

BLUE LINE STATION SHELTER REHABILITATION FACT SHEET

The Project

This project consists of the replacement or rehabilitation of San Diego Trolley Blue Line station shelters from downtown San Diego to the San Ysidro International Border.

The Need

The San Diego Trolley Blue Line was built in 1981 and included simple station shelters. They have endured more than 30 years of use and now have reached the end of their useful lives. Many of the station shelters can be easily replaced, while others require full rehabilitation.

The aging shelters are an increasing threat to passenger safety and comfort. The aging infrastructure, aging wiring, and dry rot

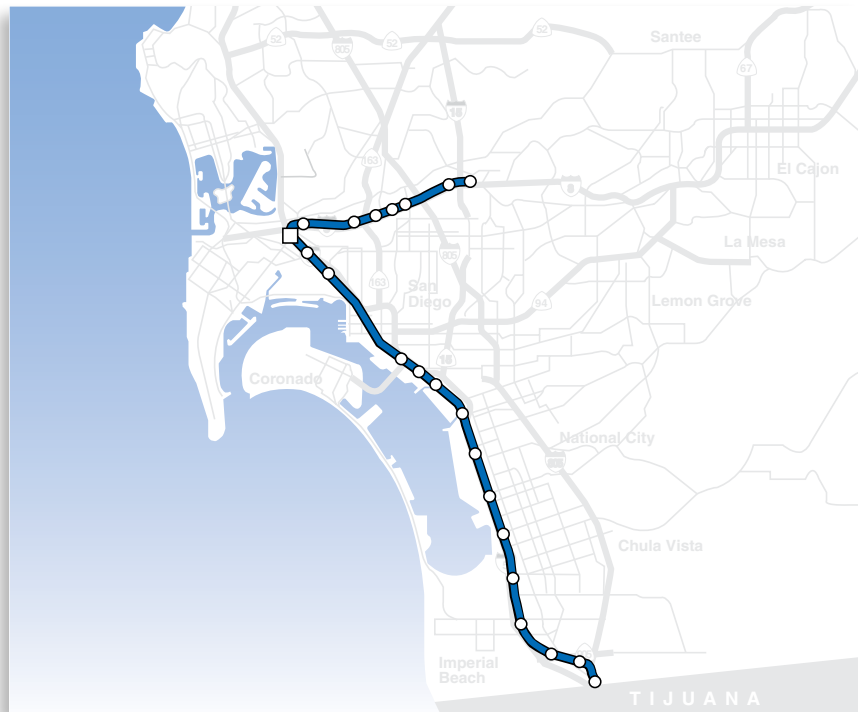

present a danger that must be corrected. The longer the delay in carrying out the rehabilitation, the greater the deterioration will drive up the replacement and repair costs. The condition of the facilities is causing additional operating costs and, moreover, represents a poor image and presentation of light rail transit station facilities.

Project Costs

The estimated cost of the shelter rehabilitation project is \$3.4 million.

Funding Status

Local funds will be made available to match federal dollars.
