” measures (such as car-sharing schemes) achieved vehicle kilometer reductions of 6 to 8 percent, while those with “luxury” measures (such as company buses) or “push” measures (such as parking management) achieved reductions in the range of 15 to 20 percent. This led to the conclusion that plans combining both “carrots and sticks” are the most effective (Cairns et al., 2002).

---

\(^{15}\) A “travel plan” is the equivalent of what is known in the United States as a Transportation Management Plan (TMP) (Enoch and Zhang, 2008). United Kingdom experience with travel plan employer participation rates is included in the “Site-Versus System-Level Impacts” subsection which follows.
This review of Dutch travel plans by Touwen in 1999 concluded that travel plans consisting of communication/marketing measures, basic measures such as carpooling and cycle leasing, and organizational measures such as flextime achieved an average reduction of 8 percent in vehicle kilometers traveled. However, if luxury measures or disincentive measures were added, the average reduction was about 20 percent (Cairns et al., 2002).

This study by the Cairns organization itself tracked and reported on its own selection of 26 workplace travel plan case studies from locations in Birmingham, Bristol, Buckinghamshire, Cambridgeshire, Merseyside, Nottingham, and York. Although the study reports trip reductions, the strategies employed were not specified. The report seems to have been more oriented to exploring the process by which the programs were engineered, their costs, and projections of their possible effects at different levels of geographic resolution (Cairns et al., 2002).

The vast majority of travel demand management effectiveness data presented up to this point in Chapter 19 has been measured and analyzed at the site level, providing findings about TDM impact on travel to and from particular offices, campuses, and other specific employment and institutional sites engaging in specific sets of TDM strategies. Most of this data addresses only the effect on travel produced by the journey to and from work or school. Some results have been presented at a program level, such as employee or student pass programs facilitated by public transportation agencies but implemented at the site level in conjunction with individual employers or institutions.

This focus on site-level work-commute-trip impacts is consistent with the scope of this chapter, which (in accord with its title) addresses employer and institutional TDM strategies and not programs more or less independent of employers such as residence-based programs or area-wide agency programs. Examples of broader agency-implemented programs are wide-area transit improvements and regional rideshare matching programs.

Indeed, a number of important objectives associated with TDM apply at the site level, including employee and through-traffic congestion mitigation at site access points, site traffic pollutant emissions reduction, parking facility needs reduction, and employee benefits. Nevertheless, the question remains about the broader effects of site-based TDM on all employees within an urban sector, on overall peak-period area street traffic, on major transportation facilities, and on regional vehicle trip making and VMT. Information about such broader effects would be useful for a quantitative understanding of TDM efficacy in addressing objectives such as regional transportation facility congestion mitigation, energy conservation, improved regional air quality, and reduction in global warming gas emissions.

As one moves from the site level toward the broader area level or regional traffic facility level the following stages of impact dissipation apply (Pratt, 1990):

Stage 1. A leveling out of effects among differing participating employer and institutional scenarios, reflecting various types and sizes of employers and TDM programs, and averaging out of high-effectiveness and lower-effectiveness programs.
Stage 2. Dissipation of work-trip effects as average site-level effects are mixed with the unaffected commuting associated with non-participating employers.

Stage 3. Additional trip-reduction dissipation as work-commute trips are mixed in with non-work site-generated travel produced by both participating and non-participating employers and institutions along with other interspersed land uses.

Stage 4. Further leveling-out of impacts as locally generated trips and traffic are intermixed with other trips and traffic. On transit systems and local area streets only intra-regional through movements will normally be of significance, but on regional highway facilities, other traffic will include intercity travel.

These stages are referred back to, often with examples, in the discussion which follows.

Impacts at the site level vary according to employer type, most notably whether an office, retail, or industrial employer is involved, and size of employer. Although most studies have found no significant relationship among TDM program effectiveness levels for large, medium, and medium-small employers, it has generally been presumed that fewer TDM actions are workable for firms of less than 100 employees (Comsis and ITE, 1993). According to 2004 U.S. Census data, 36 percent of all employees work for firms with less than 100 employees (U.S. Census, 2007).°

**Degree of Employer Participation**

Site-level TDM impacts, even once averages are calculated (Stage 1 dissipation as identified above), apply only to employers actually participating in the employer-dependent TDM strategies. These impacts are diluted, on an employment-area level, by non-participating employers (Stage 2 above).

The degree of employer participation or non-participation is heavily impacted by the regulatory environment. Where no legal requirement compels participation, employer involvement is voluntary, and participation generally reflects the employer’s self-interest. Where a legal requirement for TDM program participation derives from the administration of land use and zoning regulations, the requirement may directly apply only to new sites and not to pre-existing employment. Full mandatory participation, such as applied in Southern California’s air quality Regulation XV program, does not really apply to all employers. “Full mandatory” participation typically applies only to employers of 100 (sometimes 50) or more employees. Further background on effects of employer type and regulatory influences is provided in the “Underlying Traveler Response Factors” section under “Voluntary Versus Regulatory Employer Motivation” and “Characteristics of Employer.”

Degree of employer participation has been approximated in some analyses by means of “employer participation rate” averages. Evaluating degree of site-level impact dilution by non-participating employers requires associating employer subgroups with their average employer participation rates (Comsis and ITE, 1993). Table 19-34 gives default experience-based employer participation rates for voluntary employer participation from the “FHWA TDM Evaluation Model” and indicates their empirical and/or judgmental basis. As can be seen, these rates were based on very limited expe-

---

16 National employment statistics such as this provide only an approximate indication of employment site size distributions and almost certainly understate the prevalence of smaller-size establishments. Self-employed persons without payroll are excluded, and large employers may have secondary places of business which, from an employee transportation perspective, are similar to small businesses.
Empirical voluntary employer participation rates have been reported in the aggregate for the United Kingdom. Termed “level of travel plan take-up,” the observed rates apply to all degrees of travel plan scope and intensity. (The United States equivalent of a travel plan is a Transportation Management Plan, or TMP.) The concept of the travel plan arrived in the United Kingdom from the United States in the mid-1990s, after first being taken up by the Netherlands. The U.K. Department of Environment, Transport, and the Regions (DETR) is pursuing “widespread voluntary take-up of travel plans” according to a 1998 white paper.

The highest U.K. employer participation rates have been observed among local government entities. In 1997/1998, 3 percent had TMPs on a permanent basis and another 4 percent had TMPs on a pilot or trial basis, for a total of 7 percent participation. The total had risen to 24 percent by 2001 and 62 percent by 2006. Participation rates are observed to be much more modest in the U.K. private sector. Of firms with 100 or more employees, 4 percent had permanent TMPs in 1997/1998, with no data available on pilot or trial TMPs. The total of permanent and experimental TMPs equated to a 7 percent participation rate in 2001 and rose to 11 percent participation in 2006. Small businesses of less than 100 employees have been found to be relatively neglected. Circa 2000, only 19 percent of small businesses were even aware of the travel plan concept (Enoch and Zhang, 2008).

Notes:  
<sup>a</sup> As utilized in the FHWA TDM Evaluation Model.

<sup>b</sup> The National Ridesharing Demonstration Program report indicated a higher overall voluntary employer participation rate for minimal-effort, low-impact carpool programs but without any breakout by firm size.

<sup>c</sup> Of Boston area firms selling transit passes to their employees, 7.6 percent subsidized them. This was 20 percent of the carpool program employer participation rate for firms with over 100 employees. The number of firms subsidizing transit passes (56) was also 20 percent of the number of firms with variable work hours programs (285).

<sup>d</sup> Programs such as Denver’s Eco Pass and Seattle’s FlexPass (see “Response by Type of Strategy” — “Changes in Fare Categories” — “Unlimited Travel Pass Partnerships” in Chapter 12, “Transit Pricing and Fares”) offer the potential for updated participation rate calculations but none such have been encountered.

Intermediate Effects of Dissipation

Continuing briefly with U.K. experience, it is of interest that two estimates have been prepared of national-level commute trip vehicle travel reductions attributable to travel plan implementation. DETR research published in 2004 produced estimates that commute trip vehicle kilometers of travel (VKT) reductions in the range of 0.4 to 3.3 percent had been achieved. This finding is complemented by a slightly earlier independent estimate that the travel-plan-attributable reduction in commute VKT had possibly been 1.143 billion kilometers per year, or 0.74 percent of the auto commute total (Enoch and Zhang, 2008). These U.K. estimates address the dissipation in Stages 1 and 2—and to a certain extent Stage 4—as described above, but not the Stage 3 intermixing of commute travel with travel for all other trip purposes.

In the United States, as of the early 1990s, results for a number of programs that had taken an area-wide approach to TDM were not suggestive that TDM was an effective broad-area strategy. Many of these efforts were associated with TMAs that had largely depended on voluntary cooperation by employers or developers and lacked the technical guidance and legal clout to move beyond a marketing-based approach. Lacking decisive actions, these programs had not proven to be instruments of significant change (Comsis and ITE, 1993).

During a somewhat longer contemporary time frame, California saw widespread adoption of mandatory employer-based trip reduction, implemented primarily through city and county ordinances and air quality district rules. The objectives were congestion mitigation or pollutant emission reduction. These programs were terminated or drastically altered by California legislation signed in January 1996 that prohibited mandatory programs. The reported results of these mandatory trip-reduction programs do not encompass the full sequence of employer-based TDM impact dissipation, but do provide a look at the work-commute-trip reduction averages achieved by all non-exempted firms across whole political jurisdictions (Stage 1 dissipation as identified earlier). Exempt firms were typically those with fewer than 100 employees (Dill, 1998).

Table 19-35 lists 13 such programs, including two from outside California, and indicates the drive-alone mode share and reduction averages achieved. Drive-alone rate reductions somewhat overstate vehicle trip reductions, since the carpooling alternative diminishes but does not fully erase vehicle trips. Nonetheless, they are a useful indicator. As can be seen by examination of the table, the average drive-alone work-commute reduction was 3-1/2 percentage points. The range, excluding the highest and lowest outliers, was from no effect to a 7 percentage-point drive-alone trip reduction among covered employees.

Results from SCAQMD for the 5-year period 1988–1993 provide additional information for the greater Los Angeles region. Employers with over 100 employees were required to submit plans and status annually, although somewhat longer times between plan submissions was not uncommon. Implementation of the mandatory program was gradual, and started with the region’s largest employers. Data for 817 sites with 4 or more plans give an indication of average vehicle ridership (AVR) progress over time. The aggregate (weighted average) AVR for these sites was 1.196 at the time of the first plan, 1.220 for the second plan, 1.271 for the third, and 1.288 for the fourth. This equates to a 7.7 percent improvement in AVR, over a span of 3-plus years, equivalent to slightly over a 7 percent reduction in journey-to-work vehicle trips per employee.
Looking at all 4,999 participating employment sites with valid information and two-or-more approved plans, the aggregate starting AVR was 1.205. The last reported AVRs, as of November 1993, aggregated to 1.257, up 4.3 percent. The corresponding trip reduction was 4.1 percent over the 1- to 3-plus-year time spans involved. The average commute-trip drive-alone share for the 4,999 sites decreased from 73.5 percent to 67.2 percent, a 6.3 percentage-point reduction. That shift translates into a 9.6 percent drive-alone share decline from the initial to the most current plan. It was largely attributable to increased carpooling, with the carpooling share increasing from 15.5 to 21.4 percent. Concurrently, vanpooling increased from 1.2 to 1.9 percent. The transit share increase was slight, from 4.0 to 4.3 percent. Walk and bike, together 3.0 percent, did not change. While the CWW day-off share increased from 1.3 to 1.9 percent, the telecommuting share dropped from 1.4 percent to 0.3 percent (Young and Luo, 1995).

Only 6 percent of regulated sites charged for parking. In their earlier plans, 69 percent of employers offered direct financial subsidies for alternative modes. This investment in vehicle trip reduction declined, however, to 53 percent in the last plans of the 5-year evaluation period. No more than a weak statistical relationship was found between AVR progress and site characteristics and between AVR progress and program duration. Location in the Los Angeles Central Business District (CBD) affected the mix of mode shifts, however. At the 188 CBD sites, carpool and transit shares started at

Note: The source states: “Determining the actual impact of these programs is beyond the scope of this paper… the issue is to determine what is significant or worthwhile.”

\(^a\) Percentage-point change in drive-alone share.

\(^b\) The focus of the Pleasanton program was on peak-congestion mitigation, more than trip reduction per se, and the program relied heavily on variable work hours measures.

around 21 to 22 percent. Carpooling increased 4 percentage points and transit increased 3 percentage points from the first-reported to the last-reported shares.

A significant negative relationship was found between AVR progress, expressed as aggregate percent gain in AVR, and the initial AVR. Of particular note was the 14 percent average drop in AVR for the 582 sites starting with an initial AVR of 1.5 and above (Young and Luo, 1995). The research paper does not examine possible causes of the program failure affecting the group of sites with a high AVR to start with. Clearly overall average program results, though they remained positive, were dragged down by this outcome.

The case study, “Overall TDM Program Effects over Time—Bellevue, Washington,” (see this chapter’s “Case Studies” section), looks at impacts of the first two stages of dissipation on employee travel mode shares. While estimated employee vehicle trip reductions at key employers were on the order of 30 percent or more in response to TDM program implementation, the overall downtown employee drive-alone commute share reductions were on the order of 10 percent over a 20-year time span. (A second data source places the reduction at 2 percent.) In response to both employer TDM and extensive public improvements to bus transit services, the corresponding transit commute share doubled (see case study for sources).

End Results of Dissipation

Only two fully or partially empirical studies addressing all four stages of dissipation of TDM program effects, as identified above under “Overview of System-Level Impact Relationships,” have been encountered. In the fully empirical study, dissipation as one moves outward from the involved employment area—primarily through intermixing with other travel (Stages 3 and 4 dissipation)—was measured in the early 1970s for the introduction of variable work hours for Canadian government workers in Ottawa, Canada. The relative impacts are highly illustrative even though the specific traffic-peaking reductions obtained are uniquely large because of the single-employer dominance of the national government in downtown Ottawa.

The primary effectiveness measure in the Ottawa study, given that trip-reduction measures were not part of the variable work hours program, was percentage reduction in the peak-hour to peak-period traffic ratio. The construct of this measure was such that it was equal to the percentage reduction in peak-hour traffic in those instances where there was no change in peak-period traffic volumes. It was applied to both street traffic volumes and transit ridership.

The street traffic effect was measured in the PM peak period. The reduction in the peak-hour to peak-period auto traffic ratio was 21.6 percent as measured at parking lots. Non-work travel and other traffic intermixing effects were such that the corresponding reductions as measured at the central Ottawa Cordon and at the Ottawa River screenline dropped to 10.2 and 5.7 percent, respectively. Corresponding PM transit ridership peaking reductions were 23.7 percent for government employee transit riders, as measured at their workplace, down to 19.2 percent for all peak-direction transit riders at the central Ottawa Cordon. Peaking reductions for AM peak-period transit riders were 16.9 percent at the workplace and 8.4 percent at the central Ottawa Cordon (Safavian and McLean, 1975).

There is no other known fully empirical research on system-level effects of TDM. It is doubtful that broad-area traffic volume reduction impacts of typical site-level employee-trip-reduction programs are amenable to direct field measurement of traffic volume changes given the potential for confounding effects ranging from land development to shifts in economic conditions. Successful
empirical measurement requires rigorous surveys of person- and vehicle-trip making, planned sufficiently in advance of initial program implementation, and paired with good luck that brings minimal or reliably quantifiable exogenous impacts.

The partially empirical study encountered is particularly useful in that the methodology not only covers—in effect—all four stages of dissipation but goes further, estimating congestion and emissions reduction effects. By so doing, it addresses the importance of even modest traffic reductions to congestion mitigation.

The subject of the partially empirical study was an 8.6-mile north-south stretch of I-5, centered on downtown Seattle, along with the employers along the way and their CTR programs. Employers within an approximately 3.6-mile band were considered, including all located in the Seattle CBD. Coverage included 189 employers with CTR programs. The empirical component of the study included the before and after trip reduction strategies of each employer with a CTR program, participation rates for the nearly 63,000 employees involved, and commute trip origin-destination data. The modeled component started with the estimation of the corresponding VTRs, done using EPA’s COMMUTER Model (see “Additional Resources”—“Analytic Tools”). Non-participating employers were accounted for through the non-inclusion of any trip-reduction effects for employers without included CTR programs. The vehicle trips eliminated were then assigned to an already calibrated and evaluated current-conditions CORSIM microsimulation traffic representation of the corridor, to assess what conditions would be without CTR program TDM. For simplicity and considering their function, the analysis treated the I-5 reversible express lanes as ramps and otherwise excluded them from the analysis (Georggi et al., 2007).

Not all TDM strategies in place were credited in the analysis, again for simplicity. The included strategies were alternative work schedules, employer TDM support strategies, travel cost changes, and flexible work hours. The estimated VTR average for the employers with CTR programs was between 11.3 and 14.2 percent. The higher number assumed observed parking charges were all attributable to the CTR programs, while the lower number took into account that the basic charges might have existed anyway (but without carpool/vanpool discounts). The higher estimate was adopted for the extended analysis. Note that these average VTR estimates correspond to Stage 1 dissipation of the four stages outlined earlier.

The completed traffic analysis (corresponding to Stage 4 dissipation) found a difference in peak period traffic volume on study corridor I-5 on-and-off-ramps averaging about 4 percent. The largest peak-direction changes on any individual ramp were about 50 to 55 percent depending on the peak period (Georggi et al., 2007). Corresponding performance measure effects, more substantial than the volume changes might at first glance imply, are covered in the “Cost-Effectiveness” and “Energy and Environmental Relationships” subsections to follow.

In addition to these two empirically-based studies, a few forecasts or hypothetical estimates have been made of system-level effects inclusive of all four stages of impact dissipation. In the mid-1980s, for example, a precursor of the FHWA TDM Evaluation Model and traffic assignment (simulation) techniques was used to estimate the effect of potential Minneapolis airport-area TDM on adjacent I-494 traffic volumes. The “Low Scenario,” employing modest TDM measures in combination with assumption of mixed-use land development, was forecast to offer a 7 to 11 percent vehicle-trip reduction, compared to conventional development with no TDM, as measured at participating employer/land-development sites. After accounting for all types of impact dissipation, this was projected to equate to a 2 percent average workplace vehicle-trip reduction, including both new and old development, and a 1 percent reduction in peak traffic on the I-494 study-area segment. The “High Scenario,” employing mandatory TDM with strong parking management
along with mixed-use development, was estimated to offer an 8 to 27 percent VTR at participating sites, a 6 percent average workplace VTR, and a 2 percent peak-traffic reduction on the adjacent I-494 segment (Pratt, 1990).\footnote{The original estimates included effects of workplace-based variable work hours programs and facility-based TSM measures such as freeway metering/bypass lanes and HOV lanes. These effects are not included here for clarity of presentation.} Insofar as this study only looked at suburban freeway mainline volumes and the Seattle I-5 analysis described immediately above reported only urban freeway ramp volumes, direct comparison is not possible, but the estimated traffic outcomes appear to be generally compatible.

Note that the Minneapolis airport-area “High Scenario” key employer and average workplace impact estimates are in the same ballpark as the downtown Bellevue empirical results now available (see the Bellevue case study). On the other hand, the Bellevue program is a uniquely successful example and is outlying-downtown-oriented. Actual results for voluntary TDM programs in spread-out suburban employment areas would likely be in the realm of the Minneapolis I-494 “Low Scenario” estimates. It is also of interest to note that the Minneapolis I-494 “High Scenario” estimate for facility-level traffic reduction of 2 percent is of the same order of magnitude, although somewhat lower than, the estimates by Kenneth Orski of a theoretically achievable 2 to 3 percent decrease in regional vehicle trips and 3 to 4 percent decrease in regional vehicle miles of travel (VMT) (Orski, 1993). These estimates were presented earlier, at the end of the “Voluntary Versus Regulatory Employer Motivation” discussion within the “Underlying Traveler Response Factors” section.

As of this writing, Washington is one of very few states that currently have strong Commute Trip Reduction laws or the equivalent. State officials have noted that “Washington and Oregon are the only states where the percentage of people driving alone to work decreased between 1990 and 2000." Oregon has similar regulations plus urban growth boundaries. In Washington State the 1990–2000 drive-alone share reduction was 0.6 percentage points, from 73.9 percent to 73.3 percent, an 0.8 percent decline. Nationwide, the U.S. drive-alone share for commuting increased by 3.4 percent (Washington State Department of Transportation, 2007). Although these observations cannot demonstrate causality, they are suggestive of a broad-scale TDM, transportation investment and operations, and land use public policy impact. Comparing the Washington State 1990–2000 drive-alone share reduction with the national drive-alone share increase suggests that this combined impact may, over a decade, be on the order of a 4 percent drive-alone share reduction/dampening under favorable mandatory regulation conditions.

**Cost-Effectiveness**

Numerous studies in the 1990s investigated the cost-effectiveness of TDM approaches for reducing vehicle travel and also emissions. A major motivation in these studies was the outcry from employers in Southern California who complained about substantial costs to implement trip reduction programs under the requirement of Regulation XV, made in the context of growing evidence that the program was falling short of its goals in achieving trip-reduction targets. A 1993 study by Ernst & Young caused widespread controversy when it concluded that employers participating in Regulation XV were realizing an annual expense per employee of $105 for that participation, with a cost per trip reduced of $3,000 per year.

In a challenge of these findings, contrary evidence from other studies was presented, including Chicago ($31.42 per employee per year); San Diego ($26.15); Commuter Transportation Services...
($57); UCLA/USC ($31); TCRP ($14.70); Maricopa County, Arizona ($8); Pima County, Arizona ($18); and Washington State ($9). From these data it was concluded that a more appropriate estimate of cost per employee would be in the $8 to $57 range, with an average of $24 (Schreffler, 1996). An earlier study at University of California, Berkeley tended to reinforce the latter findings with an average cost of $31 per employee per year and a median cost of $20, although the objective of the University of California, Berkeley study had been to demonstrate that other transportation management measures—such as pricing, land use density, and a broader range of alternatives—would be generally more cost-effective than regulatory TDM (Wachs, 1993).

In Part III (Section 3.4) of the 1993 FHWA report, Implementing Effective Travel Demand Management Measures, an assessment is made in circa 1991–1992 dollars of the cost and cost-effectiveness of 22 employer programs researched for the study. Parking was charged for outright at 12 of these 22 organizations. These 12 plus another six of the programs included incentives and/or disincentives of some sort.

The analysis looked at direct costs associated with administering the program, plus any subsidies or costs of providing services, and then also estimated cost savings. Savings were determined as either revenues generated by the program (such as parking fees) or costs averted, particularly avoided costs related to employee parking. Only situations where the employer was paying a separate, definable cost for parking were considered to be avoidable.

Over the sample of 22 employers, the direct cost per daily one-way vehicle trip reduced ranged from $0 to $6.75, with an average of $1.22 (weighted by trips). Cost savings per trip reduced ranged from $0 to $6.21, with a weighted average of $1.94. Net cost per trip reduced, or direct cost minus cost savings, ranged from $4.99 to $3.32, with a weighted average of $0.72.18 If this net cost were presented in terms of the entire employee base (perhaps a better measure of the cost impact on an employer) the range was from $1.81 to $2.01 per employee, with an average of $0.24 for the overall sample.

The lesson taken from this analysis was that employer TDM programs that incorporate financial incentives and disincentives—most particularly including the availability and price of parking—are not only the most effective in reducing vehicle trips, but have the lowest cost per employee and per trip reduced of all programs. Indeed, as just presented, the net costs per trip and per employee were each found to be negative on average (Comsis and ITE, 1993). This finding may also partially explain the high cost per employee and per trip in the Ernst & Young study. The great majority of programs that were in place and examined in that study were support-type programs that did not use incentives and disincentives (Schreffler, 1996).

Similar findings about the effect of different program types were derived from the results of a survey of 49 employers in the TCRP Project B-4 study (Comsis, 1994). In this project, a framework was used that categorized employer programs into four groupings: programs that were essentially support measures, programs incorporating services, programs built on incentives and disincentives, and programs combining services with incentives/disincentives. Table 19-36 shows the cost-effectiveness results from this analysis.

---

18 The trip cost data presented here in the first half of this paragraph are the only known instance in this chapter of performance data dimensioned in one-way trips. The findings should be multiplied by two before comparing with other information in the chapter on cost per trip reduced.
As the level of program intensity grows from support to full-fledged services-plus-incentives, the average VTR also increases. This increase runs from the seemingly odd result of an average computed gain in vehicle trips for the support programs of a −1.4 percent VTR (see Note b in Table 19-36) on up to a reduction of 24.5 percent for the service and incentive programs. Looking at costs, support programs cost the employer an average of $13.92 per employee per year, while service-based programs, which have a higher VTR impact, cost $29.16 per employee per year. Incentive/disincentive-based programs cost the employer $13.46 per employee per year, less than one-half the cost of the services programs but reducing twice the rate of trips. Service/incentive programs cost $92.94 per year per employee, the highest unit cost, attributable to the extensive nature of the programs—especially the services and subsidies. These programs, however, also achieve the highest average trip reduction, at 24.5 percent.

The picture changes sharply when avoided costs are factored in. When this is done, the support and the services programs change imperceptibly, since they haven’t reduced trips substantially, and because parking was not found to be a problem at these employers. However, the incentive/disincentive programs show an average net cost savings of $111.47 per employee per year. The service/incentive programs—comparatively expensive on a direct cost basis—become financially attractive with avoidable cost savings factored in, providing a net cost savings of $24.77 per employee per year.

The relationships change somewhat when costs are examined on a per-trip basis. Support programs average $0.62 in direct cost per daily vehicle trip reduced (a cost per trip was only calculated for those programs with a positive trip reduction). Service programs average $1.49 per daily vehicle trip reduced, again about double the cost of the support programs. Incentive programs realize a cost of $0.37 per trip, lower than the others, while service/incentive programs cost $1.35 per trip. The average direct cost per daily vehicle trip reduced is $0.75 for all programs, a surprisingly

Notes: 

- a Computed only for programs with a positive trip reduction.
- b A negative VTR implies that the sample program(s) had vehicle trip rates that were actually greater than the average from the surrounding area with which they were compared.

Source: Comsis (1994), with table corrections by the Handbook authors, derived on the basis of the disaggregated data in the source document.
low number. When net costs are computed on a per-trip basis, the two high-yield program types, incentive and service/incentive, emerge as the most cost effective, with cost savings of $1.36 and $0.63 per daily vehicle trip reduced, respectively. In contrast, neither the support nor the services programs had avoidable costs to claim, and hence their net cost per trip reduced is the same as the direct cost per trip (Comsis, 1994).

A “Trip Reduction Performance Program” sponsored by the Washington State Department of Transportation (WSDOT) offers a window into 2005–2009 trip reduction costs under the state’s CTR regulations. Under this program entities ranging from employers to agencies contract with WSDOT to deliver specified trip reductions. WSDOT sets an upper limit of a $460 annual cost per average daily trip reduced, less than $2.00/day. Although many participants compete for funds at this limit, other projects come in substantially lower (Hillsman, 2009).

One of several effectiveness measures relevant to TDM is congestion reduction. The Seattle I-5 corridor TDM-impact analysis described in the previous subsection estimated that study area peak period ramp volumes would average about 4 percent higher without the existing CTR programs. Traffic flow theory and observation indicate that it is the last few percentage points of traffic growth that can move congestion from slowed traffic to traffic essentially at a standstill, and vehicle trip reduction should have the opposite effect, unless counterbalanced by induced traffic.

Theory and experience were backed up by the analysis, which (using the CORSIM traffic simulation model) determined that spatial congestion in the study area—measured in lane miles of congestion—would increase by 23 percent in the 4-hour AM peak period and 44 percent in the 4-hour PM peak period in the absence of current TDM programs. Similarly, it was determined that temporal congestion expressed as the timespan during which 20 percent or more of the network is congested would increase by 31 percent in the AM and 30 percent in the PM. With results such as these, it is possible to see how Washington State’s Commute Trip Reduction Task Force in 2005 estimated that Washington’s CTR programs were saving at least $24 million annually in reduced Puget Sound travel delay cost (based on 2003 data). Workers at CTR sites were estimated to be saving $13.7 million in fuel costs. The state’s CTR program investment in 2005 was $2.7 million. This leverage was combined with additional investment by local jurisdiction partners and participating employers (Georggi et al., 2007). The employer contribution is understood to be in the $30 to $40 million range (Hillsman, 2009). A full-scale cost-effectiveness evaluation would obviously fully quantify not only these additional cost contributions, but also additional societal and corporate/institutional costs and benefits.

Energy and Environmental Relationships

Because their purpose is to reduce vehicle trips and vehicle miles of travel, TDM strategies are frequently considered as mechanisms to reduce energy use and vehicle emissions. The outcome for both—energy used and pollutants emitted—is dependent not only on the number of vehicle trips and travel miles. It is also dependent on the operating conditions under which the trips and travel occur, as well as the state of engine and fuel technology. From the mid-1970s, as a result of concerns about foreign petroleum dependency and growing problems with air pollution in American cities, legislation has pushed vehicle manufacturers and petroleum companies to improve upon the performance of their products. Beginning with the 1978 model year, foreign and domestic vehicle manufacturers were obliged to meet federal standards and time schedules for corporate average fuel economy (CAFE standards) and rates of emissions (Hillsman, 2009). Hence, the domestic vehicle fleet (light duty much more than heavy duty) has seen fuel economy and emissions performance grow. Perhaps the biggest gains occurred in the 1990s following passage of the Clean Air Act Amendments, and more may now be anticipated in the future.
The purpose of this background is to convey the perspective that energy consumption and vehicle emissions are derived outcomes depending heavily on the state of technology and fuels, which have been evolving rapidly. Therefore, it can be potentially misleading to attempt comparisons of the capabilities and cost-effectiveness of particular TDM strategies in reducing emissions or fuel consumption using past data, given that there are so many context variables that contribute to the outcome.

In spite of the fuel conservation efforts of the 1970s, as the real cost of fuel softened in subsequent years, manufacturers lured consumers back to large, heavy, and high-horsepower vehicles. These included light trucks and SUVs, which faced much less restrictive fuel economy and emissions standards. Partially as a result, but also in response to increased driving overall, transportation energy consumption rose markedly and has returned as a major policy issue. As such, it is a key element of foreign petroleum dependency and global warming concerns.

Also, while vehicles have become less polluting of ozone-contributing gasses (VOC, NOx, and CO), the past focus has not been on greenhouse gas emissions. The greenhouse gas pollutants, primarily CO2, are directly tied to fossil fuel combustion. Conventional emissions control technology cannot effectively mitigate the greenhouse gas effects of high rates of motor vehicle use. Only fossil fuel consumption reduction—a function of fuel efficiency enhancement and VMT reduction—can lower CO2 emissions.

There have been many studies where TDM measures have been considered and analyzed for adoption as Transportation Control Measures (TCMs) to mitigate pollution impacts. In a Transportation Research Board study of the benefits of the U.S. government’s Congestion Mitigation and Air Quality (CMAQ) program published in TRB Special Report 264, a literature review examined scores of Metropolitan Planning Organization (MPO) and academic research studies that attempted to estimate the travel and emissions effects of TCMs. It was found, however, that virtually all of these studies were limited in that they were modeling efforts and not empirical studies. Consequently, only a small number of studies provided the basis for the CMAQ review. The selected studies had the characteristic that their travel impacts were based on empirical observation, though emissions models were necessary to estimate the travel impact effects on emissions.

Perhaps the most substantial resource used by the TRB/CMAQ study was a set of demonstration projects conducted in California under various sponsors in the 1990s. The common denominator of these studies was the way their impacts were determined. Each of the projects had been closely monitored through before-and-after data collection, accompanied by detailed tracking of costs and operating characteristics. The three different programs involved were the Los Angeles County Metropolitan Transportation Authority (MTA) TDM Demonstration program, which funded more than 170 TDM projects to test the costs and effectiveness of eight categories of projects in reducing vehicle trips, VMT, and emissions; California law/program AB2766, which provided $60 million in funding from vehicle registration revenues toward 250 projects aimed at reducing vehicle air pollution; and the San Diego-Coronado Bridge Toll Revenue Program, which used bridge toll revenue to finance projects to increase bridge capacity and reduce congestion and improve air quality (Committee for the Evaluation of the Congestion Mitigation and Air Quality Improvement Program, 2002). A summary covering these three programs has been presented in a 1998 TRB paper (Pansing, Schreffler, and Sillings, 1998). Results of this assessment are shown in Table 19-37.

The table shows the range of impacts on vehicle trips and travel, four key pollutants, and the corresponding cost associated with reducing each. Unfortunately, while overall travel impacts were measured, underlying modal shares were not reported for these projects. Predictably, the range of impacts across all strategy categories—both for travel and emissions—is so broad as to preclude
strong conclusions about relative cost-effectiveness, since the impact is substantially controlled by the scale (cost) of the project. Even when normalized in relation to cost, one still observes a considerable range in the cost-based performance for most of the strategies, likely related in part to ambient conditions. The biggest ranges in performance are associated with the alternative-fuel-vehicle measures and the transit improvements, while the core TDM measures (with the exception of telecommunications) seem more stable in their measured performance. Generally what can be observed from these data is the rather favorable performance of the TDM strategies (except telecommunications and to some extent vanpools) in reducing VMT and emissions.

Largely but not entirely similar conclusions were reached in the TRB/CMAQ evaluation itself. Table 19-38 offers a summary of the emissions cost-effectiveness taken from Table E-4 of the CMAQ study. The median values shown are also derived from a fairly wide range of impacts found in the representative projects (Committee for the Evaluation of the Congestion Mitigation and Air Quality Improvement Program, 2002).

Two important conclusions were reached by the TRB/CMAQ study:

- The success of any strategy depended greatly on its being applied in an appropriate context.

- Several of the strategy categories that had favorable cost-effectiveness in reducing emissions were of the TDM genre.

While inspection and maintenance ranked as the most cost-effective of all strategies, well above average cost-per-ton performance was found in the TDM categories of regional ridesharing programs, charges and fees, vanpool programs, miscellaneous TDM, and employer trip reduction. Conversely, among the least cost-effective TDM strategies were telework programs, transit shuttles or feeder lines, and bicycle/pedestrian facilities and programs. Also less cost-effective than the top 10 strategies for reducing emissions were such widely popular Transportation System Management (TSM) measures as park-and-ride lots, freeway/incident management programs, and HOV facilities (Committee for the Evaluation of the Congestion Mitigation and Air Quality Improvement Program, 2002).

