Environment

TransNet
ENVIRONMENTAL MITIGATION PROGRAM
FACT SHEET

Overview
Through the Environmental Mitigation Program (EMP), SANDAG protects, preserves, and restores native habitats as offsets to disturbance caused by regional and local transportation projects.

The EMP is funded by TransNet, a regional half-cent sales tax for transportation administered by SANDAG. San Diego County voters approved the original TransNet, a 20-year, $3.3-billion program in 1987. Before the measure expired in 2008, voters supported extending it for another 40 years to 2048. The EMP was established as part of the TransNet extension, which is expected to generate an additional $14 billion for highway, transit, and local road projects, as well as other transportation improvements. All EMP-related expenditures are reviewed by the TransNet Independent Taxpayer Oversight Committee to ensure fiscal accountability.

In 2012, the California chapter of the American Planning Association recognized the EMP with the Best Practices Award.

Saving Money and Expediting Projects
The EMP goes beyond traditional mitigation. The program allows SANDAG to buy land early – at lower costs and in larger parcels – and bank it for future mitigation needs as opposed to buying land in small pieces to satisfy mitigation requirements project by project. As SANDAG and its partner agencies seek permits to construct projects over the next several decades, portions of the land purchased earlier will be used as mitigation. The economic benefit will be the difference between the cost of the land purchased in large parcels earlier, and the higher price if acquired in smaller parcels at later dates.

Mitigation costs under a traditional project-by-project approach could approach $850 million. Under the EMP’s comprehensive approach to mitigation, it is estimated that $200 million in savings could be achieved, which in turn will be applied to regionwide habitat preservation efforts.

(Continued on reverse)
Ultimately, the EMP accelerates project delivery by ensuring a reliable approach for funding the required mitigation in advance of projects. Through the EMP, SANDAG meets the mitigation needs of major transportation infrastructure projects identified in the Regional Transportation Plan (RTP) while promoting the preservation of habitat identified in regional habitat conservation plans.

Accomplishments
As of July 2016, the EMP has helped conserve more than 8,600 acres of habitat with a value of nearly $158 million, in partnership with nonprofit conservation groups and local, state, and federal agencies. In addition, the program has supported scientific research and regional collaboration on land management, joint use of resources, promotion of best management practices, and strategies for long-term funding.

In its early years, the EMP focused on acquisition of uplands and was able to save taxpayer money due to favorable market conditions. Now focus is shifting to the acquisition and restoration of wetlands, including coastal lagoons. The I-5 North Coast Corridor Program, approved in August 2014 by the California Coastal Commission, includes the acquisition and restoration of 160 acres of coastal wetlands and enhancements for an additional 500 acres in conjunction with highway, transit, and pedestrian improvements.

Following massive wildfires that burned more than 600,000 acres in San Diego County in 2003 and 2007, the program funded efforts to restore damaged habitat and assess the level of recovery. With support from the EMP, the U.S. Geological Survey in 2011 finished a five-year evaluation that found neither the coastal sage scrub nor the chaparral habitat has fully recovered. The findings helped to raise awareness of lost biodiversity, and the importance of proactively planning for recovery after wildfires.

Other efforts funded by the EMP include: the installation of steel barriers to keep illegal off-road vehicles from infringing on vernal pools; mapping of the dwindling cactus patches used as habitat by the California cactus wren; removal of exotic weeds from endangered species habitat; field research on the Thorne’s hairstreak and Hermes copper butterflies to determine whether they should be listed as endangered species; an ongoing study to track the movement of mountain lions in the area between the coast and eastern foothills of San Diego County; and the construction of two platforms on San Miguel Mountain and Jamul Mountain to serve as nesting sites for golden eagles.

Regional Collaboration and Oversight
Through the EMP Working Group, SANDAG coordinates with local, state, and federal agencies, as well as nonprofit groups to manage, monitor, and acquire land. This collaborative approach ensures that best practices are disseminated, gaps in resources are identified, and duplicate efforts are eliminated.