The two areas where conclusions differed markedly between the California-based studies and the TRB/CMAQ study were with respect to vanpools and bicycle facilities. Note that while vanpooling exhibits a tendency toward disappointing cost-effectiveness in the summary of California studies (see Table 19-37), the cost spread is wide, and it places a respectable fourth out of 19 for

---

A significant limitation affecting single-objective/single-function cost-effectiveness (or cost-benefit) analyses such as these is that other benefits to individuals or society are not considered. This issue is expanded upon with respect to non-motorized transport (NMT) facilities in Chapter 16, “Pedestrian and Bicycle Facilities.” See “Economic and Equity Impacts” in that chapter’s “Related Information and Impacts” section.
cost-effectiveness in the TRB/CMAQ study. Conversely, bicycle facilities appear relatively cost-effective for emissions reductions in the California studies summary, while appearing 2/3 of the way down the TRB/CMAQ cost-effectiveness ranking.

Finally, referring back again to the previously described Seattle I-5 corridor TDM-impact analysis, the CORSIM traffic simulation of conditions in the 8.6-mile study corridor produced emissions impacts with and without the 2003 TDM programs at the 189 CTR-participant employers. It was estimated that, absent the CTR-based TDM programs, AM and PM peak-period HC emissions would increase by a total of 38.1 kilograms, representing a 10.3 percent increase in the AM period and a 13.1 percent increase in the PM period. Estimated peak-period CO emissions increases would total 2,654.3 kilograms, a 9.6 percent increase in the AM and a 12.7 percent increase in the PM. Similarly, NOx emissions would increase by a peak-periods total of 122.2 kilograms, an 8.9 percent increase in the AM period and a 10.9 percent increase in the PM period (Georggi et al., 2007).

**ADDITIONAL RESOURCES**

Many of the other chapters of this TCRP Report 95, “Traveler Response to Transportation System Changes” Handbook constitute additional resources for TDM. More specifics are provided in the introduction to this chapter’s “Overview and Summary” section. Additional resources external to TCRP Report 95 include the following materials.

*FHWA TDM Report, Practitioner Manuals, TDM Model, and Website Resources*

Perhaps the most comprehensive set of research and guidance materials on employee-focused TDM is still the report series titled Implementing Effective Travel Demand Management Measures, prepared by Comsis and the Institute of Transportation Engineers (ITE) in 1993 for the Federal Highway Administration, with support from the Federal Transit Administration. The set of materials in this series includes:

- A main report with the following three sections (Comsis and ITE, 1993):
  
  Part I—A basic “Introduction to Travel Demand Management,” including an overview of strategies, terminology, application environments, and expectations for impact.

  Part II—An “Inventory and Review of TDM Measures,” with detailed information on 11 categories of strategies, including improved alternatives (transit, carpool, vanpool, and bike/pedestrian improvements); incentives and disincentives (complementary support measures, HOV priority treatments, economic incentives, parking supply and pricing, and tolls and congestion pricing); and alternative work arrangements (variable work hours, compressed work weeks, and telecommuting). Included for each strategy is a description of its various forms, when and where it is most appropriately used, how it achieves its impact, other strategies with which it is or is not complementary, examples in application, ranges of potential impact, implementation issues, and additional references.

  Part III—A “Synthesis of Findings” that first introduces empirical findings from a sample of TDM programs, analyzing and discussing them in a manner to help reveal those features that are most critical to success. An analytic tool, the TDM Evaluation Model, is then presented as a means of estimating combined effects of TDM strategy packages applied in different travel
settings. The model is used to create tables and graphs that indicate ranges of impacts of each strategy across different levels and settings. Cost-effectiveness is then explored, and guidance is provided to assist in design and implementation of real-world TDM programs.

- A set of three Practitioner Guidance Manuals, also prepared for FHWA but published and distributed by the Institute of Transportation Engineers (ITE):

  *Implementing Effective Employer-Based Travel Demand Management Programs, A Guidance Manual.* For employers or professionals designing employer TDM programs, this manual provides an introduction to TDM, objectives, review of strategies, and recommended steps to take in designing and implementing a program. There is a worksheet section where the user is led through a program design, in which tables and charts are provided to ascertain the impact of the particular set of strategies selected (ITE, 1993).

  *Areawide Travel Demand Management Programs, A Guidance Manual.* This resource provides similar guidance in understanding and designing alternative TDM programs, but from the perspective of either a public agency or an area-wide organization such as a TMA or transportation district. This manual incorporates both employer-side measures and area-wide measures such as those that a public agency might initiate (ITE, 1992a).

  *Marketing Research for Transportation Demand Management Programs, A Guidance Manual.* Provides special guidance on how to obtain the appropriate data and conduct the proper analyses to better ensure that the right strategies are chosen in relation to characteristics of the particular market. Covered are market research methods, research questions and information needs, information gathering techniques, data analysis methods, and special calculation forms and a look-up table as aids for applying the marketing research results (ITE, 1992b).

  FHWA offers contemporary TDM information through its “Travel Demand Management” webpages at http://ops.fhwa.dot.gov/tdm/index.htm and the “Travel Demand Management Toolbox” found therein. The report, *Mitigating Traffic Congestion: The Role of Demand-Side Strategies*, linked through the “Publications and Reference Materials” section of the toolbox, places TDM in a broader context of demand-side strategies. This report provides an overview discussion of each type of demand-side strategy along with 26 case studies (Association for Commuter Transportation et al., 2004).

**Center for Urban Transportation Research Resources**

The National Center for Transit Research at the Center for Urban Transportation Research (CUTR) at the University of South Florida maintains a highly active program of research and analysis dedicated to Transportation Demand Management. The following is a list of reports, references, or services of interest.

**Economics of Travel Demand Management: Comparative Cost Effectiveness and Public Investment.** This 2007 project developed a methodology that combines academic and practitioner experiences within a theoretical framework that aims to capture consumers’ price responsiveness to diverse transportation options by embracing the most relevant tradeoffs faced under income, modal price and availability constraints. This work may be accessed at http://www.nctr.usf.edu/pdf/77704.pdf.
Development of the theoretical model led to the design and implementation of Trip Reduction Impacts for Mobility Management Strategies (TRIMMS), a practitioner-oriented, sketch-planning tool. The spreadsheet, which includes elements for estimating the effects of the “soft” marketing and support strategies, is available for download at http://www.nctr.usf.edu/spreadsheet/TRIMMS.zip.

Impact of Employer-based Programs on Transit System Ridership and Transportation System Performance. This is the full 2007 report on the Seattle I-5 TDM impact analysis covered in the “Related Information and Impacts” section under “Site- Versus System-Level Impacts”—“End Results of Dissipation.” It includes description of the analysis methodology and can be accessed at http://www.nctr.usf.edu/pdf/77605.pdf.

National Smart Transportation Archive Researcher. The National Smart Transportation Archive Researcher (NSTAR) was developed to make available an online, updatable, easily searchable database of case studies documenting effective use of TDM strategies to reduce VMT and SOV mode share. The database is intended for use by transportation professionals and worksite employee transportation coordinators to develop and improve the effectiveness of their own programs. The database is located on the Help Desk of the National TDM and Telework Clearinghouse at http://www.nctr.usf.edu/clearinghouse.

The accompanying Best Practices Guide features 12 in-depth case studies of some of the more effective worksite trip reduction programs. These particular worksites are located in Washington State and reflect a mandatory regulatory environment requiring employers to participate and produce results. The case studies were developed from data of the Washington State Department of Transportation’s Commute Trip Reduction Program along with interviews with worksite employee transportation coordinators. The Best Practices Guide is available at http://www.cutr.usf.edu/tdm/pdf/NSTAR.pdf. Over 100 employer case studies may be viewed at http://www.nctr.usf.edu/helpdesk/casestudies.htm.

State and Regional Program Reports

A series of evaluation reports developed for the Los Angeles County MTA TDM Demonstration Program provide not only information on the range of VMT, air quality, and cost impacts of a wide range of TDM strategies, but also serve as a practical guide in methods of empirical evaluation. While the vast majority of TDM or TCM measures are designed and implemented with little or no data gathered on their net effects, this study is exemplary in the careful application of before-and-after evaluation data collection methods, by far the most reliable way to assess travel and other impacts when many internal and external variables are at play. See in particular the MTA Transportation Demand Management Evaluation Final Report (Comsis and Pansing, 1997) and the MTA TDM Demonstration Program Third-Party Evaluation Final Report (Comsis et al., 1996)

The Washington State Legislature created a trip reduction performance program in 2003 to encourage entrepreneurs, private companies, transit systems, cities, non-profit organizations, developers, and property managers to provide services to employees that result in fewer vehicle trips arriving at worksites. The final report for 2003–2005 contains case studies with before-and-after data. It is found at http://www.wsdot.wa.gov/NR/rdonlyres/FF9220C9-EC49-46B7-A84D-B5103C63F0CA/0/20032005_CTR_ProgramReport.pdf.

The Washington State DOT Commute Trip Reduction (CTR) Program 2005 annual report notes that employee drive-alone rates, vehicle trips, and VMT to CTR worksites have decreased significantly. However, it also notes that progress toward the program’s statutory goals has been variable.
Other Information Sources

TCRP Report 87, “Strategies for Increasing the Effectiveness of Commuter Benefits Programs” (2003) may be accessed via http://144.171.11.107/Publications/Blurbs/Strategies_for_Increasing_the_Effectiveness_of_Com_152144.aspx. Marketing tactics and messages are suggested in the course of addressing means to promote effective programs. Appendix D, Table D-6, has a list of approximately 40 employers who offer commuter tax benefits to employees, along with their participation rates.

The Victoria Transport Policy Institute (VTPI) Online TDM Encyclopedia, developed and actively maintained by the VTPI, is a comprehensive resource on a wide range of transportation management strategies (Victoria Transport Policy Institute, 2009). The Encyclopedia is a truly “online” resource, accessible at http://www.vtpi.org/tdm/index.php, and offers a high degree of flexibility in searching for and extracting information on TDM. The Encyclopedia describes a large number of TDM applications and contains information on TDM planning, evaluation, and implementation. Hyperlinks provide access to more detailed information, including case studies and reference documents. The Online TDM Encyclopedia has an international perspective, with ideas and examples from across the world. VTPI, the creator and supporter of the Encyclopedia, is an independent research and consulting organization located in Victoria, British Columbia.

Canadian government resources include the Transportation Demand Management Database, found at http://www.tc.gc.ca/programs/environment/UTSP/tdm.htm. Included are profiles and results for 92 projects worldwide, focused on sustainable development, energy efficiency, accessibility, and increased productivity.

A good summary of TDM experience in the Netherlands and in the United Kingdom is provided by the British study Smarter Choices—Changing the Way We Travel, prepared for the Department for Transport (DfT) (Cairns et al., 2002).

Analytic Tools

One of the earliest tools still in use is the TDM Evaluation Model. It was developed by Comsis Corporation in the early 1990s from a combination of empirical TDM research studies and traditional transportation planning logit mode split models. The original purpose was to supplement the conventional “four-step” metropolitan travel forecasting process when performing corridor, subarea, or even regional transportation impact studies involving TDM alternatives. Voluntary and mandatory employer participation rates are taken into account.

The TDM model is generally applied to regional forecast trip tables (base year, present year, or future), and is used to estimate the impact on mode split, vehicle trip rate, and VMT for each origin-destination pairing. The revised trip tables may then be returned to the four-step (or other) travel demand model for traffic assignment. In this manner it is possible to interpret the effects of employer TDM programs on actual facility volumes and levels of service. Model outputs may then be used for air quality analysis. The model is also a reasonably convenient way of investi-
gating the traffic impact of new development projects and the benefits of applying development-level TDM mitigation. The Federal Highway Administration’s public version of the TDM model is available via the FHWA website at http://www.fhwa.dot.gov/environment/cmaqat/descriptions_tdm_evaluation_model.htm.

Subsequent TDM modeling tools have focused more narrowly on the design and impact of individual employer/institutional programs. In other words, the subject is an individual site, and not a population of employers such as might be targeted under an area-wide program initiative or ordinance. Examples of such tools include the Travel Demand Management Program software developed for the South Coast Air Quality Management District in Los Angeles by the California Air Resources Board (Comsis, 1993b). The research behind the development of this model was presented earlier in the “Related Information and Impacts” section under “Modeling Studies,” along with the more recent Worksite Trip Reduction Model developed by CUTR.20

Another fairly recent model, again with a single-employer focus, is the U.S. Environmental Protection Agency’s COMMUTER Model. It was developed under contract by Sierra Research, drawing heavily from the original TDM Evaluation Model. A major literature review was conducted to identify new sources of impact information for each of the strategies featured in the model (Sierra Research, 1999). There has been a model coefficient update as of 2002 (U.S. Environmental Protection Agency, 2005), supporting a version 2.0 of the model. Perhaps the biggest change over the TDM Evaluation Model, other than the convenience of a modern, menu-aided user interface, is the ability to calculate emissions. The model was created to support the introduction of voluntary emissions reduction programs for metropolitan nonattainment areas seeking credit for air quality conformity demonstrations. The model and version 2.0 manuals can be accessed and downloaded from the EPA site at http://www.epa.gov/otaq/stateresources/tools.htm.

CASE STUDIES

“Transportation Days” Marketing and Outreach Programs—Cross Westchester Expressway Corridor

Situation. In Westchester County, New York, the Cross Westchester Expressway linking Tarrytown, White Plains, and Port Chester with the New York State and New England Thruways attracted major development during the 1970s and ’80s. By 1980, the corridor had 100,000 jobs, and during the 1980s more than 20,000 new jobs were added. By 1985, congestion during peak travel periods was becoming routine, and long queues were occurring both morning and evening on the Tappan Zee Bridge. A major factor in bridge congestion was the crossing of Rockland County residents over the Hudson River to reach the jobs in Westchester County. Studies supported by Westchester County, New York State DOT, New York Metropolitan Transportation Council (NYMTC), and private groups identified a need for adding transportation capacity to the Tappan Zee Bridge and the Cross Westchester Expressway. However, it was also recognized that these improvements would be costly and take many years to accomplish. In the interim, attention was turned to making more

20 As noted in the “Related Information and Impacts” section under “Modeling Studies,” CUTR issued an update to the Worksite Trip Reduction model during the timeframe of the Chapter 19 review and publication process. The update is known as TRIMMS© Version 2.0 and provides parameter, user-interface, and benefit-analysis enhancements and revisions (Concas and Winters, 2009).
efficient use of existing facilities by encouraging commuters to switch from single occupant vehicle (SOV) commuting to transit and ridesharing.

**Actions.** In 1989, the New York State Energy Office awarded a grant to the Westchester County Department of Transportation to “develop, market, implement, operate, support and monitor Transportation Management Programs” for the purpose of saving energy, reducing congestion and air pollution, and providing transportation alternatives. A specific goal of removing 1,100 SOVs from daily commuting was established. The program developed to meet these objectives included bringing employers, developers, building managers, and local and state officials together in an ad hoc advisory group to support program activities; conducting a survey of workers to identify commuting patterns and needs; targeted transit service improvements; preparing a marketing and information package on commuting options; presenting the marketing and information materials in “Transportation Days” held at work places through the corridor; and evaluating the results of the program activities.

The employee survey was distributed to over 20,000 workers at 130 employers in the corridor in September 1990. From approximately 6,500 responses, results of the survey were used to fashion a set of transit service modifications for implementation in the fall of 1991. Concurrently, a marketing and information program was developed, including a slide show with presentation script and a Commuter Information Package. The slide show was later recorded on video for use at Employee Transportation Days, which were conducted throughout 1992 at the work sites of 79 employers in the corridor, representing almost 12,000 employees. Almost 3,000 information packages were distributed through these activities, with an additional 2,500 packages distributed through other agencies and meetings.

**Analysis.** In February 1993, a sample of workers who responded to the 1990 survey were recontacted to obtain information on their exposure to the marketing program and any changes in commuting patterns. This was made possible by having obtained the employee’s work phone number in the 1990 survey. Only employees whose employer participated in Employee Transportation Days or had received the Commuter Information Packages were contacted. Of roughly 1,300 names and phone numbers from the original survey, contact was made with 596 phone numbers. Because of employee turnover during the 2-year period since the initial survey, the individual answering the phone was often not the original respondent. This difference was noted and the survey was administered anyway, primarily attempting to determine whether the employee had changed modes and the factors behind that decision.

**Results.** Of the 596 persons participating in the follow-up survey, 356, or about 60 percent, were the same individual surveyed in the original survey. Thus 240, or 40 percent, were different and considered “new” employees since the 1990 survey. Of the 356 repeat respondents, 71 (18 percent) indicated that they had attended a Transportation Day event, compared to 31 (13 percent) of the 240 “new” respondents. Overall, 190 of the 596 total respondents changed commute mode between 1990 and 1993. Nevertheless, overall, the percentage of commuters driving alone remained at virtually the same level—68.6 percent before and 69.3 percent after. In terms of vehicle trip reduction (VTR), vehicle trips per 100 workers increased from 77.4 to 79.3 during the period, indicating that vehicle trips actually increased by 2.5 percent.

The subgroup of respondents classified as “new” employees (not in the 1990 survey) appear to have shown greater tendency to shift modes than those who were surveyed previously. Only 83 of the 356 “repeat” respondents, or 23.3 percent, indicated a change in mode in the second survey, compared to 107 of 240, or 44.6 percent, of the “new” respondents. Whereas that higher rate of mode shift might not be universally positive—commuters could have changed to or from driving alone—
the “new” group also logged a better trip reduction than the “repeat” group. Drive-alone rates for the “repeat” group increased from 66.9 percent to 69.4 percent during the program, representing an increase in vehicle trips of 5.1 percent (77.7 to 81.7). In the “new” group SOV use declined from 71.3 percent to 69.2 percent. Vehicle trips were reduced by 0.6 percent (down from 78.3 to 77.8 per 100). A possible explanation is that the new employees were more likely to be considering alternatives during their period of transition.

Looking at the entire sample of 596 respondents, of the 409 (69 percent) who drove alone prior to the program, 332 (81 percent) continued to drive alone after program efforts, while four (1 percent) chose to walk, 45 (11 percent) chose to rideshare, 24 (6 percent) shifted to transit, and the remaining four (1 percent) chose “other.” Of those 98 (16 percent) who originally were in ridesharing, only 37 (38 percent) continued to rideshare, 49 (50 percent) switched to driving alone, six (6 percent) switched to transit, and the remaining six (6 percent) walked or traveled by “other” means. Finally, of those 74 (12 percent) who previously commuted by transit, 39 (53 percent) continued to take transit, while 24 (32 percent) switched to SOV, six (8 percent) switched to ridesharing, and the remaining five (7 percent) walked or traveled by other means. So, in effect, rideshare commuters proved to be the least likely of all modal groups (not counting the 15 respondents originally reporting walk or other modes) to stay with their original mode (38 percent), while those who drove alone were the most likely to retain their original mode (81 percent)—a substantial margin of difference.

Closest to the primary focus of the evaluation was the extent to which the marketing and information program, and particularly the conduct of Transportation Days, was influential in triggering a mode shift. As shown in Table 19-39, a higher percentage of workers who attended a Transportation Day switched from driving alone (the share dropped from 68.6 percent to 63.7 percent) than did the workers who did not attend, where drive-alone rate actually increased from 68.9 percent to 70.8 percent. In general the group that attended also showed greater tendency to shift to vehicle-trip-saving modes, including transit and walking, while those who did not attend showed only a slight shift to transit and to “other.” (“Other” has been assumed to be driver-serve-passenger or taxi.) The shifts of the group that attended resulted in a vehicle trip reduction of 7.5 percent, while the shifts of those who did not attend resulted in a vehicle trip increase of 4.2 percent. The question to be asked is whether the Transportation Day strategy was responsible for the switch, or whether the persons interested enough to attend the event were more highly disposed to considering and seeking an alternative mode.

| Vehicle Trips per 100 | 76.1 | 70.4 | 78.7 | 82.0 |

19-143
When asked to identify reasons for changing commute mode, no respondent cited attendance at a Transportation Day at the workplace as a primary reason for doing so. Rather, 10 percent said it was because their work schedule had changed, 12 percent attributed it to a change in residence, and another 12 percent linked it to buying or selling a car. Of those who specifically changed mode from driving alone, the top reasons were that a carpool/vanpool option opened (14 percent), driving alone was too expensive or hard on the vehicle (8 percent), the car became unavailable as an option due to mechanical condition or competing uses (5 percent), or the carpool/vanpool offered more convenience (5 percent). Meanwhile, those who shifted mode to driving alone cited loss of a carpool/vanpool member (11 percent); discovery that taking the bus was inconvenient/uncomfortable (9 percent); need for use of the car en route to, from, or while at work (5 percent); or that the company moved (2.4 percent), ridesharing was stressful (2.4 percent), or parking became available (1.6 percent).

In a very generic sense, however, being exposed to the marketing and informational materials—either at a Transportation Day or through receipt of the Commuter Information Package—influenced a somewhat higher percentage of commuters to change modes. Of the 292 survey respondents who saw the information, 100 (54 percent) changed modes, versus only 86 of 295 (46 percent) who did not see the information. Nevertheless, it appears that the only conclusion that can be reached from these findings is that some connection exists between exposure to the marketing materials and a shift in mode. Whether or not the persons who sought this information were also those who were actively looking for an alternative cannot be satisfactorily determined from the data.

More . . . Somewhat complicating results for this evaluation is the fact that an economic recession took place in 1991–92, which had a major effect on rates of hiring and termination. The downturn in activity was felt to diminish the perception and concern about traffic. However, at the same time the passage of the 1990 Clean Air Act Amendments brought new interest in employer trip reduction programs, the New York metropolitan area having received a “severe” nonattainment rating with respect to ozone. It is unclear to what extent these two potentially counterbalancing events impacted the study results or interacted with each other.

University of Washington’s U-PASS Program—Seattle, Washington

Situation. The University of Washington’s (UW) Seattle campus occupies 43 acres in the University District, about 3 miles north of downtown Seattle, across Lake Union and Portage Bay. As of 2005, student enrollment was about 39,000 and faculty and staff was about 22,000, compared to about 27,900 and 17,000 in 1991. The size of this operation, the demand it was placing on the local transportation system, the desire to grow, and the trends in demand for campus parking, led university officials to develop a Transportation Management Plan (TMP) in 1983. The purpose was to expand travel options for students, faculty, and staff and thus shift them away from single-occupant vehicle travel. Specific goals included maintaining 1983 traffic volumes to and from campus during peak periods and limiting on-campus parking supply to 12,300 spaces, while ensuring that spillover into the surrounding neighborhoods would not result. Subsequently, in the course of developing of a 1989 General Physical Development Plan for the campus, university officials realized that growth plans would result in a significant increase in vehicle trips, along with a loss of about 1,700 surface
parking spaces. A task force formed to develop a new TMP to address this concern seized on the importance of combining transportation incentives (mostly in the form of cheap and available transit) with complementary disincentives (higher parking fees) in the new plan.

**Actions.** The core strategy of the new TMP was the U-PASS, a universal pass providing cardholders with a range of transportation options and incentives. U-PASS began as a 3-year pilot program in 1991, and based on its proven success, has continued to this day. In 2005 the U-PASS could be purchased at a price of $41 per quarter by students and $57 per quarter by faculty and staff. The pass provides holders unlimited rides on any of the regional or local transit services, reduced carpool and free vanpool parking, vanpool subsidies (up to $40 monthly), discounted “occasional” parking permits, ridematching services, local merchant discounts (including bicycle equipment and services), emergency ride home (for employees), subsidized use of FlexCar carsharing services, and access to Night Ride evening neighborhood shuttle service. UW uses more than 90 percent of its annual U-PASS budget ($13 million in 2005) for the purchase of service through contracts with local public transportation providers. The large number of riders and consistency of revenue has led transit providers to greatly increase the amount and quality of transit service to the campus.

Managing parking is a key element of the TMP, and the pricing of parking is a major component of the U-PASS program. The introduction of U-PASS was accompanied by a 50 percent increase in the cost of parking. The University has maintained a policy of controlling the rise in U-PASS fees and keeping them significantly lower than the cost of parking. In 2005, the cost of a U-PASS for employees is about one-fourth the cost of a parking permit. The cost of quarterly parking permits has increased from $108 in 1991 to $233 in 2005 (116 percent), while gate-issued daily parking has increased from $4 to $10 (150 percent), and parking at the Montlake lot has gone up from $1.25 to $4 per day for cash payments (220 percent) and $2.62 for those who choose to debit the charge to their university Husky Card™. Meanwhile, the cost of a student U-PASS has only increased by 105 percent, from $20 to $41 per quarter, and for employees by 111 percent, from $27 to $57 per quarter.

Eligibility for U-PASS includes students registered in state-funded courses, or those taking degree-credit courses on the Seattle campus through UW Extension. Faculty and staff employed in permanent positions and working at least half-time, temporary and hourly employees working at least 3 days per week, Visiting Scholars, and retirees employed on campus 40-percent-time or at least 3 days per week, are also eligible for U-PASS. During 2005, the average number of U-PASSes in use was 44,156, an increase of 21 percent from the time the program was introduced in 1991. Eighty-six percent of students and 54 percent of employees participated in the program in 2005.

**Analysis.** Travel patterns of faculty, staff, and students are measured through a biennial survey, conducted in the fall of even-numbered years. The results are compiled into biennial U-PASS reports and related evaluations for use in university administration and by other interested parties.

**Results.** Despite a 22 percent growth in the employee and student population, university-related peak hour traffic remains below 1990 levels, and more than three-quarters of the campus population travels to campus in a mode other than driving alone. Commute mode shifts, especially the shift from driving alone to public transit, are given primary credit for the traffic mitigation. As seen in Figure 19-2, prior to the U-PASS program (survey in 1989), 33 percent reached the campus by driving alone, 21 percent by public transit, 23 percent by walking, 10 percent by carpool/vanpool, 8 percent by bicycle, and 4 percent by other means. By 2004, the drive-alone rate had dropped to 23 percent, while public transit increased to 38 percent. Carpool/vanpool remained the same at
10 percent, while bicycle (6 percent), walk (22 percent), and “other” (1 percent) dropped slightly. Assuming that “other” is either driver-serve-passenger or taxi, a vehicle trip rate in 2004 of 29 per 100 may be computed and compared with a rate of 42 in 1989. This gives a VTR of 31 percent.21

Figure 19-2  Commuting mode choices at the University of Washington before and after U-PASS program implementation

The effect of the parking pricing strategy, along with the other U-PASS elements, has meant a 41 percent reduction in the number of SOV parking permits since program inception. The number of parking spaces used has declined as faculty, staff, and students have shifted away from driving alone. Despite the university’s major growth, the total number of parking spaces has held about the same at roughly 11,500, while the average utilization rate has gone from 87 percent in 1990 to 72 percent in 2005.

More . . . Funding for U-PASS in 2005 totaled $12,955,500, of which 49 percent was derived from user fees, 41 percent from parking fees, 3 percent from parking fine revenue, and 7 percent from

---

21 This computation conservatively uses an arbitrary 2.0 average carpool/vanpool occupancy for both 2004 and 1989. A less conservative assumption of 2.5 average carpool/vanpool occupancy in both years would give 2004 and 1989 vehicle trip rates of 28 and 41, respectively, and a VTR of 32 percent. In either case, the reduction is roughly one-half the 62 percent trip rate differential calculated in TCRP Project B-4, based on comparison of University travel data to the surrounding area’s work commute mode split as reflected in the 1990 CTPP. The 62 percent is what has been used, for consistency, in the various analyses involving the 82-program sample. However, the newer 31 or 32 percent VTR estimate, made with benefit of before-and-after survey data, is clearly the more applicable/reliable.
other university sources. The distribution of program expenditures, also totaling $12.95 million, was principally for transit service contracts (92 percent), accompanied by administration and monitoring (3 percent), marketing and public relations (2 percent), the Night Ride Shuttle (2 percent), ridesharing/ridematch elements (1 percent), and bike and pedestrian improvements (1 percent).

The success of the U-PASS program, and the idea of putting a transit pass into virtually everyone’s hands at a greatly reduced price, convinced Metro to extend the idea to employers. This widespread distribution encourages the occasional as well as the regular transit rider. As of the early 2000s, Metro’s FLEXPASS program served 130 employers and 118,000 commuters, of which some 44,000 were U-PASS customers. FLEXPASS is believed to have been the first employer-based program of its kind in the nation.

Staggered Work Hours in Manhattan—New York, New York

Situation. This case study is adapted from the Second Edition “Traveler Response to Transportation System Changes” Handbook because of its particular relevance to addressing transit usage peaks and associated crowding such as were occurring in mid-2008 in response to $4.00/gallon gasoline prices. On April 1, 1970, the Port Authority of New York and New Jersey (PATH: Trans-Hudson Transit), in cooperation with the Downtown-Lower Manhattan Association, initiated a staggered work hours program. The Lower Manhattan area had a worker population of 480,000, about 85 percent of whom used rail transportation for their work trip. A survey of 113 firms with 136,000 employees total indicated that 66 percent began their work day at 9:00 AM and that 64 percent ended it at 5:00 PM.

Actions. The program at first involved about 50,000 employees of 45 concerns. Some 46,000 had their beginning time shifted from 9:00 to 8:30 AM, and 4,000 to 9:30 AM. Within 2 years 250 offices with over 100,000 employees total were participating, and a similar program was being developed for Midtown Manhattan. Schedule shifts of at least 30 minutes were recommended to compel a definite change in commuting habits.

Analysis. Before and after counts were taken in February 1970 and 1972 at three of the area’s most heavily used subway stations. Vehicular volumes were also monitored at the Brooklyn Battery Tunnel and the Battery Parking Garage. The employees of 27 firms were surveyed to assess reaction.

Results. The counts showed a 26 percent decline in station usage (17,658 to 13,074) during the peak 9:00–9:15 AM period, and a 24 percent passenger volume increase (12,024 to 14,864) between 8:30 and 8:45 AM. At the PATH World Trade Center Terminal, passenger counts fell 18 percent (7,500 to 6,224) between 5:00 and 5:15 PM, and rose more than 50 percent (3,100 to 4,750) between 4:30 and 4:45 PM. In contrast, the monitoring of vehicular volumes showed little or no significant change attributable to the staggered hours.

About 85 percent of the participating employees sampled in the employee survey favored staggered hours over the previous arrangement. Some 45 percent reported they were experiencing less
congestion (50 percent reported no change), and 50 percent were more satisfied with their work trips under the staggered hours program (9.8 percent were less satisfied). Of the supervisors sampled, 24.6 percent reported improved employee punctuality. Only 11.6 percent reported increased tardiness. About 15 percent cited some operational communications problems, but none indicated any actual drop in efficiency.

Reasons for the improved employee punctuality were examined with a study of the distribution and length of all rail rapid transit and commuter rail AM peak-period delays recorded on 18 randomly selected days in 1970. The study indicated that a rapid transit commuter with a 9:00 AM reporting time at work, compared to a commuter with an 8:30 AM reporting time, had a 25 percent greater likelihood of encountering a delay, and that each delay averaged 40 percent longer in duration. Similarly, a commuter rail user starting work at 9:00 AM had a delay likelihood 67 percent greater and an average delay duration 50 percent longer. This equates to a 1 hour morning trip time reduction each month for rapid transit users on an 8:30 AM schedule, and a larger savings for commuter rail users. Interestingly, rapid transit service between 8:10 and 8:30 AM (2,369 trains scheduled) was found to be nearly equal to the service offered between 8:40 and 9:00 AM (2,427 trains scheduled), and train annulments (cancelled or out-of-service trains, which figure more heavily in passenger overcrowding than delay) were 17 percent more frequent for the 9:00 AM commuter than for the 8:30 AM commuter.

More . . . An unknown in considering programs such as this is the extent to which gradual adoption of flexible work hours in recent years may have reduced the remaining potential for alternative work arrangements peak spreading by shifting the baseline starting point. A survey of the present-day ambient traffic peaking on or at critical facilities, followed by comparison with a baseline of documented historical peaking data, would be a good beginning for addressing this question.

Lloyd District Travel Demand Management—Portland, Oregon

Situation. The Lloyd District is a medium-to-high-density commercial and residential area of Portland, Oregon, located just east of the Central Business District (CBD) across the Willamette River. Once predominately a low-rise residential area, its development into a mixed-use activity center on its own right accelerated in the late 1980s with the introduction of MAX light rail transit (LRT) service. In addition to the Lloyd Center Shopping Mall, the Lloyd District became home to high-density retail streets, as well as the Oregon Convention Center, the Rose Garden Arena, and the Memorial Coliseum. Shoppers, event goers, employees, and residents found themselves competing for increasingly scarce on- and off-street parking with commuters to downtown Portland, who were parking at free on-street spaces and then riding transit into the CBD. This situation was not only producing traffic and parking problems in the Lloyd District, but also undermining the region’s transportation goal of reducing SOV use for commuting to the downtown.

In 1990, the City of Portland, along with a coalition of downtown business interests, the Portland Development Commission, the regional transit agency (TriMet), and the regional planning organization (Metro), began development of the Central City Transportation Management Plan. This plan had as its goal providing for 75,000 new jobs and 15,000 new housing units in the central city by 2010. As part of its structure, the plan divided the city into eight districts. The Lloyd District
was one of these districts and, because of its proximity to the CBD, was expected to capture 20 per- cent of the new jobs and 13 percent of the new housing units.

**Actions.** In September of 1997 the City of Portland, in concert with TriMet and the Lloyd District’s Transportation Management Association (LDTMA), implemented the Lloyd District Partnership Plan (LDPP). The plan was specifically aimed at curbing SOV use for the commute to and from the Lloyd District. Adding further impetus to the plan was the establishment of the Employee Commute Options (ECO) Rule by the Oregon Department of Environmental Quality in 1996, requiring the implementation of trip reduction measures in order to maintain National Ambient Air Quality Standards. The ECO rule required any employer of 50 or more employees to develop a plan for achieving a 10 percent reduction in work-destined vehicle trips within a 3-year time frame. Participation in the LDPP lifted many of the ECO requirements for individual worksites in return for supporting district-wide measures such as limiting and charging for parking.

The LDPP included six major elements: (1) transit service improvements, including three direct express bus routes to the Lloyd District business core; (2) infrastructure improvements providing for a concentration of passengers and buses, convenience of transfers, and passenger amenities; (3) rideshare and bicycle improvements; (4) parking management strategies, including parking meters on most streets within the district, limitations on new parking supply, maximum parking ratios, and carpool metered spaces; (5) TDM strategies including the TriMet PASSport discount pass program, emergency ride home, and communication and promotion activities; and (6) program evaluation consistent with ECO rule requirements.

**Analysis.** A study was undertaken, as part of the City of Portland’s assessment obligation, by Portland State University. A survey was conducted involving 259 employers in the Lloyd District, inquiring as to whether the way they usually got to work changed since the parking meters were installed in August 1997. A retrospective approach was necessary because the evaluation project was not commissioned until 1998, 1 year after the LDPP was implemented. The sample of employers equated to 19 percent of Lloyd District’s 1,370 employers. A survey was mailed to all employees in the set of 233 employers having 49 or fewer employees, representing 545 employees total, and to a random sample of about 50 percent of the 26 employers with 50 or more employees. In all, 1,000 surveys were sent out, and 519 were returned and deemed valid for analysis. Out of the 519 total respondents, 400 answered the question of whether they had changed the way that they got to work, with 23 percent indicating that a change in mode had occurred.

**Results.** The survey returns were divided into three groups: all respondents, respondents whose employers participated in the PASSport program, and those whose employers did not participate in PASSport. (As presented earlier in this chapter, PASSport is a mechanism through which employers can help discount the cost of transit passes for their employees.) It was found that for all respondents, driving alone decreased by 7 percent (from 60 percent to 56 percent), with most of the shift going to carpooling, which increased by 38 percent (from 12 percent to 17 percent), while transit retained its existing share of about 19 percent. Walking, biking, and “other” showed insubstantial increases. For those respondents whose employer participated in PASSport, drive alone decreased by 19 percent and, again, a majority of those shifting went to carpooling, which increased by 41 percent. Transit share did see a 12 percent increase within this group, while walk/bike/other changed negligibly. Mode shares among the non-PASSport employees showed a 2 percent increase in drive-alone mode and a 36 percent decrease in transit, although carpooling still increased by 20 percent. The reason for this may have to do with the special carpool parking provisions discussed next.
When the parking meters were installed in the Lloyd District in the fall of 1997, the rate on most streets was $0.75 per hour for a 2-hour limit, 20 to 30 percent less than meter pricing in the CBD. Long-term (5-hour) meters were installed at the outer fringes of the District, reserved until 10:00 AM for carpoolers, who were required to display a special permit costing $30/month. Thereafter the cost was $0.35/hour.

A key finding was that most employees in the Lloyd District responded to the introduction of parking meters not by diverting to another mode, but by demonstrating a willingness to pay for what was once free. Use of the on-street carpool spaces remained low in terms of the proportion of all those who drove and parked (less than 1 percent for the entire sample). Of those who drove and parked, the percentage who parked in off-street parking—either employer-provided or commercial—increased. Data indicate that before the meters were introduced, 61 percent of employees who drove and parked in the District paid nothing to park. This percentage declined to 46 percent after the meters. However, the average price for those employees who paid something to park only increased from $0.34 to $0.37 per hour. Among the PASSport employees, 47 percent parked free before the meters versus 28 percent after, while the average cost for those who paid increased from $0.34 to $0.36 per hour.

The survey asked employees to rank the top three reasons for changes, if any, in travel behavior. The greatest share, 25 percent, indicated that their reason for shifting was unconnected to any TDM measure, but rather reflected a change in lifestyle. The next largest share, 22 percent, said that installation of the parking meters was their No. 1 reason for changing, followed by 19 percent who said that the PASSport program was their top reason. In ranking their No. 2 reasons for change, nearly 36 percent of employees who changed behavior cited the PASSport program, while about 7 percent cited parking meters as their second reason.

More . . . A policy of seeking Lloyd District employee input is credited with having enhanced TDM program impacts over time. As part of periodic LDTMA surveys, employees are queried about their perceived needs. This information is fed back to participating employers and also guides LDTMA prioritization of new bus service. Additional bus service is offered in direct response to Lloyd District transit ridership growth.

VTPI’s Online TDM Encyclopedia presents updated information on mode split in the Lloyd District, which suggests a deepening of impact both in SOV trip reduction and in a positive shift toward transit use as the preferred alternative. These 2005 data indicate a drive-alone share down to 43 percent from 60 percent in 1997, transit at 39 percent mode share versus 21 percent in 1997, and ridesharing at 11 percent compared to 16 percent in 1997. The 2005 statistics also indicate that biking and walking have stayed about the same, at around 3 percent and 2 percent, respectively, while telecommuting and compressed work week (CWW) use has increased from 0.5 percent or less to just under 1 percent each.

TDM was undoubtedly not the sole cause of the 1997–2005 shift toward transit use. In 1998, the MAX Blue Line (the east-west LRT service running through the Lloyd District) was extended into the west suburbs of Portland. In 2001, Lloyd District Blue Line service was augmented with MAX Red Line trains to the airport. In 2004, the connecting MAX Yellow Line serving Northeast Portland was opened through the western edge of the district.

Overall TDM Program Effects over Time—Bellevue, Washington

Situation. The City of Bellevue is located across Lake Washington from Seattle. It is a suburb that since the late 1970s has sought to foster TDM through its employers, undergirded by municipal and state development regulations, and with support of transit improvements. TDM-related case studies covering individual Bellevue employers are found in Chapter 13, “Parking Pricing and Fees” (see “US WEST Parking Pricing and Management”), and Chapter 18, “Parking Management and Supply” (see “CH2M Hill Employee Parking Management”). This Chapter 19 case study, as an adjunct to the “Site- Versus System-Level Impacts” discussion in the “Related Information and Impacts” section, seeks to ferret out the combined effects of employer TDM strategies and public strategies on overall commuting to downtown Bellevue.

Downtown Bellevue is relatively unique for a suburban activity center. The rectangle encompassing the downtown, approximately 3/4 of a mile on a side, had over 23,000 workers in 1986—60 percent of them office workers—and a 1.3 million square foot regional shopping center. The street system is an imperfect grid, with most streets forming superblocks 600 feet on a side. Building setbacks are reduced compared to the suburban norm. I-405, linking the Seattle area’s east-side suburbs, is on the east side of downtown Bellevue.

Actions. Bellevue operated between 1981 and 1986 under an incentive agreement between Seattle Metro (now King County Metro) and the City of Bellevue whereby Bellevue was rewarded with additional transit services in return for increasing employer densities and obtaining lower parking ratios in the downtown. The city continues to incorporate transportation demand management programs (TMPs) into new development approval conditions. Employment density has increased, with 34,250 downtown jobs in 2000, up almost 50 percent in 14 years. The ratio of parking to floor space allowed in new buildings is roughly one-half the minimum that applied prior to 1979, and individual employers have made parking pricing a part of their TMPs (see the case studies noted above in Chapters 13 and 18). During the 1987–1989 period, a Transportation Management Association (TMA) was established and HOV marketing, vanpool incentive, and guaranteed ride home (GRH) programs were tested, enhanced, and incorporated into the overall program. Over time the HOV and transit use incentives/subsidies have evolved regionally into Metro’s heavily marketed FlexPass program of partnerships with employers (see “Response by Type of Strategy”—“Changes in Fare Categories”—“Unlimited Travel Pass Partnerships” in Chapter 12, “Transit Pricing and Fares”). Passage of Washington State’s Commute Trip Reduction (CTR) Law, and the implementation of mandatory elements specific to Bellevue, further undergirds the Bellevue program.

Specific bus service improvements have included restructuring and expansion over the years. The Bellevue Transit Center was opened in 1985. In the 1987–1989 time frame, almost one-half the bus services in the Eastside area including Bellevue were reorganized with the objective of establishing

---

22 Many downtown Bellevue statistics, particularly the newer ones, are for a slightly larger area, either a 1- × 3/4-mile rectangle that encompasses I-405 and the Bellevue interchange on the east, or an in-between-sized area covering the westerly half of I-405 and the interchange.
a true Eastside Transit System. (One service approach tried and discarded was the provision of a Downtown Bellevue bus circulator, as described in Chapter 10, “Bus Routing and Coverage,” under “Response by Type of Service and Strategy”—“Circulator/Distributor Routes”—“Workplace to Retail and Restaurants Circulators.”) In the late 1990s, the suburban bus services of King County Metro overall were reorganized into a multi-centered “hub and spoke” system that more comprehensively focused on selected non-Downtown Seattle employment areas while still serving the Seattle CBD. Core route frequencies and service hours were enhanced. Bellevue was the largest of the suburban employment center hubs where essentially all routes were brought through or terminated at the central transit center. The Bellevue/Seattle-CBD and Bellevue/University-District core routes were among those extensively improved for all-day bi-directional service with multi-destination connections (see the case study, “Service Restructuring and New Services in Metropolitan Seattle,” in Chapter 10).

**Analysis.** The primary measure of downtown Bellevue TDM impact available over a 20-plus-year time period is downtown employee commute mode shares. Those presented under “Results” in Table 19-40 have been obtained from periodic survey efforts which, in contrast to the more frequent CTR reportings, cover essentially all downtown Bellevue employers rather than just those large enough to be under CTR reporting requirements. (The more recent comprehensive surveys have made use of CTR reportings, combining them with supplemental surveys to obtain the broader picture.) The surveys have differences among them in methodology, highlighted in the Table 19-40 footnotes. These differences produce inconsistencies that make mode share comparisons between surveys somewhat problematical, requiring extra caution in results interpretation. The downtown survey mode share data has been supplemented by U.S. Census “usual” commute mode results, along with additional information assembled to support a descriptive analysis, most particularly data specially developed by King County Metro on Bellevue transit service levels and ridership over the 1994–2005 period.

**Results.** Table 19-40 presents the 1984–2005 downtown Bellevue comprehensive mode share survey results discussed above. The U.S. Census Transportation Planning Package (CTPP) provides similar data, but for fewer years. Downtown Bellevue “usual” commute mode shares from the CTPP for 1980, 1990, and 2000, respectively, were 79, 82, and 77 percent drive alone, 4.7, 5.1, and 8.0 percent transit, and 14, 12, and 13 percent carpool. All other modes were individually less than 0.5 percent, except walk. The reported 1980, 1990, and 2000 walk shares were 2.2, 0.4, and 1.5 percent, respectively.23

---

23 The walk shares pattern suggests that variations related to CTPP procedures, including sample size, may well be overwhelming trends or indications of stability. Also, the pattern of CTPP transit shares does not seem to track ridership data presented below in Table 19-41 as well as the downtown Bellevue survey transit shares in Table 19-40.
The downtown Bellevue survey results seem to suggest moderately consistent trends for both the drive-alone and transit commute modes, downward over time in the case of drive alone, and upward for transit. The CTPP results seem to exhibit a lack of strong, consistent trends for all modes except transit. Together, the two data sources suggest a 20-year drive-alone commute share reduction—over somewhat different time spans—of somewhere between 10 percent (downtown surveys) and 2 percent (CTPP). Corresponding transit share increases are in the range of 133 percent (downtown surveys) to 70 percent (CTPP), roughly a doubling. (As noted in Footnote 23, the downtown survey findings are better supported by transit ridership data than the CTPP findings.) Carpool use shows no consistency over time in the mode share data. Despite efforts to improve the pedestrian environment, rendered less than optimal by busy streets, walking to work has shown no upward (or downward) trend.

More . . . It is useful, in interpreting the mode share results over time, to examine how effective the overall Bellevue TDM program has been in achieving public transit improvement and parking management. Measures of bus service improvement and usage are illustrated in Table 19-41 for the 1996–2005 time period. Table 19-42 provides downtown Bellevue off-street parking inventory information for the 1987–2006 period. The parking inventory encompasses more than just employee parking—motor pool and customer parking are included—but provides at least an indication of parking supply and pricing trends.

Notes: Changes in methodology from survey to survey render mode share comparisons problematical, especially among the 1984–2000 surveys.

Workers in 1984 were asked to list all commute modes used. In 1990 they were asked their typical commute mode, as is done in the U.S. Census. The procedures documentation for 1996 was not available. Mode shares for 2000–2005 were based on worker reporting of modes used for each commute during the previous week.

The 1984 all-commute mode shares provided here have been approximated by the Handbook authors — starting with the 1984 multiple-responses-allowed office-commute shares of 77.7 percent drive alone, 7.4 percent bus, 16.2 percent carpool, and 2.1 percent other — by normalizing to 100 percent to compensate for the multiple-responses-allowed survey procedure and then factoring by the 1990 mode-by-mode all-commute to office-commute share ratios.

Where vanpool shares are not provided, vanpools were included with carpools. Where walk, bike, CWW, and telework shares are not provided, they may be assumed to be included within “other.” For 1990, “Multi-mode” and “No typical mode” have been added to “other.”

</table>

Notes: AM peak defined as 6:00 AM to 9:00 AM.

DB = Downtown Bellevue.

Passenger alightings include transfer passengers.

Downtown Bellevue passenger alightings on King County routes grew to 2,219 in 2007. A possible contributing factor (and example of exogenous influences) is an improvement in the Bellevue CBD office vacancy rate from 9.12 percent in 2005 (11.07 percent in 2004) to 6.00 percent in 2007.

</tbody>
</table>

Notes: Space count includes employee and customer, motor pool, free and pay, and public and private off-street parking.

DB = Downtown Bellevue.

Average Daily Fee is a weighted average for pay parking only, in current (not constant) dollars. At least up through 1996, 80 percent of downtown Bellevue parking spaces were free.

The 1996–2005 transit service and ridership data in Table 19-41 illustrate that transit service improvement intentions have been followed through on and have been accompanied by increased ridership. The fact that AM bus arrivals in downtown Bellevue—a measure of bus service intensity—increased most between 2000 and 2005, while ridership increased most between 1996 and 2000, stands out as an apparent anomaly. However, the Chapter 10 case study, “Service Restructuring and New Services in Metropolitan Seattle,” presents evidence that the jump in ridership was strongly related to a well-received late 1990s service restructuring into a fully formed “hub and spoke” operating pattern that allowed a major focus on serving suburban employment centers. For example, key trunk-line bus routes serving downtown Bellevue achieved 6 to 30 percent productivity increases (weekday passengers per hour of bus service) between 1994 and 1998.
The 1987–2006 off-street parking data in Table 19-42 are a little harder to relate to employer responses to TDM, given that substantial non-employer parking is not separately identified. Nevertheless, the fact that an almost 50 percent increase in employment between 1986 and 2000 was accompanied by only a 21 percent increase in downtown parking spaces between 1987 and 2002 is strongly suggestive of a tightening parking supply. The doubling of all-day parking fees between 1987 and 2006, even though it is less than the near-tripling of fees in the Seattle CBD (provided for comparison), is also suggestive of demand management progress. The major post-1996 jump in all-day parking fees and its correspondence with the sharpest transit ridership and transit share increases, and the sharpest drive-alone share decrease, gives added credence to the apparent importance of parking-related employer TDM actions along with the public transit improvements in achieving vehicle trip reduction.

Table 19-42 gives only a hint of parking price plateauing in the 2002–2006 period. Both the amount and cost of priced employee parking tended to decrease at employers with building leases negotiated in the 2001–2003 period following the “dot-com bust,” which resulted in a period of high downtown Bellevue office vacancy rates. CTR survey results (not reported here) suggest a corresponding lagged response in the form of higher drive-alone mode shares and diminished carpooling. The 2005 surveyed commute mode shares in Table 19-41 are thus likely not a survey anomaly but instead a true reflection of mode shift “backsliding” traceable back through parking pricing to economic conditions.

The overall downtown 20-year drive-alone commute reduction of 10 percent (or 2 percent per the CTPP results) represents a diffusion of higher reductions obtained at individual employment sites. Bellevue City Hall, CH2M Hill, and US WEST are examples of individual sites achieving estimated employee VTRs on the order of 30 percent or more. Performance at other involved employers was for the most part less dramatic. Throughout the 1980s, at least, gains in transit and ridesharing use in the downtown were limited primarily to those employers that located in Bellevue post-1980, suggesting the critical importance of the TMP-mandated parking management. Only post-1980 employers were compelled by formal city requirements to constrain parking supply. The TMA successfully gained broad membership, financing, and recognition, but not a broad commitment toward substantive TDM program actions. The municipal TMP and more recent state CTR requirements have served as the primary impetus for stronger TDM actions.

24 These site-specific vehicle trip reductions are calculated not from time-series data, but instead by comparison with neighboring employment areas.

APPENDIX A—TABLE 19-A—82-PROGRAM SAMPLE

Introduced in the “Analytical Considerations” subsection of the “Overview and Summary,” the 82-program sample is drawn upon extensively in this chapter. The introduction to the “Response by Type of TDM Strategy” section further expands upon the use of the 82-program sample in the chapter. This appendix, specifically Table 19-A, provides details on each employer program included. The first column identifies the employer and site for each of the 82 programs. The second column identifies the source of the information, according to the following code:

The “Type,” “Location,” and “Setting” columns should be largely self-explanatory, with “CBD” standing for Central Business District and “Sub CBD” standing for suburban CBD. It may be inferred that “Campus” and “Office Park” settings are essentially suburban.

The “Near Transit” column gives the transit availability, either “High,” “Medium,” or “Low.” “Transit availability” is a simplified transit accessibility measure where higher transit availability infers service by more scheduled buses/trains on more transit routes. Employers with no nearby transit stop are assigned to the “Low” transit availability ranking. The next five columns describe each employer’s TDM program as of the early 1990s, when this data was collected. Program elements are listed according to the four-type TDM categorization used in this chapter, except that parking conditions are identified separately in their own column.

The first two “Vehicle Trip Rate” columns give the project average number of commute round trips per employee for the employer in question (“Project”) along with a corresponding baseline average rate against which to gauge the given program’s effectiveness (“Control”). For more on the derivation of these baseline rates, see especially Footnote 3 in the “Analytical Considerations” discussion of the “Overview and Summary.”

The final “Vehicle Trip Rate” column provides a calculation of the difference between the project vehicle trip rate and the control rate, expressed as a percentage of the control rate (“Difference”). Here the negative values represent an employer program project rate less than the control rate. In contrast, in the tables and text of the main body of this chapter, it is a positive Vehicle Trip Reduction (VTR) rate that implies program success at trip reduction relative to the norm.

HOW TO ORDER TCRP REPORT 95*

Ch. 1 – Introduction (2012)

Multimodal/Intermodal Facilities
Ch. 2 – HOV Facilities (2006)
Ch. 3 – Park-and-Ride/Pool (2004)

Transit Facilities and Services
Ch. 4 – Busways, BRT and Express Bus (TBD)**
Ch. 5 – Vanpools and Buspools (2005)
Ch. 6 – Demand Responsive/ADA (2004)
Ch. 7 – Light Rail Transit (TBD)**
Ch. 8 – Commuter Rail (TBD)**

Public Transit Operations
Ch. 9 – Transit Scheduling and Frequency (2004)
Ch. 10 – Bus Routing and Coverage (2004)
Ch. 11 – Transit Information and Promotion (2003)

Transportation Pricing
Ch. 12 – Transit Pricing and Fares (2004)
Ch. 13 – Parking Pricing and Fees (2005)
Ch. 14 – Road Value Pricing (2003)

Land Use and Non-Motorized Travel
Ch. 15 – Land Use and Site Design (2003)
Ch. 16 – Pedestrian and Bicycle Facilities (2011)
Ch. 17 – Transit Oriented Development (2007)

Transportation Demand Management
Ch. 18 – Parking Management and Supply (2003)
Ch. 19 – Employer and Institutional TDM Strategies (2010)

*TCRP Report 95 chapters will be published as stand-alone volumes. Estimated publication dates are in parentheses. Each chapter may be ordered for $20.00. Note: Only those chapters that have been released will be available for order.

**Deferred for a future TCRP project effort.

To order TCRP Report 95 on the Internet, use the following address:

books.trbbookstore.org

At the prompt, type in TC095 and then follow the online instructions. Payment must be made using VISA, MasterCard, or American Express.

Summary

This report investigates the optimal (best overall, taking into account all benefits and costs) transportation emission reduction strategies. Current evaluation methods tend to undervalue mobility management (also called Transportation Demand Management or TDM) strategies that increase transport system efficiency by changing travel behavior, due to biases that include (1) ignorance about these strategies; (2) failure to consider co-benefits; (3) failure to consider rebound effects of increased fuel economy; (4) belief that mobility management impacts are difficult to predict; (5) belief that mobility management programs are difficult to implement; and (6) belief that vehicle travel reductions harm consumers and the economy. More comprehensive and objective analysis tends to rank mobility management strategies among the most cost-effective emission reduction options. This report describes ways to correct current planning bias so mobility management solutions can be implemented to the degree optimal.
Introduction
Imagine two neighbors with different transportation profiles. One walks, bikes and rides public transit for most local travel, but drives a fuel inefficient sport utility vehicle 4,500 annual miles for out-of-town trips, consuming 300 gallons of fuel and producing three tons of CO₂. Another drives a fuel efficient hybrid 100 daily miles, consuming 600 gallons of fuel and producing six tons of CO₂ annually. Which travel pattern is best overall?

The lower mileage driver not only consumes less fuel and produces less pollution, she also imposes less traffic congestion and accident risk, reduces road and parking costs, and gets more exercise through walking and cycling. As a result, her transport pattern is best for society overall.

However, most current transportation emission reduction programs focus on changing vehicle and fuel type rather than the amount people drive. Such programs generally ignore the additional external costs that result when increased fuel efficiency stimulates additional vehicle travel, and the additional benefits (besides energy conservation and emission reductions) resulting from travel reductions. This is inefficient and unfair.

Mileage reduction strategies tend to be ignored because people often assume they are difficult to implement and harm consumers. That is not necessarily true. Many motorists would prefer to drive somewhat less and rely more on alternative modes, provided those alternatives are convenient, comfortable and affordable. Improving travel options and rewarding mileage reductions can benefit consumers directly, as well as reduce emissions and other transport problems.

This report identifies optimal (i.e., overall best, taking into account all factors) ways to reduce transport energy consumption and pollution emissions. It explores the process used to evaluate emission reduction strategies and identifies common biases that favor efficient vehicle solutions (which change what people drive) over efficient transport systems solutions (which change how much people drive). It complements related reports that describe cost-effective emission reduction strategies (Litman 2007).

This has important implications because transportation activity has many economic, social and environmental impacts. It is a mistake to ignore any significant impacts when evaluating potential emission reduction options, yet this is commonly done, resulting in solutions to one problem (such as air pollution) that exacerbate other important problems (such as traffic congestion, accident risk or consumer costs), and undervaluing solutions that provide multiple benefits. This is good news overall, because it means that by applying more comprehensive analysis it is possible to identify truly optimal emission reduction strategies that maximize overall benefits to society.
Effectiveness and Scope

There are many possible ways to conserve energy and reduce emissions. They differ widely in terms of their effectiveness (amount of energy consumption and emissions reduced) and impacts (total costs and benefits), as illustrated in Figure 1.

*Figure 1  Effectiveness and Scope of Emission Reduction Strategies*

Cap-and-trade programs generally only support industrial emission reductions. LEED standards support building energy conservation. Efficient vehicle incentives reduce transport energy consumption but provide few other benefits, and by stimulating more driving can exacerbate traffic problems. Transportation pricing reforms (fuel taxes, distance-based insurance and registration fees, parking pricing, etc), and carbon taxes, reduce energy consumption and traffic impacts. Public transit and nonmotorized improvements provide modest energy savings but many additional benefits.

Cap-and-trade programs generally focus on industrial emissions and some building emissions, due to administrative convenience (it is easier to contract with a few large emitters than numerous small companies and households). Incentives to purchase fuel efficient vehicles, such as CAFE standards and feebates, can reduce motor vehicle energy consumption per vehicle-mile but provide few other benefits, and by reducing per-mile vehicle operating costs they tend to increase total vehicle traffic (a rebound effect) which increases problems such as congestion, roadway costs and accidents (Litman 2005; Morrow, et al. 2010). Transport pricing reforms (fuel taxes, distance-based insurance and registration fees, parking pricing, etc) reduce energy consumption and traffic impacts. Carbon taxes encourage energy conservation in all sectors. Improving travel options, such as public transit and nonmotorized travel, individually provide relatively modest energy savings but by reducing vehicle traffic provide many additional benefits.

Strategies that help achieve multiple planning objectives (congestion reductions, road and parking cost savings, accident reductions, improved mobility for non-drivers, improved public fitness and health, etc.), rather than just energy conservation and emission reductions, represent true sustainable transportation policies (Litman and Burwell 2006).
Current Emission Reduction Evaluation Activities

Numerous current efforts implicitly or explicitly evaluate the cost effectiveness of emission reduction strategies:

- Various studies and catalogues provide information on the effectiveness, costs and benefits of various emission reduction strategies (CCAP 2005; Dalkmann and Brannigan 2007; VTPI 2007; Gallagher, et al. 2007; Bomberg, et al. 2008; Mayors Climate Protection Center).
- Studies provide an emission reduction supply curve (strategies ranked from lowest to increasing cost per ton of emissions reduced), so decision-makers can select the set of policies and programs that achieve emission reduction targets at the lowest total cost (Jansen and Denis 1999; McKinsey 2007; NAO 2007).
- Legislation that implements emission reduction policies, regulations, taxes and trading programs (CAB 2006; RFF 2007).
- Emission markets allocate or auction emission rights that participants can buy or sell, to help implement the most cost-effective strategies (WRI 2007).
- Carbon offset programs through which consumers and businesses finance emission reductions, which often emphasize cost effectiveness (www.carbonfund.org).

These efforts use various analysis methods to evaluate potential strategies. How options are analyzed affects results. A strategy that ranks high by one methodology may be ignored or undervalued by another. To identify truly optimal solutions analyses should consider all potentially significant emission reduction options and their impacts.

Table 1 lists various transportation emission reduction strategies. These fall into two major categories: cleaner vehicles (more efficient and alternative fuel vehicles which reduce per-mile emission rates), and mobility management (strategies that reduce total vehicle travel).

Most comprehensive studies indicate that both cleaner vehicles and mobility management strategies are needed to achieve energy conservation and emission reduction targets (Robèrt and Jonsson 2006; Burbank 2008; Leather 2009), but most current emission reduction analyses are biased against mobility management because they:

- **Ignore mobility management or only considers a few strategies.** Emission reduction planning sometimes ignores mobility management altogether, or only considers a limited number of potential strategies.

- **Ignore co-benefits.** Current analysis gives little consideration to benefits such as congestion reduction, road and parking facility cost savings, consumer savings, reduced traffic accidents, and improved mobility for non-drivers, although these benefits are often larger in total value than emission reduction benefits.

- **Ignore induced travel impacts.** Current analysis generally ignores the additional external costs that result when increased vehicle fuel efficiency and subsidized alternative fuels stimulates additional vehicle travel, called a *rebound effect*.

- **Considers mobility management emission reductions difficult to predict.** Although case studies and models exist for many of these strategies, this information is not widely applied to energy planning.

- **Considers mobility management programs difficult to implement.** Such programs often involve multiple stakeholders, such as regional and local governments, employers and developers, and various special interest groups. As a result, they tend to seem difficult and risky compared with other emission reduction strategies that only require changes to utility operations, fuel production or vehicle designs.

- **Assumes vehicle travel reductions harm consumers and the economy.** In fact, many mobility management strategies benefit consumers directly and increase economic productivity. There is plenty of evidence that, with improved travel options and efficient incentives, consumers would choose to drive less, rely more on alternative modes, and be better off overall as a result.

For these reasons, many current emission reduction planning efforts ignore mobility management altogether (Gallagher, et al. 2007; CBO 2009) or only mention them incidentally (McKinsey 2007). As a result, currently proposed emission reduction efforts will fail to implement mobility management as much as optimal and so will miss an opportunity to help address other planning objectives, such as congestion reduction, traffic safety, consumer savings and improved mobility for non-drivers. More comprehensive analysis will give mobility management strategies the support they deserve.

The next section of this report examines these biases in more detail.
Biases Against Mobility Management

This section discusses in more detail various biases in current emission reduction evaluation.

Mobility Management Overlooked

Many energy analysts are unfamiliar with mobility management, are only aware of a small portion of total potential strategies, or significantly underestimate mobility management’s potential emission reductions. There is often confusion over what it is called and how it is defined; efforts to reduce vehicle travel are sometimes referred to as demand management or transportation demand management, or described as driving disincentives, road pricing, commute reduction, transit improvements, or land use management. As a result, analyses often consider only a limited set of mobility management strategies.

Fortunately, this problem is relatively easy to correct. A variety of resources now exist which identify potential mobility management strategies and provide information on their costs, benefits and implementation requirements (CCAP 2005; Dalkmann and Brannigan 2007; VTPI 2007; European Program for Mobility Management).

Co-benefits Ignored

Conventional analysis often gives little consideration to additional (besides emission reduction) benefits provided by mobility management, such as congestion reductions, road and parking cost savings, consumer cost savings, increased traffic safety, improved mobility options for nondrivers, and improved physical fitness and health, although they are often significant in value. Economists increasingly recognize the value of comprehensive analysis that considers these impacts (Castillo et al. 2007; Creutzig et al. 2009; Kendra et al. 2007; Litman 2007; Leather 2009).

Induced Travel Impacts Ignored

Current analysis generally ignores the additional external costs that result when increased vehicle fuel efficiency or alternative fuel subsidies stimulate additional vehicle travel, called a rebound effect (Rebound Effects,” VTPI 2007). Long-term rebound effects typically range from 15-30% (Small and Van Dender 2007; UKERC 2007). For example, with a 20% rebound effect, a 50% increase in fuel economy will cause mileage to increase 10%, resulting in 40% net energy savings. Some recent analysis acknowledge that rebound effects will reduce net energy savings, but other induced travel impacts, such as increased congestion, accidents and facility costs are seldom considered or quantified (CBO 2003).

Table 2 compares different types of transportation emission reduction strategies, taking into account co-benefits and rebound effects. More efficient or alternative fuel vehicles conserve energy, reduce air pollution, and may save consumers money (if fuel savings offset any additional vehicle costs), but because they tend to increase total annual mileage they tend to exacerbate other problems such as traffic congestion, road and parking facility costs, accidents and sprawl. By reducing total vehicle travel, mobility management strategies provide a wider range of benefits.

Efficient and alternative fuel vehicles only provide a few benefits, and by increasing total vehicle travel tend to exacerbate problems such as congestion, accidents and sprawl. Mobility management provides far more benefits. (✓ = achieves benefits; * = reduces benefits)

Figure 2 indicates estimates of various transportation costs, measured per vehicle-mile. The largest category is vehicle ownership (fixed costs, including vehicle purchase, financing, depreciation and registration fees), totaling about $2,700 per year or 21¢ per vehicle-mile, followed by other costs such as travel time, vehicle operation, crash damages, roadway costs, vehicle parking, congestion, air pollution, resource externalities (economic costs of importing petroleum), traffic services, water and noise pollution.

**Figure 2: Per-Mile Automobile Costs (Litman 2006a)**

![Per-Mile Automobile Costs](image)

This figure illustrates estimated automobile costs averaged per vehicle-mile.
Air pollution is a moderate-size cost, typically estimated at 2-4¢ per vehicle-mile for an average automobile, with higher values for dirty vehicles in urban areas and lower values for cleaner vehicles in rural areas (EDRG 2007). Adding climate change emission costs does not significantly change air pollution’s ranking. For example, $100 per metric tonne of carbon equals about $27 per ton of carbon dioxide equivalent, which equals about 25¢ per gallon of gasoline or about 2.2¢ per average vehicle-mile. This represents the upper range of carbon price estimates. Although damage costs may be higher, control costs (the marginal cost of reducing or sequestering a tonne of carbon) is likely to stay below this level and rational prices reflect whichever is cheapest (Litman 2006a). Incorporating upper-bound carbon values increases average automobile air pollution costs from 2-4¢ to 4-6¢ per vehicle-mile. This is not to ignore vehicle emission costs, but indicates the importance of considering other impacts too. An emission reduction strategy is worth much less if it increases other costs and worth much more if it reduces other costs.

Figure 3  Efficient Automobile Use (Litman 2006a)

This figure illustrates estimated impacts of reduced emissions per vehicle-mile. (Light blue indicates reduced costs, red indicates increased costs)

For example, if pollution and resource externalities total 6¢ per vehicle-mile, a strategy that halves per-mile energy consumption and emissions by raising fuel economy from 20 to 40 mpg provides benefits worth 3¢ per vehicle-mile, or $375 per year for a vehicle driven 12,500 annual miles. However, if motorists respond by driving 10% more miles (a typical rebound effect), energy and emission reduction benefits decline 10% to $338, and mileage-related costs increase (Figure 3). A 10% increase in congestion, crash, road and parking externalities totals 2.7¢ per vehicle-mile or $338 per year, offsetting the energy and emission reduction benefits. On the other hand, a mobility management strategy that reduces vehicle travel 20% provides energy conservation and emission reduction benefits worth 6¢ per vehicle-mile reduced, or $150 annually, plus 20% reductions in mileage-related costs, totaling $675, or $825 in total annual benefits (Figure 4).
**Figure 4** Reduced Mileage Automobile Costs (Litman 2006a)

This figure illustrates estimated impacts of reduced vehicle-milage. (Light blue indicates reduced costs)

**Emission Reductions Considered Difficult to Predict**

Mobility management emission reduction effects are considered difficult to predict since they rely on behavior change, as opposed to technological changes. This perceived uncertainty makes it difficult for mobility management strategies to qualify for emission trading credits. These problems can be overcome (Donoso, Martinez and Zegras 2006). Case studies and models can be used to predict mobility management travel impacts and emission reductions (Pratt 2007; VTPI 2007; CCAP 2008). Different types of mobility management strategies require different prediction methods.

- Conventional travel models can predict the effects of some mobility management strategies, such as transit service improvements, transit fare reductions, and increases in road or parking prices, and newer models can predict the impacts of other strategies such as transit service quality improvements (“Travel Model Improvements,” VTPI 2007).
- Catalogues of mobility management strategies often include case studies that indicate their travel impacts and emission reductions (CCAP 2005; VTPI 2007)
- Specialized models predict the effects of specific combinations of incentives in a particular trip reduction program (USF 2006).
- Price elasticity models predict the effects of price changes on travel behavior (“Transportation Elasticities,” VTPI 2007).
- Models and case studies predict the effects that land use changes have on travel behavior and per capita emissions (Ewing, et al. 2007; DKS Associates 2007; “Land Use Impacts On Travel,” VTPI 2007; Glaeser and Kahn 2008).
**Mobility Management Programs Considered Difficult To Implement**

Mobility management strategies often involve multiple stakeholders and new organization relationships, such as various levels of government, employers, developers, various special interest groups, and transportation management associations, and so often seem difficult and risky compared with changes to vehicle designs or fuel (Wright and Fulton 2005). Energy analysts sometimes assume incorrectly that these strategies require new technologies, such as GPS-based pricing or high-speed rail (Lash 2007). These perceived difficulties often make it difficult for mobility management strategies to qualify for emission trading credits.

However, there is now extensive experience with various mobility management strategies (CCAP 2005; VTPI 2006; Association for Commuter Transportation; European Program for Mobility Management). Mainstream transportation organizations now recognize the value of mobility management (often under the name of transportation systems operations) and increasingly implement it as a way to solve problems such as traffic congestion and inadequate mobility for non-drivers (CUTR 2007; Poorman 2005).

**Vehicle Travel Reductions Considered Harmful**

People often assume mobility reduction harms consumers and the economy, and so should be avoided (CAB 2006). However, this assumption is not necessarily true (Litman 2009a). Many mobility management strategies directly benefit consumers by improving their travel options or providing positive incentives. For example, if people drive less due to improvements in alternative modes or in response to positive incentives such as parking cash out (commuters who use alternative modes receive the cash equivalent of parking subsidies), they must be better off overall since they could otherwise continue driving. Similarly, many consumers will choose more accessible, walkable communities, and drive fewer miles, if such communities have other attributes they value such as security, affordability and prestige. Even strategies that apply negative incentives, such as higher prices, can benefit consumers overall, if communities use revenues to reduce other taxes or provide new services they value.

Several current trends increase the value of alternative modes, including aging population, rising fuel prices and increasing traffic congestion (Litman 2006b). Although few motorists want to give up driving altogether, at the margin (compared with their current travel patterns) many people would prefer to drive less, and rely more on other forms of transport, provided that they are convenient, comfortable and affordable. As a result, mobility management strategies are increasingly justified to meet consumer demands.

Accurate mobility management evaluation requires consumer surplus analysis to measure the value consumers place on a change in the price or quality of their consumption (in this case, of vehicle travel). These methods are well established and widely used in economic evaluation (Small 1999; “Evaluating TDM,” VTPI 2007).
Regulations: Necessary and Effective

Advocates often claim that fuel efficiency regulations are necessary to overcome market resistance to more efficient and alternative fuel vehicles and are the most efficient way to achieve energy savings. Their arguments have some merit.

Consumers tend to require very short paybacks on energy saving investments. Vehicles are durable goods and the vehicles purchased now by higher-income motorists will be driven by lower-income motorists many years in the future. To the degree that future consumers will prefer more fuel efficient vehicles than what is currently being purchased, regulations may be justified to achieve equity as well as environmental objectives.

Advocates of regulation argue that fuel is inelastic: large price changes have relatively little impact on fuel consumption. They often cite analysis by Small and Van Dender (2007) which indicated that gasoline price elasticities were -0.09 in the short run and -0.40% in the long run during the 1997 to 2001 period, about half the values observed from 1966 to 1996. They implied that these trends will continue, resulting in ever declining price sensitivity. However, those results likely reflect unique factors during those years, including declining real fuel prices, demographics (peak Baby Boom driving years), and sprawl-encouraging development policies. Recent studies suggest that fuel price elasticities increased after 2006 (CERA 2006). Komanoff (2008) estimates that the short-run U.S. fuel price elasticity reached a low of -0.04 in 2004, but this increased to -0.08 in 2005, -0.12 in 2006 and -0.16 in 2007.

This suggests that regulations may be justified to help shift the vehicle market toward more efficient and alternative fuel vehicles to reduce emissions and anticipate future consumer demands, but these should be implemented in conjunction with complementary policies such as consumer education about fossil fuel external costs and future price increases, gradual and predictable fuel tax increases, and mobility management strategies to avoid unintended consequences from increased vehicle travel rebound effects.
Improving Emission Reduction Evaluation

This analysis indicates that, in various ways, current emission reduction planning tends to overlook and undervalue mobility management solutions. Fortunately, all of these biases can be corrected. Although this involves overcoming various obstacles, the potential benefits are very large, making the effort worthwhile. More comprehensive analysis allows planners to identify the truly optimal emission reduction strategies, which provide far greater benefits than what would be selected by current, biased evaluations.

Table 3 summarizes the various types of biases against mobility management emission reduction strategies, and ways to correct them for more comprehensive and objective analysis.

### Optimal Emission Reduction Strategies

Although there are many possible ways to reduce energy consumption and pollution emissions, some are much better overall than others because they provide additional benefits (Cambridge Systematics; Leotta 2007). Table 4 summarizes examples of these “win-win” strategies.

*This table summarizes various Win-Win strategies that encourage more efficient transportation.*

Frank, et al. (2010) and found that “smart growth” urban form factors (transit accessibility, residential density, and street connectivity) tend to increase per capita walking activity and reduce per capita motor vehicle fuel consumption, providing both health and environmental benefits.

One of the most appropriate emission reduction strategies is to eliminate current fuel subsidies (Koplow 2010; Metschies, Thielmann and Wagner 2007), and gradually and predictably increase fuel taxes, at least to reflect all public expenditures on roadways and...
traffic services, or to apply a carbon tax on all fossil fuels (“Fuel Tax Increases,” VTPI 2006; Sterner 2006; Metschies 2005; Carbon Tax Center; Litman 2009c).

Policies that encourage fuel efficient vehicle purchases are justified now to prepare for higher future fuel prices, and to reduce the relative disadvantage of driving efficient vehicles (if the entire fleet becomes more efficient there is less stigma and risk to smaller vehicle users). These include vehicle fuel efficiency standards (or carbon emission limits), feebates (surcharges on less efficient vehicles with revenues used to rebate efficient vehicle purchases), and efficiency-based vehicle taxes and fees. To minimize rebound effects and maximize total benefits it will be important to implement fuel tax increases and mobility management strategies in conjunction with efficient vehicle policies.

Alternative fuels should be encouraged primarily by higher gasoline and diesel prices, particularly with carbon taxes (Toman, Griffin and Lempert 2008). Some alternative fuels may deserve public support for basic development, but these should be evaluated critically to insure they are justified, taking into account all economic, social and environmental costs. Electric vehicle development should be encouraged but their production and use should not be subsidized since their overall benefits are modest; they reduce tailpipe emissions but increase electric generation emissions and already receive about 2.5¢ per vehicle-mile subsidy because they pay no road use taxes. Propane and LPG also provide only modest benefits and so deserve only modest support.
Conclusions

There are many potential energy conservation and emission reduction strategies. Which are best? Which deserve the greatest support? Some provide significant co-benefits and avoid undesirable, unintended consequences and so provide greater total benefits. In general, a gallon of fuel conserved by reducing vehicle travel provides an order of magnitude more benefit than the same energy savings provided by shifts to more efficient or alternative fuel vehicles. This occurs because mileage reductions provide other economic, social and environmental benefits, such as reduced traffic congestion, facility costs, accidents and sprawl. Many mobility management programs are justified for their economic benefits and so provide essentially free environmental benefits. In contrast, increased vehicle fuel efficiency tends to stimulate more total vehicle travel, which exacerbates other transportation problems: emissions decline but congestion, parking costs, accidents and sprawl increase.

Mobility management helps communities prepare for future demands. Current demographic and economic trends (aging population, rising fuel prices, increased traffic congestion and changing consumer preferences) are increasing the value of alternative modes and smart growth development.

This is not to suggest that energy conservation is unimportant or that efforts to improve vehicle fuel efficiency or develop alternative fuels is harmful. On the contrary, petroleum consumption and pollution emissions are urgent problems to solve. However, emission reduction efforts should consider all options and impacts in order to implement those that are overall most beneficial. Although some regulations may be justified to overcome market impediments to more efficient and alternative fueled vehicles, these should be implemented in conjunction with complementary policies such as consumer education about fossil fuel external costs and future price increases, gradual and predictable fuel tax increases, and mobility management strategies to avoid unintended consequences from increased vehicle travel rebound effects.

Most current evaluation tends to overlook and undervalue mobility management benefits. More comprehensive analysis allows mobility management strategies to be implemented to the degree justified. Mobility management is often excluded from emission trading altogether or bears an unreasonably high burden of proof. We need better tools to predict mobility management emission reduction impacts and co-benefits, and protocols to implement mobility management programs within emission markets. This paper identifies specific biases in most current emission reduction analyses and provides recommendations for correcting these errors. The result can provide a framework for identifying truly optimal solutions.

The strategies recommended in this paper are “win-win” solutions that provide multiple benefits. They are justified on economic efficiency grounds and so can provide essentially free emission reductions.

1.0 Executive Summary

The District of Columbia is attracting new residential, commercial, and retail development and redevelopment at an unprecedented pace. This activity, while highly beneficial in many respects, generates significant additional vehicular traffic to, from, and within the District. The current redevelopment permit process lacks a systematic approach and process within DDOT and among all District agencies for integrating Transportation Demand Management (TDM) policies as a way of meeting the District’s goals of reducing auto trips and accommodating travel through the complete transportation network.

TDM is now handled on a project-by-project basis, with limited opportunities for coordination among agencies or implementation of sub-area TDM goals. Current practice applies a one-size-fits-all framework to development, with limited differentiation across diverse geographic areas, development types, development sizes, or other aspects. This approach does not allow maximization of TDM opportunities or provide a process for consistently applying TDM analyses, nor does it apply TDM expectations specific to the anticipated traffic impacts of various types and scales of proposed development.

To address these issues, DDOT initiated this analysis of TDM in the development review process. The project included three primary tasks:

Review of Best Practices and Standards:
National best practices were researched to identify examples of effective systematic approaches to TDM. Through the research it became evident that TDM in the development process tended to be addressed in two general ways:

- Addressing TDM directly through the development approval process and in particular through parking ordinances. By limiting parking or encouraging denser development, developers need to consider TDM early on and must participate in ongoing programs to provide alternative access options to ensure the viability of their projects.

- Developing TDM participation ordinances that require ongoing financial contributions (proffers) from the developer, include enforceable penalties, and generally entail submission of a TDM plan prior to the occupancy of the development.

Evaluate the Potential for TDM under the Existing District of Columbia Development Review Process:
District stakeholders (including the development community, advocacy groups, District agencies, and agencies from other local municipalities) were interviewed to analyze the existing development review process and inconsistencies in how the development review process is perceived by different user groups. Stakeholders were also asked about potential strategies for amending the existing process based on the needs of their constituents. Staff members from peer municipalities throughout the region were interviewed for informational purposes, to further assist in identifying successful practices and highlighting potential pitfalls.
**Recommend Improvements and Changes to the Development Review Process:**

Based on the national best practices and input received from stakeholders, the Project Team developed recommendations to more fully integrate TDM into the District’s development review process. The recommendations represent both near-term priorities (implementation within six months) and long-term direction for DDOT’s consideration (implementation within three years). These recommendations are summarized in Table 1 and are fully described in this report.

To assist DDOT and developers in the formulation of TDM plans, a comprehensive listing of TDM measures for consideration is provided as an attachment to this document. This table separates developments into different categories based on the amount of peak hour traffic generated by the site and whether the application is by-right, a Planned Unit Development (PUD), or one that requires a variance.

Any final TDM planning and guidance documentation will require close coordination between DDOT and the DC Office of Planning (DCOP), the DC Office of Zoning (DCOZ), other departments within the District and, possibly, developers themselves to produce a workable procedure that will be acceptable to the Planning Board and can lead to development of reasonable ordinances in the future. It was evident in the review of best practices that a legislated solution, unique to the region involved, was necessary for a TDM program to be fully successful. As such it is recommended that a workgroup of district stakeholders, possibly by DDOT, be formed to investigate the best way to require that TDM considerations be included in the development process. Political realities and legal considerations will figure predominately in this discussion and more parties will need to be involved than were interviewed for this study. However, to assist DDOT staff in envisioning what a TDM plan might consist of, a draft plan has been provided as an appendix to this document. This generic plan is based on the project team’s experience in developing similar plans for other locations in the country and has been modified to better reflect the District’s needs. The intent of this document is to spearhead the use and application of TDM strategies into the District’s planning process, noting that the final document may be modified by input from all of the interested parties and stakeholders.

Ultimately if TDM impacts are to be quantified it will need to be within a broader context. Currently DDOT does not have a preferred quantitative methodology for assessing the impacts of various planning issues such as project level trip generation, parking policy, land use/development patterns and TDM. Attempting to quantify any single one of these elements in isolation, either for a particular site or district-wide, is not advisable as the interaction between them is a fundamental consideration. The transportation impacts of a development can only be quantified if synergetic relations are implicitly considered care is taken not to double count any benefits. Failure to do so will likely result in underestimation the impact of any one of these element, as is often the case with TDM measures. An understanding of all these factors is vital since ultimately all of them are necessary if the district is to meet its quality of life, economic and environmental goals. Further investigation and development of a cohesive analytic framework that is inclusive of all these elements is warranted.
Table 1: Summary of Recommendations

<table>
<thead>
<tr>
<th>Near-Term (Implementation within six months)</th>
</tr>
</thead>
<tbody>
<tr>
<td>• DDOT should make it standard practice that all development plans, regardless of size, address all applicable DDOT land use, bicycle, pedestrian, transit, and corridor plans as well as make reasonable allowances for future TDM requirements, particularly sidewalk and bicycle accommodation and transit right of way. Small-scale developments/redevelopments should support all District and neighborhood plans, but should be exempt from the requirement for a formal TDM package.</td>
</tr>
<tr>
<td>• DDOT should expand its current outreach and advocacy efforts to encourage voluntary adoption of TDM measures by developers and building management companies in the District.</td>
</tr>
<tr>
<td>• DDOT should develop written guidance explaining the agency’s interpretation of the Comprehensive Plan. DDOT may choose to include TDM goals or targets as part of this effort.</td>
</tr>
<tr>
<td>• Create a directory of DDOT recognized TDM planners. Require development applications to include a TDM Plan, preferably drafted by a DDOT recognized planner or one with demonstrated credentials. Track TDM plan submissions and base ongoing consultant recognition on submitted TDM plans.</td>
</tr>
<tr>
<td>• As the District’s requirements for TDM measures increase, additional resources within DDOT will need to be allocated to implement and administer the program.</td>
</tr>
<tr>
<td>• All new developments should support the District’s TDM policies as per the District’s Comprehensive Plan. The elements do not need to be onerous, particularly for smaller developments; however, all developments have a role to play in reinforcing the District’s commitment to transit, alternative transportation programs and services, and vehicle trip reduction.</td>
</tr>
<tr>
<td>• The formation of Transportation Management Associations (TMAs) within the District is a goal of the Comprehensive Plan. DDOT will need address this recommendation and/or develop a functional equivalent to administer and monitor any TDM requirements implemented in the District. (Near-Term (Process), Long-Term (Operational))</td>
</tr>
<tr>
<td>• DDOT should judiciously enforce existing Zoning Regulations to demonstrate the agency’s commitment to furthering TDM measures in the District.</td>
</tr>
<tr>
<td>• DDOT should encourage developers seeking LEED certification to adopt as many of the Alternative Transportation related credits as possible.</td>
</tr>
</tbody>
</table>
Table 1 Continued: Summary of Recommendations

<table>
<thead>
<tr>
<th>Long-Term (Implementation within three years)</th>
</tr>
</thead>
<tbody>
<tr>
<td>- Until there is an established process for ongoing surveying to demonstrate success, quantification of site-level TDM impacts for the purposes of mitigation is not appropriate.</td>
</tr>
<tr>
<td>- DDOT, DC Office of Planning (DCOP), other relevant district agencies and officials should formalize TDM considerations into the current DDOT/OP development review process.</td>
</tr>
<tr>
<td>- DDOT will need to spearhead an effort to formalize TDM as a regulatory requirement for new developments and as an ordinance in the Zoning Regulations for the District. This ordinance will need to address not only physical elements at the time of design and construction, but also ongoing survey requirements and the ability to assess fines when violations are identified or program goals are consistently not met. Funding of specific TDM programs will also need to be addressed.</td>
</tr>
<tr>
<td>- Measures of Effectiveness for TDM programs should be two-fold: a reduction in peak period vehicle trips and a reduction in overall weekly vehicle trips.</td>
</tr>
<tr>
<td>- Rather than calculating the potential impact of any specific elements of a TDM plan, DDOT should set overall vehicle trip goals and allow the developer to address the specific goals accordingly, with success determined via ongoing surveys and reporting back to DDOT.</td>
</tr>
</tbody>
</table>
2.0 Existing Conditions

2.1 Introduction to Transportation Demand Management

Transportation Demand Management (TDM) is a set of strategies, programs, services, and physical elements that influence travel behavior by mode, frequency, time, route, or trip length in order to help achieve highly efficient and sustainable use of transportation facilities. To effect meaningful travel behavior change and encourage the widespread utilization of alternatives to Single Occupant Vehicles (SOV), residents and other travelers must first understand the options available in the multimodal transportation system – how they work, how to use them, and the benefits they offer. This requires a level of information and support that demystifies travel options and makes them rational and desirable alternatives to the car.

TDM policies are the mechanisms for reducing SOV trips by focusing the demand for transportation services on alternative modes and providing the public with the incentives as well as information to use these alternatives. This is TDM in the active sense of services and programs. At the same time, to maintain high-quality transportation services, programs must cater to the needs of all residents, regardless of age, income, or physical ability. Without these characteristics, travel demand will not be fully addressed and travelers will be encouraged to use SOV’s or not travel at all. The goal of TDM is essentially to nurture a sustainable community that embraces alternatives to the car while enhancing mobility.

2.2 The Benefits of TDM

TDM Benefits for Individuals
TDM services help residents and workers make better use of the many available transportation options. Assistance in finding and using these can be a very valuable lifestyle and economic benefit. For those who do not or cannot drive, non-SOV travel options provide the mobility needed to hold employment, go to the doctor, shop, and otherwise lead a fulfilling lifestyle. For others, travel options can relieve the stress, time, or cost of a commute, or allow for more productive use of the time they travel. The monetary savings in fuel, vehicle wear and tear, or owning fewer vehicles in the household can be substantial.

Moreover, the ancillary health benefits can be extensive; public transportation is many times safer than the private automobile and the simple exercises of walking or bicycling, whether to one’s destination or to access public transit, can reduce obesity, lower the risk of heart disease and reduce myriad of other illnesses. In sum, TDM can be support an improved quality of life on many levels.

---

1 A synopsis of select studies substantiating the observed benefits of TDM can be found on the Victoria Transportation Policy Institute website: http://www.vtpi.org/tdm/tdm58.htm
TDM Benefits for Businesses
By managing or lessening the number of vehicles accessing and parking at the worksite, TDM can save companies substantial capital associated both directly and indirectly with parking costs. They can also provide even more important, though less visible, business advantages by virtue of the benefits to employees. The benefits to individual employees can also accrue to the company in the form of less stressed, more satisfied, and productive workers, easier recruitment, an expanded labor pool, expanded service hours, improved morale, better retention of employees, and less tardiness and absenteeism due to traffic, stress, or health issues.

TDM Benefits for the Community
The combined benefits of TDM to individuals and to companies also aggregate to benefit the community as a whole. Less traffic, improved access, greater mobility, and many choices in travel modes will add up to an enhanced quality of life for District citizens, workers, and visitors. Less vehicular traffic also means less air pollution, and less contribution to water pollution from urban storm water runoff.

TDM Can Be Cost Effective
One of TDM’s advantages is that it is more cost-effective and more environmentally sustainable than providing additional transportation infrastructure. In one investigation of community-based programs that promote travel behavior change, the Victoria, Australia Department of Infrastructure found that such programs can be highly-effective in both increasing use of public transit as well as use of other alternatives to the private car. The Victoria study concluded that marketing-based TDM programs have resulted in financial benefits of $3.09 to $4.70 for every dollar invested in the program. Additionally, businesses may form partnerships with other businesses to share costs for implementing TDM programs and services, such as shuttle services to and from transit stations and shared ride programs, such as vanpooling and fleet management for carpools increasing the return on investment even further.

2.3 Washington, D.C.’s TDM Policy
Washington, D.C.’s municipal government provides TDM measures by balancing the transportation supply with pedestrian, bicycle, and transit facilities in roadway rights-of-way, reducing the cost to ride transit (Metrocheck), and sponsoring alternative modal options (including the DC Circulator and SmartBike DC). The District has also affirmed the prioritization of TDM with specific policies and actions in its Comprehensive Plan:

- **Policy T-3.1.1:** Transportation Demand Management (TDM) Programs: Provide, support, and promote programs and strategies aimed at reducing the number of car trips and miles driven (for work and non-work purposes) to increase the efficiency of the transportation system.

---

2 Travel Demand Management: Public Transport Business Case, Ker for Department of Infrastructure, Victoria, June 2003.

• **Policy T-3.1.2:** Regional TDM Efforts: Continue to pursue TDM strategies at the regional level and work with regional and federal partners to promote a coordinated, integrated transportation system.

• **Action T-3.1.A:** TDM Strategies: Develop strategies and requirements that reduce rush hour traffic by promoting flextime, carpooling, transit use; encouraging the formation of Transportation Management Associations; and undertaking other measures that reduce vehicular trips, particularly during peak travel periods. Identify TDM measures and plans as appropriate conditions for large development approval. Transportation Management Plans should identify quantifiable reductions in vehicle trips and commit to measures to achieve those reductions. Encourage the federal and District governments to explore the creation of a staggered workday for particular departments and agencies in an effort to reduce congestion.

### 2.4 District Development Application Process

Beyond sponsoring and funding public TDM initiatives, many municipalities have established TDM programs as the responsibility of developers, since private developments generate many of the person trips that the transportation system must accommodate. Private TDM requirements are often incorporated into the development application review process, as there is a rational nexus between potential transportation impact and providing TDM measures that mitigate those impacts.

The Development Review Division of the Office of Planning (OP) assesses plans that are generally large, complex, and precedent-setting in their potential to change the character of an area. While development is viewed as the economic engine of the District, protecting the integrity of neighborhoods is equally important. The Development Review Division encourages growth in a way that is sensitive to the needs and values of neighborhoods. In Washington DC, there are three types of development applications: Matter of Right, Planned Unit Development (PUD), and Special/Variance.

Matter of Right applications meet the use and form requirements within the Zoning Regulations, and are not anticipated to significantly affect the District’s transportation system. Therefore, the District does not usually request TDM measures from Matter of Right applications. The exception to this is the Zoning Regulations’ requirements to provide bicycle parking, though this is considered a parking requirement, not a TDM measure.

A PUD is a planning tool which allows a developer greater flexibility in site planning and building design. This flexibility permits the developer to incorporate amenities in the project that exceed those that could have been achieved under the general provisions of the Zoning Regulations. When a project is designated as a PUD, standards are specifically tailored to the project, including TDM measures. Similarly, when a development application includes a request for a variance, TDM measures are frequently attached to balance the value of the project and mitigate potential impacts.

While the District has not codified TDM requirements as part of the development review process for any development application category, the policy statements in the Comprehensive Plan have served as the impetus for creation of a list of voluntary strategies that are recommended in the review process. The “Transportation Demand Management Strategies for Site Plan Review” (Department of Transportation, September 2008), offer 11 TDM elements including bicycle parking and changing facilities, preferential...
parking for car/vanpools and carsharing vehicles, complimentary transit fare media for new tenants, and provision of information to simplify trip planning by alternative modes. These TDM strategies are recommended to applicants seeking approval of PUDs or variances, though the District cannot require these elements. While many developers have agreed to provide combinations of these strategies, there is currently no process for long-term monitoring or enforcement; and as such the implementation and going maintenance of these strategies in the District is unclear.

2.5 Federal Government and Military Facilities

One of the challenges facing District planners is that federal facilities and military installations are not necessarily bound by decisions of the planning council or DDOT. Traditionally both of these stakeholders have worked closely with DDOT and others to help advance the goals of the local agencies. In terms of TDM, The Federal Government has an aggressive program based on the Federal Executive Order for Ridesharing, authored by President Jimmy Carter, February 1, 1980. The language in the order was based on a program he created for the state of Georgia to address the challenges of the oil embargo in 1979. The order was written into law to increase ridesharing as a means to conserve petroleum, reduce congestion, improve air quality, and provide an economical way for Federal employees to commute to work. Each Federal agency is responsible for promoting and providing oversight for their individual programs with reporting requirements submitted to the Office of Management and Budget (OMB). The following text from the Executive Order lists some of the requirements:

*Executive Order 12191--Federal Facility Ridesharing Program*

Agencies shall establish an annual ridesharing goal tailored to each facility, and expressed as a percentage of fulltime personnel working at that facility who use ridesharing in the commute between home and work. Agencies that share facilities or that are within easy walking distance of one another should coordinate their efforts to develop and implement ridesharing opportunities.

Agencies shall designate, in accordance with OMB, an employee transportation coordinator. Agencies that share facilities may designate a single transportation coordinator. The coordinator shall assist employees in forming carpools or vanpools (employee-owned or leased) and facilitate employee participation in ridesharing matching programs. The coordinator shall publicize within the facility the availability of public transportation. The coordinator shall also communicate employee needs for new or improved transportation service to the appropriate local public transit authorities or other organizations furnishing multi-passenger modes of travel.

Agencies shall report to the Administrator of General Services, hereinafter referred to as the Administrator, the goals established, the means developed to achieve those goals, and the progress achieved. These reports shall be in such form and frequency as the Administrator may require.

Like other federal facilities, military installations are largely not legally bound incorporate DDOT recommendations into site plans. However the military does have a history of working closely with the local communities to minimize impacts of their facilities. TDM has taken on renewed importance with
the military (including the NSA) as a result of the 2005 Base Relocation And Closure (BRAC) study and resulting in a migration of employees underway across the greater DC region. TDM has figured prominently in the plans for growing bases in Virginia and Maryland, and as the military embraces TDM, opportunities will exist for DDOT to endorse and possibly participate in these activities.

3.0 Lessons Learned and Input

3.1 Best Practices

As part of the ongoing effort to identify ways of better integrating TDM into the District’s overall development process, a research effort was undertaken to locate TDM programs across the country and summarize some of the best practices and approaches. Candidate programs were identified by online sources, suggestions by DDOT staff, and practitioners in the field (see Appendix A for the complete summary of best practices). From the initial review, six locations were chosen for more in-depth study:

- Cambridge, MA
- Montgomery County, MD
- Arlington, VA
- Alexandria, VA
- Contra Costa (Bay Area), CA
- Seattle, WA Metropolitan Region

The research into these programs revealed that including TDM in the development process tends to be addressed by one of the following three generalized approaches:

- By directly specifying TDM requirements in the development approval process.
- Through the use of TDM ordinances that require long-term commitment by developers, property managers, and owners, which influences the development process early on and throughout the planning stages.
- A combination of the two options above.

Review of the various ordinances, regulations, and planning policies identified during the research effort revealed a vast array of specific approaches to implementation. Goals varied widely, with some agencies looking at TDM as a traffic mitigation tool, others setting goals for alternative modes of transportation, and still others using TDM to complement and reinforce their urban planning vision. However, a number of general themes were identified that are relevant to the District’s initiative to incorporate TDM in the development review process:

- The more successful TDM programs rely on continuing, enforceable ordinances. Stand alone programs relying on voluntary measures, while somewhat successful in reducing auto trips, tended to have less influence on the nature or type of the development in a region. This is specifically applicable to Washington, D.C.’s existing voluntary TDM strategies, which are inconsistently incorporated into development applications and are not verified to ensure they were implemented as proposed.
While regulation and requirements are included in the most successful TDM programs, education about the benefits of TDM is an integral component to maximizing TDM’s success. Providing developers with research into the value of TDM (as described in Chapter 2), as well as assisting in the marketing of these programs to prospective tenants and owners helps convert the interest in quality of life improvements into an economic incentive for developers to provide TDM programs.

Approaches to “elevate TDM” in the development process are unique to how each particular region operates from a political perspective. As such, few “one size fits all” practices are recommended for wholesale application elsewhere.

TDM Ordinances take on many forms and may tie into zoning, the building/site approval process, or specific parking requirements.

The existence of an agency with enforcement authority appeared to be a necessary element for TDM to have a significant impact.

Monitoring is a major requirement for TDM programs to be successful, with the vast majority of programs requiring annual reporting. The most effective survey programs are those tied to other survey requirements in the region in order to limit the time commitment required of property managers and/or employers/residents.

In order to have TDM considered early in the development process, most locations make the submission of a TDM plan a requirement for the certificate of occupancy. The degree to which these plans are scrutinized varied widely, with many plans only making up a small section of the overall traffic impact study.

The metric by which the success of a program will be evaluated has a direct impact on how TDM is approached. Metrics are generally a reflection of the underlying policy goals of the TDM program. For example, a metric based on transit use might be part of a broader goal to focus development at major transit stations, while a parking-oriented TDM ordinance might attempt to focus development along corridors.

The most successful TDM programs generally set low thresholds (size of development, number of employees, number of parking spaces, etc.) when TDM requirements become mandatory. However, these choices were made based on a broad range of thresholds, and in some cases programs focused solely on larger employers and/or developments. Successful integration across all sizes and types of development generally entailed a graduated introduction of TDM requirements.

Significant TDM program support funded at least in part by the city/regional agency was a common theme in the more successful examples. This generally took the form of a significant staff commitment at the regional government office to TDM efforts (including an area-wide coordinator with either extensive staff managing support internally or through consultant agreements) or an active Transportation Management Association (TMA).

While difficult to measure, TDM efforts appear to be greatly affected by the local culture or mindset. San Francisco, Seattle and Cambridge are all examples of areas that have aggressive trip reduction goals, thus developers in these areas tend to address TDM early on as a selling feature. Anecdotally, businesses attracted to these locations also appear to place a high value on quality of life issues addressed by TDM either in response to customers or as a benefit to staff.
• Locations with limitations on parking and roadway capacity (physically, as in San Francisco, or self-imposed, as in Arlington) also tended to have the strongest programs. In these locations TDM directly influences accessibility and the ultimate viability of projects, resulting in a development process where TDM is a fundamental consideration.

• The difficulty of implementing TDM in a residential setting was noted in a number of locations, with only the most active programs addressing this type of development in a significant way.

### 3.2 Focus Group Input

Representatives from District organizations (including the development community, advocacy groups, District agencies, and agencies from other local municipalities) were interviewed to analyze the existing development review process and inconsistencies in how the development review process is perceived by different groups. Stakeholders were also asked about potential strategies for amending the existing process based on the needs of their constituents. Staff members from peer municipalities throughout the region were interviewed for informational purposes, to further assist in identifying successful practices and highlight potential pitfalls. The following summarizes the key inputs provided by stakeholders at the focus group meetings (see Appendix B for complete documentation of focus group meetings):

• There is support from Washington, D.C.’s Zoning Commission to require TDM elements as part of development applications.

• The level of frustration with the current, overall District development process was palpable. Most of the groups, both public and private, talked of systemic problems in the system to the point where it was labeled nonexistent by some. It cannot be stressed strongly enough that this is fundamental issue.

• Legal requirements for TDM elements should be formalized to ensure maximum effectiveness. Requirements should include elements to be provided in the development application, as well as mechanisms for ongoing funding, monitoring, and enforcement of TDM requirements.

• Currently there is no enforcement process or mechanism to impose fines. Even if fines were collected there is no way to direct funds to TDM projects.

• TDM requirements should be predictable and based on an easily replicated format. This will provide TDM benefits, by encouraging developers to include TDM in applications while minimizing the additional workload on District staff.

• Different processes may be required to ensure TDM is included in the process for Matter of Right, PUD, and Variance developments.

• TDM elements should be considered equivalent to other transportation mitigations (roadways, intersections, signals) and not as amenities.

• Education on the value of TDM should be provided to developers, Advisory Neighborhood Commissions (ANCs), community members, and the Zoning Commission.
4.0 Recommendations

The District’s Comprehensive Plan established a specific policy objective of reducing the number of car trips and miles driven (for work and non-work purposes) as a way to increase the efficiency of the transportation system. Incorporating TDM strategies into the development review process is a direct mechanism for supporting this goal.

Based on the national best practices and input received from stakeholders, a list of actions were developed to more fully integrate TDM into the District’s development review process. The recommendations represent both near-term priorities (implementation within six months) and long-term direction for DDOT’s consideration (implementation within three years).

A comprehensive listing of TDM measures for implementation is provided in Table 2. This table details a menu of TDM measures that can be applied in different combinations, allowing applicants to formulate a TDM program that best addresses their project’s specific characteristics. The table separates developments into different categories based on the amount of peak hour traffic generated by the site and whether the application is Matter of Right, a Planned Unit Development (PUD), or one that requires a variance. While all PUD and Variance applications would require a TDM program developed from the elements described in Table 2, Matter of Right applications (which are considered “Consistent with the Zoning Regulations”) would only require a TDM program if it is projected to generate at least 25 person trips in the peak hour or entails renovation of more than 25 percent of the total property value.

4.1 Maximizing TDM with the Current Process (Near Term: Implementation within 6 months)

A) DDOT should expand its current outreach and advocacy efforts to encourage voluntary adoption of TDM measures by developers and building management companies in the District.

Until such time that TDM plans and programs become officially mandated in the District, DDOT should expand its current efforts to promote and help fund voluntary TDM programs. Programs might include conducting TDM workshops with District Council, Zoning Commission, ANCs, and the public to educate them about opportunities and develop a District-wide TDM vision. This represents a sizable increase over DDOT’s current TDM efforts and as such additional staffing, funding and/or consultant resources would be required. It is anticipated that this effort would target substantive developments; expansion of the current outreach effort to the general public is also recommended.

Once TDM programs are officially mandated in the District, DDOT should maintain an education campaign that emphasizes how TDM supports the community’s quality of life and how District agencies can assist developers and neighborhoods in designing TDM programs appropriate to each site’s context. Also this will allow developers to become more accustom to incorporating TDM considerations into their site plans, laying the groundwork for mandatory requirements should the district move in that direction.
B) **DDOT should develop written guidance explaining the agency’s interpretation of the Comprehensive Plan. DDOT may choose to include TDM goals or targets as part of this effort.**

The District’s Comprehensive Plan is a legal document with both federal and District elements. As such, it is appropriate that DDOT provide official written documentation summarizing the agency’s interpretation of the plan as it applies to those elements under DDOT’s purview.

By setting out exactly what DDOT expects of developers that are seeking project approval, DDOT can help steer design in a direction that speaks to the agency’s goals. This document should not be limited to TDM, but encompass DDOT’s entire development process. This document should:

- Reiterate the scope and general tone of the Comprehensive Plan;
- State the specific impact the plan has on transportation planning policy;
- List agency-specific goals (in a broad sense);
- State the future direction of DDOT, specifically addressing the anticipated rules and regulations that the department will be advocating for TDM; and
- Specify the extent that TDM will play a role in the granting of project approval requests in the development evaluation process.
- While it is beyond the scope of this project, other transportation elements of the plan under the purview of DDOT should also be addressed more fully that is provided in the Plan itself.

The intent of this recommendation is to address the sentiment that DDOT has been inconsistent in its approach and to build credibility regarding the agency’s commitment to TDM. DDOT may also choose to establish goals for the TDM program in the district as part of this effort. In the near term goals may simply serve as notice to the development community that consideration of TDM in transportation plans is important to DDOT as an agency. In the longer term reporting and monitoring of TDM effectiveness at the project level could become standard practice in the district (see recommendation L below.) Formalization of the above elements may be appropriate for incorporation into future updates of the Comprehensive Plan or provided as a complementary document.

C) **DDOT should encourage developers seeking LEED certification to adopt as many of the Alternative Transportation related credits as possible.**

The Leadership in Energy and Environmental Design (LEED) represents an opportunity for DDOT in regards to TDM. Fourteen points currently fall under the category of Sustainable Sites, four of which are assigned to Alternative Transportation: Public Transportation Access, Bicycle Storage & Changing Rooms, Alternative Fuel Vehicles, Parking Capacity and Carpooling. DCOP regularly presses for high levels of LEED accomplishment in PUD applications, and many District buildings are required to meet LEED standards under the Green Building Act. DDOT and DCOP should encourage developers to seek the full alternative transportation credit for developments in suitable locations. LEED certification includes inspection after one year of occupancy to verify that programs are adopted, which offers at
least some follow-up that DDOT/DCOZ currently cannot provide. While this may have a limited overall impact in regards to TDM and would only apply to developments seeking LEED certification, it again sends a message to developers regarding the District’s commitment towards advancing TDM.

**D) DDOT should judiciously enforce existing Zoning Regulations to demonstrate the agency’s commitment to furthering TDM measures in the District.**

Currently, bicycle parking and signage are the only TDM elements enforceable under the Zoning Regulations. Anecdotally, these requirements appear to be often ignored. As a show of intent, DDOT through the Department of Consumer & Regulatory Affairs (DCRA) should coordinate an ongoing effort to identify and address TDM commitments that have not been fulfilled. In the very near term, a compliance review could be undertaken to identify deficiencies in any current bicycle parking and signage requirements, as well as any TDM commitments included in PUD, variance, campus plan, and special exception approval orders. Responsible parties would be alerted as to any issues noted and follow-up action taken as is possible under current regulatory authority. In the longer-term, any enforceable TDM requirement could be pursued. In both the short and the long term a two-phase approach is recommended. In the first phase a wide area review will be staged. Building operators will be informed of what is being done and if any shortcomings that were noted. Deficiencies should be used as an opportunity for education on the value of TDM, as well as a reminder of applicants’ commitments. Follow-ups can then be completed three months later, and at that point corrective action can be taken as deemed appropriate. It is anticipated that actively working with the responsible parties to address problem areas will be sufficient. At some time in the future when TDM requirements become more entrenched, more aggressive actions could potentially be taken including fines, press announcements, and theoretically nullifying Certificates of Occupancy (rescinding of approvals is not a recommended course of action). None of these stronger actions is considered preferable and given the potential ramifications should only be pursued where inaction is blatant and negative impacts are both evident and indisputable.

**E) DDOT should make it standard practice that all development plans, regardless of size, address all applicable DDOT land use, bicycle, pedestrian, transit, and corridor plans as well as make reasonable allowances for future TDM requirements, particularly sidewalk and bicycle accommodation and transit right of way. Small-scale developments/redevelopments should support all District and neighborhood plans, but should be exempt from the requirement for a formal TDM package.**

Through the building code and the project approval process, DDOT has the ability to request, and in some cases require, that infrastructure for TDM, be incorporated into current and future project designs. Sidewalks, bicycle accommodations (lanes, trails, parking, shower facilities), and right-of-way set-asides for transit improvements (bus lanes, room for shelters) are all examples of design considerations that would be difficult, if not impossible, to implement after a project is built. It is also appropriate for DDOT to request certain infrastructure improvements as part of a new development that go above and beyond the needs of the development itself.
To ensure that TDM programs are supportive and not onerous, smaller scale developments should be exempt from TDM requirements. These projects should still be consistent with other Zoning Regulations and District-and neighborhood plans.

The intent of this recommendation is to make TDM a matter-of-fact in the district. It is recognized that small reconstruction and redevelopment projects, particularly residential developments, should not be disproportionately impacted by new regulatory requirements. In these cases wider efforts to inform and educate developers, business owners and residents of the larger TDM goals for the district may be sufficient.

F) All new developments should support the District’s TDM policies as per the District’s Comprehensive Plan. The elements do not need to be onerous, particularly for smaller developments; however, all developments have a role to play in reinforcing the District’s commitment to transit, alternative transportation programs and services, and vehicle trip reduction. (Near-Term (Voluntary), Long-Term (Required))

TDM considerations are often limited to larger developments. In the long term, this will result in a patchwork approach and may give developers a valid complaint regarding inconsistent treatment. There are design-based TDM measures that all developments can integrate as a matter of fact without requiring ongoing investment or operation. These include:

- Leaving space in lobbies for information and telephones to taxi/transit/ridesharing services;
- Ensuring that designs reflect the Bicycle and Pedestrian Master Plans;
- Ensuring adequate pedestrian and bicycle facilities under current codes as well as any anticipated requirements above and beyond the master plan;
- Orienting development to the street and allowing for a clear path from the front door to transit facilities;
- Managing parking in a way that reflects the urban nature of the District; and
- Participation in neighborhood programs/promotions.

Efforts could be as simple as acknowledging receipt of an information packet describing the District’s alternative transportation programs when a building permit is approved (the person obtaining the permit would be responsible for supplying the materials to the building occupants.) These and other low or no-cost options are items that all developments, regardless of size, could incorporate. Having near-term voluntary goals will help the development community adjust and adapt prior to the requirements becoming mandatory.

G) Create a directory of DDOT recognized TDM planners. Require development applications to include a TDM Plan, preferably drafted by a DDOT recognized planner or one with demonstrated credentials. Track TDM plan submissions and base ongoing consultant recognition on these submitted TDM plans.

DDOT should begin to review TDM plans submitted by consultants and identify samples it considers to be adequate for developments of a given size and scope. DDOT can then provide these examples to developers, applicants, and consultants as needed. Once a consultant has provided two or more
documents found to be sufficient, that organization or individual can ask to be placed on a list of recognized TDM planners maintained by DDOT. Individuals may also be allowed to submit two or more TDM plans from other areas or otherwise demonstrate their credentials for review. DDOT would maintain a list that can be supplied to interested parties as needed, preferably on the DDOT website. DDOT should review the TDM plans submitted by recognized consultants or other individuals to ensure that they continue to provide sufficiently detailed analysis. The purpose of this list would not be to exclude practitioners; qualified individuals could continue to submit plans for other parties as appropriate. Successful implementation of this element however would reduce DDOT staff time spent reviewing and commenting on plans submitted by recognized consultants. DDOT’s legal counsel should investigate District-wide certification processes, as well as liability and fairness issues.

**H) As the District’s requirements for TDM measures increase, additional resources within DDOT will need to be allocated to implement and administer the program.**

Based on the input received during the stakeholder interview process, the project team agrees that DDOT’s current staffing levels would be unable to fully accommodate all of the department’s desired TDM efforts, the additional administration associated with the proposed program, and coordinating efforts with OP and other district agencies. The capacity of current staff would need to be reviewed and additional resources considered (increased staffing, consultant assistance, outsourcing to other agencies, etc.) if the review and implementation of TDM is to be implemented as envisioned. TDM requirements should only be increased in conjunction with DDOT’s staffing being comparably expanded. Additional TDM requirements for developers without follow-up by DDOT will only result in unmet commitments and disenfranchisement of the public and development communities.

**I) The formation of Transportation Management Associations (TMAs) within the District is a goal of the Comprehensive Plan. DDOT will need address this recommendation and/or develop a functional equivalent to administer and monitor any TDM requirements implemented in the District. (Near-Term (Process), Long-Term (Operational))**

Both the current version and proposed update to the Comprehensive Plan envision the formation of TMAs or functionally equivalent organizations as a way to administer, oversee, support and enforce TDM requirements. TMAs would not represent a separate “level of government,” but instead would be an extension of DDOT’s ongoing efforts to reduce the impact of vehicular transportation. If TMAs are not feasible, DDOT should propose a different approach for inclusion of TDM oversight in future comprehensive plan updates. TMA’s, as a semi or fully independent entity, may also be able to act as a conduit for funding from outside sources, addressing some of the constraints DDOT has regarding dedicated funding.

Regardless of the eventual organizational title or structure, a body responsible for planning, supporting, following through, and enforcing TDM requirements will need to be developed. A funding commitment would be required by the District as part of this effort, since these types of organizations are typically not self-sustaining. A portion of the funding could come from members (funding formulas vary); however DDOT would need to address the issue of how outside funding could remain targeted to TDM projects and not end up in the general fund. Having TDM programs administered by a separate entity
may address this issue. A three-year timeframe for developing an approach is reasonable and should be
defined prior to the next update to the District’s Comprehensive Plan.

The primary role of the agency/organization will be to coordinate and promote TDM and alternative
transportation as well as to review and assist larger developments with their independent programs.
This organization might also assist DDOT by review the annual TDM reports submitted by larger
developments. Depending on funding mechanism, this group might also be responsible for producing
an annual report summarizing the effectiveness of its efforts. Some of the roles the organization would
fill include:

- Hiring a coordinator and support staff who will attend, and become part of, DDOT’s broader
  TMA network;
- Be the neighborhood champion of TDM and alternative transportation. Be a clearinghouse for
  local and regional TDM programs and opportunities;
- Develop a strategic marketing plan, with detailed schedules and budget, based on the outcome
  of meetings with the ANC/local community;
- Coordinate efforts with local ANC groups assigning transportation representatives or
  coordinators for each organization/association;
- Provide oversight of TDM programs of individual developers within the region;
- Possibly manage and host a local TDM Web site;
- Review the TDM annual reports from larger developments;
- Create (and potentially oversee) a monitoring and evaluation plan;
- Represent the TDM concerns of residents, employers and employees;
- Schedule transportation events;
- Open a Commuter Store in the neighborhood;
- Coordinate with leasing agents and building management companies to promote TDM and help
  them meet TDM commitments/requirements;
- Provide personalized transportation assistance to local residents and employees; and
- Distribute fare media and other transportation incentives.

An operational role may also be involved, such as working with several developments to pool resources
and implement more extensive measures. As an example, individual developments might not be able to
facilitate the creation of a shuttle service, but a larger agency might be able to coordinate such a service.
Such an expanded role for the organization would be at the discretion of DDOT. TMAs, however, are not
typically invested with authority over physical infrastructure (responsibility of which remains with either
DDOT or the property owner).
4.2 Long Term Changes to Maximize TDM Benefits (Implementation within three years)

**J) Until there is an established process for ongoing surveying to demonstrating success, quantification of site-level TDM impacts for the purposes of mitigation is not appropriate.**

There is a general desire in the district to quantify reductions in traffic and travel demand which can be attributed directly to project or development level TDM measures. However, credit for TDM benefits should only be taken if the program is reliably implemented, monitored (i.e. surveys taken regularly), and enforced (through fines or other actions that require an ongoing commitment). Unfortunately, the District is unable to accommodate or require any of these prerequisites at this time. Without such a process and the means to follow up on TDM commitments, one could potentially take advantage of the situation by promising to implement certain programs, taking credit for them in the planning approval process, and then ultimately failing to provide the promised items. Conversely, may developers need TDM to implement specific projects if their developments are to be successful. Failure on the part of DDOT or other agencies to fulfill their role in the TDM process might also be identified in the survey effort. It is premature at this time to formally and quantitatively consider the impacts of any program that is not enforceable or sustainable. As a result, in the near-term the District will need to encourage voluntary actions, formalize policy and begin the process of creating a regulatory framework to incorporate TDM in the District. Until the regulatory framework is established, DDOT should establish a pilot self-monitoring program for property owners who voluntarily agree to participate. Volunteers who submit evidence of TDM program implementation should be rewarded with ongoing agency support and positive press announcements.

**K) DDOT, DC Office of Planning (DCOP), other relevant district agencies, officials and stakeholders should formalize TDM considerations into the current DDOT/OP development review process.**

There is no formal or consistent process followed by both DDOT and OP when considering TDM in the current development review process. An official process should be formalized between the agencies (to transcend beyond current staff tenure) and include coordination with the Zoning Administrator (and DCRA for Matter of Right applications). The following steps are suggested as possible inclusions:

- At the pre-application preparation meeting, should it occur, DDOT would present the TDM table. (Input from stakeholders indicated that these meetings are offered to all applicants to facilitate the application preparation and review process. This meeting is not mandatory, but when it occurs, the TDM Table should be included as an agenda item.)
- When the applicant files a pre-hearing statement, DDOT would review the provided TDM program. OP and DDOT would send joint recommendations on the application. When applicable, this could be incorporated into the review of zoning relief requests.
- DDOT only has direct oversight on a limited number of transit services in the District; however, transit is an alternative mode that is key to the success of any TDM program. As such it is recommended that WMATA be included as an advisor into the development review process, primarily to provide comment on larger scale developments and Transit Oriented Development (TOD) projects.
Adopting these recommended steps would require addressing current shortcomings in the overall development approval process, including more regular engagement by DDOT. Additional staffing resources would need to be made available to implement these measures.

Workshops should also be offered to the BZA and ZC members, as well as ANCs, to educate relevant stakeholders in TDM as a policy priority and effective means of implementation (workshops on special exemptions, campus plans, PUDs, and variances can be held when relevant). Separate workshops for the DCOZ are recommended on the importance of follow-up on TDM agreements in the post-approval period for PUDs.

I) DDOT will need to spearhead an effort to formalize TDM as a regulatory requirement for new developments and as an ordinance in the Zoning Regulations for the District. This ordinance will need to address not only physical elements at the time of design and construction, but also ongoing survey requirements and the ability to assess fines when violations are identified or program goals are consistently not met. Funding of specific TDM programs will also need to be addressed.

For TDM to be effective in the District it will need to become a formalized and mandated planning element, fully outlined in new zoning ordinances. Some of the long-term elements that DDOT should consider for inclusion in the plan include:

- Adopt the TDM Expectations Table (see Table 2) as part of Zoning Regulations (or equivalent) and authorize DDOT to serve as the administrative agency.
- Establish a requirement that a TDM plan be included with the development application. The size of the actual document would be in line with the size of the development. Smaller developments might just provide a listing of the programs, a contact person, a funding commitment and a brief description of program. Larger developments would require extensive reports that would include goals and reporting commitments and may include elements such as:
  1. Providing contact information for the individual overseeing the TDM aspects of the project with a commitment for regular (annual) updates;
  2. A commitment to develop an operations manual delineating day-to-day tasks undertaken to successfully implement program;
  3. Branding the TDM program based on input from focus group studies;
  4. Developing a strategic marketing plan based on the outcome of the focus group studies;
  5. Developing programs specific to each TDM strategy;
  6. Conducting annual transportation trip generation and mode split surveys, including a baseline survey;
  7. Track the progress and success of each TDM program;
  8. Creating a monitoring and evaluation plan;
  9. Commitment to submit annual TDM report based on requirements;
 10. Hosting a development-specific TDM Web site;
 11. Addressing the TDM concerns of the residents, employers and employees of the specific developments;
 12. Scheduling alternative transportation promotional events at the applicant site;
 13. Locating a TDM office within the applicant site;
 14. Developing a targeted marketing program for residential sales/leases;
15. Developing a targeted marketing program for commercial programs for office tenants;
16. Establish a dedicated transportation fund, likely managed by DDOT, to fund TDM programs (that cannot be shifted to the General Fund). While this fund will include developer contributions, it should not be expected that the TDM program will be self-sustaining.\(^4\) Alternately, funding may flow through a TMA or similar independent body;
17. Offer an in lieu payment option where developer includes no TDM elements but pays a lump sum into District’s Transportation Fund (equivalent to TDM requirements for 30 years) and permit DDOT/TMAs to implement a TDM program on-site or to fund an implementing agency such as a TMA that has taken on this role.\(^5\) In this case DDOT would need to work closely with the developer to ensure developer and operators have the support (programs, policies and in some cases infrastructure) to ensure that TDM targets are met;
18. Establish modal split goals for all new developments. Require the developer/successors to conduct an annual survey of residents/tenants/employees. Allow the public to notify DDOT or Zoning Enforcement if commitments are not provided; and
19. Authorize DDOT or Zoning Enforcement to monitor all developments for TDM commitments at least once per year or based on public notifications. Establish a fine system based on number of days commitments are not provided.

A sample TDM plan is provided in Appendix C for illustrative purposes and a possible starting point for the DDOT in beginning to develop a plan for use in the district.

**M) Measures of Effectiveness for TDM programs should be two-fold: a reduction in peak period vehicle trips and a reduction in overall weekly vehicle trips.**

TDM and auto trip reduction in general is not just a tool for addressing peak period traffic, it is also a way to increase mobility for all residents, employees, and travelers in the District all the time. Also, parking is the primary consideration for residents and is not limited to peak travel periods. Any performance measures or monitoring should therefore include both peak period and weekly travel (all-day and weekend.) How these measures are estimated will require further investigation.

**N) Rather than calculating the potential impact of any specific elements of a TDM plan, DDOT should set overall vehicle trip goals and allow the developer to address the specific goals accordingly, with success determined via ongoing surveys and reporting back to DDOT.**

Quantification of TDM measures is challenging. The state of the practice is generally sketch level techniques intended to give a general idea of TDM impacts. The EPA COMMUTER model is generally accepted as the preferred estimation technique; however, it was intended for gross estimates of emissions reductions associated with TDM programs, not as a traffic analysis tool. Several locations,
including cities and counties near the District, have turned to performance-based programs instead of program quantification. This allows the developer and/or the building operator to select measures best suited to their projects. The District will need to establish a reasonable set of goals that developers and building operators are expected to achieve. These goals should be sensitive to the location of the development relative to transit services as well as the mode shares achieved by similar developments in the District. A study will need to be undertaken to identify how DDOT will set these goals. Initially DDOT may choose to turn to the MWCOG model mode share component and the Census Transportation Planning Package (CTPP) as possible sources for baseline and achievable mode shares goals. In the future, DDOT should require annual surveys from developments with TDM plans and from the TMAs in the region, which would provide a robust source of information to draw from.

</table>

* Shuttles and Direct Access to Metro are site specific. DDOT expectations for these measures will be dependant on the practicality of adopting them at a specific location.

Guide to Users:
Use the top row of this table to identify the category which best describes the development proposal, the minimal TDM measures expect are indicated in column below along with others that may be used as substitutes and/or above and beyond the minimum requirements. These expected measures which develop for maneuvering TDM plans in other locations both in the greater DC region and nationally. DDOT encourages the adoption of measures above the minimum expected, reserves the right to require additional measures beyond these minimal expectations as warranted.
5.0 Other Planning Issues that Indirectly Impact TDM

In undertaking this study, a number of general planning concepts and goals were proposed that, while supportive of TDM, are beyond the scope of this work. These are provided to DDOT as suggestions for the agency as it continues to refine its approach to TDM and the planning process in general.

- Establishing parking maximums by neighborhood or district would have a profound impact on transportation and development. In this scenario, if a developer wanted to provide more spaces than allowed in an area, a per-space fee could be levied and funds deposited into the District’s non-auto transportation fund. In this case, shift the standard traffic impact from “10 additional trips generated” to “any increase in the amount of off-street parking they maintain for non-residential uses.” This is an initiative that should be jointly investigated between DDOT and OP.

- Require the “unbundling” of parking costs from real estate purchases and leases so that parking costs can be better understood by occupants and DDOT. (One peer model is San Francisco’s unbundling requirement in its Zoning Code for downtown.)

- Establish multimodal standards that specify the number of trips that can be generated by and accommodated in any zone.
  - Include trip supply for all modes (roadway capacity, transit capacity, and sidewalk and bike network completeness).
  - Assign weights for each mode and assign to districts based on the Comprehensive Plan.
  - If a proposed development will generate more trips than the supply will accommodate, require the development to expand the transportation network based on the modal weights and balance mode use with TDM measures.

- Establish, as policy, that the District will not widen any roadways for additional auto capacity. This concept, often referred to as “complete streets,” is based upon the belief that the current transportation network accommodates all the peak hour trips it can and will not be significantly expanded (widening to accommodate additional capacity for alternative modes or to address substandard safety conditions would be exempt from this requirement). Therefore, since all new developments will create additional trips, all new developments will result in impacts.
  - Calculate how many new trips could be accommodated by all of the non-auto transportation projects in the District’s Transportation Improvement Program (TIP).
  - Determine the price of all of the non-auto transportation projects in the District’s TIP.
  - Calculate the average price per additional trip accommodated by the transportation network by dividing the total cost by the total number of trips.
  - When a development is proposed, determine how many trips it will generate. Require the developer to pay the District an impact fee based on the number of trips generated multiplied by the average price per trip accommodated.
  - Dedicate the impacts fees paid to the implementation of the non-auto transportation improvements.

1.0 Introduction

As part of the ongoing effort to identify ways of better integrating Travel Demand Management (TDM) into the District’s overall development process, a research effort was undertaken to identify TDM programs from across the country and to summarize some of the best practices and approaches. Candidate studies were identified by online sources, suggestions by DDOT staff and through practitioners in the field. From the initial review, six locations were chosen for more in depth study:

- Cambridge, MA
- Montgomery County, MD
- Arlington, VA
- Alexandria, VA
- Contra Costa (Bay Area), CA
- Seattle, WA Metropolitan Region

These more detailed reviews drew upon the experience of the project team and additional research into the specific programs. For the other TDM programs identified, shorter descriptions are provided. Additional point-form summaries are provided for regional programs where only limited information could be found as well as a selection of site specific programs.

1.1 General Observations

Review of the various ordinances, regulations and planning policies identified during the research effort revealed a vast array of approaches. Goals varied widely, with some agencies looking at TDM as a traffic mitigation tool, others setting goals for alternative modes of transport, still others using TDM to complement and re-enforce their urban planning vision. However a number of general themes were identified that may assist the District in formulating an approach for the region:

- Approaches to “elevate TDM” in the development process are very unique and a reflection of how a particular region operates from a political perspective. As such, few “tried and true” methods exist.
- The metric by which the success of a program will be evaluated has a direct impact on how TDM is approached. Metrics are generally a reflection of the underlying policy goals of the TDM program. For example, a metric based on transit use might focus development at major transit station, a parking ordinance might focus development along corridors.
- The more successful TDM programs rely on continuing, enforceable ordinances. Stand alone programs relying on voluntary measures, while often somewhat successful in reducing auto trips, tended to have less influence on the nature or type of the development in a region.
- Ordinances take on many forms and may tie into zoning, the building/site approval process or specific parking requirements.
- The most successful TDM programs generally set low thresholds (size of development, number of employees, number of parking spaces, etc.) where TDM requirements become mandatory. However a broad range of thresholds exist and in some cases programs focus solely on larger employers and/or developments.
- In order to have TDM considered earlier in the development process, most locations make the submission of a TDM plan a requirement of the certificate of occupancy. The degree to which
these plans are scrutinized varied widely, with many plans only being a small sub-section within a project’s traffic impact study.

- Significant TDM program support funded at least in part by the city/regional agency was a common theme in the more successful examples. This took the form of a significant staff commitment at the regional government office to TDM efforts (including an area-wide coordinator) or an active Transportation Management Association (TMA).
- The existence of an agency with enforcement authority appeared to be a necessary element for TDM to have a significant impact.
- While difficult to measure, TDM efforts appear to be greatly impacted by the local culture or mindset. San Francisco, Seattle and Cambridge, MA are all examples of areas that have aggressive trip reduction goals and anecdotally developers in these areas tend to address TDM early on as a selling feature. Businesses attracted to these locations also appear to place a high value on quality of life issues addressed by TDM either in response to customers or as a benefit to staff.
- Locations with limitations on roadway capacity (physically as in San Francisco or self-imposed as in Arlington) and parking also tended to have the strongest programs. In these locations TDM directly influences accessibility and ultimately the viability of projects. The results tended to be a development process where TDM is a fundamental consideration.
- The difficulty of implementing TDM in a residential setting was noted in a number of locations, with only the most active programs addressing this type of development in a significant way.
- Monitoring is a major requirement if TDM programs are to have an influence, with the vast majority of programs requiring annual reporting. The most successful survey programs are those tied to other survey requirements in the region.

The diversity of approaches suggests that a “one-size-fits-all” program may not be as successful in a setting as large as the District. Developing programs tailored to specific communities and neighborhoods is an option that may warrant further consideration.
2.1 Detailed TDM Program Review: Cambridge, Massachusetts

A. Background

The City of Cambridge established a Vehicle Trip Reduction Ordinance (VTRO) in 1992 to reduce overall auto trip impacts in the city. Out of this ordinance, the City has developed two new programs, one to mandate TDM participation at existing developments and one to cover new development projects — the City’s Parking and Transportation Demand Management (PTDM) ordinance and its Article 19 process (A19), respectively.

The PTDM enjoys widespread support among the city council, city planners, the business community, and the public. This is most clearly evident by the Cambridge City Council’s September 11, 2006 vote to eliminate the program’s sunset clause in order to expand the positive impact of the program. The A19 program is newer and has recently begun to affect residential developments.
B. Vehicle Trip Reduction Ordinance

In 1992, the Cambridge City Council passed the Vehicle Trip Reduction Ordinance as part of an effort to address community concerns about increasing traffic congestion and environmental pollution. The ordinance required the City government to begin implementing Transportation Demand Management strategies such as transit subsidies and bicycle parking that would reduce vehicle trips by City staff. The most significant effort was led by the Environmental and Transportation Planning Division of the City’s Community Development Department, which also began working cooperatively with citizens, businesses, and institutions in Cambridge and the Boston area to implement similar TDM benefits for their employees.

C. Parking & Transportation Demand Management (PTDM) Ordinance

In 1998, a formalized, mandated TDM program for businesses in Cambridge was approved by the City Council with the passage of the PTDM Ordinance (Section 10.18 of the Cambridge Municipal Code).

1. Participation Trigger

The PTDM Ordinance is triggered when any landowner in the City of Cambridge seeks any increase in the amount of off-street parking they maintain for non-residential uses. All landowners are required to register their parking with the City’s Traffic, Parking & Transportation Department (TPTD) which has maintained a comprehensive inventory of all off-street parking facilities in Cambridge since 1971. The Director of TPTD determines if a building permit or parking license to increase registered parking has triggered the PTDM Ordinance and if so, sends notification to the landowner.

2. Compliance

Compliance with PTDM requires approval of a PTDM plan by a PTDM Planning Officer. Parking facilities with a total of 5 to 19 spaces are considered “small projects” and must implement three unique TDM measures from a toolbox of suggested TDM measures – as a one-time implementation with no required monitoring or performance targets.

The list of specific measures is not documented in the ordinance, but is rather maintained and updated by the Planning Officer. Commonly implemented measures include:

- subsidized transit passes;
- information kiosks;
- bike racks;
- bike showers;
- car-sharing spaces;
- carpool spaces; and
- a guaranteed ride home program.

Projects that create facilities of 20 or more parking spaces are considered “large projects” and are subject to greater implementation and reporting requirements. Most significantly, most projects must commit to reducing their percentage of drive-alone trips by 10% from 1990 levels for the census tract in
which the site is located. To achieve this goal, landowners must prepare an aggressive package of TDM measures under the guidance of the Planning Officer.

Typical plans include many of the small project measures listed above as well as:

- Membership in a Transportation Management Association (TMA);
- Market-rate parking fees;
- Employee transportation accounts;
- On-site transportation coordinators;
- Commuter awareness events;
- Shuttles to transit;
- Transit shelters;
- Bike stations; and
- Tele-commute programs.

Each plan must also include a detailed monitoring program to determine the mode shares of all persons who may use the subject parking facility. Programs typically include annual or biennial employee surveys, parking utilization counts, and driveway counts — each of which are compared to a base-year set of observations.

All small or large project plans must be approved or rejected by the PTDM Planning Officer within 90 days of their submittal. If a plan is rejected, the landowner cannot receive a permit to expand their parking facility.

Large projects that are subject to monitoring must implement additional, more aggressive TDM measures if they fail to meet the mode split goal of a 10% drive-alone-rate reduction from 1990 levels for the census tract in which the site is located.

3. Administration and Enforcement

If a landowner fails to comply with the PTDM, the TPTD Director may take enforcement action until the landowner complies. Enforcement can consist of a fine of $10 per day for every parking space in the facility or even physical closure of the subject facility. Landowners are directed to work with the City’s PTDM Planning Officer who is appointed by the City Manager and works in the Community Development Department. The Planning Officer provides guidance to landowners, approves final PTDM plans, and reviews and approves any required monitoring reports.

Compliance has been very high and consistent. To date, non-compliance penalties have not been used. Survey return success has been aided by the fact that the State requires a number of annual surveys from employers. As a result, employers tend to have already implemented effective strategies for surveying, including contracting out for the services.
4. Performance Measures

The fixed 10% target reduction in drive-alone commute rates is the primary performance measure for the program. A secondary measure of the program’s impact is its own growth in terms of how many developments enter into PTDM agreements.

5. Performance to Date

The PTDM Ordinance has been very successful for Cambridge. Nearly 100 large projects have resulted in detailed monitoring plans — and dozens of small project landowners have implemented one-time TDM measures. The regular monitoring requirement for large projects has demonstrated much success. Over 85-percent of the monitored businesses have met or exceeded their mode split goal. The average drive-alone mode split for monitored businesses by 2004 had dropped from 68% to 55%, removing an estimated 7,000 vehicle trips from Cambridge roads each day.

The ordinance is notable for both its impact on new developments and popularity. It enjoys widespread support among the city council, city planners, the business community, and the public. The original ordinance contained a sunset clause for the ordinance, which was lobbied for by the business community which feared the implications of TDM on the cost of business. After two renewals, the sunset clause has been eliminated in the latest version of the ordinance, so PTDM is now a permanent program.¹

Developers who originally received the ordinance with skepticism found that employees support the transit benefits program and it has become an effective marketing tool to attract prospective employees.

Success stories include the Technology Square development which sought to double its office and research campus from 1M square feet to 2.6M square feet and add over 600 new parking spaces. During preparation of its PTDM plan, the developer cut back the parking expansion by over 200 spaces and was able to commit to a drive-alone rate of 50 percent. Within one-year, the project exceeded this goal, and was operating at only 40 percent drive-alone by year two. A smaller development with 220,000 square feet of office space and 220 parking spaces committed to a 56 percent drive-alone mode split in 2002, and has been performing at less than 48 percent since.

6. Funding

Program participants fund their own mitigation activities, and are not required to contribute to the overall cost of program administration.

D. A19 and the Project Special Review Permit

The success of the PTDM program, though significant, was limited in its impact on overall traffic generation by the program’s narrow focus — existing land uses for which parking expansions were sought. Throughout the 1990’s, Cambridge residents continued to oppose the overall level of local traffic growth due to rapid development within the city, especially in East Cambridge. Eventually,

¹ Section 10.18.090
citizens demanded a halt on development, eventually settling for the Interim Planning Overlay Petition (IPOP) that sought detailed traffic review of new developments along with impact thresholds and mitigation requirements.

The IPOP became formalized as Article 19 of the City’s zoning ordinance. While the City’s PTDM did not require participation from residential developments, the only exclusion in A19 was for university housing.

1. Intent of A19

The intent of A19 is to establish traffic and urban design standards for development projects likely to have significant impact on abutting properties and the surrounding urban environment.

To realize this intent, A19 codifies the city’s urban design objectives and establishes detailed building and site development standards to (1) regulate new building construction in the city’s commercial and high density residential areas; (2) establish standards by which significant adverse traffic impacts can be measured; and (3) establish procedures by which individual proposals can be reviewed by the Planning Board, city staff and the general public before a building permit is issued.

2. Traffic Impact Review

The Planning Board assesses the impact of the vehicular traffic, and pedestrian and bicycle circulation expected to be generated by a proposed development project. The procedures and requirements are intended to encourage applicants to adopt a development program that reduces the number of single occupancy vehicles coming to the site.

Such a program is also expected to encourage pedestrian and bicycle access to the site and throughout the neighboring district, while reducing potential negative impacts of the vehicles coming to the site on abutting properties. While the review focuses especially on the impacts affecting abutting properties and the immediate environment, the impacts on streets and locations more distant from the site, and on transit and bus facilities serving the site, are also assessed.

3. Project Special Review Permit

To ensure that new construction or changes of use in existing buildings do not impose substantial adverse impacts on city traffic, a special permit process was established as part of A19.

a. Participation Threshold

A Project Special Review Permit (PSRP) is required for new building construction based on the gross floor area (GFA) and nature of the proposed project, as stipulated within the ordinance. In an existing building, the PRSP shall be required where the total GFA of a new use or uses on a lot exceeds the threshold limits set forth for new developments.
b. Application

An application for the PSRP is made to the City Planning Board. The application must consist of the following materials:

- Planning Board Special Permit Application Form. The application shall include all required plans and narrative statements. The site plan and other plans, elevations, and drawings shall clearly show:
  - The access and egress points for all forms of travel to the site;
  - The location of adjacent bus and transit stops;
  - The schematic design of proposed mechanical equipment; and
  - The architectural screening treatment proposed for that mechanical equipment.
- Traffic Study. This must include a geographic and functional scope determined by the Traffic, Parking and Transportation Department (TPTD) to be appropriate to the location of the project. In general, the study must review intersections where the project will have significant and measurable impact.

The TPTD must issue a certification to the applicant within twenty-one (21) days of its submission that the traffic study has been done in a complete and reliable manner. Where that certification is denied, the applicant may revise the information in the traffic study and resubmit it; a certification of the revised study must be issued or denied by the TPTD within fourteen (14) days of the resubmission of material.

Based on guidelines established by TPTD, the traffic study must include a narrative discussion of:

- The nature and quantity of vehicles traveling to the site including, in addition to passenger cars, service, delivery and other commercial vehicles;
- The likely impact of such vehicular traffic on abutters, abutting streets, and nearby residential streets, including on-street parking behavior;
- The physical nature of pedestrian and bicycle access to the site and the quantity of movements anticipated for each;
- An analysis of the crash history at intersections within the study area; and
- Parking and transportation demand management measures proposed to ameliorate any adverse traffic impacts identified in the study.

Additional elements of the Application (not related to traffic) include:

- A Tree Study;
- An Urban Design Objectives Narrative;
- A Sewer Service Infrastructure Narrative;
- A Water Service Infrastructure Narrative; and
- A Noise Mitigation Narrative.

c. Approvals Evaluation

The Planning Board only grants the special permit if it finds that the project will have no substantial adverse impact on city traffic within the study area as analyzed in the Traffic Impact Review. In determining whether a proposal has substantial adverse impacts on city traffic the Planning Board assesses the following indicators:
Project vehicle trip generation: weekdays and weekends for a twenty-four hour period, and A.M. and P.M. peak vehicle trips generated;
- Change in level of service at identified signalized intersections;
- Increased trip volume on residential streets;
- Increase of length of vehicle queues at identified signalized intersections; and
- Lack of sufficient pedestrian and bicycle facilities.

When one or more of the indicators is exceeded, it is indicative of potentially substantial adverse impact on city traffic. In making its findings, however, the Planning Board considers the mitigation efforts proposed, their anticipated effectiveness, and other supplemental information that identifies circumstances or actions that will result in a reduction in adverse traffic impacts.

Such mitigation efforts and actions can include, but are not limited to:
- Transportation Demand Management plans;
- Roadway, bicycle, and pedestrian facilities improvements;
- Measures to reduce traffic on residential streets; and
- Measures undertaken to improve safety for pedestrians and vehicles, particularly at intersections identified in the Traffic Study as having a history of high crash rates.

The precise numerical values that indicate potentially substantial adverse impacts for each of these indicators are revised periodically by the City Planning Board in consultation with the TPTD, and published and made available to all applicants.

4. Results

Around 2002, several large residential developments were proposed. This was the first real test of applying the new program’s requirements to residential development, which was met with much resistance. Residential developers claimed they were fulfilling an official City goal by providing more housing, and so shouldn’t be treated like commercial developers. However, traffic studies of the projected impacts of large residential developments were not easily dismissed — and the new legislation has been upheld.

E. Residential Implementation – A New Challenge

Residential projects tend not to trigger the primary VTRO criteria — peak-hour trip generation — as much as they do secondary criteria such as daily trip rates. Therefore, unlike commercial developments, impacts were not as clear for peak-hour intersections. Impacts on overall daily trip volumes, by contrast, are not as easy to quantify, nor as immediately noticeable. For instance, a large residential development may not significantly impact nearby intersections at any one hour of the day, though it produces a significant amount of trips throughout the day.

**TDM Measures for Residential Developments**

The most effective measures among commercial developments caused much debate and resistance among residential developers — contributions to the transit shuttles, subsidized transit passes, and
ongoing, annual monitoring. These measures required on-going financial commitments, which were deemed to be unsustainable by some homeowners’ associations.

Cambridge’s zoning prevents unbundling (assessing a fee for parking distinct from rental fees or home purchases), so pricing parking is not an available tool for residential developments. Bike & pedestrian measures have been frequently implemented — racks, sidewalks, paths, bigger elevators, etc. Other TDM toolbox measures that have been used include car-sharing, electric charging stations, posting transit information in lobbies and on websites, and on-site transportation coordinators (provided by the management office).
2.2 Detailed TDM Program Review: ARLINGTON COUNTY’S TDM PROGRAM FOR SITE PLAN DEVELOPMENT

A. Background

Arlington County’s coordinated policy approach to land use and transportation planning has allowed it to grow rapidly over the last 30 years without major expansions in the highway network and minimal traffic growth. In that time, nearly 18,000 residential units, 14 million square feet of office space, 1.5 million square feet of retail, and 1,218 hotel rooms have been built just in the area served by the county’s Orange-Line Metrorail corridor – Rosslyn, Courthouse, Clarendon, Virginia Square, and Ballston stations. Other major development areas include the Jefferson Davis and Columbia Pike Corridors. Today, the County contains more than 46 million square feet of office and retail space – more than downtown Dallas, Denver, or Seattle².

As intense as this development has been, it has generated only modest levels of traffic growth. Year 2000 U.S. Census data show that almost half of Orange-line corridor residents ride transit to work. Traffic counts from 1997 to 2004 show that while office and residential square footage increased by 17.5% and 21.5% respectively, traffic along the Rosslyn-Ballston corridor grew by only 2.3%. Surveys at large apartment buildings have shown peak hour auto trip generation rates of one trip per 5.9 units, far below the standard in the Institute of Transportation Engineers’ Trip Generation Manual.

The resulting economic prosperity has been remarkable, including the lowest property tax rate among the major cities and towns in northern Virginia and a AAA bond rating. The county’s Metrorail corridors provide 50% of the County’s tax base — on only 7% of the land. The County also enjoys far lower vacancy rates and higher lease and sale prices, compared to other regional locations.

B. The TDM Program for Site Plan Development

Arlington County’s TDM Program for Site Plan Development is an Arlington County Commuter Services (ACCS) program adopted by the County Board in 1990. This program was the product of a joint task force of the Arlington County Planning and Transportation Commissions, and an outgrowth of the comprehensive site-plan review process headed by the Arlington County Department of Community Planning, Housing and Development (DCPHD).

Arlington’s TDM policy focuses on workplace commuter travel and looks to reduce peak hour work travel by achieving a reduction of single occupant vehicle trips. Its objectives are consistent with, and help support, those of the County’s Master Transportation Plan, including achievement of major street and intersection level of service goals.

The key program requirements include:

- A TDM plan for each development consistent with the TDM Matrix (see Figure 1);
- A standard site plan condition to implement the TDM Matrix;
- In-building parking provisions that extend preference to vanpools, carpools, and bicycles;
- The encouragement of travel to and from the work place by modes other than single occupant automobile through various educational and incentive measures;
- Coordination and cooperation on such measures among employers, building owners, and management companies. The county has one central transportation management agency (TMA), Arlington Transportation Partners, that serves this function for most developments; and
- Arlington County using its roles as developer of public buildings and as employer to encourage TDM practices.

---

3 Ibid
4 The county’s second TMA, the recently formed, Potomac Yards TMA, was established exclusively to assist in the implementation, coordination, and monitoring of TDM’s generated among developments within a single, large development area in southern Arlington County.
C. The Matrix

Recommended County TDM programs are set forth in the TDM matrix (see Figure 1). However, upon providing clear and convincing evidence that particular elements of the TDM matrix may be inappropriate for a particular project, the developer may propose substitution of other elements which provide equivalent value.

No Site Plan TDM Program is expected to incorporate all the strategies outlined in the matrix. Rather, the matrix provides a framework of options from which the County will help developers identify appropriate actions for their project. In doing so, the County distinguishes the intensity of the strategies, matching them with the assessed impact of different developments on the transportation system. The greater the impact, the more intense the mitigation measures in the approved Site Plan will be. The categories and density thresholds are described in the matrix below and through the following context codes:

Matrix Land Use Category Codes
A. Development plan is consistent with the General Land Use Plan (GLUP), and no traffic problems are projected related to the development and its surroundings.
B. Development plan is consistent with the GLUP, however, traffic problems are projected related to the development and its surroundings.
C. A GLUP amendment is requested for a non-conforming development plan, no traffic problems are projected however.
D. A GLUP amendment is requested, and traffic problems are projected.

The DCPHD reviews submitted site plan proposals to assess transportation impacts and opportunities. Reviews incorporate an assessment of site characteristics, proposed land-uses, a traffic impact analysis (TIA) report, and a proposed parking plan. The ACCS then helps the developer identify site-specific strategies and prepare a TDM plan. Each TDM strategy is selected to mitigate the transportation impacts of the site on a case-by-case basis.

Developers can obtain further assistance in implementing their TDM plan requirements by contacting the County’s primary TMA – Arlington Transportation Partners (ATP), a division of ACCS – or the County’s TDM planner.
To ensure that parking rates will reflect true market conditions in a competitive environment, lease agreements with parking garage operators are encouraged. Although a set number of spaces may be reserved for a tenant, the cost of an individual parking space is not controlled by the tenant and subsidies are prevented from being passed along to specific persons.

* If GFA is less than 100,000 SF
** If GFA is 100,000 - 200,000 SF
*** If GFA is more than 200,000 SF

6 To date, approved Site Plans have not required either Contribution - to offset monitoring and compliance costs - or Performance Guarantees.
D. Participation

Participation in the Site Plan Review process is voluntary, but incentivized through density bonuses. Each zoning district permits a certain type and level of development "by-right." Beyond this, certain districts provide public review processes for a special exception by "site plan" that allows for greater flexibility in use, density, and form of development. The key to the success of the Site Plan Review Process is that additional development potential serves as an incentive to developers to seek a special exception by site plan and participate in the process.

To date, the density bonuses have been significant enough to attract the majority of new development projects into the process. By framing incentives in terms of added project density, the Site Plan Review Process supports the County’s objective of concentrating development around transit stations.

E. Implementation

The developer must follow conditions outlined in the final approved site plan in order to receive a building permit and to continue to be in compliance with the property’s existing zoning. While entering the site plan approval process is voluntary, once approvals are received, TDM conditions run for the life of the building, regardless of ownership, and guide all future decisions regarding development on the property.

The developer of an approved site plan property must implement the TDM program and obtain approval from the County before gaining the first Certificate of Occupancy. At this time the developer will prepare a property TDM Report. Subsequent to the first approval, the property owner will re-submit the property’s TDM Report on the anniversary of the approval of the first Certificate of Occupancy.

Common components of site plan implementation include:

- Ridesharing promotion;
- Parking management;
- Transit promotion;
- On-site construction measures;
- Mutually agreed off-site provisions or contributions;
- Lease agreements; and
- Monitoring and compliance

F. Common Strategies

Some of the most common strategies used today include:

- Conducting an employee transportation survey, provided free by ATP;
- Attending a free, ATP-sponsored employer workshop or seminar;
- Posting commuter information in a company newsletter, on a central bulletin board, internal e-mail system, or website;
Installing a permanent display case, stocked with commuter information tailored to the specific worksite, in a central area;
Hosting an on-site transportation event for employees;
Providing preferred parking spaces for carpools and vanpools;
Implementing an informal teleworking program;
Installing bicycle and/or shower facilities to encourage bicycle and pedestrian commuting; and
Offering employees flextime, compressed work week, or job sharing options.

More intensive TDM strategies include:
- Starting a formal telework program;
- Instituting a tax-free transit benefits program, either employer-sponsored or through pre-tax payroll deduction;
- Developing a commuting incentive program for those who carpool, bicycle or walk to work;
- Providing an employee/customer shuttle to local transit stations or other service areas;
- Supplementing the regional Guaranteed Ride Home program with an additional employer-sponsored service;
- Implementing a parking fee for solo drivers (for employers who previously offered free parking);
- Offering free or reduced-price parking for carpools and vanpools (where a fee previously existed);
- Starting business-sponsored or subsidized vanpools; and
- Implementing an active Air Quality Action Days program.

G. Monitoring and Compliance

The County’s TDM planner is assigned to cover TDM compliance and monitoring. Staff for these tasks has increased along with the number of properties with Site Plan review obligations.

For Category D projects, developers can be required to provide a performance guarantee to assure continuing performance. To date this option has not been used by the County for any project.

H. Performance Measures

The Arlington TDM program seeks to achieve the following results, which may be employed as evaluators of the success of the program:

1. Maintain pre-construction peak hour levels of service at major intersections.
2. Limit single occupancy vehicle trips generated by development.
3. Reduce vehicle-generated air pollution.
4. Maximize transportation alternatives while minimizing single occupancy travel.
5. Utilize transportation facilities efficiently.
6. Encourage efficient, cost effective modes of transportation that focus on moving people, not vehicles.
7. Improve transit information and dissemination so people will be able to make the most efficient and friendly use of the system.
8. Utilize public transportation effectively and efficiently, through improved system information, frequencies, routing, connections, transfers; innovative technologies are encouraged.
9. Configure mass transportation to provide access to, through, and around employment centers.
10. Encourage innovative technologies that move people between home and work the most efficient and effective way.
11. Maximize convenience of inter-modal transfers between the commuter rail system and feeder/distributor systems.
12. Encourage group riding and shared parking arrangements through parking management plans.
13. Minimize or eliminate barriers to group riding.
14. Review transportation management plans during the site development process.

I. Performance

Arlington’s TDM initiatives have successfully evolved and expanded since authorization of the original policy in 1990. Today, over 110 site plans have been approved by the County Board with TDM plans and ACCS now includes a ten-person sales team that serves 600 businesses. Ninety percent of all development is now conducted through the Site Plan review program - almost all of the remaining 10% consists of either single-family homes or small, town home developments.

J. Funding

The most fundamental obstacle to long-term operation of the TDM program is a lack of funding. Currently, no dedicated funding is available for ACCS; instead programs rely upon state and federal grants. Unlike most other civic functions performed by Arlington, TDM programs have no financial backing from the County. This leaves this important function in a precarious position, especially in its potential for continued growth. Recent changes that have brought improved financial security for the program include: indexing contribution increases to inflation (as indicated by the Consumer Price Index) and expanding the obligation for Transit Store/TMA contributions from 10 years to 30 years.

The key opportunity for the County continues to be the level of development demand. This has allowed the County to extract substantial civic improvements from private developers without slowing development activity. In fact, over time, the public investments secured by the program increase development demand by contributing to the distinct mobility environment that makes Arlington County a uniquely desirable place to live, work, and visit.

2.3 Detailed TDM Program Review: MONTGOMERY COUNTY’S TRANSPORTATION MANAGEMENT DISTRICTS AND TRAFFIC MITIGATION PLANS

A. Background

Montgomery County Commuter Services (MCCS), a section of the Division of Transit Services in Montgomery County’s Department of Public Works and Transportation (DPWT), provides free commuter assistance to county employers and employees through education and promotional outreach services, as well as incentive programs and a transit store.\(^7\)

Beginning in the late 1980’s, Montgomery County established Transportation Management Districts (TMDs) to provide concentrated services to encourage the use of transit and other commuting options in the County’s major business districts — Downtown Bethesda, North Bethesda, Friendship Heights, and Downtown Silver Spring. A dedicated TMD staff was assigned to each district, to focus efforts in these areas.

\(^7\) These are physical stores although online fare media sales are also available - http://www.montgomerycountymd.gov/cittmpl.asp?url=/apps/dpwt/fare_media/index.asp.
B. The TMD Program

The County has four broad goals for its TMDs:
- Reduce traffic congestion;
- Increase transportation capacity;
- Reduce air and noise pollution; and
- Promote bicycle and pedestrian access.

On November 26, 2002, the County Council passed legislation mandating that employers with 25 or more full- or part-time employees located within a TMD actively work with their TMD’s staff to reduce drive-alone commute trip rates. At a minimum, these employers are required to:
- Designate a Transportation Benefits Coordinator to serve the company’s employees;
- Implement a Traffic Mitigation Plan (TMP) – developed in consultation with TMD staff;
- Submit an Annual Report of Activities; and
- Participate in the County’s Annual Commuter Survey.

1. The Traffic Mitigation Plan
MCCS and its contractors assist County employers in developing a Traffic Mitigation Plan (TMP) designed to reduce the rates at which their employees drive alone to work. Each TMP is reviewed by the TMD staff and the Advisory Committee for that TMD which recommends approval or changes. The Director of DPWT has final approval authority.

2. Annual Report of Activities
Once a year, employers are asked to summarize the activities they have undertaken to implement their plans. Employers who successfully encourage “Better Ways to Work” (used as the program’s tag line) are eligible for local and national recognition and awards.

3. Annual Commuter Survey
Employers receive Annual Commuter Surveys from Commuter Services for distribution to their employees. Employers are required to circulate the Commuter Surveys to their employees within 45 days for their completion. The completed Annual Commuter Surveys are submitted to each Employer’s TMD. All surveys are conducted in the spring.

These surveys are used to track employee commuting patterns in the TMD and to monitor progress toward reaching any commuting goals set in the County’s Annual Growth Policy. They help DPWT determine what changes to programs and services are necessary. Employers are asked to make a good faith effort to achieve an 80% response rate from their employees.

The County assists employers in reaching the target response rate by supporting the efforts of the company’s Transportation Benefits Coordinator (TBC) in getting a survey into every employee’s hand. The TBC is the contact person at that employment site with whom MCCS and its contractors work to provide services and the person who is asked to distribute the survey. Surveys are available in hard copy format or online, distributed through the company email system. The County also provides detailed instructions, flyers, and prize drawings for participants who take the survey. If requested, TMD staff will hand out surveys at company-sponsored events and provide refreshments and additional prize drawings for participants.
**4. Common TMP Strategies**

- Designate contact person for employee transportation information (TBC);
- Distribute information on transit/pooling/other commute alternatives to employees on a regular basis;
- Commute information/alternatives presentations to employees at worksite by TMD staff;
- Information on commuting alternatives provided to new employees (orientation materials and presentations available from TMD staff);
- Attendance at free TMD-sponsored meetings/workshops permitted for TBC to learn about new services;
- Ozone Action Days participation (regional program to alert people to dangerous air quality days);
- Guaranteed Ride Home Promotion (free regional program offering emergency rides);
- Permanent display area for TMD-provided bus schedules and other transportation information;
- Provide ADA transportation options information;
- Tax-free monthly transit subsidies provided to employees (County subsidies and State commuter tax credit may be available);
- Transit passes/tokens offered for purchase at worksite (at full or reduced price);
- Pre-tax payroll deduction for transit costs;
- Transit/pedestrian amenities at worksite, e.g. sidewalks, benches, etc.;
- Bike amenities at worksite - racks, lockers, and/or showers (TMD may be able to supply);
- Employee carpool matching service;
- Free or reduced rate parking for car/vanpools offered to employees;
- Preferred location and/or reserved parking for car/vanpools offered to employees;
- Alternative work schedules: Flex Time, Compressed Work Week; and Telecommute, telework, and job-sharing.

**C. Compliance**

The basic steps for compliance among qualifying employers include:

1. Contact TMD Staff for assistance in customizing an effective TMP;
2. Submit TMP to DPWT — DPWT reviews submitted TMP. Upon successful review, DPWT issues confirmation of approval;
3. Work with TMD Staff and employees to actively implement and promote the strategies that are included in approved TMP;
4. Participate in the Annual Commuter Survey;
5. Submit an annual “Report of Activities” documenting results of TMP implementation.

To date, compliance rates have been very high – estimated by one TMD administrator to be about 95%. There are very few non-compliant companies in any of the TMDs. Those few will probably face fines in the near future. Failure to comply is a misdemeanor under County Code.

The County sets an 80% survey-response rate target in order to effectively measure the program’s performance. While this is a goal which many employers do not reach, most produce response rates

---

8 Jim Carlson, Planning Specialist, Montgomery County Commuter Services
significant enough to effectively track program performance. For some agreements, the TMDs conduct their own mode split surveys, usually through driveway counts at the employment site.

D. Enforcement

An employer or owner that does not submit a traffic mitigation plan or provide survey data within 30 days after a second notice has committed a Class C violation. Continued non-compliance can result in fines.

To date, the County has not invoked any non-compliance penalties though enforcement efforts are being undertaken. There are no penalties for failing to achieve established survey-response rate targets.

E. Performance Measures

In addition to the broad goals set out for established TMDs, commuting goals are identified for each district, stated as the percentage of participant-commuters not driving to work during peak times – tracked by the County as “non-auto driver mode share” (NADMS). Current NADMS targets for each TMD are as follows:

- Bethesda: 37%;
- North Bethesda: 39%;
- Friendship Heights: 39%; and
- Silver Spring: 46% (50% for new development\(^9\)).

While there are no individual NADMS targets established for participants, these targets serve as effective performance measures for the overall program.

F. Performance

Each TMD has active TMPs from dozens of area employers – see Figure 3.

\(^9\) Established developments in Silver Spring are grandfathered at 46% in order to allow the County to maintain and update ambitious NADMS targets for new development in this transit-rich location.
All TMDs have achieved or exceeded their NADMS target, according to the latest processed survey data (2006).  

G. Funding – County

A variety of funding structures have been established to support TMD efforts. The Bethesda and North Bethesda TMDs are primarily funded from parking revenues: parking meter payments, parking violation revenue, monthly permits for public parking lots, and In-Lieu of parking development fees. For the Bethesda TMD, revenues from the Bethesda Parking Lot District facilities (including lots and garages) are used to support TMD expenses as well as other types of transportation costs. In the North Bethesda TMD, the County installed more than 800 parking meters to manage its parking system which also generates revenue for TMD activities.

Silver Spring TMD is eligible to receive net revenue from the Silver Spring Parking Lot District when available, though net revenue is not always generated there. The TMDs in Silver Spring and Friendship Heights are supported by other sources, including developer fees and funds from the County’s general operating budget. Friendship Heights is the only TMD that does not receive any parking revenue, as there are no County parking facilities in Friendship Heights.

Around 2005, the County began assessing an annual fee for most new projects within TMDs. These revenues are collected by the County and allocated to traffic mitigation actions — identified in coordination with TMD staff and the TMD Advisory Committees. The fee is currently set at $.10/SF for all commercial uses. There is enabling legislation for applying a fee of up to $60 per unit for multi-family residential development, but the County has chosen not to implement this strategy. The fee is assessed upon use and occupancy of the development.

---

10 Carlson, Montgomery County Commuter Services

Developments deemed to produce significant increases in traffic may also be required to produce a Traffic Mitigation Agreement, which outlines measures they will take to mitigate their project’s traffic impacts.

This policy may soon be changing significantly with the recent adoption of a new County growth policy. This policy will likely increase the frequency with which Traffic Mitigation Agreements are required. In addition, developers usually are required to pay the cost of driveway counts and similar monitoring required as part of their development approval.

H. Funding – Participants

Participants must bear the cost of the specific strategies they implement as part of their TMP. However, MCCS and its contractors provide assistance to all County employers, including those mandated to participate in the TMD program. Free services provided include:

- Transportation Benefits Plans — How to design a suitable plan, while boosting productivity and morale;
- Transit Subsidies and Tax Credits — How commuter benefits can lower taxes for employers and employees;
- Public Transportation — Information on routes, fares, schedules, and where to buy transit passes, including pre-tax Metrochek and other discounts;
- Carpools/Vanpools — Free assistance in forming or joining a carpool;
- Parking — Information on free/discount parking for carpools/vanpools and park-and-ride lots;
- Biking/Walking — Help with rental lockers, commuting routes, and other amenities;
- Guaranteed Ride Home — Free rides home in cases of emergency or unscheduled overtime;
- Teleworking/Alternative Work Schedules — How to design a program tailored to specific needs;
- Car Sharing — Programs that provide 24/7 access to a vehicle, available at Metro stations;
- Accessible Transportation — Freedom of mobility for those with special needs;
- HOV Lanes Information — Where, when, and how to access them;
- Customized Seminars and Presentations — For setting up a commuting benefits program that works for each business; and
- Commuter Information/ Marketing Materials — Fact sheets, posters, flyers, exhibits fairs.
2.4 Detailed TDM Program Review: CITY OF ALEXANDRIA, VIRGINIA

A. Background

In 1997, as a result of traffic congestion from new development and rapid economic growth, the City of Alexandria’s leadership determined that a traffic mitigation plan would need to be created to maintain the attractiveness and viability for Alexandria as a place to live and work. This was especially true in the light of rapid commercial development adjacent to the King Street, Braddock Road and Eisenhower Metrorail Stations. New development in the area of the rail stations included an 80-acre parcel with 6.5 million square feet of mixed use development adjacent to the King Street and Eisenhower Metrorail Stations, as well as a 1.2 million square foot mixed-use development directly across from the King Street Metrorail Station. Development along the Eisenhower corridor was imminent as local developers began applying for Special Use Permits (SUPs) for creating a commercial business community along the once desolate two-lane highway, parallel to Interstate I-495. Additionally, the King Street Metrorail Station had become a transit center, or hub, for the region-wide Washington Metropolitan Area Transportation Authority’s (WMATA) Metrorail system Blue and Yellow lines, as well as Amtrak’s Northeast Regional Service (Boston to Richmond) and the newly authorized Virginia Railway Express, commuter rail service.
providing service from Fredericksburg/Manassas, through Alexandria, terminating at Washington DC’s, Union Station. Utilizing the transit services options by the three providers created a tremendous opportunity to mitigate the impact of future development. The City’s Office of Transit Services and Programs (OTS&P) would provide the administrative support to monitor compliance to the proposed traffic mitigation planning ordinance. OTS&P already provided outreach to the business community on transit services and transportation program options.

B. Transportation Management Planning (TMP) Ordinance

On May 16, 1987 the City of Alexandria Council passed the Transportation Management Plan (TMP) Ordinance (No. 3204) which requires developers to reduce Single Occupant Vehicle (SOV) traffic associated with their projects. The TMP Ordinance was the first in the Commonwealth of Virginia and only one of two in the Washington, DC region. The other being the Adequate Public Facilities Ordinance required in Montgomery County, Maryland.

C. Purpose of the Ordinance

The Alexandria City Council created the Ordinance not to limit development but rather to limit the amount of traffic that development would create. This is accomplished by requiring the developer to provide certain incentives and apply selected transportation demand management (TDM) strategies to commuters who choose to use transit services and participate in transportation programs, and provide disincentives to those commuters who choose to drive alone to and from their place of employment in the City of Alexandria, each day. The Plan, that includes the use and implementation of transit services and transportation programs, is known as the TMP, or Transportation Management Plan.

D. Goal of the Transportation Management Planning Ordinance

The goal of the Ordinance is that through the operation, and management of an approved TMP program, peak period trips generated by a development will be reduced by 10% to 30% over the AM peak period trips generated by a development without a TMP program.

Each TMP consists of two parts: the developer’s submitted TMP and the supplementary City staff recommendations. These recommendations are printed and become part of the TMP SUP that is officially adopted by the Alexandria City Council. The two documents, together, represent the ‘working TMP’ and the developer is responsible for complying with the provisions adopted in both of these documents. Where there is conflict between the two documents, the language in the staff recommendations prevails. A standard supplemental staff recommendation would be that each applicant designates a TMP Coordinator upon application for the initial building permit. The Coordinator shall maintain an on-site office and be responsible for establishing and administering the TMP for the project, including all of the approved TMP activities, or strategies.

The City Council will approve an application for a SUP if it determines that:
• The Applicant’s TMP is in accord with the requirements of the TMP, and
• The TMP, together with any amendments deemed appropriate by City Council, demonstrates that reasonable and practicable actions will be taken in conjunction with and over the life of the proposed use which will produce a significant reduction in the traffic and transportation impacts of the use.

In deciding whether such a determination may be made, City Council may consider whether either of the following goals for the proposed use will be achieved by the TMP:

**Goal #1:**
That 10% to 30% of the total number of projected trips for commercial, industrial, retail or residential uses, during the AM and PM peak periods, utilize a travel mode other than the single occupancy vehicle;

**Goal #2:**
That no more 40% of the projected SOV trips from commercial, industrial, retail or residential uses, occur between 6 AM and 10 AM, and that no more than 40% of the number of projected SOV trips occur between 3 PM and 7 PM.

E. Development Projects Subject to the TMP Ordinance

All new developments meeting the following size (square footage [SF]) thresholds that are required to receive a SUP before construction can begin.

**Figure 4: Thresholds for Special Use Permits**

<table>
<thead>
<tr>
<th>Proposed Use</th>
<th>Minimum SF</th>
</tr>
</thead>
<tbody>
<tr>
<td>Office</td>
<td>50,000 or more SF of usable space</td>
</tr>
<tr>
<td>Retail</td>
<td>40,000 or more SF of usable retail sales space</td>
</tr>
<tr>
<td>Residential</td>
<td>250 or more dwelling units</td>
</tr>
<tr>
<td>Mixed-Use</td>
<td>If the proposed building includes any of the uses listed above which meet the size threshold, the TMP must be prepared for the entire project.</td>
</tr>
</tbody>
</table>

F. Application and Approval Process

The developer’s application for a SUP must contain a Traffic Impact Study (TIS) to assess the peak period traffic impacts of the proposed project without the TMP in place, and a mitigation plan (TMP) with goals and strategies to reduce SOV traffic, particularly during AM and PM peak hour periods.
The Departments of Planning & Zoning (P&Z) and Transportation and Environmental Services (T&ES) review the SUP application and make joint recommendations to the Alexandria Planning Commission. After the Planning Commission reviews the SUP application along with the recommendations of P&Z and T&ES, the Commission makes their recommendation to City Council which finally either approves or disapproves the application. An SUP application may be amended with conditions that are recommended from Planning, T&ES and the Planning Commission. The developer must comply with the conditions. The SUP and thus, the TMP, run with the land and are mandatory and binding upon the applicant, all owners of the land, and all occupants and upon all of their heirs, successors and assigns.

G. Components of the TMP

The required TIS determines the extent to which traffic mitigation measures are needed, and which traffic mitigation measures and strategies will be the most effective.

An important impact of the TIS is that the minimum amount of parking the developer is allowed to build is adjusted downward to take into account the number of people that will be commuting by Single Occupant Vehicle (SOV) travel. Developers typically take advantage of being allowed to build less parking, therefore at full occupancy there is not enough parking for everyone to drive alone to the project. Consequently, developers are able to charge higher parking rates.

The TMP includes a reasonable and effective combination of some or all of the following elements which shall be appropriate to the size, scale and location of the proposed use and shall demonstrate that reasonable and practicable actions will be taken in conjunction with and over the life of the use which will produce a significant reduction in the traffic and related impact of the use.

- Designate a TMP Coordinator to market and promote SOV alternatives and implement and manage the approved TMP.
- Offer ridesharing incentive programs which may include activities to encourage and assist in the formation of carpools, vanpools and bus pools. This includes cash payments or subsidies; preferential parking spaces and discounted parking charges.
- Offer public transit incentive programs which may include:
  - The provision of Para transit services to/from convenient public transit sites and to accommodate midday and evening excursions;
  - The construction of transit shelters and amenities;
  - The construction of bus/rail transit stations and related facilities;
  - Dedication of land and the provision of other subsidies for the construction and operation of public transit facilities;
  - The provision of transit fare media subsidies and marketing programs; and potentially
  - The provision of other analogous incentive programs.
- Recommended improvements in public transit which services the site of the proposed use, such as changes in service routes, increases in the frequency of service, alterations in the location of facilities, the establishment of fare incentive programs and other measures designed to make the public transit more accessible to occupants of the proposed use.
• Bicycle and pedestrian incentive measures which may include the provision of bicycle parking and storage facilities; the construction and extension of bicycle paths and pedestrian walkways; the provision of shower and locker facilities; and, similar incentive features.

• In the case of office and industrial uses, variable work hour, or flex time, programs under which employees working at the proposed use will stagger their work hours in order to affect a reduction in the amount of peak period traffic to and/or from the use which would otherwise occur.

• Measures to reduce the reliance on SOV by employees and others who will travel to and from the proposed use which may include parking fee structures tailored to discourage SOV vehicles. Proscription of tenant-employer subsidy of parking costs for SOV vehicles. Time and other access restrictions of parking spaces in on-site parking facilities. Programs to support and encourage the utilization of alternative transportation modes.

• Use and accessory use design options which reduce reliance on SOV vehicles by employees and others who will travel to and from the proposed use, such as the provision of less parking area than that required under the provisions of the Ordinance. Shared parking arrangements. The incorporation of residential units (in the case of proposed commercial use).

• Any other techniques, or combination of techniques, capable of reducing the traffic and related impacts of the proposed use, such as the following:
  o Set aside a minimum of 5% of the off-street parking to be reserved for carpool and vanpool vehicles until 10:30 AM on weekdays.
  o Sell transit fare media at a location on the approved TMP development site.
  o Create a TDM program, including all applicable and reasonable program initiatives, i.e. rideshare matching, preferential & discounted parking, teleworking, etc.
  o Provide incentives for commuters who use bicycles and walking as their commute mode, including the installation of bicycle lockers and provision of shower facilities.
  o Implement alternative work hour programs, i.e. staggered work hour, flextime and compressed work weeks.
  o Create a parking management program, whereby parking pricing policy is established that supports HOV travel.
  o Establish a TMP Account to fund TMP program activities. Commercial and retail developments are required to spend, at least, $0.10 per square foot of occupied floor space annually. Residential projects are required to spend $60.00 per dwelling unit. These rates typically increase by 4% annually or through the consumer price index. They may also be tied to parking fees, or other appropriate means stated within the specific SUP.
  o Install bus shelters and similar amenities to enhance transit usage.
  o Install transit information display and maintain the same.

H. Legal Requirements

Failure to comply with the conditions of the approved TMP may result in revocation of the SUP.
2.5 Detailed TDM Program Review: Contra Costa County Department of Conservation and Development - Transportation Demand Management Plan

A. Introduction

In 1992 Contra Costa County (CA) passed their first Transportation Demand Management Plan Ordinance and Guidelines with revisions in 1995 and 1997. The focus of the Ordinance is to require developers to use effective ways to reduce traffic trips, and their associated impacts, created by new development projects.

County staff will review development projects with the Applicant (developer/owner) based on these guidelines and determine if a combination of acceptable options/measures will reduce the net number of trips that the project is anticipated to generate. This Ordinance provides recommended TDM measures and guidelines to achieve trip reduction.

The County faces the inevitability of a growing population, in conjunction with an expanding job market. The County’s TDM Ordinance Guidelines are committed to reduce traffic congestion through techniques designed to encourage the use of modes of transportation alternative to the single-occupancy vehicle (e.g. carpool, transit, etc.). The following sections paraphrase the ordinance and provide additional insights into the intent of each section.

B. Intent and Purpose of the Ordinance

Under the County’s zoning ordinance or possibly under a project’s conditions of approval, County staff has the authority to require the submittal and approval of a TDM program prior to the issuance of a
building permit for a project. TDM programs associated with development projects typically aim at achieving the following general outcomes:

- Reduce the frequency and distance of auto trips;
- Spread peak-hour trip making to off-peak time periods;
- Shift trips toward the use of environmentally friendly and non-motorized modes of transportation; and
- Provide technological solutions to reduce the environmental impacts of vehicular traffic, such as provision of charging stations to encourage the use of electric/hybrid vehicles, and provision of real-time or interactive information on bus services.

It should be noted that development projects are also subject to the potential requirement of Traffic Impact Analysis (TIA), which may include mitigations to individual and cumulative project impacts at study intersections, roadway segments, and/or freeways as well as on-site and site access improvements.

The TDM Ordinance defines important terms to clarify the type of projects subject to its requirements:
(a) "Residential Project" means any residential development application containing thirteen or more dwelling units that must be approved through a public hearing process and has not received final approval.
(b) "Non-Residential Project" means any non-residential or mixed-use development application that must be approved through a public hearing process and has not received final approval. Non-residential projects also include an application to expand an existing office or industrial structure that has at least five thousand square feet of gross floor area, by twenty-five percent or more of the structure’s gross floor area.

C. Application for Off-Street Parking Reductions

A project may qualify for reductions in off-street parking requirements. An Applicant requesting parking reductions must submit a conceptual TDM program to the community development department concurrently with the application for the project. If the tenant is known, the project Applicant and tenant must jointly submit the conceptual TDM program.

The two main benefits to project Applicants associated with a reduced off-street parking requirement are: (1) Significant savings in construction and maintenance costs for off-street parking; and, (2) The availability of space/land that otherwise would be used for parking. Such space could be utilized to provide on-site amenities, landscaping, or increased project density subject to County approval.

A mixed-use development application can have characteristics that could qualify for a reduction in off-street parking required by the zoning code. Different uses can vary in their peak parking demands in a
day, week and/or season which could support the concept of shared parking. An example would be opening up office parking to an entertainment complex in the evening to more fully utilize the facility.

D. Required Information for Development Permit Application

1. Conceptual TDM Program

The conceptual TDM program must identify TDM measures that can be demonstrated to attain the trip reduction necessary to qualify for the requested parking reductions. The department must review the project’s conceptual TDM program and make a recommendation to the division of the planning agency hearing the project application.

All Conceptual TDM Programs must contain a monitoring, evaluation and enforcement component.

To ensure the success of the TDM program, it is important that the project Applicant establish mechanisms that guarantee the perpetuity of the program. Examples of such mechanisms are described below:

- Incorporate the TDM program requirements into the Covenants, Conditions & Restrictions (CC&Rs) of the property to ensure that the TDM program runs with the land.

- Incorporate the TDM program requirements into the tenant lease agreement to ensure that occupants of the project site cooperate with the property owner/Applicant, property manager and/or the County in meeting all requirements.

2. Proposed Improvements

The Applicant must include in the tentative map, land use permit, or development plan application, any improvements that will provide access to public transit, ridesharing opportunities and non-motorized forms of travel.

If the project lies within a transit service area identified in the circulation element of the General Plan, the Applicant must consult with the transit service provider on the need to provide infrastructure to connect the project with the transit services. Evidence of compliance with this requirement may include correspondence from the local transit provider(s) regarding the potential need for installing bus turnouts, shelters or bus stops at the site.
3. Final TDM Program

The design and implementation of the final TDM program must be a condition of a project’s approval. The Applicant and all subsequent owners of the project must provide deed notification of mandatory participation in the final TDM program to all subsequent purchasers and owners of the project.

The County’s approval of a TDM program for a reduction in off-street parking is discretionary. County staff will review the Conceptual TDM Program, in consultation with the Applicant, and determine its potential to achieve the off-street parking reduction requested in the development application. A recommendation for a Final TDM Program will be made to the approving body. Approval may be conditional and include performance standards which, if not met, would require reconsideration of the Final TDM Program. If the TDM Program is not approved, there will be no reduction in off-street parking requirements.

Following the County’s review and approval process, the Final TDM program will be set as a condition of approval on the project. The project Applicant and all subsequent owners of the project must provide deed notification of mandatory participation in the Final TDM program to all subsequent purchasers, owners and tenants of the project.

E. TDM Requirement for Residential Projects

1. Residential TDM Program Content

The Applicant of a residential project containing thirteen or more dwelling units must prepare and implement a TDM program that includes at least the following:

(1) Owner-Occupied Units. Upon a residential dwelling being sold or offered for sale, the Applicant must notify and offer to the buyer or prospective buyer, as soon as it may be done, materials describing public transit, ridesharing, and non-motorized commuting opportunities available in the vicinity of the project. Such information must be transmitted no later than the close of escrow;

(2) Rental Units. Upon a residential dwelling being rented or offered for rent, the Applicant must notify and offer to the tenant or prospective tenant, materials describing public transit, ridesharing, and non-motorized commuting opportunities in the vicinity of the development. The materials must be approved by the Department of Conservation and Development. The materials must be provided no later than the time the rental agreement is executed.

The Applicant and all subsequent owners of the project must provide deed notification of mandatory participation in the TDM program to all subsequent purchasers and owners of the project.
The TDM Program for a residential project should be understood as a disclosure document to the occupants of the residential project. It discloses the transportation facilities and services located on-site and off-site that are available to the occupants.

The TDM Program must be approved prior to issuance of the first building permit for the project, unless the conditions of approval indicate otherwise. The Applicant must submit an initial submittal to County staff for review. County staff will review this submittal and identify any revisions needed, in consultation with the application, to receive approval. County staff’s primary concern is that the TDM program be accurate regarding the on-site and off-site transportation services available for project residents and that it be easily understood by residents.

2. Proposed Improvements

The Applicant must include in the tentative map or development plan application, all improvements that will provide access to public transit, ridesharing opportunities and non-motorized forms of travel.

The Applicant whose project lies within a local transit service area identified in the circulation element of the general plan must consult with the local transit service provider on the need to provide infrastructure to connect the project with transit services. Evidence of compliance with this requirement may include correspondence from the local transit provider(s) regarding the potential need for installing bus turnouts, shelters or bus stops at the site.

Proposed improvements are a primary feature of a TDM Program for residential projects. The Program will incorporate a copy of the project’s site plan showing the internal paths, bicycle parking, pedestrian/cyclist connections to off-site facilities pedestrian signage and lighting, etc. It will also require a plan/map showing bicycle lanes/routes, sidewalks/paths in the area around the project site. If the project lies within a transit service area identified in the Circulation Element of the General Plan, a map showing the transit services and the stops closest to the project site is also required.

E. TDM Requirement for Non-Residential Projects

The Applicant must include in the tentative map or development plan application, all improvements that will provide access to public transit, ridesharing opportunities and non-motorized forms of travel.

The Applicant whose project lies within a local transit service area identified in the circulation element of the general plan must consult with the local transit service provider on the need to provide infrastructure to connect the project with transit services. Evidence of compliance with this requirement may include correspondence from the local transit provider(s) regarding the potential need for installing bus turnouts, shelters or bus stops at the site.
F. Transportation Strategies Options

The four general categories of strategies recognized by Contra Costa are outlined in Figure 5. For each initiative, the Effectiveness, Cost and Implementor are defined as follows:

Effectiveness – is a measurement tool to determine the value of the effort in reducing single occupant vehicle trips at the site. Effectiveness is on a scale of 1-10, with 10 being the most effective and 1 being the least effective.

Cost – indicates the cost relative to the other options listed.

X = no cost

$ = low cost (less than $10/year per employee, or offered by 511 Contra Costa

$$ = medium cost ($10-$30/year per employee)

$$ = high cost (more than $30/year per employee, or higher infrastructure cost)

Implementor – identifies who will likely implement this strategy. This may be the developer, (property owner) or employer; however in some cases, the rideshare agency called 511 Contra Costa (511 CC) provides these services free of charge, or for a nominal charge.

2.6 Detailed TDM Program Review: Trip Reduction in the Seattle, Washington Metropolitan Area

A. Introduction and Overview

The trip reduction ordinance in King County, Seattle, Washington, as well the following Washington State jurisdictions, are tied to the Washington State, Commute Reduction (known as CTR) State law 70.94:

- Settle Commute Trip Reduction (Washington)
- Non CBD Transportation Management Ordinance - Bellevue (Washington)
- Commute Trip Reduction Program - Durham County (North Carolina)
- Commute Trip Reduction Plan - Camas (Washington)
- Commute Trip Reduction Plan Ordinance - Thurston County (Washington)
- Commuter Trip Reduction - Gig Harbor (Washington)
- Commute Trip Reduction - Puyallup (Washington)
- Commute Trip Reduction Program - SeaTac (Washington)
- Commute Trip Reduction Parking Program - Spokane County (Washington)
- Commute Trip Reduction Law - Kitsap County (Washington)
- Commute Trip Reduction Plan Ordinance - Tumwater (Washington)
- Commute Partnerships Program - King County (Washington)
- Commute Trip Reduction Program (Municipal Ordinance - Vancouver (Washington)

The King County CTR program began in 1996 and by 1999, 425 King County employers reduced daily SOV travel to work by 40%. The objective of the ordinance, the first established in Bellevue, Washington, is to provide a framework for all state jurisdictions to be consistent state-wide and help to meet air quality standards through the implementation of trip reduction strategies required of employers who have 100 or more employees.
Employers that meet the criteria must identify themselves to the city/county within 180 days of either moving to the area or growing in employment number at a worksite to 100 or more employees. Such employers shall be given 180 days to develop and submit a CTR program. Employers that do not identify themselves within 180 days are in violation of the ordinance. Newly affected employers shall have two years to meet the first CTR goal of a 15 percent reduction in proportion of single occupant vehicle trips or vehicle miles traveled per person; four years to meet the second goal of a 20 percent reduction; six years to meet the third goal of a 25 percent reduction; and twelve years to meet the fourth goal of a 35 percent reduction from the time they begin their program.

Under Washington State law, the Commute Trip Reduction (CTR) approach addresses employers having at least 100 employees who commute to work during peak commute hours of 6 AM -9 AM. CTR-affected employers are required to designate an employee transportation coordinator (ETC), distribute information about alternatives to driving alone, and report on performance goals. Over 6,400 employees (18 percent) of an estimated 35,000 downtown workforce are affected by CTR requirements. The 2006 update to the state CTR Act encouraged municipalities to enhance TDM efforts in areas of concentrated development, and Bellevue has designated downtown as a Growth and Transportation Efficiency Center (GTEC). Under this new state framework, Bellevue’s GTEC endeavors to reduce 5,000 daily auto trips by 2011 through multiple voluntary programs for employers, employees, residents, and visitors in downtown Bellevue. Rounding out the TDM repertoire, TMPs address the role of property owners and managers. Generally, TMPs support an efficient transportation network by promoting awareness of and incentivizing alternatives to driving alone, moving more people on existing infrastructure. In regard to the GTEC goal of 5,000 less auto trips, transit capacity is expected to accommodate only half, meaning that carpool and vanpool TMP requirements will be a major element in accommodating the other half.

Bellevue’s TMP is a traffic and parking plan agreement between the city and developers intended to mitigate transportation impacts of new development. First under the authority of the Washington State Environmental Policy Act, and now under city code, the City of Bellevue currently requires ongoing Transportation Management Programs for new developments depending on their size and land use. Depending on the development, a TMP may include a number of programmatic and performance requirements to reduce drive-alone commutes, such as:

- Posting transit and rideshare information
- Distributing information
- Designating a Transportation Coordinator
- Providing Preferential Parking for carpools and vanpools
- Providing Financial Incentives for carpool, vanpool, and transit commuters
- Providing a Guaranteed Ride Home program for carpool, vanpool, and transit commuters

In addition to these requirements, large downtown office buildings are required to provide commuter information for tenants having 50 or more employees, institute lease agreements incorporating employee surveys and line item parking costs, provide a ridematching service, and demonstrate a 35 percent reduction in drive-alone commuting over a 10 year period.
B. TMP History

The earliest TMP agreement was established downtown in 1980, and by 1987 there were nine agreements. Early TMP agreements focused on preventing parking spillover of office buildings, and then focus shifted to reducing drive-alone commute trips. In 1987, TMP requirements were codified and included varying requirements for buildings of different land uses and sizes, both within and outside of downtown.

Between 1987 and 1995, fifteen developments were TMP-conditioned both downtown and Citywide, mostly in the Bellevue-Redmond area. In 1995, the TMP code was revised to include: additional downtown specific requirements, particularly for office developments; and, adjusted square footage thresholds at which developers were required to implement a TMP.

C. TMP Implementation and Administration

After a developer submits a design proposal for a specific project in Bellevue, development services staff review the proposal for code compliance. Transportation Development Review staff inform the developer of any transportation-related design modifications or concerns, including a TMP, if required. If a development is determined to require a TMP, the developer must sign and record an agreement with the Bellevue city clerk and King County office of records before a building permit is issued. Recorded agreements do not include specific requirements; they are general agreements stating that the property owner will comply with the TMP city code. Following these two steps, implementation requirements differ between downtown developments and developments outside of downtown.

Developers are to submit an action plan within six months of the temporary certificate of occupancy (TCO). With the help of transportation planning staff, developers confirm this action plan in writing, describing the specific transportation management techniques that the property owner will use to encourage non-drive-alone commuting and reduce peak period vehicle trips. The action plan is not required to be recorded. A survey to determine commute behavior of employees and a report are then due a year after the certificate of occupancy (CO), followed by biennial surveys and reports for the life of the building. A number of downtown properties use the professional services of the Transportation Management Association (TMA) to administer surveys, reports, and programmatic requirements.

3.0 Other Travel Demand Management Programs and Initiatives

In addition to the case studies, a number of additional programs were identified during the literature review. The following are brief summaries of the programs using information readily available.

3.1 Gainesville, Florida

The City provides specific design standards that developers must incorporate according to the size and impact of the project. Depending on the size and impact, developers can choose from a list of transportation improvements to mitigate the conditions. These improvements include traffic signals, dedicated turn lanes, bus pass programs for residents or employees of the development, payments to the regional transit system which will add or increase the frequency of bus service, ride-sharing or van pooling, participation in a TDM program, or provision of shading over sidewalks.
3.2 Alachua County, Florida
The planning approval process in Alachua County requires that each development must document both new and ongoing mass transit modifications, bicycle/pedestrian modifications, and any other TSM/TDM strategies undertaken to date to reduce single occupant vehicle (SOV) trips, and changes in mass transit frequency and level of service as well as bicycle/pedestrian levels of service, when such levels of service are adopted by the Board of County Commissioners. This information is included in the county’s annual Monitoring Report which evaluates and recommends mitigative measures involving/including local street networks, transit, bicycle/pedestrian facilities, and service to address any transportation system capacity deficiencies identified in the report for the year being monitored.

3.3 Boca Raton, Florida
To meet the requirements of the Downtown Boca Raton DRI development order, the City of Boca Raton is required to prepare and implement a Transportation Demand Management program before issuing certificates of occupancy for developments of more than 1.5 million square feet of office equivalents. The City elected to prepare a trip reduction ordinance to meet this requirement, officially known as the Transportation Demand Management Plan. The proposed ordinance would require the development of a TDM Plan for any building, structure, or development with a minimum of 50 full time and/or part time employees and has the specified minimum size:

- general retail of 15,000 square feet of gross floor area;
- general office of 50,000 square feet of gross floor area;
- medical office of 30,000 square feet of gross floor area;
- light industrial/warehouse of 100,000 square feet of gross floor area; and
- others including hotel/motels, schools, nursing homes, movie theatres, day care centers, restaurants, recreation facilities, and government or institutional uses.

The requirements of the TDM Plan include provisions for facilities supporting a variety of alternative transportation modes, including transit. The TDM Plan for each development would adopt some combination of at least two elements contained in a list that includes:

- public transit incentive programs, including the construction of transit shelters and amenities and the provision of fare subsidies;
- public transit improvements, such as changes in service routes;
- increases in frequency of service, alteration in the location of facilities;
- the establishment of fare incentive programs and other measures designated to make public transit service more accessible to the occupants of the proposed use; and
- designated spaces provided on site that are restricted to bus pool vehicles, for those who utilize bus subscription service. Bus pool spaces would be provided at a minimum rate of 2 percent of the total parking required by the City Code of Ordinances or the Downtown Development Order. The spaces must be non-handicapped employee parking spaces located closest to the building entrance.

3.4 Hillsborough County, Florida
Hillsborough County has no legal requirements either for employers to reduce trip making by their employees or for their employees to participate. In order to address TDM in the county, the Bay Area Commuter Services, the transportation management organizations and the transportation management
initiatives seek to foster voluntary actions through their employer outreach efforts to increase employer participation in TDM programs. The County’s TDM Program Scenario consists of the following strategies:

- Employer outreach to encourage the voluntary adoption and support of TDM programs among large employers or worksites (56% of employees work for employers with more than 100 employees. Only 3% of companies have more than 100 employees.);
- Advocating for new and expanded transit services;
- Compressed work week and telecommuting outreach program;
- Vanpool program management and promotions;
- Matching program for employer-provided discounts for transit, vanpool and other commute benefits;
- Preferential parking for carpools and vanpools.

3.5 Prince George’s County, Maryland

The Maryland National Capital Park and Planning Commission (MNCPPC) is currently responding to a request from the Prince George’s County Council to create Transit District Development Plans (TDDP) in the College Park, Prince George’s Plaza, New Carrollton, and West Hyattsville areas of the County. The goal of the TDDPs is to reduce vehicle trips during specified periods of the day. A transit district is a legally defined geographic area in which vehicle trip reduction procedures, strategies, and programs are required. Developers within transit districts may be asked to provide bus shelter installations, transit use incentives and improved pedestrian facilities.

3.6 San Diego, California

The City has identified several strategies that have potential for implementation at work sites in San Diego. These strategies include: alternative work schedules, telecommuting, alternative modes of travel, on-site amenities that reduce employees’ need to have access to a personal vehicle, and parking management. The initial focus of the City’s TDM program is to work with large employers to seek their participation in implementing TDM strategies at their work site. Based on research conducted by others, employer-based TDM programs are most effective in reducing trips during peak periods. The City’s employer-based TDM program has both voluntary and regulatory components.

**Voluntary** - Voluntarism requires motivation and commitment, and thus, involves extensive efforts to market TDM benefits to potential participants (employers with 50 or more employees.) These efforts could include, but are not limited to:

- Extensive dialogue and coordination;
- Marketing and advertising, campaigns;
- Public-private partnerships with employers and institutions;
- Incentives; and
- Training.

**Regulatory** - The City is considering requiring developers applying for discretionary permits or tentative maps for developments or redevelopments of commercial, scientific research, mixed use or industrially zoned projects exceeding 25,000 square feet of gross floor area to file a Developer Transportation Demand Management Plan as a condition of the permit. The plan requirement would be a condition of approval placed upon development during the discretionary permit review process. The purpose of the plan is to promote consideration of Transportation Demand Management objectives early in the
development process. Such consideration could include providing bike lockers, carpool parking, showers and lockers; developing designs that promote biking and walking; and parking management.

3.7 Dallas-Fort Worth, Texas
NCTCOG, the Metropolitan Planning Organization for the Dallas-Fort Worth area, has been instrumental in ensuring the incorporation of TDM and TSM elements in any Major Investment Study or MIS, which in this region is an extension of the NEPA requirements for large scale projects but also includes those without federal funding. TDM aspects include:
- Employer Trip Reduction Programs (ETR);
- Vanpools (and other similar ridesharing modes);
- Park-and-Ride Facilities;
- Transportation Management Associations;
- Bicycle and Pedestrian Transportation Improvements.

4.0 Summaries of Additional Regional TDM Initiatives

In the following section information is provided on TDM programs, both regional and site-specific, that were not fully detailed in the literature reviewed. The information that was available however provides insights that may prove using to the District in the development of its approach.

4.1 City of Aspen, CO
- Types of TDM: Mode Choice
- Keywords: tourism, shuttle service, paid parking, marketing, ridesharing, recreation, HOV
- Area Demographics: Premier winter sports and recreation destination in west-central Colorado. Peak season visitor population nearly matches resident population.
- Program: Various programs including carpool parking incentives, mandatory shuttle service, paid parking programs, and aggressive marketing.
- Results: Money generated from the paid parking program directly benefits demand-side strategies. Traffic volumes have not exceeded 1993 volumes. Parking occupancy reduction of 10%.
- Cost of Program: Unavailable; numerous departments cover resource needs. As an indication, the City's marketing budget (including printing costs) for 2003 was approximately $50,000.
- Staff: The City of Aspen has one full-time individual dedicated to demand-side strategies.
- Contact: Lynn Bader, City of Aspen, www.aspenpitkin.com

4.2 Lake Tahoe Basin, CA
- Types of TDM: Mode Choice, Route Choice
- Keywords: tourism, trolley service, private shuttle service, gondola, transportation management association, recreation
- Area Demographics: Mountain communities surrounding Lake Tahoe, an attractive year-round recreation and vacation destination. Historically, a peak Friday in August experiences the highest annual daily traffic volumes. About 56,000 live in the Tahoe Basin year-round.
- Program: Various programs including two summer trolley services and private shuttle services catering primarily to Basin visitors. Private investments such as the Heavenly Gondola.
• Results: 20% of Heavenly’s visitors arrive via the gondola. In 2001, the combined trolley service ridership was nearly 90,000 passengers during a limited summer operational season.
• Cost of Programs: Limited information available. In 2001, the Nifty 50 trolley service operated on a budget of $200,000 which included 5 vehicles. During the same year, the TNT / TMA operated with a budget of about $160,000.
• Staff: Limited information available. South Shore TMA has one full-time person. TNT / TMA utilizes one full time director and one part-time employee.
• Contact: Dick Powers, South Shore TMA and Jennifer Merchant, TNT / TMA

4.3 Hennepin County, MN
• Types of TDM: Modal Shift, Location Shift
• Keywords: Transit subsidy, Pre-Tax benefits, Legislation
• Employer Demographics: Hennepin County, Minnesota, has 130 offices and facilities dispersed throughout the county with differing levels of transit service at each site. About 10,000 County employees are located in downtown Minneapolis and are well served by transit.
• Results: Estimated 60% drive alone, 15% carpool, 2% vanpool, 15% bus, 3% telework, 5% flextime
• Cost: $559,000 bus subsidy + $14,000 vanpool, parking and administration costs = $573,000 - $109,000 FICA Savings = Total Cost: $464,000.
• Staff: Minimal staff time and staff costs once program was set up.
• Contact: Mike Bastyr, Sr. Human Resources Representative, 612-348-4640

4.4 Commonwealth Atlantic Properties, Arlington County, Virginia
• Proposed a redevelopment plan for Potomac Yard in Arlington
• 2.9 million square feet of office and commercial space
• 1.4 million square feet for residential and hotel use.
• Plan also includes new streets, parks, and other amenities
• As a condition of development, the developer agreed to a Transportation Management Plan. The developer is required to achieve a transit/bike/walk mode share of 40 percent through a combination of TDM, Transportation Systems Management (TSM) and other strategies.

4.5 The Florida Hospital System, Orlando, Florida
• As a condition of their Certificate of Occupancy, the Florida Hospital must continue to be an “active and financially supportive” member of the Downtown Orlando Transportation Management Association (DOTMA).
• Either through DOTMA or on their own, the hospital must develop a TDM program.
• The TDM program is to consider “at a minimum the following”
  o Parking management provisions for carpools and vanpools
  o Publicity for transit and ridesharing information
  o Work hour adjustments (compressed week, flextime)
  o Telecommuting (where possible)
  o Showers and bicycle lockers
  o Daycare facilities.
4.6 Transportation Expansion Project (T-REX),– Denver, CO
- As part of the T-REX project, a TDM-based maintenance of traffic/construction mitigation program was required through the existing regional program TransOptions.
- TransOptions seeks specifically to reduce congestion associated with major roadway projects.
- Roadway Project sponsors have dedicated $3 million to the TransOptions program,

4.7 Port of Long Beach, Long Beach, CA
- The Los Angeles region has 16 million residents, 9 million jobs, and one of the busiest freight ports in the world.
- The Long Beach port moves close to 13,000 20-foot long containers each day.
- To better manage this high level of goods movement, Intelligent Transportation Systems (ITS) were employed as a tool to implement TDM concepts traditionally seen in personal commuting.
- Concepts explored included better scheduling, better routing and reduction of bottlenecks at check points.

4.8 University of Washington – Seattle, WA
- Types of TDM: Mode Choice
- Keywords: U-PASS, university transportation, parking disincentive, flexible parking, transit service
- Area Demographics: UW-Seattle is the City’s second largest employment and activity center outside of the central business district. In 2002, enrollment topped 39,000 students.
- Program: One pass, the U-PASS, provides an array of transportation options including transit service, preferential parking, consumer discounts, and rideshare matching.
- Results: Due to its success, other campuses have developed their own programs using U-PASS as an example. U-PASS has saved UW-Seattle capital investment costs associated with traditional parking expansion projects. U-PASS has eliminated 91 million trips since 1991.

4.9 Zion National Park, UT
- Types of TDM: Mode Choice
- Keywords: national park, shuttle system, sustainable practices, parking restriction, road closure, alternative fuel vehicles
- Area Demographics: Utah’s first national park, annual visitation of 2.61 million in 2002.
- Program: Mandatory summer shuttle system since 2000 serving Zion Canyon and Springdale. Parking is restricted on Scenic Drive.
- Results: 75% of Zion’s annual visitors use the system. In 2000, the shuttle system reportedly reduced nearly 1,200 vehicle trips per day and almost 11,000 vehicle miles traveled per day.
- Cost of Program: $12 million for the initial capital investment and approximately $2.5 million in annual operating costs.
- Contact: Ron Terry, Zion National Park

4.10 Calibre – Alexandria, VA
- Types of TDM: Modal Shift, Location Shift
- Keywords: Transit Subsidy, Parking Management, Shuttle, Relocation, Parking Cash Out, Telework, Lease Negotiation
• Employer Demographics: Located in Alexandria, VA near Washington, DC in an area well served by subway, commuter train and bus
• Program: $65 transit, bike or walk subsidy, $65 parking cash out, carpool subsidy, telecommute
• Cost of Program: $99,500 - $30,000- transit subsidies, $5,500 Telecommute program administration, $64,000 TeleworkVA! subsidy
• Staff: 2 (Benefits Coordinator and HR Director)
• Results: 2% carpool, 12% transit, 5% telework
• Contact: Michelle Voisinet Caylor, Benefits Coordinator mcaylor@calibresys.com

4.11 CH2M Hill – Denver, CO
• Types of TDM: Time Shift, Location Shift
• Keywords: Telework, Intranet, Technology, Flextime, Relocation
• Employer Demographics: Located in a suburban business park, little bus service, ample parking, adjacent to a large corridor construction project.
• Program: Corporate Telework and Flextime policies, “Look Before You Leave” Intranet travel site, relocation based on commute time analysis, accessibility to roadways and future alternative mode infrastructure.
• Results: 17% mode shift
• 8% Telework and Flextime, 3% transit, 5% Carpool, 5% bike
• Cost of Program: $60,000 includes 40 hours a month of staff time, Intranet upkeep and marketing costs.
• Staff: 1 FTE with limited transportation related responsibilities.
• Contact: Michele Wagner, michele.wagner@ch2m.com

4.12 Georgia Power Company – Atlanta, GA
• Types of TDM: Modal shift, Location shift
• Keywords: Company sponsored vanpools, Fleet vehicles, transit subsidy, telework, intranet
• Employer Demographics:
• Program: Smart Ride commuter options program. Offers a variety of commuter options to employees
• Results: 15% Compressed/flex time, 13% Vanpool/Carpool, 5% Telework
• Staff: 3 FTE. 1 Project Coordinator, 2 Corporate Facilities Analysts
• Contact: Jane Franklin, Project Coordinator 404-506-1967

4.13 Johns Manville – Denver, CO
• Types of TDM: Modal Shift
• Keywords: Transit subsidy, parking management, pre-tax benefits
• Employer Demographics: Corporate office located in downtown Denver near ample bus and light rail service, limited parking. Although Johns Manville has multiple offices around the country, the program is offered to Denver employees only
• Program: 100% transit subsidy, GRH, free-parking vouchers and parking subsidy
• Results: 55% drive alone, .5% vanpool, 44% bus/rail, .5% walk, carpool not tracked
• Cost of Program: $372,129 includes parking charges, EcoPass and parking validation stamps.
• Staff: 1 FTE, Risk Management Coordinator dedicates 20 hours a month to transportation benefits.
4.14 Nike – Beaverton, OR
- Types of TDM: Time Shift, Modal Shift
- Keywords: Internal Rideshare Technology, Incentives, Flextime, Relocation, Transit Subsidy, Bike Commute
- Employer Demographics: Located in a suburban business park, bus and light rail service, ample parking. 5,000 employees at world headquarters.
- Program: Evolution of incentive based program from Nike Buck giveaway to TRAC program featuring prize incentives, transit and rail subsidy, preferential parking, shuttle, service amenities and flextime.
- Results: 78% SOV, 10% carpool, 5% bus/rail, 5% flextime, 2% bike
- Cost of Program: $302,000 annually plus staff time. 43% of expenditures go to shuttle operations, 34% to transit subsidies, 6% to incentives, 1% to marketing, remainder to other expenses.
- Staff: 1 FTE, Transportation Specialist dedicates 150 hours a month to the TRAC program.
- Contact: Pam Linam, LinamP@JM.com

4.15 Overlake Christian Church – Redmond, WA
- Types of TDM: Modal Shift
- Keywords: Suburban Location, Carpool, Incentives
- Employer Demographics: Located in the City of Redmond, WA, Overlake Christian Church has ample free parking and receives minimal bus service.
- Program: The transportation benefits program provides up to 16 hours of paid time off per year to employees utilizing other forms of alternative transportation and $20 a month financial subsidy for public transportation.
- Results: 52% drive alone, 1% bus, 26% carpool, 12% Flextime/compressed work week
- Cost of Program: $4,000
- Staff: 1 FT with other various responsibilities including transportation program and 1 FT Director with only oversight of program.
- Contacts: Nancy Thorgeson, Director of Human Resources, nancyt@occ.org; Barbara Graef, Human Resources Administrative Assistant, barbg@occ.org

4.16 Simmons College - Boston, MA
- Types of TDM: Modal Shift
- Keywords: Transit subsidy, Parking Management, Incentives, Disincentives, Shuttle
- Employer Demographics: Located in a dense, area of Boston, MA that is well served by transit.
- Program: $65 T-Pass subsidy, increased parking costs
- Staff: 1 (Director of Auxiliary Services), contributes approximately 20 hours a month to transportation program and has assistance from other staff.
- Results: 27% transit usage, 41% SOV, 32% carpool, bike, walk
- Contact: Roy Schifilitti, roy.schifilitti@simmons.edu

4.17 Swedish Medical Center – Seattle, WA
- Types of TDM: Modal Shift
• Keywords: Transit Subsidy, Ferry Subsidy, Parking Management, Preferential Parking, Vanpool and Carpool subsidy, State and Local Mandates
• Employer Demographics: Swedish has three campuses dispersed throughout the greater Seattle area: First Hill in a downtown, dense, area well served by transit and Ballard and Providence, less dense and less transit service.
• Program: Carpool promotion program expanded to include transit, vanpool and parking benefits. Program is flexible given different shifts and campuses.
• Results: Varies with each campus.
• Cost of Program: $1.6 million for Flexpass, Puget Pass and Washington State Ferry Pass
• Staff: 1 FTE, Parking Manager/Employee Transportation Coordinator dedicates 80 hours a month to transportation benefits program.
• Contact: Karen Lee Kimber, Parking Manager/Employee Transportation Coordinator, Karen.Kimber@swedish.org.

4.18 Texas Children’s Hospital - Houston, TX

• Types of TDM: Modal Shift
• Keywords: Transit subsidies, Vanpool Subsidies, Carpool allowances, Recruitment and retention, Home/Life balance
• Employer Demographics: Located within the largest medical center in the world, TCH is the largest pediatric hospital in the United States.
• Results: 20% mode shift, 10% carpool/vanpool, 10% transit
• Staff: 1 FTE for seven sites
• Contact: Patsi Davis, Transportation Specialist, 832-824-2070

4.19 Metropolitan Seattle Transit-Oriented Development and Flexcar – Seattle, WA

• Types of TDM: Mode Shift, Origin/ Destination Location Choice, Trip Substitution Choice
• Keywords: park and ride, transit oriented development, parking variance, car sharing
• Area Demographics: Metropolitan Seattle, project locations are varied
• Program: Transit-oriented development at existing park and ride facilities, car sharing program.
• Results: New multi-family construction parking variance. Flexcar operates over 100 vehicles in more than a dozen Seattle area neighborhoods.
• Cost of Program: $1 million appropriation for staffing, consulting fees, and project development for TOD Program. Additional private development costs. The County contributes up to $200,000 per year for member incentives and staff support.
• Staff: Three project managers oversee the TOD Program.
• Contact: Flexcar – Christine Anderson, Flexcar Program Manager, King County Department of Transportation, cristine.anderson@metrokc.gov
  TOD - Ron Posthuma, King County Department of Transportation, TOD Program Manager, ron.posthuma@metokc.gov.
4.20 Orenco Station Mixed-Use Development – Hillsboro, OR

- Types of TDM: Mode Choice, Location Choice
- Keywords: light rail, transit-oriented design, housing, zoning, community design
- Area Demographics: Master-planned community at Orenco Station proximate to Tri-Met Westside MAX light rail within metropolitan Portland, Oregon.
- Program: Transit-oriented development featuring a varied housing selection and pedestrian-friendly amenities. Free transit passes are offered to all new tenants for one year.
- Results: 53% increase in transit usage after Westside light rail opened. Reduced need to travel outside of immediate community for discretionary trips.
- Contact: www.orencostation.com

5.0 Summary

Through the research undertaken to identify best practices in TDM integration it became evident that the process tends to be addressed in three general ways:

- By directly specifying TDM requirements in the development approval process.
- Through the use of TDM ordinances that require long term commitment by developers and owners, knowledge of which, influences the development process early on and throughout the planning stages.
- A combination of the two options above.

A difficulty noted in some locations was a poor record of enforcement and support for TDM programs. In situations where programs tended to wane over time, TDM is not given significant consideration and the result has been developments designed to be viable with or without a robust TDM program in place.

TDM programs and policies are very unique and reflect the political landscapes of the regions concerned. Tying TDM requirements to other elements such as parking and transit ridership simply reflects the difficulties some areas have in promoting TDM as a stand-alone measure. By tying TDM to these other elements, the goals of trip reduction can be achieved within a development process that might not consider it otherwise. However, other regions have successfully promoted TDM independent of other factors. This is all simply a reflection of how TDM is perceived and how the local approval process works. The diversity of approaches is a reflection of regional differences which has resulted in solutions as unique as the regions involved.

Date: December 14, 2009

Subject: TDM in the Development Review Process: Interview and Focus Groups
Summary and Key Findings

Introduction

This technical memorandum summarizes the input received during the Focus Group interviews conducted during the week of December 7, 2009. Interviews included representatives from the development community, advocacy groups, District agencies, and agencies from other local municipalities. Interviews included representatives from the following organizations:

- Arlington County Department of Environmental Services
- North Bethesda Transportation Management District
- City of Alexandria Office of Transit Services and Programs
- Coalition for Smarter Growth
- Developers (2) and Land Use Attorney (1)
- Downtown DC Business Improvement District
- District Office of Planning
- District Department of Transportation

Several of the interviews were held in close door sessions at the request of the interviewees and/or to encourage frank and open discussion. Staff interviewed at other local municipalities was done for informational purposes and to further assist the district in identifying successful practices in the region as well as to highlight potential pitfalls.

Arlington County Department of Environmental Services
John Durham, TDM Planner

Arlington County’s TDM Program for Site Plan Development was adopted by the County Board in 1990. Arlington’s TDM policy focuses on workplace commuter travel and looks to reduce peak hour work travel by achieving a reduction of single occupant vehicle trips. TDM measures are required for use permits if the developer wants an exception to the zoning code such as reduced parking, even if there is no increase in density.
Arlington County’s planners have learned many lessons over the program’s 20-year lifespan. The following outlines the key lessons learned:

- The most critical elements for a successful TDM program include:
  - Political support: Elected officials and citizen commissions must be willing, and have the vision, to back up TDM planning requests. Educate these key people to the goals of good planning for sustainable development.
  - Enforceable language, to understand the information flow of the design process: Develop standards and apply them fairly to all development. Permit language should be precise; never use the word “May” when you mean “Shall or Will”. Any weakness will be exploited creating loopholes to weaken the provisions or save money.
  - Understand the process is collaborative and adversarial at the same time. You seek to collaborate to create a more robust business environment, which is good for developers.
  - Maintain control over the provisions (i.e. you make the decisions, not the developer).
  - Enforcement authority and staff: A dedicated staff person is needed to visit and inform on a regular basis to maintain continuity of the programs, as well as to keep property manager contacts up to date and apprised of their responsibilities.

- TDM programs are not intuitive to most project applicants, nor the owners or managers who will be responsible for on-going program operations. Therefore, clearly defined responsibilities and goals must be spelled out in the approvals that are granted with the TDM requirements. These must be monitorable and enforceable over the long-term and should include all requirements inherited by project inheritors and successors, not just original applicants.

- To ensure agreements are fulfilled, significant penalties must be included in the TDM code. The objective is never to have to penalize, but if needed, the penalties must be of the magnitude and schedule to persuade immediate correction of the deficiency.

- Capital requirements should be included in the original building design. It is much harder to redesign or retrofit a structure later and result in the facilities needed for effective use of the program elements. Transit information, bike storage, and pedestrian access are examples.

- Applicants should be required to utilize the skills of design specialists. General designers, engineers, or planners do not have adequate education to design the specialty elements needed to support significant pedestrian and bicycle usage. One option is for the municipality to provide these services as part of design review and charge the applicant for the service.

- Do not require the TDM program to be self-sustaining financially. In Arlington, only 4% of program costs are generated by the program itself. Arlington considers the program’s objectives and results are worth the cost of financially supporting the program.

- New TDM elements being considered for the update to the County’s TDM Matrix include unbundling parking, carsharing, and providing Smart Trip Cards to every new tenant.

- Arlington encourages cooperation between the County and project applicants. The County provides assistance in developing TDM programs by meeting early and often with applicants, and recommending what should be included in their TDM program. Once projects are open, the County also offers on-site reviews to help building operators implement their programs.
An important element is to help elected officials understand beyond the value of TDM to the details of specific TDM elements. That way, when Staff recommends TDM programs, they generally have the support of elected officials who will ultimately approve the plan.

Most developers would prefer a more expensive, predictable process, to a less expensive inconsistent one where results cannot be predicted.

Make sure any financial commitments are tied to the inflation index, otherwise today’s commitments provide little financial results in the future. Also make sure financial commitments are based on square footage, not number of units.

Incorporate TDM service providers into your TDM program. For example, working with carsharing companies to understand what they need to be successful in developments, will help develop TDM elements that result in successful programs.

Allow TDM users to help monitor the program. Place TDM commitments on-line where building residents and tenants can see what they’re “entitled to”, and request them directly from the building before reporting them to the municipality. Complaints that do reach the municipality should be responded to with on-site visits and notification of how the agency and building operator addressed the issue.

North Bethesda Transportation Management District (NBTMD)
Peggy Schwartz, Executive Director

- TDM in Montgomery County is administered under the Adequate Public Facilities Ordinance which originally was adopted in 1978.
- Focus is on growth policy while mitigating traffic.
- TDM Application Process consists of the submittal of a trip reduction plan in the form of a Traffic Mitigation Plan (directed to employers) or a Traffic Mitigation Agreement (directed to residential development).
- The TMP is a requirement for the application process and is included in the mandated Traffic Mitigation Agreement and Traffic Mitigation Plan. This is a single submission, not stand-alone documents.
- Plan is submitted to Montgomery County Park and Planning, with a copy to the Montgomery County Department of Transportation after approval.
- After approval, the Agreement and Plans are shared with Montgomery County DOT for implementation and tracking.
- The role of NBTMD is to assist employers within their policy area in complying with the TMP and TMA and/or assisting them in reporting on implementation of TDM plans and strategies.
- Montgomery County’s ordinance has goals based on traffic flow and auto travel times and as such the metrics used are focused on roadway operations, not directly on the success of programmatic strategies (i.e. Roadway and intersection level of service vs. measurement of mode share).
- Trip reduction goals are determined by the planning or policy area where the development is located. Each policy area has its own trip reduction goals.
- Federal agencies are exempt from the ordinance.
- Approved developments must submit annual reports which include how the TMP funds are spent as per their reporting requirements found in the ordinance.
- The Planning Department is the first to find out about applications for new development.
Peggy Schwartz Continued

- Challenges noted:
  - Lack of organization within the jurisdiction;
  - Confusion as to whom to report changes to; and
  - Lack of staff experience with TDM.

City of Alexandria, Office of Transit Services and Programs (OTS&P)
James Maslanka, Division Chief, OTS&P

- The City of Alexandria’s TDM ordinance is simply know as the Transportation Management Plan (TMP) and was originally adopted in May, 1988.
- Agencies involved are the Office of Transit Services and Programs and City Planning and Zoning Department.
- For the TDM application process, information on compliance with the City’s TDM/TMP is presented to the Applicant when they seek to secure Special Use Permits to develop property (both commercial and residential).
- Federal Agencies are exempt from the ordinance.
- Although Federal Agencies are NOT required to comply to any land use ordinances, the City of Alexandria is pleased with the cooperation and efforts of the Patent and Trade Offices (PTO), located in the Carlyle development adjacent to the Eisenhower and King Street Station Metrorail Stations. In good faith, PTO, with its 6,500 employees, has achieved a 51% trip reduction, above and beyond the required established trip reduction goal for Carlyle which is 49%. The Federal agency, also in good faith, provides the City with on-going reporting on TDM activities.
- Approved developments must submit semi-annual reports which include how the TMP funds are spent as part of the mandatory reporting process.
- The Planning and Zoning Department is the first to find out about applications for new development. The staff reviewing TDM plans attend weekly meetings with Planning and Zoning to find out about new developments.
- The TMP is a requirement for the application process and is included in the mandated Transportation Impact Study/Traffic Impact Analysis usually submitted by traffic engineers on behalf of the applicant. The TMP is NOT a stand-alone document.
- Challenges:
  - Monitoring for non-compliance;
  - Change of ownership of property;
  - Change in property management firm; and
  - Public hearing process.
- OTS&P suggested that residential properties, other than multiple dwelling units such as condos and apartment buildings, should never be required to comply with the TMP.
Coalition for Smarter Growth
Cheryl Cort, Policy Director

- Washington D.C. currently has no policy to require TDM in the development process. A new policy should be developed that encompasses the entire District, but prioritized Downtown. One policy document which should be reviewed to find support for a TDM policy is the Comprehensive Plan.
- Community input on TDM in the development process is limited to BZA hearings and ANC meetings.
- A menu of TDM options would help agencies and the public recommend projects applicable to different neighborhoods and land uses, as well as help create campus specific plans for campuses and PUD’s. Factors to consider include intersection density and transit density, which should also help determine applicable parking ratios. TDM should also be considered on an area-wide basis through a Transportation District Management approach.
- Project planning should consider a trade-off between traffic impacts, parking supply and cost, and TDM elements. There may be an opportunity to encourage developer-supported TDM programs, if the District can show why TDM can be less expensive to provide than it costs to build parking. It would also help garner community and representative support, if TDM can be shown to reduce auto trips.
- District-sponsored projects should be the first included in a TDM policy. One example is the DCUSA project (Target at Columbia Heights) which was built with more parking than is used; parking is an expensive project cost that is “bleeding the District money.”
- By-right applications are a separate concern, as the District may not be able to require TDM elements for these projects, unless they change the status of TDM to a level equivalent with safety and welfare.
- The following elements should be considered as part of TDM programs:
  - Constraining parking
  - Requiring charging for parking and unbundling those costs from leases/purchases
  - Transit passes
  - Pedestrian and bicycle access
  - Bicycle storage
  - Changing rooms and showers
- An enforcement mechanism is also required as part of the TDM Code, to ensure promised TDM elements are provided.

Developers/Lawyers/Downtown DC Business Improvement District

- The District has no official TDM policy or requirement. In comparison, there is a clearly delineated Streetscape Program which applicants can incorporate into their designs and the public can understand.
- There is also a need for a “different culture” at District agencies, based on transparency and allowing all projects to follow a consistent process.
- TDM Plans should be integrated with the Vehicular and Bicycle Parking Plans required under District zoning.
Developers/Lawyers/Downtown DC Business Improvement District Continued

- Many developers see the value for LEED certification as a project amenity that can be marketed. TDM programs should be marketed the same way. Developers would also support TDM if they understood how they can save money by building fewer parking spaces.
- There is no post-construction follow-up to make sure TDM commitments are provided, or if they are provided on building opening, to make sure they’re provided in the long-term.
- The only way to retrofit existing buildings (or provide new operating programs) is to offer a tax credit. Otherwise, there’s no incentive to start a new TDM program.
- Proposed Clean Air Incentives Program: The District currently imposes a sales tax on all parking spaces except those bundled in the cost of a lease or purchase. All parking should be unbundled, with the parking taxed at the parking sales tax rate. This tax could be waived with the implementation of TDM programs instead.
- It is critical that any new TDM program be consistent, so Developers understand the cost when initiating projects.
- Developers reported a frustration in the entire development approval process inclusive of the TDM requirements. Developers were unsure what ultimately will be required of them in terms of analysis requirements, acceptable methods, assumptions, etc. as well as final documentation.
- Developer noted a desire for less negotiation and “back and forth” when approving a project.
- Developers and their advocates noted, without exception, that additional upfront costs would be welcomed for a consistent, well defined, transparent and equitable process. As an aside, two parties noted that Montgomery County assesses a one-time fee of $11,000 per peak hour auto trip reduced if that is accounted for in the traffic impact study, however this has not been tested as no new major development has occurred since this was enacted (effects of the current economic recession). One person providing this information felt the amount was too high.
- Developers feel that TDM requirements should be reflective of the size and location of a particular development. Flexibility in the requirements is also desirable (which elements of TDM to use).
- Developers and their advocates noted that higher up-front costs are preferable to an ongoing commitment. Developers would like to ensure that TDM fees benefit their projects directly.
- It was noted that documentation requirements are unnecessarily onerous and seemingly arbitrary.
- DCOP and DDOT are thought not to speak in one voice.
- There are instances where the first indication of any TDM issues from either DCOP or DDOT were three weeks prior to the planning commission hearing.
Zoning Commission is frustrated that a) TDM is not a consistent process; and b) the connection is not clear between recommended TDM elements and development applications.

- Zoning Commission is supportive of TDM Programs and providing less parking as part of development approvals.
- Residents frequently request more on-site parking to reduce the number of drivers looking for free on-street spaces.
- DCOP and DCDOT have re-energized their development review process. Representatives from the agencies are in on-going communication and jointly meet with applicants.
- The only leverage to require TDM programs currently lies with the Zoning Commission.
- Planned Unit Developments are treated differently than traditional zoning applications, because they are supposed to be superior to as-of-right projects. This also provides leverage to request more from the developer to make it a superior project, including TDM programs.
- Context for TDM requirements should be based on land use and distance to MetroRail station, which can be found in the District’s Comprehensive Plan.
- WMATA is not currently involved in development of TDM programs, with no mechanism for transferring funds for operating transit services.
- Development applicants are happiest when the application process (including TDM) is clear and predictable.
- TDM Policy is supported by the Comprehensive Plan, but to be effective it needs to be solidified in regulations.
- The Zoning Commission Public Hearing is the only time when DCOP and DDOT have standing to present their technical recommendations. The Applicant can modify their application anytime until the Zoning Commission takes Proposed Action.
- There are three types of development applications: Matter of Right, Planned Unit Development, and Special/Variance.
- The only way TDM requirements can be added to a project are PUD or Variance.
- There is no process for proffers in District applications, aside from within the PUD approval process.
- Zoning Commission is supportive of TDM and expects more detailed TDM plans with each application; however, these plans must make sense individually and in relation to other applications.
- Residents generally don’t ask for TDM elements in their comments on development applications.
- Long-term enforcement of TDM requirements is unclear, other than it is led by DCRA. ANC’s are a potential watchdog for compliance, as are building tenants or unit owners. In addition to an unclear enforcement process, it is unclear where fines would be deposited.
An airtight system to require TDM in the development application/review process is needed. The District can’t be capricious in their requirements, but if the details are not specified, developers will take advantage of any ambiguity.

DDOT is now included in the application process from early scoping. This allows DDOT to outline for applicants what TDM measures will be required.

Bicycle requirements are included in the Zoning Code. No other TDM elements are required by zoning. This limits DDOT’s leverage to create a reliable process and results.

Developers currently will agree to low-cost TDM elements including marketing and providing bike racks. They do not want to commit to programs with on-going costs, such as transit passes.

Zoning Commission would like TDM elements to be defined by the number of Single Occupancy Vehicle trips they would reduce. This would also help developers understand the value of the requested/required TDM programs.

There is no long-term monitoring or enforcement of current TDM agreements.

TDM elements should be specified as mitigations, not amenities. Amenities can be eliminated, mitigations cannot.

TDM elements by mode:

- **Vehicular Parking**
  - Zoning Commission and agencies support less parking. Residents request more.
  - Car sharing raises security issues, especially in residential-only buildings.

- **Bicycle**
  - Bicycle spaces are required in the Zoning Code and these elements are generally provided.
  - There has been a mixed response to providing space for the District’s Bike Sharing Spaces
  - Also a mixed response to requiring showers/changing rooms.

- **Transit**
  - TDM Plans can require providing transit passes for new residents/tenants (though it is difficult to ensure they are provided).
  - Bus shelters are provided by an advertising contract, so developers cannot provide them.
  - No way to provide operating funds to WMATA, but funds could potentially be provided to DDOT for streetcar/circulator service. Clarification of how to accept these funds is still needed.

- **Impact Fees**
  - No clear process on how to accept these fees currently exists.
  - DDOT staff needs a process to simplify TDM program approval.

The ANC’s were mentioned as a potential avenue for monitoring TDM compliance.
Additional Comments

The follow are some general concepts which came up repeatedly during the interview process. These recommendations from the interviewees are provided to help inform the process as the project moves forward:

1. There is support from Washington DC’s Zoning Commission to include TDM elements in development applications.
2. The level of frustration with the current, overall district development process was palpable. Most of the groups, both public and private, talked of systemic problems in the system to the point where it was labeled non-existent by some. It cannot be stressed strong enough that this is a fundamental issue.
3. Legal requirements for TDM elements should be formalized to ensure maximum effectiveness. Requirements should include elements to be provided in the development application, as well as mechanisms for on-going funding, monitoring, and enforcement of TDM requirements.
4. Currently there is no enforcement process, there is no mechanism available to impose fines, and even if fines were collected there is no way to direct funds to TDM projects.
5. TDM requirements should be predictable, based on an easy to replicate format. This will provide TDM benefits, encourage developers to include TDM in applications, and minimize additional workload of District staff.
6. Different processes may be required to ensure TDM is included in the process for By-Right, PUD, and Variance developments.
7. TDM elements should be considered equivalent with other transportation mitigations (roadways, intersections, signals) and not amenities.
8. Education of the value of TDM should be provided to developers, ANC/Community members, and Zoning Commission.
Appendix C: Draft TDM Plan Requirements
For proposed development the TDM requirement will be submitted in the format of a TDM Strategic Plan (“The TDM Plan”) attached as a Proffer, or an item that serves the same purpose to the proposed Site Plan being submitted for approval by the Applicant developer for residential (all uses with the exception of single family dwellings), commercial, hotel, retail and all other uses.

The Proffer, or item, will set forth the programmatic elements of a transportation demand management plan (the “TDM Plan”) that shall be implemented by the Applicant, and if applicable subsequently the Umbrella Owners Association (“UOA”) to encourage the use of transit (Metrorail, Metrobus, and DC Circulator), other high occupant vehicle commuting modes, walking, biking and teleworking, etc. in order to reduce automobile trips generated by the uses constructed on the Application Property. The TDM Plan shall be provided to complement the numerous physical attributes of the proposed development that provide for transportation systems management and may be referenced elsewhere in proffers required by DDOT. Depending on the timeline for development, “The TDM Plan” may be submitted, as part of the Proffer, in assigned phases relative to development thresholds and construction constraints.

I. The TDM Strategic Plan will address four specific areas:

A. Trip Reduction Objectives.

General. The purpose of the TDM Plan shall be to reduce vehicle trips generated by the uses constructed on the Application Property through the use of mass transit, ride-sharing, and/or other strategies.

Stabilization. Specifically, upon “stabilization” of the Application Property and thereafter, the objective of the TDM Plan shall be to reduce vehicle trips generated by the on-site uses during the weekday peak periods as defined by DDOT by a required percentage as well as an overall reduction in all daily vehicle trips. “Stabilization” of the Application Property shall be deemed to occur on either the one-year anniversary of the issuance of the last initial RUP (residential use permits) for a dwelling unit to be constructed on the Application Property or on the one-year anniversary of issuance of the last initial Non-RUP for floor area representing 80% of full occupancy of the first of the office buildings to be constructed on the Application Property.
During Construction. In addition, during construction of the Application Property the objective of the TDM Plan shall be to reduce trips generated by on-site residential uses and on-site office uses, and construction activities.

Baseline. The baseline number of vehicle trips from which such reductions shall be determined at the time of the trip generation analyses required by DDOT shall be based on the methods adopted by agency at the time of the analysis.

B. TDM Program Plan and Implementation

In order to meet the objectives set forth by DDOT, the Applicant shall implement the TDM Strategic Plan prepared by them, or on their behalf. It is the intent of this proffer that the TDM Strategic Plan adapt over time to respond to the ever-changing transportation related circumstances of the site, the surrounding community and the region, as well as to technological and/or other improvements all with the objective of meeting the required objectives by DDOT. As such, the TDM Strategic Plan may be amended from time to time, subject to approval of DDOT.

Within 90 days of the approval of this Application, the Applicant shall designate a transportation management professional to be the Transportation Coordinator ("TC") for the building or development, whose duties shall be to further develop, implement and monitor the various components of the TDM Plan. The TC shall oversee all elements of the TDM Plan and act as the liaison between the Applicant and DDOT. The TC may be employed either directly by the Applicant/UOA or through a property management company contracted by the Applicant/UOA. The Applicant shall provide written notice to DDOT of the designated TC, along with a demonstration of his/her qualifications, within 10 days of such designation and, thereafter, within 10 days of any change in such designation, plus an annual written notice to DDOT confirming the person’s name and contact information. Following the initial designation of the TC, the Applicant/UOA shall continuously employ, or cause to be employed, a TC for the Application Property.

Within 180 days of approval of this Application the Applicant, through the TC, shall establish an initial budget sufficient to implement the TDM Strategic Plan for the forthcoming year (the “TDM Budget”). The TDM Budget shall include a contingency (the “TDM Budget Contingency”) equivalent to a minimum of 10% of the amount of the TDM Budget. The Applicant shall provide written documentation demonstrating the establishment of the TDM Budget to DDOT within 10 days of its establishment. In conjunction with annual monitoring of TDM strategies the TC shall re-establish the TDM Budget for the forthcoming year. If acceptable a cost of living component will be including in the budget. As a rule, Federal agencies do not comply to/with local TDM ordinances.

C. TDM Account, Remedy Fund and TDM Penalty Fund
TDM Account: Within 90 days of the approval of the Proffer, and TDM Strategic Plan, the Applicant shall establish and fund a TDM Account in the initial amount established by DDOT. The purpose of the account is to help fund the TDM budget, including a TDM budget contingency. The TDM account shall be established in an interest bearing account with a fully insured and licensed financial institution. The Applicant shall provide written documentation demonstrating the establishment of the TDM account to DDOT within 10 days of its establishment TDM account shall be utilized by the transportation coordinator (TC) each year to implement the approved TDM Strategic Plan in accordance with the TDM Budget. The TC shall provide an annual audit of the TDM Account to DDOT, and such audit shall include demonstration that the applicable strategies of the TDM Strategic Plan were implemented and sufficiently funded that year.

Any funds remaining in the TDM Account at the end of any given year shall be transferred to the TDM Remedy Fund until such time as the TDM Remedy Fund has achieved a balance required by DDOT. Upon such time as the TDM Remedy Fund achieves the balance, any funds remaining in the TDM Account at the end of any given year shall remain in the TDM Account to be utilized for the forthcoming year. In the event that the TDM Remedy Fund is drawn upon then the process for replenishing the TDM Remedy Fund as outlined above shall be repeated until the TDM Remedy Fund again achieves the required balance.

The TDM Account shall be replenished annually following the establishment of each year’s TDM Budget reporting expenditures in an annual report to DDOT.

D. Land Use and Trip Generation

Assumption: Required trip reduction goals established by DDOT

Trip Generation: As part of the required monitoring of the TDM programs, the Applicant shall measure actual auto trip generation from the site at select intervals to evaluate the success in meeting the auto trip objectives (maximums) as required by the DDOT. Specifically, the Applicant shall conduct an auto trip generation analysis to monitor peak period auto trips generated by the uses constructed on the Applicant’s property using either traffic count or survey based methods as appropriate. Auto trips generated will be determined at the following phases of the construction process:

Phase I: Following the occupancy of an agreed upon density
Phase II: Double the amount of occupancy of Phase I
Phase III: Following stabilization of the Proffer which will occur after one-year following issuance of the last initial RUP for a dwelling unit to be constructed on the Applicant property or one year following the issuance of the last initial Non-
RUP for floor area representing 80% of full occupancy of the first office building constructed by the Applicant.

**Phase IV:** One year following stabilization  
**Phase V:** Two years following stabilization

Following the Phase V, and the fifth auto trip generation analysis, if the auto trip standards are NOT met then the Applicant, or successor developer (but not successor UOA) shall conduct additional auto trip generation analyses as provided until such time as two consecutive post stabilization auto trip generation analyses state that the auto trip requirements are being met. Auto trip generation analyses shall include vehicle counts or survey based analysis as defined by DDOT, however, the consultant may make recommendations as to the definition. Additionally, if the results of the auto trip analyses indicate that the goals have not been met, the Applicant shall meet with DDOT to review the approved TDM Plan and develop modifications to the TDM strategies to ensure that the auto trip goals are met.

II. Existing Conditions

Prior to DDOT establishing an official policy for TDM as part of the planning process it is recommended that Section B, development of a TDM Strategic Plan, be required for all new development separate of the planning and approval process through DDOT zoning/planning.

As we advance further into the 21st Century, strategies to manage demand will be more critical to better transportation operations and system performance than strategies to increase capacity (supply) of facilities. The inability to easily and quickly add new infrastructure, coupled with the growth in passenger and freight travel, have led to the need for transportation system managers and operators to pay more attention to managing demand.

The original concepts of demand management took root in the 1970s and 1980s from legitimate desires to provide alternatives to single occupancy commuter travel – to save energy, improve air quality, and reduce peak-period congestion. Today, the need to manage travel demand has broadened to encompass the desire to optimize transportation system performance for both commute and non-commute types of trips, and during both recurring as well as non-recurring events.

Growth in population, number of vehicles and the number of travelers, freight, and development has affected travel demand and re-shaped travel patterns. Managing travel demand now occurs at shopping malls, tourist sites, employment areas, or special events, such as the Olympics. The need to manage demand can occur in the middle of the day, during weekends, or evenings. Demand–side approaches are needed to help address transportation issues created by growth and the variability in demand for use of the system.

In this light, the Federal Highway Administration's Office of Transportation Management is pleased to present this new report on demand-side strategies and the important role that it plays in 21st Century transportation operations. This report builds upon previous work done on travel demand management in the early 1990's to present a newer, more contemporary, perspective on what managing demand in the 21st Century really means.

Given the greater need to manage demand under a broader set of situations and conditions, as well as the influence of information and the technologies to deliver it, the concept of demand management in the 21st Century takes on a broader and more relevant meaning. Managing demand in the 21st Century goes beyond just encouraging travelers to change their travel mode from driving alone to a carpool, vanpool, public transit vehicle, or other alternative. Managing travel demand today is about providing travelers, regardless of whether they drive alone or not, with informed choices of travel route, time, and location – not just travel mode.

Information and the technology to deliver it to travelers are beginning to have a significant impact on managing demand for both commute and non-commute situations. Real-time information systems can now let travelers make better decisions about how they travel (mode), when they travel (time), which route they travel (route), and whether they travel at
all. Real-time traveler information systems are also critical to managing significant shifts in demand that occur as a result of special events, tourist activity, incidents and emergencies, schools, shopping centers, recreation areas, medical facilities, weather problems, and reconstruction projects. In the 21st Century, the need to deliver information to help manage transportation demand will grow and be further supported by intelligent transportation systems (ITS) technologies.

The FHWA Office of Operations has a two-pronged action agenda of awareness and guidance to evolve the thinking of managing demand to a more 21st Century perspective. This report is a significant step in that direction.

To learn more, visit our website at: www.ops.fhwa.dot.gov

We look forward to working with organizations, public agencies, and interest groups to advance the ideas presented in this publication.

INTRODUCTION

Traffic congestion is slowing America down. In cities large and small, from the east coast to the west coast, traffic congestion is steadily getting worse each year. A larger percentage of the nation's roadway network is congested, more severely and for longer portions of each day, than ever before. In 1982, the average person living in one of the country's 75 largest cities faced seven hours of travel delay per year. By 2001, that figure had shot to 26 hours of delay per year, and the most severely congested periods of the day – once known as the “rush hour” – stretched to cover nearly six hours of each day. By 2001, the severity of peak-period congestion also intensified, with the average “rush hour” trip taking nearly 40% longer than the same trip at other times of the day (TTI, 2003).

The impacts of traffic congestion are far-reaching – impacting individuals, families, businesses and communities. The Texas Transportation Institute (TTI), at Texas A&M University, calculates that the country’s “congestion invoice” amounted to nearly $70 billion in 2001 – the byproduct of 3.5 billion hours of delay and 5.7 billion gallons of excess fuel consumed in congestion-related delays. These costs directly affect individuals and families, as people spend more time and money stuck in traffic. For most American households, transportation costs now account for 18% of total household expenditures. Only shelter represents a larger portion of expenditures, at 19%. The impacts on lower-income families are even more severe. For households earning between $12,000 and $23,000 per year, transportation expenses consume one in every four dollars spent (STPP, 2000).

Recognizing the growing burden of traffic congestion and the importance of efficient access and mobility, community leaders and transportation planners are actively working on transportation improvements to alleviate traffic congestion. Much needed roadway, bridge, and transit infrastructure projects – considered transportation “supply” or “capacity” enhancements – are underway across the country to mitigate travel delays and accommodate future growth needs.

As urban areas mature, however, opportunities for further investments in transportation infrastructure are often limited. Urban transportation corridors increasingly lack the physical space to accommodate more lanes. In some areas, communities voice concerns that impacts to private rights-of-way or sensitive environments outweigh the potential benefits of expanding facilities. Many areas simply lack the funds needed to pay for major roadway or transit projects. Competition for limited federal and state funds is intense, and even where needed infrastructure projects are in the planning or construction stages, project completion can still be years away.
Effectively tackling traffic congestion increasingly means employing all available strategies. New infrastructure projects – from roads to bridges to transit facilities – remain a core element of comprehensive transportation improvement programs.

Supplementing these “supply-side” investments are a broad array of “demand-side” strategies intended to make existing transportation facilities work better. Demand-side strategies are designed to better balance people’s need to travel a particular route at a particular time with the capacity of available facilities to efficiently handle this demand. Many people have attended a sporting event or a concert where everyone tries to leave the same place at the same time. While in the extreme, this is a perfect example of where travel demand exceeds available supply – and severe traffic congestion often results. The focus of demand-side strategies is to provide people with enhanced travel choices – from choices in travel mode (such as driving, using transit or bicycling), to choices in travel route and trip departure-time – and to provide incentives and information for people to make informed travel choices. For example, many sports and concert venues provide incentives for people to arrive a little early or stay a little late, essentially spreading the “peak” of the demand to travel to/from the building, reducing traffic congestion, and improving the visitor’s overall experience.

This contemporary understanding of demand-side strategies is broader in scope than prior, more traditional views of transportation demand management – or TDM. To some, the realm of demand management applications is limited primarily to encouraging alternatives to single-occupant vehicle travel for the commute to work. In practice, however, this narrow view is no longer consistent with the broad applications of demand-side strategies currently underway across the country. Today’s applications are not only limited to facilitating shifts in travel mode – they also address shifts in travel routes and travel departure-times (for all travelers, including single-occupant vehicle drivers). Today’s applications also extend beyond a focus on commute trips. At national parks, sports stadiums, university campuses, and other diverse destinations, transportation and facility managers are implementing demand-side strategies as part of coordinated efforts to reduce congestion. On bridges, and along corridors undergoing roadway reconstruction programs, demand-side strategies are helping travelers avoid congestion by utilizing alternative travel routes, travel times and/or travel modes – or by reducing the need for some trips altogether by facilitating work from home options a few days a month.

*Mitigating Traffic Congestion: The Role of Demand-Side Strategies* articulates a framework for understanding contemporary efforts to manage demand and improve the performance and efficiency of transportation systems. The document provides extensive examples of programs already underway in a variety of application settings, including over 25 in-depth case studies from across the country.
The in-depth case studies illustrate a handful of the many applications of demand-side strategies in place today. The case studies attempt to highlight the diversity of programs, with an effort to find examples that also provided one or more measures of program effectiveness. A few highlights from the case studies include:

- **SBC Park** (formerly Pac Bell Park) in San Francisco – a 41,000 seat baseball stadium – forged an access plan that integrated excellent access to existing transportation facilities (roadways, bus and rail transit, ferry services, and an extensive sidewalk network) and a comprehensive transportation management plan. With only 5,000 dedicated parking spaces available, demand-side strategies to promote a variety of mode and route travel options, along with advanced transit ticket sales and an aggressive marketing program, were key to the stadium’s success. The year the park opened, approximately 50% of baseball fans arrived in non-auto modes, over 100,000 advance-purchase transit tickets were sold, and the limited number of parking spaces were rarely full.

- **CH2M Hill** in Denver implemented a transportation program to improve the commute and enhance their employee recruitment and retention abilities. They designed an aggressive telework program with full-time and part-time telework options, and instituted a flextime program to better support a variety of commute options. CH2M Hill also designed the “Look Before You Leave” program, which encouraged all employees to check traffic conditions on a company intranet that centralized a variety of resources for current traffic conditions, roadway construction updates, etc. This resource encouraged employees to avoid the most congested travel routes and travel times whenever feasible. At this suburban work location, 17% of CH2M Hill employees use transit, carpool, bicycle, or telework. In 2002, the program reduced the number of miles driven by employees by over 115,000, and saved nearly 3,700 staff hours.

- **Lee County Bridges** crossing the Caloosahatchee River in southwest Florida are a major source of congestion and travel delay for the region. In 1997, County leaders implemented a variable pricing system for the bridge tolls which incorporated a discount for travelers crossing the bridges just before and just after the peak-periods (when using the electronic toll collection system). A 1999 survey found that this demand-side pricing system encouraged 7% of users to shift their travel patterns to cross the bridges during the discounted, non-peak hours of the day.
A full understanding of demand-side strategies must recognize the reasonable limits of these applications. Demand-side strategies should not be considered total solutions to regional traffic congestion problems. Rather, they should more often be implemented as part of an integrated set of solutions that balance supply-side infrastructure investments and demand-side strategies. Demand-side strategies can be relatively easy to implement in a shorter timeframe, within a more constrained budget, than capital improvements. As such, supply-side and demand-side approaches can prove complementary – with demand-side efforts taking on an asset management role by maximizing the performance and extending the life of existing roadways. Successful demand management programs often leverage the synergistic results of many demand-side strategies working together – essentially producing the cumulative results of a number of small percentage improvements.

Demand-side strategies are ultimately about choice and balance. Expanding the array of mode, route and departure-time choices available – supported by robust real-time traveler information, incentives, and other resources – allows each person to choose the options that work best for them regarding when they travel, the mode and route they use to get there, or whether they travel at all.

What’s Inside?
Mitigating Traffic Congestion outlines a framework for understanding the full scope of demand-side strategies, and provides a wealth of case studies, both brief and in-depth, that illustrate where and how these strategies are already underway. The document is organized around these primary five sections:

- **The Demand-Side Framework** – The broad framework for understanding demand-side strategies, their impact on traveler choices, and the varied settings where they are applied.

- **Summary of Case Study Experience** – A review of the case studies collected and key lessons learned from the case study exploration.
